| 9.4.1              | Requirements for class 1 devices  |    |
| 9.4.2              | Requirements for class 2 devices  | 70 |
| 9.4.2.1            | General Description   |    |
| 9.4.2.2            | Normal procedures of virtual call setup and release                         | 70 |

4

| 9.4.2.2.1   | Identification of the call as a DPRS call  |    |
|-------------|--|----|
| 9.4.2.2.2   | Bandwidth attributes of the call   |    |
| 9.4.2.2.3   | Creation of DLC link and MAC logical connection.                                       |    |
| 9.4.2.2.4   | Temporary states during the setup procedure  |    |
| 9.4.2.3     | Abnormal release of Virtual Calls  |    |
| 9.4.2.4     | Release of Logical Connection  |    |
| 9.4.2.5     | The handshake (stay alive) procedure   |    |
| 9.4.3       | Requirements for class 3 devices   |    |
| 9.4.3.1     | General Description  |    |
| 9.4.3.1.1   | Identification of the call as a DPRS call  |    |
| 9.4.3.1.2   | Connection attributes  |    |
| 9.4.4       | Requirements for class 4 devices   |    |
| 9.4.4.1     | General Description  |    |
| 9.4.4.1.1   | Identification of the call as a DPRS call  |    |
|             | source and physical connection management for Class 3 and Class 4 devices              |    |
| 9.5.1       | Simplified Class 3 connection management   |    |
| 9.5.2       | Suspend management (Tx side)   |    |
| 9.5.3       | Suspend management (Rx side)   |    |
| 9.5.4       | Resume management  |    |
| 9.5.5       | Stay alive (timer control)   |    |
| 9.5.6       | Stay alive (periodic resume)   |    |
| 9.5.7       | Simplified Class 4 connection management   | 74 |
| 10 MAC      | layer procedures   | 74 |
|             | nayer procedures   |    |
| 10.1.1      | Frame and multiframe structure   |    |
| 10.1.2      | Bit mappings   |    |
| 10.1.2.1    | Multiple bitmappings rule  |    |
| 10.1.3      | void   |    |
| 10.1.4      | Scrambling   |    |
| 10.1.5      | Error control  |    |
| 10.1.6      | Void   |    |
| 10.1.7      | Void   |    |
| 10.1.8      | RFP idle receiver scan sequence  |    |
| 10.1.9      | PT receiver scan sequence  |    |
| 10.1.10     | PT states and state transitions  |    |
| 10.1.10.1   | PT states and state transitions for PTs not supporting fast setup                      | 75 |
| 10.1.10.2   | PT states and state transitions for PTs supporting fast setup                          |    |
| 10.1.10.2.1 | Fast setup control information provided by the FT                                      | 76 |
| 10.1.10.2.2 | PT states and state transitions when PT and FT supports complete setup detection       | 77 |
| 10.1.10.2.3 | PT states and state transitions when PT and FT supports Selective setup detection only |    |
| 10.1.10.2.4 | Fast setup control information provided using MAC paging                               | 78 |
| 10.1.11     | Identities   | 78 |
| 10.2 No     | on continuous broadcast  | 78 |
| 10.2.1      | Request for specific Q channel information   | 78 |
| 10.2.2      | Request for a new dummy  |    |
|             | wnlink broadcast   |    |
| 10.3.1      | N <sub>T</sub> messages  |    |
| 10.3.2      | Q <sub>T</sub> messages  |    |
| 10.3.2.1    | Q <sub>T</sub> - static system information   |    |
| 10.3.2.2    | Q <sub>T</sub> - FP capabilities   |    |
| 10.3.2.2.1  | Standard FP Capabilities   |    |
| 10.3.2.2.2  | Extended FP Capabilities.  |    |
| 10.3.2.2.3  | Extended FP Capabilities part 2  |    |
| 10.3.2.3    | Q <sub>T</sub> - SARI list contents  |    |
| 10.3.2.4    | Multiframe number  |    |
|             | ging broadcast   |    |
| 10.4.1      | Paging message formats   |    |
| 10.4.1.1    | Long or full page message format   |    |
| 10.4.1.2    | Short page message format  |    |
| 10.4.1.3    | Zero length page message format.   |    |
| 10.4.1.4    | MAC resume and control page message format   | 85 |

| 10.4.1.5    | MAC layer information in zero and short length paging messages                                   |     |
|-------------|--|-----|
| 10.4.1.5.1  | RFP status   | 85  |
| 10.4.2      | MAC layer information messages procedures  | 86  |
| 10.4.2.1    | Blind slot information for circuit mode service  | 86  |
| 10.4.2.2    | Bearer handover/replacement information  | 87  |
| 10.4.2.3    | Other bearer position  | 87  |
| 10.4.2.4    | Recommended other bearer position  | 87  |
| 10.4.2.5    | Dummy or C/L bearer position   | 87  |
| 10.4.2.6    | C/L bearer position  | 87  |
| 10.4.2.7    | RFP-status and Modulation Types  | 87  |
| 10.4.2.8    | Blind slot information for packet mode service   |     |
| 10.4.3      | Paging Procedures  |     |
| 10.4.3.1    | LCE Paging   |     |
| 10.4.3.2    | MAC Paging   |     |
| 10.4.3.2.1  | Support of MAC Paging commands for resume and paging detection control                           |     |
| 10.4.3.2.2  | Support of MAC Paging codes for control of fast setup  |     |
| 10.4.4      | Paging detection.  |     |
| 10.4.4.1    | Normal duty cycle  |     |
| 10.4.4.2    | High duty cycle  |     |
| 10.4.4.3    | Low duty cycle   |     |
|             | Logical Connection Setup   |     |
|             | Logical Connection Release   |     |
|             | Connection Modification  |     |
| 10.7.1      | Connection Modification to change bandwidth  |     |
| 10.7.1      | Bandwidth negotiation  |     |
| 10.7.1.1    | Bandwidth negotiation with A-field messages  |     |
| 10.7.1.1.1  | Bandwidth negotiation with B-field messages  |     |
| 10.7.1.1.2  | Order and sequence of operations   |     |
| 10.7.1.2    |  |     |
|             | Bandwidth modification   |     |
| 10.7.1.2.1  | Order and sequence of operations   |     |
| 10.7.1.3    | Suspend  |     |
| 10.7.1.4    | Resume   |     |
| 10.7.1.5    | Bandwidth modification rejection and error handling  |     |
| 10.7.1.5.1  | Error handling   |     |
| 10.7.2      | Connection modification to change service type, slot type, modulation type or adaptive code rate |     |
| 10.7.2.1    | Connection modification to change MAC service type   |     |
| 10.7.2.2    | Connection modification to change slot type  |     |
| 10.7.2.3    | Connection modification to change the modulation scheme and adaptive code rate                   |     |
| 10.7.2.4    | ATTRIBUTES_T.req/cfm   |     |
|             | Physical Connection Setup  |     |
| 10.8.1      | Single bearer physical connection setup  |     |
| 10.8.2      | Multibearer Physical Connection setup  |     |
|             | Physical Connection Release  |     |
|             | Bearer Setup   |     |
| 10.10.1     | Duplex bearer setup procedures   |     |
| 10.10.1.1   | MAC control messages   |     |
| 10.10.1.2   | PT initiated initial duplex bearer setup (pilot bearer)  | 103 |
| 10.10.1.2.1 | 1  |     |
| 10.10.1.2.2 | Usage of channel list procedures   | 103 |
| 10.10.1.2.3 | 1 1  |     |
| 10.10.1.3   | FT initiated initial duplex bearer setup (pilot bearer)  | 105 |

## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Digital Enhanced Cordless Telecommunications (DECT).

The present document is based on EN 300 175-1 [1] to EN 300 175-8 [8]. General attachment requirements and speech attachment requirements are based on EN 301 406 [33] (replacing TBR 006 [i.3]) and EN 300 176-2 [10] (previously covered by TBR 010 [i.4]). Further details of the DECT system may be found in TR 101 178 [i.1].

The present document has been developed in accordance to the rules of documenting a profile specification as described in ISO/IEC 9646-6 [19].

The information in the present document is believed to be correct at the time of publication. However, DECT standardization is a rapidly changing area, and it is possible that some of the information contained in the present document may become outdated or incomplete within relatively short time-scales.

## 1 Scope

The present document defines the standard for packet radio services for Digital Enhanced Cordless Telecommunications (DECT) systems conforming to EN 300 175-1 [1] to EN 300 175-8 [8]. It is the basis of profiles, which define more specific applications (Application Specific Access Profiles ASAPs), aimed at the connection of terminals supporting packet data services to a fixed infrastructure, both private and public.

DECT Packet Radio Service defines several operation modes, named Classes, and several transported services and protocols, that may be frame relay or character oriented.

- Class 1 does not use a network layer C-plane and provides a service similar to a Wireless Local Area Network.
- Class 2 implements full DPRS capabilities, including complete C-plane with call control and mobility management, and provides all capabilities of the packet service of public cellular networks (i.e. GPRS). Both services Class 1 and Class 2 support multiberaer and asymmetric connections, and implement Management Entity procedures intended to achieve maximum performance, optimal efficiency and minimal access times.
- Class 3 and Class 4 are simplified modes intended for auxiliary data services in voice terminals or other moderate rate data services.

The annexes to the present document contain the conventions for interworking of the frame-relay and character oriented services, as well as, other relevant information. The following services are defined in the present document:

Frame relay services:

- LAN IEEE 802.3 [13] (also known as ISO/IEC 8802-3), (clause B.4).
- LAN IEEE 802.5 [14] (also known as ISO/IEC 8802-5), (clause B.5).
- Internet Protocol (IP) [15], (clause B.6).
- Point to Point Protocol (PPP) [16], (clause B.7).
- Generic interworking (clause B.8) that allows the direct transport of other protocols.

Character Oriented Services:

• V.24 asynchronous interface, including a Packet Assembler and Disasembler (PAD) module (annex C).

The present document defines the additional requirements on the Physical Layer (PHL), Medium Access Control (MAC) layer, Data Link Control (DLC) layer and Network (NWK) layer of DECT. The standard also specifies Management Entity (ME) requirements, which ensure the efficient use of the DECT spectrum.

The present document includes New Generation DECT, a further development of the DECT standard introducing wideband speech, improved data services, new slot types and other technical enhancements.

## 2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:

19

- if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document;
- for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at <a href="http://docbox.etsi.org/Reference">http://docbox.etsi.org/Reference</a>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

### 2.1 Normative references

The following referenced documents are indispensable for the application of the present document. For dated references, only the edition cited applies. For non-specific references, the latest edition of the referenced document (including any amendments) applies.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

Access Rights Identity (ARI): See EN 300 175-6 [6].

link: association between two DLC layer entities

NOTE: This can either be one DLC C-plane association or one DLC U-plane association. Usually, but not necessarily, one DLC Link is mapped to one Logical connection.

**logical connection:** association between two instances of the MAC MBC that can be used by higher layers to exchange U-plane or C-plane data

logical connection establishment: in service class 2, the procedure to create a logical connection

NOTE: The logical connection establishment is instantiated by the DLC upon request of the NWK layer.

logical connection release: in service class 2, the procedure to release a logical connection

NOTE: The logical connection release is usually instantiated by the DLC upon request of the NWK layer, but under certain circumstances it could also be initiated by the ME.

<sup>[</sup>i.32] ITU-T Recommendation X.25: "Interface between Data Terminal Equipment (DTE) and Data Circuit-terminating Equipment (DCE) for terminals operating in the packet mode and connected to public data networks by dedicated circuit".

**multiframe:** repeating sequence of 16 successive Time Division Multiple Access (TDMA) frames, that allows low rate or sporadic information to be multiplexed (e.g. basic system information or paging)

**New Generation DECT:** further development of the DECT standard introducing wideband speech, improved data services, new slot types and other technical enhancements

**Packet Data Protocol (PDP):** terminology used in GPRS and 3GPP that refers to any of the data protocols transported over the radio packet service (IP, X.25, etc.)

**PDP context:** terminology used in GPRS and 3GPP to denote the context associated to a packet data connection. It is equivalent to "virtual circuit".

Permanent Virtual Circuit (PVC): Virtual Circuit that can be established and cleared only by configuration

**physical connection:** association between two sets of TBCS at MAC layer including the underlying bearers that belong to a single logical connection

physical connection establishment: procedure to activate all bearers and TBCs related to a single logical connection

NOTE: The Physical Connection establishment is always under control of the Management Entity (ME).

physical connection release: procedure to release all bearers and TBCs associated with a Logical connection

NOTE: Physical Connection release is always under control of the Management Entity (ME).

resume: procedure to establish the physical connection related to a suspended logical connection

resumed state: state of an established Logical connection, open at MB, DLC and NWK, with active TBCs and physical layer

**service class 1:** local area applications, for which terminals are pre-registered off-air with one or more specific Fixed Parts (FPs), and establishment of service and user parameters is therefore implicit, according to a profile-defined list

service class 2: private and public roaming applications for which terminals may move between FPs within a given domain and for which association of service parameters is explicit at the time of service request

suspend: procedure to release the physical connection without releasing the logical connection

suspended state: state of an established logical connection with no associated TBCs or physical layer resources

TDMA frame: time-division multiplex of 10 ms duration, containing 24 successive full slots

NOTE: A TDMA frame starts with the first bit period of full slot 0 and ends with the last bit period of full slot 23.

Virtual Call (VC): any packet-mode user connection that can be setup and released by means of NWK layer C-plane procedures

NOTE: A Virtual Call is the packet-mode equivalent of a circuit-mode call. Virtual Calls can only be provided by DPRS services class 2, 3 or 4.

Virtual Circuit: any packet-mode user connection able to transport the user packet data protocol. Each Virtual Circuit provides an independent and isolated context for each subscriber data session and is mapped to one DLC Link and to one MAC Logical connection.

NOTE 1: A Virtual Circuit in DPRS is equivalent to what in GPRS and UMTS is called "PDP context".

- NOTE 2: Virtual circuits could be of two types: Virtual Calls (VC) and Permanent Virtual Circuits (PVC).
- NOTE 3: A Permanent Virtual Circuit is the packet-mode equivalent of a circuit-mode leased line. A PVC can be provided by any DPRS service classes. Service class 1 provides by construction a PVC between any pair of FP, PP. In service class 2, 3 or 4 a PVC is a degenerated case of a VC.

### 3.2 Symbols

For the purposes of the present document, the following symbols apply:

| BA                    | The part from the A-field that provides indication for the content of the B-field of one MAC layer packet |
|-----------------------|---|
| С                     | for conditional to support (process mandatory)  |
| С                     | higher layer control Channel (see $C_S$ and $C_F$ )   |
| C <sub>F</sub>        | higher layer signalling Channel (Fast)  |
| C <sub>S</sub>        | higher layer signalling Channel (Slow)  |
| Ι                     | for out-of-scope (provision optional, process optional) not subject for testing                           |
| Ι                     | higher layer Information channel (see $I_N$ and $I_P$ )   |
| I <sub>N</sub>        | higher layer Information channel (unprotected)  |
| Ip                    | higher layer Information channel protected (in general, any variant)                                      |
| IP                    | Internet Protocol   |
| I <sub>PF</sub>       | higher layer U-plane channel in E+U mode slots  |
| I <sub>PM</sub>       | higher layer Information channel, multi-subfield (protected) B-field with error detection only            |
| I <sub>PMR</sub>      | higher layer Information channel, multi-subfield (protected) B-field with MOD-2 protected                 |
|                       | channel operation (ARQ)   |
| I <sub>PQ</sub>       | higher layer Information channel single-subfield (protected) field with error detection only              |
| I <sub>PQR</sub>      | higher layer Information channel single-subfield (protected) B-field with MOD-2 protected                 |
|                       | channel operation (ARQ)   |
| I <sub>PX</sub>       | higher layer Information channel (protected) with error correction capability based on                    |
|                       | Turbocoding   |
| Lc                    | a DLC layer C-plane protocol entity   |
| M                     | for mandatory to support (provision mandatory, process mandatory)   |
| M <sub>T</sub>        | MAC control, one M-channel message  |
| N                     | identities channel  |
| N/A                   | for not-applicable (in the given context the specification makes it impossible to use this capability)    |
| N <sub>T</sub>        | Identities information, one N-channel message   |
| 0                     | for optional to support (provision optional, process mandatory)   |
| O.x<br>P <sub>T</sub> | option comprising number of items<br>one P-channel message  |
| -                     | -   |
| Q<br>Q <sub>T</sub>   | system information channel<br>System information and multiframe marker                                    |
| -                     | Higher layer connectionless channel (protected)   |
| SI <sub>P</sub>       |   |
| WtA<br>WtB            | Waiting time A<br>Waiting time B  |
| X                     | excluded, not allowed   |
| ZAP                   | The expression probably originates from comic books where characters are "zapped" indicated by            |
| 2                     | a balloon with the word ZAP! in big letters. When things get zapped in comic books they often are         |
|                       | killed or destroyed. In computer/telecommunication jargon, zapping can refer to various processes         |
|                       | used to fix things, e.g. to modify usually to correct, erase or reset. In DECT "ZAP bit" settings are     |
|                       | used to zap a user, that is to make the user unable to use the service.                                   |

The symbols defined in this clause are applied for procedures, features, and services in the present document if not explicitly otherwise stated. The interpretation of status columns in all tables is as follows:

- Provision mandatory, process mandatory means that the indicated feature service or procedure shall be implemented as described in the present document, and may be subject to testing.
- Provision optional, process mandatory means that the indicated feature, service or procedure may be implemented, and if implemented, the feature, service or procedure shall be implemented as described in the present document, and may be subject to testing.

NOTE: The used notation is based on the notation proposed in ISO/IEC 9646-7 [20].

## 3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| AC<br>ACK<br>AI/F<br>ARI<br>ARQ<br>ASAP<br>BCD<br>C/L<br>CC | Authentication Code<br>ACKnowledgement<br>Air Interface<br>Access Rights Identity<br>Automatic Retransmission reQuest<br>Application Specific Access Profile<br>Binary Coded Decimal<br>ConnectionLess<br>Call Control |
|---|--|
| NOTE: A NW  | K layer functional grouping.   |
| СНО   | Connection HandOver  |
| CI  | Common Interface   |
| CLIP  | Calling Line Identification Presentation   |
| CN  | Carrier Number   |
| C-plane   | Control plane  |
| CRC   | Cyclic Redundancy Check  |
| CSMA/CD   | Carrier Sense Multiple Access with Collision Detection   |
| CTS   | Clear To Send  |
| CUG   | Closed User Group  |
| DCDL-net  | Distributed Communication DECT Local network   |
| DCE   | Data Circuit terminating Equipment   |
| DCK   | Derived Cipher Key   |
| DECT<br>D-GMEP  | Digital Enhanced Cordless Telecommunications<br>DPRS Generic Media Encapsulation Protocol (see clause B.8)   |
| D-GWIEF<br>DLC  | Data Link Control  |
| DPRS  | Data Packet Radio service  |
| DSR   | Data Set Ready   |
| DTE   | Data Terminal Equipment  |
| DTMF  | Dual Tone Multi-Frequency  |
| DTR   | Data terminal Ready  |
| E+U   | Mode of the B-field E/U multiplexer carrying U-plane data and signalling   |
| ECN   | Exchanged Connection Number  |
| EFREL   | Enhanced Frame RELay service   |
| FC  | Frame Control  |
| FCS   | Frame Check Sequence   |
| FP  | Fixed Part   |

## 4 Description of services

## 4.1 The DECT Packet Radio Service (DPRS)

#### 4.1.1 Service objectives

At the moment of drafting of the present document the Internet Protocol has been consolidated as the universal data standard able to transport any application or service, and able of being transported by any transmission media.

27

The DECT community has recognized this reality a long time ago, and DECT specification includes mechanisms for efficient transport of Internet protocol and the application protocols on top of that.

The DECT Packet Radio Service (DPRS) is the DECT base specification for the transport of packet-mode data. It includes powerful mechanisms providing context control, mobility management and security, and takes advantage of powerful features of the DECT common interface to offer a high performance data transport mechanism.

The main objective of DPRS is the efficient transport of Internet protocol (IP) [15] and any related data protocol (such LAN or application protocols). DPRS takes advantage of the work done by IETF and the IT industry to cover a wide range of services and applications. Furthermore, by using this approach, DECT will be able to provide further applications and services to be developed in the future.

The present document defines the base functions for packet mode data transport over DECT and provides a selection of features, operation modes and interworking functions and defines an interoperability profile. DPRS may be used directly, or may be used as a base standard for developing further application profiles.

### 4.1.2 Characteristics of the DECT packet data service

The DECT Packet Radio service provides an efficient transparent transport of IP or other packet data protocol with the following characteristics:

**Packet mode:** the service provided by DECT uses only the air interface resources when there are data to be transported, allowing re-use of the spectrum by statistical multiplexation between multiple users and systems.

**Connection Oriented:** the service provided by DECT provides controlled and isolated logical paths between ends - Virtual Circuits- that can be permanent or switched. The fact that DECT provides a connection-oriented service does not introduce any kind of restriction when transporting connectionless protocols (like IP), and provides important advantages regarding to the security and mobility management. It is also possible to have in the same DECT system several data networks completely isolated between them.

**Complete mobility management:** DECT provides complete mobility management (handover, roaming) like a cellular system.

**Security:** DECT provides serious authentication and ciphering exactly as a cellular system (i.e. GSM). Ciphering is performed at MAC layer using dedicated Hw and does not consume application processing power.

**Asymmetric connections:** DPRS makes use of the TDD characteristic of DECT to revert the transmission direction of the bearers, doubling the transmission speed of the system. This process is performed automatically and continuously by the system in order to optimize transmission speed. There is no a favoured direction of transmission. The system could move from maximum speed downlink to maximum speed uplink according to the data to be transmitted.

**High Speed:** DPRS offers transmission speeds of up to 5 068 Mbit/s asymmetric or 2 772 Mbit/s + 2 772 Mbit/s symmetric with the higher modulation mode (64 QAM modulation). With the basic GFSK modulation schema, the maximum transmission speeds are 845 kbit/s asymmetric or 460 kbit/s + 460 kbit/s symmetric.

The capacities offered by DECT are similar to a cellular communication system like GPRS or UMTS.

| Service   | Class 1  | Class 2, 3 and 4 |
|---|----------|------------------|
| Point-to-point protected data transfer PP-FP with ARQ                                 | YES      | YES              |
| Point-to-point protected data transfer FP-PP with ARQ                                 | YES      | YES              |
| Point-to-multi-point data transfer FP-PP  | OPTIONAL | OPTIONAL         |
| Point-to-point data transfer PP-PP  | OPTIONAL | OPTIONAL         |
| (distributed communication)   |          |                  |
| Authentication  | -        | YES              |
| Encryption  | YES      | YES              |
| Permanent Virtual Circuit (PVC) operation   | YES      | YES              |
| Virtual Call (VC) operation   | -        | YES              |
| Intra-cell bearer handover (see note)   | YES      | YES              |
| Inter-cell bearer handover (see note)   | -        | YES              |
| Inter-cell connection handover (for multicell systems)                                | -        | OPTIONAL         |
| Inter-cell external handover  | -        | OPTIONAL         |
| NOTE: Bearer handover capability may be provided by the bearer replacement procedure. |          |                  |

#### Table 1: Summary of service capabilities

28

## 4.1.3 Performance Objectives

The DPRS has the performance and service objectives given in the following tables. Due to the nature of radio transmission and packet data in general, figures could be lower in case of bad radio links, or spectrum usage competition with other system.

| Performance  | Value   | Notes                  |
|--|---|------------------------|
| Maximum supported SDU size for Frame Relay services (see annex B)  | ≥ 1 528 octets  | Note 1                 |
| Maximum supported SDU size for character oriented services (see annex C)   | ≥ 29 octets   |                        |
| Maximum one-way delay  | Down to 50 ms<br>configurable   | Note 2                 |
| Maximum sustainable unidirectional throughput (per slot), GFSK 2-level modulation.   | 76,8 kbps net   | Notes 3 and 4          |
| Maximum sustainable unidirectional throughput<br>(single-transceiver system), GFSK 2-level modulation                              | 844,8 kbit/s net  | Notes 2, 3 and 4       |
| Maximum sustainable full bi-directional throughput (single-transceiver system), GFSK 2-level modulation                            | 460,8 kbit/s net  | Notes 2, 3 and 4       |
| Maximum sustainable unidirectional throughput (per slot),<br>high-level modulation   | 460,8 kbps net  | Notes 3, 4 and 5       |
| Maximum sustainable unidirectional throughput (single-transceiver system), high-level modulation.                                  | 5,0688 Mbit/s net   | Notes 2, 3, 4 and 5    |
| Maximum sustainable full bi-directional throughput (single-transceiver system), high level modulation                              | 2,7648 Mbit/s net   | Notes 2, 3, 4 and 5    |
| Maximum system throughput in a multi-transceiver system  | 50 Mbit/s<br>(10 parallel unidirectional<br>connections in a<br>DCDL-net) | Notes 2, 3, 4, 5 and 6 |
| Total user bandwidth available to be shared between all transmitters in an area (assuming 10 frequencies), GFSK 2-level modulation | 9,216 Mb/s<br>(10 frequencies)  | Notes 3, 4 and 6       |
| Total user bandwidth available to be shared between all transmitters in an area (assuming 10 frequencies), high level modulation   | 55,296 Mb/s<br>(10 frequencies)   | Notes 3, 4, 5 and 6    |
| Establishment of PT to FT physical connection (average)  | < 50 ms   | Note 2                 |
| Establishment of FT to PT physical connection (average)  | < 50 ms   | Note 2                 |
| Undetected bit error ratio   | < 10 <sup>-10</sup>   |                        |

#### **Table 2: Performance objectives**

|  | Performance   | Value | Notes |
|--|---|-------|-------|
| Uncorrected bit error ratio (for air interface BER 10 <sup>-3</sup> and < 10 <sup>-7</sup> |   |       |       |
| delay = 1  | delay = 100 ms)   |       |       |
| NOTE 1:  | NOTE 1: This is the minimum mandatory value for the MTU (Maximum Transmission Unit) of the transported protocol.<br>This figure is compatible with the MTU used in IEEE 802.3 [13] and IP networks (larger values may be used in<br>IP networks, but segmentation of larger MTUs is handled by the routers). All DPRS systems provide at least<br>this value, and may optionally implement larger values. |       |       |
| NOTE 2:  | Figures could be impossible to achieve in case of competition at the air i/f between several terminals or systems.  |       |       |
|  | <ul> <li>E 3: Net user data rate available for high layer protocols without considering the DECT overheads.</li> <li>E 4: Assuming Double Slot and MAC service I<sub>PQ</sub>.</li> </ul>   |       |       |
|  | Using 64 QAM modulation.<br>Assuming the 10 frequencies available in the original D<br>frequencies are available in several countries at 1 900  |       |       |

### 4.1.4 DPRS U-plane Services

DPRS provides a set of U-plane protocol transport capabilities. Each of them, are defined in an annex of the specification, which, by historic reasons, are called "Interworking" specifications. The present edition of DPRS supports the following U-plane interworking modes:

- Ethernet: provides the transport of IEEE 802.3 [13] or Ethernet LAN protocols.
- **Token Ring:** provides the transport of IEEE 802.5 [14], Token Ring protocol.
- **IP:** provides the transport of Internet Protocol v4 [15] or v6 [36] protocols.
- **PPP:** provides the transport of Point to Point Protocol [16].
- **Generic media encapsulation:** provides a generic transport for application protocols (such as SMTP, HTTP, POP, SIP, etc) directly transported over DECT DLC service.
- **V.24:** provides the emulation of a V.24 asynchronous serial line.

The DPRS Interworking types can be classified in two classes: Frame Relay or Character stream services.

- Frame Relay Service: it is a packet transport service intended for transporting frames of any data protocol.
- Character stream service: it is packet transport service intended for transporting streams of octets.

The Interworking type V24 is a character stream service. All others are Frame Relay services.

The Frame Relay service is intended for transporting frames of any data protocol. The service provides packet delimiters. The character stream service is intended for transporting streams of octets. It provides a Packet Assembler and Disassembler (PAD).

The different Protocol interworking services are defined in annexes B and C.

### 4.1.5 DPRS operation modes (Classes)

DECT Packet Radio Service defines several operation modes, named Classes, with the following capabilities:

- DPRS Class 1 is a restricted mode without Network layer C-plane. It provides a service similar to a Wireless LAN.
- DPRS Class 2 implements full DPRS capabilities, including complete C-plane with call control and mobility management, and provides all capabilities of the packet service of public cellular networks (i.e. GPRS). Both services Class 1 and Class 2 supports multiberaer and asymmetric connections, and implements Management Entity procedures intended to achieve maximum performance, optimal efficiency and minimal access times.
- DPRS Class 3 and Class 4 are simplified modes intended for auxiliary data services in voice terminals or other moderate rate data services. However, they provide NWK layer C-plane with call setup and mobility management.

### 4.1.6 DPRS System Categories

DPRS systems are classified in categories depending on the data performance objectives of the system. Each category has specific requirements, additional to the general DPRS features and services. Table 5 defines the mandatory requirements for each DPRS category.

30

The declaration of DPRS category is optional. It is possible to have DPRS systems not belonging to any data category. Such systems are called "no categorized" systems. However, the alignment to one or several DPRS categories is advisable in order to improve interoperability.

The following categories are defined:

- **Category 1:** Low-end systems providing a symmetric data rate of 50 kbit/s over a single bearer, using long slot.
- **Category 2:** Mid-end multibearer systems providing a data rate up to 500 kbit/s supporting symmetric and asymmetric connections.
- **Category 3:** High-end systems providing a data rate up to 844 kbit/s supporting symmetric and asymmetric connections.
- **Category 4:** High level modulation systems implementing up to 8PSK modulation, supporting symmetric and asymmetric connections and providing a data rate up to 2,534 Mbit/s.
- **Category 5:** High level modulation systems implementing up to 64QAM modulation and MAC encodec protected service, supporting symmetric and asymmetric connections and providing a data rate up to 4,950 Mbit/s.

Table 5 defines the mandatory features and services for each DPRS category. Such mandatory requirements should be understood as additional to the base requirements that are applicable to all DPRS systems.

DPRS Categories are back compatible in the following way:

- DPRS Category 2 systems shall support also Category 1.
- DPRS Category 3 systems shall support also Categories 1 and 2.
- DPRS Category 4 or 5 systems shall support also Categories 1, 2 and 3.

When FP and PP do not have the same Category, the features of the highest category supported by both sides shall be used.

### 4.2 Protocol architecture

DPRS offers to the user a maximum delay frame relay or streamed data service, incorporating procedures for flow control (path by path, using bandwidth control) and automatic retransmission (DLC transmission class 2).

The DPRS U-plane common bearer service is the DLC service LU10 (see EN 300 175-4 [4]) with selective retransmission (SEL), transmission Class 2, and configurable maximum delay, controlled by means of the Information Element <<Transit delay>>.

On top of LU10, DPRS transports the external protocol by means of a interworking layer. This interworking layer defines a set of interworking modes that provide the transport of the most usual data protocols. The transported protocol may be frame oriented (i.e. IP or LAN) or character oriented (i.e. V.24).

- Additional requirements for interworking to frame relay services are defined in annex B.
- Additional requirements for interworking to external stream-oriented services are defined in annex C.

In the case of character oriented services, the DPRS interworking layer (defined in annex C) provides a packet assembler and disassembler (PAD) function.

The interworking layer of DPRS is designed to be expandable by creating further interworking modes in annexes B or C for the transport of additional external protocols.

The generic media encapsulation transport mechanism (clause B.8) provides a way for transporting multiple protocols over DPRS. This mechanism is used for the transport of application protocols directly over DPRS.

The reference model of the data protocol stacks at air interface and Interworking functions is depicted in figures 1 and 2.

Figure 1: Reference configuration for DPRS U-plane

Figure 2: Reference configuration for DPRS C-plane

Specific Interworking Functions (IWF) determine the interactions between the DECT U-plane and the relevant Application protocol.

NOTE: Through the present document at many places when describing the communication between two DECT terminals the DECT traditional abbreviations FT (FP) and PT (PP) have been used. This approach has been chosen to ease understanding and does not exclude the usage of a HyP instead - for the HyP applications complete information can be found in Distributed communications description in EN 300 175-5 [5].

#### 4.2.1 Reference configuration for Internet Protocol and LANs

#### 4.2.1.1 Reference configuration for Internet Protocol

One of the most relevant use cases of DPRS is the transporting of Internet Protocol (IP). IP acts as a convergence layer allowing multiple application protocols to be transported over DPRS. The U-plane protocol stack for IP is shown in figures 3 and 4.

 PT
 Boxes in grey are a direct consequence of the present document.
 FT

 Boxes in white are implementation choices dependant.

#### 4.3 Service and feature definitions

For the purposes of the present document the following service and feature definitions apply.

#### 4.3.1 PHL service definitions

GFSK modulation [DPRS-P.1]: 2 level Gaussian frequency Shift Key (GFSK) modulation as defined by EN 300 175-2 [2], clause 5.

 $\pi/2$  DBPSK modulation [DPRS-P.2]: 2 level  $\pi/2$  DBPSK modulation as defined by EN 300 175-2 [2], clause D.1.

 $\pi/4$  QBPSK modulation [DPRS-P.3]: 4 level  $\pi/4$  DQPSK modulation as defined by EN 300 175-2 [2], clause D.2.

 $\pi/8$  D8PSK modulation [DPRS-P.4]: 8 level  $\pi/8$  D8PSK modulation as defined by EN 300 175-2 [2], clause D.3.

16 QAM modulation [DPRS-P.5]: 16 level QAM modulation as defined by EN 300 175-2 [2], clause D.4.

64 QAM modulation [DPRS-P.6]: 64 level QAM modulation as defined by EN 300 175-2 [2], clause D.5.

Physical Packet P32 [DPRS-P.7]: Physical packet P32 (full slot) as defined by EN 300 175-2 [2], clause 4.4.2.

Physical Packet P64 [DPRS-P.8]: Variable capacity Physical packet P00j as defined by EN 300 175-2 [2], clause 4.4.3, with j = 640.

Physical Packet P67 [DPRS-P.9]: Variable capacity Physical packet P00j as defined by EN 300 175-2 [2], clause 4.4.3, with j = 672.

Physical Packet P80 [DPRS-P.10]: Physical packet P80 (double slot) as defined by EN 300 175-2 [2], clause 4.4.4.

General PHL [DPRS-P.11]: General Physical layer procedures applicable to all DPRS terminals.

Fast hopping radio [DPRS-P.12]: Radio transceiver able to perform frequency change during the interval between two consecutive Physical Packets P32 (full slot) or P80 (double slot).

### 4.3.2 MAC service definitions

**general** [**DPRS-M.1**]: set of basic requirements regarding data formats, multiplexing, CRC usage, scanning and locking, which are prerequisites to communication between peer MAC entities.

**non-continuous broadcast [DPRS-M.2]:** simplex service from FT to PT which allows PTs to acquire more Q channel information (i.e. TARI) and to request a new dummy bearer.

**continuous broadcast [DPRS-M.3]:** simplex service from FT to PT whereby the FT maintains at least one bearer with continuous transmissions. The PT can use the information carried in this bearer to lock to the FT and to obtain knowledge about the FT (GAP-M.2).

34

**paging broadcast [DPRS-M.4]:** service whereby the identities of specific PTs can be broadcast by the FT. This service is normally used by the FT to request a specific PT to setup a link to the FT (GAP-M.3).

**B-field advanced connection control [DPRS-M.5]:** MAC control procedures providing complete MAC support of single bearer or multibearer connections using the complete capability of MAC control signalling. It uses B-field signalling for setting-up and releasing the required bearer(s), and includes access control procedures, bandwidth modification procedures, including suspend and resume, support for double-simplex bearers and channel lists procedures. MAC connections used in DPRS use advanced control set (advanced connections) and may coexist with other advanced or basic connections between the same PT-FT pair. Also, several instances of DPRS connections between a single PT-FT pair may exist. Independent connections are differenced by the Exchanged Connection Number (ECN) identifier.

**I**<sub>PM</sub>\_error\_detection MAC service type [DPRS.M.6]: I<sub>P</sub>\_error\_detection symmetric or asymmetric service as defined in EN 300 175-3 [3], clauses 5.6.2.1 (type 3: I<sub>P</sub>\_error\_detection symmetric) and 5.6.2.2. (type 7: I<sub>P</sub>\_error\_detection asymmetric) with multi-subfield protected B-field as defined in EN 300 175-3 [3], clause 6.2.1.3.3.

**I**<sub>PMR</sub>\_error\_correction MAC service type [DPRS.M.7]: I<sub>P</sub>\_error\_correction symmetric or asymmetric service as defined in EN 300 175-3 [3], clauses 5.6.2.1 (type 4: I<sub>P</sub>\_error\_correction symmetric) and 5.6.2.2. (type 8: I<sub>P</sub>\_error\_correction asymmetric) with multi-subfield protected B-field as defined in EN 300 175-3 [3], clause 6.2.1.3.3 and Mod-2-protected channel operation as defined by EN 300 175-3 [3], clause10.8.2.

**U-plane point-to-multipoint service [DPRS-M.8]:** simplex service from FT to PT whereby the FT transfers a single SDU of U-plane data from one source point to one (or more) destination points. The service uses the SI<sub>p</sub> logical channel: the SI<sub>p</sub> information is protected by MAC layer error detection procedure based on 16 bit CRCS.

 $C_S$  higher layer signalling [DPRS-M.9]: low rate connection oriented data service with ARQ using the  $C_S$  channel to transfer higher layer signalling data (GAP-M.5).

 $C_F$  higher layer signalling [DPRS-M.10]: high rate connection oriented data service with ARQ using the  $C_F$  channel to transfer higher layer signalling data.

**encryption activation [DPRS-M.11]:** service providing means for enabling the encryption whereby on demand all higher layer data is transferred across the DECT air interface in an encrypted form. Always initiated by the PT. A connection release automatically disables ciphering (GAP-M.7).

**encryption deactivation [DPRS-M.12]:** service providing means for disabling the encryption whereby on demand all higher layer data is transferred across the DECT air interface in an encrypted form. A connection release automatically disables ciphering (GAP-M.14).

quality control [DPRS-M.13]: provides means for monitoring and controlling the radio link quality (GAP-M.6).

**physical channel selection [DPRS-M.14]:** defines the policy for the dynamic selection of a channel, caused by the fact that an old one has to be changed or a new one is needed. Detection of bad quality on the physical channel in use (i.e. due to weak signals or interference), detection of a RFP with a stronger signal than the one of the own RFP, detection of local congestion are all criteria that can be used to select the channel.

**Secondary Access Rights Identity (SARI) support [DPRS-M.15]:** ability to support, in addition to the primary Access Rights Identity (ARI), secondary ARIs that the FT broadcasts less frequently than PARIs. These may be used to reflect an inter-operators agreement allowing a portable to access more than one operator or services through FT (GAP-M.13).

**DPRS bearer handover [DPRS-M.16]:** bearer quality maintenance procedure by setting up a replacement bearer in the same cluster. Opposing to conventional voice channel handover, there is no the requirement of using identical LBN and maintaining identical data on both bearers. Furthermore, the old bearer can be released, before or after the setup of the new one.

**Fast setup [DPRS-M.17]:** support of the capability for directly setup the initial bearer of a connection from the FT side without the need of using any paging procedure. This facility speeds up the bearer setup procedure reducing the latency time to the minimum possible. The PT should be ready to accept the setup attempts performed by the FT.

**connection handover [DPRS-M.18]:** connection quality maintenance by setting up replacement bearers in the same or a different cluster, each with identical LBN and maintaining identical data bearers with identical LBN. Subsequently the old bearers are released.

 $G_F$  channel [DPRS-M.19]: fast simplex channel that is used to provide control of U-plane entities. For example it is used to carry acknowledgements for asymmetric connections.

**I**<sub>PQ</sub>\_error\_detection MAC service type [DPRS.M.20]: I<sub>P</sub>\_ error\_detection symmetric or asymmetric service as defined in EN 300 175-3 [3], clauses 5.6.2.1 (type 3: I<sub>P</sub>\_ error\_detection symmetric) and 5.6.2.2. (type 7: I<sub>P</sub>\_ error\_detection asymmetric) with single-subfield protected B-field as defined in EN 300 175-3 [3], clause 6.2.1.3.4.

**I**<sub>PQR</sub>\_error\_correction MAC service type [DPRS.M.21]: I<sub>P</sub>\_error\_correction symmetric or asymmetric service as defined in EN 300 175-3 [3], clauses 5.6.2.1 (type 4: I<sub>P</sub>\_error\_correction symmetric) and 5.6.2.2. (type 8: I<sub>P</sub>\_error\_correction asymmetric) with single-subfield protected B-field as defined in EN 300 175-3 [3], clause 6.2.1.3.4 and Mod-2-protected channel operation as defined by EN 300 175-3 [3], clause 10.8.2.

**I**<sub>PX</sub>\_encoded protected MAC service type [DPRS.M.22]: I<sub>P</sub>\_ encoded protected symmetric or asymmetric service as defined in EN 300 175-3 [3], clauses 5.6.2.1 (type 5: I<sub>P</sub>\_ encoded protected symmetric), 5.6.2.2. (type 9: I<sub>P</sub>\_ encoded protected asymmetric) and annex I.

**I**<sub>PF</sub> channel [DPRS-M.23]: simplex channel used to transmit **I**<sub>P</sub> data multiplexed in the same bearer with MAC signalling and **G**<sub>F</sub> channel data. Also known as E+U mux mode. Defined in EN 300 175-3 [3], clause 10.8.4.

**Full slot [DPRS-M.24]:** support of the physical packet P32 and appropriate D-field mapping according to modulation type (D32a for GFSK modulation).

**Long slot 640 [DPRS-M.25]:** support of the physical packet P00j with j=640 and appropriate D-field mapping according to modulation type (D64a for GFSK modulation).

**Long slot 672 [DPRS-M.26]:** support of the physical packet P00j with j=672 and appropriate D-field mapping according to modulation type (D67a for GFSK modulation).

**Double slot [DPRS-M.27]:** support of the physical packet P80 and appropriate D-field mapping according to modulation type (D80a for GFSK modulation).

Multibearer connections [DPRS-M.28]: support of multibearer connections using more than one bearer.

Asymmetric connections [DPRS-M.29]: support of asymmetric connections using double simplex bearers, and the asymmetric variant of the MAC service type (types 7, 8 and 9) as defined in EN 300 175-3 [3], clause 5.6.2.2.

A-field simplified connection control [DPRS-M.30]: MAC control procedures providing support of single bearer connections using A-field control signalling. They provide procedures for setting-up and releasing the bearer and the associated connection. When used in combination with management Class 3 (ME.3), it includes limited support of suspend and resume and channel lists procedures. MAC connections used in DPRS use advanced control set (advanced connections) and may coexist with other advanced or basic connections between a single PT-FT pair. Independent connections are differenced by the Exchanged Connection Number (ECN) identifier.

### 4.3.3 DLC service definitions

**LU10 Enhanced Frame RELay service (EFREL) [DPRS-D.1]:** an enhanced frame relay service accessed through the LU10 SAP. The LU10 shall operate on a generic field of user data that shall be transferred into and out of the DLC U-plane as a single SDU. This SDU is assumed to contain one external frame, but the operation of LU10 shall be independent of the actual contents of the SDU. LU10 shall provide mechanisms that offer reliable transport of the generic SDUs, and that preserve the SDU boundaries.

36

**FU10a** [DPRS-D.2]: offers a defined fixed length frame structure and buffering functions for transmission of U-plane data to the MAC layer (at the transmit side) or accepts data from the MAC layer (at the receiving side) on demand and with minimum delay. Frame type FU10a is used for the forward path of unidirectional links. Bi-directional links may be implemented using two unidirectional links.

**FU10b** [**DPRS-D.3**]: offers a defined fixed length frame structure and buffering functions for transmission of higher layer U-plane control data from the DLC to the MAC layer (at the transmit side) or accepts data from the MAC layer (at the receiving side) on demand and with minimum delay. Only to be used for symmetrical bi-directional links.

**FU10c [DPRS-D.4]:** offers a defined fixed length frame structure and buffering functions for transmission of higher layer U-plane control data from the DLC to the MAC layer (at the transmit side) or accepts data from the MAC layer (at the receiving side) on demand and with minimum delay. Used to carry acknowledgements or negative acknowledgement for connections. Frame type FU10c is used for the backward control path of unidirectional links: it contains a list of receive sequence numbers for the forward link.

**Data Link Service (LAPC + Lc) class A service [DPRS-D.5]:** single frame acknowledged C-plane data link service providing a data link between one FT and one PT. The higher layer information is segmented (if necessary) and transmitted in numbered frames. The Lc service, upon which LAPC is defined, provides frame delimiting, transparency and frame synchronization (GAP-D.1).

**Data Link Service (LAPC + Lc) class U service [DPRS-D.6]:** unacknowledged C-plane data link service providing a data link between one FT and one or more PTs. The higher layer information is segmented (if necessary) and transmitted in unnumbered frames. The Lc service, upon which LAPC is defined, provides frame delimiting, transparency and frame synchronization, but no error recovery is defined.

Lc Service [DPRS-D.7]: service providing channel dependant fragmentation, recombination, frame synchronization and frame delimiting transparency. Fragmentation is obtained by means of dividing a LAPC data unit into more than one service data units for delivery to the MAC layer C logical channel, whilst recombination is obtained by means of joining several service units received from the MAC layer C logical channel into a LAPC data unit. Allows the LLME to select the logical channel for Lc operation on a frame-by-frame basis.

**broadcast Lb service [DPRS-D.8]:** simplex point-to-multipoint transmission using simple fixed length DLC frames providing a restricted broadcast service in direction FP to PP(s) (GAP-D.3).

**intercell voluntary connection handover [DPRS-D.9]:** internal handover process provided and initiated by the DLC layer (as a result of a particular policy, implementers dependent, application on link management. E.g. continued poor quality of service from the MAC layer), whereby one set of DLC entities (C-plane and U-plane) can re-route data from one MAC connection to a second new MAC connection not in the domain of the same cell, while maintaining the service provided to the NWK layer (GAP-D.5).

**connection modification [DPRS-D.10]:** service that allows the DLC to modify a connection with connection type "Unknown".

**encryption activation [DPRS-D.11]:** transporting the NWK layer encryption request and the cipher key to the MAC layer, thereby enabling the encryption process in the MAC layer (GAP-D.6).

**encryption deactivation [DPRS-D.12]:** transporting the NWK layer encryption deactivation request to the MAC layer, thereby disabling the encryption process in the MAC layer (GAP-D.9).

Connectionless U-plane [DPRS-D.13]: provision of data to multiple addresses using the SI<sub>P</sub> MAC channel.

## 4.3.4 NWK feature definitions

**PT initiated virtual call [DPRS-N.1]:** virtual call initiated by a DECT PT. (DPRS equivalent to GAP-N.1 "outgoing call" [11]).

37

**off-hook** [**DPRS-N.2**]: ability to indicate the action of going off-hook, e.g. to start call setup or accept a call (GAP-N.2).

**on-hook (FULL Release) [DPRS-N.3]:** ability to indicate the action of going on-hook (e.g. to terminate a call) and fully release the radio resource (GAP-N.3).

dialled digits (basic) [DPRS-N.4]: capability to dial digits 0-9, x, # (GAP-N.4).

**register recall [DPRS-N.5]:** ability of the PP to request the invocation of the supplementary service "register recall" over the DECT interface and the ability of the FP to transmit the request to the local network. Register recall means to seize a register (with dial tone) to permit input of further digits or other action (GAP-N.5).

**go to DTMF signalling (defined tone length) [DPRS-N.6]:** go to DTMF signalling with defined tone length (GAP-N.6).

**pause (dialling pause) [DPRS-N.7]:** ability to generate or indicate a dialling pause, e.g. to await further dial tone (GAP-N.7).

**FT initiated virtual call [DPRS-N.8]:** virtual call initiated by the FT side (DPRS equivalent to GAP-N.8 "incoming call" [11]).

authentication of PP [DPRS-N.9]: process by which the identity of a DECT PP is checked by the FP (GAP-N.9).

**authentication of user [DPRS-N.10]:** process by which the identity of a user of a DECT PP is checked by the FP. The User Personal Identification (UPI), a personal identification of 0 to 8 digits, manually entered by the user, is used for user authentication (GAP-N.10).

**location registration [DPRS-N.11]:** facility whereby a PP can be registered with a FP or a cluster of FPs such that incoming calls, radio pages or messages may be routed to it (GAP-N.11).

**on-air key allocation [DPRS-N.12]:** capability to transform Authentication Code (AC) into User Authentication Key (UAK) using the key allocation procedure (GAP-N.12).

**identification of PP [DPRS-N.13]:** ability for the FP to request and PP to provide specific identification parameters (GAP-N.13).

service class indication/assignment [DPRS-N.14]: assignment by the FP to PP of the service class and indication to the FP by the PP of the contents of its service class (GAP-N.14).

alerting [DPRS-N.15]: activates or deactivates alerting at the PP using any appropriate indication (GAP-N.15).

**ZAP** [**DPRS-N.16**]: ability first to assign and then to re-program the account data held in the PP so that access rights may be suspended subject to the conditions set by the service provider being met, coupled with the ability to re-program the account data again to reinstate access rights once these conditions have been met. One ZAP field shall be provided per account field. The PP has the right to authenticate the FP prior to the execution of ZAP suspend (GAP-N.16).

encryption activation FT initiated [DPRS-N.17]: activation of the encryption process requested by FT (GAP-N.17).

**subscription registration procedure on-air [DPRS-N.18]:** standardized procedure for loading subscription registration data into a PP in real time over the air-interface (GAP-N.18).

**link control [DPRS-N.19]:** ability to request, accept, maintain and release a data link for the purposes of a NWK layer procedure (GAP-N.19).

terminate access rights FT initiated [DPRS-N.20]: ability of the FP to delete a subscription in the PP (GAP-N.20).

**partial release [DPRS-N.21]:** ability to release an established or in progress Call Control (CC) call whilst retaining the radio resource for the purpose of accessing further services (GAP-N.21).

**go to DTMF (infinite tone length) [DPRS-N.22]:** go to DTMF signalling, indicating infinite DTMF tone duration (GAP-N.22).

go to pulse [DPRS-N.23]: go to pulse (decadic) signalling (GAP-N.23).

**signalling of display characters [DPRS-N.24]:** transmission to the PP of characters to be displayed on the user's PP display (if provided) (GAP-N.24).

**display control characters [DPRS-N.25]:** characters sent to the PP to control the user's display in the PP (if provided). Such characters include cursor control, clear screen, home, flash, inverse video etc. (GAP-N.25).

authentication of FT [DPRS-N.26]: process by which the identity of a FP is checked by the PP (GAP-N.26).

**encryption activation PT initiated [DPRS-N.27]:** activation of the encryption process suggested by PT. The real time start of ciphering is done in the MAC layer and is always initiated by the PT (GAP-N.27).

**encryption deactivation FT initiated [DPRS-N.28]:** deactivation of the encryption process requested by FT. The real time stop of ciphering is done in the MAC layer and is always initiated by the PT (GAP-N.28).

**encryption deactivation PT initiated [DPRS-N.29]:** deactivation of the encryption process suggested by PT. The real time stop of ciphering is done in the MAC layer and is always initiated by the PT (GAP-N.29).

**Calling Line Identification Presentation (CLIP) [DPRS-N.30]:** ability to provide the calling party number to the called party before accepting the call (GAP-N.30).

**internal call [DPRS-N.31]:** call between 2 users that does not make use of the local network resources. This is typically useful in residential environments (GAP-N.31).

**service call [DPRS-N.32]:** call initiated by a DECT PT for entering of FT related service and adjustment procedures in a transparent way. After having sent the service call indication, the PT behaves according to the rules of a normal call (GAP-N.32).

**Dynamic parameters allocation [DPRS-N.33]:** ability to assign/negotiate DPRS protocol handling specific parameters.

Service Negotiation at virtual call setup [DPRS-N.34]: ability to negotiate call/service parameters during virtual call setup.

**In call service change [DPRS-N.35]:** ability to modify call/service parameters (e.g. bandwidth, IWU parameters, etc.) while the call is maintained.

**NWK layer management [DPRS-N.36]:** management of NWK layer related data (e.g. identities, location registration, etc.).

Identity assignment [DPRS-N.37]: ability to assign and store different types of PT related identities.

**DECT external handover [DPRS-N.38]:** external handover is the process of switching a call in progress from one Fixed Part (FP-1) to another Fixed Part (FP-2). This means the handover occurs between two independent systems, where each system has its own lower layers of protocol and has an independent set of network layer Service Access Points (SAPs). To make external handover possible, a common management entity above the two fixed terminations is necessary (equivalent to CAP-N.1 [12]).

**Message waiting indication [DPRS-N.39]:** this feature enables a user to receive an indication of the status of a message server (e.g. a voice mailbox) to which the user has access (CAP-N.4).

Detach [DPRS-N.40]: this feature enables a PT to report to the FT that the PT is not ready to receive calls (CAP-N.5).

**Enhanced location registration [DPRS-N.41]:** this feature enables automatic location registration of PT at expected intervals of time. (CAP-N.6).

**On-air modification of user parameters [DPRS-N.42]:** this feature enables the FT to modify the active subscription data of the PT (CAP-N.7).

## 4.3.5 Application service definitions

AC to bitstring mapping [DPRS-A.1]: mapping of the AC into a bitstring (GAP-A.1).

multiple subscription registration [DPRS-A.2]: ability of PP to store more than one subscription (GAP-A.2).

**manual entry of the Portable Access Rights Key (PARK) [DPRS-A.3]:** ability of the PP to accept a manual entry of the PARK for ensuring attachment to the right FP in a physical area covered by many providers (GAP-A.3).

## 4.3.6 Distributed Communication

**Distributed Communication [DPRS-DC.1]:** ability of a DECT terminal to provide means for or assist direct communication between any two terminals, members of a "closed" local DECT network. Such terminals may be of type HyP, or, of type PP or FP (when additional specific procedures are provided).

## 4.3.7 Management Entity

**Class 1 Management [DPRS-ME.1]:** inter and intra DECT protocol layers management of the simplified version of DPRS protocol requirements that does not incorporate Network layer C-plane.

**Class 2 Management [DPRS-ME.2]:** inter and intra DECT protocol layers management of the full version of DPRS protocol requirements that does incorporate full C-plane.

**Class 3 Management [DPRS-ME.3]:** simplified management for single bearer DPRS connections intended for services like software downloading or limited content browsing as agenda, SMS or configuration facilities. Provides simplified mechanisms for connection management, limited support of suspend/resume and it incorporates NWK layer C-plane providing call control and mobility management.

**Class 4 Management [DPRS-ME.4]:** simplified management for single bearer DPRS connections intended for services like software downloading or limited content browsing as agenda, SMS or configuration facilities. Provides simplified mechanisms for connection management and does not support suspend/resume. It incorporates NWK layer C-plane providing call control and mobility management.

## 4.3.8 Call Control (CC) and Mobility Management (MM) Service Class

Service Class 1 [DPRS-G.1]: it is restricted service without Network layer C-plane. It excludes call setup procedures and does not provide mobility management.

**Service Class 2 [DPRS-G.2]:** it is full operational DPRS service. It offers complete C-plane DECT protocols, including call-setup procedures, mobility management, service management and service negotiation.

**Service Class 3 [DPRS-G.5]:** it is a restricted DPRS service with simplified management. It offers C-plane DECT protocols, including call-setup procedures and mobility management and limited support of suspend/resume.

**Service Class 4 [DPRS-G.6]:** it is a restricted DPRS service with simplified management. It offers C-plane DECT protocols, including call-setup procedures and mobility management. It does not support suspend/resume.

## 4.3.9 U-plane Service and Interworking type

**Frame Relay Service [DPRS-G.3]:** it is a packet transport service intended for transporting frames of any data protocol. The service provides packet delimiters.

**Character stream service [DPRS-G.4]:** it is a packet transport service intended for transporting streams of octets. It provides a Packet Assembler and Disassembler (PAD).

Ethernet Interworking [DPRS-I.1]: provides the transport of IEEE 802.3 [13] or Ethernet LAN protocols.

Token Ring [DPRS-I.2]: provides the transport of IEEE 802.5 [14], Token Ring protocol.

IP Interworking [DPRS-I.3]: provides the transport of Internet Protocol v4 [15] or v6 [36] protocols.

PPP Interworking [DPRS-I.4]: provides the transport of Point to Point Protocol [16].

**Generic media encapsulation Interworking [DPRS-I.5]:** provides a generic transport for application protocols (such as SMTP, HTTP, POP, SIP, etc) directly transported over DECT.

V.24 Interworking [DPRS-I.6]: provides the emulation of a V.24 asynchronous serial line.

## 4.3.10 DPRS System Categories

**Category 1 [DPRS-CAT.1]:** low-end systems providing a symmetric data rate of 50 kbit/s over a single bearer, using long slot.

**Category 2** [DPRS-CAT.2]: mid-end multibearer systems providing a data rate up to 500 kbit/s supporting symmetric and asymmetric connections.

**Category 3 [DPRS-CAT.3]:** high-end systems providing a data rate up to 844 kbit/s supporting symmetric and asymmetric connections.

**Category 4 [DPRS-CAT.4]:** high level modulation systems implementing up to 8PSK modulation, supporting symmetric and asymmetric connections and providing a data rate up to 2 534,4 kbit/s.

**Category 5** [**DPRS-CAT.5**]: high level modulation systems implementing up to 64QAM modulation and MAC encodec protected service, supporting symmetric and asymmetric connections and providing a data rate up to 4 950 kbit/s.

## 4.4 General Class/Service/Interworking support

| ltem                | Name of service                      | Reference             | Support  | t status |

## 4.5 System categories

## 4.5.1 Mapping between DPRS categories and features/services

Equipment belonging to each DPRS category type shall support the features and services defined in the following table and shall use these features/services when establish communication with other systems belonging to the same category.

For features/services not listed in this table, the status defined in clauses 7, 8, 9, 10 and 11 shall apply.

|                    | DPRS Category to feature/service mapp                                  |                |        | 6+-          | tue             |
|--------------------|--|----------------|--------|--------------|-----------------|
| Category           | DPRS Feature/Service   | Reference      | Note   | Status<br>PT |                 |
| DPRS-CAT.1         |  | 4.3.10         |        |              | FT              |
| Category 1 systems | GFSK modulation [DPRS-P.1]:  | 4.3.1          |        | М            | М               |
|                    |  | -              |        |              |                 |
|                    | Physical Packet P64 [DPRS-P.14]:                                       | 4.3.1          |        | М            | М               |
|                    | I <sub>PM</sub> _error_detection MAC service type                      | 4.3.2          |        | М            | М               |
|                    | [DPRS.M.6]   |                |        |              |                 |
|                    | I <sub>PMR</sub> _error_correction MAC service type                    | 4.3.2          |        | 0            | 0               |
|                    | [DPRS.M.7]   |                |        |              |                 |
|                    | I <sub>PF</sub> channel [DPRS-M.23]                                    | 4.3.2          |        | C51          | C5 <sup>-</sup> |

42

NOTE 3: Category 2 systems shall also support all features of Category 1 systems and shall be able to interoperate with them.

NOTE 4: Category 3 systems shall also support all features of Category 1 and Category 2 systems and shall be able to interoperate with them.

NOTE 5: In the case where a FP and a PP do not have the same category capabilities, the initiating side should use the highest category supported by both sides.

# 4.5.2 Supported data rates for equipment declaring compliance to a data category

Equipment belonging to each DPRS data category type shall support, at least, the following number of active slots and data rates described as mandatory in table 6. They may optionally support the number of active slots and data rates described as optional in the table.

|                                  | Supported data rates   | for eac               | h system Ca           |                                   | _                           |                     |

## 4.5.3 Indication of compliance with a data category

All DPRS data equipment compliant with the present specification, shall broadcast the supported number of bearers and the supported category type, if any, using the Terminal capability and the fixed part capabilities information elements in the way described in the present document.

NOTE: Manufacturers may indicate the category type and the maximum number of supported bearers in their documentation with the text "DPRS Cat n x+x/y+1" where n is the maximum Category supported and x and y the maximum number of bearers supported in symmetric and asymmetric configurations.

# 5 PHL requirements

## 5.1 Physical Layer services

PT and FT shall support the following PHL requirements.

| ltem      | Name of service                     | Deference            | Reference Support | t status     |
|-----------|-------------------------------------|----------------------|-------------------|--------------|
| item      | Name of service                     | Reference            | PT                | FT           |

## Table 7: Physical layer service support

## 5.2 Modulation schemes

The following modulation schemes defined by EN 300 175-2 [2], annex D shall be supported.

| Modulation scheme | S-field                        | A-field     | B + Z-field | Support status |  |  |  |  |
|-------------------|--------------------------------|-------------|-------------|----------------|--|--|--|--|
| 1a                | GFSK                           | GFSK        | GFSK        | C81            |  |  |  |  |
| 1b                | π/2-DBPSK                      | π/2-DBPSK   | π/2-DBPSK   | C82            |  |  |  |  |
| 2                 | π/2-DBPSK                      | π/2-DBPSK   | π/4-DQPSK   | 0              |  |  |  |  |
| 3                 | π/2-DBPSK                      | π/2-DBPSK   | π/8-D8PSK   | 0              |  |  |  |  |
| 5                 | 5 π/2-DBPSK π/2-DBPSK 16 QAM O |             |             |                |  |  |  |  |
| 6                 | π/2-DBPSK                      | π/2-DBPSK   | 64 QAM      | 0              |  |  |  |  |
| C81: IF 1b is     | s not supported THEN           | I M ELSE O. |             |                |  |  |  |  |

## 5.4 PHL layer procedures

## 5.4.1 General radio requirements

As specified in EN 300 175-2 [2] and EN 301 406 [33] (replacing TBR 006 [i.3]).

## 5.4.2 Minimum Normal Transmit Power (NTP)

The nominal NTP shall be greater than 80 mW per simultaneously active transmitter as shown by the test verdict criteria and declaration of EN 300 176-1 [9], clause 10.2.3.

The radio receiver sensitivity shall be -86 dBm, or better.

## 5.4.4 Z-field

The Z-field shall be transmitted by RFPs and PTs.

## 5.4.5 Sliding collision detection

PT and FT shall be able to detect sliding collision on received packets.

Minimum criteria for sliding collision are defined as S- or Z-field failure. Early sliding collision detection may be supported by other means e.g. signal strength measurements in the guard band.

47

The Z-field is defined to have failed if the received X- and Z-fields are not identical.

S-field failure is defined with some tolerance in order not to restrict the physical implementation of the word synchronization detector.

S-field failure may be indicated if there are 1 or more bit errors in bits s12 to s31 (errors in bits s0 to s11 shall be ignored). In all cases, S-field failure shall be indicated if 3 or more bit errors occur in bits s16 to s31.

## 5.4.6 Physical channel availability

A FP shall be able to receive and transmit on all DECT frequencies f0 to f9 and at least half of the slot pairs 0 to 11.

A PP shall be able to receive and transmit on all DECT frequencies f0 to f9, and shall be able to lock on any slot number 0 to 11, and receive and transmit at least on every slot pair that is not directly neighboured to the slot the PP is locked to, or to a slot on which a traffic bearer is active at the PP.

## 5.4.7 Synchronization window

Related to its reference timer, the PP synchronization window shall be at least  $\pm 4$  bits for bearers to the RFP to which the reference timer is synchronized, and at least  $\pm 10$  bits for other bearers.

## 5.4.8 Power management

To fight mutual interference between data terminals operating in different local DECT networks when using for the transmission most of the slots from a frame, control of the transmission power is recommended.

If transmission power control procedure is implemented, the requirements in EN 300 175-2 [2], annex E shall fully apply.

## 5.4.9 Fast hopping radio

The radio transceiver shall be able to perform any frequency change during the interval between two consecutive Physical Packets P32 (full slot) or P80 (double slot).

6 MAC layer requirements

# 6.1 MAC services

## Table 10: MAC service support for mobility class 1 and 2

48

# 8 NWK layer requirements

The NWK layer provisions shall include the following entities:

- Call Control (CC);
- Mobility Management (MM);
- Link Control Entity (LCE);
- Connectionless Message Service (CLMS).

Only mobility class 2 equipment requires a NWK layer. For mobility class 1 equipment configuration parameters shall be according to annex A of the present document.

NWK layer procedures shall be as defined in EN 300 444 [11] (GAP), in EN 300 824 [12] (CAP), or when relevant, in the present document.

## 8.1 NWK features

#### Table 14: NWK features status

|           | Feature supported                           |           |     |     |  |

## Table 19: Distributed Communication feature to procedure mapping

# 9 Management Entity Requirements

## 9.1 Introduction

The Management Entity (ME) is responsible for management of physical resources and logical associations between and into the DECT protocol layers.

## 9.1.1 Management Entity (ME) operation modes

DPRS provides four operation modes of the Management Entity (ME): Class 1, Class 2, Class 3 and Class 4.

- ME Class 1 provides complete MAC connection control (including multibearer and assimetric connections), packet handling, but it does not include NWK layer C-plane (no call control or mobility management procedures). The service provided by ME Class 1, called is equivalent to a Wireless LAN.
- ME Class 2 provides complete DPRS funcionalities, including complete MAC connection control, optimized packed handing functionalities and complete NWK layer C-plane with call control and mobility management functionalities. The service provided by Class 2 is equivalent to the packet service of a cellular system with efficient packet handling.

- ME Class 3 provides a simplified management mode for single bearer DPRS connections. It is optimized for the data needs of voice terminals or other limited rate data devices. Applications include software downloading, limited content browsing such as agenda browsing, SMS handling or configuration facilities. Provides simplified mechanisms for connection management and limited support of suspend/resume and it incorporates NWK layer C-plane.
- ME Class 4 provides a simplified management mode for single bearer DPRS connections. It is optimized for the data needs of voice terminals or other limited rate data devices. Applications include software downloading, limited content browsing such as agenda browsing, SMS handling or configuration facilities. Provides simplified mechanisms for connection management and it incorporates NWK layer C-plane. It does not support suspend/resume.

| Feature supported   |                    |           | Status |      |
|---|--------------------|-----------|--------|------|
| Service   | Name of feature    | Reference | PT     | FT   |
| DPRS-ME.1   | Class 1 management | 4.3.7     | C201   | C201 |
| DPRS-ME.2 Class 2 management  |                    | 4.3.7     | C202   | C202 |

## Table 21: Management Entity mode to procedures mapping

62

## 9.2 Description of the DPRS operation principles

## 9.2.1 General

In DPRS, the management of the "physical connections" is always under control of the Management Entity (ME). The ME decides in real time the activation, release, or change of bandwidth of the physical connection, based on the existence of U-plane data or C-plane messages to be transmitted, and according to the requirements described in this clause. The higher layer entities are responsible for the presence or absence of the valid data at the MAC service boundaries upon which such lower layer resource management is based.

## 9.2.2 Service class 1

Service class 1 is a simplified version of DPRS that does not incorporate C-plane. Class 1 is intended for small private applications with restricted mobility and control features. Because of back-compatibility reasons, class 1 uses a specific ad-hoc solution with some differences with class 2 equipment.

In service class 1, the "physical connection", the MBC instance, and the DLC link, are permanently associated. The activation and release of the physical resources are done by setup and release of the DLC "link". All requirements provided in this clause are valid, taken into account that the activation or release of a "physical connection" has associated the activation or release of the MBC and DLC layers.

Service class 1 provides a user service that is equivalent to a Permanent Virtual Circuit (PVC).

## 9.2.3 Service class 2

Service class 2 provides additionally the capabilities of the DECT C-plane. In service class 2, any NWK layer service is permanently mapped to a DLC layer "link" and to a MBC logical instance called "logical connection". All these entities exist during the length of a user connection. User connections could be "Virtual Calls" (VC) or "Permanent Virtual Circuits" (PVC).

NOTE: A DPRS virtual call is identical to what in GPRS is called "PDP context". A PVC is a particular case of virtual call permanently connected by configuration.

It is possible to having multiple data contexts (virtual calls) in the cell and between each PT-FT pair. Each "virtual call" behaves as a connection oriented pipe transporting the user protocol. Security (authentication and encryption) and mobility management operations (i.e. handovers) are performed by the DECT system and higher layer application does not need to worry on them.

The service provided by Class 2 management is equivalent to the packet service of a cellular system.

The allocation of physical resources to the "logical connection" is performed in real time by the Management Entity, based on the existence of U-plane data or C-plane messages to be transmitted, and according to the requirements described in this clause. The set of bearers and TBCs temporally allocated to a "logical connection" is the "physical connection".

A "logical connection" is in active state if it has associated a "physical connection" and in suspended state otherwise.

Class 2 management includes the capability of dynamic parameters broadcast or negotiation that allows to refine the packet handling efficiency.

## 9.2.4 Service class 3

Service class 3 provides a simplified management mode for single bearer DPRS connections. It is optimized for the data needs of voice terminals or other limited rate data devices. Applications include software downloading, limited content browsing such as agenda browsing, SMS handling or configuration facilities. Class 3 provides NWK layer C-plane, limited support of suspend/resume, call control and mobility management, however the ME operation is largely simplified.

## 9.2.5 Service class 4

Service class 4 provides a simplified management mode for single bearer DPRS connections. It is optimized for the data needs of voice terminals or other limited rate data devices. Applications include software downloading, limited content browsing such as agenda browsing, SMS handling or configuration facilities. Class 4 provides NWK layer C-plane, call control and mobility management, however it does not support suspend/resume.

# 9.3 Resource and physical connection management for Class 1 and Class 2 systems

This clause describes when a "Physical Connection" should be setup or released, and which procedures should be used for Class 1 and Class 2 systems.

For Class 3 and Class 4 devices refer to clause 9.5.

## 9.3.1.1 Conditions for resumption and management procedures

## 9.3.1.1.1 General

The FT may resume a Physical Connection, if any of the following conditions meet:

- there are user plane data to be transmitted downstream;
- there are high layer C-plane data to be transmitted downstream (applicable only to service class 2);

64

- there are MAC control messages to be transmitted downstream;
- the PT was suspended by the FT due to bandwidth administration reasons having data to be transmitted upstream;
- the PT has attempted to resume the connection with the result of being rejected by the FT.
- NOTE: The activation of the Physical Connection as consequence of the handshake procedure is considered as part of condition 3 (see clause 9.4.3).

#### 9.3.1.1.2 ME procedures for FT initiated connection resumption

For equipment of both mobility class 1 and mobility class 2, MAC connection establishment from the FT to the PT goes as follows.

#### 9.3.1.1.2.1 Fast setup ME procedure

The FT shall try to establish the Physical Connection using the FT initiated setup procedure (fast setup) (see clause 10.10.1.3) if the FT supports Fast Setup, and the PT supports fast setup and is supposed to be in idle-locked state with setup detection.

• The PT will be supposed to be in idle-locked state with setup detection if the time elapsed since the Physical Connection was released by last time is lower than timer T909.

The fast setup procedure should result in at least one setup attempt. If the PT is supposed not to be in idle-locked state with setup detection, then the fast setup is not required.

#### 9.3.1.1.2.2 MAC paging ME procedure

If Fast setup procedure not been used, then the FT shall try to establish the Physical Connection using MAC-resume paging procedure (see clauses 9.3.1.1.2.2 and 10.4).

If Fast setup procedure has been used and has failed, then the FT may try to establish the Physical Connection using MAC-resume paging procedure, or may skip this step, and use directly LCE-paging.

The MAC resume paging shall be done according to clause 10.4.

The FT may take into account the time elapsed since last suspension and the value of timer T911 (and T909 if fast setup is supported) in order to determine is the PT is in high duty cycle paging detection, or in normal paging detection (see clause 9.3.1.2.5).

If the FT has performed the previous check:

- The FT shall send the MAC resume paging request in a frame recognized by the PT.
- If the procedure fails, the FT is free to repeat the MAC paging attempt, wait for the normal duty cycle window, or start directly the LCE paging procedure.

If the FT has not performed the previous check (the FT does not know in which state the PT is):

- The FT may act as if the PT were in high duty cycle paging detection performing a maximum of two MAC-resume paging attempts.
- If they fail, the FT shall wait for the next normal duty cycle window and shall perform a normal MAC paging attempt.
- Only if previous attempt fails, the FT could initiate the LCE-paging procedure (normal duty cycle window). The FT is also allowed to repeat the MAC paging procedure (normal duty cycle window).
- FTPT.
- NOTE: MAC paging is not required if the FT has done a Fast Setup attempt and Fast Setup is supported by the PT.

#### 9.3.1.1.2.3 LCE paging ME procedure

If the previous setup procedures have failed, the FT shall try to establish the Physical Connection using LCE-resume paging (see clause 12.15). The FT shall use fast LCE-resume paging, if the FT knows that the PT is in high duty cycle paging detectionPT.

Otherwise (if the FT knows that the PT is in normal duty cycle state, or if it does not know in which state the PT is) the FT shall use normal LCE-resume paging.

If fast LCE-paging has been used and has failed, the FT shall try to establish a Physical Connection with normal LCE-resume paging.

• The FT may freely choose the number of fast LCE-paging attempts before trying normal LCE-paging.

The LCE resume paging procedure shall be done according to the procedure described in clause 12.15.

In case of no response from the PT, the FT may repeat the paging attempt according to implementation specific algorithms. Process may continue until violation of the handshake (stay alive) procedure (see clause 9.4.3), when the connection shall be released.

#### 9.3.1.1.2.4 Class 1 systems

#### **Class 1 systems**

For class 1 systems, the paging shall be initiated by the ME, by issuing a MAC\_PAGE-req primitive. The SDU passed with the primitive shall be such that the contents of the paging message is as defined in EN 300 175-5 [5], clause 8.2.1, short format message, using default TPUI, with the following exception:

• the LCE header field shall have the value 111 (Ip\_error\_correct) or 110 (Ip\_error\_detect).

Receipt of a paging message with a mobility class 1 TPUI indicates that the paging message should be handled by the ME. Upon receipt of a MAC-PAGE-ind primitive with the TPUI of the PT as parameter, the ME shall issue a MAC\_CON-req primitive.

#### 9.3.1.2 Connection Suspension conditions

#### 9.3.1.2.1 General

The ME of the FT may request a suspension of the connection at any time according to implementation specific algorithms.

In addition to that, the FT shall request a suspension of the connection in the following cases:

- in case of no user-data or C-plane activity;
- by violation of the minimum number of bearers (MAC Bandwidth command);
- by loss of all received bearers;

• by loss of the last duplex bearer controlling the connection.

The FT shall indicate the relevant Suspension reason as indicated in clause 10.7.1.3.

If the FT indicates for suspension reason the < Local temporary transmission/reception limits > or <br/> shandwidth administration> or any other reason but has set the flag -f (see clause 10.7.1.3), THEN, the PT shall accept the suspension even if there is a data for transmission up-link.

In all other cases, if there is data for transmission up-link, or if the FT has used the flag -s, the PT may reject the suspension, see clause 10.7.1.

In any case, the FT is allowed to force the PT down to the minimum number of bearers, negotiated by the NWK layer.

NOTE: Under "number of bearers" throughout the present document, the number of simplex bearers in one direction is to be understood, e.g. a double simplex bearer consist of 2 simplex bearers, whereas, a duplex bearer consist of 1 uplink and 1 down-link simplex bearers.

## 9.3.1.2.2 Connection suspension due to no data activity

The ME of the FT shall request a suspension of the connection if no new PDU or C-plane message has been transmitted nor received during an internal timer (FT suspend timer) indicating suspension reason < No data for transmission >.

The value of the internal FT suspend timer is not standardized, and can vary dynamically.

NOTE 1: However, it is recommended to make this timer equal to T903.

See clause 10.7.1 for the suspend procedure.

NOTE 2: Timer T903 is set by the FT (see annex A).

# 9.3.1.2.3 Connection suspension due to violation of the minimum number of bearers (MAC Bandwidth command)

The FT shall suspend the connection if the MAC layer is unable to set the "minimum number of bearers" for any of the directions of the connection, and this situation exists for more time than T906 indicating suspension reason < Violation of the minimum number of bearers >. See clause 10.7.1 for the suspend procedure.

NOTE: See annex A for definition and value of T906.

The FT may suspend the connection if it receives from the PT a Bandwidth request message with values out of the range negotiated at NWK layer.

## 9.3.1.2.4 Connection suspension by loss of all received bearers

The FT will suspend the connection if all received bearers of the connection are lost, and this situation exists for more time than T908.

NOTE: See annex A for definition and value of T908.

## 9.3.1.2.5 Activation of Fast Scan mode and/or high duty cycle paging detection after Connection suspension

After the suspension of the connection, if the PT supports fast setup, and parameter T909 (see annex A) (class 2 devices) is different from zero, the PT shall pass to Idle-locked state with setup detection (fast scan mode), as defined in EN 300 175-3 [3], clause 11.3.3.2.

The PT shall remain in this state for at least the time specified in the parameter T909 During this time, the PT shall accept FT initiated bearer setup using the procedure defined in clause 10.10.1.2. After this time the PT may pass to normal Idle-locked state with page detection (EN 300 175-3 [3], clause 11.3.3.1).

For service class 1 equipment the value of T909 is stored in the PT configuration table (see clause A.1.2).

For service class 2 equipment, T909 is variable parameter (see clause A.1.3.2) that can be negotiated between FT and PT by means of the << SETUP-CAPABILITY >> NWK layer information element (see clause 12.8).

If the PT does not support fast setup, the timer T909 has been set to zero, or the timer has expired, then, the PT shall pass to Idle-locked state with high duty cycle paging detection.

67

The PT shall remain in this state the time indicated by timer T911.

After the expiration of timer T911, the PT shall pass to Idle-locked state with normal duty cycle paging detection.

The value zero of timer T911 means that the PT shall pass directly to normal duty cycle paging detection.

NOTE: It is not allowed to use slow duty cycle paging detection when in suspend state.

If a connection is resumed and immediately suspended as consequence only of the stay alive procedure (see clause 9.4.3), the timers T909 and T911 shall not be reset, and the PT shall continue in the detection mode determined by the timers.

## 9.3.1.3 Conditions for Bandwidth modification

#### 9.3.1.3.1 General

The ME of the FT could decide a change in the bandwidth of a connection at any time according to implementation specific algorithms. The FT will use the Bandwidth modification procedure described in clause 10.7.

The PT shall mandatory accept any change of Bandwidth instanced by the FT if the requested bandwidth is within the maximum and minimum values negotiated at NWK layer.

## 9.3.2 Requirements applicable to the Portable Part (PP)

## 9.3.2.1 Conditions for connection resumption

The Connection will be resumed by the PT if and only if any of the following conditions meet:

- the PT has U-plane data ready to be sent upstream;
- the PT has C-plane data ready to be sent upstream;
- the PT has MAC control messages to be transmitted upstream;
- the PT initiated this procedure with the result of being refused by the FT, as described in clause 9.3.2.1.5, and a time equal to WtB ("Waiting time B"), defined in annex A, has elapsed.
- NOTE: The resumption of the Physical Connection as consequence of the handshake procedure is considered as part of condition 3.

If the connection was previously suspended by the FT, (see clause 9.3.1.2.1), the PT shall not request a connection resume during an interval equal to WtB ("Waiting time B") as defined in annex A.

#### 9.3.2.1.1 Procedure for PT initiated Connection resumption

The sequence of procedures for the resumption of a connection shall consist on PT initiated pilot bearer setup (see clause 10.10) followed by connection modification (see clause 10.7).

## 9.3.2.1.2 "RFP-busy-for-data" flag

The PT shall not initiate the PT initiated connection resumption procedure if the RFP has activated the RFP-busy-for-data flag in RFP status (EN 300 175-3 [3], clause 7.2.4.3.9).

#### 9.3.2.1.3 Waiting time for collision avoidance after deactivation of "RFP-busy-for-data" flag

If the RFP had activated the RFP-busy-for-data flag in RFP status (EN 300 175-3 [3], clause 7.2.4.3.9), after the deactivation of this flag, the PT shall wait a random interval WtA (see clause A.1.2.1) before initiating any bearer setup procedure, to prevent access collisions. In case of access collision during the following PT initiated setup procedure (see clause 10.10.1.2), the PT shall wait a random interval WtA before repeating the access request attempt. In case of successive collisions, formula will be applied with successive increment in the spreading range.

#### 9.3.2.1.4 Bandwidth after resumption

As consequence of the procedure, the FT will inform the PT about the number of bearers (bandwidth) to be used. This value shall be within the range negotiated by the network layer. The PT will use always the bandwidth mandated by the FT.

#### 9.3.2.1.5 Resumption rejection by the FT

If as consequence of the setup procedure, the FT rejects the access attempt with the message Bandwidth = zero, the PT will do the following actions:

- PT shall immediately release all bearers;
- PT shall wait the waiting time WtB (see clause A.1.2.2) and shall repeat the pilot bearer setup procedure (see clause 10.10.1.2).

In case of repetitive failures the waiting time WtB shall be increased to obtain congestion avoidance, according to the formulae given in annex A.

NOTE: During the time the PT is waiting the waiting time WtB, there exists the possibility that the FT may initiate the resume of the connection. A good implementation of the FP ME should do that if the conditions that justified the access rejection (i.e. congestion) end before the completion of WtB. However, the PT keeps the timer running until its expiration, since it also applies to bandwidth expansion requests (see clause 9.3.2.3.1). The PT cannot request bandwidth expansion until termination of the timer.

#### 9.3.2.2 Conditions for Connection Suspension

#### 9.3.2.2.1 General

The ME of the PT may request a suspension of the Connection at any time according to implementation specific algorithms.

In addition to that, the PT shall initiate a suspension of the Connection in the following cases:

- in case of no user-data or C-plane activity;
- by violation of the minimum number of bearers (MAC Bandwidth command);
- by loss of all received bearers;
- by loss of the last duplex bearer controlling the connection.

The PT shall indicate the relevant Suspension reason as indicated in clause 10.7.1. If the PT indicates for suspension reason the < Local temporary transmission/reception limits > and the minimum number of bearers negotiated by the NWK layer was "0" the FT shall accept the suspension even if there is a data for transmission down-link. In all other cases, if there is data for transmission downlink, the FT may reject the suspension, see clause 10.7.1.

#### 9.3.2.2.2 Connection suspension due to no data activity

The ME of the PT shall request a suspension of the connection if no new PDU or C-plane message has been transmitted nor received during a consecutive period of T903 indicating suspension reason < No data for transmission >. See clause 10.7.1 for suspend procedure.

NOTE: Timer T903 is broadcasted by the FP (see annex A).

# 9.3.2.2.3 Connection suspension due to violation of the minimum number of bearers (MAC Bandwidth command)

The PT shall suspend a Connection if the MAC layer is unable to set the "minimum number of bearers" for any of the directions of the connection, and this situation exists for more time than T906\_indicating suspension reason < Violation of the minimum number of bearers >. See clause 10.7.1 for suspend procedure.

NOTE: See annex A for definition and value of T906.

#### 9.3.2.2.4 Connection suspension by loss of all received bearers

The PT will suspend a Connection if all received bearers of the connection are lost, and this situation exists for more time than T908.

NOTE: See annex A for definition and value of T908.

#### 9.3.2.2.5 Activation of fast scan mode after Connection suspension

The same requirements specified in clause 9.3.1.2.5 are applicable in this case.

#### 9.3.2.3 Conditions for Bandwidth modification

#### 9.3.2.3.1 General

The ME of the PT could request a change in the bandwidth of a connection at any time according to implementation specific algorithms. The PT will use the Bandwidth modification procedure described in clause 12.6.

The Bandwidth modification requested by the PT has the nature of suggestion. The FT is free to accept or not the Bandwidth modification requested by the PT. The PT will mandatory accept the Bandwidth indicated by the FT in the answer to the Bandwidth message if the value is within the maximum and minimum values negotiated at NWK layer.

When as described in clause 10.7.1, the PT requests a suspension of the Connection, the FT will decide, taken into account the existence or not of data downstream, whether to suspend the Connection, or to modify the bandwidth (i.e. reverting the direction). Decision is indicated in the values of the bandwidth message sent by the FT.

When a PT has requested a bandwidth modification that involves increasing the number of bearers, and it has been refused by the FT, the PT shall not repeat the request of bandwidth extension during an interval WtB (see clause A.1.2.2).

NOTE: The PT may request bandwidth modification reducing number of bearers at any time.

#### 9.3.2.3.2 Rules for the bandwidth request by the PP

While the administration of the bandwidth by the FP is based on implementer specific algorithms, it is necessary to standardize some basic rules regarding the request of bandwidth by the PPs in order to achieve a fair and well balanced behaviour. This is specially needed when several PPs from different vendors interact with the same RFP. The rules are also necessary to prevent the PPs to request unnecessary amounts of bandwidth, which would lead to spectrum inefficiency and unfair competition with other PP with less aggressive request algorithms.

The basic principles are summarized in three general rules:

- **Rule 1:** The PT should request the bandwidth according to the existence of data to be transmitted upstream and does not need to worry about the existence of data for transmission downstream in the FT (that the PT does not know).
  - In asymmetric logical connections (connections defined as asymmetric at the NWK layer setup process), it is allowed to the PT to request always downstream bandwidth equal to 1.
- NOTE 1: The PT may do that, even if the requested combination is meaningless or not possible (i.e. a system that does not support upstream double simplex bearers).

- The FT may ignore the value indicated by the PT for downstream bearers, and shall be in charge of providing the correct downstream value in the bandwidth.cfm message according to the data at FT and fulfilling the capabilities of PT, FT and the values set for NWK layer logical connection.

70

- **Rule 2:** The PT should request an amount of bandwidth fair and proportional to the amount of data to be transmitted upstream.
- **Rule 3:** The PT should request a bandwidth reduction if it cannot fill effectively the allocated upstream bearers.
- NOTE 2: If the Bandwidth reduction is not accepted by the FT (this may happen, for instance, if only duplex bearers are supported and there is data downstream) the PT does not need to repeat the procedure.

## 9.4 Logical Connection and virtual call management

This clause describes when the MAC "Logical Connections" and higher layer connections (DLC link and NWK layer "virtual call") are created or released, and which procedures should be used.

## 9.4.1 Requirements for class 1 devices

Class 1 devices do not support NWK layer C-plane. Therefore, it is not possible to setup "Virtual calls" (VC). The service provided by Class 1 devices is equivalent to a "Permanent virtual Circuit" (PVC) setup by configuration. The MAC logical connection is also permanent and established by configuration.

## 9.4.2 Requirements for class 2 devices

#### 9.4.2.1 General Description

DPRS service class 2 supports two types of user Connections: Virtual calls (VC) and Permanent Virtual Circuits (PVC).

"Virtual Calls" (VC) are packet-mode user connections that can be setup and released by means of NWK layer C-plane procedures. A "Virtual Call" is the equivalent in packet-mode to a circuit-mode "Call".

NOTE: A "Virtual Call" is equivalent to what in GSM/UMTS is called "PDP Context".

There exist the possibility to have more than one "Virtual Call" or "Permanent Virtual Circuit" between the same PT FT pair. The different VCs or PVCs could be connected to different destination networks or can have different priorities or other properties.

"Permanent Virtual Circuit" (PVC) are packet-mode user connections that are established and cleared by configuration. A "Permanent Virtual Circuit" is the equivalent in packet-mode to a circuit-mode "Leased Line". A Wireless LAN service could be also implemented as a Permanent Virtual Circuit.

In DPRS, service class 2, any user connection has permanently associated a DLC layer "link" and a MAC "logical connection" (MBC).

#### 9.4.2.2 Normal procedures of virtual call setup and release

Virtual Calls are setup always by means of the NWK layer CC-SETUP (see clause 12.5) procedure. Setup of the Virtual Call will cause the creation of a DLC "link" and a MAC "logical connection" (MBC) associated to the call.

The normal release of VCs is done by means of the NWK layer Call release procedure (see clause 12). The CC-RELEASE message (see clause 12) shall be exchanged between both peers. The releasing of the virtual call automatically causes the clearing of the DLC and MAC "logical connection" (MBC) associated to the call.

#### 9.4.2.2.1 Identification of the call as a DPRS call

The call is identified as a DPRS call by means of the field NWK layer attributes (octet 3) = "DPRS Class 2" ("00010"B) in Information Element <Call Attributes> (see EN 300 175-5 [5], clause 7.7.5).

## 9.4.2.2.2 Bandwidth attributes of the call

If the call is multibearer (Class 2), it is mandatory the use of the IE <Connection Attributes> (see EN 300 175-5 [5], clause 7.7.11). The IE may be optionally exchanged in single bearer Class 2 connections.

The exchange of the IE <Connection Attributes> and <Call Attributes> are usually done in the same message CC-SETUP. If this is not the case (i.e. service change), the <Call Attributes> should be exchanged successfully before expanding the bandwidth with the <Connection Attributes>.

In DPRS, the NWK layer bandwidth attributes set by the IE < Connection Attributes> define the limits of the possible bandwidth states to be set by the MAC layer. See annex K of EN 300 175-5 [5]. The number, type and direction of the bearers depend on dynamic ME decisions, that are also dependent on instantaneous traffic demands.

#### 9.4.2.2.3 Creation of DLC link and MAC logical connection.

The setup of a DPRS call by means of the NWK layer procedure causes the creation of a DLC link (or a pair of DLC links, one per direction in the case of frames FU10a/c) associated to the DPRS call.

At MAC layer, the setup of the NWK layer call creates a DPRS logical connection at the MBC level. This MBC connection is the same used during the setup process, that becomes a DPRS one at this instant. Starting from this time, the connection adquires the DPRS properties and is ruled by the provisions described in clause 9.3.

#### 9.4.2.2.4 Temporary states during the setup procedure

During the short time between initial MAC setup (advanced control, bearer request), and the successfully exchange of the IE <call attributes>, the MAC connection is not a DPRS one yet. During this interin situation the connection has the following properties:

- Single bearer only.
- C-plane only (no DLC U-plane is set).
- Advanced connection.
- Use of CF channel as negotiated in the MAC setup messages.
- General MAC connection rules as defined by EN 300 175-3 [3]. No suspend allowed yet.

## 9.4.2.3 Abnormal release of Virtual Calls

Virtual Calls may be released by the ME without NWK layer Call-release procedures in case of violation of the handshake (stay alive) procedure described in next clause. The abnormal release of a virtual call shall automatically cause the clearing of all NWK, DLC and MAC resources associated to the call.

In the case of PVC's setup by configuration, the connections shall never be released. In case of failure of the handshake procedure, a notification will be send to the OAM subsystem in the FP side.

## 9.4.2.4 Release of Logical Connection

The MAC logical connection is released in the following cases:

- in case of normal release of the Virtual Call (see clause 9.4.2.2);
- in case of abnormal release of the Virtual Call (see clause 9.4.2.3);
- as consequence of connection handover procedure (see clause 11.7).

The DLC link is released with the logical connection.

## 9.4.2.5 The handshake (stay alive) procedure

During suspended state of one connection PT may due to different reasons release the connection without noticing the FT, e.g. PT leaves the coverage area or is switched off. To prevent the FT from hanging a specific handshake control for a suspended connection is introduced which shall be operated through the stay-alive procedure as described in this clause.

The stay alive procedure consists of a successful bearer establishment followed by a connection modification to for bandwidth "0" (i.e. new connection suspension negotiation), followed by a bearer release (suspension).

The stay alive procedure is indicated by the special code (Mup = 0, Tup = 0, Mdown = 5, Tdown = 0) in the Bandwidth req message.

NOTE 1: In order to expedite the process, the PT is allowed to send the messages B\_field\_bearer\_request and B\_field\_BANDWIDTH.req in the same frame, and bearer release in the following one.

To get a handshake control for suspended connections, a connection shall not be in suspended state for more than T910. To meet this rule, the PT is responsible to perform a handshake with the FT at least T910-T200 after entering the suspend state. In order to avoid connection release caused by a single bearer setup procedure that failed, PTs shall perform handshake attempts in shorter time intervals than T910. The PT shall try five handshake attempts within T910. After successful handshake (successful bearer setup) the Timer T910 and the counter for handshake attempts shall be reset.

The FT is allowed to initiate a handshake with the PT at any time.

Upon entering the connection SUSPENDED state every side shall start timer T910. Upon successful establishment of a pilot bearer for a suspended connection timer T910 shall be cancelled at both sides.

If a MAC connection associated to a Virtual Call has been in suspend state for more than T910, the connection, including the controlling MBC, the associated DLC and the virtual call shall be released.

NOTE 2: As no physical connection is established, this clearing procedure does not need any further air interface (bearer release) procedure.

NOTE 3: T200 is the MAC connection setup timer. Its value can be found in EN 300 175-3 [3], clause A.1.

In regard to the stay alive procedure, the parameters in the bandwidth modification message shall be set as follows:

Mup = 0, Tup = 0, Mdown = 5, Tdown = 0

If during the stay-alive procedure, before answering to the connection modification negotiation for bandwidth "0", the responding side receives internal indication that there is higher layers data for downlink transmission this side may:

- either accepts the suspension by sending back the BANDWIDTH.cfm message with the (0,0,0,0) values and initiates afterwards a resumption; or
- alternatively, it may ignore the BANDWIDTH.req received and send its own BANDWIDTH.req with the relevant needed values. If during stay alive procedure the initiating side receives a BANDWIDTH.req suggesting values different than 0 it shall abandon the stay alive procedure and continue with the de-facto "resumption" procedure.

However, if it has been the PT who has received data and has answer with a Bandwidth.req with needed values, the FT has always the choice to reject the request with a new Bandwidth.cfm (=0) message, and the PT shall act as indicated in clause 9.3.2.1.5.

## 9.4.3 Requirements for class 3 devices

## 9.4.3.1 General Description

Class 3 DPRS calls use the same setup and release procedures as Class 2 calls with the difference that call is always single bearer. In most cases, but not necessarily, the simplified MAC A-field setup and release procedures are used. The following differences with Class 2 call applies.

#### 9.4.3.1.1 Identification of the call as a DPRS call

The call is identified as a DPRS Class 3 call by means of the field NWK layer attributes (octet 3) = "DPRS Class 3" ("00011"B) in Information Element <Call Attributes> (see EN 300 175-5 [5], clause 7.7.5).

73

• The exchange of the IE <Call Attributes> is usually done in the message CC-SETUP.

#### 9.4.3.1.2 Connection attributes

The use of the IE <Connection attributes> is in general not needed and its support is optional.

## 9.4.4 Requirements for class 4 devices

### 9.4.4.1 General Description

In class 4 calls, suspend/resume is not allowed an the call behaviour is similar to a circuit switched call. In most cases the simplified MAC A-field setup and release procedures are used. The following differences with Class 3 call applies.

#### 9.4.4.1.1 Identification of the call as a DPRS call

The call is identified as a DPRS Class 4 call by means of the field NWK layer attributes (octet 3) = "DPRS Class 4" ("00110"B) in Information Element <Call Attributes> (see EN 300 175-5 [5], clause 7.7.5).

The exchange of the IE <Call Attributes> is usually done in the message CC-SETUP.

# 9.5 Resource and physical connection management for Class 3 and Class 4 devices

## 9.5.1 Simplified Class 3 connection management

This clause describes when a "Physical Connection" should be setup or released, and which procedures should be used.

In Class 3 management, the invocation of the suspend procedure is optional for any peer which may decide to suspend the call or not (see clause 9.5.2).

## 9.5.2 Suspend management (Tx side)

Any peer involved in an active data call may invoke the suspend procedure if there is no data activity in the call. The invocation of the suspend is optional.

Suspend procedure is performed by executing the MAC release procedure without previously clearing the call at NWK layer.

NWK and DLC call contexts shall be preserved during the suspension.

MAC ECN number allocated to the connection is reserved when it is in suspend state.

## 9.5.3 Suspend management (Rx side)

Any peer receiving a MAC release message over the bearer of a Class 3 connection that has not been explicitly released at NWK layer, shall understand that this is a suspend request.

The receiving peer shall perform the MAC release and the data call shall pass to suspend state.

The lack of reception of bearers without any previous MAC signalling is also understood a suspension request.

NWK and DLC call contexts shall be preserved during the suspension. MAC ECN number allocated to the connection is reserved when it is in suspend state.

## 9.5.4 Resume management

Any peer with a data call in suspend state shall execute the resume procedure if there are data or NWK layer signalling to be transmitted over the connection.

Resume procedure is executed by the PP running the MAC setup procedure with the ECN allocated previously to the connection.

The FP executes the resume sending a resume page message to the PP. The resume page may be MAC, LCE fast or LCE normal according to the supported capabilities in the PP.

## 9.5.5 Stay alive (timer control)

Any peer with a call in suspend state shall run a timer of value T910, defined by configuration (annex A). If the timer expires, the virtual call shall be released at all layers.

The timer is reset each time when the call enters the active state.

## 9.5.6 Stay alive (periodic resume)

Any peer with capability to invoke the suspend procedure, shall monitor that the call is not in suspend state longer than the timer T910, and shall resume the call periodically to avoid the expiration of the timer.

## 9.5.7 Simplified Class 4 connection management

The Class 4 management mode is, by definition, the mode when suspend/resume is not allowed. When a data call is established using Class 4, the suspend procedure cannot be invoked, and there is no need to support any of the sub-procedures related to it.

Any peer receiving a MAC release message over the bearer of a Class 4 connection that has not been explicitly released at NWK layer, shall understand it as an error case, and shall release the call at all layers.

In the event of lack of reception of bearers without any previous MAC signalling, the normal procedures and timers defined in EN 300 175-3 [3] applies, which may result on the release of the call at all layers if no MAC bearer can be setup within the timer interval.

# 10 MAC layer procedures

# 10.1 General

## 10.1.1 Frame and multiframe structure

The FT and PT shall support frame and multiframe structures as defined in EN 300 175-3 [3], clause 4.2.

## 10.1.2 Bit mappings

The FT and PT shall support the D-field mappings as defined in EN 300 175-3 [3], clause 6.2.1.1 for the supported Physical Packets (clause 5.1, table 7) and modulation schemas (clause 5.2, table 8).

The FT and PT shall support the A-field mappings as defined in EN 300 175-3 [3], clause 6.2.1.2 for the supported modulation schemas (clause 5.2, table 8).

The FT and PT shall support the B-field mappings as defined in EN 300 175-3 [3], clause 6.2.1.3 for the supported Physical Packets (clause 5.1, table 7) and modulation schemas (clause 5.2, table 8).

## 10.1.2.1 Multiple bitmappings rule

All bearers in use by the PT and FT in the same connection shall be identical regarding slot type and B-field CRC schema. However, if the PT or FT supports multiple slots an/or B-field CRC-schemas, they can be different for different connections.

75

- NOTE: In  $I_{PQ}$  or  $I_{PX}$  encodec protected MAC services, the switching to multisubfield CRC schema due to the insertion of E or E+U type mux is not considered for this rule and can happen on a bearer-by-bearer basis.
- 10.1.3 void

## 10.1.4 Scrambling

The FT and PT shall support scrambling as defined in EN 300 175-3 [3], clause 6.2.4.

## 10.1.5 Error control

The FT and PT shall support R-CRC and X-CRC generation as defined in EN 300 175-3 [3], clause 6.2.5.

For modulation schemes 1a and 1b as defined in clause 5.2 of the present document, FT and PT shall support 16-Bit R-CRC as defined in EN 300 175-3 [3], clause 6.2.5.2.

For modulation schemes 2 and 3 as defined in clause 5.2 of the present document, FT and PT shall support 32-Bit CRC as defined in EN 300 175-3 [3], clause 6.2.5.5.

## 10.1.6 Void

10.1.7 Void

## 10.1.8 RFP idle receiver scan sequence

The FT shall support primary scan as defined in EN 300 175-3 [3], clause 11.8.

## 10.1.9 PT receiver scan sequence

The PT receive scan sequence, whenever active, shall lead the RFP primary scan by one frame, as defined in EN 300 175-3 [3], clause 11.9.

If PT has blind slots, i.e. slots on which setup of bearer is not possible due to implementation limitations these shall be indicated during subscription and location registration to the FT as described in clause 12.3.

NOTE 1: Indication for PT blind slots has been introduced to the present document after version 1.1.1. Therefore PTs developed before version 1.2.0 may have limitation but will not be able to indicate them to the FT. Therefore, a FT supporting fast setup should be aware that failure of the setup may be due to PT limitations which have not been announced. Some examples of possible limitations could be inability of the PT to receive setup on slots adjacent to the slot on which the PT is locked or currently transmitting, or PT is able to receive only on every second slot odd or even. In such situation the FT should repeat the setup on different slot expecting possible limitations.

NOTE 2: The PT receiver scan sequence is relevant for the FT initiated direct setup (fast setup) procedure.

## 10.1.10 PT states and state transitions

### 10.1.10.1 PT states and state transitions for PTs not supporting fast setup

NOTE: See clause 10.1.10.2 for PTs supporting any fast setup mode.

The procedure shall be performed as specified in EN 300 175-3 [3], clause 11.3.3, with the following provisions.

For Class 2 systems:

- After the transition from Active\_Locked to Idle\_Locked state the PT shall pass to idle locked state with paging detection, high duty cycle.
- However, if the transition from Active\_Locked to Idle\_Locked state has been consequence of a complete release of a connection (logical connection release), then the PT shall go to high duty cycle, only if it has indicated the support of "fast paging" in the Setup capability IE. Otherwise, it will pass directly to normal duty cycle paging detection mode.

Class 3 or Class 4 PTs shall go to high duty cycle paging detection mode only if the PT has indicated the support of "fast paging" in the Setup capability IE in any case (independently whether the transition is the result of a suspend of a complete release in Class 3 systems).

Class 1 PTs shall go to high duty cycle paging detection mode only if the PT declares the support of fast paging in its documentation (see clause A.1.4), and may skip this mode if it is known that the FT does not support fast paging, and this has been registered in the PT configuration (see clause A.1.4).

The PT shall remain in high duty cycle paging detection mode a period of time equal to the broadcasted value of timer T911. After the expiration of this timer it shall pass to normal duty cycle paging detection mode.

See clause 10.4.4 for description of paging detection mode state transitions.

If the PT supports the low duty cycle paging detection mode (optional feature), and only in the case of a virtual call (logical connection) release, the PT shall check if the FP supports also this low duty cycle (indicated in IE <Setup Capability>). Only if the three conditions meet, the PT shall pass to low duty cycle paging detection mode.

#### 10.1.10.2 PT states and state transitions for PTs supporting fast setup

NOTE 1: This clause applies for PTs supporting any fast setup detection mode.

The procedure shall be performed as specified in EN 300 175-3 [3], clause 11.3.3, with the following provisions.

The PT may implement two modes of setup detection capability:

- a) Idle\_Locked state with Complete setup detection.
- b) Idle\_Locked state with Selective setup detection.

The properties of both modes are described in EN 300 175-3 [3], clause 11.3.3.2.

The implemented mode is indicated in octet 3 of the Information Element <<Setup Capability>> provided by the PP at registration.

NOTE 2: It is possible to implement both modes, Complete and Selective.

The FT may also support operation of any of these, or both modes, and indicates their support in the same bits of <<<Setup Capability>> exchanged at registration.

#### 10.1.10.2.1 Fast setup control information provided by the FT

Immediately before a transition from Active\_Locked to Idle\_Locked state, the FT has the option of sending a fast setup control command to the PT by mean of the following ways:

- By using the reason code "stay in listen for setup mode" in the Release message.
- By inserting a Channel List Command LISTEN in any duplex Bearer sent FT ⇒ PT, immediately before the connection release.
- The combination of both mechanisms (depending of the info field values used in the Release message).

It shall be assumed that the LISTEN command sent by  $FT \Rightarrow PT$  is related to the fast setup control when it is transmitted in the same slot carrying the "Bandwidth = 0, 0" (suspend) message, or afterwards.

# 10.1.10.2.2 PT states and state transitions when PT and FT supports complete setup detection

The behaviour depends on whether fast setup control information has been transmitted by the FT immediately before the transition from Active\_Locked to Idle\_Locked state.

#### 10.1.10.2.2.1 Case 1: no setup control information provided by the FT

When both, the PT and the FT supports COMPLETE setup detection, and there has not been transmission of fast setup control information, the PT shall pass to idle locked state with Complete setup detection mode immediately following the transition from Active\_Locked to Idle\_Locked state when there is an active DPRS logical connection (connection suspension), and shall remain in this state for a period of time equal to timer T909.

The duration of T909 is communicated to MAC by the ME. During the time the PT is in setup detection mode it will also detect paging with high duty cycle (see clause 9.3.1.3).

The setup detection mode shall not be used and the PT shall go directly to paging detection state if (any of the following):

- the PT does not support fast setup (indicated in IE <Setup Capability> IE); or
- the FP has indicated no use of fast setup in IE <Setup capability> or has set a value of T909 equal to zero (both indicating no use of fast setup); or
- the transition from Active\_Locked to Idle\_Locked state is consequence of a complete release of a connection (logical connection release).

Otherwise, after the expiration of the timer T909, the PT shall pass to idle locked state with paging detection high duty cycle.

However, if the transition from Active\_Locked to Idle\_Locked state has been consequence of a complete release of a connection (logical connection release), then the PT shall go to high duty cycle, only if he has indicated the support of "fast paging" in the Setup capability IE. Otherwise it will pass directly to normal duty cycle paging detection mode.

The PT shall remain in high duty cycle paging detection mode a period of time equal to the broadcasted value of timer T911. After the expiration of this timer it shall pass to normal duty cycle paging detection mode.

See clause 10.4.4 for description of paging detection mode state transitions.

If the PT supports the low duty cycle paging detection mode (optional feature), and only in the case of a virtual call (logical connection) release, the PT shall check if the FP supports also this low duty cycle (indicated in IE <Setup Capability>). Only if the three conditions meet, the PT shall pass to low duty cycle paging detection mode.

NOTE: DPRS PTs do not need to be in FT setup detection mode when they are in Active\_Locked state.

#### 10.1.10.2.2.2 Case 2: setup control information provided by the FT

When the FT has provided setup control information, inserting the reason code "say in listen for setup" in the release message, the PT shall obey the instructions given in the message and shall pass to COMPLETE, SEL1, SEL2a or SEL2b mode according to the message. The rest of the procedure, including the length of timer T909, is identical to clause 10.1.10.2.2.1.

In the event that the PT supports Complete and does not support Selective modes, it shall go to Complete setup detection mode, only if the CN indicated by the command is compatible with the PT scan sequence. Otherwise it shall ignore the command.

If the FT has provided setup control information by inserting a channel list command LISTEN in the slot or after a "Bandwidth = 0, 0" command, and a Release message has not been used by the FT (or has not been received), it shall be assumed that the desired state is Selective Setup detection, listening to the SN and CN indicated in the LISTEN command. SEL1 mode shall be used if only one channel list command for one bearer has been received, and SEL2 if two commands have been received.

# 10.1.10.2.3 PT states and state transitions when PT and FT supports Selective setup detection only

#### 10.1.10.2.3.1 Case 1: no setup control information provided by the FT

If the PT supports only SELECTIVE modes and no control information has been provided by the FT, the PT shall use SEL1 mode over the slot of the last duplex bearer and over the PT receiving scan sequence.

The rest of the procedure, including the length of timer T909, is identical to clause 10.1.10.2.2.1.

If the identification of which is the last duplex bearer is unclear (several duplex bearers released at the same time) the PT shall choose the one with highest LBN.

NOTE: It is highly advisable that the FT provides setup control information always if there are several duplex bearers.

#### 10.1.10.2.3.2 Case 2: setup control information provided by the FT

When the FT has provided setup control information, inserting the reason code "say in listen for setup" in the release message, the PT shall obey the instructions given in the message and shall pass to COMPLETE, SEL1, SEL2a or SEL2b mode according to the message. The rest of the procedure, including the length of timer T909, is identical to clause 10.1.10.2.2.1.

If the FT has provided setup control information by inserting a channel list command LISTEN in the slot or after a "Bandwidth = 0, 0" command, and a Release message has not been used by the FT (or has not been received), it shall be assumed that the desired state is Selective Setup detection listening to the SN and CN indicated in the LISTEN command. SEL1 mode shall be used if only one channel list command for one bearer has been received, and SEL2 if two commands have been received.

#### 10.1.10.2.4 Fast setup control information provided using MAC paging

When a PT is in Idle\_Locked state with a DPRS virtual connection active (i.e. in suspend state), it shall listen the paging channel for MAC resume and control page message address to it. Upon the reception of such message, the PT shall inmediatelly obey the command transmitted in the message (resume, go to setup detection mode or go to a paging detection mde). If the received command is the setup control, the PT shall pass to the setup detection mode indicated by the command, and shall remain in this state fot a time equal to Timer T909, that shall be reset upon reception of the command.

## 10.1.11 Identities

The provisions of EN 300 175-3 [3], clause 11.7 and EN 300 175-6 [6] shall be implemented with respect to the structure and use of identities.

## 10.2 Non continuous broadcast

## 10.2.1 Request for specific Q channel information

This procedure relates to TARI support. When supported it shall be implemented according to the requirements in this clause.

The FT shall indicate the availability of TARI information in the TARI related field of the  $Q_T$ -5 message as indicated in clause 7.2.3.6 of EN 300 175-3 [3] and clause 10.3.2.3 in the present document. If this field is set to "No" the PT shall not request TARI information.

The PT shall have the capability to submit and the FT shall understand and respond to, requests for specific Q channel information as defined in EN 300 175-3 [3], clause 9.3.1.2.

The PT shall have the capability to initiate, and the FT shall understand and respond to a request for extended system information as defined in EN 300 175-3 [3], clause 11.2.

#### Request for a new dummy 10.2.2

The PT shall have the capability to initiate, and the FT shall understand and react upon a request for a new dummy bearer as defined in EN 300 175-3 [3], clause 9.3.2.

79

#### 10.3 Downlink broadcast

The procedure shall be performed as defined in EN 300 175-3 [3], clause 9.1.1.

#### 10.3.1 N<sub>T</sub> messages

The FT shall be capable of sending and the PT shall be capable of receiving and processing the  $N_T$  message as defined in EN 300 175-3 [3], clause 7.2.2, with contents as defined in table 22.

| MAC<br>message/broadcast<br>element | Field within the<br>message/broadcast<br>element | Standard values<br>within the MAC<br>message | Normative action/comment                         |
|-------------------------------------|--|--|--|
| << RFPI >>                          |  |  |  |
|                                     | < E-bit >  | 0  | No SARI.   |
|                                     |  | 1  | SARI available. Relates to service SARI support. |
|                                     | < PARI >   | All  |  |
|                                     | < RPN >  | All  |  |

#### Table 22: Values used within $N_{T}$ message

# 10.3.2 $Q_T$ messages

## 10.3.2.1 Q<sub>T</sub> - static system information

The FT shall be capable of sending and the PT shall be capable of receiving and processing the  $Q_T$  static system information message as defined in EN 300 175-3 [3], clause 7.2.3.2, with contents as defined below.

| MAC message              | Field within the message | Standard values<br>within the MAC<br>message | Normative action/comment   |
|--------------------------|--------------------------|--|--|
| << Static system info >> |                          |  |  |
|                          | < Q <sub>H</sub> >       | 0  |  |
|                          | < NR >                   | 0, 1   | PT shall support all values in order to gain lock.<br>Asymmetric connections are not required to be<br>supported by the PT.  |
|                          | < SN >                   | 0 to 11                                      | PT shall support all values.   |
|                          | < SP >                   | 0  | PT shall support all values in order to gain lock.<br>Half slot connections are not required to be<br>supported by the PT.   |
|                          | < ESC >                  | 0, 1   | PT may ignore and assume the value to be 0.  |
|                          | < Txs >                  | 0 to 3                                       | PT may ignore and assume the value to be 0.  |
|                          | < Ext-car >              | 0, 1   | PT shall support all values in order to keep in<br>synchronization with the primary scan.  |
|                          | < RF-car >               | All  | The PT shall not use carriers, which are not supported.  |
|                          | < SPR >                  | 0  | PT may ignore.   |
|                          | < CN >                   | 0 to 9, 10 to 32                             | PT shall support normal values, and extended frequencies. The PT is not required to support transmission/reception on the extended frequencies.  |
|                          | < SPR >                  | 0  | Until other values are defined PT shall assume this value has been set to 0.   |
|                          | < PSCN >                 | 0 to 9, 10 to 32                             | PT shall support normal values, PT may be not able<br>to transmit on any of the extended frequencies,<br>however it shall be able to calculate the exact<br>position of the PSCN based on all indicated to be<br>supported by the FT carriers. |

Table 23: Values used within static system info

In case of the < Ext-car > bit is set to 1, the RFP shall also broadcast the extended RF carrier information message as defined in EN 300 175-3 [3], clause 7.2.3.3, where the fields are allowed the following values.

| MAC message            | Field within the message | Standard values<br>within the MAC<br>message | Normative action/comment   |
|------------------------|--------------------------|--|--|
| << Extended RF carrier |                          |  |  |
| information >>         |                          |  |  |
|                        | < Q <sub>H</sub> >       | 2  |  |
|                        | < RF carriers >          | a <sub>12</sub> to a <sub>34</sub> : {0, 1}  | These bits may be set to indicate support for carriers 10 to 32. |
|                        | < RF band >              | All relevant                                 | For values see EN 300 175-2 [2].                                 |
|                        | < SPR >                  | 0  | PT may ignore.   |
|                        | < Nr of RF               | All  |  |
|                        | carriers >               |  |  |

## 10.3.2.2 Q<sub>T</sub> - FP capabilities

#### 10.3.2.2.1 Standard FP Capabilities

The FP shall indicate its standard capabilities using the fixed part capabilities  $Q_T$  message as described in EN 300 175-3 [3], clause 7.2.3.4, with contents as defined below. The PT shall be able to receive and understand this message.

| MAC message           | Field within the message | Standard values within the MAC message | Normative action/comment  |
|-----------------------|--------------------------|--|---|
| << FP capabilities >> |                          |  |   |
|                       | < Q <sub>H</sub> >       | 3                                      |   |
|                       | < a <sub>12</sub> >      | 1                                      | Extended FP info (Q <sub>H</sub> = 4).  |
|                       | < a <sub>17</sub> >      | 1                                      | Full slot.  |
|                       | < a <sub>19</sub> >      | [0, 1]                                 | low duty cycle Idle_Locked mode allowed.  |
|                       | < a <sub>21</sub> >      | [0, 1]                                 | C/L uplink, relates to Distributed communication.   |
|                       | < a <sub>22</sub> >      | [0, 1]                                 | C/L downlink, relates to procedure Dynamic Parameter Allocation, clause 12.8, SI <sub>P</sub> service |
|                       |                          |  | and Distributed communication.  |
|                       | < a <sub>25</sub> >      | 1                                      | B-field setup.  |
|                       | < a <sub>26</sub> >      | [0, 1]                                 | C <sub>F</sub> messages, if PT supports only C <sub>S</sub>   |
|                       |                          |  | messages it may ignore this value.  |
|                       | < a <sub>29</sub> >      | 1                                      | I <sub>P</sub> _error_detect.   |
|                       | < a <sub>30</sub> >      | [0, 1]                                 | I <sub>P</sub> _error_correction, if PT supports only   |
|                       |                          |  | I <sub>P</sub> _error_detect it may ignore this value.  |
|                       | < a <sub>31</sub> >      | [0, 1]                                 | Multibearer connections.  |

 Table 25: Values used within Standard FP capabilities

In case of mobility class 2, the MAC extended fixed part information message shall be used and, therefore, bit  $a_{12}$  of the fixed part information field shall be set to 1.

### 10.3.2.2.2 Extended FP Capabilities

The FP shall indicate its extended capabilities using the Extended fixed part capabilities  $Q_T$  message as described in EN 300 175-3 [3], clause 7.2.3.5, with contents as defined below. The PT shall be able to receive and understand this message.

| MAC message   | Field within the message | Standard values within the MAC message | Normative action/comment                     |
|---|--------------------------|--|--|
| << FP capabilities >>   |                          |  |  |
|   | < Q <sub>H</sub> >       | 4                                      |  |
|   | < a <sub>21</sub> >      |  | MAC suspends and resume procedure supported. |
|   | < a <sub>22</sub> >      | [0, 1]                                 | I <sub>PQ</sub> services supported.          |
|   | < a <sub>23</sub> >      | 1                                      | Extended FP capabilities Part 2.             |
| NOTE: For the higher layer capabilities, , bits < $a_{25}$ to $a_{47}$ >, see clause 12.16. |                          |  |  |

In case of mobility class 2, the MAC extended fixed part capability part 2, information message shall be used and, therefore, bit  $a_{23}$  of the extended FP capability field shall be set to 1.

## 10.3.2.2.3 Extended FP Capabilities part 2

The FP shall indicate its extended capabilities using the Extended fixed part capabilities part 2  $Q_T$  message as described in EN 300 175-3 [3], clause 7.2.3.11, with contents as defined below. The PT shall be able to receive and understand this message.

| MAC message  | Field within the message | Standard values within the MAC message | Normative action/comment                              |  |
|--|--------------------------|--|---|--|
| << FP capabilities >>  |                          |  |   |  |
|  | < Q <sub>H</sub> >       | C (hex)                                |   |  |
|  | < a <sub>12</sub> >      | [0, 1]                                 | Long slot support (j = 640).                          |  |
|  | < a <sub>13</sub> >      | [0, 1]                                 | Long slot support (j = 672).                          |  |
|  | < a <sub>14</sub> >      | [0, 1]                                 | E+U-type mux and channel IPF basic procedures         |  |
|  |                          |  | supported (see note 2).                               |  |
|  | < a <sub>15</sub> >      | [0, 1]                                 | channel I <sub>PF</sub> advanced procedures supported |  |
|  |                          |  | (see note 2).   |  |
|  | < a <sub>16</sub> >      | [0, 1]                                 | channel SI <sub>PF</sub> supported (see note 2).      |  |
| NOTE 1: For the higher layer capabilities, bits $< a_{24}$ to $a_{47} >$ , see clause 12.16.     |                          |  |   |  |
| IOTE 2: See clauses 10.21.2.3 and 10.22 for E+U type mux and channel I <sub>PF</sub> procedures. |                          |  |   |  |

#### Table 27: Values used within Extended FP capabilities part 2

## 10.3.2.3 Q<sub>T</sub> - SARI list contents

The FT may send and the PT shall be capable of receiving and processing (if broadcast by the FT) the  $Q_T$  SARI message as defined in EN 300 175-3 [3], clause 7.2.3.6, with contents as defined in table 28.

This is relevant if the N<sub>T</sub> message indicates SARI support.

| Table 28: Value | es used within | SARI list contents |
|-----------------|----------------|--------------------|
|-----------------|----------------|--------------------|

| MAC message              | Field within the message | Standard values within the MAC message | Normative action/comment  |
|--------------------------|--------------------------|--|---|
| << SARI list contents >> |                          |  |   |
|                          | < Q <sub>H</sub> >       | 5                                      |   |
|                          | < SARI list length >     | All                                    |   |
|                          | < TARIs yes/no >         | All                                    | The PT may ignore it if Tertiary<br>Access Rights Identity (TARI) request<br>is not supported (support of TARI is<br>not required). |
|                          | < Black yes/no >         | All                                    | The PT shall be able of distinguishing<br>ARI from black ARI even if TARI is not<br>supported.                                      |
|                          | < ARI or black-ARI >     | All                                    |   |

### 10.3.2.4 Multiframe number

 $Q_T$  message carries the multiframe number which is used in the encryption algorithm. Both, FT and PT, shall be able to transmit and respectively retrieve the information carried in this message.

modulo 2\*\*24.

|  | Table 29: Values used within Q | T multiframe number message |
|--|--------------------------------|-----------------------------|
|--|--------------------------------|-----------------------------|

# 10.4 Paging broadcast

# 10.4.1 Paging message formats

The FT and PT shall support the following paging message formats as defined in EN 300 175-3 [3], clause 7.2.4.1 (for MAC resume paging message).

## 10.4.1.1 Long or full page message format

#### Table 30: Values used within long and full-page message format

| MAC message                              | Field within the message                                | Standard values<br>within the MAC<br>message | Normative action/comment  |
|--|---|--|---|
| << P <sub>T</sub> long page format >> or |   |  |   |
| << P <sub>T</sub> full page format >>    |   |  |   |
|  | < P <sub>T</sub> -header extend flag >                  | 0,1  | a <sub>8</sub> = 1 means another page   |
|  | (a <sub>8</sub> )                                       |  | message shall start in the next frame in this multiframe that is permitted to contain a $P_T$ type. |
|  | < BS SDU length indication > $(a_9 \text{ to } a_{11})$ |  |   |
|  |   | 010  | Full-page message shall be<br>used to carry LCE resume page<br>message.                             |
|  |   | 100  | Not the last 36 bits of a long page (see note).   |
|  |   | 101  | The first 36 bits of a long page (see note).  |
|  |   | 110  | The last 36 bits of a long page (see note).   |
|  |   | 111  | All of a long page (first and last) (see note).   |
|  | < BS channel data >                                     | All  | The content of the BS channel   |
|  | (a <sub>12</sub> to a <sub>47</sub> )                   |  | data is defined by the<br>LCE-message definition.   |
| NOTE: Long page messag                   | e format shall be used to carry                         | CLMS-fixed - channel                         | data - otherwise not applicable.  |

# 10.4.1.2 Short page message format

| MAC message                            | Field within the message   | Standard values<br>within the MAC<br>message | Normative action/comment  |
|--|--|--|---|
| << P <sub>T</sub> short page format >> |  |  |   |
|  | $< P_{T}$ -header extend flag > (a <sub>8</sub> )                    | 0,1  | a <sub>8</sub> = 1 means another page   |
|  |  |  | message shall start in the next frame in this multiframe that is permitted to contain a $P_T$ type. |
|  | < BS SDU length indication ><br>(a <sub>9</sub> to a <sub>11</sub> ) | 001  | Short page message.   |
|  | < BS channel data ><br>(a <sub>12</sub> to a <sub>31</sub> )         | All  | The content of the BS channel data is defined by the LCE-message definition.                        |
|  | < MAC info type ><br>(a <sub>32</sub> to a <sub>35</sub> )           | Various                                      | The definition of MAC layer<br>information to be supported is<br>done by clause 10.4.2.             |
|  | < MAC information > $(a_{36} \text{ to } a_{47})$                    | Various                                      | The definition of MAC layer<br>information to be supported is<br>done by clause 10.4.2.             |

## Table 31: Values used within short page message format

# 10.4.1.3 Zero length page message format

| MAC message                        | Field within the message   | Standard values<br>within the MAC<br>message | Normative action/comment  |
|------------------------------------|--|--|---|
| << P <sub>T</sub> zero length page |  |  |   |
| format >>                          |  |  |   |
|                                    | $< P_T$ -header extend flag > (a <sub>8</sub> )                      | 0,1  | a <sub>8</sub> = 1 means another page   |
|                                    |  |  | message shall start in the next frame in this multiframe that is permitted to contain a $P_T$ type. |
|                                    | < BS SDU length indication ><br>(a <sub>9</sub> to a <sub>11</sub> ) | 000  | Zero length page message.   |
|                                    | < 20 LSBits of RFPI ><br>(a <sub>12</sub> to a <sub>31</sub> )       | All  |   |
|                                    | < MAC info type > $(a_{32} to a_{35})$                               | Various                                      | The definition of MAC layer<br>information to be supported is<br>done by clause 10.4.2.             |
|                                    | < MAC information > $(a_{36} to a_{47})$                             | Various                                      | The definition of MAC layer<br>information to be supported is<br>done by clause 10.4.2.             |

## 10.4.1.4 MAC resume and control page message format

| MAC message                        | Field within the message2                               | Standard values<br>within the MAC<br>message | Normative action/comment  |
|------------------------------------|---|--|---|
| << P <sub>T</sub> MAC resume page  |   |  |   |
| format >>                          |   |  |   |
|                                    | $< P_T$ -header extend flag > (a <sub>8</sub> )         | 0,1  | a <sub>8</sub> = 1 means another page   |
|                                    |   |  | message shall start in the next frame in this multiframe that is permitted to contain a $P_T$ type.                           |
|                                    | < BS SDU length indication > $(a_9 \text{ to } a_{11})$ | 011  | MAC resume and control page   |
|                                    | < PMID >(a <sub>12</sub> to a <sub>31</sub> )           | All  | PMID.   |
|                                    | < ECN / info 3 > (a <sub>32</sub> to a <sub>35</sub> )  | All  | Exchanged connection number<br>in resume:<br>0000 in paging control.<br>0000, 0001, 0010 in fast setup<br>control (see note). |
|                                    | < Command $>$ (a <sub>36</sub> to a <sub>37</sub> )     | 11   | Resume.   |
|                                    |   | 01   | Paging detection mode control   |
|                                    |   | 10   | Fast setup control (see note).  |
|                                    | < info 1 > (a <sub>38</sub> to a <sub>41</sub> )        | All  | 1111 or SN (resume and fast setup control).   |
|                                    | < info 2 > $(a_{42} \text{ to } a_{47})$                | All  | 1111 or CN (resume).  |
| NOTE: Command "10"<br>implemented. | and fast setup related codes need                       | d only to be supported                       | I<br>if fast setup (DPRS-M.17) is   |

#### Table 33: Values used within MAC resume page message format

## 10.4.1.5 MAC layer information in zero and short length paging messages

The following MAC layer information types defined by EN 300 175-3 [3], clause 7.2.4.3 shall be supported (understood) by a PT.

| Table 34: Types of MAC layer paging information to be supported by a P |
|--|
|--|

| a <sub>32</sub> | a <sub>33</sub> | a <sub>34</sub> | a <sub>35</sub> | MAC information type   |  |
|-----------------|-----------------|-----------------|-----------------|--|--|
| 0               | 0               | 0               | 1               | Blind slot information for circuit mode service.                         |  |
| 0               | 0               | 1               | 0               | Other bearer.  |  |
| 0               | 0               | 1               | 1               | Recommended other bearer.  |  |
| 0               | 1               | 0               | 1               | Dummy or C/L bearer position.  |  |
| 1               | 0               | 0               | 1               | Bearer handover/replacement information.                                 |  |
| 1               | 0               | 1               | 0               | RFP-status and Modulation Types (see clause 10.4.1.5.1). (The Modulation |  |
|                 |                 |                 |                 | Types replaces the spare bits.)  |  |
| 1               | 1               | 0               | 0               | C/L bearer position  |  |
| 1               | 1               | 1               | 1               | Blind slot information for packet mode service. (This replaces the       |  |
|                 |                 |                 |                 | Modulation Types information.)   |  |

## 10.4.1.5.1 RFP status

|                 | RFP    |                                 | Modulation Types |                 |                 |  |  |
|-----------------|--------|---------------------------------|------------------|-----------------|-----------------|--|--|
|                 | status |                                 | A-field          | (B +            | Z)-fields       |  |  |
| a <sub>36</sub> |        | a <sub>39</sub> a <sub>40</sub> | a <sub>43</sub>  | a <sub>44</sub> | a <sub>47</sub> |  |  |

Figure 6: RFP status

| RFP status            | Meaning  |
|-----------------------|--|
| 0xxx                  | RFP clear for data.  |
| 1xxx                  | RFP busy for data (see note).  |
| request n<br>RFP-stat | sy for data" means that the RFP recommends PTs not to send access nessages for data towards this RFP. The procedure how to react on us "RFP-busy-for-data" during suspension is defined by 3.2.1.2 and during bearer establishment is defined in clause 10.10. |

Table 35: RFP status

Bits a<sub>40</sub> to a<sub>43</sub> define the modulation schemes supported in the A-field, in addition to the default one (see note).

| a <sub>40</sub> | a <sub>41</sub> | a <sub>42</sub> | a <sub>43</sub> | A-field modulation scheme                                 |
|-----------------|-----------------|-----------------|-----------------|---|
| Х               | Х               | Х               | 0               | 2-level modulation supported.                             |
| Х               | Х               | Х               | 1               | 2-level modulation not supported.                         |
| Х               | Х               | 0               | Х               | 4-level modulation not supported.                         |
| Х               | Х               | 1               | Х               | 4-level modulation supported.                             |
| Х               | 0               | Х               | Х               | 8-level modulation not supported.                         |
| Х               | 1               | Х               | Х               | 8-level modulation supported.                             |
| 1               | Х               | Х               | Х               | Reserved.   |
| 0               | 0               | 0               | 0               | Previous "spare" code: only 2-level modulation supported. |

Table 36: RFP status A-field modulation scheme

Bits  $a_{44}$  to  $a_{47}$  define the modulation schemes supported in the (B + Z)-fields, in addition to the default one.

| a <sub>44</sub> | a <sub>45</sub> | a <sub>46</sub> | a <sub>47</sub> | (B + Z)-fields modulation scheme                          |
|-----------------|-----------------|-----------------|-----------------|---|
| Х               | Х               | Х               | 0               | 2-level modulation not supported.                         |
| Х               | Х               | Х               | 1               | 2-level modulation supported.                             |
| Х               | Х               | 0               | Х               | 4-level modulation supported.                             |
| Х               | Х               | 1               | Х               | 4-level modulation not supported.                         |
| Х               | 0               | Х               | Х               | 8-level modulation supported.                             |
| Х               | 1               | Х               | Х               | 8-level modulation not supported.                         |
| 0               | Х               | Х               | Х               | Reserved.   |
| 1               | 1               | 1               | 1               | Previous "spare" code: only 2-level modulation supported. |

Table 37: RFP status B+Z field modulation scheme

NOTE: The "default" modulation scheme is profile dependant (see clause 5.2).

# 10.4.2 MAC layer information messages procedures

The following MAC layer information message procedures are defined as described below. Each supported message shall be broadcasted at least once every 10 s.

### 10.4.2.1 Blind slot information for circuit mode service

RFPs that have blind slots due to technological limitations, such as a slow synthesizer, shall announce these blind slots. This may include blind slots due to active bearers as well. Also the slots reserved for packet mode service may be indicated as blind for circuit mode service. This can be dynamically configured by the Management Entity, to optimize the available slots for different services. The idea behind the reserved slots for a specific service is the highly dynamic behaviour of packet mode services, while circuit mode services often carry unprotected voice samples, which should not be impacted by frequent disturbance that may be generated by the packet mode service. By separating the services in different slots, this interference is avoided.

Not available (blind) slot means that the FP mandates the PT not to attempt a setup on this slot for that service type.

If the PT receives blind slot information, it is mandatory for that PT to use it in the process of channel selection. The PT does not have to wait for the blind slot information before making the channel selection.

NOTE: This information is coded identically to the GAP blind full slots to allow compatibility.

## 10.4.2.2 Bearer handover/replacement information

It is mandatory for RFPs not supporting bearer handover or bearer replacement within the whole FP to broadcast the bearer handover information.

## 10.4.2.3 Other bearer position

The RFP is recommended to broadcast the "other bearer" information indicating the position of a 2<sup>nd</sup> dummy bearer or traffic bearer, if such bearer exists.

## 10.4.2.4 Recommended other bearer position

The RFP is recommended to broadcast the "recommended other bearer" information indicating the position of another bearer. This message shall not be sent unless the bearer that it is sent on will be released in less than or equal to 4 multiframes.

## 10.4.2.5 Dummy or C/L bearer position

The RFP shall announce the dummy bearer position, if a dummy bearer exists.

## 10.4.2.6 C/L bearer position

The RFP shall announce the connectionless downlink bearer position, if such a bearer exists. The bearer position must be announced 1 Multi-Frame (4 MF in case of low duty cycle) in advance of transmission of C/L data via this bearer.

## 10.4.2.7 RFP-status and Modulation Types

The RFP should send the RFP-status information "RFP busy-for-data/not-busy-for-data" as soon as possible after a detection of a change in RFP-status, i.e. in the first allowed frame after the change. It is recommended that the RFP periodically sends the RFP-status information. It is not recommended to send this message very often when the status changes frequently, because the other messages may be delayed too long. A practical limit may be to send this information not more than once a second.

RFPs which are capable of Higher Layer Modulation shall transmit this message to announce this capability, otherwise the peer will assume that only default modulation is available. For the present document, this is 2-level modulation.

### 10.4.2.8 Blind slot information for packet mode service

The RFP shall announce the slots which are blocked for packet mode service. The coding of the message is identical to clause 10.4.2.1 Blind slot information for circuit mode service, except that the MAC layer information type bits equal 1111, or value "F".

## 10.4.3 Paging Procedures

### 10.4.3.1 LCE Paging

The procedure shall be performed as defined by EN 300 175-3 [3], clauses 9.1.3.1 and 9.1.3.2.2.

This procedure includes transmission and reception of Zero length, short, full and Long page messages.

In the LCE procedure, the B<sub>S</sub> channel SDU is provided by the DLC layer.

The procedure is compatible with normal, high and low duty cycle paging detection modes in the PT.

## 10.4.3.2 MAC Paging

#### 10.4.3.2.1 Support of MAC Paging commands for resume and paging detection control

The procedure shall be performed as defined by EN 300 175-3 [3], clauses 9.1.3.1 and 9.1.3.2.2 with the following specific provisions.

The message to be used shall be the "MAC\_ resume\_and\_control\_ page" as defined in EN 300 175-3 [3], clause 7.2.4.1 with the values defined in clause 10.4.1.4.

The following commands in the paging message (bits  $a_{36}$  to  $a_{37}$ ) shall be supported: "11" resume and "01" paging detection control.

The FT may use any of the following options in the resume message:

- 1) transmit no special info (SN and CN = 1111);
- 2) transmit a SN only;
- 3) transmit a SN and a CN.

In option 1, the PT shall use its own channel selection algorithms to select the slot and carrier.

In option 2, the PT shall use slot SN in the setup attempt and shall use the carrier according to the setup scan sequence.

In option 3, the PT shall use slot SN and carrier CN in the setup attempt.

NOTE: In option 3, the setup may be done out of the scan sequence.

In the case of the paging detection control command, the two possible cases shall be supported.

MAC paging is entirely handled at MAC layer. The procedure is triggered by the ME.

The procedure is compatible with normal and high duty cycle paging detection modes in the PT.

#### 10.4.3.2.2 Support of MAC Paging codes for control of fast setup

If the implementation (PT or FT) supports the service DPRS-M.17 (fast setup), then the command "10" = "control of fast setup" shall be also supported, with the possible options, according to the values of info 1 and info 3 fields defined in clause 7.2.4.1.4 of EN 300 175-3 [3].

All other provisions of clause 10.4.3.

## 10.4.4 Paging detection

#### 10.4.4.1 Normal duty cycle

The procedure shall be performed as defined by EN 300 175-3 [3], clause 9.1.3.2.1.

The PT shall be in the state "Normal Idle Locked mode" as defined in EN 300 175-3 [3], clause 11.3.3.1. In this mode, the PT shall receive any B<sub>S</sub> channel transmitted in frame 0 and additional frames that are commanded by the extend flag.

The normal duty cycle detection state applies to both, LCE and MAC paging procedures.

Normal duty cycle is the default detection state when there is no active DPRS virtual connection. When there is a virtual connection in suspend state, the PT enters in normal duty cycle after T911 timer expiration.

### 10.4.4.2 High duty cycle

The procedure shall be performed as defined by EN 300 175-3 [3], clause 9.1.3.2.1.

The PT shall be in the state "High duty cycle Idle Locked mode" as defined in EN 300 175-3 [3], clause 11.3.3.1. In this mode, the PT shall receive any  $B_S$  channel transmitted in frames 0, 2, 4, 6, 10 and 12 of the multiframe sequence.

The high duty cycle detection state applies to both, LCE and MAC paging procedures.

The support of high duty cycle when there is no active DPRS virtual connection shall be indicated by the PT using higher layer functions (IE <Setup capability>, see EN 300 175-5 [5], clause 7.7.40).

When there is an active virtual connection, the high duty cycle is the first duty cycle the PT enters after a connection suspension, if setup detection mode is not used. After an interval of time in high duty cycle, (controlled by timer T911), the PT moves to normal duty cycle.

If setup detection mode is used, the PT shall pass to paging detection mode, high duty cycle, after expiration of timer T909. Timer T911 will start in the transition.

#### 10.4.4.3 Low duty cycle

The procedure shall be performed as defined by EN 300 175-3 [3], clause 9.1.3.2.1.

The PT shall be in the state "Low duty cycle Idle Locked mode" as defined in EN 300 175-3 [3], clause 11.3.3.1. In this mode, the PT shall receive any  $B_S$  channel in frame 0 every four multiframes.

The low duty cycle detection state applies only to LCE paging and can only be used when there are no active DPRS virtual connections.

The PT shall check that the mode is supported by the FT (broadcasted in IE <Setup capabilities>). If this is not the case, the PT shall not enter in this mode.

# 10.5 Logical Connection Setup

Logical Connection Setup is the procedure of creation of MBC. This procedure is immediately followed by a Physical connection setup.

The creation of an MBC is defined by EN 300 175-3 [3], clause 10.2.4.1.

Physical Connection setup is defined by clause 10.8.

If A-field procedures  $(M_T)$  are used, physical Connection setup is defined by clause 10.23.1.

# 10.6 Logical Connection Release

Logical Connection Release is the procedure of removal of an MBC. This procedure is proceeded by either a NWK layer release procedure or by a handshake failure.

The NWK layer release procedure will cause DLC layer to send a MAC\_DIS-req primitive to MBC.

The handshake procedure as defined in clause 9.4.2.3 will cause the ME to send a MAC\_DIS-req primitive.

Logical connection release will also cause Physical Connection release as defined in clause 10.8.

# 10.7 Connection Modification

### 10.7.1 Connection Modification to change bandwidth

The connection modification procedure to change the bandwidth shall be supported as defined by EN 300 175-3 [3], clause 10.3.1.

The procedure shall be used in the following three cases:

• as part of the setup of a multibearer connection;

- modification of the bandwidth of an existing connection;
- release of a Physical Connection (i.e. suspend, modify to zero bandwidth).

The connection modification procedure consists of two phases:

- bandwidth negotiation;
- bandwidth modification commit.

The suspend and resume procedures can be considered special cases of the "Connection Modification to change bandwidth" procedure.

## 10.7.1.1 Bandwidth negotiation

Bandwidth negotiation is the procedure by means of what, both peers negotiate the number of bearers of the connection.

DPRS allows to execute this procedure in two ways: using A-field messages or using B-field messages. In the first case the messages BANDWIDTH\_T request and confirm as defined in clause 7.2.5.3.9 shall be used. In the second case the messages shall be BANDWIDTH\_B request and confirm as defined in clause 7.3.2.6. Both procedures shall be supported.

The initiating side shall indicate the bandwidth request by means of a BANDWIDTH.req message. The receiving side shall reply to this with a BANDWIDTH.cfm message. The bandwidth indicated by the BANDWIDTH.cfm message is the negotiated bandwidth.

The initiating side may freely choose to execute the procedure in A-field or B-field. The BANDWIDTH.cfm shall be send as the same type of message as the request.

NOTE 1: Depending on the case, it could be more efficient to use one or the other.

In case of call setup, the bandwidth negotiation procedure shall be initiated by the call originating side.

In case of resume, the bandwidth negotiation procedure shall be initiated by the side which initiates the resume.

In any other case, the bandwidth negotiation procedure may be initiated by any of the peers.

The bandwidth negotiation procedure will be initiated by any of the peers as response to changes in data traffic, and may be initiated by the FT due to bandwidth administration reasons.

The bandwidth negotiation shall never be ignored. Upon reception of any correctly formatted A-field or B-field BANDWIDTH.req request message, the receiving peer shall answer the message with a BANDWIDTH.cfm of the same type.

The "number of bearers" fields in Bandwidth request and confirm messages shall be within the range of values agreed at the NWK layer negotiation, plus the value 0,0 (suspend state). The response to the exceptional case of receiving a message with unlawful values is described in clause 10.7.1.5.

The content of the "number of bearers" fields in the confirm message could be different from the requested value. The rules and conditions for the bandwidth request and allocation are defined in clause 9.3.

NOTE 2: In DPRS, the FT is the ultimate entity in charge of the bandwidth allocation and distribution.

Figure 7: Bandwidth negotiation

In order to improve efficiency of bandwidth usage, it shall be allowed to use the BANDWIDTH\_T messages instead of the BANDWIDTH\_B messages, wherever appropriate, but the bandwidth-confirm shall be send as the same type of message as the request.

#### 10.7.1.1.1 Bandwidth negotiation with A-field messages

The messages BANDWIDTH\_T request and confirm as defined in EN 300 175-3 [3], clause 7.2.5.3.9, shall be used.

This messages shall be used fulfilling the standard T-MUX priority schema as defined in EN 300 175-3 [3], clauses 6.2.2.1.1 and 6.2.2.1.2.

The following fields of the message shall be supported by the PT and the FT.

| MAC message                 | Field within the message   | Standard values within the MAC message | Normative action/comment                   |  |  |  |  |
|-----------------------------|--|--|--|--|--|--|--|
| << M <sub>T</sub> message : | >>   |  |  |  |  |  |  |
|                             | < M <sub>T</sub> header >  | 0001                                   | "Advanced connection control".             |  |  |  |  |
|                             | < Command >  | 8                                      | "Bandwidth_T.request".                     |  |  |  |  |
|                             |  | 9                                      | "Bandwidth_T.confirm".                     |  |  |  |  |
|                             | < MUp >  | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).      |  |  |  |  |
|                             | < TUp >  | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).      |  |  |  |  |
|                             | < MDown >  | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).      |  |  |  |  |
|                             | < TDown >  | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).      |  |  |  |  |
|                             |  |  | connection suspension, see clause 10.7.1.  |  |  |  |  |
| Otherv                      | erwise the bandwidth values shall be within the limits configured (mobility class 1) or negotiated at call |  |  |  |  |  |  |
| setup                       | (mobility class 2).  |  |  |  |  |  |  |
|                             | •  | 1                                      | e, the bandwidth is immediately negotiated |  |  |  |  |
| to 0, a                     | nd the pilot bearer released   | l.                                     |  |  |  |  |  |

Table 38: Values used within BANDWIDTH\_T message

#### 10.7.1.1.2 Bandwidth negotiation with B-field messages

The messages BANDWIDTH\_B request and confirm as defined in EN 300 175-3 [3], clause 7.3.2.6, shall be used.

B-field messages can be transmitted in any frame (contrary to A-Field messages), and in any subfield, except when specifically noted. There can be other B-field messages in other subfields.

| MAC message       | Field within the message  | Standard values within the MAC message | Normative action/comment                 |  |  |  |
|-------------------|---|--|--|--|--|--|
| << MBn message >> |   |  |  |  |  |  |
|                   | < MBn header >  | X001                                   | "Advanced connection control".           |  |  |  |
|                   | < Command >   | 8                                      | "Bandwidth_B.request".                   |  |  |  |
|                   |   | 9                                      | "Bandwidth_B.confirm".                   |  |  |  |
|                   | < FMID >  | All                                    |  |  |  |  |
|                   | < MUp > 0, 1 to 23 Bandwidth values (see notes 1 a  |  |  |  |  |  |
|                   | < TUp >   | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).    |  |  |  |
|                   | < MDown >   | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).    |  |  |  |
|                   | < TDown >   | 0, 1 to 23                             | Bandwidth values (see notes 1 and 2).    |  |  |  |
| NOTE 1: The band  | width value 0 is used in the  | ese messages to initiate a co          | onnection suspension, see clause 10.7.1. |  |  |  |
| Otherwise         | erwise the bandwidth values shall be within the limits configured (mobility class 1) or negotiated at   |  |  |  |  |  |
| call setup        | all setup (mobility class 2) or service change.   |  |  |  |  |  |
|                   | : In case of a connection setup due to the handshake procedure, the bandwidth is immediately negotiated |  |  |  |  |  |
| to 0, and t       | he pilot bearer released.   |  |  |  |  |  |

Table 39: Values used within BANDWIDTH\_B message

#### In case of bandwidth negotiation during an active physical connection:

- The bandwidth negotiation procedure can be performed at any time.
- If A-Field is used, M<sub>T</sub> messages shall be sent fulfilling the standard T-MUX priority schema as defined in EN 300 175-3 [3], clauses 6.2.2.1.1 and 6.2.2.1.2.

92

• Provisions described in clause 9 regarding the ME procedures shall be fulfilled.

#### In case of bandwidth negotiation for resuming of a suspended connection:

• If B-field messages are used, the earliest possible transmission of the Bandwidth request and confirm messages are the same slots carrying the BEARER request/confirm messages. The bandwidth negotiation, and its consequence procedures, are conditional to the success of the bearer setup procedure.

Both sides should initiate the bandwidth modification only if they are able to roll back these operations in case the initial (pilot) bearer setup fails. Otherwise, they should wait for the completion of the setup procedure.

- If M<sub>T</sub> messages are used, the procedure shall only be performed after the end of the setup procedure.
- NOTE: The recommended Bandwidth negotiation procedure, when performed during a resume or stay alive process is the B-field procedure.

### 10.7.1.2 Bandwidth modification

Depending on the actual situation, the following procedures can be used to modify the bandwidth of a connection.

- To add additional duplex bearers, the single additional duplex bearer setup procedure shall be used as defined in clauses 10.10.1.4 (PT initiated) and 10.10.1.5 (FT initiated).
- To add additional simplex bearers, the double simplex bearer setup procedures shall be used as defined in clause 10.10.2.2 (upstream) and 10.10.2.3 (downstream).
- To release bearers, the unacknowledged bearer release procedure shall be used as defined in clause 10.11.1.
- To reverse double simplex bearers, the fast release procedure shall be used as defined in clause 10.11.4.

In addition to the setup procedures, there may be channel list procedures executed before or during the bearer setups. Channel list procedures are mandatory for double-simplex bearers and recommended for additional duplex bearers.

The use of channel list messages and the internal sequencing of each setup or release procedure are described in clauses 10.10.1.2, 10.10.1.3, 10.10.1.4, 10.10.1.5, 10.10.2.2 and 10.10.2.3.

#### 10.7.1.2.1 Order and sequence of operations

The bandwidth modification commit consists on multiple setup and/or release operations that can be executed in parallel, fulfilling the following sequencing rules. The order of actions to be performed and the earliest possible execution time shall be as follows:

- 1) **Channel list messages: GOOD and POOR:** these procedures can be executed at any time, even before the Bandwidth negotiation.
- 2) **Channel list message LISTEN:** the earliest timing for this message is the same slot that carries the  $FT \Rightarrow PT$  message in the Bandwidth negotiation:
  - Reason: this is the earliest point when the final Bandwidth is known, and the LISTEN command really initiates a setup procedure by activating a receiver at one of the sides.
- 3) **Release and fast release procedures**: one slot after the transmission/reception of the BANDWIDTH.cfm message.

NOTE 1: The procedure description indicates which peer should send the release.

- 4) Setup of additional duplex bearers: one slot after the transmission/reception of the BANDWIDTH.cfm message:
  - To use this timing, the implementation shall be able to recognize and use any channel list message received together (same slot) with the BANDWIDTH.cfm.

NOTE 2: If there has been a duplex bearer setup, it means that there has not been any duplex release.

- 5) Setup of double-simplex bearer: one slot after the following three conditions are met:
  - BANDWIDTH.cfm received;
  - LISTEN channel list command received OR START command sent on an existing bearer;
  - Release or fast release of all double-simplex bearers in the other way (if any) at least initiated (first RELEASE message sent and received).

#### 10.7.1.2.1.1 Additional restrictions for A field messages

The previous list assumes the use of B-field messages in all cases. The list is also valid when  $M_T$  messages are used when allowed (bandwidth and channel list), however, in addition to the restrictions listed, the additional restrictions consequence of the T-MUX multiplexer priority and of the fact that only one  $M_T$  message may be transmitted each time shall apply.

### 10.7.1.3 Suspend

The suspend procedure is a special case of bandwidth modification, with negotiated value equal zero.

Additional situations will also lead to a suspend, without prior exchange of bandwidth negotiation messages:

- loss of all bearers of a connection;
- loss of the last duplex bearer, controlling the connection;
- violation of bandwidth, see clause 9.3.1.2.3.

In these additional situations, the bandwidth modification is immediately performed.

To request the suspension the initiating side shall use one of the following messages.

The following message fields as defined in EN 300 175-3 [3], clause 7.2.5.3.9 (for BANDWIDTH\_T request and confirm) and clause 7.3.2.6 (for BANDWIDTH\_B request and confirm) shall be supported by the PT and the FT.

| MAC m                | nessage  | Field within the message  | Standard values within the MAC message | Normative action/comment   |
|----------------------|--|---|--|--|
| << M <sub>T</sub> me | ssage >>   |   |  |  |
|                      |  | < M <sub>T</sub> header >   | 0001                                   | "Advanced connection control".   |
|                      |  | < Command >   | 8                                      | "Bandwidth_T.request".   |
|                      |  | < MUp >   | 00000                                  | Suspend.   |
|                      |  |   | 00001                                  | -f option (FT only) (see note 2).  |
|                      |  |   | 00010                                  | -s option (see note 3).  |
|                      |  | < TUp >   | 00000                                  | Suspend.   |
|                      |  | < MDown >   | 00000                                  | Shall not be used (see note 1).  |
|                      |  |   | 00001                                  | Suspend reason - No data for transmission.   |
|                      |  |   | 00010                                  | Suspend reason - Local<br>temporary<br>transmission/reception limits.  |
|                      |  |   | 00011                                  | Suspend reason - Data overflow.  |
|                      |  |   | 00100                                  | Suspend reason - Violation of<br>the minimum number of bearers<br>or requested number of bearers<br>out of limits. |
|                      |  |   | 00101                                  | Suspend reason - Handshake for stay alive procedure.   |
|                      |  |   | 00110                                  | Suspend reason - other   |
|                      |  |   | 00111                                  | Suspend reason - bandwidth administration (FT only).   |
|                      |  | < TDown >   | 00000                                  | Suspend.   |
|                      | When < TUp > and < Tdown > are set to "00000" the meaning of the values set in < MDown > field shall be understood as to indicate the reason for the requested suspension. The value "00000" shall not be used for backwards compatibility reasons. If a terminal receives this value it shall understand it as Suspension reason unknown. |   |  |  |
| NOTE 2:              |  | The option -f (force) when sent by the FT makes the suspend order unquestionable, even in the cases where the PT is allowed to refuse the suspend if it has data to be sent upstream. |  |  |
| NOTE 3:              | The option -s (soft) when sent by the FT allows the PT to refuse the suspend if it has data to be sent upstream.   |   |  |  |

Table 40: Values used within BANDWIDTH\_T.request message

The following fields as defined in EN 300 175-3 [3], clause 7.3.2.6 of the BANDWIDTH\_B request and confirm messages shall be supported by the PT and the FT.

| MAC message  | Field within the message  | Standard values within the MAC message | Normative action/comment  |
|--|---|--|---|
| << MBn message >>  | ,   |  |   |
|  | < MBn header >  | X001                                   | "Advanced connection control".  |
|  | < Command >   | 8                                      | "Bandwidth_B.request".  |
|  | < FMID >  | All                                    |   |
|  | < MUp >   | 00000                                  | Suspend.  |
|  |   | 00001                                  | -f option (FT only) (see note 2).                                     |
|  |   | 00010                                  | -s option (see note 3).   |
|  | < TUp >   | 00000                                  | Suspend.  |
|  | < MDown >   | 00000                                  | Shall not be used (see note 1).                                       |
|  |   | 00001                                  | Suspend reason - No data for transmission.                            |
|  |   | 00010                                  | Suspend reason - Local<br>temporary<br>transmission/reception limits. |
|  |   | 00011                                  | Suspend reason - Data overflow  |
|  |   | 00100                                  | Suspend reason - Violation of   |
|  |   |  | the minimum number of bearers   |
|  |   | 00101                                  | Suspend reason - Handshake for stay alive procedure.                  |
|  |   | 00110                                  | Suspend reason - bandwidth administration (FT only).                  |

### 10.7.1.4 Resume

Resumption is the procedure used to leave the suspend state by setting up an initial pilot duplex bearer, followed by bandwidth negotiation and modification when necessary. Management Entity will trigger this procedure as defined in clauses 9.3.1.1 and 9.3.2.1.

In case of a connection resumption in a different cluster than where the connection was suspended, the PT will use the "connection\_handover\_request" rather than the "access\_request" type of bearer request message.

#### 10.7.1.5 Bandwidth modification rejection and error handling

A request for bandwidth negotiation shall never be ignored. It is mandatory to complete the procedure answering with a BANDWIDTH.cfm message.

Bandwidth modification rejection is defined as the case when the FT receives a Bandwidth request sent by the PT that is attempting a resume process, or a bandwidth modification increasing the number of bearers and the FT answers with either:

- Bandwidth confirm = zero, indicating that the PT should remain or pass to suspend state.
- Bandwidth confirm with smaller number of upstream bearers than requested by the PT.
- NOTE: See rule 1 of clause 9.3.2.3.2 regarding request of bandwidth downstream by the PT.

The conditions when the FT could reject a bandwidth negotiation request are defined in clauses 9.3.1 and 9.3.2.

The modification by the FT of the number of bearers in downstream direction (either increasing it or decreasing it) is not considered a Bandwidth negotiation rejection.

When the PT receives a bandwidth negotiation rejection, it shall obey the confirmed number of bearers set by the FT and shall not initiate other resume or bandwidth increase attempt during an interval equal to Waiting time WtB (see clause A.1.2.2).

#### 10.7.1.5.1 Error handling

No DPRS terminal should send a Bandwidth request or confirm message with a number of Bearers out of the range negotiated at NWK layer (Class 2 devices) or configured (Class 1 devices).

Exception to the rule is the downstream maximum number of bearers in a Bandwidth request sent by a PT that could be set to 1 in all cases (correct value shall be returned by the FT).

If case of a Bandwidth request message with unlawful number of bearers send by any peer, the other peer could either, return the a Bandwidth confirm with the lawful combination of number of bearers closest to the request, or returning a Bandwidth confirm equal to zero and suspend the connection.

In case of multiple requests for Bandwidth with unlawful values, the other peer may initiate a Service change procedure in other to renegotiate the NWK layer values, or release the NWK layer virtual call with Release Reason "Negotiation failed".

# 10.7.2 Connection modification to change service type, slot type, modulation type or adaptive code rate

### 10.7.2.1 Connection modification to change MAC service type

The MAC connection modification procedure to change the service type is needed to change the actual service type of a logical connection to a new one due to the result of the NWK service negotiation defined by clause 12.5 or service changes defined in clauses 12.6 and 12.7.

The connection modification procedure to change the service type between the following service types defined by EN 300 175-3 [3], clauses 5.6.2.1 and 5.6.2.2:

- I<sub>PM</sub>\_error\_detect;
- I<sub>PM</sub>\_error\_correct;
- I<sub>PO</sub>\_error\_detect;
- I<sub>PO</sub>\_error\_correct;
- I<sub>PX</sub>\_encodec protected.

The connection modification procedure to change the service type is mandatory to support, if other MAC service types than  $I_{PM}$ -error\_detect are supported.

The connection modification procedure to change the service type shall be performed as defined by EN 300 175-3 [3], clause 10.3.2.1. The attributes\_request and attributes \_confirm message exchanged for this procedure shall be the ATTRIBUTES\_T.req/cfm message as defined by EN 300 175-3 [3], clause 7.2.5.3.8.

The connection modification to change service type shall be only performed following a NWK layer Service Change negotiation.

## 10.7.2.2 Connection modification to change slot type

The MAC connection modification procedure to change the slot type is needed to change the slot type of a logical connection to a new one due to the result of the NWK service negotiation defined by clause 12.5 or service changes defined in clauses 12.6 and 12.7.

99

The connection modification procedure is in charge to change the slot type between the following slot types defined by EN 300 175-3 [3], clause 6.2.1.1:

- Full slot (physical packet P32);
- Double slot (physical packet P80);
- Long slot (physical packet P64);
- Long slot (physical packet P67).

The connection modification procedure to change the slot type is optional to support, and has only sense if multiple MAC slots supported.

The connection modification procedure to change the slot type shall be performed as defined by EN 300 175-3 [3], clause 10.3.2. The attributes\_request and attributes\_confirm message exchanged for this procedure shall be the ATTRIBUTES\_T.req/cfm message as defined by EN 300 175-3 [3], clause 7.2.5.3.8.

The connection modification to change slot type shall be only performed following a NWK layer Service Change negotiation to change slot (see clause 12.6.2).

# 10.7.2.3 Connection modification to change the modulation scheme and adaptive code rate

The modulation scheme is related to a physical connection. A physical connection is always setup using the profile related default modulation scheme.

The default modulation scheme for this profile is:

- 2-level-modulation for S- and A-field;
- 2-level-modulation for B- and Z-field.

If other than this default modulation schemes are supported or, if  $I_{PX}$  encodec protected service is supported, the PT and FT shall support the connection modification procedure to change the modulation scheme and/or adaptive code rate as defined by this clause.

In case of call setup, this connection modification procedure is used to switch the logical and physical connection to the modulation scheme negotiated by the NWK service negotiation defined by clause 12.5.

In case of connection resumption, this connection modification procedure is used to switch the physical connection to the modulation scheme negotiated for the related logical connection without any further NWK service negotiation.

The connection modification procedure to change the modulation scheme shall be performed as defined by EN 300 175-3 [3], clause 10.3.4. The attributes\_request and attributes\_confirm message exchanged for this procedure shall be the ATTRIBUTES\_T.req/cfm message as defined by EN 300 175-3 [3], clause 7.2.5.3.8.

## 10.7.2.4 ATTRIBUTES\_T.req/cfm

This clause applies to all connection modification cases covered by clause 10.7.2.

The ATTRIBUTES\_T.req/cfm message as defined by EN 300 175-3 [3], clause 7.2.5.3.8 shall be used for connection modification to change service type and/or modulation scheme.

The message shall be supported if any connection modification case covered by clause 10.7.2 has to be implemented.

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.3.8 of the ATTRIBUTES\_T.req/cfm messages shall be supported by the PT and the FT.

| MAC message                  | Field within the message   | Standard values         | Normative action/comment                       |

|                              |  |                         | indicator used.                                |

Table 44: Values used within ATTRIBUTES\_T.req/cfm messages

NOTE 1: Modulation fields other default modulation schema need to be supported only if high level modulation is implemented.

NOTE 2: Adaptive code rate has to be supported only if I<sub>PX</sub> encodec protected is implemented.

# 10.8 Physical Connection Setup

The MBC will establish a Physical Connection upon request of the ME. It either can be a single bearer Physical Connection or a multibearer Physical Connection.

# 10.8.1 Single bearer physical connection setup

In order to setup a single bearer connection, the procedure "PT initiated initial duplex bearer setup (pilot bearer)" as defined in clause 10.10.1.2 shall be used.

In addition to that, the following cases of the bandwidth negotiation procedure defined in clause 10.7.1 shall be supported:

- Suspend, as defined in clause 10.7.1.3.
- Resume, as defined in clause 10.7.1.4 with the only value 1,1,1,1 for the 4 number of bearers parameters.

• Bandwidth modification rejection, as defined in clause 10.7.1.5, only for the case bandwidth confirm = 0 (suspend), when the PT is attempting a resume process.

# 10.8.2 Multibearer Physical Connection setup

In order to setup a multibearer connection, the following procedures shall be supported:

- initial duplex bearer setup (pilot bearer), as defined in clauses 10.10.1.1 and 10.10.1.2;
- additional duplex bearer setup, as defined in clause 10.10.1.4;
- double simplex bearer setup, as defined in clauses 10.10.2.1, 10.10.2.2 and 10.10.2.3 only if asymmetric connections are supported;
- connection modification to change Bandwidth (all cases), as defined in clause 10.7.1.

Clause 10.7.1.2.1 defines the correct sequencing, rules for parallel execution, and early possible starting point of the different procedures.

# 10.9 Physical Connection Release

Physical Connection release is the procedure to release all bearers associated to a logical connection (see clause 10.11).

# 10.10 Bearer Setup

## 10.10.1 Duplex bearer setup procedures

The following duplex bearer setup procedures are possible:

- PT initiated initial duplex bearer setup (pilot bearer), (see clause 10.10.1.2);
- FT initiated initial duplex bearer setup (pilot bearer), (see clause 10.10.1.3);
- PT initiated additional duplex bearer setup, (see clause 10.10.1.4).

### 10.10.1.1 MAC control messages

This clause applies to all duplex bearer setup procedures.

The following fields as defined in EN 300 175-3 [3], clause 7.3.2 of the BEARER\_REQUEST and BEARER\_CONFIRM and WAIT messages shall be supported by the PT and the FT.

#### Table 45: Values used within Advanced Connection Control messages during duplex bearer setup

| MAC message       | Field within the message | Standard values<br>within the MAC<br>message | Normative action/comment                                    |
|-------------------|--------------------------|--|---|
| << MBn message >> |                          |  |   |
|                   | < MBn header >           | X001   | "Advanced connection control".                              |
|                   | < Command >              | 0  | "Access_request".   |
|                   |                          | 1  | "Bearer handover request"                                   |
|                   |                          | 2  | "Connection_handover_request"<br>(optional).                |
|                   |                          | 4  | "Bearer_confirm".   |
|                   |                          | 5  | "Wait".   |
|                   | < FMID >                 | All  |   |
|                   | < PMID >                 | All  |   |
|                   | < ECN >                  | All  | See note 1.   |
|                   | < LBN >                  | 1 to 15                                      | The value 15 is reserved for the pilot bearer (see note 1). |

| MAC message | Field within the message    | Standard values<br>within the MAC<br>message | Normative action/comment  |
|-------------|-----------------------------|--|---|
|             | < up/down/ss/sm >           | "11"B and "10"B                              | Symmetric single bearer connection<br>and multibearer connection<br>(see notes 1 and 2).        |
|             | < service type >            | 2  | I <sub>PM</sub> _error_detect (see note 1).   |
|             |                             | 3  | I <sub>PMR</sub> _error_correct (optional);<br>(see note 1).                                    |
|             |                             | 6  | I <sub>PQ</sub> _error_detect (mandatory for<br>4- and 8-level modulation)<br>(see note 1).     |
|             |                             | 7  | I <sub>PQR</sub> _error_correct (optional)<br>(see note 1).                                     |
|             | < max. lifetime >           | 0 to 7                                       | If only I <sub>P</sub> _error_detect is supported,<br>this value may be ignored<br>(see note 1) |
|             | < slot type >               | 0, 2, 3, 4                                   | Full, double, long 640 and long 672 slots (see note 1).   |
|             | < A-field modulation type > | 3  | Default modulation scheme to use<br>for bearer setup is 2 - level<br>modulation (see note 1).   |
|             | < (B + Z) field mod. type > | 3  | Default modulation scheme to use<br>for bearer setup is 2 - level<br>modulation (see note 1).   |

4-level-modulation.

8-level-modulation.

message.

Higher modulation type: modulation type and adaptive code rate shall be indicated by an attributes

For additional duplex bearer setup procedures (see clauses 10.10.1.4 and 10.10.1.5), the following fields of the CHANNEL\_LIST message as defined in EN 300 175-3 [3], clauses 7.3.2.7 and 10.5.2 shall be understood by the receiving side and taken into account for channel selection as defined by EN 300 175-3 [3], clauses 11.4.2 and 11.4.3.

The code "11"B shall be used in the initial bearer setup, the code "10"B shall be used an the

additional bearer setup. The codes "00"B and "01"B shall not be used (even if the connection

NOTE 1: For command values 0, 1, 2 and 4 only.

includes also asymmetric bearers).

NOTE 2:

| MAC message       | Field within the message | Standard values within the MAC message | Normative action/comment       |
|-------------------|--------------------------|--|--------------------------------|
| << MBn message >> |                          |  |                                |
|                   | < MBnheader >            | X001                                   | "Advanced connection control". |
|                   | < Command >              | 10                                     | "Channel_list".                |
|                   | < RPN >                  | All                                    |                                |
|                   | < Command >              | 001                                    | GOOD.                          |
|                   |                          | 110                                    | LISTEN.                        |
|                   |                          | 111                                    | START.                         |
|                   |                          | 010                                    | POOR.                          |
|                   |                          | 100                                    | QUERY_N.                       |
|                   |                          | 011                                    | F/S NOT.                       |
|                   | S/D                      | 1                                      | Duplex bearer.                 |
|                   | SN                       | 0 to 11                                |                                |
|                   | SP                       | 0                                      | S-field starts at f0.          |
|                   | CN                       | 0 to 9, optionally 10 to 63            |                                |

## 10.10.1.2 PT initiated initial duplex bearer setup (pilot bearer)

This procedure applies to either, the initial setup of a logical connection, or the resume of an existing one.

The procedure may be triggered by the PT itself (PT initiated call or PT initiated resume), or may be executed in response to a MAC resume paging (FT initiated resume process only), or to a LCE paging message (FT initiated call or FT initiated resume).

103

The procedure applies also to Bearer handover and Connection handover (if supported).

#### 10.10.1.2.1 Prerequisites

Before attempting the bearer setup a PT shall check the Fixed part capability FP broadcast and the status of the "RFP-busy-for-data" flag (see clause 10.4.2).

- 1) The PT shall not initiate a DPRS bearer setup towards RFPs that does not support DPRS with the required service (FREL or CHAR) and the required Interworking type.
- 2) The PT shall not initiate a DPRS bearer setup towards RFPs with the RFP status "busy-for-data" activated.

In case 1) and if the situation is an initial call setup, the PT should try to find another RFP with the required services and which is free for data.

In case 1) and if the situation is a resume process, the PT should try to find another RFP with the required services, free for data, and should check that a handover to this RPF is possible according to RFP identity and PT capabilities.

In case 2), the PT could act as in case 1), or wait until a change in RFP-busy-for-data status flag occurs.

The PT can skip the enforcement of the rule defined in this clause if the bearer setup is consequence of a received MAC resume paging.

#### 10.10.1.2.2 Usage of channel list procedures

If the PT initiated bearer setup procedure is consequence of a MAC paging message (indirect FT initiated setup procedure), it is possible to transmit in the paging message information related to which slot (SN) and carrier (CN) should be used in the setup. See clauses 10.4.3.2.1 and 10.4.1.4 for description of the possible commands in the MAC resume and control paging message. The PT shall obey the received command for selection of the slot and carrier used in the setup.

In any other case, the PT shall use the standard bearer selection procedures described in EN 300 175-3 [3], clause 11.4. However, the channel selection lists could be influenced by channel list procedures executed in previous active stages of the connection.

#### 10.10.1.2.3 Detailed procedure description

The setup procedure shall be performed as defined by EN 300 175-3 [3], clause 10.5.1.3.1 with the following provisions and additions.

- 1) The PT can initiate the procedure at any frame irrespective of the state of the A-field multiplexer.
- 2) The PT shall send the B-field message "Bearer Request" with the following provisions:
  - TA header = 111.
  - A-field: M<sub>T</sub> message "B-field setup, first PP transmission".
  - BA header: alternative meaning (slot type).
  - B0 subfield: Bearer request message with the values and options described in clause 10.10.1.1, table 45:
    - Type of Bearer request: the message code could be "ACCESS\_REQUEST", "BEARER\_HANDOVER\_REQUEST" or "CONNECTION\_HANDOVER\_REQUEST".
    - Slot type coded again correctly inside the message.

- ECN (Exchange connection number):
  - If the setup is the resume of an existing connection: ECN = ECN of the existing connection.
  - If the setup is the initial setup of a new logical connection: ECN = new ECN value not used by this FT-PT pair (allocated at this time).
- LBN (Logical Bearer number): new LBN value not used by this FT-PT pair (allocated at this time).
- B0 message may be repeated in other subfields. \_
- NOTE 1: The best-practice for this repetition, if used, is placing the message in subfield B3.
  - Additional MAC control messages may be inserted in subfields B1, B2 or B3.
- NOTE 2: Insertion of messages in B4 and further subfields is possible but their processing by the FT is not guaranteed.
- NOTE 3: An example of additional MAC control message that may be transmitted in this frame is "Bandwidth request".
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this first transmission.
- The FT shall be able to receive and process at least the first four subfields (B0 to B3) of the slot. Reception of 3) subfields B4 and beyond in this first transmission is optional.
  - The processing of commands included in the slot in addition to the Bearer Request is conditional to the success of the setup procedure and can only be done when indicated as "early possible execution" for each operation in clause 10.7.1.2.1.
  - Optionally, a number of WAIT messages may be exchanged between "bearer\_request" and "bearer\_confirm" if required by the implementation.

NOTE 4: The use of WAIT messages should be avoided since it slows down the procedure.

The FT should answer with a B-field Bearer confirm in the other half of the same duplex bearer. The answer 4) can happen at any frame irrespective of the state of the A-field multiplexer. The optimal performance is achieved by responding in the next half frame. The specific provisions for the B-Field Bearer confirm are the following:

- TA header = standard TA according to the normal T-MUX sequence, which is not modified for this response.
- A-field: the normal channel according to T-MUX sequence.
- BA header: regular meaning with code "110" always.
- B0 subfield: Bearer confirm message with the values and options described in table 45:
  - Type of message: the message code shall be "BEARER\_CONFIRM".
  - Slot type coded correctly inside the message.
  - ECN (Exchange connection number):
    - If the setup is the resume of an existing connection: ECN = ECN of the existing connection.
    - If the setup is the initial setup of a new logical connection: ECN = ECN of the new connection (value set by the PT).
  - LBN (Logical Bearer number): the LBN value set by the PT in the Bearer request message.
- B0 message may be repeated in other subfields.

NOTE 5: The best-practice for this repetition, if used, is placing the message in subfield B3.

- Additional MAC control messages could be inserted in ANY subfield. Execution will be conditional to the success of the bearer setup.
- NOTE 6: Examples of additional MAC control messages that may be transmitted in this frame are "Bandwidth request" and channel list commands (LISTEN, GOOD or POOR).
  - It is not allowed to send C<sub>F</sub> or I<sub>PF</sub> channel in this bearer yet.
- 5) The PT sends in the next half frame the confirmatory "other" message that may be any A-field channel with a correctly received A-field CRC. The other message has the following provisions:
  - TA header = standard TA according to the normal T-MUX sequence on PT side.
  - A-field: the normal channel according to T-MUX sequence, which is not modified for this response.
  - BA and B-field. Any valid B-field, including:
    - U-plane data.
    - MAC control only or MAC control and I<sub>PF</sub>.
    - MAC control and C<sub>F</sub> (if C<sub>F</sub> supported).
    - C<sub>F</sub> only (if C<sub>F</sub> supported).
    - Null B field.
- NOTE 7: In other words, the "other" frame is a standard bearer with any valid content. A-field has to be received correctly.
  - "other" frame shall be always transmitted in clear.
- 6) The FT sends in the next half frame the second "other" message with the same provisions as for the previous "other" message.
- 7) If connection is encrypted, encryption starts in the next half frame after the second "other" message.

Figure 8: PT initiated setup of initial duplex bearer

#### 10.10.1.3 FT initiated initial duplex bearer setup (pilot bearer)

NOTE: This procedure is also known as "fast setup".

This procedure shall only be used for the resume of an existing logical connection, and shall be initiated by the FT ME according to the rules described in clause 9.

The FT initiated connection setup is also referred to as fast setup. The only bearer-request message allowed in this case is the access-request.

#### 10.10.1.3.1 Prerequisites

Clause 9 describes the cases when the FT may resume an existing connection.

#### 10.10.1.3.2 Usage of channel list procedures

There are no specific channel list procedures to be performed before a FT initiated initial duplex bearer setup. The FT may use implementation specific algorithms for packet mode slot selection procedures, and shall select the frequency according to the expected PT scan sequence (fast setup scan sequence).

#### 10.10.1.3.3 Detailed procedure description

The setup procedure shall be performed as defined by EN 300 175-3 [3], clause 10.5.1.3.2 with the following provisions and additions.

- 1) The FT can initiate the procedure at any frame irrespective of the state of the A-field multiplexer.
- 2) The FT shall send the B-field message "Bearer Request with the following provisions:
  - TA header = standard TA according to the normal T-MUX sequence on FT side.
  - A-field: the normal channel according to T-MUX sequence on FT side.
  - BA header: alternative meaning (slot type).
  - B0 subfield: Bearer request message with the values and options described in clause 10.10.1.1. table 45:
    - Type of Bearer request: the message code shall be "ACCESS\_REQUEST":
      - "BEARER\_HANDOVER\_REQUEST" or "CONNECTION\_HANDOVER\_REQUEST" are not allowed when initiated by the FT.
    - Slot type coded again correctly inside the message.
    - ECN (Exchange connection number): ECN = ECN of the existing connection (the setup is always the resume of an existing connection).
    - LBN (Logical Bearer number): new LBN value not used by this FT-PT pair (allocated at this time).
  - B0 message may be repeated in other fields.
- NOTE 1: The best-practice for this repetition, if used, is placing the message in subfield B3.
  - Additional MAC control messages could be inserted in subfields B1, B2 or B3.
- NOTE 2: Insertion of messages in B4 and further subfields is possible but their processing by the FT is not guaranteed.
- NOTE 3: Examples of additional MAC control messages that may be transmitted in this frame are "Bandwidth request" and channel list (LISTEN, GOOD or POOR).
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this first transmission.
- 3) The PT when listening for fast setup mode, shall first check the BA bit indicator, that should contain the same type of slot used in the existing DPRS logical connection. PT may ignore the B-field of messages with a different BA code. If the BA header is the expected, then, the PT shall look at subfields B0 and B3 if B0 is corrupted looking for a Bearer Request message addressed to it. It this message if found, the PT shall be able to process the remaining subfields looking for additional MAC control messages:
  - The process of commands included in the slot in addition to the Bearer Request is conditional to the success of the setup procedure and can be done when indicated as "early possible execution" for each operation in clause 10.7.1.2.1.
  - Optionally, a number of WAIT messages may be exchanged between "bearer\_request" and "bearer\_confirm" if required by the implementation.

NOTE 4: The use of WAIT messages should be avoided since it slows down the procedure.

- 4) The PT should answer with a B-field Bearer confirm in the other half of the same duplex bearer. The answer can happen at any frame irrespective of the state of the A-field multiplexer. The optimal performance is achieved by responding in the next half frame. The specific provisions are the following:
  - TA header = standard TA according to the normal T-MUX sequence on PT side, which is not modified for this response.
  - A-field: the normal channel according to T-MUX sequence.
  - BA header: regular meaning with code "110" always.
  - B0 subfield: Bearer confirm message with the values and options described in table 45:
    - Type of message: the message code shall be "BEARER\_CONFIRM".
    - Slot type coded correctly inside the message.
    - ECN (Exchange connection number): ECN = ECN of the existing connection (the setup is always the resume of an existing connection).
    - LBN (Logical Bearer number): the LBN value set by the FT in the Bearer request message.
  - B0 message may be repeated in other fields.
- NOTE 5: The best-practice for this repetition, if used, is placing the message in subfield B3.
  - Additional MAC control messages may be inserted in ANY subfield. Execution will be conditional to the success of the bearer setup.
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this bearer yet.
- 5) The FT sends in the next half frame the confirmatory "other" message that may be any frame with a correctly received A-field (any channel). The "other" message has the following provisions:
  - TA header = standard TA according to the normal T-MUX sequence on FT side.
  - A-field: the normal channel according to T-MUX sequence, which is not modified for this response.
  - BA and B-field. Any valid B-field, including:
    - U-plane data.
    - MAC control only or MAC control and I<sub>PF</sub>.
    - MAC control and C<sub>F</sub> (if C<sub>F</sub> supported).
    - C<sub>F</sub> only (if C<sub>F</sub> supported).
    - Null B field.
- NOTE 6: In other words; the "other" frame is an standard bearer with any valid content. A-field has to be received correctly.
  - "other" frame shall be always transmitted in clear.
- 6) The PT sends in the next half frame the second "other" message with the same provisions as the previous "other message".

7) If connection is encrypted, encryption starts in the next half frame after the second "other" message.

108

#### Figure 9: FT initiated setup of pilot bearer (fast setup)

#### 10.10.1.4 PT initiated additional duplex bearer setup

This procedure applies to the bandwidth expansion of an already established active connection and is executed as part of a bandwidth modification commit.

The procedure also applies to the setup of a new duplex bearer as part of the bearer replacement procedure.

#### 10.10.1.4.1 Use of the procedure and Master side

This procedure is used for the setup of any duplex bearer in an already Active connection, nevertheless the type, number of bearers or direction of the connection.

The procedure is used in the following cases:

- Bandwidth expansion of an already active connection.
- Bearer replacement due to lack of quality of existing duplex bearers.
- NOTE: In the last case, this procedure applies even if the bearer with quality issues is the only one.

The PT is the Master side of the procedure (by definition of a PT initiated procedure).

#### 10.10.1.4.2 Prerequisites

The prerequisites for starting the procedure are the following (any or several of then):

- the transmission or reception of a Bandwidth message sent in direction FT ⇒ PT (it can be either the bandwidth request or confirm) increasing the number of duplex bearers; or
- the number of active duplex bearers is lower than the current Bandwidth by any reason; or
- the PT takes the decision to perform a DPRS handover (bearer handover or bearer replacement procedures) due to quality issues in any existing duplex bearer; or
- the PT receives a request from the FT to perform a handover of any existing duplex bearer by means of the "Bearer and connection control" message (see clause 16.16.4 and EN 300 175-3 [3], clause 7.3.4.2).

#### 10.10.1.4.3 Usage of channel list procedures

The PT initiated additional duplex bearer setup procedure could be used as response to different use cases. Depending on the case, the use of channel list commands before the setup could be optional or even mandatory. In some cases a waiting time prevents the PP to perform the bearer setup if it has not received channel list commands from the FP.

The channel list messages LISTEN, GOOD or POOR send from FT to PT may be used.

#### 10.10.1.4.3.1 Use cases for channel list procedures

The following situations related to the use of the additional duplex bearer setup procedure could happen. Each case will have a different channel list procedure.

| Case a) | duplex setup as part of a bearer handover or replacement procedure consequence of the lost of, or quality problems in the last duplex bearer of the connection. I.e. there are no more duplex bearers with satisfactory quality in the connection. |
|---------|--|
| Case b) | duplex setup as part of a bearer handover or replacement procedure, however there are other duplex bearers with satisfactory quality in the connection.  |
| Case c) | duplex setup as part of a bearer handover or replacement procedure requested by the FT by means of the "Bearer and connection control" message.  |
| Case d) | duplex setup as result of a Bandwidth expansion, if the connection is asymmetric downlink.   |
| Case e) | duplex setup as result of a Bandwidth expansion, in any other case (connection symmetric or asymmetric uplink).  |

The setup of duplex bearers to re-establish the target number of bearers defined in the current bandwidth if there has not been any bandwidth change (i.e. some bearers have been lost) is considered a sub-case of case b) (or case a) if the last bearer has been lost).

#### 10.10.1.4.3.2 Channel list procedures for the different cases

#### Case a)

The use of channel list procedures is optional. PT shall start the setup procedure immediately and shall not wait for channel list commands. However, even in this case, there exist the possibility to use channel list procedures.

 If the PT have received LISTEN command(s) (for duplex bearers) during the last 3 frames, and the slot/channels indicated in the command(s) have not been consumed by other setups, then the PT shall use these slot/channels as first choices for the setup attempt.

However, if these slot/channels cannot be used due to blind slot limitations or other reasons, the PT shall skip this rule and shall act as 2).

- NOTE 1: Be aware that in this case (rule 1), the setup could be performed out of the scan sequence.
- NOTE 2: The FT could have send the LISTEN commands by several reasons. For instance the FT could have also detected the quality issues that caused the replacement. Anyway, the transmission of channel list commands by the FT is optional.
- NOTE 3: The reason of the value of 3 frames is that the issuer of the LISTEN command keeps active its receiver on the indicated slot/channel during 4 frames (see EN 300 175-3 [3], clause 10.5.2.1). After this time, it is not guaranteed that the Rx will recognize the setup attempts.
- 2) In any other case, the PT shall perform the setup on the scan sequence. The chosen slot/frequency could be influenced by other channel list messages (GOOD, POOR) sent previously by the FT.

#### Case b)

The procedure shall be as **case a**) with the only difference that in absence of valid LISTEN command the PT could choose either to perform the setup on the scan sequence (sub-procedure 2) of case a), or to request channel list commands to the FT by means of the channel list command QUERY\_N.

#### Case c)

In **case c**), the FT should preferably transmit the channel list command LISTEN (the one or several) in the same slot that is carrying (in other subfields) the command "Bearer and connection control". The PT shall use the slot/channel indicated in these LISTEN commands as first choices for channel selection. Otherwise, the PT shall act as case b).

#### Case d)

In **case d**), the FT shall mandatorely perform the channel selection and transmit the channel list command LISTEN, either in the same slot carrying the "Bandwidth" command or in the following TDMA frames. The FT shall transmit enough LISTEN commands for, at least, the number of bearers that has to be setup to fulfil the Bandwidth expansion.

110

During the 10 (TEN) TDMA frames following the reception of the "Bandwidth" command, the PT shall only perform the bearer setups if it has received LISTEN commands and over the slot/channel indicated by them.

After this timer, the PT is allowed to perform setups on the scan sequence without having received LISTEN commands.

If the PT does not receive LISTEN commands, it can request them to the FT by means of the QUERY\_N command. The PT could also include suggestions for channel selection by means of the commands GOOD or POOR.

If the PT receives the channel list command QUERY\_N from the FT, it shall answer with a proposal of channel selection based on the PT view coded by means of command(s) GOOD. The PT could also add commands POOR.

The channel selection performed by the FT and transmitted by the command(s) LISTEN will be based on the following:

- 1) If the FT has available slot/channels that are known to work properly in this PT-FT connection, it will send directly this channel selection(s) in one or several LISTEN commands.
- NOTE 4: This happens, for instance, in case of resumes or bandwidth expansion, if the FT reuses slot/channels already used by the connection.
- 2) If the FT is not sure about the channel selection, it can request information to the PT by means of the command QUERY\_N. The PT shall answer with a proposal of channel selection from its side (coded by means of commands GOOD). The FT shall use this information, and its own status and channel view to decide the selection that will be send by means of the channel list command(s) LISTEN.

In all cases the FT shall take into account the limitations of the PT regarding blind slots (known from the IE Terminal Capability).

NOTE 5: The waiting time of 10 frames is designed to avoid collisions with potential setups of double simplex bearers initiated from the FT side.

#### Case e)

Procedure shall be as in case d).

The following notes applies to all cases.

- NOTE 6: In case of multiple additional duplex bearers, several channels may be indicated by one or several LISTEN commands.
- NOTE 7: It is allowed to send surplus LISTEN commands (more channels indicated in LISTEN messages than bearers needed to fulfil the bandwidth). In this case, the PT may choose between the commands. The remaining slot/channels may be used in subsequent setups in case of setup failures, or in case of bearer replacements. The PT should take into account that the FT keeps its receiver active over the channels indicated in the LISTEN during four frames (see EN 300 175-3 [3], clause 10.5.2.1).
- NOTE 8: In case of connections with both additional duplex bearers and double simplex bearers, it is possible to understand from the S/D bit in the channel list command if it refers to a duplex or a double simplex bearer.

#### 10.10.1.4.4 Detailed procedure description

The setup procedure shall be performed as defined by EN 300 175-3 [3], clause 10.5.1.3.1 with the following provisions and additions.

1) The PT can initiate the procedure at any frame irrespective of the state of the A-field multiplexer. In the cases d and e) of channel selection (clause 10.10.1.4.3), the PT shall have received LISTEN commands, or shall wait for the expiration of the waiting time of 10 (TEN) frames.

- 2) The PT shall send the B-field message "Bearer Request" with the following provisions:
  - TA header: the PT shall use the following TA codes:
    - TA code 110: this code shall be used if the setup is *expected* by the FT. The setup is *expected* by the FT if there has been the transmission of the channel list command LISTEN sent by the FT before the setup. In this case, the PT shall perform the setup in a carrier/slot indicated in the LISTEN commands.

111

- TA code 111: this code shall be used if the setup is *unexpected* by the FT. The setup is *unexpected* by the FT if there has not been transmission of LISTEN channel list command. In this case, the PT is attempting a bearer setup on the FT primary scan sequence, exactly as the case of initial bearer setup.
- NOTE 1: The fundamental difference between both cases is that in the *expected* setup, the FT should have active a temporary receiving=only TBC on the slot/carriers indicated by the channel list commands. Only in this case, the PT may perform an *expected* setup with TA=110.
- NOTE 2: In the case of *expected* setup, the LISTEN command should have been sent before the setup, according to the timing described in EN 300 175-3 [3], clause 10.5.5.2.
  - A-field: M<sub>T</sub> message "B-field setup, first PP transmission".
  - BA header: alternative meaning (slot type).
  - B0 subfield: Bearer request message with the values and options described in clause 10.10.1.1, table 45:
    - Type of Bearer request: the message code shall be "ACCESS\_REQUEST".
    - Slot type coded again correctly inside the message.
    - ECN (Exchange connection number): ECN = ECN of the existing connection.
    - LBN (Logical Bearer number): new LBN value not used by this FT-PT pair (allocated at this time).
  - B0 message may be repeated in other subfields.
- NOTE 3: The best-practice for this repetition, if used, is placing the message in subfield B3.
  - Additional MAC control messages could be inserted in subfields B1, B2 or B3.
- NOTE 4: Insertion of messages in B4 subfield and beyond is possible but its processing by the FT is not guaranteed.
- NOTE 5: It is not expected that additional MAC control messages are inserted in this slot.
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this first transmission.
- 3) The FT shall be able to receive and process at least the first four subfields (B0 to B3) of the slot. Reception of subfields above B3 in this first transmission is optional.
  - The process of commands included in the slot in addition to the Bearer Request is conditional to the success of the setup procedure and can only be done when indicated as "early possible execution" for each operation in clause 10.7.1.2.1.
  - Optionally, a number of WAIT messages may be exchanged between "bearer\_request" and "bearer\_confirm" if required by the implementation.

NOTE 6: The use of WAIT messages should be avoided since it slows down the procedure.

4) The FT should answer with B-field "Bearer confirm" in the other half of the same duplex bearer. The answer can happen at any frame irrespective of the state of the A-field multiplexer. The optimal performance is achieved by responding in the next half frame. The specific provisions are the following:

112

- TA header = standard TA according to the normal T-MUX sequence, which is not modified for this response.
- A-field: the normal channel according to T-MUX sequence.
- BA header: regular meaning with code"110" always.
- B0 subfield: Bearer confirm message with the values and options described in table 45:
  - Type of message: the message code shall be "BEARER\_CONFIRM".
  - Slot type coded correctly inside the message.
  - ECN (Exchange connection number): ECN = ECN of the existing connection.
  - LBN (Logical Bearer number): the LBN value set by the PT in the Bearer request message.
- B0 message may be repeated in other fields.
- NOTE 7: The best-practice for this repetition, if used, is placing the message in subfield B3.
  - Additional MAC control messages could be inserted in ANY subfield. Execution will be conditional to the success of the bearer setup.
- NOTE 8: An example of additional MAC control messages that may be transmitted in this slot is "Bearer and connection control".
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this bearer yet.
- 5) The PT sends in the next half frame the confirmatory "other" message that could be any frame with a correctly received A-field (any channel). The other message has the following provisions:
  - TA header = standard TA according to the normal PT T-MUX sequence.
  - A-field: the normal channel according to T-MUX sequence, which is not modified for this response.
  - BA and B-field. Any valid B-field, including:
    - U-plane data.
    - MAC control only or MAC control and I<sub>PF</sub>.
    - MAC control and C<sub>F</sub> (if C<sub>F</sub> supported).
    - C<sub>F</sub> only (if C<sub>F</sub> supported).
    - Null B field.
- NOTE 9: In other words; the "other" frame is a standard bearer with any valid content. A-field has to be received correctly.
  - "other" frame shall be always transmitted in clear.
- 6) The FT sends in the next half frame the second "other" message with the same provisions as the previous "other" message.
- 7) If connection is encrypted, encryption starts in the next half frame after the second "other" message.

113

#### Figure 10: PT initiated setup of additional duplex bearer

#### 10.10.1.5 FT initiated additional duplex bearer setup

This procedure is never used in DPRS.

## 10.10.2 Double simplex bearer setup

Double simplex bearer setup procedures are needed if asymmetric connections are supported. The following double simpler bearer setup procedures are possible:

- Upstream double simplex bearer setup (clause 10.10.2.2).
- Downstream double simplex bearer setup (clause 10.10.2.3).

DPRS uses the direct double simplex bearer setup method as described in EN 300 175-3 [3], clause 10.5.1.4. The use of channel list procedures is mandatory.

#### 10.10.2.1 MAC control messages

This clause applies to all double simplex bearer setup procedures.

The following fields as defined in EN 300 175-3 [3], clause 7.3.2 of the BEARER\_REQUEST and BEARER\_CONFIRM and WAIT messages shall be supported by the PT and the FT.

| MAC message       | Field within the message    | Standard values<br>within the MAC<br>message | Normative action/comment   |
|-------------------|-----------------------------|--|--|
| << MBn message >> |                             |  |  |
|                   | < MBn header >              | X001   | "Advanced connection control".   |
|                   | < Command >                 | 0  | "Access_request".  |
|                   |                             | 1  | "Bearer handover request"<br>(optional).   |
|                   |                             | 2  | "Connection_handover_request"<br>(optional).   |
|                   |                             | 3  | Unconfirmed access request (see note 3).   |
|                   |                             | 4  | "Bearer_confirm".  |
|                   |                             | 5  | "Wait".  |
|                   |                             | 12   | Unconfirmed handover (see note 3).   |
|                   | < FMID >                    | All  |  |
|                   | < PMID >                    | All  |  |
|                   | < ECN >                     | All  | See note 1.  |
|                   | < LBN >                     | 1 to 15                                      | The value 15 shall not be used (see note 1).   |
|                   | < up/down/ss/sm >           | "00"B and "01"B                              | Asymmetric uplink and asymmetric<br>downlink connections<br>(see notes 1 and 2).                                     |
|                   | < service type >            | 2  | I <sub>PM</sub> _error_detect (see note 1).  |
|                   |                             | 3  | I <sub>PMR</sub> _error_correct (optional)   |
|                   |                             | 6  | (see note 1).<br>I <sub>PQ</sub> _error_detect (mandatory for  |
|                   |                             |  | 4- and 8-level modulation) (see note 1).   |
|                   |                             | 7  | I <sub>PQR</sub> _error_correct (optional)<br>(see note 1).  |
|                   | < max. lifetime >           | 0 to 7                                       | If only I <sub>P</sub> _error_detect is supported<br>this value may be ignored<br>(see note 1)                       |
|                   | < slot type >               | 0, 2, 3, 4                                   | Full, double, long 640 and long 672 slots (see note 1).  |
|                   | < A-field modulation type > | 3  | Default modulation scheme to use<br>for bearer setup is 2 - level<br>modulation (see note 1).                        |
|                   | < (B + Z) field mod. type > | 3  | Default modulation scheme to use<br>for bearer setup is 2 - level<br>modulation (see note 1).                        |
|                   |                             | 2  | 4-level-modulation.  |
|                   |                             | 1  | 8-level-modulation.  |
|                   |                             | 0  | Higher modulation type: modulation<br>type and adaptive code rate shall<br>be indicated by an attributes<br>message. |

# Table 47: Values used within Advanced Connection Control messages within double simplex bearer setup

NOTE 2: The code "00"B shall be used for upstream double simplex bearers setup. The code "01"B shall be used for downstream double simplex bearers setup. The codes "10"B and "11"B shall not be used.
 NOTE 3: Only for double simplex bearer setup procedures.

For double simplex bearer setup procedures, the following fields of the CHANNEL\_LIST message as defined in EN 300 175-3 [3], clauses 7.3.2.7 and 10.5.2 shall be understood by the receiving side and taken into account for channel selection as defined by EN 300 175-3 [3], clauses 11.4.2 and 11.4.3.

Table 48: Values used within the MB CHANNEL\_LIST message in double simplex bearer setup

| MAC message       | Field within the message | Standard values within the MAC message | Normative action/comment       |
|-------------------|--------------------------|--|--------------------------------|
| << MBn message >> |                          |  |                                |
|                   | < MBnheader >            | X001                                   | "Advanced connection control". |
|                   | < Command >              | 1010                                   | "Channel_list".                |
|                   | < RPN >                  | All                                    |                                |
|                   | < Command >              | 000                                    | ACTIVE.                        |
|                   |                          | 001                                    | GOOD.                          |
|                   |                          | 110                                    | LISTEN.                        |
|                   |                          | 111                                    | START.                         |
|                   |                          | 010                                    | POOR.                          |
|                   |                          | 100                                    | QUERY_N.                       |
|                   |                          | 011                                    | F/S NOT.                       |
|                   | S/D                      | 0                                      | Double simplex bearers.        |
|                   | SN                       | 0 to 11                                |                                |
|                   | SP                       | 0                                      | S-field starts at f0.          |
|                   | CN                       | 0 to 9, optionally 10 to 63            |                                |

#### 10.10.2.2 Upstream double simplex bearer setup

This procedure applies to the bandwidth expansion of an already established active connection and is executed as part of a bandwidth modification commit.

#### 10.10.2.2.1 Use of the procedure and T-side

This procedure shall be only used when the connection to be setup is asymmetric uplink. Parameters TUp and TDown of the bandwith message  $FT \Rightarrow PT$  (request or confirm) shall be used to determine the targeted connection direction.

The PT is the T-side and Master side for the bearer setup procedure.

NOTE: Master side for bearer setup procedures is defined as the peer that sends the "Bearer request" message.

However, the FT (R-side) shall be the master side for channel selection.

#### 10.10.2.2.2 Prerequisites

The prerequisite for starting the procedure is the transmission or reception of the Bandwidth message sent in direction  $FT \Rightarrow PT$  (it can be either the Bandwidth request or confirm).

The bandwidth indicated in the  $FT \Rightarrow PT$  message shall be asymmetric uplink.

#### 10.10.2.2.3 Channel selection and usage of channel list procedures

The use of channel list commands in this procedure is mandatory.

The channel list commands LISTEN and ACTIVE are mandatory and are used in all cases. Other commands may be used in some cases.

The sequence and use of the channel list messages is described in the procedure description.

The channel selection shall be done by the FT (R-side). The FT shall select the slots and carriers before initiating the procedure, and shall send them to the PT by means of one or several LISTEN commands. The PT shall obey the commands and perform the setups in the indicated slot and carrier.

The channel selection done by the FT shall fulfil the rules described in EN 300 175-3 [3], clause 10.5.1.4.4. The PT may send to the FT channel information by means of the commands GOOD and POOR. Depending on the case, the FT may use this information or not (see EN 300 175-3 [3], clause 10.5.1.4.4). The FT may use implementation specific algorithms in order to improve this channel selection.

In all cases the FT shall take into account the limitations of the PT regarding blind slots (known from the IE Terminal Capability).

- NOTE 1: In resume or bandwidth expansion cases, it is advisable to select slots/carriers already used by this PT-FT transmission in the same or previous active stages.
- NOTE 2: The PT has tendency to see as dirty and report as POOR any channel used by the FT in the last times, even if the channel has been liberated at the time of the setup. This phenomenon has to be taken into account by the FT in the channel selection.

The FT could ask channel information to the PT by means of the QUERY\_N command. If queried, the PP shall reply with channel list information (command GOOD and optionally POOR).

#### 10.10.2.2.4 Detailed procedure description

The procedure shall be performed as described in EN 300 175-3 [3], clause 10.5.1.4, with the following options:

- Direct double simplex bearer setup procedure.
- Start at LISTEN.
- Encryption synchronization by Bearer setup/ACTIVE transition.

The sequence of operations shall be the following:

- 1) The FT initiates the procedure by sending the channel list command LISTEN in any existing duplex bearer:
  - By doing that, the FT is activating a receiver in the slots indicated by the command.
  - Before that, the FT has selected the slots and carriers for the bearers as described in clause 10.10.2.2.3.
  - The earliest point to start the procedure by sending the LISTEN command is the same slot that carries the  $FT \Rightarrow PT$  command of the Bandwidth negotiation.
- 2) The PT sends the B-field "Bearer request" message on both slots of the selected double simplex bearers:
  - This can be done immediately upon receiving the LISTEN command and can start by the lower slot (0 to 11) or the higher slot (12 to 23) of the double simplex bearer.

The following provisions are done for the bearer Request message:

- TA header =  $M_T$  code 110.
- NOTE 1: In the case of double simplex bearers, there can not be *unexpected* setup, as for the additional duplex bearers (see clause 10.10.1.4.4). Usage of channel list commands is mandatory.
  - A-field: M<sub>T</sub> message "B-field setup, first PP transmission".
  - BA header: alternative meaning (slot type).
  - B0: field: Bearer request message with the values and options described in clause 10.10.2.1, table 47:
    - Type of Bearer request: the message code shall be "UNCONFIRMED\_ACCESS\_REQUEST".
    - Slot type coded again correctly inside the message.
    - ECN (Exchange connection number): ECN = ECN of the existing connection.
    - LBN (Logical Bearer number): new LBN value not used by this FT-PT pair (allocated at this time).
  - B0 message, could be repeated in other fields.

- The channel list command START could be optionally inserted in subfields B1, B2 or B3.
- NOTE 3: However, this is not necessary, since DPRS uses ACTIVE for encryption synchronization. Note that in previous versions of the present document, the START message was mandatory for this purpose and that there are many parts in the CI standard referring to this fact.
  - It is not allowed to send  $C_F$  or  $I_{PF}$  channel in this transmission.
- 3) The FT shall be able to receive and process at least the four first subfields (B0 to B3) of the slot. Reception of subfields above B3 in this first transmission is optional.
- 4) The PT shall repeat the Bearer Request message on both slots of the bearers for a maximum of two additional frames until the reception of the ACTIVE command as described in next step:
  - The maximum number of "Bearer request" messages that the T-side shall send in the worst case (no ACTIVE received) is six messages = three frames.
- 5) The FT upon reception of the "Bearer request" messages on both slots of the bearer shall send on any existing duplex bearer the B-field command ACTIVE, and shall connect the bearer to the MBC associated to the connection (indicated by the ECN):
  - Several ACTIVE commands can be transmitted in one slot on the duplex bearer.
  - The earliest possible point for sending the ACTIVE message is one frame after the LISTEN command.
- 6) The U-plane transmission by the PT may start immediately. The first frame after the ACTIVE message shall be transmitted in clear:
  - It is optional to use it, or to left it blank with an "empty B field" BA code, depending on the security requirements of the application.
- 7) Encryption starts ONE frame after the ACTIVE message.
- 8) If the FT has not send the ACTIVE command or the PT has not received it for an specific double simplex bearer, the PT shall continue sending "Bearer request" for two additional frames (maximum three frames, six messages in total).
- 9) If the FT has send the ACTIVE message, but receives again a Bearer request, it shall send again the ACTIVE command and shall reset the encryption synchronization.

Figure 11: Successful upstream direct double simplex bearer setup

#### 10.10.2.3 Downstream double simplex bearer setup

This procedure applies to the bandwidth expansion of an already established active connection and is executed as part of a bandwidth modification commit.

#### 10.10.2.3.1 Use of the procedure and T-side

This procedure shall be only used when the connection to be setup is asymmetric downlink. Parameters TUp and TDown of the bandwith message  $FT \Rightarrow PT$  (request or confirm) shall be used to determine the targeted connection direction.

The FT is the T-side and Master side for both bearer setup procedure and channel selection.

NOTE: Master side for bearer setup procedures is defined as the peer that sends the "Bearer request" message.

#### 10.10.2.3.2 Prerequisites

The prerequisite for starting the procedure is the transmission or reception of the Bandwidth message sent in direction  $FT \Rightarrow PT$  (it can be either the bandwidth request or confirm).

The bandwidth indicated in the  $FT \Rightarrow PT$  message shall be asymmetric downlink.

#### 10.10.2.3.3 Channel selection and usage of channel list procedures

The use of channel list commands in this procedure is mandatory.

The channel list commands START and ACTIVE are mandatory and are used in all cases. Other commands may be used in some cases.

The sequence and use of the channel list messages is described in the procedure description.

The channel selection shall be done by the FT (T-side). The FT shall select the slots and carriers before initiating the setup procedure, and shall send them to the PT by means of one or several START commands. The PT shall obey the commands and listen for setup in the indicated slot and carrier.

The channel selection done by the FT shall fulfil the rules described in EN 300 175-3 [3], clause 10.5.1.4.4. The PT may send to the FT channel information by means of the commands GOOD and POOR. Depending on the case, the FT may use this information or not (see EN 300 175-3 [3], clause 10.5.1.4.4).

NOTE 1: It is advisable to select slots/carriers already used by this PT-FT transmission in the same or previous active stages.

The FT may use implementation specific algorithms to improve the channel selection procedures.

In all cases the FT shall take into account the limitations of the PT regarding blind slots (known from the IE Terminal Capability).

NOTE 2: The PT has tendency to see as dirty and report as POOR any channel used by the FT in the last times, even if the channel has been liberated at the time of the setup. This phenomenon has to be taken into account by the FT in the channel selection.

The FT could ask channel information to the PT by means of the QUERY\_N command. If queried, the PP shall reply with channel list information (command GOOD and optionally POOR).

#### 10.10.2.3.4 Detailed procedure description

The procedure shall be performed as described in EN 300 175-3 [3], clause 10.5.1.4, with the following options:

- Direct double simplex bearer setup procedure.
- Start at START.
- Encryption synchronization by Bearer setup/ACTIVE transition.

The sequence of operations is the following:

- 1) The FT initiates the procedure by sending the channel list command START in any existing duplex bearer.
  - Before that, the FT has selected the slots and channels for the bearers as described in clause 10.10.2.3.3.
  - The earliest point to start the procedure by sending the START command is the same slot that carries the  $FT \Rightarrow PT$  command of the Bandwidth negotiation.
- 2) The PT activates a receiver at the slots indicated by the START command.
- 3) The FT sends the B-field "Bearer request" message on both slots of the selected double simplex bearers:
  - This can be done immediately (in the next slot) upon transmission of the START command and can start by the lower slot (0 to 11) or the higher slot (12 to 23) of the double simplex bearer.

The following provisions are done for the bearer Request message:

- TA header = standard TA according to the normal FT T-MUX sequence.
- A-field: the normal channel according to FT T-MUX sequence.
- BA header: alternative meaning (slot type).
- B0: field: Bearer request message with the values and options described in clause 10.10.2.1, table 47:
  - Type of Bearer request: the message code shall be "UNCONFIRMED\_ACCESS\_REQUEST".
  - Slot type coded again correctly inside the message.
  - ECN (Exchange connection number): ECN = ECN of the existing connection (the setup is always a bandwidth expansion of an existing connection).
  - LBN (Logical Bearer number): new LBN value not used by this FT-PT pair (allocated at this time).
- B0 message, could be repeated in other fields.
- NOTE 1: The best-practice for this repletion, if used, is placing the message in subfield B3.
  - Additional MAC control messages could be inserted in subfields B1, B2 or B3.
- NOTE 2: Insertion of messages in B4 and further subfields is possible but its processing by the PT is not guaranteed.
- NOTE 3: It is not expected the insertion of additional MAC control messages in this slot.
  - It is not allowed to send C<sub>F</sub> or I<sub>PF</sub> channel in this transmission.
- 4) The PT shall be able to receive and process at least the four first subfields (B0 to B3) of the slot. Reception of subfields above B3 in this first transmission is optional.
- 5) The PT shall repeat the Bearer Request message on both slots of the bearers for a maximum of two additional frames until the reception of the ACTIVE command as described in next step:
  - The maximum number of "Bearer request" messages that the T-side shall send in the worst case (no ACTIVE received) is six messages = three frames.
- 6) The PT, upon reception of the "Bearer request" messages, shall send on any existing duplex bearer the B-field command ACTIVE, and shall connect the bearer to the MBC associated to the connection (indicated by the ECN).
  - Several ACTIVE commands can be transmitted in the slot on the duplex bearer.
  - The earliest possible point for sending the ACTIVE message, in the usual case of having only one duplex bearer, is one frame and a half after the START command.

- 7) The U-plane transmission by the FT may start immediately. The first frame after the ACTIVE message shall be transmitted in clear:
  - It is optional to use it, or to left it blank with an empty B field BA code, depending on the security requirements of the application.
- 8) Encryption starts ONE frame after the ACTIVE message.
- 9) If the PT has not send the ACTIVE command for an specific double simplex bearer, the FT shall continue sending "Bearer request" for two additional frames (maximum three frames, six messages in total).
- 10) If the PT has send the ACTIVE message, but receives again a Bearer request, it shall send again the ACTIVE and shall reset the encryption synchronization.

Figure 12: Successful downstream direct double simplex bearer setup

# 10.11 Bearer Release procedures

The following fields of the RELEASE message as defined in EN 300 175-3 [3], clause 7.3.2.10 shall be supported by the PT and the FT.

| MAC message         | Field within the message  | Standard values within the MAC message | Normative action/comment                 |  |  |
|---------------------|---|--|--|--|--|
| << MBn message >>   |   |  |  |  |  |
|                     | < MBn header >  | X001                                   | "Advanced connection control".           |  |  |
|                     | < Command >   | 15                                     | "Release".                               |  |  |
|                     | < FMID >  | All                                    |  |  |  |
|                     | < PMID >  | All                                    |  |  |  |
|                     | < LBN >   | All                                    |  |  |  |
|                     | < reason >  | 1                                      | Bearer release.                          |  |  |
|                     |   | 2                                      | Connection release (see note 1).         |  |  |
|                     |   | 3                                      | Bearer setup or HO failed (see note 2).  |  |  |
|                     |   | 4                                      | BHO successfully completed (see note 2). |  |  |
|                     |   | 11                                     | Reversal.                                |  |  |
|                     |   | 15                                     | Stay on listen for fast setup mode       |  |  |
|                     |   |  | (see note 3).                            |  |  |
|                     | <info 1=""></info>  | all                                    | See note 3.                              |  |  |
|                     | <info 2=""></info>  | all                                    | See note 3.                              |  |  |
| NOTE 1: The connect | OTE 1: The connection release reason shall only be used during logical connection release.            |  |  |  |  |
| NOTE 2: Only used   | 2: Only used when double simplex bearer handover is supported.  |  |  |  |  |
| NOTE 3: Only used i | Only used in FT $\Rightarrow$ PT side when fast setup (DPRS-M.17) is supported by both sides. PTs not |  |  |  |  |
| supporting          | supporting fast setup (DPRS-M.17) may ignore the code.  |  |  |  |  |

#### Table 49: Values used within MBn RELEASE message

#### 10.11.1 Unacknowledged release

To release a duplex or a double simplex bearer with the unacknowledged release procedure, the transmitting side sends a RELEASE message with reason "bearer release" or "connection release" in two consecutive frames, and then immediately seizes all transmission on this bearer. This is defined in EN 300 175-3 [3], clause 10.7.2.1.

Figure 13: Unacknowledged release

## 10.11.2 Crossed release (duplex bearers only)

The cross release is a variation of the unacknowledged release procedure, applicable only to duplex bearers. It is equivalent to initiate the unacknowledged release procedure from both ways, and stop the procedure after the first reception of RELEASE from the other way. The procedure automatically falls down to regular unacknowledged release if the message from the other peer is not received.

The procedure shall be performed as described in EN 300 175-3 [3], clause 10.7.2.1.2.

Cross release speeds up the release procedure by half frame.

NOTE: The Crossed release is a potential case of the unacknowledged bearer release that happens when both peers try to initiate the procedure at the same time.

122

Figure 14: Crossed release

#### 10.11.3 Acknowledged release

To release a double simplex bearer with the acknowledged release procedure, the receiving side sends a RELEASE message with reason "bearer release" via any bearer in the reverse direction. This is defined in EN 300 175-3 [3], clause 10.7.2.2.

Figure 15: Acknowledged release

NOTE: The acknowledged release is rarely used in DPRS normal operation, however it may be used in error cases. It is used, for instance, by the receiver side in case of incorrect reception of the bearers. See clause 10.16.5.

## 10.11.4 Fast release

The fast release is the preferred procedure for reversing the direction of double simplex bearers.

To reverse the transmission direction on a double simplex bearer with the fast release procedure, the transmitting side sends a RELEASE message with the reason field set to "reversal" on both simplex bearers, and starts scanning on both released simplex bearers for the next 4 frames. The receiver of the RELEASE message may use the released bearer to setup a double simplex bearer into the other direction, using the double simplex bearer setup procedures, case "Initiated by FAST RELEASE", as defined in EN 300 175-3 [3], clause 10.7.2.3, and with the specific provisions described in clauses 10.10.2.1 (MAC control messages), 10.10.2.2 (upstream setup) and 10.10.2.3 (downstream setup), with the following differences:

- For double simplex bearer reversal from downstream to upstream, the setup procedure (upstream) shall be performed as described in clause 10.10.2.2.4 starting at step 2) after reception of the "Bearer Release/Reverse" message instead of LISTEN. Optional START message inserted in the same bearer as "Bearer request" shall not be used.
- For double simplex bearer reversal from upstream to downstream, the setup procedure (downstream) shall be performed as described in clause 10.10.2.3.4 starting at step 3) after reception of the "Bearer Release/Reverse" message instead of after transmission of START.

The transmission of the RELEASE message with reason field set to "reversal" is equivalent to the transmission of the channel list message LISTEN used in the double simplex bearer setup procedure. In this case, there are not differences regarding the channel selection rules between both directions.

NOTE 1: The reason for this behavior is that the fact that the slot/carrier is in use in one way, makes reasonable to try it in the other way.

In the case of multiple double simplex bearers, the procedure shall be executed for all of them.

NOTE 2: It is not allowed to have double simplex bearers in both ways.

123

# 10.11.5 Definition of the procedure to use and the Master side for the different release cases

Definition: the master side is the side in charge of sending the RELEASE command.

#### 10.11.5.1 Suspend cases

Parameters TUp and TDown of the bandwith message  $FT \Rightarrow PT$  (request or confirm) shall be used to determine the *targeted* connection type. Suspension occurs if TUp = TDown = 0 in this message.

#### 10.11.5.1.1 FT initiated suspend

If the *current* connection type is asymmetric downlink or symmetric:

- The FT shall be the master.
- PT may optionally send also RELEASE over duplex bearers (it will cause a crossed release).

If the *current* connection type is asymmetric uplink:

- The PT shall be the master.
- FT may optionally send also RELEASE over duplex bearers (it will cause a crossed release).

#### 10.11.5.1.2 PT initiated suspend

If the *current* connection type is asymmetric uplink or symmetric:

- The PT shall be the master.
- FT may optionally send also RELEASE over duplex bearers (it will cause a crossed release).

If the *current* connection type is asymmetric downlink:

- The FT shall be the master.
- PT may optionally send also RELEASE over duplex bearers (it will cause a crossed release).

#### 10.11.5.2 Bandwidth modification cases

Parameters TUp and TDown of the bandwith message  $FT \Rightarrow PT$  (request or confirm) shall be used to determine the targeted connection type.

#### 10.11.5.2.1 Reversal of asymmetric connection: from asymmetric downlink to uplink

- The FT shall be the master for double simplex (either to reverse or to release them) and for duplex (releasing).
- Crossed release shall not be used.

NOTE: Release of duplex happens only if there are several duplex bearers and the bandwidth change involves reduction of them. At least one duplex bearer should remain.

124

#### 10.11.5.2.2 Reversal of asymmetric connection: from asymmetric uplink to downlink

- The PT shall be the master for double simplex (either to reverse or to release them) and for duplex (releasing).
- Crossed release shall not be used.
- NOTE: Release of duplex happens only if there are several duplex bearers and the bandwidth change involves reduction of them. At least one duplex bearer should remain.

#### 10.11.5.2.3 Modification from asymmetric downlink to symmetric

- The FT shall be the master for double simplex (either to reverse or to release them) and for duplex (releasing).
- Crossed release shall not be used.

NOTE: Release of duplex happens only if there are several duplex bearers and the bandwidth change involves reduction of them. At least one duplex bearer should remain.

#### 10.11.5.2.4 Modification from asymmetric uplink to symmetric

- The PT shall be the master for double simplex (either to reverse or to release them) and for duplex (releasing).
- Crossed release shall not be used.
- NOTE: Release of duplex happens only if there are several duplex bearers and the bandwidth change involves reduction of them. At least one duplex bearer should remain.

# 10.11.5.2.5 Modification from symmetric to asymmetric downlink (with release of duplex bearers)

- The FT shall be the master for duplex bearers releasing.
- Crossed release shall not be used.

# 10.11.5.2.6 Modification from symmetric to asymmetric uplink (with release of duplex bearers)

- The PT shall be the master for duplex bearers releasing.
- Crossed release shall not be used.

## 10.11.6 Listen for setup control codes in Release message

If the PT supports fast setup (any fast setup mode), the reason code "stay in listen for setup mode" and the associated info 1 and info 2 codes may be transmitted in the RELEASE message and shall be recognized by the PT. See clause 10.1.10.2 for the state transitions the PT supporting fast setup.

The transmission of the "stay in listen for setup mode" code and associated info 1 and info 2 fields is only allowed in duplex bearers, and may be used in the unacknowledged release (clause 10.11.1) or in the crossed release (clause 10.11.2).

# 10.12 Advanced connection handover

The procedure shall be performed as defined in clause 10.5. This procedure will be used only for intercell connection handover, anyhow the procedure is equivalent for intra- and inter-cell handover.

For connection handover in the case of resumption: see clause 10.7.

Before starting the CHO the bandwidth of the old connection may be reduced to the minimum to allow a higher amount of selectable bearers for the new connection.

125

# 10.13 I channel operation

The connection oriented logical I channel data use one of the following service types defined by EN 300 175-3 [3], clauses 5.6.2.1 and 5.6.2.2:

- I<sub>PM</sub>\_error\_detect;
- I<sub>PM</sub>\_error\_correct;
- I<sub>PO</sub>\_error\_detect;
- I<sub>PO</sub>\_error\_correct.
- I<sub>PX</sub>\_encoded\_protected;
- I<sub>PF</sub>\_channel.

In relation to the modulation schemes supported, the following  $I_P$  services shall be supported.

#### Table 50: I<sub>P</sub> services to support

| Modulation scheme   | I <sub>PM</sub> _error_detect | I <sub>PQ</sub> _error_detect | I <sub>PM</sub> _error_correct | I <sub>PQ</sub> _error_correct |
|---|-------------------------------|-------------------------------|--------------------------------|--------------------------------|
| 1a/1b   | М                             | 0                             | 0                              | 0                              |
| 2   | 0                             | М                             | 0                              | 0                              |
| 3   | 0                             | М                             | 0                              | 0                              |
| NOTE: Modulation schemes 2 and 3 are optional to support. |                               |                               |                                |                                |

## 10.13.1 Protected I channel error\_detect mode

The FT and PT shall support protected I channel operation in error\_detect mode as defined in EN 300 175-3 [3], clause 10.8.3.2.

The Ip\_error\_detect mode shall apply for the Ip services IpM\_error\_detect and IpO\_error\_detect.

## 10.13.2 Protected I channel error\_correct mode

The FT and PT shall support protected I channel operation in error\_correct mode as defined in EN 300 175-3 [3], clause 10.8.2.

The  $I_{p}$ -error\_correct mode shall apply for the  $I_{p}$  services  $I_{PMR}$ -error\_correct and  $I_{POR}$ -error\_correct.

#### 10.13.2.1 Unilateral jump

FT and PT shall support unilateral data jump procedure according to EN 300 175-3 [3], clause 10.8.2.5.2.

#### 10.13.2.2 Bearer reset

FT and PT shall support bearer reset according to EN 300 175-3 [3], clause 10.8.2.5.3.

## 10.13.3 Connectionless SI<sub>P</sub> mode

The  $SI_P$  service uses the connectionless downlink procedure as defined by EN 300 175-3 [3], clause 9.1.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The  $SI_P$  protected data connectionless downlink service is used by the FP-PT point-to-multipoint service to transfer the data frames, after the LU10 framing and FU10a segmentation functions have been performed on the point-to-multipoint SDU (see clause 11).

The FP shall only transmit  $SI_P$  data starting at the start of a paging cycle. A PT shall understand the presence of  $SI_P$  data to be indicated by the coding  $BA = SI_P$ .

The connectionless downlink bearer used to carry the  $SI_P$  service shall be announced by the PT MAC layer information = "Dummy or C/L bearer" or "C/L bearer position".

A connectionless bearer is marked as a connectionless bearer by the value of the TA-bits = 010.

The TDMA frame immediately following the frame in which  $SI_P$  data was received shall also be monitored to find out whether it contains  $SI_P$  data.

In this way  $SI_P$  data shall be understood to be present in each subsequent TDMA frame until the BA and MAC layer information codings indicate that the  $SI_P$  data field is no longer present. No further  $SI_P$  information shall then be available until the start of the next paging cycle.

The start of a paging cycle in this context shall be that time-slot in frame 0 of a multiframe that is carrying the start of a paging message. When paging repetition is supported by the fixed part, the modulo 4 of the number of this multiframe shall be 0.

PTs in low\_duty\_cycle mode shall listen to frames where the modulo 4 of the number of the multiframe is 0.

New connectionless downlink bearers shall be announced by the FP by broadcast of the PT MAC layer information = "Dummy or C/L bearer" or "C/L bearer position" at least one multiframe or 4 multiframes if low\_duty\_cycle\_mode is allowed at this FP in advance of the first transmission of  $SI_P$  data.

# 10.14 C channel operation

## 10.14.1 C<sub>S</sub> channel

FT and PT shall support  $C_S$  channel data transmission and reception as defined in EN 300 175-3 [3], clauses 10.8.1 and 10.8.1.1.

## 10.14.2 C<sub>F</sub> channel

FT and PT shall support  $C_F$  channel data transmission and reception as defined in EN 300 175-3 [3], clauses 10.8.1 and 10.8.1.2. However, the priority of  $C_F$  channel over U-plane shall be ruled as defined in the next clause.

For Class 2 devices, the use of  $C_F$  channel and its priority is negotiated by means of the NWK layer IE <Connection Attributes>, see EN 300 175-5 [5], clause 7.7.11, that is performed during call setup and optionally at any time (CC-Service Change).

Once such negotiation has been performed, the use of  $C_F$  and the  $C_F$  setting in MAC control messages (Attributes) should follow the decision taken at NWK layer.

Before such negotiation is done, or in absence of it (i.e. Class 1 devices), the use of  $C_F$  is controlled by a flag in MAC "Attributes" command. For indirect FT initiated setup, the code "0101" in LCE paging "field 2:setup info" (see EN 300 175-5 [5], clause 8.2.2), indicates to the PT that may start using channel  $C_F$ . In such case, the NWK layer call setup may be performed over  $C_F$ .

In absence of "Attributes" exchange, or the reception of the setup info code "0101" in LCE paging, the initial NWK layer call setup shall be performed over  $C_S$ , switching to  $C_F$  only after NWK layer negotiation

The suspension and resume of any DPRS connection does not change the setting of  $C_{F}$ . Both peers shall use  $C_{F}$ , or not, as before the suspension.

A FT or PT that has indicated that it supports  $C_F$  channel (see clause 10.3.2.2.1 for the FT and 12.3 for the PT), shall accept the setting of  $C_F$  in the NWK layer negotiation.

If  $C_F$  channel is active, all C-plane transmission shall take place preferably on the  $C_F$  channel. However, it is allowed to use  $C_S$  channel if  $C_F$  channel has priority D (lowest) and there is no interruption in the U plane data flow.

## 10.14.2.1 Priority schema of the C<sub>F</sub> channel

This clause defines the relative priority of the  $C_F$  channel over U-plane (I-channels) and other B-field control channels in DPRS connections.

In DPRS, it is possible to select the priority level of  $C_F$  channel by means of the NWK layer IE <Connection Attributes> (see EN 300 175-5 [5], clause 7.7.11). The setting is done by means of octets 6 and 6a.

NOTE: This clause applies only to Class 2 systems. There is no C<sub>F</sub> channel in DPRS Class 1 systems.

The priority scheme of the different B-field channels shall be as defined in EN 300 175-3 [3], clause 6.2.2.4 (Priority scheme in E or E+U mode) with the following exceptions and specific provisions:

- The priority of all channels except C<sub>F</sub> channel shall be shall be as defined in the clause 6.2.2.4 of EN 300 175-3 [3].
- The priority of channel C<sub>F</sub> and its retransmissions depends on the negotiated value of the fields "C<sub>F</sub> channel attributes" in the Information Element <Connection Attributes> (see EN 300 175-5 [5], clause 7.7.11):
  - a)  $C_F$  channel attribute = "101" = Priority A (highest):
    - Channel C<sub>F</sub> has always priority over U-plane data. The priority of C<sub>F</sub> versus U plane and other channels is exactly as described in EN 300 175-3 [3], clause 6.2.2.4. C<sub>F</sub> channel may use all duplex bearers in a multibearer connection and always with priority over U plane.
  - b)  $C_F$  channel attribute = "100" = Priority B:
    - There is one bearer where channel C<sub>F</sub> has priority over U-plane data. Priority for this bearer is exactly as described in EN 300 175-3 [3], clause 6.2.2.4. If there are additional duplex bearers, C<sub>F</sub> may use further bearers, but then without priority over U plane data.
  - c)  $C_F$  channel attribute = "010" = Priority C:
    - Channel C<sub>F</sub> has less priority than U-plane data (as priority D), until a time limit of 250 ms. If there is C<sub>F</sub> data buffered and waiting for transmission longer than 250 ms, then the priority is changed to priority B (priority over U plane in one bearer).
  - d)  $C_F$  channel attribute = "001" = Priority D (lowest):
    - Channel C<sub>F</sub> has always less priority than U-plane data. The priorities of C<sub>F</sub> channel retransmissions and fresh data are reduced to priorities 9 and 10 in the list described in EN 300 175-3 [3], clause 6.2.2.4. C<sub>F</sub> channel may only be transmitted if there is no U plane data to fill in all bearers.
  - e)  $C_F$  channel attribute = "000" = no  $C_F$  channel:
    - There is no C<sub>F</sub> channel. All higher layers C-plane traffic is routed through the C<sub>S</sub> channel.

# 10.15 Encryption

# 10.15.1 Encryption process - initialization and synchronization

The procedure shall use DSCA and shall be performed as defined in EN 300 175-7 [7], clauses 6.4.4 and 6.4.5. Encryption shall be applied to each of the logical C, I, and  $G_F$  channels.

If encryption is provided by the FT, the FT shall support broadcast of multiframe number as defined in EN 300 175-3 [3], clauses 7.2.3.7, 9.1.1 and clause 10.3.2.3 in the present document. The multiframe number shall be synchronized between the RFPs in the whole internal handover area.

# 10.15.2 Encryption mode control

The procedure shall be performed as defined in EN 300 175-7 [7], clause 6.4.6.

Figure 17: Encryption procedures

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.7 in the MAC control ( $M_T$ ) message shall be supported by the PT and the FT.

| MAC message                  | Field within the message  | Standard values within the MAC message | Normative action/comment            |  |
|------------------------------|---------------------------|--|-------------------------------------|--|
| << M <sub>T</sub> message >> |                           |  |                                     |  |
|                              | < M <sub>T</sub> header > | 5                                      | Encryption control.                 |  |
|                              | < Command >               | 0                                      | Start Encryption Request.           |  |
|                              |                           | 1                                      | Start Encryption Confirm.           |  |
|                              |                           | 2                                      | Start Encryption Grant.             |  |
|                              |                           | 4                                      | Stop Encryption Request (see note). |  |
|                              |                           | 5                                      | Stop Encryption Confirm (see note). |  |
|                              |                           | 6                                      | Stop Encryption Grant (see note).   |  |
| NOTE: These comm             |                           |  |                                     |  |

#### Table 51: Values used within M<sub>T</sub> message

## 10.15.2.2 PT procedure for enabling encryption

If the PT-MAC receives a MAC\_ENC\_EKS-req primitive then it shall start the encryption switching process on one bearer as described in EN 300 175-7 [7], clause 6.4.6.3. In case of a multi-bearer connection, all other bearers of the connection shall switch to encrypted mode at the same time as the bearer performing the single bearer encryption mode procedure.

Additional bearers that are setup after the connection has switched to encrypt mode shall switch to encryption mode immediately after the bearer has been established.

## 10.15.2.3 PT procedure for disabling encryption

If the PT-MAC receives a MAC\_ENC\_EKS-req primitive then it shall start the encryption switching process on one bearer as described in EN 300 175-7 [7], clause 6.4.6.4. In case of a multi-bearer connection, all other bearers of the connection shall switch to clear mode at the same time as the bearer performing the single bearer encryption mode procedure.

# 10.15.3 Handover encryption process

The procedure shall be performed as described in EN 300 175-7 [7], clause 6.4.7.

The additional bearers of the new multibearer connection shall switch to encrypt at the same time as the bearer performing the single bearer encryption mode procedure.

# 10.16 Quality control

# 10.16.1 RFPI handshake

RFPI handshake procedure shall be performed as defined in EN 300 175-3 [3], clause 11.5.1.

# 10.16.2 PT frequency correction

PT frequency correction procedure shall be performed as defined in EN 300 175-3 [3], clause 11.5.2.2.

## 10.16.3 Bearer quality report

Receiver side will send bits Q1 and Q2 reporting quality of received bearers. Report shall be done in bits  $a_3$  and  $a_7$  of a field in the reverse bearer in case of duplex bearers.

The bit Q1 shall be set as defined in EN 300 175-3 [3], clause 10.8.1.3.4. The bit Q2 shall be set as described in EN 300 175-3 [3], clause 10.8.1.3.3. In  $I_{p}$ -error\_correct services, the bit Q2 shall be set as defined in EN 300 175-3 [3], clause 10.8.2.4.1, and the bit BCK, set as defined in EN 300 175-3 [3], clause 10.8.2.4.2, shall be send in the place of bit Q1.

FT and PT should use the information of the received bits Q1 and Q2 to take the decision to perform bearer replacement procedures.

FT may use the information of the Q1 and Q2-bits sent by the PT, to decide whether to switch antenna or not.

#### 10.16.3.1 Bearer quality report for asymmetric bearers

For asymmetric connections, the bits Q1 and Q2 reporting quality of the double simplex bearers shall be carried by means of the "Bearer quality in an asymmetric connection" message, (EN 300 175-3 [3], clause 7.3.4.4).

The bit Q1 shall be set as defined in EN 300 175-3 [3], clause 10.8.1.3.4. The bit Q2 shall be set as described in EN 300 175-3 [3], clause 10.8.1.3.3. In  $I_{p}$ -error\_correct service, the bit Q2 shall be set as defined in EN 300 175-3 [3], clause 10.8.2.4.1, and the bit BCK, set as defined in EN 300 175-3 [3], clause 10.8.2.4.2, shall be send in the place of bit Q1.

FT and PT should use the information of the received bits Q1 and Q2 to take the decision to perform bearer replacement procedures.

FT may use the information of the Q1 and Q2-bits sent by the PT, to decide whether to switch antenna or not.

By negotiation it is possible to avoid the insertion of the message in all frames, or to suppress the message. In this case the "Bearer and connection control" procedure described in clause 10.16.4 shall be used for quality control purposes (see note 3).

The negotiation is performed as described in clause 12.8.

In absence of negotiation the report shall be send in all frames.

There is the possibility to send the message in more than one bearer, however the content of the message shall be always updated (fresh) according to the time when it is sent.

- NOTE 1: The bearer(s) carrying the message is(are) called "special bearer(s)" (see EN 300 175-3 [3], clause 5.6.2.2).
- NOTE 2: The suppression of the "Bearer quality in an asymmetric connection" message deactivates the DECT basic quality feedback mechanism (bits Q1/Q2) and should be only done under very good and steady radio quality conditions. The alternative procedure has a slower response time and a limited control capability and may not handle properly the case of simultaneous loss of quality on several bearers.

## 10.16.4 Bearer and connection control

PT and FT shall use the "Bearer and connection control" message EN 300 175-3 [3], clause 7.3.4.2, to request the other side to perform antenna switch, bearer replacement or bearer handover. Requests for bearer handover may be understood as requests for bearer replacements or bearer handover in DPRS.

| MAC message       | Field within the message | Standard values within the MAC message | Normative action/comment  |
|-------------------|--------------------------|--|---|
| << MBn message >> |                          | -                                      |   |
|                   | < MBn header >           | X011                                   | "Quality Control".  |
|                   | < Command >              | 0000                                   | Antenna switch (s) for the bearers<br>identified by LBN indicated in < param_1 ><br>and < param_2 > - Optional (see note).                      |
|                   |                          | 0001                                   | Antenna switch for all bearers of this<br>connection to the RFP identified by its<br>RPN indicated in < param_1 > - Optional<br>(see note).     |
|                   |                          | 0010                                   | Bearer handover/bearer replacement of<br>the bearer(s) identified by LBN in <<br>param_1 > and < param_2 >- Optional<br>(see note).             |
|                   |                          | 0011                                   | Connection handover - Optional (see note).  |
|                   |                          | 0100                                   | Frequency control for the bearer identified<br>by LBN indicated in < param_1 > -<br>Optional (see note).  |
|                   |                          | 0101                                   | Frequency control for all bearers of this<br>connection to the RFP identified by its<br>RPN indicated in < param_1 > - Optional<br>(see note).  |
|                   |                          | 0110                                   | Advance timing for all the bearers of this<br>connection to the RFP identified by its<br>RPN indicated in < param_1 > - Optional<br>(see note). |
|                   |                          | 0111                                   | PT informs that it is transmitting prolonged preamble in all the frames - Optional (see note).  |
|                   |                          | 1000                                   | Frequency replacement to carrier CN on<br>slot pair SN indicated in < param_1 > and<br>< param_2 > respectively - Optional<br>(see note).       |
|                   | < FMID >                 | All                                    |   |
|                   | < PMID >                 | All                                    |   |
|                   | < param_1 >              | All                                    |   |
|                   | < param_2 >              | All                                    |   |
|                   | < spare >                | 0000 1111                              |   |
|                   |                          |  | and Connection Control shall support at   |
| least one of t    | he commands and the r    | elated procedures.                     |   |

#### Table 52: Values used within Bearer and Connection Control messages

132

# 10.16.5 A-CRC handshake

If no correct A-CRC has been received (in regard to the active FT identity) during a time of T908, the bearer shall be released. Duplex bearers shall use the unacknowledged bearer release procedure defined in clause 10.11.1. Double simplex bearers receiving side shall use the acknowledged bearer release procedure as defined in clause 10.11.3.

NOTE: The normal reaction on the release of a bearer because of A-CRC handshake failure will be a bearer replacement. In case of release of all bearers the suspend-state will be entered.

# 10.17 Physical channel selection

The selection of a physical channel for a new bearer shall be performed according to the requirements in EN 300 175-3 [3], clause 11.4. The selection procedure for additional bearers in a multibearer connection shall also take into account the channel list procedures as defined in EN 300 175-3 [3], clause 10.5.2.

# 10.18 Bearer replacement

This procedure is the main way to improve the quality of a connection by changing bearers to different channels within the same cluster.

133

"Bearer replacement" is defined to be the procedure where an old bearer is replaced with a new bearer that has a different LBN or where the old bearer was lost before the new bearer is setup with the same LBN. The procedure to setup the new bearer is defined by clause 10.10. The procedure to release the old bearer is defined in clause 10.11.

For replacement of one bearer of an  $I_{P}$ -error\_correct connection the procedure is defined in EN 300 175-3 [3], clause 10.8.2.5.1.

NOTE: The timer T906 guards the time the amount of bearers is less than the minimum.

In multiberer connections, and for all bearers except the last one, it is preferred to first drop the old bearer and then setup the new bearer. It is not required to have the new bearer active before the old bearer is released.

# 10.19 Bearer handover request

The procedure shall be performed as defined in EN 300 175-3 [3], clauses 10.6.2 and 10.6.3. The B-field procedures shall be supported. The bearer setup procedures are defined by clause 10.10 and the bearer release procedure is defined by clause 10.11.

The procedure is equivalent for intra- and inter-cell handover.

The FT should not release the old bearer within 10 ms after the establishment of the new bearer.

Bearer handover is optional to be supported by DPRS compliant terminals. If PT supports it but FT does not, normally, the FT will not respond to the bearer handover request send by the PT. In any case if bearer handover procedure fails, the PT shall try bearer replacement or connection handover (if connection handover is supported by the FT).

# 10.20 G<sub>F</sub> channel

## 10.20.1 G<sub>F</sub> channel data

#### 10.20.1.1 G<sub>F</sub> channel transmission

The transmitter side of FT and PT shall support the  $G_F$  channel transmission as defined in EN 300 175-3 [3], clause 7.3.6.

#### 10.20.1.2 G<sub>F</sub> channel reception

The receiver side of FT and PT shall support the of  $G_F$  channel reception, as defined in EN 300 175-3 [3], clause 7.3.6, and shall understand the frame format FU10c when transmitted over  $G_F$  channel.

# 10.21 Time multiplexers

## 10.21.1 A-field Multiplexer

#### 10.21.1.1 Tail Multiplexer (T-MUX)

The FT and PT shall support T-MUX as defined in EN 300 175-3 [3], clause 6.2.2.1.

## 10.21.1.2 A-tail identifications

The FT and PT shall understand all A-field tail identifications (bits  $a_0$  to  $a_2$ ) as defined in EN 300 175-3 [3], clause 7.1.2. The value 101 - "escape" need not be understood. To distinguish a connectionless bearer from a non-connectionless bearer the  $N_T$  message send on a connectionless bearer shall carry the value "Identity information ( $N_T$ ) on connectionless bearer" (010) and the value "Identity information ( $N_T$ )"(011) in all other cases.

134

# 10.21.2 B-field control Multiplexer (E/U-MUX)

## 10.21.2.1 B-field control Multiplexer (E/U-MUX), basic modes

#### 10.21.2.1.1 U-type Multiplexer

The FT and PT shall support U-type mode multiplexer as defined in EN 300 175-3 [3], clause 6.2.2.2.

#### 10.21.2.1.2 E-type Multiplexer, all MAC control

The FT and PT shall support E-type mode multiplexer as defined in EN 300 175-3 [3], clauses 6.2.2.2 and 6.2.2.3 with the following restriction:

• Only the "all MAC control" mode (channels M and G<sub>F</sub>, BA code "110"), shall be supported.

The FT and PT shall support the E-type mode "all MAC control" as defined in EN 300 175-3 [3], clause 6.2.2.3 (tables 6.24 to 6.33) for the supported D-field mappings (defined in clause 6.2, table 11) and modulation type (defined in clause 5.1, table 7).

#### 10.21.2.1.3 E/U-Mux priority schema

The FT and PT shall support the priority schema as defined in EN 300 175-3 [3], clause 6.2.2.4 with the following restrictions:

- I<sub>PF</sub> channel modes and I<sub>PF</sub> segmentatition control are not applicable.
- C<sub>F</sub> channel modes are not applicable.

#### 10.21.2.1.4 B-field identifications (basic)

The FT and PT shall use and understand all B-field identifications (bits  $a_4$  to  $a_6$ ) as defined in EN 300 175-3 [3], clause 7.1.4 with the following restrictions:

- Codes for E-mux with C<sub>F</sub> channel ("010", "011", 100" and "101") are not applicable.
- Code "110" is only understood as "E-type all MAC control".
- Code "111" is only understood as "no B-field".

## 10.21.2.2 B-field control Multiplexer (E/U-MUX), C<sub>F</sub> modes

#### 10.21.2.2.1 E-type Multiplexer, all modes

The FT and PT shall support E-type mode multiplexer as defined in EN 300 175-3 [3], clauses 6.2.2.2 and 6.2.2.3, including the modes "E-type all  $C_F$ ", and "E-type not all  $C_F$ ".

The FT and PT shall support all E-type modes as defined in EN 300 175-3 [3], clause 6.2.2.3 (tables 6.24 to 6.33) for the supported D-field mappings (defined in clause 6.2, table 11) and modulation type (defined in clause 5.1, table 7).

#### 10.21.2.2.2 E/U-Mux priority schema

The FT and PT shall support the priority schema as defined in EN 300 175-3 [3], clause 6.2.2.4 with the following restriction:

•  $I_{PF}$  channel modes and  $I_{PF}$  segmentation control are not applicable.

#### 10.21.2.2.3 B-field identifications (C<sub>F</sub>)

The FT and PT shall use and understand all B-field identifications (bits  $a_4$  to  $a_6$ ) as defined in EN 300 175-3 [3], clause 7.1.4 with the following restrictions:

- Code "110" is only understood as "E-type all MAC control".
- Code "111" is only understood as "no B-field".

#### 10.21.2.3 B-field control Multiplexer (E/U-MUX), E+U modes

#### 10.21.2.3.1 E+U-type Multiplexer

The FT and PT shall support the E+U type multiplexer as defined in EN 300 175-3 [3], clauses 6.2.2.2 and 6.2.2.3.

The FT and PT shall support all E+U-type modes as defined in EN 300 175-3 [3], clause 6.2.2.3 (tables 6.24 to 6.33) for the supported D-field mappings (defined in clause 6.2, table 11 and modulation type (defined in clause 5.1, table 7).

#### 10.21.2.3.2 E/U-Mux priority schema

The FT and PT shall support the priority schema as defined in EN 300 175-3 [3], clause 6.2.2.4.

#### 10.21.2.3.3 B-field identifications (E+U type)

The FT and PT shall use and understand all B-field identifications (bits  $a_4$  to  $a_6$ ) as defined in EN 300 175-3 [3], clause 7.1.4 with the following restrictions:

- Codes for E-mux with C<sub>F</sub> channel ("010", "011", 100" and "101") are only applicable if C<sub>F</sub> channel is supported.
- Code "111" is only used for E+U type mux if MAC service I<sub>P</sub>\_error\_correct is used. Otherwise it means "no B-field".

## 10.22 I<sub>PF</sub> channel

# 10.22.1 I<sub>PF</sub> channel general

The FT and PT shall support the higher layer U-Plane channel in E+U type slots ( $I_{PF}$ ) as defined in EN 300 175-3 [3], clauses 5.3.1.4 and 10.8.4.

The FT and PT shall support the "Null or  $I_{PF}$  segmentation info" message as defined in EN 300 175-3 [3], clause 7.3.3, using and understanding the meaning of the "spare or  $I_{PF}$  segmentation info" field, and all NCF header codes.

The FT and PT shall use and understand all NCF codes in the message " $G_F$  channel data packet" as defined in EN 300 175-3 [3], clause 7.3.6.

The FT and PT shall activate the  $I_{PF}$  channel and the E+U type multiplexer (see clause 10.21.2.3) as defined in EN 300 175-3 [3], clause 10.8.4.2.

The FT and PT shall support the I<sub>PF</sub> channel basic procedures as defined in EN 300 175-3 [3], clause 10.8.4.3.1.

The FT and PT shall support the special case procedure as defined in EN 300 175-3 [3], clause 10.8.4.3.3, if the B-field mapping of the supported slot type (defined in clause 6.2, table 11) and modulation type (defined in clause 5.1, table 7), produces a MAC packet size (DLC PDU) not multiple of 64 bits.

The FT and PT shall support the I<sub>PF</sub>\_error\_detect operation procedures as defined in EN 300 175-3 [3], clause 10.8.4.5.

The FT and PT shall support the backcompatibility rule as defined in EN 300 175-3 [3], clause 10.8.4.7.

## 10.22.2 I<sub>PF</sub> channel advanced procedures

The FT and PT shall support the I<sub>PF</sub> channel advanced procedures as defined in EN 300 175-3 [3], clause 10.8.4.3.2.

## 10.22.3 I<sub>PF</sub> channel error\_correct procedures

The FT and PT shall support the I<sub>PF</sub> channel error\_correct procedures as defined in EN 300 175-3 [3], clause 10.8.4.4.

## 10.22.4 SI<sub>PF</sub> channel

The FT and PT shall support the connectionless U-Plane channel in E+U type slots, (SI<sub>PF</sub>) as defined in EN 300 175-3 [3], clause 5.3.2.3.

# 10.23 A-field (M<sub>T</sub>) procedures

## 10.23.1 General

A-field MAC control procedures are available for special applications. The following procedures are available:

- PT initiated A-field advanced bearer setup.
- A-field connection/bearer release.
- A-field bearer handover request.
- A-field connection handover request.

## 10.23.2 PT initiated A-field advanced bearer setup

The connection setup procedure shall be performed as defined in EN 300 175-3 [3], clauses 10.2.4.1 and 10.2.4.2 or 10.2.4.3.

The connection setup procedure described in EN 300 175-3 [3], clause 10.2.4.2 shall be used in all cases.

- PT initiated setup (all cases).
- FT initiated indirect setup (paging).

The bearer setup procedure shall be performed in all cases as defined in EN 300 175-3 [3], clause 10.5.1.2.

The exchange of the messages "Attributes\_T.req" and "Attributes\_T.cfm" is mandatory in all cases. The PT shall send the "Attributes\_T.req" message after reception of the "Bearer.cfm" as described in EN 300 175-3 [3], clause 10.5.1.2.1.

In the case of FT initiated (indirect) setup, the LCE paging code = "110"B shall be used in the initial setup of the call and LCE = "111"B in the case of resume of an existing connection.

#### 10.23.2.1 M<sub>T</sub> access request message

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.3 of in the MAC control ( $M_T$ ) message shall be supported by the PT and the FT.

136

| MAC message                        | Field within the message   | Standard values within the MAC message | Normative action/comment            |  |  |
|------------------------------------|--|--|-------------------------------------|--|--|
| < <m<sub>T message&gt;&gt;</m<sub> |  |  |                                     |  |  |
| •                                  | <m<sub>T header&gt;</m<sub>  | 1                                      | "Advanced connection control".      |  |  |
|                                    | <command/>   | 0                                      | "Access_request".                   |  |  |
|                                    |  | 4                                      | "Bearer_confirm".                   |  |  |
|                                    |  | 5                                      | "Wait".                             |  |  |
|                                    |  | 6                                      | "Attributes_T_request" (see note).  |  |  |
|                                    |  | 7                                      | "Attributes_T_confirm" (see note).  |  |  |
|                                    | <fmid></fmid>  | All                                    |                                     |  |  |
|                                    | <pmid></pmid>  | All                                    | See clause 13.4 of EN 300 444 [11]. |  |  |
| NOTE: For values in                | NOTE: For values in the Attributes T reg/cfm message, see next table 54. |  |                                     |  |  |

#### Table 53: Values used within M<sub>T</sub> message

# 10.23.2.2 M<sub>T</sub> Attributes\_T.req/cfm message

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.3.8 of the ATTRIBUTES\_T.req/cfm messages shall be supported by the PT and the FT.

| MAC message                  | Field within the message                | Standard values<br>within the MAC<br>message    | Normative action/comment   |
|------------------------------|---|---|--|
| << M <sub>T</sub> message >> |   |   |  |
|                              | < M <sub>T</sub> header >               | 0001  | "Advanced connection control".   |
|                              | < Command >                             | 6   | "Attributes_T.request".  |
|                              |   | 7   | "Attributes_T.confirm".  |
|                              | < ECN >                                 | All   |  |
|                              | < LBN >                                 | 1 to 15   | The value 15 is reserved for the pilot bearer.   |
|                              | < up/down/ss/sm >                       | All   |  |
|                              | < service type >                        | 2   | I <sub>PM</sub> _error_detect.   |
|                              |   | 3   | I <sub>PM</sub> _error_correct (optional).   |
|                              |   | 6   | I <sub>PQ</sub> _error_detect (optional).  |
|                              |   | 7   | I <sub>PQ</sub> _error_correct (optional).   |
|                              | < max. lifetime >                       | 0 to 7  | Optional. If only I <sub>P</sub> _error_detect is  |
|                              |   |   | supported, this value may be ignored.  |
|                              | < slot type >                           | 0, 2, 3, 4                                      | Full, double, long 640 and long<br>672 slots allowed. Long 640<br>mandatory, all others optional |
|                              | < C <sub>F</sub> >                      | [0, 1]  | Support of C <sub>F</sub> optional.  |
|                              | < extended (B + Z) field<br>mod. type > | 0   | (extended (B + Z) field not used).   |
|                              | < adaptive code rate >                  | 0   | (no coding used).  |
|                              | < A-field modulation type >             | 3   | Default modulation scheme to use<br>for bearer setup is 2-level<br>modulation.                   |
|                              | < (B + Z) field mod. type >             | 3   | Default modulation scheme to use<br>for bearer setup is 2-level<br>modulation.                   |
| NOTE: Adaptive               | code rate has to be supported           | only if I <sub>PX</sub> (I <sub>P</sub> encodec | protected) is implemented.   |

## 10.23.3 A-field connection/bearer release

The procedure shall be performed as defined in EN 300 175-3 [3], clauses 10.4 and 10.7.2.1.

The procedure may be used if the connection is either, basic or advanced. The proper value shall be inserted in the  $M_T$  header.

Figure 18: Bearer release

## 10.23.3.1 $M_T$ message

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.2 in the MAC control ( $M_T$ ) message shall be supported by the PT and the FT.

| Table 55: Va | lues used | within M- | r message |
|--------------|-----------|-----------|-----------|
|--------------|-----------|-----------|-----------|

| MAC message                        | Field within the message    | Standard values within the MAC message | Normative action/comment            |
|------------------------------------|-----------------------------|--|-------------------------------------|
| < <m<sub>T message&gt;&gt;</m<sub> |                             |  |                                     |
|                                    | <m<sub>T header&gt;</m<sub> |  |                                     |
|                                    | -                           | 1                                      | Advanced connection control.        |
|                                    | <command/>                  | 15                                     | Release.                            |
|                                    | <fmid></fmid>               | All                                    |                                     |
|                                    | <pmid></pmid>               | All                                    | See clause 13.4 of EN 300 444 [11]. |

## 10.23.4 A-field bearer handover request

The procedure shall be performed as defined in EN 300 175-3 [3], clauses 10.6.2 and 10.5.1.1.

The procedure is equivalent for intra- and inter-cell handover.

The procedure may be used if the connection is either, basic or advanced. The proper value for the  $M_T$  header shall be used.

The FT should not release the old bearer within 10 ms after the establishment of the new bearer.

## 10.23.4.1 M<sub>T</sub> message

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.2 in the MAC control ( $M_T$ ) message shall be supported by the PT and the FT.

| MAC message                        | Field within the message    | Standard values within the MAC message | Normative action/comment            |
|------------------------------------|-----------------------------|--|-------------------------------------|
| < <m<sub>T message&gt;&gt;</m<sub> |                             |  |                                     |
|                                    | <m<sub>T header&gt;</m<sub> |  |                                     |
|                                    |                             | 1                                      | "Advanced connection control".      |
|                                    | <command/>                  | 1                                      | "Bearer_handover_request".          |
|                                    |                             | 4                                      | "Bearer_confirm".                   |
|                                    |                             | 5                                      | "Wait".                             |
|                                    | <fmid></fmid>               | All                                    |                                     |
|                                    | <pmid></pmid>               | All                                    | See clause 13.4 of EN 300 444 [11]. |

#### Table 56: Values used within $M_T$ message

## 10.23.5 A-field connection handover request

The procedure shall be performed as defined in EN 300 175-3 [3], clauses 10.2.4.2 and 10.5.1.1.

The procedure may be used if the connection is either, basic or advanced. The proper value for the  $M_T$  header shall be used.

The procedure is equivalent for intra- and inter-cell handover.

#### 10.23.5.1 M<sub>T</sub> message

The following fields as defined in EN 300 175-3 [3], clause 7.2.5.2 in the MAC control ( $M_T$ ) message shall be supported by the PT and the FT.

| MAC message                        | Field within the message    | Standard values within the MAC message | Normative action/comment   |
|------------------------------------|-----------------------------|--|--|
| < <m<sub>T message&gt;&gt;</m<sub> |                             |  |  |
|                                    | <m<sub>T header&gt;</m<sub> |  |  |
|                                    |                             | 1                                      | "Advanced connection control".   |
|                                    | <command/>                  | 2                                      | "Connection_handover_request". PT<br>shall capable to send. FT shall be<br>capable to process. |
|                                    |                             | 4                                      | "Bearer_confirm".  |
|                                    |                             | 5                                      | "Wait".  |
|                                    | <fmid></fmid>               | All                                    |  |
|                                    | <pmid></pmid>               | All                                    | See clause 13.4 of EN 300 444 [11].  |

Table 57: Values used within M<sub>T</sub> message

# 11 DLC layer procedures

# 11.1 LU10 Enhanced Frame RELay service (EFREL)

The procedure shall be performed as defined in EN 300 175-4 [4], clause 11.12.1. The following text together with the associated clauses define the mandatory requirements with regard to the present document.

The SDU shall be segmented into fixed length segments, where the segment length shall depend on the PDU structure chosen (see clause 11.2).

The following MAC services may be used:  $I_{PM}$  \_error\_detection,  $I_{PQ}$  \_error\_detection,  $I_{PMR}$  \_error\_correction,  $I_{POR}$  \_error\_correction and  $I_{PX}$  \_encodec\_protected.

The transmission class 2 shall be used.

The selective retransmission protocol (SEL) shall be used.

Modulus shall be 512, i.e. the receive sequence number and the send sequence number has a default range from 0 to 511. If the window size  $\leq$  128 both peers shall ignore the 9th bit (ES9) of the sequence numbers.

## 11.1.1 Window size

The window size can be negotiated in the range of 1 to 256 by the NWK-layer.

The default value for the window size is 32.

This default value will be used in absence or failure of NWK-Layer negotiation.

Any DPRS device shall support at least the following values for the window size.

Table 58: Window size data rates

| Minimum mandatory supported window size | Maximum Data rate supported (at the air i/f) |
|---|--|
| 32                                      | Up to 96 kbit/s                              |
| 64                                      | > 96 kbit/s to 200 kbit/s                    |
| 128                                     | > 200 kbit/s                                 |

Any PT shall accept in a negotiation any value proposed by the FT between the default (32) and the minimum mandatory supported window size.

A FT shall propose in the negotiation a window size value equal to the minimum mandatory value of table 58, if it has opened only one DPRS connection (only one PT is connected to this FT with a single DPRS connection).

## 11.1.2 U-plane transmission class 2

## 11.1.2.1 Sending side procedures

The procedure shall be performed as defined in EN 300 175-4 [4], clause 14.3.4.1. The following text together with the associated clauses define the mandatory requirements with regard to the present document.

The sequence numbers shall be added using the rules defined below.

If a connection oriented MAC service is used (see EN 300 175-3 [3], clause 5.6), then the send sequence number shall be set to zero at the start of the MAC connection, and this value shall be used for the first transmitted frame over that MAC connection. The send sequence numbers of successive frames shall be contiguous (Modulus) during the lifetime of that MAC connection.

If a connectionless MAC service is used (see EN 300 175-3 [3], clauses 5.7 and 9.1.2.2), then the send sequence number of the first segment of a DLC SDU may be arbitrarily chosen. The send sequence numbers of successive frames shall be contiguous (Modulus) within one DLC SDU.

At the transmitting side a complete SDU shall be received in a DL\_U\_DATA-req primitive. The SDU shall be passed to the segmenting function and segmented into an integral number of segments. The last segment shall be filled with fill octets if necessary. The information content of each PDU shall be marked using the length indicator as described in EN 300 175-4 [4], clause 14.2.3.3.

Several PDUs may be submitted once to the MAC layer in a single MAC\_CO\_DATA-req primitive in response to each MAC\_CO\_DTR-ind primitive. The number of PDUs shall be less than or equal to the maximum number requested in the MAC\_CO\_DTR-ind primitive.

## 11.1.2.2 Receiving side procedure

The procedure shall be performed as defined in EN 300 175-4 [4], clause 14.3.4. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The receive sequence number shall be set to 0 at service establishment.

Several PDUs may be received from the MAC layer in a single MAC\_CO\_DATA-ind primitive. The receive side shall re-order the PDUs using the send sequence numbers. The receive side shall then search for SDU boundaries using the extended more bit as defined in EN 300 175-4 [4], clause 13.3.

A complete SDU shall be assumed to exist, and shall be passed to the IWU using a DL\_U\_DATA-ind primitive when the following conditions are satisfied:

- two successive boundaries have been identified using the extended More bit (i.e. there are no intermediate boundaries);
- PDUs have been successfully received for all of the sequence numbers that lie between those boundaries.

## 11.1.3 SDU transmission and delivery mode

The standard delivery mode shall be used in all cases, except for character orienter interworking (annex C) that shall use the in-sequence delivery mode.

# 11.2 FU 10 framing (FU10a, FU10b, FU10c)

The procedure shall be performed as defined in EN 300 175-4 [4], clause 12.11. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

## 11.2.1 FU10a

FU10a frames as defined in see EN 300 175-4 [4], clause 12.11 shall be used for the forward path of unidirectional links. Bi-directional links may be implemented using two unidirectional links for each direction. FU10a is the standard frame for DPRS.

## 11.2.2 FU10b

FU10b frames as defined in see EN 300 175-4 [4], clause 12.11 may optionally be used for bi-directional links and shall only be used after negotiation by the network layer, see clause 12.5.

## 11.2.3 FU10c

FU10c frames as defined in see EN 300 175-4 [4], clause 12.11, with total length of 7 octets shall be used for the backward control path.

The SN NACKed in a FU10c frame shall be provided in order, i.e. if NACK SN = 1 and NACK SN = 2 are to be sent NACK SN = 1 shall be included in the FU10c before NACK SN = 2. The modulo operation shall be taken into account, e.g. SN = 0 shall be after SN = 511 and for window sizes  $\leq 128$  (SN = [0.255]), SN = 0 shall be after SN = 255.

If there are not enough NACKs to be sent in one FU10c frame, the last NACKed SN shall be replicated in all remaining octets before the FU10c is sent.

In the NACKs commands, the sequence number shall be set as the SN of the missing PDUs. In the ACK command, the sequence number shall be set as the highest received SN plus 1 (see EN 300 175-4 [4]).

EXAMPLE 1: Example of completion of a FU10c frame in case the receiver has successfully received all PDUs with numbers up to SN = 254 and PDU with SN = 2, missing SN = 255, 0 and 1. The window size has been defined as  $\leq 128$ , allowing to ignore the bit 9:

Octet\_1 = 255 (ACK 255); Octet\_2 = 255 (NACK 255); Octet\_3 = 0 (NACK 0); Octet\_4 = 1 (NACK 1); Octet\_5 = 1 (NACK 1); Octet\_6 = 1 (NACK 1); Octet\_7 - "10000000" (1 ACK plus 5 NACKs). EXAMPLE 2: Same case as example 1, but window size has been defined as >128 making necessary the use if bit 9. In this case the received PDUs have been: all PDU up to SN = 254 and PDU with SN = 258. Missing PDUs are SN = 255, 256 and 257:

Octet\_1 = 255 (ACK 255); Octet\_2 = 255 (NACK 255); Octet\_3 = 0 (NACK 256); Octet\_4 = 1 (NACK 257); Octet\_5 = 1 (NACK 257); Octet\_6 = 1 (NACK 257); Octet\_7 - "10111100" (1 ACK plus 5 NACKs plus bit 9 of the six sequence numbers).

EXAMPLE 3: Example of completion of a FU10c frame in case the receiver has successfully received all PDUs with numbers up to SN = 254 and there are no missing PDUs (window size is irrelevant in this case, since bit 9 is set to 0):

Octet\_1 = 255 (ACK 255); Octet\_2 = 0 (NULL); Octet\_3 = 0 (NULL); Octet\_4 = 0 (NULL); Octet\_5 = 0 (NULL); Octet\_6 = 0 (NULL); Octet\_7 - "01000000" (This frame contains only one ACK message in RSN#1, no NACKs).

#### 11.2.3.1 Insertion of FU10c frames in FU10a frames of the opposite link

The FT and PT shall support the transport of FU10c frames by insertion in the frame FU10a of the opposite link using the procedure described in EN 300 175-4 [4], clause 12.11.2.1.

The sending side can take dynamically the decision on how to transport the FU10c frames according to traffic and situation of the E/U multiplexer of the bearers used in the connection.

- NOTE 1: As general rule, the sending side should avoid the use of G<sub>F</sub> channel using instead the FU10a insertion mechanism if there is no bearer with E/U mux in selection E or E+U due to other reason.
- NOTE 2: The FU10a insertion mechanism is recommended in any case for FU10c frames related to the backward link in an asymmetric connection (FU10c sent in forward direction).
- NOTE 3: For FU10c frames related to the forward link (FU10c frames sent on backward channel), it is recommended the use of the  $G_F$  channel, if the backward slot (or if any of them, if there are more than one) is in E or E+U mux selection due to other channel (f.i. MAC control).

# 11.3 Class A operation

The class A link operation can be either PT or FT initiated. To simplify the description this clause considers on the PT initiated procedures; for the FT initiated procedures, "PT" shall be replaced with "FT" and vice versa. This is valid for the entire clause 11.3 and the associated clauses.

## 11.3.1 Class A link establishment

The procedure shall be performed as defined in EN 300 444 [11], clause 9.1 except of clause 9.1.1.4 which is replaced by clause 11.2.1.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

If class B acknowledged transfer is requested but not supported by the receiving side (B acknowledged transfer is not required to be supported for DPRS), the I\_frame requesting class B operation shall be treated as though it was a class A frame, see EN 300 175-4 [4], clauses 9.2.4.3.1 and 9.2.4.3.2 b).

## 11.3.1.1 Lower Layer Management Entity (LLME) establishment of a MAC connection

The procedure shall be performed as defined in EN 300 175-4 [4], clause 10.2 and EN 300 175-3 [3], clause 8.1.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

For a link to be established a suitable MAC connection is needed. If such one does not exist the LLME shall request it.

#### Figure 19: Establishment of a MAC connection initiating side

| Parameter                     | Information within the parameter   | Normative action/comment                    |

|-------------------------------------|----------------------|

The successful setup of the advanced connection may be followed by a connection modification, as defined in EN 300 175-4 [4], clause 10.2.3, case B.

## 11.3.2 Class A acknowledged information transfer

Advanced

All relevant

The procedure shall be performed as defined in EN 300 444 [11], clause 9.2, with the exception identified in this clause.

Both PT or FT shall be able to handle NWK layer messages longer than 63 octets, e.g. the CC-SETUP message may be of up to and more than 80 octets. Longer than 63 octets messages shall be segmented in DLC an sending side and re-assembled in DLC receiving side as specified in EN 300 175-4 [4], clause 7.7.2.

## 11.3.3 Class A link release

<< << <<

<< << <<

<<

<< Connection type >>

<< ECN >>

The procedure shall be performed as defined in EN 300 444 [11], clause 9.3.

## 11.3.4 Class A link re-establishment

The procedure shall be performed as defined in EN 300 444 [11], clause 9.4.

144

## 11.4 Class U operation

For class U operation only the U-format is used in the control field defined in EN 300 175-4 [4], clause 7.4, with contents as defined in table 62.

| DLC command     | Field within the command | Standard values within the command | Normative action/comment |
|-----------------|--------------------------|------------------------------------|--------------------------|
| << U-command >> |                          |                                    |                          |
|                 | < U U U >                | 000                                |                          |
|                 | < P/F >                  | 0                                  |                          |
|                 | < U U >                  | 0 0                                |                          |
|                 | 1 1                      | 11                                 |                          |

Table 62: Values used within DLC command

## 11.4.1 Class U use of LLN for unacknowledged information transfer

The procedure shall be performed as defined in EN 300 175-4 [4], clause 9.3.1.

## 11.4.2 Class U link establishment

The procedure shall be performed as defined in EN 300 175-4 [4], clause 9.3.2.

## 11.4.3 Class U unacknowledged information transfer

The procedure shall be performed as defined in EN 300 175-4 [4], clause 9.3.3.

## 11.4.4 Class U unacknowledged release

The procedure shall be performed as defined in EN 300 175-4 [4], clause 9.3.4.

## 11.5 Lc frame delimiting and sequencing service

### 11.5.1 C<sub>s</sub> channel fragmentation and recombination

The procedure shall be performed as defined in EN 300 175-4 [4], clauses 6.1.2, 6.1.3, 6.1.4 and 6.1.4.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The complete frame shall be fragmented into 5 octet fragments.

## 11.5.2 C<sub>F</sub> channel fragmentation and recombination

The  $C_F$  channel shall be operated according to the procedures defined in EN 300 175-4 [4], clauses 6.1.2, 6.1.3, 6.1.4 and 6.1.4.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The complete frame shall be fragmented into 8 octet fragments.

## 11.5.3 Selection of logical channels (C<sub>S</sub> and C<sub>F</sub>)

The selection of the  $C_F$  instead of the  $C_S$  channel for Lc operation, shall be done according to the conditions defined in EN 300 175-4 [4], clause 10.2.5.

If both sides have indicated that they support  $C_F$  channel (see 10.3.2.2.1 for the FT and 12.3 for the PT) all C-plane transmission shall take place on the  $C_F$  channel.

## 11.6 Broadcast Lb service

### 11.6.1 Normal broadcast

The procedure shall be performed as defined in EN 300 175-4 [4], clauses 6.2.1, 8.3.3.1, 9.4.1.1 and 9.4.1.2 and EN 300 175-3 [3], clause 8.2.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Short frame format (frame length = 3) and long frame format (frame length = 5) are required to be supported.

Figure 21: Normal broadcast

#### Table 63: Information used within the DL\_BROADCAST-req primitive

| Parameter                  | Information within the parameter | Normative action/comment   |
|----------------------------|----------------------------------|--|
| << Cluster address list >> | All cluster/an integer           |  |
| << Message unit length >>  | 3, 5 octets                      | Short and long frame format (if FT<br>supports DPRS N.19, LCE Resume<br>Paging) are required to be supported |
| << Message unit >>         | From the NWK layer               |  |

#### Table 64: Information used within the MAC\_PAGE-req primitive

| Parameter                  | Information within the parameter   | Normative action/comment   |
|----------------------------|--|--|

#### Table 66: Information used within the DL\_BROADCAST-ind primitive

### 11.6.2 Expedited broadcast

The procedure shall be performed as defined in EN 300 175-4 [4], clauses 6.2.1, 8.3.3.1, 9.4.2.1 and 9.4.2.2 and EN 300 175-3 [3], clause 8.2.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The primitive exchange and their contents are similar to the Normal Broadcast except that the DL\_EXPEDITED primitives are used instead of the DL\_BROADCAST and the type of broadcast is identified as "fast". Short frame format (frame length = 3) and long frame format (frame length = 5) are required to be supported.

#### Table 67: Information used within the DL\_EXPEDITED-req primitive

| Parameter                  | Information within the parameter | Normative action/comment                                 |
|----------------------------|----------------------------------|--|
| << Cluster address list >> | All cluster/an integer           |  |
| << Message unit length >>  |                                  | Short and long frame format are required to be supported |
| << Message unit >>         | From the NWK layer               |  |

#### Table 68: Information used within the MAC\_PAGE-req primitive

| Parameter                  | Information within the parameter   | Normative action/comment                       |
|----------------------------|--|--|
| << cluster ID >>           | All clusters/an integer  |  |
| << page type >>            | Fast   |  |
| << length of page field >> | 20 or 36   |  |

## 11.7 Connection handover

## 11.7.1 Class A connection handover

For single bearer connections the procedure shall be performed according to EN 300 444 [11], clause 9.7.

For multi-bearer connections the procedure shall be performed as defined in EN 300 175-4 [4], clauses 9.2.7.3, 9.2.7.3.1, 9.2.7.3.3, 10.5 and 9.2.7.1.2. The following clauses define the mandatory requirements with regard to the present document.

148

If FP receives a connection handover request and this is executed successfully, then the FP shall release the old MAC Logical Connection (MBC) if this is still in suspend state.

### 11.7.1.1 Voluntary handover

As a result of continued poor quality of service from the MAC layer, the LLME in the PT shall inform the PT LAPC entity, the LAPC entity shall enter the Handover pending condition, timer < DL.05 > is not needed to be started, a new MAC connection shall be requested to be established.

The establishment of a new MAC connection shall be achieved by the LLME connection setup procedure according to clause 10.5, immediately followed by a connection modification procedure (see EN 300 175-4 [4], clause 10.2.3 case B) in case of multibearer connections to restore the attributes of the old connection.

If a new MAC connection is successfully established the LAPC entity shall leave the Handover pending condition, and one of the two MAC connections shall be released by the PT using the LLME MAC connection release procedure (see EN 300 175-4 [4], clause 9.3.1.2).

This implies that in case of unsuccessful handover the associated links shall not be released since the connection is still operational (even with bad quality).

- NOTE 1: Any time an unexpected upward MAC\_DIS-ind primitive is received, the receiver of this primitive may assume that the connection and the far side of the link have been released.
- NOTE 2: For multibearer connections the handover may be done by downgrading the bandwidth either to 1 or to 0 bearers.

#### 11.7.1.2 Associated procedure

#### 11.7.1.2.1 LLME connection handover management

The procedure shall be performed as defined in EN 300 175-4 [4], clause 10.5. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Timer < DL.06 > shall be started either after the connection handover is successfully completed or immediately after N251 successive "unsuccessful" connection handover attempts.

It shall be stopped upon an initiation of a link release "abnormal" (see EN 300 444 [11], clause 8.38) or release indication from MAC layer (see EN 300 444 [11], clause 9.3).

As long as < DL.06 > is running, no connection handover attempts shall be initiated.

#### 11.7.1.3 Exceptional case

#### 11.7.1.3.1 Receipt of a request for link release

If while in the connection handover pending condition a link release request has been received from the own NWK layer the handover pending condition shall be cleared and class A link release procedure (see EN 300 444 [11], clause 9.3) shall be performed.

The associated connection and the connection for which establishment is in progress shall also be released using the LLME release of the MAC connection procedures (see EN 300 175-4 [4], clause 9.3.1.2).

## 11.8 Connection modification

The procedure shall be performed as defined in EN 300 175-4 [4], clause 10.2.3. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

During the establishment of advanced connections, whenever the MAC\_CON-req primitive has specified a multi-bearer connection or the connection type as "unknown" a MAC\_MOD-req primitive shall be sent to identify the exact connection attributes. The primitive shall not be sent immediately after the MAC\_CON-req primitive instead it shall be delayed in order to allow some higher layer exchanges to occur using a C<sub>S</sub> only MAC service. These higher layer exchanges shall be used to agree the wanted service, which shall then be invoked at the MAC layer using the MAC\_MOD primitives.

Connection modification may be used to modify service attributes of established advanced connections of known service type. This may be used by the LLME to optimize the use of the resources by changing the bandwidth of existing connections (including the complete reversal of unidirectional connections) in response to service demands or it may be used in response to a NWK layer request for changing the connection characteristics (i.e. slot type, service type).  $C_F$  service data integrity shall always be preserved during connection modification. If the "minimum bearers" parameter is changed to a value greater than the actual bandwidth, the physical connection will be released if the MAC cannot achieve the new requirement.

Connection modification may occur during connection handover as well.

| Parameter                                    | Information within the parameter   | Normative action/comment  |
|--|------------------------------------|---|
| << MCEI >>                                   | MAC Connection Endpoint Identifier | Refer to EN 300 175-4 [4], clause 10.2.4.4.   |
| << ECN >>                                    | All                                | Refer to EN 300 175-4 [4], clause 10.2.4.4.   |
| << Slot type >>                              | Full slot                          |   |
| << switching >>                              | Non                                |   |
| << Service type >>                           | I <sub>PM</sub> _error_detection   |   |
|  | I <sub>PMR</sub> _error_correction | Optional.   |
|  | I <sub>PQ</sub> _error_detection   | Optional, for modulation scheme 1a and 1b; mandatory, for modulation schemes 2 and 3. |
|  | I <sub>PQR</sub> _error_correction | Optional.   |
| Target number of uplink simplex bearers.     | All                                | In the range agreed by the higher layers.   |
| Target number of downlink simplex bearers.   | All                                | In the range agreed by the higher layers.   |
| Minimum acceptable uplink simplex bearers.   | All                                | In the range agreed by the higher layers.   |
| Minimum acceptable downlink simplex bearers. | All                                | In the range agreed by the higher layers.   |

| Result     | Accept/reject                      |   |

#### Table 73: Values used within the MAC\_MOD-cfm primitive

## 11.9 Encryption switching

The procedure shall be performed as defined in EN 300 175-4 [4], clause 10.6, EN 300 175-7 [7], clauses 6.5.3 and 6.4.6 and EN 300 175-3 [3], clause 6.2.3. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The procedure for encryption deactivation is not required to be supported since a new connection is always established in clear mode. Therefore any connection or link release implies encryption deactivation.

### 11.9.1 Associated procedure

#### 11.9.1.1 Providing Encryption key to the MAC layer

On receipt of the DCK in a DL-ENC\_KEY-req primitive the DLC shall transmit it to the MAC layer.

A record shall be kept for the active (the one used for the current encryption) DCK for use in case of connection handover.

### 11.9.2 Exceptional cases

#### 11.9.2.1 Encryption fails

An encryption attempt which fails means the desired "Crypted" mode is not achieved. If the MAC fails to switch from clear to encrypted mode the connection is released and the DLC layer is informed by a MAC\_DIS-ind primitive. At the peer side this indication shall arrive as a result of the connection release.

#### 11.9.2.2 Connection handover of ciphered connections

During a connection handover the new connection shall always be established in clear (encryption disabled). If the status of the old connection was "Crypted" then the LLME at the PT side shall command the DLC layer to enable ciphering on the new connection as soon as it is established by issuing a MAC\_ENC\_KEY-req primitive to the MAC layer (to provide the cipher key) followed by a MAC\_ENC\_EKS-req primitive with the flag set to "Go Crypted".

NOTE: If during the time that data has been encrypted a new DCK has been produced and stored when a connection handover of ciphered connection is performed the new key is not available at the DLC layer. Therefore the ciphering is performed using the old DCK.

Notification of successful encryption of the new connection shall be indicated by receipt of a MAC\_ENC\_EKS-cfm at the initiating side and a MAC\_ENC\_EKS-ind at the peer side. In this event no indication shall be issued to the NWK layer.

If the encryption of the new connection fails, the connection is released and the DLC layer is informed using the MAC\_DIS-ind primitive. No indication with a MAC\_ENC\_EKS-ind or a MAC\_ENC\_EKS-cfm primitive shall be provided.

## 11.10 Connectionless point-to-multipoint transmission

For the transmission of point-to-multipoint U-plane data the MAC SI<sub>p</sub> channel shall be used which is a connectionless channel that does not provide error corrections via retransmission of PDUs.

The submitted to DLC for connectionless transmission SDU shall be fragmented following the rules of the FU10a frame operation as specified in clause 11.2. Though no acknowledgement shall be provided the PDU shall be numbered to provide correct assembly at the receiving side and error detection. For assigning the numbers modulo 256 shall be used.

The resulted PDUs shall be submitted to  $SI_p$  channel on MAC request preserving the order of SDU fragmentation and the PDU should be removed from the transmitting window if such is applied.

NOTE: There may be terminals that do not listen to connectionless bearers when involved in a connection; for such terminals the information transmitted over the SI<sub>p</sub> channel is expected to be transmitted as normal U-plane data over the existing connection.

## 12 NWK layer procedures

The following clauses define the process mandatory procedures which are in the scope of the DPRS. Some of these procedures introduce modifications to procedures described in EN 300 444 [11] or EN 300 824 [12].

All protocol elements listed in the following clauses are process mandatory i.e. the FT and PT depending on their role in the procedure shall send or shall receive and process the relevant protocol elements as listed in the respective tables if not explicitly stated as being optional.

The primitives used in procedure descriptions are defined only for the purpose of describing layer-to-layer interactions. The primitives are defined as an abstract list of parameters, and their concrete realization may vary between implementations. No formal testing of primitives is intended. The primitive definitions have no normative significance.

This profile does not prevent any PT or FT from transmitting or receiving and processing any other NWK layer message or information element not specified in the profile. A PT or FT receiving an unsupported NWK layer message or information element which it does not recognize shall ignore it, as specified in EN 300 175-5 [5], clause 17. Deviations from this rule, if any, will be explicitly stated.

## 12.1 PT initiated virtual call request

NOTE 1: This procedure is the equivalent to the M<sub>T</sub> requested PDP context activation procedure of GPRS.

The following text together with the associated clauses defines the mandatory requirements with regard to the present document:

The procedure shall be performed as defined in EN 300 444 [11], clause 8.12 for the circuit-switched procedure "outgoing call request" with the following specific provisions:

The information elements supported by the CC-SETUP message depends on the use of feature DPRS-N.34 (Service negotiation at virtual call setup):

If feature DPRS-N.34 is not used or not supported, then:

- The Information element <<Basic Service>> shall be transmitted.
- The field <basic service> in the IE <<Basic service>> shall be set to one of the following basic services defined in EN 300 175-5 [5], clause E.3:
  - Basic service = Light data service with ME Class 4 (code= "1001"B).
  - Basic service = Light data service with ME Class 3 (code= "0011"B).
- The Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> shall not be transmitted.

• The virtual call can only be setup with initial parameters as defined by the basic service.

If feature DPRS-N.34 is supported, then all information elements described in the procedures associate to this feature may be used. The IE <<Basic service>> may also be used defining a default setting for all parameters not transmitted in the IEs. The following values of basic services may be used:

- Basic service = Light data service with ME Class 4 (code= "1001"B).
- Basic service = Light data service with ME Class 3 (code= "0011"B).
- Basic service = Other (code= "1111"B).
- The Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> may be transmitted, and shall be transmitted if the desired settings of the call at any IE does not match exactly with the default setting of the basic service attributes;

NOTE 2: The setting of any multibearer call, or any ME Class 2 call, requires the use of feature DPRS-N.34.

NOTE 3: The parameters transmitted in any of the IEs supersed the default setting done by the "Basic service".

In any case (DPRS-N.34 supported or not), the parameters of the call may be changed after setup using the feature DPRS-N.35, if supported.

| Information element  | Field within the<br>information element | Standard values within the field/information element | Normative action/comment  |
|--|---|--|---|
| << Basic service >>  |   |  |   |
|  | < Basic service >                       | "0110"B  | Light data service default setup attributes with ME Class 4 (see note). |
|  | < Basic service >                       |  | Light data service default setup attributes with ME Class 3 (see note). |
|  | < Basic service >                       | "1111"B  | Other.  |
| NOTE: Default light data service setup attributes are described in clause E.3 of EN 300 175-5 [5]. |   |  |   |

Table 74: Values used within the {CC-SETUP} message

NOTE 4: For the additional information elements needed to identify the required service/parameters see DPRS-N.34 Service Negotiation feature.

## 12.2 FT initiated virtual call request

NOTE 1: This procedure is the equivalent to the Network requested PDP context activation procedure of GPRS.

The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The procedure shall be performed as defined in EN 300 444 [11], clause 8.12 for the circuit switched procedure "incoming call request" with the following specific provisions.

The information elements supported by the CC-SETUP message depends on the use of feature DPRS-N.34 (Service negotiation at virtual call setup).

If feature DPRS-N.34 is not used or not supported, then:

- The Information element <<Basic Service>> shall be transmitted.
- The field <basic service> in the IE <<Basic service>> shall be set to one of the following basic services defined in EN 300 175-5 [5], clause E.3:
  - Basic service = Light data service with ME Class 4 (code= "1001"B).
  - Basic service = Light data service with ME Class 3 (code= "0011"B).

• The Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> shall not be transmitted.

153

• The virtual call can only be setup with initial parameters as defined by the basic service.

If feature DPRS-N.34 is supported, then all information elements described in the procedures associate to this feature may be used. The IE <<Basic service>> may also be used defining a default setting for all parameters not transmitted in the IEs. The following values of basic services may be used:

- Basic service = Light data service with ME Class 4 (code= "1001"B).
- Basic service = Light data service with ME Class 3 (code= "0011"B).
- Basic service = Other (code= "1111"B).
- The Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> may be transmitted, and shall be transmitted if the desired settings of the call at any IE does not match exactly with the default setting of the basic service attributes.

NOTE 2: The setting of any multibearer call, or any ME Class 2 call, requires the use of feature DPRS-N.34.

NOTE 3: The parameters transmitted in any of the IEs supersed the default setting done by the "Basic service".

In any case (DPRS-N.34 supported or not), the parameters of the call may be changed after setup using the feature DPRS-N.35, if supported.

| Information element    | Field within the<br>information element | Standard values within<br>the field/information<br>element | Normative action/comment   |
|------------------------|---|--|--|
| << Basic service >>    |   |  |  |
|                        | < Basic service >                       | "0110"B  | Light data service default setup attributes with ME Class 4 (see note) |
|                        | < Basic service >                       | "0011"B  | Light data service default setup attributes with ME Class 3 (see note) |
|                        | < Basic service >                       | "1111"B  | Other  |
| NOTE: Default light of | ata service setup attribut              | es are described in clause                                 | E.3 of EN 300 175-5 [5].   |

Table 75: Values used within the {CC-SETUP} message

NOTE 4: For the additional information elements needed to identify the required service/parameters see DPRS-N.34 Service Negotiation feature.

## 12.3 Terminal capability indication

The procedure shall be performed as defined in EN 300 444 [11], clause 8.17. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

In addition the following fields need to be supported in regard to the particular DPRS application supported, see annexes B and C.

### Table 76: Values used within the << TERMINAL CAPABILITY >> information element

| Information element       | Field within the<br>information element | Standard values<br>within the<br>field/information<br>element | Normative action/comment   |
|---------------------------|---|---|--|
| << Terminal capability >> |   |   |  |
|                           | < ext3 ><br>< Tone capability >         | 1,0<br>All  | DPRS does not support tone capability.<br>PT shall set it according to its<br>capabilities; the FT is not required to                              |
|                           | < Display Capability >                  | All   | understand it.<br>PT shall set it according to its   |
|                           |   | ,   | capabilities; the FT is not required to<br>understand it if the FT does not provide<br>DECT display services.                                      |
|                           | < Echo parameter >                      |   | See note 3.  |

|                     |   | "x x x x x x 1"B  | OPTIONAL (E+U-type mux and channel<br>I <sub>PF</sub> basic procedures supported,<br>see note 7).   |
|                     |   | "x x x x x 1 x"B  | OPTIONAL (Channel I <sub>PF</sub> advanced procedures supported).   |
|                     |   | "x x x x 1 x x"B  | OPTIONAL (Channel SI <sub>PF</sub> supported).  |
|                     | <packet category="" data=""></packet>                 | All   | OPTIONAL (NG-DECT Packet Data<br>Category).   |
|                     | < ext4h >   | 1   |   |
|                     |   | "x x x x x x 1"B  | OPTIONAL (DPRS Class 3<br>management and A-field procedures<br>(DPRS-M.30) supported, see note 8).  |
|                     |   | "x x x x x 1 x"B  | OPTIONAL (DPRS Class 4<br>management and A-field procedures<br>(DPRS-M.30) supported, see note 9).  |
|                     |   | "x 1 x x x x x x"B  | OPTIONAL (Support of Light data<br>services (TS 102 527-4 [i.2] and see<br>note 10).  |
|                     | < ext6 >  | 0,1   | ,   |
|                     | < Blind slot indication >                             | All   | PT shall set the value according to its<br>support; FT shall understand all values<br>in order to be able to setup bearers.<br>Value "11" shall be used to indicate that<br>the FT shall read the following SPx<br>fields in order to establish the exact PT<br>limitations (see note 4). |
|                     | < SP0 > to < SP4 >                                    | All   | PT shall set the value according to its<br>support; FT shall understand all values<br>in order to be able to setup bearers<br>(see note 4).   |
|                     | < ext6a >   | 1   |   |
|                     | < SP5 > to < SP11 ><br>set to "1" If service is V.24. |   | PT shall set the value according to its<br>support; FT shall understand all values<br>in order to be able to setup bearers<br>(see note 4).   |

NOTE 1: This bit shall be set to "1" If service is V.24.

NOTE 2: At least one of these bit maps shall contain 1.

- NOTE 3: All this values are out of the scope of the DPRS and need not to be included; however, if an application wished to indicate Display capabilities including octets from Octet 3d onwards, these fields may be set to "Not applicable".
- NOTE 4: PTs that have limitations shall always indicate them. However, as this requirement for indication of the PT blind slots has been introduced to DPRS after version 1.1.1, some PTs developed before this change may still have limitation but will not be able to indicate them to the FT. Therefore, a FT supporting fast setup should be aware that failure of the setup may be due to PT limitations which has not been announced. Some examples of possible limitations could be inability of the PT to receive setup on slots adjacent to the slot on which the PT is locked or currently transmitting, or PT is able to receive only on every second slot odd or even. In such situation the FT should repeat the setup on different slot expecting possible limitations.
- NOTE 5: All Profile indicators fields shall be included and set according to the support of the particular item. For backwards compatibility, if Profile\_indicator\_5 is not included it shall be understood that the PT supports only 2-level modulation scheme.

NOTE 6: IF DPRS-ME.2 THEN "1" ELSE "0".

- NOTE 7: IF DPRS-M.23 THEN MANDATORY ELSE OPTIONAL.
- NOTE 8: IF DPRS-ME.3 THEN "1" ELSE "0".
- NOTE 9: IF DPRS-ME.4 THEN "1" ELSE "0".
- NOTE 10: IF Ligh Data Services (TS 102 527-4 [i.2]) supported THEN "1" ELSE "0".

NOTE 11: IF DPRS-M.19 THEN "1" ELSE "0".

## 12.4 Internal call keypad

The procedure shall be performed as defined in EN 300 444 [11], clause 8.19. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

This type of internal calls cannot negotiate service parameters at establishment phase, the negotiated for the existing call service parameters can only be used. If new call service parameters are required the procedures related to feature "In call service change" shall be used.

## 12.5 Call Resources/Parameters negotiation

The procedure relates to feature Service Negotiation [DPRS-N.34] and shall be performed as defined in EN 300 175-5 [5], clauses 9.3.1.3, 9.3.2.3, 15.2.4 and 15.2.5. The following text together with the associated clauses defines the mandatory requirements with regard to the present document. The procedure introduces modification to the Outgoing call request and Incoming call request procedures as defined in EN 300 444 [11], clauses 8.2 and 8.12 respectively, and to the External Handover Setup as defined in EN 300 824 [12]. The procedure introduces as well modification to the Overlap Sending, Outgoing Call connection and Incoming call confirmation procedures as defined in EN 300 444 [11], clauses 8.3, 8.6 and 8.13 respectively. All modifications constitute information elements that need to be provided in addition to the already specified elements in other clauses.

To indicate/negotiate the exact parameters of the requested service the initiating side shall include into the {CC-SETUP} message:

- a << IWU ATTRIBUTES >> information element used to indicate the type/characteristics of the service requested;
- a << CALL ATTRIBUTES >> information element;
- a << CONNECTION ATTRIBUTES >> information element;
- a << TRANSIT DELAY >> information element;
- a << WINDOW SIZE >> information element.

#### Table 77: Values used within the {CC-SETUP} message

| Information element  | Field within the<br>information element                   | Standard values within the field/information element | Normative action/comment   |
|----------------------|---|--|--|
| << IWU attributes >> |   |  |  |
|                      | < Lenght of Contents >                                    | 4 to 70  | Values > 7 possible with IP IWU or<br>D-GMEP.<br>Values 9 and 11 possible with IPv4<br>address transported.<br>Values 21, 23 possible with IPv6 address<br>transported.<br>Max value 70 possible with D-GMEP,<br>4 context operations coded all with<br>optional IP control group, and separate<br>SDU size setting per direction. |
|                      | < Coding standard >                                       | 01   | Profile defined coding.  |
|                      | < Profile >   | 00000<br>00001                                       | FREL support.<br>Stream support.   |
|                      | < Negotiation Indicator >                                 | 000,<br>010  | <ul> <li>Negotiation not possible (see note 1).</li> <li>Peer attribute negotiation.</li> </ul>  |
|                      | <maximum sdu="" size=""><br/>(octets 5 and 5a)</maximum>  | ≥ 191 (equivalent to<br>1528 octets)                 | At least 1528 octets (codec as 191) shall be supported (see note 7).   |
|                      | <maximum sdu="" size=""><br/>(octets 5b and 5c)</maximum> | ≥ 191 (equivalent to<br>1528 octets)                 | Optional octet. Used only if $FP \Rightarrow PP$ and $PP \Rightarrow FP$ values are different.   |

| Information element            | Field within the<br>information element | Standard values within the field/information element |   |
|--------------------------------|---|--|---|
|                                | < Profile Subtype >                     | All  | The required for support value and the complete structure of the IWU attributes relevant to the present document are defined in the relevant Interworking annexes of the present document.<br>If IP IWU, an IPv4 or IPv6 address may be optionally transported.<br>If D-GMEP, see clause B.8. |
| << Call attributes >>          |   |  | DPRS requires for support only one set of<br>Call attributes. If this information element<br>is not included, default values shall be<br>assumed (see clause 12.5.1).   |
|                                | < Coding standard >                     | 00   |   |
|                                | < NWK layer attributes >                | 00010, 00011, 00110                                  | DPRS Class 2, DPRS Class 3, DPRS<br>Class 4. Only values for implemented ME<br>Classes need to be supported.  |
|                                | < C-plane class >                       | 010  | Class A shared is only mandatory, rest<br>are optional and need not be supported<br>by the peer side.   |
|                                | < C-plane routing >                     | 0000,<br>0100  | C <sub>S</sub> only;<br>C <sub>F</sub> only;<br>Support of C <sub>F</sub> is optional.  |
|                                | < ext5 >                                | 1  |   |
|                                | < U-plane symmetry >                    | 00   | Symmetric (see note 6).   |
|                                | < LU identification >                   | 01010  | LU10.   |
|                                | < ext6 >                                | 1  | 2010.   |
|                                | < U-plane class >                       | 101  | Class 2; SELective.   |
|                                | < U-plane frame type >                  | 1010   | FU10a/c mandatory for support.  |
|                                |   | 1010   | FU10b optional, allowed only in<br>symmetric connections - can only be<br>used if both sides indicate the support of<br>FU10b, FU10a shall be used otherwise.   |
| << Connection<br>attributes >> |   |  | Signifies the maximum capabilities of the sender for the requested call. If not included the default value shall be assumed (see clause 12.5.1).  |
|                                | < Symmetry >                            | 001<br>010<br>101<br>110                             | Symmetric only connection.<br>Asymmetric reversible.<br>Asymmetric one-way-only.<br>Asymmetric unrestricted.  |
|                                |   |  | Asymmetric types are not applicable when operating in ME Class 3 or 4.  |
|                                | < Connection identity >                 | 0000   | Not yet numbered.   |

|  | < Window size value PT $\Rightarrow$ FT >  | All  | The value shall be placed in both 3 and<br>3a octets as defined in EN 300 175-5 [5<br>clause 7.7.43 (for the range of allowed<br>values see clause 11.1.1).<br>Maximum allowed for this profile<br>value = 256 (see note 3). |
|  | ext3a  | 1  |  |
|  | < Window size value<br>PT $\Rightarrow$ FT continue >  | All  |  |
|  | ext4   | 0  |  |
|  | < Window size value<br>FT ⇒ PT >   | All  | The value shall be placed in both 3 and<br>3a octets as defined in EN 300 175-5 [5<br>clause 7.7.43 (for the range of allowed<br>values see clause 11.1.1).<br>Maximum allowed for this profile<br>value = 256.              |
|  | ext4a  | 1  |  |
|  | < Window size value<br>FT $\Rightarrow$ PT continue >  | All  |  |
| clause 12.5.<br>NOTE 2: If octet group | hay only be used if all other<br>1).<br>5 4 (i.e. 4, 4a, 4b) is omitte<br>ntroduced in clause 11.1.1 |  |  |

NOTE 4: The direction of the connection downlink (FT-to-PT) or up-link (PT-to-FT) will be dynamically negotiated at MAC layer.

NOTE 5: For backwards compatibility, if octet 7 is not included support of 2-level modulation scheme for both A- and B-field shall be assumed.

NOTE 6: If "Symmetric" is indicated octets 4b, 4c, 5a and 6a need not to be included.

NOTE 7: Value 191 (equivalent to 1528 octets) is coded as "0000001"B in octet 5 and "0111111"B in octet 5a.

If the parameters as indicated in the {CC-SETUP} message are not acceptable and support of negotiation is indicated in the << IWU-ATTRIBUTES >> the receiving side shall attempt negotiation if different services are possible, otherwise the call shall be rejected using the Abnormal call release procedure as defined in EN 300 444 [11], clause 8.7.

For negotiation of  $\langle$  IWU-ATTRIBUTES  $\rangle$  and  $\langle$  CONNECTION ATTRIBUTES  $\rangle$  the Peer attribute negotiation procedure as defined in EN 300 175-5 [5], clause 15.2.5, shall be used. For negotiation of the  $\langle$  TRANSIT DELAY  $\rangle \rangle$  and the  $\langle$  WINDOW SIZE  $\rangle \rangle$  the Operating parameter negotiation procedure as defined in EN 300 175-5 [5], clause 15.2.4 shall be used. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

If some of the proposed services in the {CC-SETUP} message are not acceptable the peer entity shall continue the call setup procedure by including one alternative service description returning the appropriate << CONNECTION ATTRIBUTES >> and/or << CALL ATTRIBUTES >> and/or << IWU-ATTRIBUTES >> and/or << WINDOW SIZE >> and/or << TRANSIT DELAY >> elements in the first response message (i.e. {CC-SETUP-ACK} or {CC-CONNECT} for FT, {CC-ALERTING} for PT).

If one or more of the values are acceptable the receiving side shall return unmodified parameters as formal acceptance of these unmodified values.

In the case related to the number of bearers to be used the peer side shall only return a value less than or equal to the initial offer; in all other cases, the allowed answer in case of acceptance of the call is indicated in table 78. If the initiating side has suggested values lower than the default values indicated in clause 12.5.1, the responding side may reject the call using the abnormal NWK release procedure.

162

The initiating side shall accept any reduced value if it does not fell below the default values for the particular parameter, and may but is not required to accept values lower than the default values indicated in clause 12.5.1. The initiating entity shall indicate its acceptance of these new attributes by proceeding with the normal call setup procedures. For the behaviour in case the negotiation fails see clause 12.5.2.

The negotiation of the lower resources is performed at higher layers where exchange of NWK layer messages is involved. The resources assignment is done at the lower layers. To provide proper functioning the LLME shall ensure that all responsible for the implementation of the agreed parameters layers and processes are informed in time for the result from the NWK layer procedures and especially before a resources allocation/modification is to be made at the lower layers.

The bandwidth negotiation at MAC may fail due to one of the sides being yet not informed for the negotiated values. This shall not lead to release of the call, the procedure shall be repeated.

An example for information exchange sequence is given in figure 22.

NOTE: The transmission of CC-SETUP and CC-CONNECT throughout the layers is not shown. Full contents of messages and primitives are not shown. Primitives are informative.

Figure 22: Service/parameters negotiation interlayer exchange

163

## 12.5.1 Default values

When an information element as listed below is not included the specified in this clause default values shall be assumed. In any case, in order to avoid misunderstanding the responding side shall always include the relevant information elements, even if the default values are supported.

| Information element   | Field within the<br>information element | Standard values within the field/information element | Normative action/comment |  |  |

Table 82: Default values for << Window size >> in the "request" message

165

## 12.5.2 Exceptional cases

If the negotiation fails, e.g. a side has suggested values lower than the default values or service that is not supported, the call shall be released using the abnormal NWK layer release procedure. An alternative set of values shall be suggested.

The {CC-RELEASE-COM} message shall be used.

| Information element         | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|-----------------------------|---|--|--|

|                             | < Reason >                              | 0B   | Negotiation failed.  |
| << IWU attributes >>        |   |  | Shall be included if the negotiation<br>failed due to unacceptable services<br>indicated in the received<br><< IWU attributes >> suggesting an<br>alternative proposal.        |
| << Connection attributes >> |   |  | Shall be included if the negotiation<br>failed due to unacceptable services<br>indicated in the received<br><< Connection attributes >><br>suggesting an alternative proposal. |

### 12.5.3 IP address allocation (IP IWU only)

This clause applies only to Interworking type Internet Protocol (clause B.6).

If IWU is Internet Protocol (IP), (clause B.6), an IPv4 or IPv6 address may be transported over the Profile subtype octets. An IP address sent by the FT to the PT has the meaning of a dynamic IP address allocated to such PP by the FP. In the message sent by the PP to FP, the IP address field shall be transmitted set to 0.0.0.0, indicating that the PP expects an IP address in the response.

Only the transport of the addresses for the supported versions of IP (IPv4 and/or IPv6) needs to be implemented.

## 12.6 Service Change procedures

# 12.6.1 Service change - Bandwidth Change (including symmetry type indicator)

The procedure relates to feature In Call Service Change [DPRS N.35] and shall be performed as defined in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Bandwidth changes shall be defined as changes that may be realized by modification of the existing MAC connection. The << CONNECTION-ATTRIBUTES >> element shall always be included to define the new connection bandwidths.

The procedure may be also used for changing of the symmetry type of the connection, by including the target symmetry type in the << CONNECTION-ATTRIBUTES >> Information Element.

The modification of Bandwidth parameters, including the symmetry type, at NWK layer, modifies the limits for the allowed bandwidth states of the connection. MAC layer is allowed to dynamically change the instantaneous bandwidth of the connection according to traffic demands, within the limits set at NWK layer.

#### Table 84: Values used within the {CC-SERVICE-CHANGE} message

| Information element         | Field within the<br>information element | Standard values within the field/information element | Normative action/comment  |  |  |
|-----------------------------|---|--|---|--|--|

the requested settings.

#### Table 85: Values used within the {CC-SERVICE-ACCEPT} message

### 12.6.1.1 Associated procedures

#### 12.6.1.1.1 Timer F/P < CC\_service > management

< CC\_service >: Service Change timer.

Value: 20 seconds.

Start: {CC-SERVICE-CHANGE} message is sent.

Stop: An indication for link release from the DLC is received; A {CC-SERVICE-ACCEPT} or a {CC-SERVICE-REJECT} message is received; {CC-RELEASE}, {CC-RELEASE-COM} messages are sent or received.

#### 12.6.1.2 Exceptional cases

#### 12.6.1.2.1 Service change request is rejected

If the receiving side is not able to handle the requested service change it shall reject it.

#### Table 86: Values used within the {CC-SERVICE-REJECT} message

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment |
|---------------------|---|--|--------------------------|
| See table 84        | See table 84                            | See table 84   | All optional.            |

#### 12.6.1.3 Examples

The modification of the lower resources is initiated from the higher layers where exchange of NWK layer messages is involved. The resources assignment is done at the lower layers. To provide proper functioning the LLME shall ensure that all responsible layers and processes are informed in time for the result from the NWK layer procedures before a resources allocation/modification is to be made at the lower layers.

Figure 23: Example of service change with the receiving side initiating the resources allocation

## 12.6.2 Service change - slot type change

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The slot type associated to the connection may be changed by invoking the Service Change Procedure with the Information Element <<Connection-ATTRIBUTES >> indicating the target slot type. Upon successfully completion of the NWK layer procedure, then the MAC layer procedure for changing slot type shall be performed as described in clause 10.7.2.2.

## The allowed parameters in the Information Element <<Connection-ATTRIBUTES >> are indicated in table 84 of clause 12.6.1.

Only changes to values of parameters corresponding to implemented slot types need to be supported. Implementation should be able to reply with a {CC-SERVICE-REJECT} if a change to a not supported value is intended.

#### 12.6.2.1 Associated procedures

See clause 12.6.1.1.

#### 12.6.2.2 Exceptional cases

See clause 12.6.1.2.

#### 12.6.2.3 Examples

See clause 12.6.1.3.

## 12.6.3 Service change - MAC service change

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The MAC service associated to the connection may be changed by invoking the Service Change Procedure with the Information Element <<Connection-ATTRIBUTES >> indicating the target MAC service type. Upon successfully completion of the NWK layer procedure, then the MAC layer procedure for changing service type shall be performed as described in clause 10.7.2.1.

The allowed parameters in the Information Element <<Connection-ATTRIBUTES >> are indicated in table 84 of clause 12.6.1.

Only changes to values of parameters corresponding to implemented MAC services need to be supported. Implementation should be able to reply with a {CC-SERVICE-REJECT} if a change to a not supported value is intended.

### 12.6.3.1 Associated procedures

See clause 12.6.1.1.

### 12.6.3.2 Exceptional cases

See clause 12.6.1.2.

#### 12.6.3.3 Examples

See clause 12.6.1.3.

### 12.6.4 Service change - modultation schema change

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

In systems supporting High Level Modulation, the modulation level associated to the connection may be changed by invoking the Service Change Procedure with the Information Element <<<CONNECTION-ATTRIBUTES >> indicating the target A and B field modulation levels.

The allowed parameters in the Information Element <</Connection-ATTRIBUTES >> are indicated in table 84 of clause 12.6.1.

Only changes to values of modulation level parameters corresponding to implemented modes need to be supported. Implementation should be able to reply with a {CC-SERVICE-REJECT} if a change to a not supported value is intended.

#### 12.6.4.1 Associated procedures

See clause 12.6.1.1.

#### 12.6.4.2 Exceptional cases

See clause 12.6.1.2.

#### 12.6.4.3 Examples

See clause 12.6.1.3.

# 12.6.5 Service change - DPRS Management Class and other Call-attributes change

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

171

The DPRS management Entity Class associated to the connection may be changed by invoking the Service Change Procedure with the Information Element <<<CALL-ATTRIBUTES >> indicating the target DPRS ME Class in the field </Network layer Attributes>.

The procedure may be also invoked to change any other parameter in IE <<CALL-ATTRIBUTES>> such as LU type and frame or C-plane channel.

The allowed parameters in the Information Element <<CALL-ATTRIBUTES >> are the same indicated in tables 78 and 79 of clause 12.5.

Only changes to values of parameters corresponding to implemented features/services need to be supported. Implementation should be able to reply with a {CC-SERVICE-REJECT} if a change to a not supported value is intended.

#### 12.6.5.1 Associated procedures

See clause 12.6.1.1.

#### 12.6.5.2 Exceptional cases

See clause 12.6.1.2.

#### 12.6.5.3 Examples

See clause 12.6.1.3.

# 12.6.6 Service change - MAC Packet lifetime, DLC Window size, DLC Transit delay and $C_F$ channel attributes change

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The MAC Packet lifetime, DLC Window size, DLC Transit delay and  $C_F$  channel attributes associated to the connection may be changed by invoking the Service Change Procedure.

For changing the MAC Packet lifetime or the C<sub>F</sub> channel attributes, the Information Element <<< CONNECTION-ATTRIBUTES >> shall be used indicating the target parameters.

For changing the DLC Window size, the Information Element <<WINDOW-SIZE >> shall be used indicating the target value(s) of the Window size.

For changing the DLC Transit Delay, the Information Element *<*<TRANSIT-DELAY *>>* shall be used indicating the target values of the Transit Delay.

The allowed parameters in these Information Elements are the same indicated in tables 78 and 79 of clause 12.5.

Only changes to values of parameters corresponding to implemented features/services need to be supported. Implementation should be able to reply with a {CC-SERVICE-REJECT} if a change to a not supported value is intended.

MAC Packet lifetime change needs to be supported only if MAC Ip\_error\_correct services are implemented.

#### 12.6.6.1 Associated procedures

See clause 12.6.1.1.

#### 12.6.6.2 Exceptional cases

See clause 12.6.1.2.

#### 12.6.6.3 Examples

See clause 12.6.1.3.

## 12.7 Service change - IWU-attributes change

### 12.7.1 IWU-attributes change - General

The procedure relates to feature In Call Service Change [DPRS-N.35] and is similar to the Bandwidth change procedure as described in clause 10.7.1 and in EN 300 175-5 [5], clauses 9.6.1 and 9.6.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

172

The IWU- attributes change shall be defined as changes that may be realized by modification of the existing MAC connection. The << IWU-ATTRIBUTES >> element shall always be included to define the new settings.

For the {CC-SERVICE-CHANGE}, {CC-SERVICE-ACCEPT} and {CC-SERVICE-REJECT} the requirements from clause 12.6 apply with the following modification.

| Information element       | Field within the<br>information element                   | Standard values<br>within the<br>field/information<br>element | Normative action/comment   |  |  |  |
|---------------------------|---|---|--|--|--|--|
| << IWU attributes >>      |   |   |  |  |  |  |
|                           | < Lenght of Contents >                                    | 4 to 23   | Values > 7 only possible with IP IWU.<br>Values > 5 only possible if octets 5b/5c<br>provided or IP IWU.   |  |  |  |
|                           | < Coding standard >                                       | 01  |  |  |  |  |
|                           | < Profile >   | 00001   | Stream support.  |  |  |  |
|                           |   | 00000   | FREL support.  |  |  |  |
|                           | < Negotiation Indicator >                                 | 000, 010  | Shall be as set during the call establishment.   |  |  |  |
|                           | < Profile Subtype >                                       | 0000  | Ethernet (WLAN).   |  |  |  |
|                           |   | 1000  | Interworking to V.24 circuits (RS232).   |  |  |  |
|                           |   | 0001  | IEEE 802.5 [14] (see clause B.5).  |  |  |  |
|                           |   | 0010  | Internet Protocol (IP) (see clause B.6).   |  |  |  |
|                           |   | 0100  | Point-to-Point Protocol (see clause B.7).  |  |  |  |
|                           |   | 1000  | DPRS Generic Media Encapsulation<br>Protocol (see clause B.8).   |  |  |  |
|                           | <maximum sdu="" size=""></maximum>                        | ≥ 191 (equivalent to  | At least 1 528 octets (codec as 191) shal  |  |  |  |
|                           | (octets 5 and 5a)   | 1 528 octets)   | be supported (see note).   |  |  |  |
|                           | <maximum sdu="" size=""><br/>(octets 5b and 5c)</maximum> | ≥ 191 (equivalent to<br>1 528 octets)                         | Optional octet. Used only if FP $\Rightarrow$ PP and PP $\Rightarrow$ FP values are different.   |  |  |  |
|                           | < Profile Subtype<br>attributes>                          | All   | The required for support value and the complete structure of the IWU attributes in regard to the present document are defined in the relevant Interworking annexes of the present document. If IP IWU, an IPv4 or IPv6 address may be optionally transported. See clauses B.8 and B.2 for Generic Media Encapsulation. |  |  |  |
| << Service Change Info >> |   |   |  |  |  |  |
| -                         | < Ext3 >  | 1   |  |  |  |  |
|                           | < Change Mode >   | 1100  | IWU attribute change.  |  |  |  |
| NOTE: Value 191 (equiva   | alent to 1 528 octets) is coo                             | ded as "0000001"B in c  | octet 5 and "0111111"B in octet 5a.  |  |  |  |

Table 87: Values used within the {CC-SERVICE-CHANGE} message

173

### 12.7.1.1 Associated procedures

See clause 12.6.1.1.

#### 12.7.1.2 Exceptional cases

See clause 12.6.1.2.

#### 12.7.1.3 Examples

See clause 12.6.1.3.

## 12.7.2 Interworking type change

The IWU-attributes change may be used to change the Interworking type and the protocol transported over DPRS. Procedure is executed using the Service Change procedure and indicating the target interworking type in the profile subtype field. The profile subtype attributes (octet 6) may also be provided in the message.

## 12.7.3 IP address change (IP IWU)

This clause applies only to Interworking type Internet Protocol (clause B.6).

The change of the IP address is a particular case of IWU attributes change. If IWU is Internet Protocol (IP, clause B.6), an IPv4 or IPv6 address may be transported over the Profile subtype octets. An IP address sent by the FT to the PT has the meaning of dynamic IP address allocated to such PP by the FP. Therefore, the Service Change procedure may be used to allocate or re-allocate such IP address.

Only the transport of the addresses for the supported versions of IP (IPv4 and/or IPv6) needs to be implemented.

## 12.7.4 Maximum SDU size change

The IWU-attributes change may be used to change the Maximum SDU size. Procedure is executed using the Service Change procedure and indicating the target maximum SDU size(s) in octets 5-5c.

## 12.8 Dynamic Parameters Allocation

The procedure is related to feature DPRS-N.33, Dynamic parameters allocation. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

For proper functioning of the DPRS protocol it is necessary a number of dynamic parameters to be allocated beforehand. For this purpose exchange of information included in << SETUP-CAPABILITY >> information element is necessary. As these parameters are used in MAC or elsewhere operation for the related behaviour and requirements clauses 9, 10 or 11 may be relevant as well.

| Bit:                                 | 8                      | 7                                     | 6  | 5                  | 4         | 3          | 2     | 1  | Octet:   |

Figure 24: SETUP-CAPABILITY information element for DPRS

Service settings (octet group 4): This is a bit mapped octet group. A "1" indicates support for the specified service setting. Reserved bits shall be set to zero and need not be checked in the receiver.

#### MAC settings (bits 1, 2, 3 of octet 4)

interface.

| Bits | 321              | Meaning  |
|------|------------------|--|
|      | x x 1            | $I_{P\_error\_correct}$ ( $I_{PMR}$ or $I_{PQR}$ ) supported.          |
|      | 0 1 x            | Allow suppression of bearer quality messages for asymmetric connection |
|      |                  | (EN 300 175-3 [3], clause 7.3.5.4) only if all Q2 bits are = 1.        |
|      | 1 0 x            | Allow suppression of bearer quality messages for asymmetric connection |
|      |                  | (EN 300 175-3 [3], clause 7.3.5.4) in any case.                        |
|      | All other values | reserved.  |

Support of simultaneous DPRS and voice calls (bits 4, 5 of octet 4)

| Bits | 54  | Meaning  |
|------|-----|--|
|      | 11  | Support of simultaneous DPRS and voice active calls (see note 1).  |
|      | 10  | Support of simultaneous DPRS logical (but not active) calls plus an active voice call (see notes 2 and 3). |
|      | 01  | Simultaneous DPRS and voice calls not supported, however switching procedure supported (see note 4).       |
|      | 0 0 | No information provided or no simultaneous support at all.   |

#### Support of multiple DPRS connections (bits 6, 7 of octet 4)

| Bits | 76  | Meaning  |
|------|-----|--|
|      | 11  | Support of multiple simultaneous DPRS logical and active physical connections (see notes 5, 7 and 8).  |
|      | 10  | Support of multiple simultaneous DPRS logical connections (but not active, see notes 6, 7 and 8).  |
|      | 01  | Reserved.  |
|      | 0 0 | Multiple DPRS connections not supported.   |
| N    |     | his flag indicates that the sending peer is able to support simultaneously a voice service call plus one or veral (depending on bits 6 and 7) DPRS active connections, all of them with bearers over the air |

- NOTE 2: This flag indicates that the sending peer does not support simultaneously a voice call plus one or several DPRS active connections. However it supports a voice service call in active state combined with one or more DPRS connections (as indicated by bits 6 and 7) in suspend state.
- NOTE 3: In this case, the active voice call is considered as valid handshake for the DPRS connection(s). So there is no need for DPRS handshake procedure when the voice call is active.
- NOTE 4: In this case, the DPRS call has to be released in order to complete the setup of the voice call and vice versa. The flag indicates that the peer is able to execute the switching procedure.
- NOTE 5: This flag indicates that the sending peer is able to support multiple simultaneous active DPRS connections with bearers over the air interface.
- NOTE 6: This flag indicates that the sending peer is able to support multiple simultaneous logical DPRS connections, but not active at the same time.
- NOTE 7: Both, virtual calls and PVCs are considered DPRS connections.

NOTE 8: This is in addition to the possible support of a simultaneous voice call as indicated by bits 4 and 5.

Service\_settings\_n Coding (Octet 4n-1): This is provided in case of demands for further DPRS standardization.

**Parameters\_settings\_1** (octet group 5): This is a bit mapped octet group. A "1" indicates that value for the particular parameter is provided in octect 6. Otherwise the default value for this parameter shall be assumed. Reserved bits shall be set to zero and need not be checked in the receiver.

NOTE 9: The default values for all parameters are provided in annex A.

#### Parameters\_settings\_1 (octet group 5):

| Bits | 7654321         | Meaning  |
|------|-----------------|--|
|      | x x x x x x 1   | Timer T903 value is provided (in octect 6).  |
|      | x x x x x 1 x   | Timer T904 value is provided (in octect 6a).   |
|      | x x x x 1 x x   | Timer T905 value is provided (in octect 6b).   |
|      | x x x 1 x x x   | Timer T909 value is provided (in octect 6c).   |
|      | x x 1 x x x x   | Timer T910 value is provided (in octect 6d).   |
|      | x 1 x x x x x   | Timer T911 value is provided (in octet 6e).  |
|      | 1 x x x x x x x | Supported connection types and maximum bearers numbers is provided (in octet 6f and 6g). |

Parameter\_settings 2 and beyond are reserved for further expansion of the set of parameters. Meanwhile, the bit 8 of octet 5 (Parameter\_settings\_1) shall be set to 1.

When number of values are provided they shall be provided in the order indicated here.

EXAMPLE: If only T905 and T910 values are included, octets 5, 6b and 6d need to be included in this order.

#### Parameters (Octet group 6):

**Timer T903 value (octet 6):** The value shall be binary coded with 1 unit = 2 frames; the value "11111111" is reserved and shall not be used.

**Timer T904 value (octet 6a):** The value shall be binary coded with 1 unit = 1 frame; the value "11111111" is reserved and shall not be used.

**Timer T905 value (octet 6b):** The value shall be binary coded with 1 unit = 1 frame; the value "11111111" is reserved and shall not be used.

**Timer T909 value (octet 6c):** The value shall be binary coded with 1 unit = 1 multi frame; the value "11111111" shall be understood as "infinite"; If the < Setup capability coding > value indicates "01" this value (if included) shall be set to "0".

**Timer T910 value (octet 6d):** The value shall be binary coded with 1 unit = 4 multi frames; the value "11111111" shall be understood as "infinite".

**Timer T911 value (octet 6e):** The value shall be binary coded with 1 unit = 4 multi frames; the value "11111111" shall be understood as "infinite".

#### **Bearers support (octets 6f and 6g):**

It indicates which types of connection (within the types described in < Connection Attributes >, see EN 300 175-5 [5], clause 7.7.11), and the maximum number of bearers that are supported for the FT or PT sending the parameter.

These octets have the following structure:

#### Bearers support 1<sup>st</sup> octet (octet 6f):

 Bits
 8 7 6
 Meaning

 x x 1
 Symmetric only connections supported (see EN 300 175-5 [5], clause 7.7.11).

 All other values
 Reserved

 Reserved bits 7 and 8 shall be set to "0".

| Bits | 54321 | Meaning  |
|------|-------|--|
|      | NNNNN | Maximum supported number of bearers upstream (see note 2). |

NOTE 10: The maximum supported number of bearers parameters refers to the maximum value that can be set by a call under current conditions. When broadcasted by the FP, the value can be dynamically changed according to the situation.

#### Bearers support 2<sup>nd</sup> octet (octet 6g):

| Dealers support 2 |      | is support 2 | verer (verer vg).  |
|-------------------|------|--------------|--|
|                   | Bits | 876          | Meaning  |
|                   |      | x x 1        | Asymmetric reversible connections supported (see EN 300 175-5 [5], clause 7.7.11).   |
|                   |      | x 1 x        | Asymmetric one-way-only connections supported (see EN 300 175-5 [5], clause 7.7.11). |
|                   |      | 1 x x        | Asymmetric unrestricted connections supported (see EN 300 175-5 [5], clause 7.7.11). |
|                   |      |              |  |

#### Bits 54321 Meaning

NNNNN Maximum supported number of bearers downstream (see note 2).

More Parameters may be added in future standardization by including of octet 6h and following 6i, ... 6n.

Application protocol Indicator coding (Octet group 7): The coding of these octets is relevant to the DPRS Generic media encapsulation transport support and is provided in clause 12.22.

For the DPRS, the << SETUP-CAPABILITY >> information element as defined in EN 300 175-5 [5], clause 7.7.40 shall apply with the following additions/modifications.

Table 88: Values used within the << SETUP-CAPABILITY >> information element

| Information element    | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|------------------------|---|--|--|
| << Setup capability >> |   |  |  |
|                        | < ext3 >                                | 1  |  |
|                        | < Protocol discriminator >              | 001  | DPRS.  |
|                        | < fast setup capability>                | 01   | Default value - mandatory to support .<br>Indicates that Fast setup is not<br>supported.   |
|                        |   | 10   | Fast setup supported.  |
|                        | < Page capability>                      | 01   | Default value - mandatory to support<br>indicates normal duty cycle paging only.<br>Flags are understood as support when<br>no virtual call is in progress.          |
|                        |   | 10   | Fast paging supported (when no data call is in progress).  |
|                        |   | 00   | Low cycle paging supported (when no data call is in progress).   |
|                        | < ext4 >                                | 1  |  |
|                        | < Service_settings_1 >                  | 0000000  | Default value - mandatory for support.   |
|                        |   | xxxxxx1  | I <sub>P</sub> _error_correct (I <sub>PMR</sub> or I <sub>PQR</sub> )  |
|                        |   |  | supported - optional for support.  |
|                        |   | xxxxx1x  | Allow suppression of bearer quality<br>messages for asymmetric connection<br>(EN 300 175-3 [3], clause 7.3.4.4) only<br>if all Q2 bits are = 1 optional for support. |
|                        |   | xxxx1xx  | Allow suppression of bearer quality<br>messages for asymmetric connection<br>(EN 300 175-3 [3], clause 7.3.4.4) in<br>any case.<br>Optional tosupport.               |
|                        |   | xx01xxx  | No simultaneous voice and DPRS call<br>supported, but switching procedure<br>supported.<br>Optional to support.  |
|                        |   | xx10xxx  | Support of simultaneous voice and<br>DPRS call, but not active.<br>Optional to support.  |
|                        |   | xx11xxx  | Support of simultaneous voice and DPRS active call. Optional to support.   |
|                        |   | 11xxxxx  | Support of multiple simultaneous DPRS logical and active physical connections. Optional to support.  |
|                        |   | 10xxxxx  | Support of multiple simultaneous DPRS<br>logical connections (but not active)<br>Optional to support.  |
|                        | < Parameter_settings_1 >                | As relevant  | If a bit is set to "0" the default values as indicated in clauses A.1.3.1 and A.1.3.2 shall be assumed.  |

| Information element | Field within the<br>information element | Standard values within<br>the field/information<br>element                               | Normative action/comment   |
|---------------------|---|--|--|
|                     | T903 (FP only)                          | For the allowed values see clause A.1.3.1  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(xxxxxx1). Otherwise, default value is<br>assumed.   |
|                     | T904 (FP only)                          | For the allowed values see clause A.1.3.1  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(xxxxx1x). Otherwise, default value is<br>assumed.   |
|                     | T905 (FP only)                          | For the allowed values see clause A.1.3.1  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(xxxx1xx). Otherwise, default value is<br>assumed.   |
|                     | T909                                    | For the allowed values see clause A.1.3.2  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(xxx1xxx). Otherwise, default value is<br>assumed.   |
|                     | T910 (FP only)                          | For the allowed values see clause A.1.3.1  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(xx1xxxx). Otherwise, default value is<br>assumed.   |
|                     | T911                                    | For the allowed values see clause A.1.3.1  | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(x1xxxxx). Otherwise, default value is<br>assumed.   |
|                     | Bearers support (2 octets )             | Types of connection<br>(bits 6,7,8) : All<br>Maximum number of<br>bearers (bits 1 to 5): | A value for this parameter is included if<br>indicated in < Parameter_settings_1 ><br>(1xxxxxx). Otherwise, it means that no<br>information on supported connection<br>type and number of bearers is provided. |
|                     |   | 1 to 23  |  |
|                     | Application Protocol<br>Indicator       | For the allowed values see clause 12.22  | Only if Generic media encapsulation<br>Interworking is supported. Several<br>octects may be used if multiply<br>application protocols are supported.   |

A PT shall include the << SETUP-CAPABILITY >> information element in the {ACCESS-RIGHTS-REQUEST} and {LOCATE-REQUEST} messages.

A FT shall include the << Setup capability >> information element in the {ACCESS-RIGHTS-ACCEPT} and {LOCATE-ACCEPT} messages. In addition the FT may include the << SETUP-CAPABILITY >> in a {MM-INFO-SUGGEST} message or in a {CLMS-FIXED} message.

Both sides are required to understand and react properly upon receipt of a << SETUP-CAPABILITY >> information element as described in this clause.

In regard to the service support indicated in the < service settings > both sides are allowed to use a particular setting only if both sides have indicated support of this service.

In regard to the values indicated in the < Parameters settings > see clauses A.1.3.1 and A.1.3.2. For the T910 parameter the lower indicated value by either side shall be considered as the agreed value and used afterwards even if this is lower than the default value as indicated in clause A.1.3.2. In all cases if a side does not provide setting for a particular parameter the default values as indicated in clauses A.1.3.1 and A.1.3.2 shall be assumed as being indicated.

For the complete contents of {ACCESS-RIGHTS-REQUEST} and {ACCESS-RIGHTS-ACCEPT} the requirements of EN 300 444 [11], clause 8.30 shall apply.

For the complete contents of {LOCATE-REQUEST} and {LOCATE-ACCEPT} the requirements of EN 300 444 [11], clause 8.28 shall apply.

For the transmission of the {MM-INFO-SUGGEST} message the Procedure for parameter retrieval initiated by the FT as specified in EN 300 175-5 [5], clause 13.7 shall apply.

For the contents of {MM-INFO-SUGGEST} the following requirements apply.

| Information element    | Field within the<br>information element | Standard values within the field/information element | Normative action/comment             |
|------------------------|---|--|--------------------------------------|
| << Info type >>        |   |  |                                      |
|                        | < Parameter type >                      | 0000110  | Dynamic parameters allocation.       |
| << Setup capability >> |   |  | For the allowed values see table 88. |

#### Table 89: Values used within the {MM-INFO-SUGGEST} message

For the transmission of the {CLMS-FIXED} message the CLMS message transmission procedure initiated by the FT as specified in EN 300 175-5 [5], clause 12.3.1 shall apply with the following clarifications.

For the contents of {CLMS-FIXED} EN 300 175-5 [5], clause 8.3 shall apply with the following modification/clarifications.

#### Table 90: Values used within the {CLMS-FIXED} message address section

| Information element    | Field within the<br>information element | Standard values within the field/information element | Normative action/comment         |
|------------------------|---|--|----------------------------------|
| < A >                  |   | 1  | Address section.                 |
| < CLMS header >        |   | 100  | Bit stream - multi-section.      |
| < Address >            |   |  | 2 octets of CLMS TPUI.           |
| Protocol Discriminator |   | 0000001  | DECT Information Element coding. |
| Length Indicator       |   | Any  |                                  |

#### Table 91: Values used within the {CLMS-FIXED} message data section

| Information element  | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|----------------------|---|--|--|
| < A >                |   | 0  | Data section.  |
| < CLMS header >      |   | nnn  | Data section number.   |
| < Data/Fill >        |   | See table 88   | A complete << Setup capability >><br>information element shall be included -<br>more than 1 CLMS fixed data sections<br>may be needed. |
| < Data/Fill (cont) > |   | See table 88   | -  |
| < Data/Fill (cont) > |   | See table 88   | -  |
| < Data/Fill (cont) > |   | See table 88   | -  |

### 12.8.1 Default Dynamic Parameters Allocation

A terminal is allowed to omit the << Setup capability >> information element if this terminal would like to indicate only default values. If the << Setup capability >> information element is not found the receiving side shall react as this has been received with all fields set to the default values as indicated in table 92.

| Information element    | Field within the<br>information element | Standard values<br>within the<br>field/information<br>element | Normative action/comment  |
|------------------------|---|---|---|
| << Setup capability >> |   |   |   |
|                        | < ext3 >                                | 0   |   |
|                        | < Protocol discriminator >              | 001   | DPRS.   |
|                        | < Setup >                               | 01  | Normal setup.   |
|                        | < Page >                                | 01  | Normal paging supported (when no DPRS virtual call is in progress).   |
|                        | < ext4 >                                | 1   |   |
|                        | < Service_settings_1 >                  | 0000000   | Default value - mandatory for support.  |
|                        |   | xxxxxx0   | I <sub>P</sub> _error_correct (I <sub>PMR</sub> or I <sub>PQR</sub> ) not supported.  |
|                        |   | xxxxx0x   | Does not allow suppression of bearer<br>quality messages for asymmetric<br>connection (EN 300 175-3 [3],<br>clause 7.3.5.4) only if all Q2 bits are = 1.                        |
|                        |   | xxxx0xx   | Does not allow suppression of bearer<br>quality messages for asymmetric<br>connection (EN 300 175-3 [3],<br>clause 7.3.5.4) in any case.  |
|                        | < Parameter_settings_1 >                | 0000000   | The default values for parameters<br>provided in clauses A.1.3.1 and A.1.3.2<br>shall be assumed. There is no information<br>provided regarding supported number of<br>bearers. |

Table 92: Default values assumed within the PT << SETUP-CAPABILITY >> if not included

180

## 12.9 Cipher-switching initiated by PT

The procedure shall be performed as defined in EN 300 444 [11], clause 8.34. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

As this procedure is likely to be used during call establishment in order to avoid delay in the call initiation a FT that do not support ciphering shall not ignore the {CIPHER-SUGGEST} message and shall respond with a {CIPHER-REJECT} message.

| Information element | Field within the<br>information element | Standard values within<br>the field/information<br>element | Normative action/comment |
|---------------------|---|--|--------------------------|
| << Reject reason >> |   |  |                          |
|                     | < Reject reason code >                  | 17   | No cipher algorithm      |

Table 93: Standard values used within the {CIPHER-REJECT} message

# 12.10 Temporary Identity Assign

The procedure shall be performed as defined in EN 300 175-5 [5], clause 13.2.2. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

181

This procedure shall not be used for assignment of an individual assigned TPUI - the location registration procedure as described in EN 300 444 [11], shall be used instead. Whenever other TPUIs need to be assigned this procedure shall be used.

Table 94: Values used within the {TEMPORARY-IDENTITY-ASSIGN} message

| Information element     | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|-------------------------|---|--|--|
| << Portable-identity >> |   |  |  |
|                         | < Type >                                | 0100000  | TPUI.  |
|                         | < Length of id value >                  | 20   |  |
|                         | < Identity-value >                      | Values in  | Individual TPUIs are not allowed to be   |
|                         |   | EN 300 175-6 [6],                                    | assigned with this procedure.  |
|                         |   | clause 6.3.1 are allowed                             |  |
| << Duration >>          |   |  | Inclusion of this information element is optional and PT is not required to understand it. |
|                         | < Lock limits >                         | 111 (binary)   | No limits.   |
|                         |   | 101 (binary)   | Temporary user limit 2.  |
|                         |   | 110 (binary)   | Temporary user limit 1.  |
|                         | < Time limits >                         | 1  | Defined time limit 1.  |
|                         |   | 2  | Defined time limit 2.  |
|                         |   | 15   | Infinite.  |
|                         | < Time duration >                       | All  |  |

### Table 95: Values used within the {TEMPORARY-IDENTITY-ASSIGN-ACK} message

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment |
|---------------------|---|--|--------------------------|
|                     |   |  | All optional.            |

# 12.10.1 Associated procedures

## 12.10.1.1 Timer F-< MM\_ident.1 > management

< MM\_ident.1 >: TPUI assignment timer.

- Value: Refer to EN 300 175-5 [5], annex A.
- Start: {TEMPORARY-IDENTITY-ASSIGN} message assigning a TPUI is sent or an interrupting higher priority transaction is completed.
- Stop:
   An indication for link release from the DLC is received.

   A {TEMPORARY-IDENTITY-ASSIGN-ACK} or a

   {TEMPORARY-IDENTITY-ASSIGN-REJECT} message is received, or, interrupting higher

   priority transaction begins.

# 12.10.2.1 PT rejects the identity assignment

If the PT is not able to handle the requested Temporary Identity assignment it should reject it.

## Table 96: Values used within the {TEMPORARY-IDENTITY\_ASSIGN-REJECT} message

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment |
|---------------------|---|--|--------------------------|
|                     |   |  | All optional.            |

# 12.11 Indirect FT initiated link establishment

# 12.11.1 Indirect FT initiated link establishment for devices supporting complete MAC control procedures (DPRS-M.5)

The following procedures shall be supported.

## 12.11.1.1 Initial setup paging

The LCE code = "110" (DPRS S code) shall be used to setup a new DPRS virtual call.

NOTE: This code will be used nevertheless the MAC service to be used in the call.

Short paging, full paging format with TPUI, and full paging format with IPUI may be used and shall be supported by FT and PT.

## 12.11.1.1.1 Assumptions for Short paging format or for Full format with IPUI

In the case of short format, or Full format with IPUI, the following assumptions shall apply:

Slot type: if the PP or FP supports only one slot type for DPRS, this slot shall be used in the setup.

If the PP and FP supports several slot types for DPRS, the slot used in the setup shall be the longest slot supported in the following sequence: double slot, long slot (j=640), full slot.

NOTE: If the slot required is not the result of this rule, then Full paging format with TPUI should be used.

Setup info: it will be assumed as "use B-field setup (no info about C<sub>F</sub> support)".

## 12.11.1.1.2 Coding for Full paging format with TPUI

In the case of full paging format with TPUI the following rules shall be fulfilled.

Slot type: it indicates the slot required in the setup process.

Possible values:

| 0001 | Long slot; $j = 640$ . |
|------|------------------------|
| 0010 | Long slot; $j = 672$ . |
| 0100 | Full slot.             |
| 0101 | Double slot.           |

**Setup info:** possible values:

| 0000 | No setup info (same assumption defined in clause 12.11.1.1.1 applies).  |
|------|---|
| 0100 | Use B-field signalling. (no info about CF support).                     |
| 0101 | Use B-field signalling, and may use C <sub>F</sub> for NWK layer setup. |

### 12.11.1.1.3 Message in case of short format

The following message shall be used.

#### Table 97: Values used within the {LCE-REQUEST-PAGE} message, initial setup, short format

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|---------------------|---|--|--|
| << LCE Header >>    |   |  |  |
|                     | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field<br>see EN 300 175-5 [5], clause 8.2.1. |
|                     | < LCE-header >                          | "110"  | Initial call setup.  |
|                     |   |  |  |
| << Short address >> |   |  |  |
|                     | < TPUI Address >                        | All  | Part of the actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.1.                                      |

#### 12.11.1.3.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req primitive as follows.

### Table 98: DL\_BROADCAST-req primitive

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
|                             | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 3 Octets                            | Short paging format.  |
| << Extended message flag >> |                                     | Related to the "long" in MAC paging primitives.   |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
| -                           | Off                                 |   |

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

## 12.11.1.1.4 Message in case of full format with TPUI

The following message shall be used.

| Information element               | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|-----------------------------------|---|--|--|
| << LCE Header >>                  |   |  |  |
|                                   | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field see<br>EN 300 175-5 [5], clause 8.2.1. |
|                                   | < LCE-header >                          | "110"  | Initial call setup   |
| < <info 1="" field="">&gt;</info> |   |  |  |
|                                   | <slot type=""></slot>                   | 1,2,4,5  | Depending on slot type. See clause 12.11.1.1.2.  |
| << TPUI address >>                |   |  |  |
|                                   | < TPUI Address >                        | All  | Actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.2.  |
| < <info 2="" field="">&gt;</info> |   |  |  |
|                                   | <setup info=""></setup>                 | 0,4,5  | Value 0 shall be understood as 4.<br>Value 5 may only be used if C <sub>F</sub> is                         |
|                                   |   |  | supported by both peers. See clause 12.11.1.2.   |
| < <info 3="" field="">&gt;</info> |   |  |  |
|                                   | <reserved lcn="" or=""></reserved>      | 0  | Reserved. It shall be set to 0.  |

#### Table 99: Values used within the {LCE-REQUEST-PAGE} message, initial setup, full format with TPUI

#### 12.11.1.4.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req or DL\_EXPEDITED primitive as follows.

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

#### Table 100: DL\_BROADCAST or DL\_EXPEDITED primitive content

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
|                             | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 5 Octets                            | Full paging format.   |
| << Extended message flag >> |                                     | Related to the "long" in MAC paging primitives.   |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
|                             | Off                                 |   |

## 12.11.1.1.5 Message in case of full format with IPUI

The following message shall be used.

#### Table 101: Values used within the {LCE-REQUEST-PAGE} message, initial setup, full format with IPUI

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|---------------------|---|--|--|
| << LCE Header >>    |   |  |  |
|                     | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field see<br>EN 300 175-5 [5], clause 8.2.1. |
|                     | < LCE-header >                          | "110"  | Initial call setup   |
| << IPUI address >>  |   |  |  |
|                     | < IPUI Address >                        | All  | Actual IPUI value. See<br>EN 300 175-5 [5], clause 8.2.2.  |

## 12.11.1.2 DPRS Resume paging

The procedure shall be described as defined in EN 300 175-5 [5], clause 14.5 with following clarification.

If MAC layer paging fails (e.g. PP has moved to another cluster) the FT LLME shall request the FT-NWK LCE for initiating a LCE resumption providing the ECN of the related link.

The LCE code = "111" (DPRS R code) shall be used to resume an existing DPRS connection.

NOTE: This code will be used nevertheless the MAC service to be used in the call.

Short and full formats may be used.

Short format and full format TPUI shall be supported and may be used by the FT.

Short format may only be used if there is only one DPRS logical connection between the pair PT-FT. In case of multiple connections, full format with TPUI is mandatory.

Full format with IPUI shall not be used.

#### 12.11.1.2.1 Assumptions for Short paging format

In the case of short format the following assumptions shall apply.

Slot type: the slot type used in the existing DPRS logical connection shall be used.

**Setup info:** it will be assumed as "use B-field setup, (no info about CF support)". However, the support of  $C_F$  shall be as previously negotiated before the suspension.

## 12.11.1.2.2 Coding for Full paging format with TPUI

In the case of full paging format with TPUI the following rules shall be fulfilled.

**Slot type:** it indicates the slot required in the setup process. It shall match with the used slot in the connection to be resumed.

Possible values:

| 0001 | Long slot; $j = 640$ |
|------|----------------------|
| 0010 | Long slot; $j = 672$ |
| 0100 | Full slot            |
| 0101 | Double slot          |

Setup info: possible values:

0000 No setup info

0 1 0 0 Use B-field signalling. (no info about  $C_F$  support). However, the support of  $C_F$  shall be as previously negotiated before the suspension.

186

The same assumption defined in clause 12.11.1.2.1 shall apply in the case of code "0000" no setup info. Therefore both codes are equivalent.

### 12.11.1.2.3 Message in case of short format

The following message shall be used.

#### Table 102: Values used within the {LCE-REQUEST-PAGE} message, resume, short format

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|---------------------|---|--|--|
| << LCE Header >>    |   |  |  |
|                     | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field<br>see EN 300 175-5 [5], clause 8.2.1. |
|                     | < LCE-header >                          | "111"  | Resume   |
| << Short address >> |   |  |  |
|                     | < TPUI Address >                        | All  | Actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.1.  |

#### 12.11.1.2.3.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req primitive as follows.

### Table 103: DL\_BROADCAST-req primitive

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
| -                           | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 3 Octets                            | Short paging format.  |
| << Extended message flag >> |                                     | Related to the "long" in MAC paging primitives.   |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
| -                           | Off                                 |   |

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

### 12.11.1.2.4 Message in case of full format with TPUI

The following message shall be used.

| Information element               | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|-----------------------------------|---|--|--|
| << LCE Header >>                  |   |  |  |
|                                   | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field see<br>EN 300 175-5 [5], clause 8.2.1.   |
|                                   | < LCE-header >                          | "111"  | Resume   |
| < <info 1="" field="">&gt;</info> |   |  |  |
|                                   | <slot type=""></slot>                   | 1,2,4,5  | Depending on slot type. It shall match<br>with the slot used bfore the suspend.<br>See clause 12.11.1.2.2.   |
| << TPUI address >>                |   |  |  |
|                                   | < TPUI Address >                        | All  | Actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.2.  |
| < <info 2="" field="">&gt;</info> |   |  |  |
|                                   | <setup info=""></setup>                 | 0,4  | Value 0 shall be understood as 4.<br>However, the support of CF shall be as<br>previously negotiated before the<br>suspension. See clause 12.11.1.1.2. |
| < <info 3="" field="">&gt;</info> |   |  |  |
|                                   | < LCN>                                  | 8 to 15<br>(LCN code + 8)                            | LCN code of the connection to be resumed. Bit 4 shall be set to 1.   |

#### Table 104: Values used within the {LCE-REQUEST-PAGE} message, resume, full format with TPUI

187

#### 12.11.1.2.4.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req or DL\_EXPEDITED primitive as follows.

Table 105: DL\_BROADCAST or DL\_EXPEDITED primitive content

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
|                             | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 5 Octets                            | Full paging format.   |
| << Extended message flag >> |                                     | Related to the "long" in MAC paging<br>primitives.  |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
| -                           | Off                                 |   |

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

## 12.11.1.2.5 LCE Resume Procedure description

This procedure is closely related to MAC resume procedure as defined in EN 300 175-3 [3].

If MAC layer paging fails (e.g. PP has moved to another cluster) the FT LLME shall request the FT-NWK LCE for initiating a LCE resumption providing the ECN of the related link.

As result the LCE shall construct a Short or a Full Page message as defined in clauses 12.11.1.2.3 and 12.11.1.2.4 using the LCE header code "111"B = "resume" and the info field (if applicable) as stated in clause 12.11.1.2.2. The connection identity for the connection to be resumed shall be provided.

The LCE shall issue the {LCE-REQUEST-PAGE} message using either a DL\_BROADCAST-req primitive or a DL\_EXPEDITED-req primitive via the B-SAP. It shall then mark the link as in the "RESUMPTION PENDING" state, and shall start timer <LCE.03>.

If timer <LCE.03> expires before the wanted link is established, the LCE should resubmit the {LCE-REQUEST-PAGE} message. Resubmitted messages shall only be issued at a lower priority than other outstanding B-FORMAT messages. A message may be resubmitted a maximum of N300 times, before it is discarded. (N300 is an application specific value. Recommended value for voice applications is 3.)

If the {LCE-REQUEST-PAGE} message is successfully received by the intended PT, it shall check whether there is a link in ACTIVE state which can be identified by the received in the paging message Connection identity. If such link exists the PT shall construct a LCE-PAGE-RESPONSE message following the rules as described in clause 14.2.3 and shall send it in a DL-DATA-req primitive over the existing link.

NOTE: The arrival of this message at PT MAC layer will consequently trigger a PT initiated connection resumption at MAC.

On receipt of the LCE-PAGE-RESPONSE (over the resumed connection) the FT-LCE shall check the identity contained in this response against a list of outstanding {LCE-REQUEST-PAGE} messages, and if the identity matches the identity associated with this link FT-LCE shall mark the link as "LINK ESTABLISHED"; it shall stop timer <LCE.03> and shall continue with normal operation (i.e. with the action that was the reason for the required resumption).

# 12.11.2 Indirect FT initiated link establishment for devices supporting simplified A-field MAC control procedures (DPRS-M.30)

The following procedures shall be supported.

## 12.11.2.1 Initial setup paging

The LCE code = "110" (DPRS S code) shall be used to setup a new DPRS virtual call.

NOTE: This code will be used nevertheless the MAC service to be used in the call.

Full paging format with TPUI shall be used and shall be supported by FT and PT.

#### 12.11.2.1.1 Assumptions for Short paging format or for Full format with IPUI

Not applicable.

## 12.11.2.1.2 Coding for Full paging format with TPUI

The following rules shall be fulfilled.

Slot type: it indicates the slot required in the setup process.

Possible values:

| 0001 | Long slot; $j = 640$ |
|------|----------------------|
| 0010 | Long slot; $j = 672$ |
| 0100 | Full slot            |
| 0101 | Double slot          |

Setup info: possible values:

0011 Use M<sub>T</sub> signalling Advanced Connection, Attributes\_T negotiation mandatory.

## 12.11.2.1.3 Message in case of short format

Not applicable.

### 12.11.2.1.4 Message in case of full format with TPUI

The following message shall be used.

# Table 106: Values used within the {LCE-REQUEST-PAGE} message, initial setup, full format with TPUI, MAC A-field

| Information element               | Field within the information element | Standard values within the field/information element | Normative action/comment   |
|-----------------------------------|--------------------------------------|--|--|
| << LCE Header >>                  |                                      |  |  |
|                                   | < W >                                | All  | For the relation between this field and<br>the < LCE-header > field see<br>EN 300 175-5 [5], clause 8.2.1. |
|                                   | < LCE-header >                       | "110"B   | Initial call setup   |
| < <info 1="" field="">&gt;</info> |                                      |  |  |
|                                   | <slot type=""></slot>                | 1,2,4,5  | Depending on slot type. See clause 12.11.1.2.2.  |
| << TPUI address >>                |                                      |  |  |
|                                   | < TPUI Address >                     | All  | Actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.2.  |
| < <info 2="" field="">&gt;</info> |                                      |  |  |
|                                   | <setup info=""></setup>              | 3  | Value 3 shall be used: "Use M <sub>T</sub>   |
|                                   |                                      |  | signalling Advanced Connection,<br>Attributes_T negotiation mandatory".                                    |
| < <info 3="" field="">&gt;</info> |                                      |  |  |
|                                   | <reserved lcn="" or=""></reserved>   | "0000"B  | Reserved. It shall be set to 0.  |

### 12.11.2.1.4.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req or DL\_EXPEDITED primitive as follows.

Table 107: DL\_BROADCAST or DL\_EXPEDITED primitive content

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
|                             | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 5 Octets                            | Full paging format.   |
| << Extended message flag >> |                                     | Related to the "long" in LCE paging<br>primitives.  |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
| -                           | Off                                 |   |

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

# 12.11.2.2 DPRS Resume paging

The procedure shall be described as defined in EN 300 175-5 [5], clause 14.5.

The LCE code = "111" (DPRS R code) shall be used to resume an existing DPRS connection.

NOTE: This code will be used nevertheless the MAC service to be used in the call.

Full format with TPUI shall be supported and shall be used by the FT.

## 12.11.2.2.1 Assumptions for Short paging format

Not applicable.

## 12.11.2.2.2 Coding for Full paging format with TPUI

The following rules shall be fulfilled.

**Slot type:** it indicates the slot required in the setup process. It shall match with the used slot in the connection to be resumed.

Possible values:

| 0001 | Long slot; $j = 640$ |
|------|----------------------|
| 0010 | Long slot; $j = 672$ |
| 0100 | Full slot            |
| 0101 | Double slot          |

Setup info: possible values:

0 0 1 1 Use M<sub>T</sub> signalling Advanced Connection, Attributes\_T negotiation mandatory". The attributes shall be as previously set before the suspension.

#### 12.11.2.2.3 Message in case of short format

Not applicable.

## 12.11.2.2.4 Message in case of full format with TPUI

The following message shall be used.

| Table 108: Values used within the {LCE-REQUEST-PAGE} message, |
|---|
| resume, full format with TPUI, A-field MAC                    |

| Information element               | Field within the<br>information element | Standard values within the field/information element | Normative action/comment   |
|-----------------------------------|---|--|--|
| << LCE Header >>                  |   |  |  |
|                                   | < W >                                   | All  | For the relation between this field and<br>the < LCE-header > field see<br>EN 300 175-5 [5], clause 8.2.1. |
|                                   | < LCE-header >                          | "111"  | Resume.  |
| < <info 1="" field="">&gt;</info> |   |  |  |
|                                   | <slot type=""></slot>                   | 1,2,4,5  | Depending on slot type. It shall match<br>with the slot used bfore the suspend.<br>See clause 12.11.2.2.2. |
| << TPUI address >>                |   |  |  |
|                                   | < TPUI Address >                        | All  | Actual TPUI value. See<br>EN 300 175-5 [5], clause 8.2.2.  |
| < <info 2="" field="">&gt;</info> |   |  |  |
|                                   | <setup info=""></setup>                 | 3  | Value 3 shall be used: "Use M <sub>T</sub>   |
|                                   |   |  | signalling Advanced Connection,<br>Attributes_T negotiation mandatory".                                    |
| < <info 3="" field="">&gt;</info> |   |  |  |
|                                   | < LCN>                                  | 8 to 15<br>(LCN code + 8)                            | LCN code of the connection to be<br>resumed. Bit 4 shall be set to 1 (see<br>EN 300 175-5 [5]).            |

#### 12.11.2.2.4.1 Primitive

For implementations fulfilling the primitives' model of EN 300 175-5 [5], the following primitive shall be used:

• The message shall be inserted in a DL\_BROADCAST-req or DL\_EXPEDITED-req primitive as follows.

| Table 109: DL | _BROADCAST or DL | _EXPEDITED primitive content |
|---------------|------------------|------------------------------|
|---------------|------------------|------------------------------|

| Parameter                   | Information within the<br>parameter | Normative action/comment  |
|-----------------------------|-------------------------------------|---|
| << Cluster address list >>  |                                     | FT needs to have knowledge as where<br>(in which cluster) the intended PT is<br>located. Alternatively paging may be sent<br>in the whole system. |
|                             | Data Link Endpoint Identifier       | See EN 300 175-4 [4], clause 7.3.6.   |
| << Message unit >>          |                                     |   |
|                             | LCE-PAGE-REQUEST                    |   |
| << Message unit length >>   |                                     |   |
|                             | 5 Octets                            | Full paging format.   |
| << Extended message flag >> |                                     | Related to the "long" in LCE paging<br>primitives.  |
|                             | Off                                 |   |
| << Error flag >>            |                                     | Usually needed for the "ind" primitive.   |
| -                           | Off                                 |   |

NOTE: The use of the primitives described by the standard or other model is up to the implementer.

## 12.11.2.2.5 LCE Resume Procedure description

The same procedure of clause 12.11.1.2.5 applies with the following differences.

Depending on the application, MAC paging may not be mandatory or not supported. In such case LCE paging shall be used directly.

As result, the LCE shall construct a Full Page message as defined in clause 12.11.2.2.4 using the LCE header code "111"B = "resume" and the info field as stated in clause 12.11.2.2.2. The connection identity for the connection to be resumed shall be provided in the "LCN" field.

The LCE shall issue the {LCE-REQUEST-PAGE} message using either a DL\_BROADCAST-req primitive or a DL\_EXPEDITED-req primitive via the B-SAP. It shall then mark the link as in the "RESUMPTION PENDING" state, and shall start timer <LCE.03>.

# 12.12 Fast paging

In the case that the PT supports high-duty cycle paging detection when there is no data call in progress, this shall be signalled to the PT by the appropriate coding of the << Setup - capabilities >> information element, which shall be transmitted in the {ACCESS-RIGHTS-REQUEST} and {LOCATE-REQUEST} messages, see clause 12.8.

For Class 2 devices:

• The high-duty cycle paging detection mode is mandatory when there is an active data call in suspended state. The << Setup - capabilities >> flag refers to the behaviour when there is not an established data call.

For Class 3 devices:

• Class 3 PTs are not required to be in high-duty cycle paging detection mode when there is a data call in active state (however they may be). The << Setup - capabilities >> flag refers to the behaviour either, when there is not an established data call, or when the data call is suspended.

The report provided by the FT in the same << Setup - capabilities >> flag shall be understood as that such FT is able to perform paging on the high duty cycle sequence (fast paging). For Class 2 devices, it refers to the case when there are no suspended data calls.

#### Collective and Group Ringing 12.13

The procedure shall be performed as defined in EN 300 175-5 [5], clause 14.4 with following modifications in regard to the paging message to be used.

193

For collective and Group ringing in regard to data calls, the long paging format shall be used as defined in EN 300 175-5 [5], clause 8.2.2 with the following modifications.

| Information element | Field within the<br>information element | Standard values within the field/information element | Normative action/comment  |
|---------------------|---|--|---|
| << LCE Header >>    |   |  |   |
|                     | < W >                                   | 1  |   |
|                     | < LCE-header >                          | 010  | Escape.   |
| << discriminator >> |   | 0010   | Collective and group ringing with defined MAC services.                               |
| << Short address >> |   |  |   |
|                     | < TPUI Address - MS                     | 1001   | Ring pattern and group mask   |
|                     | nibble >                                | 0001   | Ring pattern and assigned group TPL (12 LSB) or CBI (see note).                       |
|                     |   | All  | Depends on the value indicated in fiel<br>< TPUI Address - MS nibble > (see<br>note). |
| << Information >>   | < Spare >                               | 0000   |   |
|                     | < IWU identification >                  | 0001   | Ethernet.   |
|                     |   | 0010   | Token Ring.   |
|                     |   | 0011   | IP.   |
|                     |   | 0100   | PPP.  |
|                     |   | 0101   | V.24.   |
|                     |   | 0110   | Generic media encapsulation transpo   |

Table 110: Values used within the /I CE-REOUEST-PAGE) message

EN 300 175-5 [5], clause 8.2.1.

The PT shall examine the IWU Identification field and shall alert the corresponding application. If the user (or the application) answers the outgoing call shall be initiated in accordance to the settings of this application, including service/parameters related values, see clause 12.5.

#### Direct FT initiated link establishment 12.14

The procedure shall be performed as defined in EN 300 175-5 [5], clause 14.2.4. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The FT shall indicate to the PT whether it supports this procedure by submitting <<Setup capability>> information element as described in clause 12.8. The FT shall only use this procedure if the relevant PT has indicated in its <<Setup capability>>, see clause 12.8, that it supports "Fast Setup". In this procedure there shall be no peer-to-peer NWK layers message exchange.

Figure 25: Direct FT initiated link establishment, initiating side

| Parameter                           | Information within the parameter | Normative action/comment   |
|-------------------------------------|----------------------------------|--|
| << DLEI >>                          |                                  |  |
|                                     | Data Link Endpoint Identifier    | See EN 300 175-4 [4], clause 7.3.6.  |
| << Establish mode >>                |                                  |  |
|                                     | Class A operation                |  |
| << Radio Fixed Part (RFP) number >> |                                  | FT needs to have knowledge as where<br>(at which RFP) the intended PT is<br>located. |

## Figure 26: Direct FT initiated link establishment, receiving side

### Table 112: Values used within the DL\_ESTABLISH-ind primitive

| Parameter            | Information within the parameter | Normative action/comment            |  |
|----------------------|----------------------------------|-------------------------------------|--|
| << DLEI >>           |                                  |                                     |  |
|                      | Data Link Endpoint Identifier    | See EN 300 175-4 [4], clause 7.3.6. |  |
| << Establish mode >> |                                  |                                     |  |
|                      | Class A operation                |                                     |  |

# 12.14.1 Exceptional case

## 12.14.1.1 Link establishment failure

#### Figure 27: Direct FT initiated link establishment failure

#### Table 113: Values used within the DL\_RELEASE-ind primitive

| Parameter          | Information within the parameter | Normative action/comment            |
|--------------------|----------------------------------|-------------------------------------|
| << DLEI >>         |                                  |                                     |
|                    | Data Link Endpoint Identifier    | See EN 300 175-4 [4], clause 7.3.6. |
| << Release mode >> |                                  |                                     |
|                    | Abnormal                         |                                     |

On receipt of indication for link establishment failure the FT-LCE shall not inform the higher entities requesting the use of the link that the link establishment has failed, shall enter "LINK-RELEASED" state, and shall attempt Indirect Link establishment procedure in accordance to the Call establishment management requirements as specified in clause 9.

# 12.15 Void

# 12.16 Broadcast attributes management

RFPs belonging to the same LA shall broadcast the same values of higher layer attributes (see EN 300 175-5 [5], annex F) at any given time.

# 12.16.1 Higher Layer capabilities

The Higher Layer Fixed Part Information field shall be used with the information described in table 114. In the case that the FT is capable of supporting encryption, this shall use the DECT standard algorithm and shall be signalled to the PT by the setting of the MAC Q channel Higher Layer Information message bit  $a_{37}$ .

The DPRS PT shall be capable to read and interpret at least the following broadcast attributes codings during locking procedure. In the locked state the PT may assume them as static.

| BIT Number      | Attribute                          | Value  | Note   |
|-----------------|------------------------------------|--------|--|
| a <sub>34</sub> | Non-voice circuit switched service | 1      |  |
| a <sub>35</sub> | Non-voice packet switched service  | 0      |  |
| a <sub>36</sub> | Standard authentication required   | [0, 1] |  |
| a <sub>37</sub> | Standard ciphering supported       | [0, 1] |  |
| a <sub>38</sub> | Location registration supported    | [0, 1] | See location update procedure as an exception.   |
| a <sub>40</sub> | Non-static FP                      | [0, 1] | A FP which is mounted on a moving vehicle.   |
| a <sub>42</sub> | CLMS service available             | [0, 1] | FT may send this and PT need to understand it if FT supports CLMS services at NWK layer. |
| a <sub>44</sub> | Access Rights requests supported   | [0, 1] | The FP can toggle this bit to enable or disable on air subscription.                     |
| a <sub>45</sub> | External handover supported        | [0, 1] | FT may send this and PT need to understand it if DPRS-N.38 is supported.                 |
| a <sub>46</sub> | Connection handover supported      | [0, 1] |  |

Table 114: Higher Layer Capabilities interpretation by the PT

# 12.16.2 Extended Higher Layer capabilities

The Extended Higher Layer Fixed Part Information field shall be used with bit  $a_{46}$  and  $a_{45}$  indicating the support for DPRS frame relay and character oriented service and bits  $a_{27}$  to  $a_{33}$  indicating the supported interworking. Bit  $a_{41}$  shall be used to indicate the support of asymmetric bearers.

| BIT Number      | Attribute                                   | Value              | Note   |

# 12.16.3 Extended Higher Layer capabilities part 2

The Extended Higher Layer capabilities, part 2, Fixed Part Information field shall be used with bits  $\langle a_{25} \text{ to } a_{28} \rangle$  indicating the packet data Category of the FT.

| BIT Number  | Attribute               | Value  | Note   |
|---|-------------------------|--------|--|
| $< a_{25}$ to $a_{28} >$  | NG-DECT Packet Data     | 0      | No Packet data supported or non categorized        |
| 20 20   | Category                |        | system.  |
|   |                         | 1      | Cat 1: data Category 1 (see note).                 |
|   |                         | 2      | Cat 2: data Category 1 (see note).                 |
|   |                         | 3      | Cat 3: data Category 1 (see note).                 |
|   |                         | 4      | Cat 4: data Category 1 (see note).                 |
|   |                         | 5      | Cat 5: data Category 1 (see note).                 |
| a <sub>35</sub>   | no-emision mode support | [0, 1] | "1" IF no-emision mode supported (see              |
|   |                         |        | EN 300 175-3 [3]), ELSE "0".                       |
| a <sub>45</sub>   | Light data services     | [0, 1] | "1" IF Light data services supported               |
|   | (TS 102 527-4 [i.2])    |        | (TS 102 527-4 [i.2]), ELSE "0".                    |
|   | supported               |        |  |
|   |                         |        | ies. Packet data Categories are incremental: Cat 3 |
| systems also support Cat 1 and Cat 2; Cat 2 systems also support Cat 1. Cat 4 or Cat 5 systems also |                         |        |  |
| support Cat 1, Cat 2 and Cat 3.   |                         |        |  |

 Table 116: Extended Higher Layer Capabilities part 2 interpretation by the PT

# 12.17 U-plane handling

Data calls include service negotiation and as such may have different requirements for connection of the U-plane after some CC-plane data exchange. In any case it shall be kept in mind that there may be service negotiation phase at MAC layer following the negotiation at NWK layer which may require some delay in connection of the U-plane.

NOTE: The transmission of CC-SETUP and CC-CONNECT throughout the layers is not shown. Full contents of messages and primitives are not shown.

Figure 28: Example of connection of the U-plane in case of Service negotiation

# 12.18 Management of MM procedures

The procedure shall be performed as defined in EN 300 444 [11], clauses 6.9.6 and 13.1. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Table 117 describes whether an MM procedure is supported in any CC state or whether a restriction applies. The restriction has been made in order to limit the complexity of the receiving side so that it is not mandated to understand MM messages in all CC states for the purpose of achieving inter-operability. This table shall be considered in addition to the table included in EN 300 444 [11], clause 6.9.5.

| Procedure                 | Mandatory support in CC state |
|---------------------------|-------------------------------|
| Detach                    | F(T)-00                       |
| Temporary Identity Assign | F(T)-00                       |

# 12.19 Management - PMID

The procedure shall be performed as defined in EN 300 444 [11], clause 13.4. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The arbitrary PMID shall be recalculated for every new logical connection setup attempt.

# 12.20 Length of NWK layer messages

Both PT and FT, may use and shall be able to receive and process NWK layer message of up to 126 octets of length (mapped in 2 DLC segments, see clause 11.3.2).

# 12.21 Identities

For the structure of the FT and PT identities the requirements in EN 300 175-6 [6] apply.

Unless otherwise stated in the present document, the FT may chose to assign any type of identities according to its implementation requirements and the recommendations of EN 300 175-6 [6]. A PT shall accept the assignment of any type of IPUI and/or PARK.

# 12.22 Application media protocol support indication

All FTs that indicate support of the DECT generic media encapsulation transport in the Extended fixed part capabilities as indicated in clause 12.16 and all PTs that indicate support of the DECT generic media encapsulation transport in the << Terminal capability >> as indicated in clause 12.3 shall provide additionally information as which application protocols are supported and may use the transport, and other optional capabilities. The indication shall be provided during subscription and location registration procedures utilizing the << Setup capability >> information element as defined in this clause.

If a new Application protocol is added after the subscription is completed, in addition to re-subscribing, terminals shall indicate the support of the new protocol during location registration.

Both sides are required to understand and react properly upon receipt of a << SETUP-CAPABILITY >> information element as described in this clause.

The Generic Media Encapsulation supported protocols and capabilities octet may be used to indicate the support of a protocol or the support of some optional capabilities.

Several octets may be used if needed.

In addition to the provisions given in the present clause regarding setup capability, both DECT terminals involved in a DPRS virtual call carrying Generic Media Encapsulation Protocol shall indicate the real protocol or protocols transported over each context of the call during the context creation at call setup or at Service Change using the << IWU-ATTRIBUTES >> information element as specified in clause B.2.1.1.4.

In regard to the Application media profile support indicated in the < Application protocol indicator > both sides are allowed to use a particular protocol only if both sides have indicated support of it.

The << SETUP-CAPABILITY >> information element shall be included in the {ACCESS-RIGHTS-REQUEST} and {ACCESS-RIGHTS-ACCEPT} and the {LOCATE-REQUEST} and {LOCATE-ACCEPT} messages respectively. For the relevant subscription procedure requirements and the complete contents of {ACCESS-RIGHTS-REQUEST} and {ACCESS-RIGHTS-ACCEPT} the requirements of EN 300 444 [11], clause 8.30 shall apply. For the relevant location procedure requirements and the complete contents of {LOCATE-REQUEST} and {LOCATE-ACCEPT} the requirements of {LOCATE-REQUEST} and {LOCATE-ACCEPT} the requirements of EN 300 444 [11], clause 8.28 shall apply.

The basic structure of the <<SETUP-CAPABILITY>> information element relevant to DPRS is provided in clause 12.8. This clause provides only the coding relevant to the DPRS Generic media encapsulation transport that is the Application Protocol Indicator coding.

**Generic Media Encapsulation supported protocols and capabilities (octet group 6):** This is a bit mapped octet group. A "1" indicates support for the specified profile. Reserved bits shall be set to zero and shall not be checked in the receiver does not support them.

- 1 0 0 1 0 1 0 Restricted Light Data Services operation (see TS 102 527-4 [i.2]) supported.
- 1 0 0 1 0 1 1 Enhanced Light Data Services operation (see TS 102 527-4 [i.2]) supported.

All other values reserved

The codes indicating Application packet size shall be understood as the maximum application packet size that the peer that is sending the IE << SETUP CAPABILITY >> is able to transmit or receive (depending on the direction of the code). If the capabilities in both directions are the same, only one packet size indicator shall be used, and it shall be the one coded as "0010xxx"B. If the capabilities are different, then two codes shall be used. The codes set by the FT and PT sides may be different. A peer should not send application packets larger than the max value that the other peer has indicated it may support.

If the code for chopping option is not present, it shall be understood as that the sending peer does not support the chopping option. Only if both peers support chopping, this option may be invoked in a call. The use of chopping, when supported, is negotiated context by context at context creation.

The code for Restricted Light data Services operation is for use by the binary content download service defined in TS 102 527-4 [i.2].

# 13 Distributed Communications

13.1 Void

# 13.2 General Requirements

# 13.2.1 DCDL-net

The requirements as specified in EN 300 175-5 [5], clause I.2.1 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Requirements as which terminal from a DCDL-net shall be assigned as MASTER are not defined. The user should be given the freedom to decide in accordance to his needs and network setting circumstances.

If the MASTER is to be "disconnected" from the DCDL-net it should assign a new MASTER. Manual assignment, i.e. desubscription and subscription to a new MASTER is allowed as well.

The DCDL-net System Control Bearer shall be a connectionless bearer.

# 13.2.2 Subscription

The requirements as specified in EN 300 175-5 [5], clause I.2.2 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The basic ARI assigned to a particular DCDL-net shall be the ARI of the MASTER.

HyP terminals shall be capable of extracting the DCDL-net specific TPUIs, HyPs RFPIs and IdN form the provided by the MASTER during subscription IPUI and RFPI and shall be capable of overwriting them if the MASTER assigns its own preferable values.

# 13.2.3 Communication

The requirements as specified in EN 300 175-5 [5], clause I.2.3 shall apply.

# 13.3 Procedure description

# 13.3.1 HyP Identities

The requirements as specified in EN 300 175-5 [5], clause I.3.1 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The RFPI of the HyP as assigned by the manufacturer shall be used by the HyP for the DCDL-net ARI if a new DCDL-net is to be established and this HyP is been allocated by the user (or by the old MASTER) to be the MASTER.

201

# 13.3.2 Membership Access Rights Allocation

The requirements as specified in EN 300 175-5 [5], clause I.3.2 shall apply.

# 13.3.3 Re-initialization of membership access rights

The requirements as specified in EN 300 175-5 [5], clause I.3.3 shall apply.

# 13.3.4 Members Data Transfer

The requirements as specified in EN 300 175-5 [5], clause I.3.4 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

Whenever a change in the DCDL-net relevant information of a member occurs, the MASTER shall inform all members for the change using the MASTER initiated Members Data Transfer procedure.

# 13.3.5 Presence/Absence Indication

The requirements as specified in EN 300 175-5 [5], clause I.3.5 shall apply.

# 13.3.6 Bandwidth management

The requirements as specified in EN 300 175-5 [5], clause I.3.6 shall apply.

# 13.3.7 Direct Link Establishment

The requirements as specified in EN 300 175-5 [5], clause I.3.7 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

At any time an active member may initiate direct link establishment to another active DCDL-net member. If the link is to be to the MASTER, the PT direct link establishment and all related NWK, DLC and MAC layer procedures shall be used; in all other cases the FT initiated direct link establishment (i.e. fast setup) and all related NWK, DLC and MAC layer procedures shall be used.

During the existence of a link the roles of the involved terminals shall be as allocated at the beginning of the link establishment. For example in the case of communication between two HyPs, the initiating HyP shall be recognized and use its FMID behaving as a FT; the responding HyP shall be recognized and use its PMID behaving as a PT.

A terminal shall not attempt bearer establishment with a member that is not indicated as being currently active.

A bearer establishment may fail even the called terminal has been indicated as currently active, e.g. the called terminal is in low duty cycle mode. In such case the Indirect DCDL-net Link Establishment procedure shall be used as described in EN 300 175-5 [5], clause I.3.8.

As it may happen that though 2 terminals have registered to the MASTER they still cannot establish direct communication, e.g. due to range problems when both are at opposite sides of the MASTER, the requesting communication terminal after few failures of direct communication shall attempt of communication trough the MASTER (internal call).

# 13.3.8 Indirect Link Establishment

The requirements as specified in EN 300 175-5 [5], clause I.3.8 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

If a terminal is not capable of establishing direct communication with another terminal it shall request assistance from the MASTER. It may repeat the procedure max 3 times and in case of all 3 attempts have failed the terminal shall attempt connection via the MASTER (internal call).

If a terminal is indicated by the MASTER that another terminal wishes to directly communicate with it, the called terminal shall initiate direct link establishment to the desiring communication calling terminal.

# 13.3.9 MASTER management

# 13.3.9.1 MASTER assign

The requirements as specified in EN 300 175-5 [5], clause I.3.9.1 shall apply.

# 14.3.9.2 MASTER Change

The requirements as specified in EN 300 175-5 [5], clause I.3.9.2 shall apply.

## 13.3.9.3 DCDL-net System bearer management

The requirements as specified in EN 300 175-5 [5], clause I.3.9.3 shall apply.

# 13.3.10 Common Subscription Database management

The requirements as specified in EN 300 175-5 [5], clause I.3.10 shall apply.

# 13.3.11 Handover issues

The requirements as specified in EN 300 175-5 [5], clause I.3.11 shall apply. The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

For packet data transmission the bearer replacement procedure shall be used to handle overlapping of the position pf the System Control Bearer and an active bearer.

# 13.4 Elements of Messages/Information Elements

The requirements as specified in EN 300 175-5 [5], clause I.4 shall apply.

# 13.5 Usage of PPs or FPs in DCDL-net

The requirements as specified in EN 300 175-5 [5], clause I.6 shall apply.

# Annex A (normative): Operating parameters

# A.1 ME operating parameters

# A.1.1 Constants (applicable to class 1 and class 2 devices)

## Table A.1: Timers T906 and T908

203

| Timer | Description   | Value | Unit        |
|-------|---|-------|-------------|
| T906  | Time that the real number of bearers have to be lower<br>that the "minimum number of bearers" parameter in<br>the "MAC BANDWIDTH" command to consider it a<br>violation of bandwidth. | 2     | Seconds     |
| Т908  | Timer that the PT or FT will wait after the unnoticed loss of all bearers received from other side to pass to suspend sate.   | 10    | DECT Frames |

# A.1.2 Equations

# A.1.2.1 Waiting time for collision avoidance (WtA)

Formula for waiting time after the end (transition  $1 \Rightarrow 0$ ) of RFP-busy-for data flag (EN 300 175-3 [3], clause 7.2.4.3.9) to prevent access collisions.

# A.1.2.1.1 Description

If the RFP had activated the RFP-busy-for-data flag in RFP status (EN 300 175-3 [3], clause 7.2.4.3.9), after the deactivation of this flag, the PT shall wait a random interval WtA before initiating any bearer setup procedure, to prevent access collisions. In case of access collision during the following PT initiated setup procedure (see clause 10.10.1.1), the PT shall wait a random interval WtA before repeating the access request attempt. In case of successive collisions, formula will be applied with successive increment in the spreading range.

# A.1.2.1.2 Formula

First time (after the first failure):

WtA (1) =  $\operatorname{Rn} \times \operatorname{T905}$ 

Successive attempts:  $1\!< N \le 6$ 

WtA (N) = Rn × T905 × 2 <sup>(N-1)</sup>

Successive attempts N > 6

WtA (N) = 
$$Rn \times T905 \times 2^5$$

Where N is the number of failures, and Rn is a pseudo-random number in the range 0 to 1, calculated by the PT.

# A.1.2.2 Waiting time for congestion avoidance (WtB)

Formula for waiting time after a bandwidth modification request, either successful or not.

# A.1.2.2.1 Description

During a PT resume procedure if the FP responds indicating "bandwidth zero", the PT shall release the pilot bearer and wait an interval WtB before repeat the resume procedure. Timer WtB shall be also applied when a PT requests a bandwidth modification that involves increasing the number of bearers, and it is refused by the FT. In such a case, the PT shall not repeat the request of bandwidth extension during an interval WtB.

NOTE: The PT may request bandwidth modification reducing number of bearers at any time.

WtB is composed of a fixed part and a random component identical to WtA. In case of successive refusals, formula will be applied with successive increment in the spreading range.

#### A.1.2.2.2 Formula

First time:

WtB (1) = T904 + Rn  $\times$  T905

Successive attempts:  $1 < N \le 6$ 

WtB (N) = T904 + Rn × T905 × 2 <sup>N-1</sup>

Successive attempts N > 6

WtB (N) = T904 + Rn  $\times$  T905  $\times$  2<sup>5</sup>

Where N is the number of failures, and Rn is a pseudo-random number in the range 0 to 1, calculated by the PT.

# A.1.3 Variable parameters (class 2 systems only)

# A.1.3.1 Parameters set by the FP (class 2 systems only)

#### Table A.2: Timers T903, T904, T905 and T910

| Timer | Description   | Unit     | Minimu<br>m value | Maximum<br>value | Default<br>value |
|-------|---|----------|-------------------|------------------|------------------|
| T903  | Indicates the Maximum time that a PT could wait   | 2 DECT   | 0                 | 250              | 5                |
|       | without having data for transmission in up-link direction   | Frames   |                   | (= 500 frames)   | (= 10 frames)    |
|       | (U-plane data or C-plane messages) after which the PT shall request suspension of the logical connection. | = 20 ms  |                   |                  |                  |
| T904  | The Fixed part of the waiting time WtB (N) that a PT  | 1 DECT   | 0                 | 31               | 10               |
|       | shall wait after the PT has requested connection  | Frame    |                   |                  |                  |
|       | resumption and the FT has rejected it (see clause A.1.2.2).   | = 10 ms  |                   |                  |                  |
| T905  | Component of the Random part of the waiting time WtB  | 1 DECT   | 0                 | 31               | 10               |
|       | (N) that a PT shall wait after the PT has requested   | Frames   |                   |                  |                  |
|       | connection resumption and the FT has rejected it  | = 10 ms  |                   |                  |                  |
|       | (see clause A.1.2.2), or, after the deactivation of RFP-busy-for-data flag (see clause A.1.2.1).          |          |                   |                  |                  |
| T910  | Time after which a suspended Logical connection (and  | 4 DECT   | 5                 | 254 + infinite   | 32               |
|       | respectively Virtual Call and its associated resources)   | MFs      |                   | coded 255        | (= 128 MFs       |
|       | shall be released if there has not been any successful  | = 640 ms |                   | (= 1 016 MF      | = 20,48 s)       |
|       | handshake (stay-alive) procedure completed between  |          |                   | = 162,56 s)      |                  |
|       | the PT and the FT (see clause 9.4.2.5).   |          |                   |                  |                  |

In class 2 systems, T903, T904, T905 and T910 are chosen by the FP and communicated to the PPs by means of the << SETUP CAPABILITY >> network layer information element, see clause 12.8. Any PT shall accept any value in the range between the minimum and the maximum value as indicated in the table above.

If the << Setup capability >> information element has not been sent the default value shall be used.

# A.1.3.2 Negotiable parameters between FP and PP (class 2 systems only)

| Timer | Description  | Unit                     | Minimum<br>value | Maximum value   | Default value                  |
|-------|--|--------------------------|------------------|---|--------------------------------|
| T909  | Time during which a PT shall keep its receiver<br>active, i.e. listening for fast setup attempts after a<br>logical connection has been suspended. | 1 DECT MF<br>(= 160 ms)  | 0                | 254 + infinite<br>coded 255<br>(40,64 s + infinite)                     | 31<br>(4,96 s)                 |
| T911  | Time during which a PT shall be listening for<br>paging in high duty cycle (high duty cycle idle<br>mode) after a connection suspension.           | 4 DECT MFs<br>(= 640 ms) | 0                | 254 + infinite<br>coded 255<br>(= 1 016 MF<br>= 162,56 s +<br>infinite) | 32<br>(= 128 MFs<br>= 20,48 s) |

#### Table A.3: Timers T909 and T911

# A.1.3.2.1 Conditions of negotiation

## A.1.3.2.1.1 Negotiation of T909

If a PT supports fast setup, the value of the T909 may be negotiated with the FT by means of the <<< SETUP\_CAPABILITY >> network layer information element. Any PT shall accept any value between and including 0 and 4,96 s. A PT may but need not to support higher values.

For the negotiation the PT may suggest any value equal or higher than 4,96 s, the FT is allowed to respond with any value lower than the value suggested by the PT and this shall be the value used/assumed after the negotiation and before a new negotiation takes place.

If the PT indicates support of Fast setup and does not provide value for the T909 the FT shall assume that the PT has suggested 4,96 as value.

## A.1.3.2.1.2 Negotiation of T911

The value of the T911 may be negotiated between PT and FT by means of the  $\langle \langle SETUP\_CAPABILITY \rangle \rangle$  network layer information element. Any PT compliant with the present document shall accept any value between and including 0 and 254 (= 1 016 MF = 162,56 s). The PT may, but need not, to support the value 255 = infinite.

The negotiation shall be as follows:

- Those PTs that support the value 255 (= infinite) shall include this value (255) in the IE
   << SETUP\_CAPABILITY >>. The FT is allowed to respond with any value of the range, including zero and 255 (=infinite) and this shall be the value used/assumed after the negotiation and before a new negotiation takes place.
- 2) Those PTs that do not support the value 255 (= infinite) shall include the value 254 in the IE <<< SETUP\_CAPABILITY >>. The FT is allowed to respond with any value between and including zero and 254 (= 1 016 MF = 162,56 s), and this shall be the value used/assumed after the negotiation and before a new negotiation takes place.

If the PT does not provide any value for the T911in the << SETUP\_CAPABILITY >>, the other peer shall assume that the PT does support al values of the range, including 255 (= infinite).

If the FT does not provide any value for the T911in the << SETUP\_CAPABILITY >>, the other peer shall assume the default value 32 equivalent to 128 MF = 20,48 s.

# A.1.4 Configuration capabilities for class 1 devices

In order to assure reliable inter-working between devices complying with this profile in mobility class 1, it shall be possible to install the following parameters in the FPs and/or PPs of the system. The values of parameters referring to the PP shall be clearly indicated in the documentation of the PP, and means shall be provided in FPs for such values to be registered. The values of parameters referring to the FP shall be clearly indicated in the documentation of the FP, and means shall be provided in PP for such values to be registered.

206

| Parameter                         | Value  | Configurable in:<br>Fixed(F)/Portable(P) |
|-----------------------------------|--|--|
| Service associated with identity  | FREL or Stream   | F, P                                     |
| Data frames                       | Ethernet, Token Ring, IP, PPP, V.24,                               | F, P                                     |

|                                   | default = 31   |  |
| T910 Handshake procedure timer    | (5 to 254) × 4 DECT Multiframes + infinite                         | F, P                                     |
|                                   | coded as 255,  |  |
|                                   | default = 32   |  |
| T911 High duty cycle paging       | $(0 \text{ to } 254) \times 4 \text{ DECT Multiframes + infinite}$ | F, P                                     |
| detection timer                   | coded as 255,  |  |
|                                   | default = 32 (= 20,48 s)   |  |

#### Table A.4: Configuration capabilities for class 1 devices

# A.1.5 Configuration capabilities for class 3 and Class 4 devices

The following default values shall be used for configuration capabilities when operating in Class 3 or Class 4 management mode.

These values shall be used when dynamic parameters negotiation is not used or not supported.

NOTE: An application profile, could superseded these values and define new ones.

#### Table A.5: Configuration capabilities default values for class 3 and Class 4 devices

| Parameter                                      | Value   | Default value  |
|--|---|--|
| Service associated with identity               | FREL  | FREL   |
| Data frames                                    |   |  |
|  | For the Generic media encapsulation<br>protocol the exact Application protocol<br>supported (see clause 12.22), and ports<br>(see clause B.8.2) | HTTP   |
| Maximum supported SDU size                     | Number of octets  | 1 528  |
| Multi-bearer capability                        | 1 to 23   | 1  |
| Asymmetric capability                          | Yes/No  | No   |
| Fast paging available                          | Yes/No  | No   |
| Connectionless downlink supported              | Yes/No  | No   |
| Encryption capability                          | Yes   | Yes  |
| Static cipher key                              | 64 bits   | 64   |
| T903 Suspend timer                             | (0 to 250) × 2 DECT Frames,   | Not applicable. Free to the<br>implementation  |
| T904 Wait timer. Fixed part                    | 0 to 31 DECT Frames,  | Not applicable. Free to the<br>implementation  |
| T905 Wait timer. Random part                   | 0 to 31 DECT Frames,  | Not applicable. Free to the implementation   |
| T909 Fast setup detection timer                | 0 to 254 DECT Multiframes + infinite coded as 255,  | Not applicable. No fast setup supported  |
| T910 Handshake procedure timer                 | (5 to 254) × 4 DECT Multiframes + infinite coded as 255,  | 94 = 376 MF = 60,16 sec<br>Applicable only to Class 3 peers<br>that support suspend initiation |
| T911 High duty cycle paging<br>detection timer | (0 to 254) × 4 DECT Multiframes + infinite coded as 255   | Not applicable. No high duty cycle required  |

# A.2 Default coding of <<IWU-ATTRIBUTES>>, << CALL-ATTRIBUTES >>, << CONNECTION-ATTRIBUTES >> and << SETUP-CAPABILITY >> information elements for DPRS Basic Services

See EN 300 175-5 [5], clause 7.6.4 for definition and coding of the IE << Basic Services >>.

NOTE: Currently there are two DPRS basic services related to Light Data Services with codes "1001"B and "1010"B.

In the case of basic services related to DPRS, the setup attributes shall have default values as given below.

# A.2.1 Default setup attributes for basic service "light data service, with Class 4 DPRS management" (code "1001"B)

See TS 102 527-4 [i.2] for definition of Ligh Data Service.

# Table A.6: Default coding for << IWU-ATTRIBUTES >> information element

| Octet | Information element field   | Field Value   |
|-------|---|---|
| 3     | Coding standard   | Profile defined code  |
|       | Information transfer capability   | DPRS: Frame Relay services  |
| 4     | Negotiation indicator   | 000: Negotiation not possible   |
|       | Profile subtype   | DECT Generic Media Encapsulation  |
| 5     | Maximum SDU size $PT \Rightarrow FT$ (Most significant 7 bits)  | "0000001"B (value=191, equivalent to 1 528 octets)  |
| 5a    | Maximum SDU size $PT \Rightarrow FT$ (Least significant 7 bits)   | "0111111"B  |
| 5b    | Maximum SDU size $FT \Rightarrow PT$ (Most significant 7 bits)  | "0001011"B (value=1 528, equivalent to 12 224 octets)   |
| 5c    | Maximum SDU size $FT \Rightarrow PT$ (Least significant 7 bits)   | "1111000"В  |
| 6     | Profile subtype attributes extension bit  | "1": this is the only and last control set  |
|       | Operation code  | "01": Adds one bidirectional D-GMEP context to the<br>connection                                      |
|       | Optional Groups   | "00": there are no optional groups  |
|       | CH bit  | "0": Chopping not allowed   |
|       | Spare bits  | "00"  |
| 6a    | Seq bit (bit 8)   | "1": this D-GMEO context shall use sequence numbers   |
|       | Generic Media Context Identifier (GMCI)   | 0/1 (see note)  |
| 6b    | Application protocol identifier (most significant byte)   | "00000100"B: value =1079 = HTTP limited set nr. 2 as described in clause B.8.3.4)                     |
| 6c    | Application protocol identifier (least significant byte)  | "00110111"B   |
| NOTE: | The GMCI value to be used in the connection shall using value "0" in the PT $\Rightarrow$ FT message, and value | be GMCI = 1 and is allocated by the FT. Equivalent to $"0000001"$ in the FT $\Rightarrow$ PT message. |

## Table A.7: Default coding for << CALL-ATTRIBUTES >> information element

| Octet | Information element field | Field Value            |
|-------|---------------------------|------------------------|
| 3     | Coding standard           | DECT standard          |
|       | Network layer attributes  | DPRS Class 4 ("0110"B) |
| 4     | C-plane class             | Class A; shared        |
|       | C-plane routing           | C <sub>S</sub> only    |
| 5     | U-plane symmetry          | Symmetric              |
|       | LU identification         | LU10                   |
| 6     | U-plane class             | Class 2; SELective     |
|       | U-plane frame type        | FU10a/c                |

| Octet | Information element field                       | Field Value  |
|-------|---|--|
| 3     | < Symmetry >                                    | Symmetric only connection                                      |
|       | < Connection identity >                         | Unknown  |
| 4     | < Maximum bearers $P \Rightarrow F$ direction > | 1  |
| 4a    | < Minimum bearers $P \Rightarrow F$ direction > | 1  |
| 4b    | < Maximum bearers $F \Rightarrow P$ direction > | 1  |
| 4c    | < Minimum bearers $F \Rightarrow P$ direction > | 1  |
| 5     | < Slot type>                                    | Long slot; j = 640   |
|       | < MAC service $P \Rightarrow F >$               | I <sub>PM</sub> ; (I <sub>P</sub> error detect, multisubfield) |
| 5a    | < MAC service $F \Rightarrow P >$               | I <sub>PM</sub> ; (I <sub>P</sub> error detect, multisubfield) |
| 6     | < CF-channel attributes $P \Rightarrow F >$     | C <sub>F</sub> never (CS only)                                 |
|       | < MAC packet life time P $\Rightarrow$ F >      | Not applicable   |
| 6a    | < CF-channel attributes $F \Rightarrow P$ >     | C <sub>F</sub> never (CS only)                                 |
|       | < MAC packet life time F $\Rightarrow$ P>       | Not applicable   |
| 7     | < A attributes >                                | 2-level  |
|       | < B attributes >                                | 2-level  |

## Table A.8: Default coding for << CONNECTION-ATTRIBUTES >> information element

## Table A.9: Default coding for << WINDOW SIZE >> information element

| Octet | Information element field                          | Field Value    |
|-------|--|----------------|
| 3     | ext3   | 0              |
|       | < Window size value (P $\Rightarrow$ F) >          | "000000"       |
| 3a    | ext3a  | 1              |
|       | < Window size value (P $\Rightarrow$ F) continue > | "010000" (=16) |

# Table A.10: Default coding for << TRANSIT-DELAY >> information element

| Octet | Information element field                                    | Field Value |
|-------|--|-------------|
| 3     | <upstream (p="" <math="">\Rightarrow F) delay&gt;</upstream> | 0           |
| 4     | < downstream (F $\Rightarrow$ P) delay>                      | 0           |

| Information element     | Field within the<br>information element   | Standard values<br>within the<br>field/information<br>element | Normative action/comment   |
|-------------------------|---|---|--|
| << Set-up capability >> |   |   |  |

Table A.17: Default values assumed within the IE << SETUP-CAPABILITY >>

# Annex B (normative): Interworking conventions for the Frame Relay (FREL) service

# B.1 Scope of this annex

This annex defines the Interworking conventions for Frame Relay (FREL) service. DPRS Frame Relay service may be used for the transport of the following protocols:

- IEEE 802.3 [13]/Ethernet;
- IEEE 802.5 [14] (Token Ring);
- Version 4 RFC 791 [15] or higher, Internet Protocol (IP);
- RFC 1661 [16], Point-to-Point Protocol (PPP).

Clauses B.1, B.2 and B.3 define a set of conventions applicable to the Frame Relay service in general, and clauses B.4 to B.7 define the specific conventions for each one of the transported protocols.

In addition clause B.8 defines the DPRS Generic media encapsulation transport which provides a means for transporting simultaneously the datagrams of various Application media protocols during one and the same DECT call utilizing the DPRS frame relay service.

# B.1.1 Typical configuration for the Frame Relay service

The typical configuration for Frame Relay service is shown in figure B.1.

# Figure B.1: Reference configuration for Frame Relay (FREL) service, including interworking to connection-oriented or connectionless networks

Mobility class 2 equipment provides a full DECT C-plane, while for mobility class 1 equipment, the C-plane is replaced by a Closed User Group administration.

The specific encapsulation interworking functions are defined in the other clauses of this annex, and are depending on the transported connectionless or connection-oriented protocol. The implementation of the external network used to transport the service protocol outside the DECT system is outside the scope of this profile.

# B.2 Specific codings for mobility class 2

# B.2.1 IWU-ATTRIBUTES information element coding

Mobility class 2 equipment, implementing the Interworking Units described in this annex, shall use the following IWU-ATTRIBUTES information element coding.

| Bit: | 8                         | 7  | 6                                    | 5             | 4            | 3             | 2      | 1 | Octet:        |
|------|---------------------------|--|--------------------------------------|---------------|--------------|---------------|--------|---|---------------|
|      | 0                         | 0 << IWU-ATTRIBUTES >><br>Length of Contents (L) |                                      |               |              |               |        | 1 |               |
|      |                           |  |                                      |               |              |               |        | 2 |               |
|      | 1                         | 1 CodeStd Profile                                |                                      |               |              | 3             |        |   |               |
|      |                           | 0  | 1                                    | 0             | 0            | 0             | 0      | 0 |               |

| Negotiation not possible.   |
| Peer attribute negotiation.   |
| Exchanged attribute negotiation.  |
| Exchanged attribute negotiation and Peer attribute negotiation.                 |
|   |
|   |

Profile subtype (octet 4):

| Bits | 4321             | Meaning  |
|------|------------------|--|
|      | 0000             | IEEE 802.3 [13]/Ethernet (see clause B.4).         |
|      | 0001             | IEEE 802.5 [14] (see clause B.5).                  |
|      | 0010             | Internet Protocol (IP) (see clause B.6).           |
|      | 0100             | Point-to-Point Protocol (see clause B.7).          |
|      | 1000             | DPRS Generic Media Encapsulation (see clause B.8). |
|      | All other values | are reserved.                                      |

Maximum SDU size  $PT \Rightarrow FT$  (octets 5 and 5a): This 14-bit word represents the natural binary coding of the maximum SDU length in units of eight octets used for data transmission, with the least significant bit in position 1 of octet 5a. This value applies in both directions if octets 5b and 5c are not present. Otherwise, this value applies for the upstream direction.

The maximum possible value is "1111111" (octet 5) "1111100" (octet 5a), coding a SDU length of 131 040 bytes (16  $380 \times 8$ ).

The following codes have special values:

• "1111111" (octet 5) "1111101" (octet 5a)  $\Rightarrow$  indicates an SDU length longer than 131 040 bytes, but finite.

- "1111111" (octet 5) "1111110" (octet 5a)  $\Rightarrow$  is reserved for further development and should not be used.
- "1111111" (octet 5) "1111111" (octet 5a)  $\Rightarrow$  indicates an infinite SDU length.

NOTE: The term "infinite SDU" indicates that the data flow is handled as a stream.

**Maximum SDU size FT**  $\Rightarrow$  **PT (octets 5b and 5c, optional):** If these octets are present, this 14-bit word represents the natural binary coding of the maximum SDU length in units of eight octets used for data transmission in the FT  $\Rightarrow$  PT direction, with the least significant bit in position 1 of octet 5c.

The same special codes of octets 5/5a apply.

# B.2.1.1 Profile subtype attributes (octet group 6) of IWU-ATTRIBUTES information element

The octet group 6 of IWU-ATTRIBUTES information element shall have a profile subtype specific meaning.

The profile subtype attributes octet group is optional. If it is not present, the following assumtions shall be taken:

- For IEEE 802.3 [13] and IEEE 802.5 [14] (clauses B.4 and B.5) it shall be understood as SI<sub>P</sub> connectionless downlink not used.
- For IP (clause B.6), it shall be understood as IP version 4 (RFC 791 [15]) and no PDP address is passed in the message.
- In the case of the DECT generic media encapsulation protocol this octet group is mandatory unless a basic service has been invoked in the setting of the connection. See clause A.2 for the default values that shall be understood when this group is not present and a basic service has been invoked.

B.2.1.1.1 IEEE 802.3/Ethernet

| Bit: | 8 | 7               | 6 | 5 | 4 | 3     | 2 | 1 | Octet:       |
|------|---|-----------------|---|---|---|-------|---|---|--------------|
|      | 1 | SI <sub>P</sub> | 0 | 0 | 0 | 0     | 0 | 0 | 6 (optional) |
|      |   |                 |   |   | 5 | Spare |   |   |              |

#### Figure B.3: Ethernet

SI<sub>P</sub> bit: This bit indicates if the connectionless downlink service SI<sub>P</sub> is being used (see clause B.4.2.1).

Bit 7 Meaning

| 1 | SI <sub>P</sub> connectionless downlink is being used. |
|---|--|
| 0 |  |

0 SI<sub>P</sub> connectionless downlink not used.

#### B.2.1.1.2 IEEE 802.5 (Token-Ring)

#### Figure B.4: Token Ring

 $SI_P$  bit (bit 7 of octet 6): This bit indicates if the connectionless downlink service  $SI_P$  is being used (see clause B.5.2.2).

| Bit | 7 | Meaning  |
|-----|---|--|
|     | 1 | SI <sub>P</sub> connectionless downlink is being used. |
|     | 0 | SI <sub>P</sub> connectionless downlink not used.      |

#### B.2.1.1.3 Internet Protocol (IP)

In the case of Internet protocol (IP) Interworking, the profile subtype is used to indicate the IP version and, optionally, to pass an IP address. This facility may be used, for instance, for dynamic IP address allocation at the beginning of the virtual call.

#### Figure B.4a: Internet Protocol IPv4 or IPv6

IP version: bits 6 and 7 of octet 6.

| Bit | 76          | Meaning                       |
|-----|-------------|-------------------------------|
|     | 01          | IP version 4 (RFC 791 [15]).  |
|     | 10          | IP version 6 (RFC 2460 [36]). |
|     | All other v | alues reserved.               |

**Spare:** bits 1 to 5 of octet 6.

Spare bits are reserved for future use and shall be set to "00000".

PDP address (IP address): octets 6a to 6d if IPv4, or 6a to 6p if IPv6.

If IP type is IPv4, then the 4 following octets 6a to 6d may be used to transfer an IP address. This is indicated by bit 8 of octet 6: if bit 8 = 0, then octets 6a to 6d follows, if bit 8 = 1, then there is no address.

The four bytes set to "0", means blank address. This may be used to request an IPv4 address in the return message.

If IP type is IPv6, then the 16 following octets 6a to 6p may be used to transfer an IPv6 address. This is indicated by bit 8 of octet 6: if bit 8 = 0, then octets 6a to 6p follows, if bit 8 = 1, then there is no address.

The 16 bytes set to "0", means blank address. This may be used to request an IPv6 address in the return message.

In both cases, most significant octet of the address is codec in octet 6a and less significant byte in last octet. Bits within octets are codec with less significant bit in bit 1 of each octet.

#### B.2.1.1.3.1 Dynamic IP address allocation

The allocation by the network of Dynamic IP addresses can be done as follows.

The PP starts a PDP context (outgoing call) sending the IWU-attributes IE with the 4 bytes of address (IPv4) set to "0". The FP may return an IP address in the response message.

NOTE: This method is analogue to GPRS.

If the PDP context is started by the FP (incoming call), then the allocated IP address may be transmitted within IWU-attributes in the CC-setup message.

### B.2.1.1.4 DPRS Generic media encapsulation

For DPRS Generic media encapsulation, the following set of octets shall be inserted in octet 6 group for each D-GMEP context that is being created or released in the C-plane procedure that is using the << IWU-Attributres >> IE. If several contexts are created and/or released in the operation, several sets shall be inserted (up to four).

| Bit: | 8   | 7       | 6          | 5           | 4            | 3        | 2     | 1      | Octet:   |
|------|-----|---------|------------|-------------|--------------|----------|-------|--------|----------|
|      | 0/1 | Operati | on code    | Optiona     | l groups     | CH bit   | Spare | ("00") | 6        |
|      | seq |         | Generic I  | Media co    | ntext indi   | cator (C | GMCI) |        | 6a       |
|      |     | Арр     | lication p | rotocol id  | lentifier (r | n.s.byte | e)    |        | 6b       |
|      |     | Арр     | lication p | orotocol id | dentifier (  | l.s.byte | )     |        | 6c       |
|      |     |         | Opti       | onal cont   | rol group    |          |       |        | 6d (opt) |
|      |     |         |            |             |              |          |       |        |          |
|      |     |         |            |             |              |          |       |        | 60 (opt) |

NOTE: GMEP instances are called "contexts". Each context will usually transport a single protocol. Several contexts may be used to transport different protocols, or different instances (contexts) of the same protocol.

For each context, a D-GMEP control set shall be used. Each control set may have from 4 octets to 16 octets depending of options. Several control sets of variable length may appear in one << IWU-Attributes >> IE.

The maximum number of control sets in one signalling message shall be limited to FOUR (4) to limit the maximum size of the messages. It is possible to add additional contexts to the connection by means of the Service Change feature (DPRS-N.35) that has to be implemented if more than four instances of D-GMEP are to be multiplexed in one DPRS virtual connection.

#### B.2.1.1.4.1 Description of the different fields:

#### **D-GMEP** control set first octet (octet 6)

Extension Bit: bit 8, octet 6.

#### Bits 8 Meaning

- 0 Indicates that there is another control set after this one. Therefore another octet 6 follows the last octet of this control set.
- 1 This is the last D-GMEP control set.

**Operation code:** bits 6 and 7, octet 6.

Describes the operation to be done. The possible codes are:

#### Bits 76 Meaning

- 01 Create one D-GMEP context (bidirectional) and adds it to the connection.
- 10 Release a D-GMEP context from the connection.
- All other values reserved.
- NOTE: In virtual call setup procedures, only the code "01" may be used. The code "10" may only be used in the Service Change procedure.

#### Optional control groups indicator: bits 4 and 5, octet 6.

Indicates if there is an optional group of control octets after octet 6c, and which one. The possible values are the following:

#### Bits 54 Meaning

- 0.0 There are no optional control octets.
- 0 1 The control group for interworking to TCP/UDP/IP networks is present (see clause B.2.1.1.4.2). It indicates that there are 12 octets 6d to 6o after octet 6c with the meaning described in clause B.2.1.1.4.2.

The operation code "Remove" ("10") shall not use optional control groups, and bits 3 to 5 shall be coded to "000".

#### Chop indicator bit: bit 3, octet 6.

Indicates that it is allowed to segment (chop) the application packet in several Interworking packets, that will become DLC SDUs.

220

#### Bits 3 Meaning

- 0 Chopping not allowed
- 1 Chopping allowed

Spare bits: bits 1 and 2, octet 6.

Bits 1 and 2 of octet 6 are reserved for further development and shall be set to "0".

D-GMEP control set second octet (octet 6a): This octet is also mandatory in each control set.

Sequence numbering Bit: (bit 8, octet 6a).

#### Bits 8 Meaning

- 0 Indicates that this D-GMEP context does not require sequence numbers.
- 1 Indicates that this D-GMEP context requires sequence numbers.

If this bit is set to 1, then U-plane packets of this D-GMEP context shall be sequence numbered in the second octet of each U-plane packet (see figure B.8 in clause B.8.2).

#### **D-GMEP context identifier:** bits 1 to 7, octet 6a.

These 7 bits carry the D-GMEP context identifier that shall be used in octet 1 of the U-plane packets (see figure B.8 in clause B.8.2).

The D-GMEP context identifier is an arbitrary number allocated by the FP at the context creation time. In PT initiated virtual call setups the number shall be set to "0000000" in the request message and the allocated value shall be returned by the FT. The same applies to PT initiated Service change (DPRS-N.35) adding new contexts.

In Service change (DPRS-N.35) requesting the removal of contexts (operation "10"), the real value shall be present in all messages.

### **D-GMEP protocol identifier:** octets 6b and 6c.

These two octets are mandatory in each control set.

They indicate the protocol to be transported over the D-GMEP instance, according to the codes listed in clause B.8.3.

### B.2.1.1.4.2 Optional control octets

Optional group for TCP/UDP/IP interworking: octets 6d to 6o.

This optional group for TCP/UDP/IP interworking may be used when the FP implements an interworking to an IP network. By using this group, it is possible to map each D-GMEP context to a connection/context over an external TCP/IP connection or UDP/IP context at the FP, and controlling the fields of the external TCP/UDP/IP datagrams used when transmitting the data of each D-GMEP context.

NOTE 1: The use of this control set is an option. Application profiles may define alternative mechanisms for the control of external TCP/UDP/IP communications.

The optional group is composed of 12 octets. If used, all octets described shall be present.

The total length of the control set with this option shall be 16 octets.

By using this group, the PT is indicating the FT that it should establish a TCP/IP connection or an UDP/IP context over an external Internet network, and map the packets transported over the D-GMEP context to such TCP connection or UDP context.

The connection shall be TCP/IP if the Sequence numbering Bit (bit 8, octet 6a) is set to 1. If the Sequence numbering Bit (bit 8, octet 6a) is set to 0, then the IP communication shall be UDP/IP.

In protocols with specific descriptions (see clause B.8.3), this rule shall be also fulfilled, unless specific special rules are provided in the description.

NOTE 2: Currently there are no such special rules.

When the optional control group for interworking to TCP/IP networks used, then the control set has the following composition.

| Bit: | 8   | 7       | 6                    | 5          | 4           | 3         | 2     | 1      | Octet: |
|------|-----|---------|----------------------|------------|-------------|-----------|-------|--------|--------|
|      | 0/1 | Operati | on code              | Optiona    | l groups    | CH        | Spare | ("00") | 6      |
|      | seq |         | GME                  | P contex   | t indicato  | r (GMC    | CI)   |        | 6a     |

# Figure B.4c: DECT generic media encapsulation, including the optional group for interworking to TCP/IP networks

#### Description of the different optional fields:

Source IP address: octets 6d to 6g.

These 4 octets carry the IP address to be used by the FP as source address in an external TCP/IP connection or UDP/IP context, for all packets belonging to the D-GMEP context.

Most significant bit shall be bit 8 of octet 6d and less significant bit shall be bit 1 of octet 6g.

Unless special provisions are given in the application profile, these octets shall be left as "0.0.0.0" in the request message of a PT initiated context creation (either at call setup or at service change) and the value shall be returned by the FT.

Destination IP address: (octets 6h to 6k).

These 4 octets carry the destination IP address to be inserted by the FP in an external TCP/IP connection or UDP/IP context, for all packets belonging to the D-GMEP context.

Most significant bit shall be bit 8 of octet 6h and less significant bit shall be bit 1 of octet 6k.

Source TCP/UDP port: octets 6l to 6m.

These 2 octets carry the source TCP or UDP port number to be used by the FP in an external TCP/IP connection or UDP/IP context, for all packets belonging to the D-GMEP context.

Most significant bit shall be bit 8 of octet 6l and less significant bit shall be bit 1 of octet 6m.

Unless special provisions are given in the application profile, these octets shall be left as "0.0" in the request message of a PT initiated context creation (either at call setup or at service change) and the number shall be allocated and returned by the FT.

Destination TCP/UDP port: octets 6n to 6o.

These 2 octets carry the destination TCP or UDP port number to be used by the FP in an external TCP/IP connection or UDP/IP context, for all packets belonging to the D-GMEP context.

Most significant bit shall be bit 8 of octet 6n and less significant bit shall be bit 1 of octet 6o.

This parameter shall be set with the port number that the far end host is listening to.

NOTE 3: This number is usually, but not always, equal to the "well-known" number of the Internet application protocol. The real number the far end host is listening to should be placed here.

222

#### B.2.1.1.4.3 D-GMEP Protocol identifier codes

The protocol identifier code, as deascribed in clause B.8.3, shall be inserted in octets 6b/6c for identification of the transported protocol. Most significant bit is bit 8 of octet 6b.

See clause B.8.3.2 for the codes of protocols with specific description. For all other well-known protocols, the IETF well-known port number shall be used.

- NOTE 1: The IETF well-known port number should be used here as identifier of the protocol, independently of what is the port number to be used in the Internet connection.
- EXAMPLE: For an HTTP (full HTTP) communication (well-know port number 80) to a far end-server that is listening at port 1080, the value "80" should be coded here to identify the protocol and the value "1080" should be used in the TCP-UDP/IP optional octets (octets 6n, 6o), to indicate the destination TCP port.
- NOTE 2: In addition to the provisions given in the present clause regarding the coding of the << IWU ATTRIBUTES >> at call setup or service change, all DECT terminals supporting Generic media encapsulation are requested to indicate the supported Application Protocols, and other related capabilities, at subscription and location registration using the << SETUP-CAPABILITY >> information element as described in clause 12.22.

### B.2.2 IWU attributes implemented

|           |  | Supporte      | ed parameters       |                       |                       |

#### Table B.1: IWU-ATTRIBUTES information element support status

# B.3 Generic Frame Relay service interworking conventions

The provisions of this clause shall apply to all applications of the Frame Relay service.

# B.3.1 DLC U-plane service

The Frame Relay service shall be transported by DLC LU10 (Enhanced Frame Relay service).

### B.3.2 Transmission bit order

All data frames shall always be transmitted as DECT DLC layer SDUs. The Most Significant Bit (MSB) of each octet shall be transmitted first and the Least Significant Bit (LSB) last.

NOTE: The implementer of a FREL interworking needs to bare in mind that some application protocols may submit octets being part of their packets of data to the IWF in reverse order, e.g. the transmission requirements for an Ethernet packet as stated in IEEE 802.3 [13]/Ethernet. LAN standards are LSB first.

### B.3.3 Support of SDU size

Any DECT equipment supporting any of the DPRS Frame Relay services defined in this annex shall be capable of supporting LU10 SDU frames of at least 1 528 octets. The equipment may optionally support larger SDUs.

224

In addition to that, any DECT equipment supporting DPRS Generic Interworking and the Light Data Services (see TS 102 527-4 [i.2]) shall be capable of supporting LU10 SDU frames in the downlink direction, of at least 12 koctets. The equipment may optionally support larger SDUs.

# B.3.4 SI<sub>P</sub> connectionless downlink

If the connectionless downlink service  $(SI_P)$  is used, point-to-multipoint and broadcast packets may be transmitted by the connectionless downlink service  $(SI_P)$ . These packets may also be transmitted by DECT connection-oriented connections. If the service is not used, all traffic shall be transported by DECT connection-oriented connections.

# B.4 IEEE 802.3/Ethernet

The provisions of this clause shall apply if interworking to IEEE 802.3 [13]/Ethernet. LANs is provided.

NOTE: IEEE 802.3 is also known as ISO/IEC 8802-3.

### B.4.1 Typical configuration

The typical configuration for this specific interworking convention shall be as defined in clause B.1, figure B.1 where the transported protocol is conform to IEEE 802.3 [13] or Ethernet [i.5].

### B.4.1.1 Examples of implementation of the external transport network

Implementation of the external network used to transport the IEEE 802.3 [13] or Ethernet [i.5] frames outside the DECT system is out of the scope of the present document. Typical implementation will be the physical interface of the own IEEE 802.3 [13] or Ethernet. However, alternative implementations are also possible. Some examples of possible implementation and the associated interworking function are given in table B.2.

| DPRS Service                      | External transport<br>network                             | Referenced standards   | IWU<br>Function | Remarks   |
|-----------------------------------|---|--|-----------------|---|
| IEEE 802.3 [13]<br>Ethernet [i.5] | IEEE 802.3 [13],<br>Ethernet [i.5] (any PHY<br>interface) | IEEE 802.3 [13]/<br>Ethernet [i.5]   | Bridge          | Bridging in IWU.  |
| IEEE 802.3 [13]<br>Ethernet [i.5] | IEEE 802.3 [13],<br>Ethernet [i.5] (any PHY<br>interface) | IEEE 802.3 [13]/<br>Ethernet [i.5]   | Routing/<br>NAT | Routing in IWU with option of NAT/PAT.  |

| IEEE 802.3 [13]<br>Ethernet [i.5] | Frame Relay   | ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10]                                    | Switch          | Transparent mapping between<br>each DECT terminal and each FR<br>VC (multiple DLCIs in FR).<br>IEEE 802.3 [13]/Ethernet [i.5] over<br>FR as RFC 1490 [i.10], bridged<br>mode. |
| IEEE 802.3 [13]<br>Ethernet [i.5] | USB   | IEEE 802.3 [13], Ethernet [i.5]<br>ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10] | Bridge          | A virtual IEEE 802.3 [13]/ Ethernet<br>interface is transported over a<br>USB interface to an application<br>system.  |

Table B.2: External network implementation examples

### B.4.2 Specific interworking conventions

The conditions of clause B.3 shall be adhered to in addition to the following:

- the IEEE 802.3 [13]/Ethernet [i.5] MAC frame shall be transmitted as a single SDU beginning with the Destination Address up to (but not including) the FCS field, (see figure B.5);
- for IEEE 802.3 [13] MAC frames which contain Information fields of less than 46 octets and therefore have added PAD fields, the PAD fields shall not be transmitted, (see figure B.5);
- Ethernet MAC frames do not contain a Length field and do not provide sufficient information to establish the exact length of the Information field; therefore for Ethernet MAC frames which contain Information field with length of 46 octets the trailing octets containing all zeros shall not be transmitted (see figure B.5). Because removing of trailing octets with zeros may lead to removal parts of the information field as well, at the receiving side, on reception trailing octets with zeroes shall be added to sum up the Information field to 46 octets in length.
- NOTE 1: At the receiving side recovery of any stripped-off fields not explicitly mandated to be recovered is an implementation issue.
- NOTE 2: The requirements above do not impose any restriction on the IWF implementation. For example a designer may implement such Ethernet-to-IWF interworking where FCS bits are never calculated.
- NOTE 3: See also RFC 1042 [i.12] and RFC 894 [i.11] for the encapsulation of Internet Protocol (IP) [15] over the IEEE 802.3 [13] or Ethernet [i.5] frames.

| Preamble | SFD | Dest.Addr | Src.Addr   | L   | Information | PAD | FCS |
|----------|-----|-----------|------------|-----|-------------|-----|-----|
|          |     |           | ISO 8802-3 | MAG | C frame     |     |     |
|          |     | Dest.Addr | Src.Addr   | L   | Information |     |     |

| DECT DLC SDU |
|--------------|
|--------------|

| Preamble     | Dest.Addr          | Src.Addr | Туре | Information | Trailing<br>zeroes FCS |  |  |
|--------------|--------------------|----------|------|-------------|------------------------|--|--|
|              | Ethernet MAC frame |          |      |             |                        |  |  |
|              |                    |          |      |             |                        |  |  |
|              | Dest.Addr          | Src.Addr | Туре | Information |                        |  |  |
| DECT DLC SDU |                    |          |      |             |                        |  |  |
| Earliest     |                    | Time     |      |             | Latest                 |  |  |

#### Figure B.5: Mapping of IEEE 802.3 [13] and Ethernet MAC frames into DECT DLC SDU

- NOTE 4: Removal of the PAD and the Trailing zeroes is relevant only to frames with minimal size (Information + PAD/trailing zeroes = 46 octets).
- NOTE 5: Although the IEEE 802.3 [13] standard chooses to define an < SFD > field there is no practical difference between the < Preamble > field of the Ethernet standard and the < Preamble + SFD > field of the IEEE 802.3 [13] standard the pattern of the bits used for the coding of these fields is identical.

### B.4.2.1 Use of the connectionless downlink SI<sub>P</sub> service

The Connectionless downlink  $SI_P$  service may be used when transporting the IEEE 802.3 [13]/Ethernet service. The use of this service is indicated by the  $SI_P$  field of the profile subtype attributes as shown in clause B.2.1.1.1. If the connectionless downlink service  $SI_P$  is used, the FP is allowed to transmit multicast and broadcast Ethernet packets by the connectionless downlink service ( $SI_P$ ). The FP may also transmit these types of packets by the DECT connection-oriented connections.

If the service is not used, all traffic shall be transported by DECT connection-oriented connections.

### B.4.2.2 Special conventions for mobility class 1 systems

In mobility class 1 equipment IPUIs of type O shall be used, where the full IEEE 802.3 [13]/Ethernet. MAC address shall be mapped into the type O IPUI with the Least Significant Bit (LSB) of the IEEE 802.3 [13]/Ethernet. MAC address corresponding to the LSB of the IPUI.

# B.5 IEEE 802.5 (token ring)

The provisions of this clause shall apply if interworking to IEEE 802.5 [14] (token ring) LANs is provided.

NOTE: IEEE 802.5 is also known as ISO/IEC 8802-5.

### B.5.1 Typical configuration

The typical configuration for this specific interworking convention shall be as defined in clause B.1, figure B.1 where the transported protocol is conform to IEEE 802.5 [14].

### B.5.1.1 Examples of implementation of the external transport network

Implementation of the external network used to transport the IEEE 802.5 [14] frames outside the DECT system is out of the scope of the present document. Typical implementation will be the physical interface of the own IEEE 802.5 [14]. However, alternative implementations are also possible. Some examples of possible implementation and the associated interworking function are given in table B.3.

| DPRS Service    | External transport<br>network | Referenced standards  | IWU<br>Function | Remarks  |
|-----------------|-------------------------------|---|-----------------|--|
| IEEE 802.5 [14] | IEEE 802.5 [14]               | IEEE 802.5 [14]   | Bridge          | Bridging function in IWU.  |
| IEEE 802.5 [14] | Frame Relay                   | ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10]                     | Bridge          | Bridging function in IWU.<br>IEEE 802.5 [14] over FR.  |
| IEEE 802.5 [14] | Frame Relay                   | ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10]                     | Switch          | Transparent mapping<br>between each DECT terminal<br>and each FR VC. Multiple<br>DLCIs in FR.              |
| IEEE 802.5 [14] | USB                           | IEEE 802.5 [14],<br>ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10] | Bridge          | A virtual IEEE 802.5 [14]<br>interface is transported over<br>a USB interface to an<br>application system. |

# B.5.2 Specific interworking conventions

The conditions of clause B.3 shall be adhered to in addition to the following:

- the IEEE 802.5 [14] MAC frame shall be transmitted as a single SDU beginning with the IEEE 802.5 [14] MAC Frame Control (FC) field and ending with the MAC Information field, (see figure B.6). At the receiving side recovery of the stripped-off fields is implementation issue;
- the token ring MAC Control frames as identified by the FC byte shall not be sent and shall be correctly inter worked with the token ring network. The Frame Status (FS) byte shall not be sent, (see figure B.6).

### B.5.2.1 Special conventions for mobility class 1 systems

In mobility class 1 equipment IPUIs of type O shall be used, where the full IEEE 802.5 [14] MAC address shall be mapped into the type O IPUI with the LSB of the IEEE 802.5 [14] MAC address corresponding to the LSB of the IPUI.

### B.5.2.2 Use of the connectionless downlink SI<sub>P</sub> service

The Connectionless downlink  $SI_P$  service may be used when transporting the IEEE 802.5 [14] (token ring) service. The use of this service is indicated by Bit 7 of Octet 6 of << IWU-ATTRIBUTES >> shown in clause B.2.1.1.2. If the connectionless downlink service  $SI_P$  is used, the FP is allowed to transmit point-to-multipoint and broadcast packets by the connectionless downlink service ( $SI_P$ ). The FP may also transmit these types of packets by the DECT connection-oriented connections.

If the service is not used, all traffic shall be transported by DECT connection-oriented connections.

# B.6 Internet protocol

The provisions of this clause shall apply if interworking to Internet Protocol (IP) version 4 (RFC 791 [15]) or higher is provided.

# B.6.1 Typical configuration

The typical configuration for this specific interworking convention shall be as defined in figure B.1 where the transport protocol is Internet Protocol version 4 (RFC 791 [15]), or higher.

### B.6.1.1 Examples of implementation of the external transport network

Implementation of the external network used to transport the Internet Protocol outside the DECT system is out of the scope of the present document. Some examples of possible implementations and the associated Interworking function are given in table B.4.

| DPRS<br>Service | External transport<br>network | Referenced standards                                  | IWU<br>Function | Remarks  |
|-----------------|-------------------------------|---|-----------------|--|
| IP              | Connectionless LAN            | IEEE 802.3 [13], IEEE 802.5<br>[14]                   | Router          | IP Routing function in IWU.  |
| IP              | Frame Relay                   | ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10] | Router          | IP Routing function in IWU. IP<br>over FR as RFC 1490 [i.10],<br>routed links.   |
| IP              | Frame Relay                   | ITU-T Recommendation<br>Q.922 [i.13], RFC 1490 [i.10] | Switch          | Transparent mapping between<br>each DECT terminal and a FR<br>VC. Multiple DLCIs in FR. IP over<br>FR as RFC 1490 [i.10], routed<br>links. |
| IP              | ATM                           | RFC 1483 [i.6]  | Router          | IP over ATM Adaptation Layer 5.  |
| IP              | Serial line                   | PPP RFC 1661 [16],<br>RFC 1662 [17]                   | Router          | IP Routing function in IWU. PPP<br>used only in external transport<br>network.   |

### B.6.2 Specific interworking conventions

The conditions of clause B.3 shall be adhered to in addition to the following:

• IP datagrams shall be transmitted as a single SDU. The SDU contains the IP header followed immediately by the IP data. Since LU10 SDUs can be an arbitrarily short length there are no requirements for adding fill fields or padding.

### B.6.2.1 Special conventions for mobility class 1 systems

In Mobility class 1 equipment IPUIs of type O shall be used.

# B.7 Point-to-Point Protocol

The provisions of this clause shall apply to transport data encapsulated using the Point-to-Point Protocol (PPP), as defined in RFC 1661 [16].

# B.7.1 Typical configuration

The typical configuration for this specific interworking convention shall be as defined in clause B.1, figure B.1. In this configuration the FP interworking transparently maps any PPP packet coming from a given DECT air interface packet-mode connection to a fixed virtual circuit at the Network interface.

### B.7.1.1 Examples of implementation of the external transport network

Implementation of the external network used to transport the PPP outside the DECT system is out of the scope of the present document. Some examples of possible implementation are in table B.5.

| DPRS<br>Service | External transport<br>network | Referenced standards | IWU Function | Remarks   |
|-----------------|-------------------------------|----------------------|--------------|---|
| PPP             | Modem/PSTN                    | RFC 1662 [17]        | Switch       | Mapping of C-plane signalling between DECT and PSTN possible. |
| PPP             | ISDN (circuit-switch)         | RFC 1618 [i.7]       | Switch       | Mapping of C-plane signalling between DECT and ISDN possible. |
| PPP             | Frame Relay                   | RFC 1973 [i.8]       | Switch       | PPP over FR.  |
| PPP             | ATM                           | RFC 2364 [i.9]       | Switch       | PPP over ATM AAL 5.   |
| PPP             | Tunnel over IP network        | L2TP (or PPTP)       | Switch       | Mapping of C-plane signalling between DECT and L2TP possible. |

 Table B.5: Examples of external network implementations

### B.7.2 Specific interworking conventions

The conditions of clause B.3 shall be adhered to in addition to the following:

- The PPP packets, as defined in RFC 1661 [16] shall be transmitted directly as a single U-plane DLC layer SDU. The SDU contains the PPP "protocol field" header followed by the PPP data. The PPP framing, if used (e.g. the one defined in RFC 1662 [17] or other), shall not be transmitted over the DECT air interface.
- The maximum SDU packet size shall be 1 528 octets.

NOTE: At the receiving side recovery of any stripped-off fields is an implementation issue.

### B.7.2.1 Special conventions for mobility class 1 systems

In Mobility class 1 equipment IPUIs of type O shall be used.

# B.8 Interworking conventions for DPRS Generic Media Encapsulation transport mechanism

### B.8.1 General

This clause defines the interworking conventions for DPRS generic media encapsulation transport mechanism and protocol (D-GMEP) for transporting of protocols not covered by clauses B.3 to B.7 over DPRS. These protocols are typically (however not necessarily) application protocols.

A typical configuration example for DECT generic media encapsulation transport is shown in figure B.7.

D-GMEP allows multiplexation at Interworking level: different protocols and multiple instances of each protocol may be transported over the same DPRS virtual connection and DLC link instance.

#### Figure B.7: Reference configuration for D-GMEP

### B.8.2 Interworking Requirements

D-GMEP implements an adaptation layer at interworking level with the following capabilities:

- Multiplexing of different flows.
- Insertion of a context identifier (GMCI).
- Segmentation (chopping) of large application packets into smaller SDUs (optional).
- Sequence numbering at Tx and sequence control at Rx (optional).

### B.8.2.1 U-plane format and protocol elements

The DPRS Generic Media Encapsulation Protocol adds a header of one or two octets with the following information:

**Context and context identifier (GMCI):** To allow the handling of multiple simultaneous contexts of application protocols over a single DPRS connection, the adaptation layer assigns an identifier to each created context, called the "Generic Media context identifier (GMCI)".

The GMCI shall be assigned by the FP upon initiation of the context, and shall be used in the header of all U plane packets belonging to that context.

A context may be created at call setup, or may be added later to the call by means of a Service Change procedure (DPRS-N.35). Contexts may be also individually released during the call by means of a Service change procedure, or at call release that automatically removes all contexts.

**Sequence number and "more" bit (optional):** The second octet of the header is optional and includes a sequence number and an "M" (more) bit. If used, this octet allows the control of the sequence order and integrity at receiver side, and also the chopping of external protocol datagram into several smaller SDUs.

**DPRS Frame Relay SDU:** The header plus data unit shall constitute the DPRS Frame Relay SDU used in the DLC U-plane service.

| The DPRS Generic Media Encapsulation protocol SDU shall be coded as follows: |
|--|
|--|

| Bit: | 8   | 7   | 6                          | 5 | 4 | 3 | 2  | 1 | Octet:   |
|------|-----|---|----------------------------|---|---|---|----|---|----------|
|      | 0/1 | 0/1 Generic Media context identifier (GMCI) |                            |   |   |   |    | 1 |          |
|      | М   |   | Sequence number (optional) |   |   |   |    |   | 1a (opt) |
|      |     | Application Data Unit (start)               |                            |   |   |   |    | 2 |          |
|      |     |   |                            |   |   |   |    |   |          |
|      |     | Application Data Unit (end)                 |                            |   |   |   | 2n |   |          |

#### Figure B.8: DPRS Generic Media Encapsulation protocol SDU

#### B.8.2.1.1 Description of the protocol elements of the U-plane header

**D-GMEP U-plane header (octet group 1)** 

Sequence number indicator Bit: bit 8, octet 1.

#### Bits 8 Meaning

- 0 A sequence number and an "M" bit follows in octet 1a.
- 1 There is no octet 1a.

Generic Media context identifier (GMCI): bits 1 to 7, octet 1.

The GMCI is a unique number assigned at call setup (see clause B.2) by the FP used to identify the context of Generic Interworking Encapsulation. The relationship of this number with the protocol type and with port numbers used in external networks (f.i. TCP/UDP ports) is done at call setup or service change using C-plane. Up to 128 instances with sequence number and 128 without it may be identified.

More bit (bit 8, octet 1a): If the chopping option is used, this is the "M" (more) bit.

#### Bits 8 Meaning

- 0 This is the last segment (or the only one) of an application packet.
- 1 The next segment of the same application packet follows in next SDU.

If there is no chopping, this bit is reserved and shall be set to 0.

Sequence number: bits 1 to 7, octet 1a.

A correlative number allocated to each application packet in each GMEP context.

Octet 1a is used only if bit 8 of octet 1 is set to 0.

NOTE: The recommended practice is adding the sequence number for protocols normally transported by TCP and not using it for protocols that are normally transported over UDP, over IP or directly over LAN frames.

Octet 1a and included sequence number shall be used if the chopping option is used.

### B.8.2.2 SDU handling and interface to DLC

Consistently with other parts of the DECT standard, the term "SDU" shall be used for every formatted packet produced by the interworking layer and delivered to the DLC layer. "Application packet" refers to the external packet supplied to the interworking layer.

### B.8.2.2.1 Transmitter side procedure

The D-GMEP allows the multiplexing of disjoint data flows named "contexts". Different contexts may carry different protocols or different instances of the same protocol.

For each data flow, the following operations shall be carried out independently.

If the chopping option is used (and only in this case):

- If the application (or other external protocol) datagram is larger than the maximum SDU size defined for the system minus 2 octets, it shall be split into several segments of length compatible with the maximum SDU size.
- Otherwise, each application packet shall be transported by one SDU.

#### If the chopping option is not used:

- Each application (or other external protocol) packet shall be transported by one SDU.
- The application packets shall be smaller than the maximum SDU size defined for the DPRS connection.

The header defined in clause B.8.2 shall be added to each application packet (if no chopping is used) or to each segment (if chopping is used).

The use of chopping and of sequence numbers shall be as defined by the C-plane in IWU-Attributes at time of context creation (either at call setup or at service change, see clause B.2.1.1.4). In any case, if the chopping option is used, then the use of the sequence number is mandatory.

When sequence numbers are used, an independent numbering sequence is used for each GMEP context.

The use of the sequence number shall be indicated by bit 8 of octet 1 of the U-plane header.

If multiple contexts of the GMEP are carried over the same DPRS connection, all flows shall be multiplexed.

- NOTE 1: In case multiple contexts are multiplexed, the use of sequence numbers and of the chopping option is individual flow by flow.
- NOTE 2: It is possible to use sequence numbers for some contexts and not using them for other contexts.

The multiplexed sequence of interworking packets shall be passed to the DLC LU10. Each interworking packet shall be one DLC SDU.

#### B.8.2.2.2 Receiver side procedure

SDUs shall be received from DLC LU10 service using the standard SDU delivery mode.

NOTE: However, if there is only one D-GMEP context, and it has sequence numbers, the use of the in-sequence SDU delivery produces exactly the same result.

The traffic for the different GMEP contexts shall be separated based on the GMCI label.

Data from every context shall be processed independently as follows:

#### For contexts with sequence number only:

- The receiver side shall ensure that there is no violation of sequence. In some cases, this may require buffering packets waiting for a missing packet with lower sequence. This process shall be done individually, context by context.
- However, when there is no chance to receive the missing packet, the delivering of packets shall continue.
- NOTE 1: Correct implementation of this rule requires the interworking to be able to get information about the state of the DLC window.

NOTE 2: Therefore, there can be holes in the SDU sequence, but never a jump back.

#### If chopping option is used only:

- The interworking unit shall re-assemble segments of chopped application packets.
- If one segment of a chopped application packet is definitively missing, the interworking shall be able to signal this event to the user entity, which should act appropriately, or otherwise should discard the whole application packet.
- It is allowed to pass to the user entity, in-sequence segments of large application packets without waiting for the end boundary. However, in such a case, there should be a way to pass also an "abort" signal in case of impossibility to get the whole application packet.

#### For contexts without sequence number only:

• The buffering of packets to ensure sequence is not required. Therefore there may be sequence violations.

### B.8.3 Application protocols

### B.8.3.1 General

The Generic Media Encapsulation Interworking (D-GMEP) is intended for the transport of potentially any protocol directly on top of DPRS. The transportable protocols may belong to any of two categories:

- 1) protocols with a specific description in the present document; and
- 2) other well-known protocols, with well-known port numbers allocated by IETF for transport over TCP or UDP.

Each protocol will be identified by a protocol identifier number of 16 bits, which will be used in the C-plane call setup or service change procedures.

In the case a protocol specific description is added to the present document, the protocol identifier shall be listed in clause B.8.3.2. The specific conventions for the use of optional elements of the U-plane header such as sequence number or the chopping option shall also be indicated in this clause.

For other well-known protocols, the protocol identifier shall be the well-known port number allocated by IETF for transport over TCP/IP or UDP/IP. Sequence numbers shall be used when the protocol is transported over TCP and no sequence numbers shall be added when the protocol is transported over UDP. For protocols with both options (TCP or UDP), both options are also allowed over DECT, with the same rule: sequence numbers are added to emulate a transport over TCP, and they are not added to emulate a transport over UDP. This procedure allows the transport over D-GMEP of any application protocol used over Internet.

In the case of well-known protocols with no specific description in the present document, the protocol shall follow the provisions of its specific RFC. In the case of protocols with specific description in the present document, the description and allocated identifier number, overrules the IETF number and RFC description. In some specific cases, such as HTTP, there is a local description in the present document with some specific singularities (basically, a sub-set of the whole HTTP as defined by the RFC) and a specific protocol identifier number (1079 in this case) is defined. However, it is possible to use the protocol as described in relevant RFCs by using the IETF well-known port number (80).

### B.8.3.2 List of protocols with specific description in the present document

The following protocols are specifically listed and described in the present document. When used according to this description, the following protocol identification numbers shall be used, and the following options regarding use of sequence numbers and chopping facility shall apply.

| Protocol                                | Clause       | D-GMEP Protocol<br>identification<br>number | Use of<br>sequence<br>number | Use of chopping | Transport to be used in<br>case of Interworking to<br>IP networks |
|---|--------------|---|------------------------------|-----------------|---|

Table B.6: Protocols with specific description for transport over D-GMEP

For any other protocols, the description shall be as in relevant RFC, and the well-known port number shall be used.

### B.8.3.3 HTTP limited set nr.1

A DECT End system as defined in the present clause that is part of a distributed, collaborative, hypermedia information system shall ensure proper behaviour towards the other participants in the system and hide the physical split between FT and PT from the system. FT is responsible for such a proper behaviour, therefore all FTs that claim support for participation in such a system shall implement in full all relevant external protocols. For the purpose of this clause it is assumed that the FT shall have implemented the Hypertext Transfer Protocol (HTTP) as specified in RFC 2616 [27] to ensure the exchange of hyper media outside of the DECT system boundaries although other protocols could be implemented as well.

Internally, that is within the DECT system itself, the handling of the hypermedia could be realized in different ways which implies that different set of requirements need to be satisfied:

- a) A DECT system may chose to exclude the PTs from participation and provide proprietary handling and direct user interface in the FT. For such implementations the requirements specified in this clause do not apply and are out of the scope of the present document.
- b) Alternatively a DECT system may chose to include PTs in handling of the hypermedia. For such implementations the requirements specified in this clause do apply.
- c) Furthermore, a DECT system may be implemented that in itself is a distributed, collaborative, hypermedia information system with PTs and FT playing different roles and not necessarily being connected with an external hypermedia information system. For such implementations the requirements specified in this clause also do apply.

For the transport of hypermedia between the FT and the PTs within a DECT system implementations may chose to support in full the HTTP [27] protocol in both FT and PT. Alternatively, especially with DECT systems connected to an external hypermedia system, a limited version of the HTTP may be implemented at least in the PT depending on resource availability and implementation. For such implementations, and if the DECT system is connected with an external one, it is the FT responsibility to amend an outgoing HTTP message if necessary or downsize an incoming one allowing for proper handling by the limited PT HTTP.

FTs shall be capable of handling full and limited PT HTTP implementation, whereas PTs may implement either a full HTTP [27] or a limited one as specified bellow. The relevant support shall be indicated as specified in clause B.2.1.1.3.

Limited HTTP implementations shall support the following features as specified in RFC 2616 [27]:

- Both the "pull" and "push" data transfer models. Pull is achieved by a terminal (PT or FT) when acting as a client; Push is achieved by switching the role of the same terminal to a server (both ways using the request/response mechanism from HTTP/1.1).
- Persistent connections and pipelining with the modification that the term "TCP connection" shall be replaced by a DECT connection.
- At least GET and POST HTTP methods.
- Provision of addressing information.
- Provision of Content-Type information.

Limited HTTP implementations are not required to support more that the features indicated above and in particular they are not required to support:

235

- Other than address relevant and content type headers.
- Content encoding/decoding engines and hence may be capable of handling only uncompressed data. Consequently it is the FT responsibility to convert to/from compressed message bodies like gzip for example.
- Transfer and/or Chunked transfer coding.
- HTTP authorization, authentication and similar HTTP security mechanisms (DECT air protocols provide sufficient security).
- All media types.

### B.8.3.4 HTTP limited set nr.2 (Common HTTP profile)

The HTTP limited set nr. 2 is the "Common HTTP profile" defined in TS 102 527-4 [i.2], clause A.1. The name "Common HTTP profile" is used locally in TS 102 527-4 [i.2], and HTTP limited set nr. 2 will be used in the present document. Both terms are equivalent. The allocated protocol id to be used for protocol identification in IE <<< IWU-Attributes >> control octets is 1 079.

See TS 102 527-4 [i.2], clause A.1 for definition and requirements of the HTTP limited set nr. 2/Common HTTP profile.

### B.8.3.5 HTTP limited set nr.3 (Extended HTTP profile)

The HTTP limited set nr. 3 is the "Extended HTTP profile" defined in TS 102 527-4 [i.2], clause A.2. The name "Extended HTTP profile" is used locally in TS 102 527-4 [i.2], and HTTP limited set nr. 3 will be used in the present document. Both terms are equivalent. The allocated protocol id to be used for protocol identification in IE <<< IWU-Attributes >> control octets is 1 077.

The HTTP limited set nr. 3 is defined as a strict superset of the HTTP limited set nr. 2 and is designed for applications requiring higher interactivity between the user and the application. The main differences between the limited set nr. 3 and the limited set nr. 2 are the following:

- The "Common HTTP profile" limits user inputs to the server to URLs values. The "Extended HTTP profile" allows sending parameters or other data to the server.
- The "Extended HTTP profile" implies implementation of the POST method with the "Post Redirect Get" pattern" (see TS 102 527-4 [i.2], clause A.2.2.2.2).

See TS 102 527-4 [i.2], clause A.2 for definition and requirements of the HTTP limited set nr. 3/Extended HTTP profile.

### B.8.3.6 Electronic mail (Limited set nr. 1)

Electronic mail messages comprise an envelope and contents. The envelope contains whatever information is needed to accomplish transmission and delivery, whereas the contents comprise the object to be delivered to the recipient. The transmission delivery and envelop are specified in the RFC 5321 [29]. The content, depending on its type, is specified in various RFCs: the Internet Message Format (RFC 5322 [30]) specifies a syntax only for text messages; several extensions such as the MIME document series RFC 2045 [24], RFC 2046 [25], RFC 2049 [26], and RFC 3851 [28] describe mechanisms for the transmission of images, audio, or other sorts of structured data through electronic mail.

A DECT End system as defined in this clause that is capable of handling external electronic mail shall ensure proper behaviour towards the other participants in the system and hide the physical split between FT and PT from the system. It is the FT responsibility for such a proper behaviour, therefore all FTs that claim support for participation in a electronic mail exchange system shall implement in full all relevant external protocols. For the purpose of this clause, to ensure the exchange of electronic mail outside of the DECT system boundaries, it is assumed that the FT shall have implemented the Simple Message Transfer Protocol (SMTP) as specified in RFC 5321 [29] and the Internet Message Format as specified in RFC 5322 [30]. In addition, depending on the implementation, it may have implemented the various message formats of the messages carried as specified in other RFCs, e.g. the Multipurpose Internet Mail Extensions (MIME) Part Two: Media Types (RFC 2046 [25]), the S/MIME Version 3 Message Specification (RFC 3851 [28]), etc.

Internally, that is within the DECT system itself, the handling of the electronic mail could be realized in different ways which implies that different set of requirements need to be satisfied:

- a) A DECT system may chose to exclude the PTs from participation and provide proprietary handling and direct user interface in the FP. For such implementations the requirements specified in this clause do not apply and are out of the scope of the present document.
- b) Alternatively a DECT system may chose to include PTs in handling of the electronic mail. For such implementations the requirements specified in this clause do apply.
- c) Furthermore, a DECT system may be implemented that in itself is an electronic mail transport system with PTs and FT playing different roles, e.g. the FT as a server and the PTs as clients and not necessarily being connected with an external e-mail system. For such implementations the requirements specified in this clause also do apply.

For the transport of e-mails between the FT and the PTs within a DECT system both FT and PT shall support the Simple Message Transfer Protocol (SMTP) as specified in RFC 5321 [29] and the Internet Message Format as specified in RFC 5322 [30]. In addition, depending on the implementation, they may have implemented the various message formats of the messages carried as specified in other RFCs, e.g. the Multipurpose Internet Mail Extensions (MIME) Part Two: Media Types (RFC 2046 [25]), the S/MIME Version 3 Message Specification (RFC 3851 [28]), etc.

For DECT systems connected to an external e-mail system a typical D-GMEP SMTP implementation may designate internally, i.e. within the DECT system for the purpose of exchanging messages between the PT and the FT, the PT as a Client and the FT as a Server, whereas externally, i.e. for communication of the DECT system with external entities, the PT+FT may be designated as a Client.

### B.8.4 Interworking to external networks

This clause describes different possible scenarios of interworking to external networks and the associated specific procedures. The different procedures may be invoked and used according to the application that is built on top of D-GMEP.

### B.8.4.1 Generic Multiprotocol Interworking to External IP Networks

The following procedure provides a generic mechanism for handling the case of FP transparent interconnection to an external IP network, while the air interface transports multiprotocol data over D-GMEP.

NOTE 1: "Transparent" means that the FP is not forced to implement (however, it can do) an application level proxy. "Generic" and "•multiprotocol" means that the procedure supports multiple protocols and multiple instances of the same protocol over the air interface without fundamental restrictions.

The following provisions shall be fulfilled:

- a) Protocols IP, TCP and UDP shall be terminated at the fixed part.
- b) Traffic to/from external TCP/IP connections shall be transported over air interface using D-GMEP contexts with sequence numbers. The use of chopping is optional.
- c) Traffic to/from external UDP/IP connectionless communications shall be transported over air interface using D-GMEP contexts without sequence numbers. The use of chopping is not allowed.

- d) For both TCP and UDP protocols, it is allowed to transport multiple application protocols and different instances of the same protocol. Each protocol-instance shall be transported over one D-GMEP context. Different contexts may be addressed to the same or to different Internet servers.
- e) The activation and release of each context shall be done as indicated in clause B.2.1.1.4. Contexts may be created at virtual call setup or at service change. Contexts may be individually released at Service Change, or all of them at call release.
- f) The optional control group for IP networks shall be used for context creation (either at virtual call setup or at service change). This group shall not be used in context release.
- g) In PT initiated context creation, the values of GMCI, port origin and source IP address shall be left blank (0) and the values shall be returned by the Fixed Part.
- h) For TCP protocols, there shall be a connection-oriented association between the context (that shall include sequence numbers) and the TCP connection initiated by the FP towards the network. When the TCP connection is cleared (either by the far end host or by the FP), the context shall be released and vice versa.
- i) The maximum number of contexts that may be created in a virtual call setup procedure is limited to FOUR.
- j) The maximum number of contexts that may be created and/or released in a service change procedure is limited to FOUR.

NOTE 2: This limitation is introduced to limit the maximum size of signalling messages.

k) Features DPRS-N.34 (service negotiation at setup) and DPRS-N.35 (service change) shall be supported.

Clause E.5.1 (informative) shows as example the possible solution to the use case of an Internet browser.

NOTE 3: In addition to the solution described in this clause, there are also alternative solutions for implementing the case of an Internet browser by using IP interworking (clause B.6), PPP (clause B.7) or LAN interworking (clauses B.4 and B.5).

### B.8.4.2 Multi-context Interworking to an application proxy

The following procedure provides an intermediate complexity mechanism for transporting traffic between the PP and the FP with the following characteristics:

- HTTP protocol is transported towards a proxy implemented at the FP.
- Other protocols may be potentially supported if implemented at the proxy.
- Multiple contexts of the same protocol are supported over the D-GMEP link.
- Contexts may be dynamically created and released.
- There is no need to transport IP control information, since external TCP/UDP/IP connections are not controlled by the PP (they are controlled by the proxy).

In order to implement this case, the following options and procedures shall be supported:

- a) D-GMEP with multiple contexts shall be supported.
- b) GMCI identifier shall be returned and allocated by the FP. All PP requests shall be sent with GMCI = 0.
- c) TCP protocols (as HTTP) shall be sequence numbered. UDP protocols shall not be numbered.
- d) For TCP protocols, the use of chopping is optional.
- e) The optional TCP/IP control group in << IWU-Attributes >> shall not be used. The proxy at the FP shall use application level information for selection of the internet hosts(s) and control of external TCP/UDP/IP connections.
- f) The maximum number of contexts that may be created in a virtual call setup procedure is limited to FOUR.

g) The maximum number of contexts that may be created and/or released in a service change procedure is limited to FOUR.

NOTE: This limitation is introduced to limit the maximum size of signalling messages.

- h) DPRS-N.34 (service negotiation at setup) shall be supported, since in general it is not possible to define the IWU-Attributes as a basic service.
- i) DPRS-N.35 (Service change) shall be supported since D-GMEP contexts may be created and released during the life of the DPRS call.

# B.8.4.3 Simplified single-context Interworking to External Networks (or to an application proxy)

The following procedure provides a simplified mechanism for interworking to external networks when only one D-GMEP context is used. The protocol usually transported in this application is HTTP, and an example of application using this procedure is the Software Upgrade over the air (SUOTA). Refer to TS 102 527-4 [i.2] for details.

The following provisions shall be fulfilled:

- a) Only one D-GMEP protocol and context shall be transported over the DPRS virtual call.
- b) GMCI number 1 shall be used.
- c) The optional TCP/IP control group shall not be used. Instead of it, other non-DPRS procedures shall be used for selection of the Internet hosts(s). See TS 102 527-4 [i.2] for the procedure designed for Light Data Services such as Software Upgrade over the air (SUOTA).
- d) TCP protocols (as HTTP) shall be sequence numbered. UDP protocols shall not be numbered.
- e) For TCP protocols, it is allowed to use the DLC in-sequence SDU delivery mode (see EN 300 175-4 [4]). The use of chopping is optional.
- f) The support of Service Change (DPRS-N.35) is optional. The parameters of IWU-Attributes at call setup may be coded by a basic service. Service negotiation at setup (DPRS-N.34) is in general not needed.

# Annex C (normative): Interworking conventions for character-oriented services

# C.1 Scope

This annex specifies the interworking conventions for the DPRS character oriented service based on the V.24 interface as specified in ITU-T Recommendation V.24 [18]. Throughout the annex the term "V.24" is used to represent both the V.24 requirements as specified in the ITU-T Recommendation V.24 [18] and the V.24 based DPRS character oriented service requirements as specified in the present document.

To enhance readability of the present document, the signals are named using their unofficial "street- names" (e.g. TXD, RXD) instead of the official ITU-T Recommendation V.24 [18] circuit names (e.g. circuit 103, circuit 104). Clause C.4.1 defines this translation.

To enhance usability of this interworking, flow control based on practical implementations are implemented instead of the flow control as described in the ITU-T Recommendation V.24 [18] interface. This practical type of flow control is defined in clause C.4.3.

The reference configuration for this interworking is shown in figure C.1.

#### Figure C.1: Reference configuration showing the DPRS V.24

NOTE 1: The PP and/or the FP do not necessary have to implement a physical V.24 interface. The V.24 data could directly go into/come from an application program or to a virtual V.24 interface transported over another interface like a USB connection.

User (and user control) data to be transmitted over the U-plane of the packet mode data profiles is only guaranteed to be protected if passed through the entire U-plane protocol.

After a packet (user or user control data) has been passed to the protection mechanism (LU10) a modification of the content is in general not possible any more as parts of the SDU may already be transmitted over the CI. An expedition of user control frames can only be achieved within the queue on top of the LU10.

NOTE 2: To distinguish user data and user control data, different SAPs including SAP identifiers may be introduced.

SAP1: User Data SAPSAP2: User Control Data SAP (transfered with UIEs)SAP3: User Control Status Data SAP (transfered in each SDU-header)P2P-FL: Path-By-Path Flow Ctrl Interface

#### Figure C.2: SDU Data Flow

The following two scenarios describe different types of V.24 -connections. Scenario A shows the normal configuration such as DTE <--> DCE (e.g. computer <--> modem). Scenario B shows a configuration such as DTE <--> DTE (e.g. computer <--> computer). Scenario B is called nullmodem-connection.

DTE: Data Terminal Equipment (e.g. computer).

DCE: Data Circuit-terminating Equipment (e.g. modem, ISDN-TA).

### C.1.1 Scenario A

Figure C.4: Scenario B showing NULL-MODEM configuration

# C.2 Specific coding for mobility class 2

# C.2.1 IWU-Attribute coding

Devices implementing the Interworking Units described in this annex shall use the following IWU-Attribute coding.

| Bit: | 8   | 7   | 6        | 5           | 4        | 3        | 2       | 1    | Octet: |

Negotiation indicator (octet 4):

| Bits | 765                            | Meaning   |  |
|------|--------------------------------|---|--|
|      | 000                            | Negotiation not possible.                                       |  |
|      | 010                            | Peer attribute negotiation.                                     |  |
|      | 100                            | Exchanged attribute negotiation.                                |  |
|      | 110                            | Exchanged attribute negotiation and Peer attribute negotiation. |  |
|      | All other values are reserved. |   |  |

Profile sub-type (octet 4):

| Bits | 4321 | Meaning |
|------|------|---------|
|      | 0000 | V.24.   |

Stop bits coding (octet 5):

| Meaning        |
|----------------|
| Not specified. |
| 1 bit.         |
| 1,5 bits.      |
| 2 bits.        |
| •              |

Data bits/Parity coding (octet 5):

| Bits | 54321            | Meaning        |
|------|------------------|----------------|
|      | 0 0 x x x        | 5 bits.        |
|      | 0 1 x x x        | 6 bits.        |
|      | 1 0 x x x        | 7 bits.        |
|      | 1 1 x x x        | 8 bits.        |
|      | x x 0 0 0        | Odd.           |
|      | x x 0 1 0        | Even.          |
|      | x x 0 1 1        | None.          |
|      | x x 1 0 0        | Forced to 0.   |
|      | x x 1 0 1        | Forced to 1.   |
|      | 11111            | Not specified. |
|      | All other values | s reserved.    |

NOTE 1: In some implementations the values for the V.24 parameters Data bits and Parity are strongly related. For example, it is possible to support even or none Parity and 7 or 8 data bits, but not in all permutations. Normally you support 8 data bit with no parity and 7 data bits with even or odd parity. So you have always 8 Bit information.

Examples for Stop bits/Data bits/Parity coding:

| Bits | 7654321               | Meaning |
|------|-----------------------|---------|
|      | 0111011               | 8N1.    |
|      | 0110010               | 7E1.    |
|      | $0\ 1\ 1\ 0\ 0\ 0\ 0$ | 701.    |

Data rate (octet 5a):

| Bits | 7654321                                   | Meaning  |
|------|---|--|
|      | $0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \$ | Not specified.   |
|      | 0 0 0 0 1 x x                             | (x x+1) x 50 bit/s (50 bit/s to 200 bit/s.).                               |
|      | 0 0 0 1 x x x                             | (x x x+1) x 300 bit/s (300 bit/s to 2 400 bit/s.).                         |
|      | 0 0 1 x x x x                             | (x x x x+2) x 2 400 bit/s (4 800 bit/s to 40 800 bit/s.).                  |
|      | 0 1 x x x x x x                           | (x x x x x+1) x 8 000 bit/s (8 000 bit/s to 256 000 bit/s) (see note 2).   |
|      | 1 0 x x x x x x                           | (x x x x x+6) x 9 600 bit/s (57 600 bit/s to 35 520 bit/s) (see note 2).   |
|      | 1 1 0 x x x x                             | (x x x x+11) x 24 000 bit/s (264 000 bit/s to 624 000 bit/s) (see note 2). |
|      | $1\ 1\ 1\ 0\ 0\ 0\ 0$                     | 75 bit/s.  |
|      | $1\ 1\ 1\ 0\ 0\ 0\ 1$                     | 110 bit/s.   |
|      | $1\ 1\ 1\ 0\ 0\ 1\ 0$                     | 134,5 bit/s.   |
|      | 1110011                                   | 75 bit/s to 1 200 bit/s (see note 3).                                      |
|      | $1\ 1\ 1\ 0\ 1\ 0\ 0$                     | 1 200 bit/s to 75 bit/s (see note 3).                                      |
|      | All other values                          | reserved.  |

- NOTE 2: Some bit rates (24 000 bit/s, 96 000 bit/s, 144 000 bit/s, 192 000 bit/s, 240 000 bit/s, 288 000 bit/s, and 336 000 bit/s) are codeable in several different ways. The different codings are all valid.
- NOTE 3: The first rate is the transmit rate in forward direction of the call. The second rate is the transmit rate in backward direction of the call.

Examples for Data rate:

| Bits | 7654321               | Meaning      |
|------|-----------------------|--------------|
|      | 0000100               | 50 bit/s.    |
|      | 0000101               | 100 bit/s.   |
|      | 0000110               | 150 bit/s.   |
|      | 0000111               | 200 bit/s.   |
|      | $0\ 0\ 0\ 1\ 0\ 0\ 0$ | 300 bit/s.   |
|      | $0\ 0\ 0\ 1\ 0\ 0\ 1$ | 600 bit/s.   |
|      | 0001011               | 1 200 bit/s. |
|      | 0001111               | 2 400 bit/s. |
|      | 0010000               | 4 800 bit/s. |
|      | 0100000               | 8 000 bit/s. |
|      | 0010010               | 9 600 bit/s. |

| 0010011 | 12 000 bit/s.  |
|---------|----------------|
| 0010100 | 14 400 bit/s.  |
| 0100001 | 16 000 bit/s.  |
| 0010110 | 19 200 bit/s.  |
| 0011000 | 24 000 bit/s.  |
| 0011010 | 28 800 bit/s.  |
| 0100011 | 32 000 bit/s.  |
| 0011110 | 38 400 bit/s.  |
| 0100101 | 48 000 bit/s.  |
| 0100110 | 56 000 bit/s.  |
| 1000000 | 57 600 bit/s.  |
| 0100111 | 64 000 bit/s.  |
| 100001  | 67 200 bit/s.  |
| 1000010 | 76 800 bit/s.  |
| 0101000 | 72 000 bit/s.  |
| 0101011 | 96 000 bit/s.  |
| 1000110 | 115 200 bit/s. |
| 0101110 | 120 000 bit/s. |
| 0101111 | 128 000 bit/s. |
| 1001001 | 144 000 bit/s. |
| 1101010 | 552 000 bit/s. |
|         |                |

#### B (bit 7 Octet 5b)

0

1

| The value indicated in the "Baudrate mode" field shall be understood as request; the    |
|---|
| responding side shall either accept it or return the default value otherwise.           |
| The value indicated in the "Baudrate mode" field shall be understood as suggestion; the |
| responding side may respond with any value and the initiating side shall accept it.     |
|   |

#### F (bit 6 Octet 5b)

| 0 | The value indicated in the "Flow control" field shall be understood as request; the responding |
|---|--|
|   | side shall either accept it or return the default value otherwise.                             |
| 1 | The value indicated in the "Flow control" field shall be understood as suggestion; the         |
|   | responding side may respond with any value and the initiating side shall accept it.            |

Baudrate mode (octet 5b)

| Bits | 54  | Meaning                  |
|------|-----|--------------------------|
|      | 0 0 | Nodynamic detection.     |
|      | 01  | Dynamic detection at FP. |
|      | 10  | Dynamic detection at PP. |
|      | 11  | Reserved.                |

Flow control (octet 5b)

| Bits | 321   | Meaning                                |
|------|-------|--|
|      | 000   | No Data Flow Control.                  |
|      | x x 1 | Hardware Data Flow Control (RTS/CTS).  |
|      | x 1 x | Hardware Data Flow Control (DTR/DSR).  |
|      | 1 x x | Software Data Flow Control (Xon/Xoff). |

NOTE 4: It is not recommended to use a combination of flow controls.

Maximum SDU size (octets 6 and 6a): This 14-bit word represents the natural binary coding of the maximum SDU length in octets used for data transmission, with the least significant bit in position 1 of octet 6a.

### C.2.2 Default-values

1.

It is necessary to have default-values for the V.24 parameters, which can be easily supported by all V.24-devices:

Stop bits:

Data bits: 8.

Parity:NData rate:19 200 bit/s.Baudrate mode:no dynamic detection.Flow control:no.

If dynamic data rate detection is supported the device shall support all data rates of the following list up to and including the negotiated data rate.

245

300, 600, 1 200, 2 400, 4 800, 9 600, 19 200, 38 400, 57 600, 115 200.

### C.2.3 Negotiation of the V.24-parameters

Each V.24 parameter is negotiated separately. The V.24 parameters shall be negotiated call-by-call.

If octets 6 and 6a need to be included at least Octet 5 shall be included as well and consequently values for < Stop bits >, < Data bits > and < Parity > shall be indicated, in this case octets 5a and 5b can still be omitted if the default values of the fields as indicated in clause C.2.2 are suggested. If octets 6 and 6a are omitted (the default value for the SDU max size implies as being suggested), octets 5, 5a and 5b can be omitted as well (all defaults values imply as being suggested).

For negotiation of V.24 parameters the following rules shall apply:

| Stop Bits:     | The initiating side may suggest any valid value for this V.24 parameter. The receiving shall either accept the suggested value by returning the same value in the response or return the default value if the suggested value is not acceptable. The negotiated value shall be the value returned by the responding side (when complying with the rules above). |  |
|----------------|---|--|
| Data bits:     | Same as "Stop bits".  |  |
| Parity:        | Same as "Stop bits".  |  |
| Data rate:     | The initiating side may request any data rate. The receiving side shall either accept the suggest value by returning the same value in the response or return values lower than the suggested, or default value specified in clause C.2.2. The negotiated value shall be the value returned by the responding side (when complying with the rules above).       |  |
| Baudrate mode: | Same as "Stop bits".  |  |
| Flow control:  | Same as "Stop bits".  |  |
| NOTE: The al   | m of this monotistics is to provotist the highest common data and of hoth sides of fact or provible   |  |

NOTE: The aim of this negotiation is, to negotiate the highest common data rate of both sides as fast as possible. So the "algorithm" is optimized for this aim.

If the initiating side indicates for any value "Not specified" or the bits B and F are set, the responding side may return back any value.

If negotiation fails, to avoid endless attempt for negotiation new call setup should be initiated with default values.

# C.3 Generic interworking conventions

### C.3.1 PAD functionality

This clause describes the Packet Assembly/Disassembly unit (PAD) functionality for interworking to character oriented (asynchronous) protocols.

### C.3.1.1 Character formatting

Information is transferred between PAD entities using LU10 frames. The LU10 frame Service Data Unit (SDU) has variable length of 1 octet to 1 024 octets. The octets within the LU10 SDU are numbered 0 to n-1, octet 0 is transmitted first. The bits within the octets are numbered 1 to 8, bit 1 is transmitted first. The PAD functions as follows:

Characters are coded into octets in the following way:

- the first bit of the character received/transmitted over the upper PAD interface corresponds to bit position 1 in the octet. The second bit-to-bit 2, and the eighth bit-to-bit 8;
- 8 bit characters are transmitted with no padding. Where parity is used it is generated/removed locally;
- 7 bit characters are padded with a "0" in bit position 8. Where parity is used it is inserted in bit position 8;
- 6 bit characters are padded with a "0" in bit positions 7 and 8. Where parity is used it is inserted in bit position 7;
- 5 bit characters are padded with a "0" in bits positions 6, 7 and 8 if no parity is used. Where parity is used it is inserted in bit position 6;
- all start/stop bits are generated/removed locally by the application;
- the character configuration (length, start, stop and parity, etc.) information is conveyed between PAD entities in the {CC-SETUP} message in the << IWU-ATTRIBUTES >> information element during the call establishment phase;
- characters are inserted into the PAD-buffer in order of transmission in octets 0 to n-1.

### C.3.2 Support of SDU size

All implementations shall support a SDU size of at least the result of the following formula, which depends on the negotiated data rate and other V.24 parameters and shall be calculated at each side. A different value can be negotiated.

 $SDU\_size = MAX(29, \frac{data\_rate \times (data\_bits + parity\_bits)}{((data\_bits + parity\_bits) + (2 \times stop \_bits)) \times 8} \times t_{TDMA\_frame} \times (1 + security\_offset) + 1)$ security\\_offset = 7 %

The result of this calculation shall be rounded up to the nearest integer.

A security offset is necessary because of jitter-effects on V.24-interfaces. The value for the security offset is a result of practical experiences.

| Data rate | Data bits/Parity/Stop bits | Max. supported SDU size |
|-----------|----------------------------|-------------------------|
| 1 200     | 8N1, 7E1, 7O1              | 29                      |
| 2 400     | 8N1, 7E1, 7O1              | 29                      |
| 4 800     | 8N1, 7E1, 7O1              | 29                      |
| 9 600     | 8N1, 7E1, 7O1              | 29                      |
| 19 200    | 8N1, 7E1, 7O1              | 29                      |
| 38 400    | 8N1, 7E1, 7O1              | 43                      |
| 57 600    | 8N1, 7E1, 7O1              | 63                      |
| 115 200   | 8N1, 7E1, 7O1              | 125                     |

#### Table C.1: Values for common data rates and V.24 parameters

### C.3.3 LU10 SDU delivery mode

The SDU in-sequence delivery mode (see EN 300 175-4 [4], clause 11.12.3.2.2) shall be used.

# C.4 V.24 circuits

### C.4.1 General

The V.24 interworking supports the V.24 circuits as given in table C.2. This table also relates the official ITU-T Recommendation V.24 [18] circuit names to the more practical names as used in DPRS.

| V.24 Circuit | V.24 Meaning                               | DPRS name                 | Direction |
|--------------|--|---------------------------|-----------|
| 103          | Transmitted data                           | TXD (Transmit Data)       | To DCE    |
| 104          | Received data                              | RXD (Receive Data)        | From DCE  |
| 105          | Request to send                            | RTS (Request To Send)     | To DCE    |
| 106          | Ready for sending                          | CTS (Clear To Send)       | From DCE  |
| 107          | Data set ready                             | DSR (Data Set Ready)      | From DCE  |
| 108/2        | Data terminal ready                        | DTR (Data Terminal Ready) | To DCE    |
| 109          | Data channel received line signal detector | DCD (Data Carrier Detect) | From DCE  |
| 125          | Calling indicator                          | RI (Ring Indicator)       | From DCE  |

#### Table C.2: IWU V.24 support

Additional functionalities are:

- Xon, Xoff;
- Break and Pause.
- NOTE: Indication of break and pause conditions are not foreseen as they are not required for proper operation in nearly all cases.

If supported, the break and pause conditions shall be optional and therefore be transmitted within an optional user control information element as described above.

The V.24 connection establishment shall not influence DECT call control. The call control is only necessary to establish the connection and configure the serial port such as data coding, data rate, etc.

All information (signalling- and user data) of the V.24 connection is transferred via an encapsulation protocol.

### C.4.2 Encapsulation

### C.4.2.1 Description

For transmission a one-octet header is inserted to multiplex signal-, control-or user data on the same DECT-data link.

### C.4.2.2 Framing

The framing format is defined as below.

| First octet | Following octets |
|-------------|------------------|
| Header      | Data             |

Figure C.6: Framing of encapsulation

### C.4.2.3 Coding of encapsulation

| Bit: | 8 | 7   | 6  | 5       | 4       | 3        | 2        | 1        |
|------|---|-----|----|---------|---------|----------|----------|----------|
|      | Е | DCD | RI | DTR/DSR | RTS/CTS | Reserved | Reserved | Reserved |

#### Figure C.7: Header of encapsulation

The DTR/DSR or RTS/CTS bit respectively indicates that the peer side is not able to receive further data and therefore allows end-to-end flow control (depends on the negotiated type of Dataflow-control). It may be set with respect to the real status of the line and/or by the implementation e.g. due to the buffer status respectively.

NOTE: On the DCE-emulation side is no incoming DCD- or RI-signal from the DTE-device. Therefore the following default values should be set:
RI = 0.
DCD = DSR.
With these values a proper DCE/DCE-connection (nullmodem) can be guaranteed.

The two bits DTR/DSR and RTS/CTS in the Headerbyte are ambiguous. Therefore we need a rule how the Header shall be interpreted exactly.

#### C.4.2.3.1 DCE-emulation side interpretation

The DCE-emulation side (connected to a DTE) shall interpret received header-bits as follows:

| DCD:     | DCD. |
|----------|------|
| RI:      | RI.  |
| DTR/DSR: | DSR. |
| RTS/CTS: | CTS. |

#### C.4.2.3.2 DTE-emulation side interpretation

The DTE-emulation side (connected to a DCE) shall interpret the header-bits as follows:

| DCD:     | Ignored. |
|----------|----------|
| RI:      | Ignored. |
| DTR/DSR: | DTR.     |
| RTS/CTS: | RTS.     |

### C.4.2.4 SDU Structure

#### Figure C.8: Extended field (data) of encapsulation

The user data is transmitted transparent, but stop and start bits shall not be assembled. These bits shall be generated locally by the application. For 8 bit characters with an additional parity bit, the parity bit shall also be generated locally.

By resetting the extended bit (E = 0), the entire SDU-Contents are equal to the user data.

If the extended bit is set, both user control and user data may be inserted into the extended information field.

The first byte identifies length of directly following user control data. This byte is applied to reroute the user control and user data into the corresponding SAPs (see figure C.2).

### C.4.3 Interworking procedures and conventions

### C.4.3.1 General

#### C.4.3.1.1 Data forwarding conditions

User data and signalling data shall be assembled until one or more of the following conditions are met:

- a timer expires at any time;
- the SDU is forwarded to U-plane service entity.

### C.4.3.1.2 Dataflow Control

The dataflow shall take action local but shall be overlayed by Path-By Path or End-2-End Flow Control. Exception: It is not allowed to overlay an active local flow control with an inactive Path-By-Path or End-2-End flow control. The control information shall be generated by U-plane service or set over V.24 interface.

#### C.4.3.1.2.1 Software dataflow control

If the IWU notifies that the U-plane service is not ready to transfer data, it shall generate an Xoff. If the U-plane service indicates the data should be transmitted once again the IWU shall generate an Xon.

If the IWU notifies that an Xoff is received by V.24 interface, the IWU shall stop to transmit data over V.24 interface.

If the Xon identify is received at V.24 interface the IWU start to transmit once again.

#### C.4.3.1.2.2 Hardware dataflow control

The flow control condition indication shall be performed using circuits RTS/CTS or circuits DTR/DSR, in these cases:

At DCE-emulation side IWU interface (connected to a DTE):

- a DCE-emulation side IWU not-ready condition, initiated U-plane service, shall be indicated by turning circuit 106 (CTS) or 107 (DSR) OFF and cleared by turning circuit 106(CTS) or 107(DSR) ON;
- a DTE not ready condition shall be recognized by an ON-OFF transition and cleared by an OFF-ON transition of circuit 105 (RTS) or 108 (DTR).

At DTE-emulation side IWU interface (connected to a DCE):

- a DTE-emulation side IWU not-ready condition, initiated U-plane service, shall be indicated by turning circuit 105 (RTS) or 108 (DTR) OFF and cleared by turning circuit 105 (RTS) or 108 (DTR) ON;
- a DCE not ready condition shall be recognized by an ON-OFF transition and cleared by an OFF-ON transition of circuit 106(CTS) or 107(DSR).

NOTE: On running system, either DTR/DSR or RTS/CTS mode is available. This is set in the IWU-Attribute.

#### C.4.3.1.3 Transmission of U-plane data procedure

If the SDU is forwarded to U-plane service entity, the actual line states of V.24 are inserted into the header (done by the application).

#### C.4.3.1.4 Receive of U-plane data procedure

The header is to compare if line states of V.24 connection have been changed.

#### C.4.3.1.5 V.24 signalling

The circuits 106 (CTS)/105 (RTS) or 107 (DSR)/108 (DTR) shall be generated locally and maybe overlayed by Path-By-Path or End-2-End flow control.

### C.4.3.1.6 Configuration a V.24 interface during a Connection

#### The initiating side:

The IWU shall stop the user data transmission by using the dataflow control, it sends also the remaining data into transmit buffers and shall issue MNCC \_MODIFY.req, specifying the configuration of serial interface and link, and shall await a MNCC \_MODIFY.cfm primitive. If this primitive notifies failure, it shall enter the release-procedure, otherwise the dataflow control enable the data flow.

If the IWU receives a MNCC \_MODIFY.ind, it shall stop the data transmission by using the dataflow control, afterwards the buffer shall be cleared, the serial port shall be configure and shall await incoming data of the initiating side.

251

NOTE: It is not necessary in all MNCC\_MODIFY-events to stop the data transmission, etc. (for example: bandwidth-modification).

### C.4.3.2 Fall back procedure

If the DECT-Link breaks off, the DCE-emulation side IWU shall clear the buffer and turn circuit 107 (DSR)/106 (CTS), circuit 125 (RI) and circuit 109 (DCD) off, the DTE-emulation side IWU shall clear the buffer and turn circuit 108 (DTR) and circuit 105 (RTS) off.

### C.4.3.3 Procedure at the DCE-emulation side IWU

The IWU shall emulate a DCE. Received Data (from the air-interface) shall be forwarded via the circuit RxD to the DTE and V.24 data shall be received via the circuit TxD from the DTE (see figure C.3 for details).

NOTE: The dataflow control is not special notified. It is defined in clause C.4.3.1.2.

#### C.4.3.3.1 DTE-initiated VC establishment

If no V.24 call is established, then the IWU shall monitor the value of all state-lines. If DTR line goes ON, the IWU shall monitor the activity of the circuit TxD. The circuit TxD shall also be monitored, if no dataflow mode is negotiated. If data is detected on the circuit TxD line or a state on the state-lines is changed, then the IWU shall issue a MNCC\_SETUP-req primitive and change the state to "V.24 call Requested".

In the "V.24 call Requested" state, if the IWU receives a MNCC\_REJECT-ind primitive, it shall clear the buffer and set DSR-, CTS-, RI- and DCD-line OFF and shall return to the "No V.24 call" state. Its subsequent action shall be locally determined on the basis of the release reason contained in the primitive.

In the "V.24 call Requested" state, if the IWU receives a MNCC\_CONNECT-ind primitive it shall enter a "V.24 call Active" state. Other primitives might be received before MNCC\_CONNECT.

#### C.4.3.3.2 DCE-initiated VC establishment

Upon the receipt of a MNCC\_SETUP-ind primitive, the IWU shall determine that the service requested may be offered, and if so it will issue a MNCC\_CONNECT-ind primitive and enter the "V.24 call Active" state. Other primitives might be sent before MNCC\_CONNECT.

If the service cannot be supported, it will issue a MNCC\_REJECT-req, indicating a release reason, and will return to the "No V.24 call" state.

#### C.4.3.3.3 V.24 call release

The application shall decide in which cases the V.24 call should be released. The V.24 call release shall be done using the NWK Call release procedure (see GAP).

### C.4.3.4 Procedure at the DTE-emulation side IWU

The IWU shall emulate a DTE. Received data (from the air-interface) shall be forwarded via the circuit TxD to the DCE and V.24 data shall be received via the circuit RxD from the DCE (see figure C.3 for details).

### C.4.3.4.1 DCE-initiated VC establishment

If no V.24 call is established, then the IWU shall monitor the value of all state-lines. If the DSR line goes ON, then the IWU shall monitor the activity of the circuit RxD. The circuit RxD shall also be monitored, if no dataflow mode is negotiated. If data is then detected on the circuit RxD line, or any state line is changed, then the IWU shall issue a MNCC\_SETUP-req primitive and shall enter the "V.24 Call Requested" state.

In this state, if the IWU receives a MNCC\_REJECT-ind primitive, it shall clear the buffer and shall return to the "No V.24 Call" state. Its subsequent action shall be locally determined on the basis of the release reason contained in the primitive.

In the "V.24 Call Requested" state, if the IWU receives a MNCC\_CONNECT-ind primitive it shall enter a "V.24 Call Active" state. Other primitives might be received before MNCC\_CONNECT.

### C.4.3.4.2 DTE-initiated VC establishment

Upon the receipt of a MNCC\_SETUP-ind primitive, the IWU shall determine that the service requested may be offered, and if so it will issue a MNCC\_CONNECT-ind primitive and enter the "V.24 Call Active" state. Other primitives might be sent before MNCC\_CONNECT.

Once in this state, it shall set the value of the DTR line to the value communicated to it by U-plane service. If the service cannot be supported, it will issue a MNCC\_REJECT-req, indicating a release reason, and will return to the "No V.24 Call" state.

### C.4.3.4.3 V.24 call release

The application shall decide in which cases the V.24 Call should be released. The V.24 call release shall be done using the NWK Call release procedure (see EN 300 444 [11]).

# C.5 Definition of User Control Information Elements

UIEs can be sent within each SDU. It is allowed to send user data and UIEs in one SDU (see clause C.4.2.4).

# C.5.1 Mandatory UIEs

No mandatory UIEs at this time.

# C.5.2 Optional UIEs

A device can send the UIE < release\_reason > at any time. If a device receives this UIE it can decide how to react.

UIE\_RELEASE\_REASON:

| Field  | Code   | Comment                                 |
|--------|--|---|
| Tag    | UIE_RELEASE_REASON   | Release Reason                          |
| Length | 1  | 1 byte following                        |
| Value  | Bits 87654321<br>0xxxxxx<br>10000000<br>All other values reserved. | Proprietary reasons<br>Reason not known |

Some operating systems (e.g. Unix) sometimes use a special behaviour of the start- and stop-bit. To support this behaviour, the following two UIEs are necessary.

| Field  | Code                | Comment          |
|--------|---------------------|------------------|
| Tag    | UIE_BREAK_CONDITION | Break Condition  |
| Length | 1                   | 1 byte following |
| Value  | 0 to 255            | Unit: 10 ms      |

253

PAUSE\_CONDITION:

| Field  | Code                | Comment          |
|--------|---------------------|------------------|
| Tag    | UIE_PAUSE_CONDITION | Pause Condition  |
| Length | 1                   | 1 byte following |
| Value  | 0 to 255            | Unit: 10 ms      |

# C.5.3 Information Element Identifier

## Information Element Identifier (Tag):

# Annex D (normative): Double and long slot support

# D.1 General

DPRS supports long slot 640, long slot 672 and double slots.

All DPRS procedures can be used with full, long and double slots.

The main text of DPRS was initially written assuming that full slot is the slot type in use. This annex adds specific requirenments applicable when the other slot types are used.

254

For systems using long 640, long 672 or double slot types, the requirements specified in the following clauses shall apply.

# D.2 Requirements

# D.2.1 Frame structure and slot numbering

For the frame structure and slot numbering in the case of double slot utilization see EN 300 175-3 [3], clause 4.2.2. Long slots are equivalent to double for this purpose.

Long and double slots may start at both, even and odd full slot intervals. However Managenet Entity alogorithms shall favour the start in even positions.

In absence of other constrains (interference and slot availavility), the slots should start at even positions.

# D.2.2 Multibearer connections

All bearers of a multibearer connection shall be from the same slot type, i.e. either full, long 640, long 672 or double slot, as specified in EN 300 175-3 [3], clause 5.6.2. It is not allowed to have bearers of different type as part of one connection.

NOTE: However, a different slot size may be simultaneously used for other services (i.e. voice).

# D.2.3 Modulation schemes

No changes.

## D.2.4 Void

## D.2.5 Bit MAPs

The D-field and B-field mappings for the used slot type is applicable, as indicated in the MAC feature to procedure table.

# D.2.6 C-MUX

No changes. The rules regarding long and double slots as specified in EN 300 175-3 [3], clause 6.2.2.3.1 apply.

## D.2.7 Scrambling

The rules as specified in EN 300 175-3 [3], clause 6.2.4 regarding long and double slots apply.

# D.2.8 CRC

The rules as specified in EN 300 175-3 [3], clause 6.2.5 regarding long and double slots apply.

NOTE: The CRC generation schema for double slots is different to the one for long and full slots.

255

## D.2.9 B-field type identification

- "010" double slot required.
- "101" long slot 640 required.
- "110" long slot 672 required.

Shall be used as specified in EN 300 175-3 [3], clause 7.1.4.

# D.2.10 Fixed Part capabilities

FT that supports double and/or long slots shall indicate this in the Qt3 message setting bit  $a_{15}$  to 1 as specified in EN 300 175-3 [3], clause 7.2.3.4. Support of long slot 640 and long slot 672 is indicated by bits  $a_{12}$  and  $a_{13}$  of "Extended Physical and MAC layer capabilities (part 2)" as specified in EN 300 175-3 [3], clause 7.2.3.11.2.

# D.2.11 Portable Part capabilities

PT shall indicate whether it supports double and/or long slot operation in << Terminal Capability >> information element by setting the <Slot type capability> field to indicate in addition to the "full slot", "double slot" as well = 011, as specified in EN 300 175-5 [5], clause 7.7.41.

# D.2.12 Blind slot information

Blind slot information for double slots shall be provided in the PT message where bits  $a_{32}$  to  $a_{35}$  in the PT message header shall be set to 1110, as specified in EN 300 175-3 [3], clause 7.2.4.3.1, and the relevant information shall be provided according to EN 300 175-3 [3], clause 7.2.4.3.11.

Bling slot indication for long slots have its specific broadcast .

# D.2.13 Advanced connection control

The field "slot type" where available shall be set to the intended slot type "double slot" "long 640", "long 672" or "full slot" of the corresponding connection, e.g. see EN 300 175-3 [3], clause 7.3.2.5 for the coding of ATTRIBUTES\_B message or clause 7.2.5.2.4 for the coding of ATTRIBUTES\_T. "Double slot", "long 640" or "long 672" shall be indicated wherever necessary in the primitives exchanged between DLC and MAC layer as specified in EN 300 175-4 [4], clause 10.2.3.

# D.2.14 C<sub>F</sub> channel

If  $C_F$  channel is supported for double slot or long slot connections the rules as specified in EN 300 175-3 [3], clause 10.8.1.2 shall apply.

# D.2.15 Call establishment

For FT initiated DPRS virtual call setup, the FT shall page the PT with Long Page format indicating the required slot type. All bearers of the connection shall use the same slot type.

# D.2.16 Slot type modification during a call

Slot type modification after a virtual call has been established may optionally be supported. If implemented, the procedure shall be performed as follows:

- 1) There should not be any PDU pending for transmission or possible retransmission at DLC layer.
- NOTE 1: The second part of the requirement means that the Tx should wait either for the reception of an ACK command advancing the window, or for the expiration of the maximum lifetime timer. See DLC LU10 service operation.
- 2) Bandwidth shall be set to single-bearer and the bandwidth change (if needed) shall be completed.

NOTE 2: Step 2 may be a bandwidth reduction or a resume if the connection was suspended.

NOTE 3: Steps 1 and 2 may be done in any order.

3) The MAC connection type modification changing the slot type procedure as specified in EN 300 175-3 [3], clause 10.3.3 shall be performed using B-field signalling and without transmitting any U-plane data.

During stage 3, the DLC will not accept any SDU from higher layers.

Once stage 3 is completed, the DLC may accept new SDUs that shall be splitted in PDUs according to the size of the new slot type.

If connection type modification procedure fails without release (see EN 300 175-3 [3], clause 10.3.3) the virtual call shall not be released and will continue with the existing slot type.

# Annex Da (normative): Amendments to other DECT specifications

NOTE: This annex sums up the changes to the DECT base standard V2.2.1 (EN 300 175-1 to 3 and EN 300 175-5 to 8) and V2.2.2 of EN 300 175-4 that are needed for the implementation of the present document. These changes are part of EN 300 175-1 to 8 V2.3.0.

# Da.1 Amendments to EN 300 175-3 (DECT CI; MAC layer)

Not applicable.

# Da.2 Amendments to EN 300 175-4 (DECT CI; DLC layer)

The following amendments to EN 300 175-4 (V2.2.2) shall apply for the purpose of the present document.

# Da.2.1 LU10 Enhanced Frame RELay (EFREL) service (modify clause 11.12 of EN 300 175-4)

The following modifications to clause 11.12 of EN 300 175-4 (V2.2.2) shall apply.

# "11.12 LU10 Enhanced Frame RELay (EFREL) service

## 11.12.1 General

The LU10 is a general data transmission service for medium data rates, high error correction performance and low complexity. LU10 provides a peer-to-peer connection protocol for an acknowledged exchange of user data within the DLC\_U-Layer.

LU10 service is a frame relay service that is accessed through the LU10 SAP.

NOTE 1: Frame Relay service offered by LU10 is similar to the one defined in ITU-T Recommendation I.122 [i.16].

In the case of the 16-level or 64-level modulation option (see EN 300 175-2 [2]) the LU10 service may be used.

The LU10 shall operate on a generic field of user data that shall be transferred into and out of the DLC U-plane as a single SDU. This SDU is assumed to contain one external frame, but the operation of LU10 shall be independent of the actual contents of the SDU.

For LU10 the use of ARQ-type SEL is recommended. Go\_Back\_N is also allowed.

LU10 shall provide the following functions:

- peer-to-peer transmission of user data (SDUs);
- segmentation of SDUs into PDUs;
- management of the V(S), V(R) state variables(s) and handling of N(s) and N(R) according to the transmission class used;
- multiple SDU transfer, which means that more than one SDU (or only a part of it) can be inserted in one PDU.

LU10 shall not provide the following functions:

add neither additional header nor checksum to SDUs.

If required, these functions are assumed to be provided by the user of LU10 entity.

LU10 shall provide mechanisms that offer reliable transport of the generic SDUs, and that preserve the SDU boundaries. Depending on the SDU delivery mode, the LU10 service may preserve or may not the order of SDUs, transmitted at one LU10 SAP, when they are delivered at the other end.

258

NOTE 2: The SAP means the entry to the LU10 entity, refer to clause 11.1.

Two main procedures shall be provided:

- segmentation of the SDU at the transmitting side, reassembly to SDUs at the receiving side; 1)
- 2) peer-to-peer transmission of these segments using (small) internal frames.

To avoid possible confusion between external and internal frames the following words are used in this clause from here onwards:

- "SDU" shall refer to the user data;
- "PDU" shall refer to the internal frames;
- "Segment" shall refer to the information content of one "PDU".
- "sub-segment" or "info field" shall refer to the sub-segment of information immediately following a Length • indicator octet and with the number of bytes indicated by such indicator.

## 11.12.2 Segmentation and transmission class

The SDU shall be segmented into fixed length segments, where the segment length shall depend on the PDU structure chosen. The alternative PDU structures shall correspond to one of the internal frame types defined in clause 12, where the type depends on the chosen class of service. LU10 may use any one of the following combinations of transmission class and PDU structure. In the case of the 16-level or 64-level modulation option (see EN 300 175-2 [2]) the transmission class 2 shall be used.

| Transmission class  | PDU structure  |  |  |  |  |  |
|---|--|--|--|--|--|--|
| Class 2 unidirectional                                      | FU10a/FU10c  |  |  |  |  |  |
| Class 2 bi-directional                                      | FU10b  |  |  |  |  |  |
| Class 3 unidirectional                                      | FU10a/FU10c  |  |  |  |  |  |
| Class 3 bi-directional                                      | FU10b  |  |  |  |  |  |
| NOTE 1: Other PDU structures/transmission classe            | PDU structures/transmission classes are for further study.                           |  |  |  |  |  |
| NOTE 2: Each Instance of LU10 only uses a single            | class of service and a single frame type for all data                                |  |  |  |  |  |
| transmission, and this is defined at service establishment. |  |  |  |  |  |  |
| NOTE 3: A bi-directional link can always be implem          | E 3: A bi-directional link can always be implemented using two unidirectional links. |  |  |  |  |  |

Frames FU10a/FU10c are used to implement unidirectional links. Bi-directional links can be implemented in all cases using two unidirectional links, or alternatively, and only if the link is symmetric, using FU10b frame.

- NOTE 1: Frame FU10b is only to be used with bi-directional symmetric links carrying permanently the same bandwidth in both directions. If the link is asymmetric or variable (can change from symmetric to asymmetric), then it should be implemented using two unidirectional links with frames FU10a/FU10c.
- NOTE 2: The use of frames FU10a/FU10c is also recommendable for packet mode services where transmission in one direction does not imply simultaneous transmission in the opposite one.

In all cases, the original SDU boundaries shall be preserved (i.e. service integrity shall be maintained) by use of a length indicator and extended More bit as defined in clause 13.3.

## 11.12.3 Data transmission

## 11.12.3.1 Send side procedures

At the transmitting side a complete SDU shall be received in a DL\_U\_DATA-req primitive. The SDU shall be passed to the segmenting function and segmented into an integral number of segments. The last segment shall be filled with fill octets if necessary. The information content of each PDU shall be marked using the length indicator as described in clause 13.3, and sequence numbers shall be added using the rules defined in clause 13.4.

The resulting PDUs shall be transmitted in ascending order of sequence number (i.e. the lowest numbered segment shall be transmitted first), using the procedures defined in clause 14.3 for the agreed class of operation.

It is possible to insert several SDUs (or parts of them) in one PDU. For detailed information see clause 13.3.2.

Several PDUs may be submitted at once to the MAC layer in a single MAC\_CO\_DATA-req primitive in response to each MAC\_CO\_DTR-ind primitive. The number of PDUs shall be less than or equal to the maximum number requested in the MAC\_CO\_DTR-ind primitive.

## 11.12.3.1.1 "Early transmission" option

This option shall be specifically invoked in the interworking definition or in an application profile.

If this option is invoked, then the user entity does not need to hold a complete SDU before passing data to the DLC. Instead of that, it may pass segments of SDU (or segments of a data stream in the infinite SDU case). The segmentation and transmission of PDUs may start without waiting for the SDU end boundary.

Operation with infinite size SDUs is allowed in this mode.

## 11.12.3.2 Receive side procedure

Several PDUs may be received from the MAC layer in a single MAC\_CO\_DATA-ind primitive. The receive side shall re-order the PDUs using the send sequence numbers as defined in clauses 14.2 and 14.3 according to the agreed class of operation. The receive side shall then search for SDU boundaries using the extended more bit as defined in clause 13.3.

A complete SDU shall be assumed to exist when the following conditions are satisfied:

- 1) two successive boundaries have been identified using the extended More bit (i.e. there are no intermediate boundaries);
- 2) PDUs have been successfully received for all of the sequence numbers that lie between those boundaries.

Depending on the delivery mode and the state of the sequence of received PDUs, the identified SDU may:

- be immediately passed to the IWU using a DL\_U\_DATA-ind primitive;
- wait for the possible completion and passing of previous SDUs in the sequence before being passed to the IWU.

The following delivery modes are supported by LU10.

#### 11.12.3.2.1 Standard SDU delivery mode

This is the default mode and shall be used unless any of the others is specifically invoked in the interworking definition or in an application profile.

As soon as a complete SDU is identified as described in clause 11.12.3.2, it shall be passed to the user entity (typically the IWU) using a DL\_U\_DATA-ind primitive.

The complete SDU identified may be either, in the "In-sequence PDUs pending for delivery" or in the "out-of-sequence parts". See clause 14.3.4.2 for definitions.

NOTE: The standard delivery mode may not ensure the order of SDUs transmitted at one LU10 SAP, when they are delivered at the other end. This happens, for instance, with transmission Class 2, when there is one SDU with missing PDUs and the following SDU is completely received before the retransmission of the missing PDU comes. This behaviour is convenient for Internet and LAN Protocols where the possible violation of sequence is irrelevant. If the guarantee of sequence is necessary, the in-sequence SDU delivery mode may be used, or the sequence may be enforced by the Interworking layer. See for instance, DPRS, clause B.8.

260

## 11.12.3.2.2 In-sequence SDU delivery mode

This mode shall be specifically invoked in the interworking definition or in an application profile.

Only the complete SDUs identified in the "In-sequence PDUs pending for delivery" are immediately delivered to the user entity. SDUs identified in the "out-of-sequence" part of the window shall wait for possible reception of previous SDU before delivering. SDUs shall be always delivered in ascending order.

Complete SDU identified in "out-of-sequence" parts of the receiver window may become in-sequence, either by reception of missing PDUs, or by advancing of the window due to timing out (reception of a synchronization message).

- NOTE 1: In the last case, there may be an interruption in the SDU sequence, but never a jump back.
- NOTE 2: When there is an interruption in the SDU sequence, it is possible to identify a break in sequence, but it is not possible to determine how many SDUs are missing. If a complete control of the sequence is needed, then it is recommended the addition of sequence numbers by the IWU. See for instance DPRS, clause B.8).

In the case when several complete SDUs are created in the receiver at the same time (in the "In-sequence PDUs pending for delivery"), they shall be delivered in sequence.

NOTE 3: This case may happen by the reception of a retransmitted PDU binding together existing "out-of-sequence" SDUs with the "In-sequence PDUs pending for delivery".

## 11.12.3.2.3 PDU-in-sequence delivery mode

This mode shall be specifically invoked in the interworking definition or in an application profile.

In this mode, in-sequence received PDU are immediately delivered to the user entity without waiting for SDU boundaries. This mode is required when infinite size SDUs are used and is advisable with very large size SDUs.

In addition to the data delivery, the DLC shall provide information to the user entity on position of SDU boundaries, and on possible abnormal termination of SDUs. It is up to the user entity how to use these signals.

NOTE: The abnormal termination of SDU may happen either, due to incomplete reception of SDUs, and due to the reception of the abnormal termination signal. See clause 14.3.4.2.6.

## 11.12.3.2.4 PDU-as-received delivery mode

This mode shall be specifically invoked in the interworking definition or in an application profile.

In this mode, any received PDU is immediately delivered to the user entity without waiting for SDU boundaries, and independently on if the PDU is in or out of sequence.

This mode is compatible with infinite size and very large SDUs.

The DLC shall provide to the user entity information on position of SDU boundaries, on possible abnormal termination of SDUs, and on PDU sequence numbers. In this mode, LU10 is only in charge of the transmission procedure (including acknowledgements and retransmission requests), while the assembling of the SDU has to be performed by the user entity.

## 11.12.4 SDU boundaries definition

The SDU is intended to be equal to the packets supplied by the user entity of the DLC LU10 service. In most cases the user entity is a protocol Interworking layer (see annexes B and C). The SDU boundaries shall be placed as indicated in the interworking unit definition.

261

NOTE: The interworking unit may define SDU boundaries aligned with the higher layer protocol frames, datagrams or packets, may define a segmentation layer, or may add a PAD function.

If no special provision is given in the interworking unit definition, it shall be assumed that the SDU boundaries are aligned with the packet (frame, datagram, message, etc) boundaries of the protocol transported over LU10.

## 11.12.4.1 Infinite SDU case

This case shall be specifically invoked in the interworking definition or in an application profile. Otherwise it is not allowed.

It is possible the operation without SDU boundaries at all (as if the data to be transmitted were a continuous stream). In this case, all "M" bits are set to "1".

NOTE: Length indicators will generally be coded with the maximum allowed size of the PDU. However, this is not required, and shorted values may be used in order to synchronize transmission. The insertion of the LI with LI="0", M="1" may be used as filling pattern, if needed."

# Da.2.2 FU10 frame structure (modify clause 12.11 of EN 300 175-4)

Clause 12.11 of EN 300 175-4 (V2.2.2) shall be modified as follows.

# "12.11 FU10 frame structure

## 12.11.1 General frame structure

FU10 defines three fixed length frames. The total frame length shall always be equal to the segment size of the appropriate logical channel as detailed in figures 12.11.1.1 to 12.11.1.3.

| Bit | 8   | 7 | 6  | 5                     | 4         | 3       | 2 | 1 | Octet  |  |
|-----|---|---|----|-----------------------|-----------|---------|---|---|--------|--|
|     | Send Sequence number, bits ES8 - ES1         ES9       1st Length of information field         1st Information field         2nd Length indicator field         2nd Information octet            i <sup>th</sup> Length indicator octet |   |    |                       |           | 1       |   |   |        |  |
|     | ES9   | 2 |    |                       |           |         |   |   |        |  |

#### Figure 12.11.1.3: Frame format type FU10c

NOTE: For meaning of the NA1 and NA2 bits: see clause 14.3.4.2.

Frame type FU10b is used for bi-directional links, and for the forward path of unidirectional links. It shall use the  $I_P$  logical channel, with segment sizes as given in table 12.11.1.1.

Frame type FU10c is used for the backward (control) path of unidirectional links. Type FU10c contains a list of receive sequence numbers for all of the forward links. Frame FU10c can be transmitted either, by insertion in an FU10a frame of the opposite link (clause 10.11.2), or using the  $G_F$  logical channel. Frame FU10c has a fixed fragment size of 7 octets.

FU10N is the size in octets of the DLC PDU, and is a function of the underlying connection type.

#### Table 12.11.1.1: FU10 connection types

263

Other connection types are for further study.

## 12.11.2 Transmission of FU10c frames

When using two LU10 unidirectional links (frames FU10a/FU10c) in order to implement a bi-directional service, there is the possibility to send the FU10 frames either, via the dedicated  $G_F$  channel, or inserting them in a forward FU10a frame of the opposite link.

NOTE: It is a decision of the FU10c sending side the way of transmission of the frame. The decision can be taken dynamically according to E/U mux selection or free space in FU10a frames.

In both cases, the format of the FU10c frame is identical and is composed of 7 octets as defined in figure 12.11.1.3.

## 12.11.2.1 Insertion of the FU10c frame in an FU10a frame of the opposite link

One or several FU10c frames can be transmitted at the beginning of an FU10a frame of the opposite link using the following mechanism:

- The first length indicator of the FU10a frame shall contain the special code LI = "63" and M = "1".
- One FU10c frame of seven octets shall be inserted immediately after the length indicator.
- In the following octet there shall be a new Length Indicator. This new Length Indicator could be:
  - The same special LI = "63" and M = "1" code indicating that a new FU10c packet is inserted.

264

- The value LI ="0" and M = "0" indicating that there is nothing more in the PDU.
- NOTE 1: The FU10c frame will be always filled to 7 bytes according to the general FU10c rules.
- NOTE 2: After a second insertion of an FU10c, there will be a new length indicator with the same three possibilities. The process can be repeated until the limit indicated in note 3.
- NOTE 3: The maximum number of FU10c packets that can be inserted in an FU10a frame is limited to x due to flow control reasons, where x is equal to the number of subfields of the I<sub>P</sub> protected format for the slot size and modulation level in use.

## 12.11.2.2 Transmission of the F10c frame using the G<sub>F</sub> channel

The FU10c frames can be transmitted at any time via the G<sub>F</sub> channel.

- NOTE 1: It is a decision of the FU10c sending side the way of transmission of the frame.
- NOTE 2: It is possible to combine both transmission mechanisms. In such a case the receiver of the FU10c frame will process them in order of reception.
- NOTE 3: In case of asymmetric bi-directional links, it is advisable to use the insertion mechanism for the FU10c frames sent in the mainstream direction (acknowledging for data sent in reverse direction).

## 12.11.3 FU10 buffering procedures

The  $FB_P$ -frame buffering entity shall be used to provide a data buffering function, and is required to supply data (at the transmit side) or accept data (at the receive side) on demand and with minimum delay.

**Transmit side:** on receipt of a MAC\_CO\_DTR-ind primitive, one complete frame of data shall be submitted to the MAC layer in a MAC\_CO\_DATA-req primitive.

Receive side: each MAC\_CO\_DATA-ind primitive shall contain one complete frame of data from the MAC layer.

In all cases, the order of arrival of the higher layer information shall be preserved, and this shall be identical to the order of transmission.

## 12.11.4 Connection handover

During connection handover, FU10a/FU10b frames should be sent simultaneously to both the old and the new connections. The receive path is then switched to the new connection as soon as the new connection is fully established.

NOTE: Duplicate FU10a/FU10b frames on the old and new connections will have identical contents.

## 12.11.5 Transmission order

The physical transmission order is controlled by the MAC layer as defined in EN 300 175-3 [3]. This MAC layer ordering shall use the octet numbering and bit numbering shown above.

The operations across the DLC layer/MAC layer boundary shall be such that the DLC entity sending a frame can assume this temporal order of the frame, and that the entity receiving the frame can reconstruct it with its assumed temporal order."

# Da.2.3 Length indicator for service LU10 (modify clauses 13.3.1 and 13.3.2 of EN 300 175-4)

Clauses 13.3.1.2 and 13.3.2.2 of EN 300 175-4 (V2.2.2) shall be modified as follows.

### "13.3.1.2 Length indicator field format for service LU10

For frame type FU10a and FU10b the first length indicator shall be as follows, instead of the description of clause 13.3.1.1.

| Bit | 8   | 7  | 6  | 5  | 4  | 3  | 2  | 1 |
|-----|-----|----|----|----|----|----|----|---|
|     | ES9 | L6 | L5 | L4 | L3 | L2 | L1 | Μ |

Figure 13.3.1.2.1: FU10a First length indicator format

| Bit | 8    | 7  | 6  | 5  | 4  | 3  | 2  | 1 |
|-----|------|----|----|----|----|----|----|---|
|     | ACK/ | L6 | L5 | L4 | L3 | L2 | L1 | М |
|     | NACK |    |    |    |    |    |    |   |

Figure 13.3.1.2.2: FU10b First length indicator format

| Bit | 8     | 7  | 6  | 5  | 4  | 3  | 2  | 1 |
|-----|-------|----|----|----|----|----|----|---|
|     | spare | L6 | L5 | L4 | L3 | L2 | L1 | М |

#### Figure 13.3.1.2.3: FU10a and FU10b Format for length indicators other than the first

In case of frame type FU10a and FU10b the following applies for the length indicator L<sub>I</sub>:

•  $L_{I}$ :  $I \in \{6..1\}$  Length of Information field for FU10a and FU10b frame type.

In case of the first length indicator of frame type FU10a the following applies:

• The Send sequence number of the PDU is extended with bitES9 of the 1<sup>st</sup> length indicator field.

In case of the first length indicator of frame type FU10b the following applies:

• Bit 8 of the 1<sup>st</sup> length indicator field is used to indicate ACK/NACK relative to the received sequence number field.

In case of length indicator other that the first one, the following applies:

• The bit 8 (MSB) shall be ignored by the receiver. It shall be coded by the transmitter with "0".

NOTE: The possible coding of this bit to "1" is reserved for further evolution of the standard.

"..."

#### 13.3.2.2 Length indicator field parameters for LU10 service

For frame type FU10a and FU10b only, the following specific conventions shall apply.

The length of Information field, -  $L_I$ :  $I \in \{6...\}$  - of the length indicator shall be understand as follows:

- LI = 63 The meaning depends on the value of the more (M) bit (bit 1 in the same octet).
  - IF M = 0 Means that the frame is a synchronization frame for transmission Class 2, as defined in clause 14.3.4.1.1. This combination can only be used in the first length indicator octet.
  - IF M = 1 Means insertion of a FU10c frame for the opposite channel as defined in clause 12.11.2.1. This only applies to FU10a frames.

- LI = 62 Means that the length indicator byte is followed by a segment of payload of length equal to the maximum payload size that can be transported by the remaining number of octets of the FU10 frame. This code shall not be used if the value of the maximum payload size is lower than 62. In such a case LI shall show the real value of the payload size.
- NOTE 1: If the Length indicator octet is the first one, then the number of octets of the payload is as indicated in table 13.3.2.2.1.
- LI = 0 The meaning depends on the value of the more (M) bit (bit 1 in the same octet).
  - IF M = 0 Means that there is nothing more in the rest of the PDU that shall be filled with the fill pattern. The Rx side does not need to continue processing the PDU. A new SDU will begin at the next Length indicator with  $1 \le LI \le 62$  at the next PDU.

If the previous Length indicator preceding an info field had the M bit = 1, then this Length indicator signals an abnormal termination of an SDU. See clause 14.3.4.1.3.

If the previous Length indicator preceding an info field had the M bit set to "0", the previous SDU terminated normally at the end of the info field, and the special code in the following Length indicator does not have any special meaning regarding last SDU.

- NOTE 2: "previous length indicator preceding an info field" refers to the previous length indicator with 1≤LI≤62 in the PDU sequence. It has not necessarily had to happen in the same PDU.
- NOTE 3: Length indicator with the special codes (LI=63, M=1) and (LI=0, M=1) may be in between and are irrelevant for this rule:
  - IF M = 1 Means that there will be a further Length indicator octet in the following byte. This pattern may be repeated as times as needed.

Any other value of LI ( $0 \le LI \le 61$ ) means that the length indicator byte is followed by a segment of payload of the length indicator.

If a segment of information of length lower than the maximum payload size and larger than 61 octets needs to be inserted in a PDU, it shall be split in two or more segments of length lower than 61 inserting length indicators bytes between them. The bit "M" shall be set to 1 in all length indicators except the last one that must be equal to zero.

If a segment of information of length equal to the maximum payload size is to be inserted in a PDU, the bit "M" may be 0 or 1, depending on if it is the last field of an SDU, or if the SDU continues in next PDU. This applies either if the Length information field (LI) has been coded with the special value 62 or with the real information field length, but equal to the remaining octets of the PDU.

NOTE 4: The value of the maximum payload size that can be transported by the frame depends of the slot type, MAC service and modulation type. The value of the maximum payload size for frame FU10a is indicated in table 13.3.2.2.1.

For frame FU10b, the value of the maximum payload size is the indicated in previous table minus 1 byte.

#### 13.3.2.2.1 Meaning of the more (M) bit

**Connection Type** I<sub>PM</sub> error detect IPMR error correct

When using frame type FU10a or FU10b, the meaning of the More (M) bit shall be understood as follows:

- M = "1" and a value of the length of Information field equal to the remaining number of octets till the end of 1) the PDU indicates that the information field only contains part of a SDU. There is more to follow in the next PDU.
- NOTE 1: The value of the length of Information field equal to the remaining number of octets till the end of the PDU may be coded with the special value 62 or with the real length depending on the case.
- M = "1" and a value of the length of Information field lower than the remaining number of octets till the end of 2) the PDU indicates that the information field only contains part of a SDU, and that there will be a new length indicator byte immediately after the information field. The content of the SDU shall continue after the new length indicator.
- NOTE 2: M = "1" and the value of the length indicator equal to zero indicate that there is a new length indicator immediately after the current one.

- 3) M = "0" and a value of the length of Information field different from zero or 63, indicates one of two things:
  - a) that the information field contains a complete SDU, provided that the M bit of the previous length indicator was also set to "0";
  - b) that the information field contains the last segment of a SDU, provided that the M bit of the previous length indicator was set to "1".

In addition to that, the "M" bit set to "0" and a value of the length of Information field different from zero and lower than the remaining number of octets till the end of the PDU means additionally, that there is a new length indicator byte immediately following the information field. The bit M in such length indicator has to be examined, to check if more data of a further SDU follows in this PDU.

- 4) M = "0" and a value of the length of Information field equal to zero indicates end of SDU and end of PDU content. There is no information field after the length indicator and the remaining part of the PDU shall be discarded. A new SDU will generally begin at next PDU (however, it is allowed not transmitting any payload in next PDU by using the LI="0", M="0" indicator). Depending on the value of the M bit in previous length indicator, it may signal abnormal termination of an SDU. See clause 14.3.4.1.3.
- 5) Length Indicator (LI) = 63, and M = "0" means transmission of a synchronization message for Class 2 transmission procedures. See clauses 14.3.1.1 and 14.3.2.1.

For frame type FU10a only:

6) Length Indicator (LI) = 63, and M = "1" means insertion of FU10c frame as defined in clause 12.11.2.1, and M = "0" means that frame is a synchronization frame for transmission Class 2, as defined in clause 14.3.4."

# Da.2.4 Sequence number elements (modify clause 13.4 of EN 300 175-4)

Clause 13.4 of EN 300 175-4 (V2.2.2) shall be modified as follows.

# "13.4 Sequence number elements

## 13.4.1 Send sequence number format

| Bit | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | I/R | ES7 | ES6 | ES5 | ES4 | ES3 | ES2 | ES1 |

#### Figure 13.4.1.1: Send sequence number field format

 $ES_I = Send Sequence Number (7-bits); I \in \{7..1\};$ 

I/R = Initial/Retransmission bit.

For frame format FU10a and FU10b the following Send sequence number format shall be used.

| Bit | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | ES8 | ES7 | ES6 | ES5 | ES4 | ES3 | ES2 | ES1 |

## Figure 13.4.1.2: Send sequence number field format for FU10

For FU10a the ES9 bits from the length indicator shall be added to the 8 bits shown above (clause 13.3.1).

 $\text{ES}_{\text{I}} = \text{Send Sequence Number (9-bits); I} \in \{9..1\}.$ 

"..."

## 13.4.2 Send sequence number parameters

At the time that an in-sequence frame is designated for transmission, the value of  $ES_I$  is set equal to the value of the send state variable SN according to the selected transmission class. Refer to clauses 14.2 and 14.3.

The I/R bit shall define the meaning of the send sequence number contained in the same octet, using the following coding:

I/R = "1" First transmission (of this frame);

I/R = "0" Retransmission (of this frame).

## 13.4.3 Receive sequence number format

| Bit | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | A/N | ER7 | ER6 | ER5 | ER4 | ER3 | ER2 | ER1 |

#### Figure 13.4.3.1: Receive sequence number field format

 $ER_I = Receive sequence number (7-bits); I \in \{7..1\};$ 

A/N = ACK/NACK bit.

For frame type FU10b the following receive sequence number format shall be used.

| Bit | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | ER8 | ER7 | ER6 | ER5 | ER4 | ER3 | ER2 | ER1 |

#### Figure 13.4.3.2: Receive sequence number field format for FU10b

 $ER_I = Receive sequence number (8-bits); I \in \{8..1\};$ 

NOTE: The A/N = ACK/NACK bit. is contained in the length indicator field (octet 3) (clause 13.3.1).

## 13.4.4 Receive sequence number parameters

At the time that a frame is designated for transmission, the value of  $ER_I$  is set according to the selected transmission class. Refer to clauses 14.2 and 14.3.

The A/N bit shall define the meaning of the Receive sequence number contained in the same octet, using the following coding:

A/N = "1" Positive acknowledge;

A/N = "0" Negative acknowledge.

"..."

## 13.5 Fill elements - Fill field format

#### Figure 13.5.1: Fill field format

NOTE: Fill field octets are filled with balanced data."

# Da.2.5 U-plane peer-to-peer procedures (modify clause 14 of EN 300 175-4)

Clause 14 of EN 300 175-4 (V2.2.2) shall be modified as follows.

# "14 U-plane peer-to-peer procedures

## 14.1 General

Multiple instances of U-plane entities may exist within one PT and within one FT. These instances are assumed to operate completely independently, and the operation of only a single instance is considered here.

Each of these procedures shall only be used to provide a single point-to-point (U-plane) link between one FT and one PT. Class 0 can also be used for connectionless multicast transmission of U-plane data from an FT to PTs.

The procedures in this clause are generic in the sense that each procedure may be applicable to more than one of the LU services. The procedures are written in a modular manner, by referencing them to the elements of procedure defined in clause 13. Each modular procedure shall apply to any of the (internal) frames defined in clause 12 that contain the relevant element(s) of that procedure.

NOTE: Certain U-plane services provide for the transport of external user data that contains an (external) frame structure. In this clause, the word "frame" only refers to the (internal) frames defined in clause 12.

## 14.2 Frame transmission principles

## 14.2.1 Sequence numbering

Frame types FU3, FU4, FU5, FU6 and FU10 contain one or two octets containing sequence numbers. These are used for error control and flow control information. All of these frame types shall contain a send sequence number, and frame types FU3, FU4, FU5 and FU10 shall also contain a receive sequence number.

If a connection oriented MAC service is used (see EN 300 175-3 [3], clause 5.6), then the send sequence number shall be set to zero at the start of the MAC connection, and this value shall be used for the first transmitted frame over that MAC connection. The send sequence numbers of successive frames shall be contiguous (modulo 128) during the lifetime of that MAC connection (including logical connections).

If a connectionless MAC service is used (see EN 300 175-3 [3], clauses 5.7 and 9.1.2.2), then the send sequence number of the first segment of a DLC SDU may be arbitrarily chosen. The send sequence numbers of successive frames shall be contiguous (modulo 128) within one DLC SDU.

The receive sequence number shall be set to 0 at service establishment, and this sequence number shall be updated according to the transmission procedures given in clause 14.3.

## 14.2.2 Acknowledgements

## 14.2.2.1 Sending acknowledgements

The receiving entity shall send continuous acknowledgement data to the sending entity using the single receive sequence number or list of receive sequence numbers as appropriate. All such acknowledgement data shall be always updated at the time it is transmitted.

- NOTE 1: Continuous does not necessarily means in every frame. See receive side procedure descriptions for details.
- NOTE 2: The sending of acknowledgement data stops when there is no data transmission (see clause 14.3.4.2.2).

## 14.2.2.2 Receiving acknowledgements

Positive ACKnowledgement information (ACKs) shall only be accepted if it is received within error free frames (see note 1). Negative ACKnowledgement information (NACKs) shall be accepted if it is received within error free frames, but may also be accepted if it is contained in erroneous frames.

271

Frames that contain multiple acknowledgement octets (multiple RNs) shall contain at least one valid RN. Valid RNs shall be placed in the lowest numbered octets. No RN shall be duplicated. Exception to the previous requirement shall apply to all unused octets that shall be filled with an exact duplicate of the highest RN.

- NOTE 1: In unidirectional links, frames that contain multiple acknowledgement octets (e.g. FU6b frames) are transmitted via the Gf channel using single B-subfield (see EN 300 175-3 [3]). These frames are to be considered correctly received (i.e. error free frames) if the single B-subfield does not contain errors.
- NOTE 2: At the receiving side, the octets in these frames should be processed in ascending order. The remaining octets may then be discarded if a duplication is discovered.

## 14.2.3 Transmission classes

Four transmission classes are defined:

| no LUx retransmission or sequencing;                   |
|--|
| no LUx retransmission (sequencing only);               |
| variable throughput, limited delay LUx retransmission; |
| fixed throughput LUx retransmission.                   |
|  |

## 14.2.3.1 Class 0: No LU<sub>X</sub> retransmission or sequencing

This service provides a fixed throughput service, with the notification of MAC detected errors. Sequencing shall be provided by the MAC layer, and this shall only be guaranteed if a fixed bandwidth (fixed number of MAC bearers) can be maintained.

This shall use the following MAC I channel operation mode:

- I<sub>N</sub>: minimum\_delay;
- I<sub>N</sub>: normal\_delay;
- I<sub>P</sub>: error-correct/single bearer only;
- I<sub>P</sub>: error-detect.
- NOTE:  $I_P$  error-correct and  $I_P$  error-detect services can be used in the multi-subfield ( $I_{PM}$  or  $I_{PMR}$ ) or in the single-subfield variant ( $I_{PO}$  or  $I_{POR}$ ).

All error detection uses the normal MAC error detection procedures (see EN 300 175-3 [3]).

## 14.2.3.2 Class 1: no LU<sub>X</sub> retransmission

This service provides a variable throughput service, with removal or notification of all errors detected at the MAC layer. The correct frames are always resequenced at the receiver. If a MAC retransmission failure is reported at the sending side (e.g. if the maximum MAC retransmit count is reached) or if a sequence error is detected at the receiving side, the link may be released by the upper layer. In all cases a notification shall be issued to the higher layer whenever an error is detected.

This shall use the following MAC I channel operation mode:

I<sub>P</sub>: error-correct.

NOTE: I<sub>P</sub> error-correct service can be used in the multi-subfield (I<sub>PMR</sub>) or in the single-subfield variant (I<sub>POR</sub>).

All error detection uses the normal MAC error detection procedures (see EN 300 175-3 [3]).

## 14.2.3.3 Class 2: variable throughput, limited delay LU<sub>X</sub> retransmission

This service is characterized by the demands of variable throughput with controlled maximum delay. Each frame is retransmitted until acknowledged, or until a timer expired. The DLC retransmission may operate in Go\_Back\_N or in SELective (SEL) retransmission protocol.

This may use the following MAC I channel operation modes:

- I<sub>P</sub>: error-correct;
- I<sub>P</sub>: error-detect.
- NOTE 1:  $I_P$  error-correct and  $I_P$  error-detect services can be used in the multi-subfield ( $I_{PM}$  or  $I_{PMR}$ ) or in the single-subfield variant ( $I_{PO}$  or  $I_{POR}$ ).

All error detection uses the normal MAC error detection procedures (see EN 300 175-3 [3]).

NOTE 2: Care is needed to ensure that the application does not retransmit faster than the DLC retransmission; this could cause the offered throughput to decrease catastrophically.

## 14.2.3.4 Class 3: fixed throughput LU<sub>X</sub> retransmission

This service is characterized by the demands of a fixed throughput. Limited error correction based on the retransmission scheme is applied, but data throughput is maintained even in the presence of errors.

This shall use the following MAC I channel operation mode:

- I<sub>P</sub>: error-detect only.
- NOTE:  $I_P$  error-detect service can be used in the multi-subfield ( $I_{PM}$ ) or in the single-subfield variant ( $I_{PO}$ ).

The potential level of correction is defined by the service attributes, giving a nominal fixed delay, and the excess connection bandwidth available from the MAC layer.

In the event that a frame cannot be delivered correctly within the time limits of the service, both sides of the link shall act independently to clear the old frame.

At the transmitter, any frame that exceeds the specified lifetime (i.e. more than N ms old) is discarded without notification and shall not be retransmitted any more.

The receiver shall independently generate a replacement frame to the output, and shall mark the interruption. The receiver should then proceed as though the frame had been received correctly, including sending positive acknowledgement(s) as appropriate.

# 14.2.4 Operation parameter negotiation

Certain operating parameters may be negotiated at call establishment, as defined in EN 300 175-5 [5]. This negotiation shall be optional. The following parameters may be negotiated:

- window sizes;
- transit delay.

**Window size negotiation:** if negotiation is adopted, the negotiated values shall be used to define the maximum values. If negotiation is not used, the maximum values defined in clause 14.3 shall be used.

**Transit delay negotiation:** transit delay negotiation shall only be used for class 2 and class 3 operation. If negotiation is adopted, the negotiated values shall be used to define the maximum values for the DLC elements of the delay. If negotiation is not used, the maximum values defined in clause 14.3.5 shall be used.

# 14.3 Frame transmission procedures

## 14.3.1 General

The term "SN" shall refer to send Sequence Numbers. The term "RN" shall refer to Receive Sequence numbers.

All operations shall be understood to be Modulo 128 for both send sequence numbers and receive sequence numbers. The term "modulus" shall refer to the value 128.

273

The procedures shall be described for only one direction of operation, and each procedure shall apply to both bi-directional or unidirectional operation unless otherwise stated. Bi-directional operation shall be assumed to be based on two independent instances of a given procedure; one for each direction.

## 14.3.2 Class 0 procedures

Class 0 operation does not use any sequence numbers (SN and RN are not used). Class 0 provides a transparent interface to the MAC layer. The MAC layer service should normally provide sequencing (by invoking a constant bandwidth connection) and may optionally provide error protection.

## 14.3.2.1 Sending side procedure

The sending entity shall submit frames to the MAC layer in the order of arrival. No sequence numbers shall be added, and no retransmission shall be used.

For minimum delay operation (frame type FU1 only) the special buffering procedures described in clause 12.2.3 shall be used.

## 14.3.2.2 Receiving side procedure

**Normal operation:** the receiving entity shall deliver frames in the order they are received from the MAC layer. Packets marked as type "unknown" should be discarded. The remaining packets shall be assumed to contain valid frames, and shall be processed in their order of arrival. Frames containing errors (as indicated by the MAC layer) shall nonetheless be delivered to the higher entity, together with the error indication.

**Minimum\_delay (speech) operation:** the receiving entity shall immediately deliver frames in the order they are received from the MAC layer. All packets shall be assumed to contain valid frames, and shall be processed in their order of arrival. Frames indicated as type "unknown" or containing errors (i.e. errors indicated by the MAC layer) shall nonetheless be delivered to the higher entity, together with the error indication.

## 14.3.3 Class 1 procedures

Class 1 operation uses both SNs and RNs. If this class is used over a point-to-point link, then both SNs and RNs are used. The RNs then only provide window flow control to avoid possible sequence errors, and shall not invoke any DLC retransmission. Hence, the RNs shall only transport positive acknowledgements (ACKs), denoted by the A/N bit set to 1 (see clause 13.4.3).

If this class is used for connectionless downlink multicast transmission from a FT to PTs, then only SNs are used.

All statements made below in this clause with respect to the use of RNs and windowing only apply to point-to-point links, and are not applicable to connectionless downlink multicast transmission.

## 14.3.3.1 Sending side procedure

The sending entity shall add SNs to all frames in the order specified by that entity. The I/R bit shall be set to "1".

The resulting frames shall be submitted to the MAC layer in the order of ascending SN.

The sending entity shall maintain a maximum window size between the SN and the last received RN-1. This maximum window size shall be no greater than (modulus-1). A smaller maximum value may be negotiated at call establishment (see clause 14.2.4). A smaller operating window size may be unilaterally adopted by the sending entity at any time.

Due to the modulus operation, each SN may be re-used several times during the life of the link. The minimum interval between re-use shall meet the following requirements:

- 1) a SN shall not exceed the maximum window size;
- 2) a SN shall not be re-used within L(S) TDMA frames of the most recent previous use of that number.

The value of L(S) shall be determined by the MAC service used. L(S) shall be equal to the maximum packet lifetime (as defined at service establishment).

Received RNs with the A/N bit set to "1" shall be treated as an acknowledgement for all frames up to and including the frame number RN-1.

Whenever the window size limit is reached further transmissions shall be halted and timer <DLU-01> shall be started. This timer shall be reset whenever a valid RN is received (i.e. an RN that acknowledges one or more outstanding frames). In this case, further transmissions shall be allowed. If timer <DLU-01> expires the link shall be immediately released.

## 14.3.3.2 Receiving side procedure

The receiving entity shall accept data packets from the MAC layer in any order. Packets marked as type "unknown" and any packets containing errors in the first portion (i.e. errors in the MAC B0 subfield) shall be discarded. The remaining packets shall be assumed to contain valid frames, and shall be processed in their order of arrival.

In-sequence frames are defined as a series of one or more frames that contain no errors and that contain SNs that together form a continuous series of SNs when considered together with other received but undelivered frames. All in-sequence frames shall be immediately delivered to the higher functions.

Out-of-sequence frames are defined as all other frames (i.e. a sequence of one or more frames that do not form a continuous series of SNs or contain some errors). These frames may only be delivered after they have been buffered for at least L(R) TDMA frames after their arrival. During this buffering period, out-of-sequence frames may become in-sequence frames due to the arrival of one or more missing frames. In this event, the frames shall be immediately delivered to the higher layer.

NOTE 1: Out of sequence frames may be discarded before this time limit, in order to limit buffer sizes.

The value of L(R) shall be determined by the MAC service used. For the I<sub>p</sub>-error-correct services, L(R) shall be equal to or greater than the maximum packet lifetime (as defined at service establishment) and less than (<DLU-01> DIV 2). Hence, for this service, infinite values for the maximum packet lifetime at the MAC layer are not allowed.

NOTE 2: The recommended value for L(R) is equal to the maximum packet lifetime.

During the buffering period frames may arrive that are duplicates of one or more of the buffered frames. If the original buffered frame was correct, these duplicates shall be discarded. If the original buffered frame contained errors, the duplicate may be used to correct those errors, using selective replacement of erroneous portions (replacement of MAC BN subfields).

NOTE 3: Selective replacement is only performed for frames with the same SN. This requires error free reception of the B0 subfield (i.e. the subfield containing the SN).

If after buffering for L(R) TDMA frames, out-of-sequence frames remain out-of-sequence, the frames shall nonetheless be delivered to higher functions, together with an indication reporting the missing frames. The receiving entity shall then act as though the frames had been received in sequence. In particular, the RN shall be updated to acknowledge acceptance of these frames.

Whenever frames are delivered to the higher functions, the RN shall be set equal to the highest delivered SN + 1.

## 14.3.4 Class 2 procedures

Class 2 operation uses both SNs and RNs. The RNs provide both window control to avoid possible sequencing errors, and also invoke automatic DLC retransmission. The DLC retransmission may operate in Go\_Back\_N or in SELective (SEL) retransmission protocol.

## 14.3.4.1 Sending side procedure

The sending entity shall add SNs to all PDUs to be transmitted in frames in the order specified by that entity.

The PDUs shall be submitted to the MAC layer in the order of ascending SN, taking into account the modulus operation of the sequence numbering.

275

NOTE 1: Sequence number 0 is higher than sequence number (modulus-1).

NOTE 2: This rule means that retransmissions always have priority relative to first transmissions.

The sending entity shall maintain a maximum window size between the SN and the last received RN. The maximum window size shall be:

- (Modulus-1) when using GbN;
- (Modulus div 2) when using SEL.

A lower maximum value may be negotiated at call establishment (see clause 14.2.4). A smaller operating window size may be unilaterally adopted by the sending entity at any time.

Due to the modulo operation, each SN may be re-used several times during the life of the link. The minimum interval between reuse shall meet the following requirement:

• an SN shall not be reused within L(S) TDMA frames of the most previous use of that number.

The value of L(S) shall be determined by the protocol used:

- using I<sub>P</sub>-error-correction, L(S) shall be equal to the MAC packet lifetime+1 (as defined at service establishment);
- using I<sub>p</sub>-error-detection, L(S) shall be equal to 2.

Whenever the window size limit is reached (thereby halting further transmissions) the sending side shall commence retransmission of all outstanding PDUs not already expired, starting from the oldest unacknowledged PDU. This automatic retransmission shall be stopped whenever a usable RN is received (i.e. a RN that acknowledges one or more outstanding PDUs), and normal transmission or retransmission procedures will be resumed.

Received RN with the A/N bit set to "1" or with NA bits indicating an acknowledge, shall be treated as a positive acknowledgement for all PDUs up to and including the PDU number RN - 1. This positive acknowledgement shall cause an immediate stop to any redundant (unnecessary) retransmissions that may have been scheduled as a result of previously received negative acknowledgements.

Received RNs with the A/N bit set to "0" shall be treated as a negative acknowledgement for the single PDU number RN. Receipt of a NACK shall cause a retransmission of the indicated PDU(s) using the agreed retransmission protocol (selective or GO\_Back\_N as appropriate).

If the maximum window size is reached, no new PDUs will be inserted in the window.

As soon as a SDU is delivered from the upper layer to the DLC, a timer shall be associated with it. The SDU lifetime shall be equal to T(R) TDMA frames. Whenever a timer reaches the T(R) value, the respective SDU shall be considered expired and not (re)transmitted anymore.

The transmitting window shall not shift due to the expiry of those PDUs belonging to the expired SDU.

NOTE 3: In order to shift the window, the transmitter should wait for the reception of the Acknowledge to the synchronization message.

If a PDU contains (parts of) more than one SDU, the lifetime is associated to the lifetime of the last SDU in this PDU.

The lifetime limit should be defined at call establishment and by means of the Information Element <<Transit Delay>>.. If the lifetime limit is not specified at call establishment the following value shall apply:

• T(R) = infinite TDMA frames.

- NOTE 4: When a PDU is about to be discarded due to lifetime expiry then the transmitter may re-transmit this PDU in an attempt to prevent data loss.
- NOTE 5: The value T(R) should normally be negotiated with the <<transit-delay>> element during call establishment (see EN 300 175-5 [5] and EN 301 649 [the present document]), and may be also changed using Service Change operation (see EN 301 649 [the present document]).

During the lifetime the transmitter may retransmit the PDU. Retransmissions shall be stopped when the PDU, or a PDU with highest SN, is acknowledged.

#### 14.3.4.1.1 Synchronization message sending side procedure (LU10)

A synchronization message shall be sent after data has timed out at the transmitter. The synchronization message contains no data (PDU) but it shall be treated by the sending entity as if it were a PDU.

The synchronization frame shall have the following structure.

Figure 14.3.4.1.1.1: Synchronization message frame

Where:

- the length indicator is filled with 6 bits as the value "63" is used to indicate a synchronization frame;
- the send sequence number field contains the send sequence number of the last expired PDU;
- the M bit is set to 0;
- the content of the payload is irrelevant and shall be discarded.

NOTE 1: The recommended practice is filling the payload with the filling pattern.

NOTE 2: Length indicator value 63 combined with M bit set to 1 is used for insertion of FU10c frame. See clause 12.11.2.1.

When one or more PDUs expire, then the last expired PDU shall be replaced by the synchronization message. The synchronization message shall contain the sequence number of this PDU.

NOTE 3: Expiry of all PDUs in the transmit window will cause a re-transmit of the synchronization message only, until acknowledge. Then the transmit window can advance and take new PDUs.

Acknowledge of the synchronization message shall use a special synchronization acknowledge to indicate the correct reception of the synchronization message. When the transmitter receives this acknowledge, it knows the receiver has re-synchronized its window and the transmitter is also allowed to move the transmit window forward, accepting new PDUs for transmission.

### 14.3.4.1.2 Tx side end-of-activity rule

#### Applicability

This rule applies and is mandatory to support when the following conditions are met:

- DPRS systems operating with any ME Class supporting suspend/resume (ME Class 1, 2 or 2, see EN 301 649 [the present document]); and
- DLC U-plane service (LUx) is using transmission Class 2 (clause 14.3.4) and any frame that may carry embedded acknowledgement messages (such as FU10b or FU10a with insertion of FU10c).

NOTE 1: In DPRS ME Class 4 or in non DPRS systems, the application of the rule is optional to the implementer.

#### Rule

When the following situation is reached:

- There is only one PDU in the transmitter window (only one PDU has been sent after the last received positive ACK).
- Such PDU contains only a positive Acknowledgement command (ACK) OR an Acknowledgement command to a Synchronization message.

THEN, such PDU never expires.

- NOTE 2: Therefore, a synchronization message will not be sent, as long as such PDU is the only one in transmitter window.
- NOTE 3: If further data is received for transmission, then new PDUs will have associated a maximum lifetime and this may cause the sending of a synchronization message as described in clause 14.3.4.1.1.
- NOTE 4: This rule, in combination with the Rx rule (see clause 14.3.4.2.2), are in charge of stopping the DLC exchange when there is no user data to be transmitted. The resulting state (one PDU in transmitter window containing only an Acknowledgement message) is one of the two possible stationary states after end of data activity (the other possible state is no PDU in transmitter window).

#### 14.3.4.1.3 Abnormal SDU termination/abort signal (LU10 only)

In a normal transmission of an SDU, the last information sub-segment should be preceded by a Length indicator octet coded with a length of information different from zero and the M bit equal to zero.

The insertion of a Length indicator octet with the codes "Length of information" equal to "0" and M bit equal to "0", when there is an SDU that has not been completely transmitted (previous Length indicator preceding info field transmission had the M bit equal to "1") shall be understood as abnormal termination of the SDU.

The signal means that the transmission of the SDU ends (therefore a new SDU will start after the next Length indicator with  $1 \le LI \le 62$ , in the next PDU), and that such SDU is incomplete or corrupted.

The general properties of the LI = "0", M="0" code also apply here. Therefore, the rest of the PDU shall be discarded and the next SDU shall start in the next PDU carting payload (generally the next PDU, however it is possible to leave it black by using again the (LI = "0", M = "0") code).

The PDU boundaries, or the inclusion of Length indicators without info field, or FU10c frames in between the last SDU sub-segment and the abort signal may happen and do not modify the signal meaning.

NOTE 1: The Length indicator octet with the codes "Length of information" equal to "0" and M bit equal to "0" may be in the same PDU transporting the last info field of the SDU, or in the next one. In the second case, there may be one or several insertions of FU10c frames (with the special code LI = 63, M=1) before the transmission of Length indicator with the SDU abort signal (LI=0, M=0). In both cases there may be Length indicators with LI=0 and M=1.

NOTE 2: The utility of the abort signal is relevant in the cases when similar signals may be received by the sending side by external data links, or when the early transmission option (see clause 11.12.3.1.1) is used and there is a mistake in an SDU partially transmitted. The abort signal may be used to prevent the receiver side from assembling an incomplete or corrupted SDU.

## 14.3.4.2 Receiving side procedure

The receiving entity shall accept data packets from the MAC layer in any order. Packets marked as type "unknown" and any packets that are indicated to contain errors shall be discarded. The remaining packets shall be assumed to contain valid PDUs, and shall be processed in their order of arrival. PDUs with sequence number outside the receive window shall be discarded. Only a synchronization message shall be accepted always, even if the sequence number is outside the receive window. Duplicate PDUs shall also be discarded.

NOTE 1: If a valid PDU was discarded due to duplication, the last acknowledge should be retransmitted.

"In-sequence PDUs" are defined as a series of one or more received PDUs that contain no error and that contain SN(s) that together form a continuous series of SNs starting from the beginning of the receiver window.

"In-sequence PDUs pending for delivery" are the in-sequence series of PDUs ending at the highest in-sequence SN, but starting with the SN of the first PDU that has not been already completely delivered to higher layers.

- NOTE 2: The "In-sequence PDUs pending for delivery" will be taken into account for the SDU delivery process only.
- NOTE 3: The beginning point of the "in-sequence PDUs" and the "In-sequence PDUs pending for delivery" may differ due to two factors:
  - 1) the delivery of data to highest layers combined with some delay in sending ACKs may cause momentarily the advance of the lowest SN in the "In-sequence PDUs pending for delivery" faster than in the "In-sequence PDUs";
  - 2) in case of sending ACK to a correctly received in-sequence PDU that does not contain an SDU boundary, the reception window shifts at the receiver, but the "In-sequence PDUs pending for delivery" remains starting at the same point that now is older than the start of the Rx window.
- NOTE 4: The data in the "In-sequence PDUs pending for delivery" older than the beginning of the reception window is data completely received and acknowledged from Class 2 procedures point of view. The PDU SNs information is no longer relevant. This data may be pre-assembled and moved to a different buffer starting with the initial SDU boundary (the buffered data should be always the beginning part of an SDU). In case of large SDU, the buffered data may be even larger than the reception window.

"Out-of-sequence PDUs" are defined as all other PDUs (i.e.a set of sequences of one or more correctly received PDUs) that do not form a continuous series with the in-sequence part.

#### 14.3.4.2.1 Acknowledgement procedure

Received PDUs that are the "in-sequence" part of the window, or that allow to complete the in-sequence part, shall be acknowledged to the Tx side within a reasonable time of its reception even if no further PDUs are received. The acknowledge message shall carry as RN the highest SN of the received "in-sequence PDUs", plus one. The value of SN shall be always updated at the time the message is sent.

The algorithm for deciding when and how often the acknowledgements have to be sent is free to the implementer, however the end of activity rule described in clause 14.3.4.2.2 shall be fulfilled.

NOTE: A trade-off should be made by the implementor between acknowledge speed and throughput of the return channel. Sending an acknowledge for every received in-sequence PDU can block the return channel if only one return bearer is available, so this is inefficient and can cause data timeout on the return channel, but delivers the lowest round-trip delay. When an acknowledge is sent very seldom, the throughput of the return channel is optimal, but round-trip delay suffers or even the forward channel may get filled with re-transmits of packets that are regarded as timed-out by the transmitter. An example: when in-sequence PDUs are acknowledged every 4 frames, this takes only 25 % of the capacity of one return bearer.

## 14.3.4.2.2 Rx side end-of-activity rule

## Applicability

This rule applies and is mandatory to support when the following conditions are met:

- DPRS systems operating with any ME Class supporting suspend/resume (ME Class 1, 2 or 2, see EN 301 649 [the present document]); and
- DLC U-plane service (LUx) is using transmission Class 2 (clause 14.3.4) and any frame that may carry embedded acknowledgement messages (such as FU10b or FU10a with insertion of FU10c).

NOTE 1: In DPRS ME Class 4 or in non DPRS systems, the application of the rule is optional to the implementer.

#### Rule

When the following situation is reached:

- there is only one PDU in the receiver window; and
- such PDU contains only a positive Acknowledgement command (ACK) OR an Acknowledgement command to a Synchronization message.

THEN, the receiver MUST NOT send any ACK to such PDU.

NOTE 2: The receiver will re-start the sending of ACKs if further PDUs are received.

NOTE 3: This rule, in combination with the Tx rule (see clause 14.3.4.1.2) are in charge of stopping the DLC exchange when there is no user data to be transmitted. The resulting state (one PDU in receiver window containing only an Acknowledgement message) is one of the two possible stationary states after end of data of activity (the other possible state is no PDU in receiver window.

#### 14.3.4.2.3 Retransmission request procedure

If after buffering for L(R) TDMA frames, out-of-sequence remains out-of-sequence, the receiving entity should return a composed NACK message.

After that, as long as the out-of-sequence PDUs remain out-of-sequence, they shall continue to be buffered and at most one composed NACK message may be sent in any period of L(R) TDMA frames.

Out-of-sequence PDUs may become in-sequence PDUs due to the arrival of one or more of the missing PDUs.

For the GBN protocol a NACK shall carry a single value of RN, set equal to the lowest numbered missing PDU. For the SEL protocol, multiple RN values shall be returned; one for each missing PDU.

NOTE: In GBN, out of sequence PDUs may be discarded during this buffer period, in order to limit buffer sizes.

The value of L(R), shall be determined by the service used:

- when using the I<sub>P</sub>-error-correction protocol:
  - L(R) = (MAC packet lifetime+1).
- when using the I<sub>P</sub>-error-detection protocol:
  - L(R) = 1 TDMA frames.

#### 14.3.4.2.4 SDU delivery procedure

Both, the "In-sequence PDUs pending for delivery" and the "out-of-sequence PDUs", may be used for delivering data to higher layers, according to the specific rules given for each LUx service. For the LU10 service, see clause 11.12.3.2 for the different delivery modes.

279

### 14.3.4.2.5 Synchronization message receiver side procedure (LU10)

As soon as a synchronization message has been received, the RN shall be set to one higher than the value of the SN contained in the synchronization message and all the buffered PDUs with an SN lower than or equal to the received one should be discarded.

This operation also clears the data pending for delivery older than previous beginning of the window. Therefore, the initial point of both "in-sequence PDUs" and "In-sequence PDUs pending for delivery" is now the same and set to the SN sent in the synchronization message plus one.

NOTE 1: Discarding these PDUs guarantees the maximum lifetime. Synchronization indicates their lifetime has expired.

The re-synchronization shall be sent to higher functions to indicate a discontinuity in PDU numbering.

NOTE 2: Actual numbering might be continuous due to the modulo numbering scheme.

The synchronization message shall always be acknowledged using a special synchronization acknowledge, in order to indicate that the transmitter can advance its window. The synchronization acknowledge can have two formats, depending on the frame format used in the link:

- a) links using FU10b frame format shall use the same format as the synchronization message for the synchronization acknowledge: the Length Indicator has value 63 and the sequence number of the synchronization message is returned;
- b) links using frame formats FU10a/FU10c shall use the FU10c ACK/NACK message with a special coding for NA1 and NA2 bits = 0,0 as shown in figure 14.3.4.2.5.1. This message can be transmitted either by the  $G_F$  channel or by insertion in the FU10a frame of the opposite channel.

| Bit | 8                                   | 7 | 6   | 5         | 4       | 3   | 2   | 1   | Octet |

#### Figure 14.3.4.2.5.1: Frame FU10c, 9 Bit sequence numbering

The interpretation of the RSNs as either ACKs or NACKs is indicated by bits NA1 and NA2.

| Bit | NA1 | NA2 | Meaning  |
|-----|-----|-----|--|
|     | 0   | 0   | This frame contains an Ack of a synchronization message in RSN#1, no NACKs         |
|     | 0   | 1   | This frame contains only one ACK message in RSN#1, no NACKs                        |
|     | 1   | 0   | This frame contains one ACK message in RSN#1plus five NACK messages in RSN#2-RSN#6 |
|     | 1   | 1   | This frame contains six NACK messages  |

#### 14.3.4.2.6 Reception of an abnormal SDU termination/abort signal (LU10)

In the event of receiving an abnormal SDU termination / abort signal, as defined in clause 14.3.4.1.3, the receiving entity shall discard the abnormally terminated SDU and shall not pass it to higher layers. In implementations when delivering of SDU to higher layers is allowed before SDU termination (i.e. PDU delivery mode), then an "abort" signal shall be passed and the receiving entity shall be in charge of handling the abnormal condition.

- NOTE 1: In most cases, it means discarding the whole SDU. In some cases, for instance, when part of the SDU was released out of the DECT system, by a data link (i.e. by a TCP connection), it means the transmission of an equivalent "abort" signal by such connection. If there is no way to do that, then the DECT system should not release externally parts of the SDU before the complete reception of it.
- NOTE 2: In some special cases, for instance, when the transported payload is an application protocol, the destination application layer entity may handle the abnormal case in its own way.

## 14.3.5 Class 3 procedures

Class 3 operation uses both SNs and RNs. The RNs provide both window control to avoid possible sequencing errors, and also invoke automatic DLC retransmission. The DLC retransmission shall operate a selective retransmission protocol, combined with a lifetime limit on all packets to provide a guaranteed throughput.

## 14.3.5.1 Sending side procedure

The sending entity shall add SNs to all frames in the order specified by that entity. The I/R bit shall be set to "1" for the first transmission and to "0" for all retransmissions.

The resulting frames shall be submitted to the MAC layer in the order of ascending SN.

NOTE 1: This rule means that retransmissions always have priority relative to first transmissions.

The sending entity shall maintain a maximum window size between the SN and the last received RN. The maximum window size shall be equal to the (Modulus) of the SN used. A lower maximum value may be negotiated at call establishment (see clause 14.2.4). A smaller operating window size may be unilaterally adopted by the sending entity at any time.

Due to the modulus operation, each SN may be re-used several times during the life of the link. The minimum interval between re-use shall meet the following requirements:

- 1) a SN shall not exceed the maximum window size;
- 2) a SN shall not be re-used within L(S) TDMA frames of the most recent previous use of that number.

The value of L(S) shall be equal to 2.

The maximum lifetime of each frame shall be limited to T(R) TDMA frames. This lifetime limit should be defined at call establishment, and shall not be subsequently changed. When this limit is exceeded for a given frame, the frame shall not be retransmitted (or transmitted) and the data should be discarded. If the lifetime limit is not specified at call establishment the following value shall apply:

- T(R) default value shall be 15 TDMA frames.
- NOTE 2: The value T(R) should normally be negotiated with the <<transit-delay>> element during call establishment (see EN 300 175-5 [5]).

The discarding of a frame shall not be treated as equivalent to acknowledgement of the SN. In all cases, the SN of that frame shall not be reused until the SN has been acknowledged by the peer. The peer entity maintains a corresponding lifetime limit, and should normally issue a (false) acknowledgement for expired frames when their lifetime limit is reached.

Whenever the window size limit is reached (thereby halting further transmissions) the sending side shall commence retransmission of all unexpired but outstanding frames, starting from the oldest unacknowledged frame. This automatic retransmission shall be stopped whenever a usable RN is received (i.e. an RN that acknowledges one or more outstanding frames), and normal transmission or retransmission procedures will be resumed.

Received RNs with the A/N bit set to "1" shall be treated as a positive acknowledgement for all frames up to an including the frame number RN-1. This positive acknowledgement shall cause an immediate stop to any redundant (unnecessary) retransmissions that may have been scheduled as a result of previously received negative acknowledgements.

Received RNs with the A/N bit set to "0" shall be treated as a negative acknowledgement for the single frame number RN. Receipt of a NACK shall cause a selective retransmission of the indicated frame(s).

## 14.3.5.2 Receiving side procedure

The receiving entity shall accept data packets from the MAC layer in any order. Packets marked as type "unknown" and any packets that are indicated to contain errors in the first portion (MAC subfield BO) shall be discarded. The remaining packets are assumed to contain valid frames, and shall be processed in their order of arrival.

282

In-sequence frames are defined as a series of one or more frames that contain no errors and that contain SN(s) that together form a continuous series of SNs when considered together with other received but undelivered frames. All in-sequence frames shall be immediately delivered to the higher functions.

NOTE 1: Most higher function users of class 3 retransmission are expected to provide frame buffering such that a continuous flow of data is produced. The buffer size should be greater than the product of connection bandwidth and maximum frame lifetime.

Out-of-sequence frames are defined as all other frames (i.e. a sequence of one or more frames that do not form a continuous series of SNs or contain some errors). These frames may only be delivered after they have been buffered for T(R) TDMA frames after their arrival. During this buffering period, out-of-sequence frames may become in-sequence frames due to the arrival of one or more missing frames. In this event, the frames shall be immediately delivered to the higher layer.

As soon as an out-of-sequence frame is detected the receiving entity shall return an immediate negative acknowledgement, by returning at least one frame containing the missing RNs and the A/N bit set to "0". If necessary, multiple RN values shall be returned; one for each missing frame.

NOTE 2: Out of sequence frames may be discarded before this time limit, in order to limit buffer sizes.

The value of T(R) shall be equal to the maximum frame lifetime. This lifetime limit should be defined at call establishment, and shall not be subsequently changed. If the lifetime limit is not specified at call establishment the following value shall apply:

- T(R) default value shall be 15 TDMA frames.
- NOTE 3: The value T(R) should normally be negotiated with the << transit-delay >> element during call establishment (see EN 300 175-5 [5]).

During the total buffering period T(R) a frame may arrive that is a duplicate of one of the buffered frames. If the original buffered frame was correct, any such duplicates shall be discarded. If the original buffered frame contained errors, the duplicate may be used to correct those errors, using selective replacement of erroneous portions (replacement of MAC BN subfields).

NOTE 4: Selective replacement is only performed for frames with the same SN. This requires error free reception of the B0 subfield (i.e. the subfield containing the SN).

If after buffering for T(R) TDMA frames, out-of-sequence frames remain out-of-sequence, all of the valid frames shall nonetheless be delivered to higher functions, together with an indication for all missing frames. The receiving entity shall then act as though the frames had been received in sequence. In particular, the RN shall be updated to acknowledge acceptance of these frames.

Whenever frames are delivered to the higher functions, the RN for all positive acknowledgements shall be set equal to the highest delivered SN + 1."

# Da.3 Amendments to EN 300 175-5 (DECT CI; NWK layer)

The following amendments to EN 300 175-5 (V2.2.1), shall apply for the purpose of the present document.

## Da.3.1 References (add to clause 2 of EN 300 175-5)

The following entries shall be added to clause 2 "References" of EN 300 175-5 (V2.2.1):

[i.2] ETSI TS 102 527-4: "Digital Enhanced Cordless Telecommunications (DECT); New Generation DECT; Part 4: Light data services; Software Update Over The Air (SUOTA), Content Download and HTTP based applications".

# Da.3.2 Terminal capability (add to clause 7.7.41 of EN 300 175-5)

The following codings of Profile/Application Indicator 6 and 7 (Octets 4 to 4h) and notes shall be added to clause 7.7.41 of EN 300 175-5 (V2.2.1).

## "7.7.41 Terminal capability

#### **Profile indicator (octet group 4):**

This is a bit mapped octet group. A "1" indicates support for the specified profile. Reserved bits shall be set to zero and shall not be checked in the receiver.

#### **Profile Indicator\_1 Coding (Octet 4):**

| Bits | 7654321         | Meaning  |
|------|-----------------|--|
|      | x x x x x x 1   | CAP supported.   |

#### Table F.1: Extended higher layer capabilities

NOTE 1: The bit numbers refer to the bit positions in the MAC message. Refer to EN 300 175-3 [3], clause 7.2.3.5. NOTE 2: The default setting for all bits is "0"; meaning "not available".

NOTE 3: The supported management Class is inferred from the state of bit a21 (MAC suspend/resume supported). If bit a21= 1 then Class 3, if a21 is = 0, then Class 4."

# Da.3.4 Extended higher layer capabilities (part 2) (modify clause F.3 of EN 300 175-5)

Clause F.3 of EN 300 175-5 (V2.2.1) shall be modified as follows.

# "F.3 Extended higher layer capabilities (part 2)

If a profile is supported or a capability provided, then the bit corresponding to that profile is set to 1; otherwise (if profile/capability is not supported) the bit is set to 0.

For DPRS (EN 301 649 [the present document]) and New Generation DECT systems supporting packet data (TS 102 527-2 [i.25], the system category is indicated by bits  $a_{25}$  to  $a_{28}$ .

For New Generation DECT systems supporting extended wideband speech services (TS 102 527-3 [i.24]), supported sets of services are indicated by bits  $a_{30}$  to  $a_{40}$ .

| Bit number                         | Profile supported  |  |  |  |
|------------------------------------|--|--|--|--|
| a <sub>24</sub>                    | NG-DECT Wideband voice (see TS 102 527-1 [i.23])   |  |  |  |
| a <sub>25</sub> to a <sub>28</sub> | DPRS/NG-DECT Packet Data Category (see EN 301 649 [the present document] and TS 102 527-2 [i.25] and table F.3b)   |  |  |  |
| a <sub>29</sub>                    | NG-DECT Extended wideband voice supported (TS 102 527-3 [i.24])  |  |  |  |
| a <sub>30</sub> to a <sub>34</sub> | NG-DECT FP extended wideband voice (TS 102 527-3 [i.24]) specific sets of services   |  |  |  |
| a <sub>38</sub> to a <sub>41</sub> | (see table F.3c)   |  |  |  |
| a <sub>35</sub>                    | "no emission" mode support (see EN 300 175-3 [3], TS 102 527-3 [i.24]) and note 4)   |  |  |  |
| a <sub>36</sub>                    | List access feature support (see TS 102 527-3 [i.24])  |  |  |  |
| a <sub>37</sub>                    | Easy pairing feature support. If supported, for security reasons, set to "1" and unset at the same time as $a_{44}$ (see TS 102 527-3 [i.24] and note 5) |  |  |  |
| a <sub>42</sub>                    | Reserved   |  |  |  |
| a <sub>43</sub>                    | Reserved   |  |  |  |
| a <sub>44</sub>                    | Reserved   |  |  |  |
| a <sub>45</sub>                    | Light data services (TS 102 527-4 [i.2]) supported   |  |  |  |
| a <sub>46</sub>                    | Reserved   |  |  |  |
| a <sub>47</sub>                    | Reserved   |  |  |  |

#### Table F.2: Extended higher layer capabilities

#### Table F.3b: NG-DECT TS 102 527-2 [i.25]/DPRS Packet Data Category (Cat)

| Bits<br>a <sub>25</sub> to a <sub>28</sub> | DPRS/NG-DECT Packet Data Category                  |
|--|--|
| 0000                                       | No Packet data supported or non categorized system |
| 0001                                       | Cat 1: data Category 1 (see note 3)                |
| 0010                                       | Cat 2: data Category 2 (see note 3)                |
| 0011                                       | Cat 3: data Category 3 (see note 3)                |

| 1xxx                              | Multiple lines, see note 8   | 7.4.7 [i.24]              |
| x1xx                              | Multiple calls, see note 8   | 7.4.8 [i.24]              |
| xx1x                              | Permanent CLIR   | 7.4.12 [i.24]             |
| xxx1                              | Call forwarding  | 7.4.13 [i.24]             |
| All other values                  | Reserved for future standardization                                      |                           |

Table F.3c: NG-DECT Extended voice (TS 102 527-3 [i.24]) supported sets of services

NOTE 1: The bit numbers refer to the bit positions in the MAC message. Refer to EN 300 175-3 [3], clause 7.2.3.11.

- NOTE 2: The default setting for all bits is "0"; meaning "not available".
- NOTE 3: See the data profile specification for exact definition of Packet data Categories. Packet data Categories are incremental: Cat 5 and Cat 4 systems also support Cat 3, Cat 2 and Cat 1. Cat 3 systems also support Cat 2 and Cat 1; Cat 2 systems also support Cat 1.
- NOTE 4: Bit a35 = "1" indicates, that the system may switch to "no emission" mode operation. Bit a35 = "0" indicates, that the system will not switch to "no emission" mode operation.
- NOTE 5: Bit a37 = "1" indicates, that the FP supports the feature "easy pairing registration" (see TS 102 527-3 [i.24]).
  Bit a37 = "0" indicates, that the FP does not support the feature "easy pairing registration". Nevertheless the PP might try to use the easy pairing registration against this FP.
- NOTE 6: This Bit is provided for FPs not complying with TS 102 527-3 [i.24] (since the feature is Mandatory in TS 102 527-3 [i.24]).
- NOTE 7: This bit set implies implementation of the "Line identification" feature NG1.N.12 and the "Call identification" feature NG1.N.13 (see TS 102 527-3 [i.24]).
- NOTE 8: This bit set implies implementation of the "Common parallel call procedures" feature NG1.N.7 (see TS 102 527-3 [i.24]).

# Da.3.5 Call attributes (modify clause 7.7.5 of EN 300 175-5)

Clause 7.7.5 of EN 300 175-5 (V2.2.1) shall be modified as follows.

## "7.7.5 Call attributes

The purpose of the <<<CALL-ATTRIBUTES>> element is to describe the higher layer service to be provided by the DECT protocol. The element may be repeated in a setup message when using service negotiation.

| Bit: | 8   | 7      | 6                                    | 5   | 4                  | 3         | 2          | 1  | Octet: |
|------|-----|--------|--------------------------------------|-----|--------------------|-----------|------------|----|--------|
|      |     |        |                                      |     |                    |           |            |    |        |
|      | 0   |        | << CALL-ATTRIBUTES >>                |     |                    |           | 1          |    |        |
|      |     |        | Length of Contents (L)               |     |                    |           | 2          |    |        |

#### Figure 29: CALL-ATTRIBUTES information element

#### Coding standard (octet 3):

Bits 76 Meaning

0 0 DECT standard coding. All other values reserved.

#### **NWK layer attributes (octet 3):**

| 54321           | Meaning  |
|-----------------|--|
| 00000           | Undefined.   |
| $0\ 0\ 0\ 0\ 1$ | Basic speech.  |
| 00010           | DPRS Class 2.  |
| 00011           | DPRS Class 3.  |
| 00110           | DPRS Class 4.  |
| 01000           | DECT GSM IWP profile phase 2.  |
| 00100           | DECT UMTS IWP.   |
| $0\ 0\ 1\ 0\ 1$ | ODAP basic data.   |
|                 | $\begin{array}{c} 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \end{array}$ |

All other values reserved.

#### C-plane class (octet 4):

| Bits | 765         | Meaning                    |
|------|-------------|----------------------------|
|      | $0\ 0\ 0$   | Class U link; shared.      |
|      | 010         | Class A link; shared.      |
|      | $1 \ 0 \ 0$ | Class B link; shared.      |
|      | 101         | Class B link; independent. |
|      | All othe    | er values reserved.        |
|      |             |                            |

#### C-plane routing (octet 4):

| Bits | 4321 | Meaning   |
|------|------|---|
|      | 0000 | C <sub>S</sub> only.                              |
|      | 0001 | C <sub>S</sub> preferred/C <sub>F</sub> accepted. |
|      | 0010 | C <sub>F</sub> preferred/C <sub>S</sub> accepted. |
|      | 0100 | C <sub>F</sub> only.                              |

1 1 0 0 C<sub>F</sub> only; dedicated bearer (see note).

All other values reserved.

NOTE: When "dedicated bearer" is indicated, at least one bearer of the MAC connection is reserved for the  $C_F$  channel (i.e. not to be used for U-plane information). Otherwise, the  $C_F$  channel may be routed to either a dedicated bearer or a non-dedicated bearer (a bearer that may also carry U-plane information) (see EN 300 175-4 [4], clause 9.5.1.2 for details of dedicated bearer operation).

#### U-plane symmetry (octet 5):

| Bits | 76      | Meaning             |
|------|---------|---------------------|
|      | 0 0     | Symmetric.          |
|      | 10      | Asymmetric.         |
|      | All oth | er values reserved. |

If symmetric, only octet 5 shall appear and this shall refer to both directions. If asymmetric octet 5 shall only refer to the direction  $P \Rightarrow F$  and octet 5a shall refer to the direction  $F \Rightarrow P$ .

### LU identification (octet 5 and 5a):

| Bits | 54321           | Meaning                     |
|------|-----------------|-----------------------------|
|      | 00001           | LU1.                        |
|      | 00010           | LU2.                        |
|      | 00011           | LU3.                        |
|      | 00100           | LU4.                        |
|      | 00101           | LU5.                        |
|      | 00110           | LU6.                        |
|      | 00111           | LU7.                        |
|      | 01000           | LU8.                        |
|      | 01001           | LU9.                        |
|      | 01010           | LU10.                       |
|      | 01011           | LU11.                       |
|      | 01100           | LU12.                       |
|      | 01101           | }                           |
|      | to              | }reserved for LU13 to LU15. |
|      | 01111           | }                           |
|      | $1\ 0\ 0\ 0\ 0$ | LU16.                       |
|      | All other val   | ues reserved.               |

#### U-plane class (octets 6 and 6a):

| Bits | 765           | Meaning               |
|------|---------------|-----------------------|
|      | 000           | Class 0 min_delay.    |
|      | 001           | Class 0 normal_delay. |
|      | 010           | Class 1.              |
|      | 100           | Class 2; Go_Back_N.   |
|      | 101           | Class 2; SELective.   |
|      | 110           | Class 3.              |
|      | 111           | Not applicable.       |
|      | All other val |                       |

### U-plane frame type (octets 6 and 6a):

| Bits | 4321         | Meaning  |
|------|--------------|----------|
|      | 0001         | FU1.     |
|      | 0010         | FU2.     |
|      | 0011         | FU3.     |
|      | 0100         | FU4.     |
|      | 0101         | FU5.     |
|      | 0110         | FU6.     |
|      | 0111         | FU7.     |
|      | $1\ 0\ 0\ 0$ | FU8.     |
|      | 1001         | FU9.     |
|      | 1010         | FU10a/c. |
|      | 1011         | FU10b.   |
|      | $1\ 1\ 0\ 0$ | FU12     |

All other values reserved.

If symmetric is indicated in octet 5, only octet 6 shall appear and this shall refer to both directions. If asymmetric is indicated in octet 5, then octet 6 shall only refer to the direction  $P \Rightarrow F$  and octet 6 shall refer to the direction  $F \Rightarrow P$ ."

### Da.3.6 Basic services (modify clause 7.6.4 of EN 300 175-5)

Clause 7.6.4 of EN 300 175-5 (V2.2.1) shall be modified as follows.

### "7.6.4 Basic service

**Basic service (octet 2):** 

| Bits | 4321             | Meaning  |
|------|------------------|--|
|      | 0000             | Basic speech default setup attributes (see note 1, clauses E.1 and 9.3.1.1).                             |
|      | 0100             | DECT GSM IWP profile (Phase 2).  |
|      | 0110             | DECT UMTS IWP (TS 101 863 [i.21]).   |
|      | 0101             | LRMS (E-profile) service (EN 300 757 [i.17]).  |
|      | 0110             | GSM IWP SMS.   |
|      | $1\ 0\ 0\ 0$     | Wideband speech default setup attributes (see note 2).   |
|      | 1001             | Light data service (TS 102 527-4 [i.2]), Class 4 DPRS management, default setup attributes (see note 3). |
|      | 1010             | Light data service (TS 102 527-4 [i.2]), Class 3 DPRS management, default setup attributes (see note 3). |
|      | 1111             | Other (see clause 9.3.1.1).  |
|      | All other values | reserved.  |

- NOTE 1: The value of this field may be used in future standards to indicate "specific profile default setup attributes".
- NOTE 2: Default wideband setup attributes are described in clause E.2. Codec negotiation mechanism is described in TS 102 527-1 [i.23].
- NOTE 3: Default setup attributes for data services are defined in EN 301 649 [the present document] (DPRS), clause A.4."

### Da.3.7 Transit delay infinite (modify clause 7.7.42 of EN 300 175-5)

Clause 7.7.42 of EN 300 175-5 (V2.2.1) shall be modified as follows.

### "7.7.42 Transit delay

The purpose of the <<TRANSIT-DELAY>> element is to indicate the allowable delay that shall be imposed for data transmitting the DECT subnetwork.

| Bit: | 8 | 7                      | 6                                      | 5   | 4         | 3                   | 2     | 1 | Octet: |
|------|---|------------------------|--|-----|-----------|---------------------|-------|---|--------|
|      |   |                        |  |     |           |                     |       |   |        |
|      | 0 |                        | << TRANSIT-DELAY >>                    |     |           |                     |       |   | 1      |
|      |   | Length of Contents (L) |  |     |           |                     |       | 2 |        |
|      | 1 | 0                      | 0 Upstream ( $P \Rightarrow F$ ) Delay |     |           |                     |       |   | 3      |
|      | 1 | 0                      |  | Dow | nstream ( | $(F\RightarrowP)$ [ | Delay |   | 4      |

#### Figure 86: TRANSIT-DELAY information element

 $P \Rightarrow F$  delay ( $F \Rightarrow P$  delay) octet 3 (and 4): the << TRANSIT-DELAY >> shall be coded with the natural binary value, and the result placed in the octet with the least significant bit in position 1. Delay shall be calculated in steps of 1 TDMA frame (10 ms).

The value "0" is understood as infinite (no limit for the transit delay).

Allowable values are "0" to "63"."

### Da.3.8 IWU-to-IWU (modify clause 7.7.23 of EN 300 175-5)

Clause 7.7.23 of EN 300 175-5 (V2.2.1) shall be modified as follows.

### "7.7.23 IWU to IWU

The purpose of the <<IWU-TO-IWU>> element is to encapsulate any message or information element that cannot be interworked into one or more other DECT information element(s) or to exchange DECT Profile specific information between the peer interworking units.

If the message or element is too large to fit into a single <<IWU-TO-IWU>> element, it shall be segmented into a series of <<IWU-TO-IWU>> elements that are associated using the <<SEGMENTED-INFO>> element.

Refer to annex G for more details on the use of this element.

| Bit: | 8 | 7   | 6                      | 5       | 4     | 3     | 2 | 1 | Octet: |
|------|---|-----|------------------------|---------|-------|-------|---|---|--------|
|      |   |     |                        |         |       |       |   |   |        |
|      | 0 |     | << IWU-TO-IWU >>       |         |       |       |   |   | 1      |
|      |   |     | Length of Contents (L) |         |       |       |   | 2 |        |
|      | 1 | S/R |                        |         |       |       | 3 |   |        |
|      |   |     |                        |         |       |       |   |   | 4      |
|      |   |     | IWU-                   | I UWI-O | NFORM | ATION |   |   |        |
|      |   |     |                        |         |       |       |   |   | L+2    |

### Figure 51: IWU-TO-IWU information element

#### Send/Reject (S/R) bit:

Bits 7 Meaning

0 Rejection of message.

- 1 Transmission of message.
- NOTE 1: This Send/Reject (S/R) bit is used to distinguish between the sending of a new message (e.g. sent in the direction  $A \Rightarrow B$ ) and the rejection of a received message (e.g. message received by B can be rejected by sending "reject" code in direction  $B \Rightarrow A$ ).

#### **Protocol Discriminator (PD):**

| Bits | 654321             | Meaning   |
|------|--------------------|---|
|      | 000000             | User Specific (see note 2).   |
|      | $0\ 0\ 0\ 0\ 0\ 1$ | OSI high layer protocols.   |
|      | 000010             | ITU-T Recommendation X.263 [i.26] (see note 3).                                     |
|      | 000011             | List Access.  |
|      | $0\ 0\ 0\ 1\ 0\ 0$ | IA5 characters.   |
|      | 000110             | Light data service, software upgrade over the air (SUOTA) (see TS 102 527-4 [i.2]). |
|      | $0\ 0\ 0\ 1\ 1\ 1$ | ITU-T Recommendation V.120 [i.27] Rate adaption.                                    |
|      | 001000             | ITU-T Recommendation Q.931 [i.28] (I.451), message.                                 |
|      | 001001             | ITU-T Recommendation Q.931 [i.28] (I.451), information element(s) (see note 4).     |
|      | $0\ 0\ 1\ 0\ 1\ 0$ | ITU-T Recommendation Q.931 [i.28] (I.451), partial message. (see note 5).           |
|      | $0\ 1\ 0\ 0\ 0\ 0$ | GSM, message/TS 144 018 [i.29].   |
|      | $0\ 1\ 0\ 0\ 1$    | GSM, information element(s)/TS 144 018 [i.29] (see note 4).                         |
|      | $0\ 1\ 0\ 0\ 1\ 0$ | UMTS/GPRS information element(s) (note 4)/TS 124 008 [i.30].                        |
|      | $0\ 1\ 0\ 0\ 1\ 1$ | UMTS/GPRS, messages/TS 124 008 [i.30].  |
|      | $0\ 1\ 0\ 1\ 0\ 0$ | LRMS (EN 300 757 [i.17]).   |
|      | $0\ 1\ 0\ 1\ 0\ 1$ | RLL Access Profile (RLL access profile, EN 300 765-1 [i.19]).                       |
|      | 010110             | WRS (EN 300 700 [i.31]).  |
|      | $1\ 0\ 0\ 0\ 0\ 0$ | DECT/ISDN Intermediate System C-plane specific.                                     |
|      | $1\ 0\ 0\ 0\ 1$    | DECT/ISDN Intermediate System U-plane specific.                                     |
|      | $1\ 0\ 0\ 0\ 1\ 0$ | DECT/ISDN Intermediate System Operation and Maintenance.                            |
|      | $1\ 0\ 0\ 0\ 1\ 1$ | Terminal Data (see note 6).   |
|      | $1\ 0\ 0\ 1\ 0\ 0$ | DECT access to IP Networks specific, TS 102 265 [35].                               |
|      | $1\ 0\ 0\ 1\ 0\ 1$ | MPEG-4 ER AAC-LD Configuration Description, TS 102 527-1 [i.23].                    |
|      | 111111             | Unknown.  |

|      |                           |   |   |   |   |   |   |   | L+2    |

### Figure 53

The discriminator consists of 2 octets (octets 5 and 6) and contains the EMC.

## Annex E (informative): Implementation guidelines and examples

## E.1 Scope of this annex

This annex gives some flowcharts for typical use cases of DPRS data calls with multibearer and complete C-plane (Class 2). The first part of the annex includes flowcharts for, virtual call setup (several cases), virtual call release, service change, MAC suspend, MAC resume, MAC bandwidth change and C-plane only operations (Access-Right request, NWK layer C-plane example and stay-alive, MAC layer C-plane only example).

The second part of the annex (E.3) shows an example of operaton for an typical HTTP data transfer.

The third part of the annex (E.4) introduced a few examples of detailed diagrams with the optimal timing for selected operations (timed diagrams).

The fourth part (E.5) introduces some examples regarding the DPRS Generic Encapsulation Interworking.

Please note that they are simple and convenient implementation examples that may considered as good practice cases. However they may not be considered as the only possible implementation of the current standard (some variations are allowed). Flowcharts can be divided into atomic groups to allow for various implementations:

- CAT 1 mandatory features (single bearer connection): E.2.1, E.2.2, E.2.3, E.2.6.
- symmetric multibearer connections: previous ones + E.2.4.
- assymetric connections: previous ones + E.2.5 (bandwidth expansion, asymmetric downlink), E.2.6 (bandwidth expansion asymmetric uplink), E.2.8 (bandwidth reversal with fast release).
- Virtual call release: E.2.9.
- Bandwidth change: E.2.7 (PT initiated).
- suspend, resume, fast-setup: any of the above + E.2.10 (FT suspend), E.2.11 (PT suspend), E.2.12 (PT resume), E.2.13 (FT resume via fast setup), E.2.14 (FT resume via paging), E.2.15 (resume rejected by FT).
- stay alive: E.2.16, service re-negotiation at NWK layer: E.2.17.

The following notation conventions are adopted:

- The transmission of the network messages throughout the layers is not shown.
- For the MAC layers, continued line represents the pilot bearer.
- For the MAC layers, discontinued line represents additional bearers (i.e. duplex bearers or do uble simplex bearers).
- $\rightarrow$

- Between MAC layers, double arrow represents 2 sending of the message (one in each physical channel of double simplex bearer).

- The instance of the corresponding layer is suspended or ended for the current.

For MAC procedures the following notation is used: A(message 1) B0(message 2) B1(message 3), etc.

- A(message 1) stands for "message 1 sent in the A field".
- B0(message 2) stands for "message 2 sent in the first subfield (i.e. B0) of the multiple subfield B field format".

## E.2 Flowcharts

## E.2.1 Declaration of capabilities during subscription or location registration procedures

| ▼ ↓                    | •  | •  | <b>↓ ↓</b>                             |

Figure E.1: Declaration of capabilities during subscription or location registration procedures

- NOTE 1: Declaration of PP capabilities may also be done during location registration procedure.
- NOTE 2: "On air key allocation" feature is optional for FT, but it is recommended to perform it in order to use a dynamic key (i.e. User Authentication Key) for "Authentication of PP" feature which is mandatory.

E.2.2 Virtual call opening, first phase: establishment of the pilot bearer (valid for all DECT data system categories)

## Figure E.2: Virtual call opening, first phase: establishment of the pilot bearer (valid for all DECT data system categories)

- NOTE 1: Virtual call is initiated either from the PP or from the FP. In the last case, the LCE-REQUEST-PAGE message with LCE code =110 is used.
- NOTE 2: A virtual call always begins with the setup of an initial duplex bearer (also called pilot bearer). For this setup the B-field single bearer setup procedure (see EN 300 175-3 [3], clause 10.5.1.3) should be used (see DPRS clause 10.10.1.2). The setup messages (bearer request, bearer confirm, other, other) should always be sent in the physical channel selected for the new bearer.
- NOTE 3: PT initiated bearer request has the following characteristics:
  - TA (Tail identification) code = 111 (meaning "M<sub>T</sub> first PP transmission").
  - BA bits with the slot type.
  - A-tail with M<sub>T</sub> message "B-field setup" (defined in EN 300 175-3 [3], clause 7.2.5.8).
  - BEARER\_REQUEST in B0.
  - It may carry other messages in other subfields (Bn).
- NOTE 4: Some WAIT messages may be sent from peer side between bearer request and confirm messages (see EN 300 175-3 [3], clauses 10.5.1.1 and DPRS 10.10.1.2.3), but the use of WAIT messages should be avoided.
- NOTE 5: "other" messages are used after the bearer confirm to test the usability of the newly setup bearer. Correct reception of the "other" message enables the bearer state to be switched to "Bearer\_Established" on the receiving side and is therefore a condition for successful termination of the procedure.. The "other" messages may be any message (except *release*), i.e. any A-field (including N<sub>T</sub>) or B-field (see EN 300 175-3 [3], clause 10.5.1.3).

NOTE 6: After pilot bearer setup, there are 3 possibilities: 1/ keep the bandwidth as it is (use the bandwidth provided by the pilot bearer, see flowchart E.2.3); 2/ increase the bandwidth (see flowchart E.2.4 and E.2.5); suspend the virtual call by setting the bandwidth to zero, waiting for actual data to be transmitted (see flowcharts E.2.7 and E.2.8).

## E.2.3 Virtual call establishment, second phase, use case 1: keeping the bandwidth as it is (single bearer connection)

Figure E.3: Virtual call establishment, second phase, use case 1: keeping the bandwidth as it is (single bearer connection)

- NOTE 1: A single bearer connection is a connection for which negotiated values for <Maximum number of bearers> and <Minimum number of bearers> are both equal to 1 (see flowchart E.2.4, note 1 for negotiation constraints).
- NOTE 2: "Mup, Mdown, Tup, Tdown" stands for "Minimum uplink, downlink, Maximum uplink, downlink number of bearers" (see EN 300 175-3 [3], clause 7.2.5.3.9).
- NOTE 3: Ip\_error\_detection MAC service is used in both directions.
- NOTE 4: This use case is the typical Cat 1 case, but it can occur also for Cat 2 and Cat 3 devices.
- NOTE 5: In <<Call attributes>> I.E. the flag "DPRS" is used for the <NWK layer attributes> field. This makes the call a packet virtual call.
- NOTE 6: On each side, when the MAC layer receives MAC-MOD-req, the MBC (Multi-Bearer Control) behavior changes. By default, the MBC has a circuit-mode behavior, meaning in particular that the connection and the (pilot and only) bearer have the same lifecycle. On the contrary, in DPRS, bearers can disappear (cf. suspend/resume) while the connection at NWK layer remains active.
- NOTE 7: MAC-MOD-cfm should not be issued until the connection is fully established.

# E.2.4 Virtual call establishment, second phase, use case 2: increasing the bandwidth (Symmetric case)

298

## Figure E.4: Virtual call establishment, second phase, use case 2: increasing the bandwidth (Symmetric case)

- NOTE 1: < Maximum number of bearers > and < Minimum number of bearers > are negotiated at network level for the whole call duration (thanks to the << Connection Attributes >> information element). If sent by the call originating side (i.e. in {CC-SETUP}), these values represent the requested number of bearers and the minimum acceptable number of bearers respectively.
  - If the call originating side is the PT (as in the example), <Maximum number of bearers> in the response (i.e. in {CC-CONNECT}) represents the allocated number of bearers, and can be anywhere in between.
  - If the call originating side is the FT, <Maximum number of bearers> in the response should be equal to <Maximum number of bearers> in the request, unless the requested value is out of PT implementation range: in such a case, the PT should answer with the maximum possible values.

The values coded in the response (if accepted) will be the minimum and maximum number of bearers for the whole call duration (unless a {SERVICE-CHANGE} is used, see flowchart E.2.11). See DPRS clause 12.5 for <<IWU attributes>>, <<Call attributes>>, and <<Connection attributes>> details.

- NOTE 1a: In case of call setup, MAC-level bandwidth negotiation procedure should be initiated by the call originating side (see DPRS clause 10.7.1.1).
- NOTE 2: For all flowcharts and in order to simplify exposition, the number of bearers in the "bandwidth confirm" message is assumed to be equal to the number of bearers in the "bandwidth request" message.

NOTE 3: In order to possibly improve efficiency of bandwidth usage, BANDWITH\_B\_REQ can be replaced with BANDWITH\_T\_REQ in A field (see DPRS clause 10.7.1.1). BANDWITH\_B\_REQ/CONFIRM negotiation of wanted bearers may be repeated if the first one fails.

299

- NOTE 4: For symmetric connections, extra (or "additional") bearer setups should be PT initiated (see EN 300 175-3 [3], clauses 10.2.4.3.1 and DPRS 10.10.1.4.1). The setup messages (bearer request, bearer confirm, other, other) for duplex bearers (initial or additional) is always sent in the physical channel selected for the new bearer. "other" messages may be used to send data information.
- NOTE 5: For the setup of extra duplex bearers, it is highly recommended to use the channel list procedures. The term "channel" refers here to a TDD pair (i.e. two time slots using the same frequency; the starting points of the time slots being separated by 0,5 frame):
  - The setup is always PT-initiated (this use case), the recommended channel list message is LISTEN (see clause 10.10.1.4.3) sent by the FT on an already established duplex bearer.

GOOD or POOR may sent by PT (at any time before the LISTEN), and depending on the case, being taken into account by the FT in the channel selection (see clause 10.10.1.5.3) Use of channel list procedures decreases the connection establishment time (see EN 300 175-3 [3], clause 10.2.4.3.1). Indeed, updates of the channel selection list and of the blind slot information are not done in real time on PP side; furthermore, the FP has a better view of the channels used (however, a free channel for this FP could be already in use by another FP, so the channel list procedure should be used in compliance with the channel selection rules defined in EN 300 175-3 [3], clause 11.4).

- NOTE 6: The use of LISTEN for duplex is in practice quasi-mandatory. If no LISTEN command is sent, the PT cannot start until the expiration of a timer (10 frames).
- NOTE 7: The fastest implementation possible is achieved by sending the LISTEN (duplex) commands in the same frame as the bandwidth  $FT \Rightarrow PT$  command. PT channel list info (GOOD/POOR) could be send with the bandwidth  $PT \Rightarrow FT$  command. See example in clause E.4.

# E.2.5 Virtual call establishment, second phase, use case 3: increasing the bandwidth (Asymmetric downlink case)

Asymmetric downlink case (m+n) with m>n: establishing extra duplex and double simplex bearers.

Figure E.5: Virtual call establishment, second phase, use case 3: increasing the bandwidth (Asymmetric downlink case)

- NOTE 1: (m+n) stands for m (simplex) bearers in FP  $\Rightarrow$  PP direction, and n (simplex) bearers in PP  $\Rightarrow$  FP direction.
- NOTE 2: An asymmetric connection is a connection that has double simplex bearers. An asymmetric downlink (resp. uplink) connection is a connection for which all double simplex bearers are in the direction FP to PP (resp. PP to FP); in such a connection, FT (resp. PT) is the T-side (i.e. the transmitter of the double simplex bearers) and PT (resp. FT) is the R-side (i.e. the receiver of the double simplex bearers). For an asymmetric connection (uplink or downlink), extra duplex bearers and double simplex bearer setups are T-side initiated (see EN 300 175-3 [3], clauses 10.2.4.3.2, 10.2.4.3.3, and 10.5.1.4). For determining the T-side, the *targeted* connection type is used, not the *current* one. For determining the *targeted* connection type (asymmetric, uplink or downlink) the parameters TUp and TDown in the bandwidth message FT ⇒ PT (request or confirm) are used.

- NOTE 3: For the setup of double simplex bearers, the use of channel list procedures is mandatory (see clauses DPRS 10.10.2.2.3 and 10.10.2.3.3):
  - LISTEN and ACTIVE commands are mandatory for upstream double simplex bearer setups. LISTEN message can be sent as early as the same slot that carries the FT ⇒ PT message in the Bandwidth negotiation (see DPRS, clause 10.7.1.2.1).
  - START and ACTIVE commands are mandatory for downstream double simplex bearer setups. GOOD or POOR sent by PT (at any time before the START in an existing bearer) is possible but use of this information by FT is not guaranteed.

For the setup of duplex bearers in asymmetric connections, see flowchart E.2.4, note 5, which also applies here. In particular, GOOD or POOR could also be used for duplex bearers in flowchart E.2.5.

- NOTE 4: START could be sent earlier than shown in this diagram. See clause E.4.3 for an example of possible timing of operations.
- NOTE 5: For double simplex bearer setup, the R-side should receive the "bearer\_request" message on both physical channels and on two consecutives frames (see EN 300 175-3 [3], clause 10.5.1.4).
- NOTE 6: The typical downlink m+1 case is the case where n=1 in the flowchart.
- NOTE 7: The use of START for double simplex bearers setup is mandatory.
- NOTE 8: The use of LISTEN for duplex is in practice quasi-mandatory. If no LISTEN command is sent, the PT cannot start the setup process until the expiration of a timer (currently Ten frames).
- NOTE 9: The fastest implementation possible is achieved by sending the START (double simplex) and LISTEN (duplex) commands in the same frame as the bandwidth  $FT \Rightarrow PT$  command. PT channel list info (GOOD/POOR) could be send with the bandwidth  $PT \Rightarrow FT$  command. See clause E.4 for timed examples.

# E.2.6 Virtual call establishment, second phase, use case 4: increasing the bandwidth (Asymmetric uplink case)

Asymmetric downlink case (m+n) with m>n: establishing extra duplex and double simplex bearers.

Figure E.6: Virtual call establishment, second phase, use case 4: increasing the bandwidth (Asymmetric uplink case)

- NOTE 1: See also notes in clause E.2.5.
- NOTE 2: The use of LISTEN for double simplex bearers setup is mandatory.
- NOTE 3: The use of LISTEN for duplex is in practice quasi-mandatory. If no LISTEN command is sent, the PT cannot start the setup process until the expiration of a timer (currently Ten frames).
- NOTE 4: The fastest implementation possible is achieved by sending the LISTEN (duplex and double simplex) commands in the same frame as the bandwidth  $FT \Rightarrow PT$  command. PT channel list info (GOOD/POOR) could be send with the bandwidth  $PT \Rightarrow FT$  command.

# E.2.7 Bandwidth change of the virtual call: PT initiated use case (increasing bandwidth)

Figure E.7: Bandwidth change of the virtual call: PT initiated use case (increasing bandwidth)

NOTE: There is no NWK layer activity in this process. The bandwidth change should be between the limits established at NWK layer setup (or service change).

# E.2.8 Bandwidth reversal of an asymmetric connection (Fast release)

Figure E.8: Bandwidth reversal of an asymmetric connection (Fast release)

- NOTE 1: Original status is asymmetric downlink n + m (beaers upstream, m bearers downstream) with m > n. In the example, the change is initiated by the PT ME.
- NOTE 2: Uppon reception of RELEASE REVERSAL for all double simplex beaers, the PT does not need to continue sending the Bearer Quality message in field B0. Therefore, U-plane mode transmission may start in this frame/slot. However, there may be cases where the E or E+U mode has to be keep for some frames. If there were incomplete  $I_{PF}$  channel data, the E+U mode will be keep until complete transmission of the  $I_{PF}$  packet.

### E.2.9 Virtual call release

Figure E.9: Virtual call release

- NOTE 1: Flowchart E.2.6 represents a PT initiated connection release at network level. When the release is FT-initiated (the FT decides to close the data call), network-layer messages are in the opposite directions. Note that bearer release can also be used for bandwidth reduction, and asymmetric connection reversal (fast release).
- NOTE 2: Flowchart E.2.6 represents an asymmetric downlink connection release, for which a T-side (transmitting side) is defined. The transmitting side sends a RELEASE in B-field, in two consecutive frames, and then immediately ceases all transmission on this bearer (see EN 300 175-3 [3], clause 10.7.2.1). Consequently, to release an uplink data call, all MAC-layer messages are in the opposite direction.
- NOTE 3: To release a duplex bearer, the unacknowledged release (see DPRS, clause 10.11.1) or the crossed release (see DPRS, clause 10.11.2) procedures may be used.
- NOTE 4: To release a double simplex bearer, the unacknowledged release (see DPRS, clause 10.11.1), the acknowledged release (see DPRS, clause 10.11.3), and the fast release (see DPRS, clause 10.11.4) procedures may be used. However, the acknowledged procedure should be rarely used. The use of the fast release procedure only applies in case of reversal of an asymmetric connection direction.
- NOTE 5: To determine the procedure to be used and the release initiating side (Master), see DPRS, clause 10.11.5.
- NOTE 6: MAC\_DIS-req primitive should be unacknowledged.

## E.2.10 Suspending the virtual call: FT initiated use case

Figure E.10: Suspending the virtual call; FT initiated use case

- NOTE 1: The FT initiated suspend may happen for many reasons. For instance, the FT has no data to send, or needs to distribute the bearers to other PTs. Suspend can also happen just after bandwidth negotiation if there is no data immediately available for transmission (see also flowcharts E2.2, note 6, and http example in E.2.13). In a virtual call suspension, the connection is in suspended state *at MAC level* but stays active at NWK and DLC levels.
- NOTE 2: For symmetric connection, bandwidth modification can be initiated by FT or PT but bearer release should be sent by FT (see DPRS, clause 10.7.1.2).
- NOTE 3: When < TUp > and < TDown > are set to "00000" the meaning of the values set in < MDown > field should be understood as to indicate the reason for the requested suspension. < MDown > = 1 stands for "No data for transmission" (see DPRS clause 10.7.1.3, "Suspend").
- NOTE 4: To get a handshake control for suspended connections, the PT is responsible for performing a handshake with the FT periodically (see DPRS, clause 9.4.3).

## E.2.11 Suspending the virtual call: PT initiated use case

### Figure E.11: Suspending the virtual call; PT initiated use case

- NOTE 1: In case of connection supension, Traffic Bearer Controls (TBC-s) for all duplex bearers and all double simplex bearers die on PT and FT sides, while the two Multi-Bearers Controls (MCB-s) of the connection (one on each side) stay alive. MBC-s are MAC upper sub-layer entities, and TBC-s are MAC lower sub-layer entities.
- NOTE 2: To request a suspension, the requesting party (PT to FT) sends a *bandwidth request* message with TUp = 0 and TDown = 0. However, if the requestor is the PT, the suspension only happens if the FT confirms the suspension by sending TUp = 0 and TDown = 0 in the *bandwidth confirm* message.
- NOTE 3: After the suspension has been negotiated (meaning that the bandwidth message FT ⇒ PT (request of confirm) has been sent, with TUp = 0 and TDown = 0), the release messages are sent. DPRS, clause 10.11.5 defines the Master side for bearer releases. Master side in case of suspension depends on the *current* connection type (not the *targeted* one). In particular, Master side for bearer releases is not related to the side which requested the suspension. For a connection that is *asymmetric uplink* at suspension request time (our use case), bearer releases are initiated by the PT (T-side of the *current* connection).

FT-NWK

### PT-NWK PT-DLC PT-MAC FT-MAC FT-DLC VIRTUAL CALL IS SUSPENDED PT initiated connection resumption Re-establish pilot bearer A (B-field setup) B0(BEARER\_REQUEST) **B0(BEARER CONFIRM)** OTHER

E.2.12 Resuming the virtual call: PT initiated use case

### Figure E.12: Resuming the virtual call; PT initiated use case

- NOTE 1: The sequence of procedures for the resumption of a connection consists of a PT initiated pilot bearer setup followed by a connection modification (see DPRS, clause 9.3.2.1.1). Resumption is similar to setup, except that there is no network-layer negotiation.
- NOTE 2: If the connection was previously suspended by the FP, the PP should not request a connection resume during a time interval equal to WtB ("Waiting time B") as defined in DPRS, clause 9.3.2.1.
- NOTE 3: Some WAIT messages (not represented in the example) may be sent from peer side between Bearer request and confirm messages (see EN 300 175-3 [3], clause 10.5.1.1). However this is not recommended.
- NOTE 4: The PP will accept any change of Bandwidth sent by the FP if the requested bandwidth is within the maximum and minimum values negotiated at NWK layer (see DPRS, clause 9.3.1.3.1). The Bandwidth modification requested by the PP has the nature of suggestion. The FP is free to accept it or not (see DPRS, clause 9.3.2.3.1).

NOTE 5: Initial PT initiated bearer request has the following characteristics:

- TA code =111.
- A-tail with M<sub>T</sub> message "B-field setup".
- BA code with the slot type.
- Bearer Request in B0 subfield.
- Other MAC control messages may be present in other subfields (Bn).
- NOTE 6: In the channel list exchange (double simplex bearer setup) each bearer can carry multiple LISTEN, START or ACTIVE commands. In theory up to 24 commands in the subfields for a 2-level modulation, long slot case (3 bearers per message, 8 messages per bearer).
- NOTE 7: The procedures for upstream double simplex bearers (asymmetric uplink connection) and downstream double simplex bearers (asymmetric downlink connection) are different (see clauses 10.10.2.2 and 10.10.2.3):
  - For upstream double simplex bearers, the best solution si to use a LISTEN sent by R-side (FT). In that case, the START message is only needed if there is encryption and can be sent in the double simplex bearer itself (e.g. in B1 subfield).
  - For downstream double simplex bearers, the LISTEN is not a suitable procedure (reason: the PT could see as dirty a channel that has been used but is now free, whereas the FT knows which channels it uses for all PT-s registered to it) There can be a previous LISTEN or GOOD message sent by R-side (PT), but we cannot assume that the FT is going to accept the proposed channels. The START command is mandatory and should be sent <u>before</u> the bearer setup process, over an existing bearer.
- NOTE 8: The diagram shows a "slow motion sequence" setup, but many operations may be carried out in parallel. In particular, it is not needed to wait until the completion of the procedure to start sending data. For instance:
  - Bandwidth negotiation may start at the "other" frame of the pilot bearer setup, or even at the first frame of this setup: B0 (bearer request), B1(Bandwidth).
  - U-Plane data transmission may happen in the pilot bearer in frame 3, or even in frame 2 (other frame) if there is no bandwidth negotiation, or if it has been done in frame 1.
  - The earliest point to start the setup of additional duplex or double simplex bearers is when the bandwidth is confirmed. This is in practice the BANDWIDTH-cfm message (sent here in the FT ⇒ PT direction).
  - Multiple additional bearers can be setup in parallel (note that LISTEN, START, ACTIVE messages can support several bearers).
  - Data transmission in double simplex bearers can be done after the ACTIVE message.
- NOTE 9: If the procedure has been initiated by the PT (PT initiated resume), then in practice the established double simplex bearers will be uplink. On the contrary, if it is the response to a paging (continuation of a FT initiated resume) the established double simplex bearers could be either downlink or uplink.
- NOTE 10: The use of START for double simplex bearers setup is mandatory.
- NOTE 11: The use of LISTEN for duplex is in practice quasi-mandatory. If no LISTEN command is sent, the PT cannot start the setup process until the expiration of a timer (currently Ten frames).
- NOTE 12: The fastest implementation possible is achieved by sending the START (double simplex) and LISTEN (duplex) commands in the same frame as the bandwidth  $FT \Rightarrow PT$  command. PT channel list info (GOOD/POOR) could be send with the bandwidth  $PT \Rightarrow FT$  command.
- NOTE 13: Channel list commands may be usually transmisted in the same slot carrying the Bandwidth messages (that could be even combined with the setups).

# E.2.13 Resuming the virtual call: FT initiated direct (fast) setup use case

Figure E.13: Resuming the virtual call; FT initiated use case with fast setup

NOTE 1: FT initiated direct (fast) setup for resuming a call is the only case where the initial (pilot) bearer setup is initiated by the FT.

- NOTE 2: LISTEN command sent  $FT \Rightarrow PT$  is in practice mandatory (quasi-mandatory) to perform the setup of additional duplex. If no LISTEN is sent, the PT can only perform the setup after the expiration of a timer and over the scan sequence. If LISTEN has been sent (normal case), the setup can be done in any slot/carrier (not only on the scan sequence).
- NOTE 3: Depending on the case, the FT could decide the carrier/slot directly of could use channel list proposals sent by the PP. If the use case is a resume after short time suspension, and the FT could reuse the channels used in last active stage, then the FT does not need to rely on PT information. The fastest implementation possible for this use case, sends the LISTEN command in the same frame as the Bandwidth FT  $\Rightarrow$  PT message. For other cases, i.e. resume after long time suspension, or impossibility to reuse the carriers used last time, then the FT retrieves and uses PT channel list information. The PT sends this information by means of the commands GOOD or POOR. This can be done spontaneously by the PT, or wait until the FT interrogates it with the QUERY\_N command. The earliest convenient point for sending PT channel list info is the frame carrying the bandwidth PT  $\Rightarrow$  FT message. The following frame could carry the LISTEN commands if the FT is enough fast to calculate the channels. Note that this process delays the setup at least by one frame compared to the "resume after short time of suspension".
- NOTE 4: Similar procedure applies to the setup of double simplex upstream bearers, with the difference that here the LISTEN command is mandatory (there is no timer option). The setup can be done in any slot/carrier (not only on the scan sequence).
- NOTE 5: Similar procedure applies to the setup of double simplex downstream bearers, with the difference that here the FT sends the command START (on a duplex bearer) to indicate the channel selection that will be used in the setup. The setup can be done in any slot/carrier (not only on the scan sequence).
- NOTE 6: The triggering event may be the reception of data to be transmitted downstream, but not only. For example, if the FT had interrupted a PT that was sending data downstream, or the FT rejected an access request from a PT (due to resource allocation decisions), the FT will resume the connection with upstream direction when its resource allocation algorithm decides to grant resources to such PT.
- NOTE 7: The FT access request may be on the on arbitrary slot/carriers if selective fast setup is used and specific slots / carriers have been indicated to the PT. In any other cases (complete fast setup mode, or no specific information on carriers), the access request has to be on the fast setup scan sequence (PT receiving scan sequence).

### Figure E.14: Resuming the virtual call; FT initiated use case using paging

- NOTE 1: There are two diagrams according to whether the MAC resume paging succeeds or fails.
- NOTE 2: In case the MAC resume fails, the arrival of the MAC\_CO\_DATA-req message at MAC layer on PT side (i.e. to send LCE-PAGE-RESPONSE) triggers a PT initiated connection resumption at MAC (see DPRS, clause 10.3.1.2 and EN 300 175-5 [5], clause 14.5).
- NOTE 3: PT initiated virtual call resumption procedure (flowchart E2.9) is used as part of the FT initiated virtual call resumption, but with one difference: the Bandwidth messages are reversed (the Bandwidth request is sent by FT and the Bandwidth confirm by PT). As a consequence of this, the earliest point to start the setting of additional bearers is when the Bandwidth request has been sent (because the FT sends it).

NOTE 4: The FT may resume an asymmetric connection either in downlink or uplink directions.

313

NOTE 5: When MAC layer paging fails, the ME contacts LCE to send the paging.

### E.2.15 PT initiated resume rejected by FT

Figure E.15: PT initiated resume rejected by FT

- NOTE 1: If the FT is still congested, the Resume can be rejected by the FT a second time, a third time, etc. The Waiting time WtB should be increased (congestion avoidance) each time according to formulae in annex A.
- NOTE 2: During the waiting time (WtB), the FT may start an FT initiated resume at any time during WtB waiting. A good designed FT could do that if the congestion situation that motivated the rejection ends before WtB. It is not required to have data to send downstream to initiate the FT resume.

314

### E.2.16 Stay alive procedure (PT initiated)

Figure E.16: Stay alive procedure (PT initiated)

### E.2.17 Service re-negotiation at NWK layer

- NOTE 1: The modification of the lower resources is initiates from the higher layer where exchange of NWK layer messages is involved (see DPRS, clause 12.6).
- NOTE 2: See DPRS, clause 10.7.1.2 for Master and Slave definition.
- NOTE 3: The asymmetric links are fully reversible and may operate with the forward link in either  $FT \Rightarrow PT$  (downlink) or in  $PT \Rightarrow FT$  (uplink) mode with identical rates (see clause 5.2.2).
- NOTE 4: Bandwidth change may be rejected at NWK level.
- NOTE 5: This is a NWK layer procedure that will not be done very often. The usual DPRS operation will be: the NWK layer parameters will be negotiated when the virtual call is established (this can be even permanent i.e. always on). Then the connection is suspended, resumed, bandwidth changed, reversed, etc many times by the MAC layer in response to traffic stimulus. The NWK layer connection parameters operates as limits for the MAC changes.

## E.3 Application examples

# E.3.1 Example of HTTP session over virtual call. PT initiated use case

Figure E.18: Example of HTTP session over virtual call. PT initiated use case

- NOTE 1: MAC RESUME (upstream/downstream) stands for MAC resume paging followed by a bandwidth negotiation and establishment of an asymmetric uplink/downlink virtual call 1+n/n+1. MAC RESUME (signalling only) stands for MAC resume paging followed by a bandwidth negotiation and establishment of a symmetric virtual call 1+1.
- NOTE 2: The FP could be linked to a home gateway connected to an external HTTP server.

## E.4 Optimal sequences and time diagrams

### E.4.1 Parallel execution and optimal timing of complex operations

The diagrams presented in clause E.2 show the different operations needed for each procedure. However they does not cover the timing and possible parallel execution of operations. The timing sequence for each procedure depends on the real capabilities of the implementation. The rules that cover the possibilities for parallel execution of operations and the "early start" point of each of them are described in clause 10 of the present document. Implementers are free to design the best possible sequence of operations according to the technical capabilities of the implementations.

This clause shows the optimal possible sequences for three basic operations, assuming that implementation does not introduce any additional constrain due to software response time or other reason. The importance of these optimal sequences is dual: first, they may be used as starting point for building real implementation sequences (adding the extra time needed for the implementation constrains in each step), and second, they determine the intrinsic delay of DECT as a technology in the channel access operation. This delay is, as shown in the diagrams, 15 ms for the first bearer ready to transmit. This parameter is relevant for comparative evaluation of DECT versus other packet technologies.

The number of possible time sequences is nearly infinite, depending not only on the different options of each procedure, but also of implementation constrains. Each implementer should build its own implementation sequences according to the real implementation capabilities. Therefore, this clause is limited to three examples covering the following cases:

- PT initiated resume of upstream 9+1 connection.
- FT initiated direct (fast setup) resume of downstream 1+9 connection.
- PT initiated stay alive.

In all cases, the diagrams show the successful case (successfully completion of all operations) for ideal implementations. It is also assumed that the implementations support conditional link of operations, and that start all operations in the earliest possible starting point (according to the rules described in clause 10).

# E.4.2 Time diagram 1: optimal sequence for PT initiated resume asymmetric uplink

The following time diagram shows the optimal implementation sequence for the use case of PT initiated connection resumption requesting asymmetric uplink bandwidth. The bandwidth request is granted by the FT.

NOTE 1: The example assumes that the slots are double or long (12 slots per frame), and all of them starts always in even positions in the frame. Slots 16 and 17 is selected as duplex pilot bearer.

### Figure E.19: Time diagram 1: optimal sequence for PT initiated resume asymmetric uplink

- NOTE 2: This diagram shows the best possible implementation without any extra delay due to implementation constrains.
- NOTE 3: The average delay for starting the process is 5 ms. Depending on the position of the usable slot in frame and when the initiating event happens, the delay ranges from 0 to 12 double slots = 0 to 10 ms, average 5 ms.
- NOTE 4: The example assumes that the FT could set directly the channels without consultation to the PT (resume after a short time of suspension and the channels used in last active stage can be reused). Note that this is a case that will happen very often.
- NOTE 5: U-plane transmission can start at 15 ms over one bearer at triggering event. This is the basic intrinsic access delay of DECT.

- NOTE 6: U-plane transmission over the first available double simplex bearer happens 5,83 ms later (20,83 ms after initial event). The worst-case of last double simplex bearer is carrying data on the second half 30 ms after initial event.
- NOTE 7: In the optimal possible sequencing shown in this diagram, the implementation has ONE double slot (10/12) ms of reaction time in the worst case (i.e. between reception of BEARER confirm, BANDWIDTH confirm and LISTEN, and starting BEARER setup on the bearers indicated by the LISTEN). A practical implementation could require some extra ms of reaction time before starting BEARER request. This time (implementation specific delay) should be added to the intrinsic delays shown in the diagram.
- NOTE 8: On the other hand, the FT has 5 ms (12 slots) for answering to the bearer setup, decide if the bandwidth can be accepted and provide LISTEN commands. The response can be "cached" for the easiest cases (i.e. no bandwidth scarcity, and reuse of slots/channels already used in the last active phase). In other cases, the FT could need extra time.
- NOTE 9: Note that some operations are conditional to the success of others:. Example: if the initial BEARER request fails (pilot), the Bandwidth negotiation and the additional bearers setup should be rolled back, and the process should start again. However, these should be exceptional cases, and the average timing (delays) of the system should be dominated by the successful case.
- NOTE 10: The use of encryption depends on if the call is encrypted or not. The setting of the encryption and the possible passing of keys is a common property of the call, and does not need to be re-negotiated for each resume process. If the call was encrypted before the suspend, it should be encrypted after the resume (with the same key used before, and taken into account the variation of other ciphering inputs as the frame and LBN numbers). The encryption should start when noted. As general rule, there is one frame in clear for both, duplex ("other" frame) and double simplex. In applications where maximum confidentiality is a concern, there is the option of waiting for the encryption activation before sending data. This would add an extra delay of 10 ms.

## E.4.3 Time diagram 2: optimal sequence for FT initiated (direct) resume; asymmetric downlink connection

The following time diagram shows the optimal implementation sequence for the use case of FT initiated connection resumption (direct), setting an asymmetric downlink connection. Slots 4 and 5 is selected as duplex = pilot bearer.

## Figure E.20: Time diagram 2: optimal sequence for FT initiated (direct) resume; asymmetric downlink connection

- NOTE 1: The example assumes that the slots are double or long (12 slots per frame), and all of them start always in even positions in the frame.
- NOTE 2: The same comments done for the PT initiated case, are applicable here (changing the roles of  $PT \Leftrightarrow FT$ ).
- NOTE 3: The START channel list command is used here instead of LISTEN. The use of channel list (GOOD, POOR) messages sent by PT, is generally not needed in the easiest case of resume after a brief period of suspension (the FT reuses the channels). However, if the FT is not sure of the status of the channels, it may query the PT by means of the "QUERY\_N" command. The PT may also provide spontaneously channel list info (GOOD, POOR) that the FT could use if needed.

# E.4.4 Time diagram 3: optimal sequence for PT initiated stay alive procedure

The following temporised diagram shows the optimal implementation sequence for the use case of PT initiated stay alive.

NOTE: The time divisions in the diagram refer to double slots (as in previous example).

## E.5 Implementation examples related to DPRS Interworking options

E.5.1 Example of possible solution to the use case of an Internet browser operating over Generic Encapsulation transport mechanism (clause B.8)

### E.5.1.1 Description of the use case

Use case:

- General Purpose Internet browser in the PP with functionality similar to standard browsers.
- Internet connectivity at FP.
- Air interface protocol is Generic Encapsulation Interworking (clause B.8).
- Multiple protocols and multiple TCP connections at the network side are supported.

Implementation: as indicated in clauses B.8 and B.2.1.1.4. The FP implements the Generic multiprotocol interworking to external IP networks as described in clause B.8.4.1.

### E.5.1.1.1 Step-by-step use case description

The next paragrphs describe the step-by-step operation of an Internet browser over D-GMEP.

### Step 1: Call setup

The user starts (or awakes) the browser application in the PP.

The PP establishes a DPRS call (any ME class) indicating Generic Media Interworking. The Generic media octets at IWU-attributes will carry a single initial command opening a context for the DNS protocol.

- Command = create context.
- Sequence nr = No.
- Chopping = No.
- Protocol = DNS (protocol id = 53).
- GMCI = it is left blank by the PP, it will be returned by the FP with any arbitrary number (1-127) not currently in use (typically 1 since it is the first context).
- The optional octet for control of TCP/UDP/IP connections will be used with the following content:
  - IP source address = left blank by the PP, it will be returned by the FP.
  - IP destination address = the IP address of the Domain name server.
  - Source port number = left blank by the PP, it will be returned by the FP.
  - Destination port number = the well-known port number of the Domain name server.
- NOTE 1: In this specific case, it would be also possible to set the IP destination (IP address of the Domain name server) by the FP. But as we will see in step 4, this is not possible in general.
- NOTE 2: The returned values of source address and port are in many cases not needed by the PP. But in some cases, the PP application may need to access then. This is why they are transmitted.

NOTE 3: It is also possible to establish at this stage two contexts to two different DNS servers, if wished.

323

### Action at step 1

The DPRS call is established.

The FP Interworking creates a "context" that relations any traffic received over the D-GMEP link with GMCI=1 with a UDP "context" towards the DNS server.

### Step 2: Initiation of browsing: DNS resolution

The user writes any URL in the browser.

The browser application performs the DNS resolution of the URL by sending a DNS protocol request over the opened context (GMCI=1). This will be mapped by the FP IWU to an UDP "context" towards the DNS server. The answer from the DNS server is mapped back over the same GMEP context towards the PP browser. The PP browser knows now the IP address.

### Step 3: Initiation of browsing: First HTTP connection setup

The PP browser opens now a new GMEP context over the DPRS connection by executing a SERVICE CHANGE with the following parameters:

- Command = create context.
- Sequence nr = Yes.
- Chopping = Optional (this is independent to the example).
- Protocol = HTTP (protocol id = 80).
- GMCI = it is left blank by the PP, it will be returned by the FP with any arbitrary number.
- The optional octet for control of TCP/UDP/IP connections will be used with the following content:
  - IP source address = left blank by the PP, it will be returned by the FP.
  - IP destination address= the IP address of the HTTP server received in step 2.
  - Source port number = left blank by the PP, it will be returned by the FP.
  - Destination port number = the destination port of the HTTP connection (the number written in the browser (i.e. 1 080) or the default (80) if no number is provided).

NOTE 4: The previous context used by DNS is not released. It will be kept during the whole browsing session.

### Actions at FP

At the reception of the Service change message, the FP IWU will open a TCP connection towards the destination server and will keep this connection open until it is explicitly closed by the PP (with a release context command), by the server, or by error.

### Step 4: Browsing: exchange of HTTP data

The PP browser may send now any HTTP command to the Internet server in the same way it would do that over a TCP connection. The HTTP response reaches the browser over the same GMCI.

### Step 5: Browsing: opening of further HTTP connections

The HTTP page that is being received from the server requires now to download further data from the same, or from other HTTP server. According to the normal browsing operation, if the data is from the same server and may be requested over the same TCP connection, then the existing HTTP context (GMCI=2) will be used. In any other case, new contexts and TCP connections will be opened.

The PP will repeat the steps 2 (DNS resolution) to resolve any URL address.

Then, it performs step 3 (to setup new HTTP contexts if needed) that would be mapped by the FP to new, independent, TCP connections.

324

Finally, the step 4 (exchanging the data) is performed over the different HTTP connections.

#### **Step 6: Release of resources**

#### 6a: Release of resources by the PP

Use case: The PP browser has received all data and now decides to close any of the TCP connections. This is done by executing step 3 (service change) with the "release command". In the release command, there is no need to repeat the IP control octets. Let's assume that GMCI= 2 (HTTP) is the one to be released.

### SERVICE CHANGE: IWU-Attributes:

- Command = release context.
- Sequence nr = Yes (same value as at context creation).
- Chopping = same value as at context creation (this is irrelevant for the operation).
- Protocol = HTTP (=80) (same value as at context creation).
- GMCI = the value allocated at context creation (i.e. 2).

Action by the FP: The FP closes the TCP connection associated to GMCI=2 and frees this GMCI number for further use.

#### 6b: Release of resources by the FP

Use case: The far end server decides to close a TCP connection. When the FP receives the termination command, it completes the TCP closure as usual, and also closes the associated context over the D-GMEP by executing a SERVICE CHANGE with the "release command". The PP application is now aware that the TCP connection has been closed by the server.

Command is similar to step 6a.

#### **Step 7: Further protocols**

The described solution is general and would support protocols other than HTTP. For instance, the browser may need to open an ftp connection for downloading or it may wish to listen to the broadcast provided by an Internet radio using RTP. Any scenario may be supported as long as the limit of 128 TCP + 128 UDP contexts is not reached. In some cases, the opening of the context may be initiated by the FP side.

VoIP telephony calls may be also supported by opening the two necessary contexts (SIP and RTP).

The correct operation of the multiprotocol case requires the sequence control at Rx to be done by the interworking once the different data flows have been de-multiplexed.
