# ETSI EN 301 842-2 V1.4.1 (2005-04)

European Standard (Telecommunications series)

Electromagnetic compatibility and Radio spectrum Matters (ERM); VHF air-ground Digital Link (VDL) Mode 4 radio equipment; Technical characteristics and methods of measurement for ground-based equipment; Part 2: General description and data link layer

Reference REN/ERM-TG25-026-2

Keywords aeronautical, digital, radio, testing, VHF

# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Electromagnetic compatibility and Radio spectrum Matters (ERM).

The present document is part 2 of a multi-part series covering the VHF air-ground Digital Link (VDL) Mode 4 radio equipment; Technical characteristics and methods of measurement for ground-based equipment, as identified below:

Part 1: "EN for ground equipment";

#### Part 2: "General description and data link layer";

- Part 3: "Additional broadcast aspects";
- Part 4: "Point-to-point functions".

The present document is accompanied by an equivalent airborne standard, EN 302 842 [13] parts 1 to 4, covering the VHF air-ground Digital Link (VDL) Mode 4 radio equipment; Technical characteristics and methods of measurement for airborne equipment.

| National transposition dates   |                 |  |  |
|--|-----------------|--|--|
| Date of adoption of this EN:   | 15 April 2005   |  |  |
| Date of latest announcement of this EN (doa):  | 31 July 2005    |  |  |
| Date of latest publication of new National Standard or endorsement of this EN (dop/e): | 31 January 2006 |  |  |
| Date of withdrawal of any conflicting National Standard (dow):                         | 31 January 2006 |  |  |

# Introduction

The present document states the technical specifications for Very High Frequency (VHF) Digital Link (VDL) Mode 4 ground-based radio transmitters, transceivers and receivers for air-ground communications operating in the VHF band, using Gaussian-filtered Frequency Shift Keying (GFSK) Modulation with 25 kHz channel spacing and capable of tuning to any of the 25 kHz channels from 118,000 MHz to 136,975 MHz as defined in ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs) [14].

The present document may be used to produce tests for the assessment of the performance of the equipment. The performance of the equipment submitted for type testing should be representative of the performance of the corresponding production model.

The present document has been written on the assumption that:

- the type test measurements will be performed only once, in an accredited test laboratory and the measurements accepted by the various authorities in order to grant type approval;
- if equipment available on the market is required to be checked it will be tested in accordance with the methods of measurement specified in the present document or a documented alternative approved by the certifying authority;
- Equipment comply with EN 301 489-22 [2] and EN 301 842-1 [4].

## 1 Scope

The present document provides part 2 of the technical specifications for Very High Frequency (VHF) Digital Link (VDL) Mode 4 ground-based radio transmitters and receivers for air-ground communications operating in the VHF band, using Gaussian-filtered Frequency Shift Keying (GFSK) Modulation with 25 kHz channel spacing and capable of tuning to any of the 25 kHz channels from 118,000 MHz to 136,975 MHz as defined in ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs) [14].

The present document is designed to ensure that equipment certified to it will be compatible with the relevant ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs) [14] and VDL Mode 4 Technical Manual (TM) [1].

Manufacturers should note that in future the tuning range for the ground transceivers may also cover any 25 kHz channel from 108,000 MHz to 117,975 MHz.

The scope of the present document is limited to ground stations. The equivalent specification for airborne stations is EN 302 842 [13].

The VDL Mode 4 system provides data communication exchanges between aircraft and ground based systems supporting surveillance and communication applications. The supported modes of communication include:

- broadcast and point-to-point communication;
- broadcast services including Automatic Dependent Surveillance Broadcast (ADS-B), Traffic Information Service Broadcast (TIS-B) and Flight Information Service Broadcast (FIS-B) capabilities;
- air-to-air, air-to-ground, ground-to-air and ground mobile services;
- operation without ground infrastructure.

VDL Mode 4 is designed to be an Air/Ground subsystem of the Aeronautical Telecommunication Network (ATN) [8] using the AM(R)S band and it is organized according to the Open Systems Interconnection (OSI) model (defined by ISO). It provides reliable sub network services to the ATN system. Other networks can also be supported but these have not been focussed on in the present document.

The present document specifies functional specifications of VHF communication ground station equipment intended to be used for air-ground and air-air data communications. The present document is derived from the standards and specifications in:

- VDL Mode 4 standards produced under the auspices of the International Civil Aviation Organization (ICAO) [1].
- Other relevant standards as defined in clause 2.

It is envisaged that manufacturers may provide equipment supporting:

- broadcast services only;
- point-to-point services only;
- both broadcast and point-to-point services.

EN 301 842-1 [4] deals with tests of the physical layer. The present document defines the core link layer requirements for the VDL Mode 4 ground station necessary to support all types of equipment. This includes a simple position broadcast functionality.

The present document deals with tests of the link layer sufficient to support core link layer functionality, and it also includes requirements and tests sufficient to recognize and respond to transmissions associated with point-to-point communication. The present document does not address requirements for the full ADS-B message set, or for other broadcast applications that can be supported by the VDL Mode 4 equipment. These are covered by EN 301 842-3 [9]. Detailed requirements for point-to-point communication are beyond the scope of the present document, but can be found in EN 301 842-4 [10]. EN 301 842-4 [10] also include the interface to the Aeronautical Telecommunication Network (ATN) as defined in ATN SARPs [8].

As the measured values of equipment performance may be a function of the method of measurement, standard test conditions and methods of test are recommended in the present document.

The present document is organized as follows:

- references, definitions, abbreviations and symbols are provided in clauses 2 and 3;
- clause 4 describes the VDL Mode 4 ground station link layer;
- clause 5 performance specifications for the VDL Mode 4 ground station and ground station co-ordination;
- clause 6 provides general design requirements;
- clause 7 provides protocol tests for core link layer functions;
- a document history is contained in clause 8;
- clause A provides a detailed cross-reference to the relevant requirements contained in reference [1];
- clause B provides a description of the ISO/IEC 9646 [7] Test Methodology.

Note that the system can support a very wide range of functions. It is not practical to provide specific tests for all aspects of its functionality. The approach used is to provide detailed tests for the core link layer functionality and to provide tests of those remaining requirements which, if wrongly implemented, could cause a deterioration in the service offered by other VDL Mode 4 stations. Therefore:

- a detailed set of protocol tests are provided for the core link layer functionality necessary to support broadcast functions;
- a detailed test of position encoding and decoding is provided because of the importance of position in the management of the VDL Mode 4 link specifically and the need to support ADS-B applications in general.

#### **Mandating and Recommendation Phrases**

a) "Shall":

the use of the word "Shall" indicates a mandated criterion; i.e. compliance with the particular procedure or specification is mandatory and no alternative may be applied.

b) "Should":

the use of the word "Should" (and phrases such as "It is recommended that...", etc.) indicates that though the procedure or criterion is regarded as the preferred option, alternative procedures, specifications or criteria may be applied, provided that the manufacturer, installer or tester can provide information or data to adequately support and justify the alternative.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

# 3 Definitions and abbreviations

## 3.1 Definitions

## 3.1.1 Basic reference model definitions

The present document is based on the concepts developed in the open systems interconnect basic reference model. For the purposes of the present document the terms and definitions given in ISO/IEC 7498-1 [5] apply for:

- layer;
- sublayer;

- entity;
- service;
- physical layer;
- data link layer.

#### 3.1.2 Service conventions definitions

For the purposes of the present document, the terms and definitions given in ISO/IEC 10731 [6] applies for:

- service provider;
- request;
- indication;
- confirm.

#### 3.1.3 General definitions

For the purposes of the present document, the terms and definitions given in EN 301 842-1 [4] clause 3.1.3 and the following apply:

Aeronautical Mobile Service (AMS): mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate

Aeronautical Telecommunications Network (ATN): internetwork architecture that allows ground, air/ground, and aircraft data sub networks to interoperate by adopting common interface services and protocols based on the International Organization for Standardization Open Systems Interconnection Reference Model

**aircraft address:** unique combination of 24 bits available for assignment to an aircraft for the purpose of air-ground communications, navigation and surveillance

NOTE: An aircraft may choose not to use this unique address and can use instead a non-unique address.

Automatic Dependent Surveillance-Broadcast (ADS-B): surveillance application transmitting parameters, such as position, track, ground speed and time via a broadcast mode data link for use by any air and ground users requiring it

NOTE: ADS-B is a surveillance service based on aircraft self-determination of position/velocity/time and automatic, periodic, broadcast of this information along with auxiliary data such as aircraft identity (ID), intent information and communications control parameters, etc. ADS-B is intended to support multiple high-level applications and associated services such as cockpit display of traffic information, traffic alert and collision avoidance functionality, enhanced traffic management in the air and on the ground, search and rescue support and others.

**autotune:** procedure by which a VDL Mode 4 ground station may direct a mobile VDL Mode 4 station to transmit on a specified frequency, and with certain characteristics, by sending an uplink burst containing an autotune reservation

burst length: number of slots across which the VDL Mode 4 burst is transmitted

CTRL DLPDU: basic unit of transmission of the LME and VME

current slot: slot in which a received transmission begins

Data Link Entity (DLE): protocol state machine capable of setting up and managing a single data link connection

Data Link Protocol Data Unit (DLPDU): general burst format used by the Data Link Service (DLS) sublayer

**Data Link Service (DLS) sublayer:** manages the transmit queue, creates and destroys Data Link Entities (DLEs) for connection-oriented communications, provides facilities for the Link Management Entity (LME) to manage the DLS, and provides facilities for connection-less communications

NOTE: The DLS resides above the VDL Mode 4 Specific Services (VSS) and the MAC sublayers.

**delayed burst:** VDL Mode 4 burst that begins sufficiently after the beginning of a slot so that the transmitting VDL Mode 4 station is confident that no other VDL Mode 4 station that it could receive from and is within the guard range is transmitting in the slot

14

NOTE: The delayed VDL Mode 4 burst terminates by the end of the slot in which it began (its length is shortened to ensure completion by the nominal time).

Global Signalling Channel (GSC): channel available on a world-wide basis for VDL Mode 4 based services

ground base station: aeronautical station equipment, in the aeronautical mobile service, for use with an external antenna and intended for use at a fixed location

**link:** connects a mobile DLE and a ground DLE and is uniquely specified by the combination of mobile DLS address and the ground DLS address

NOTE: A different sub network entity resides above every link endpoint.

**link establishment:** process by which two stations discover each other, determine to communicate with each other, decide upon the communication parameters, create a link and initialize its state before beginning communications

NOTE 1: For air-ground links, this process involves the ground LME through the NSCOP protocols.

NOTE 2: For air-air links, link establishment is achieved using mobile ZOCOP protocols.

**link handoff:** process by which peer LMEs, already in communication with each other, create a link between an aircraft and a new ground station before disconnecting the old link between the aircraft and the current ground station

link layer: lies immediately above the physical layer in the Open Systems Interconnection protocol model

NOTE: The link layer provides for the reliable transfer of information across the physical media. It is subdivided into the data link sublayer and the media access control sublayer.

Link Management Entity (LME): protocol state machine capable of acquiring, establishing, and maintaining a connection to a single peer system

NOTE: A LME establishes data link and sub network connections, 'hands-off' those connections, and manages the media access control sublayer and physical layer. An aircraft LME tracks how well it can communicate with the ground stations of a single ground system. An aircraft VDL Management Entity (VME) instantiates an LME for each ground station that it monitors. Similarly, the ground VME instantiates an LME for each aircraft that it monitors. An LME is deleted when communication with the peer system is no longer viable.

Media Access Control (MAC) sublayer: acquires the data path and controls the movement of bits over the data path

physical layer: lowest level layer in the Open Systems Interconnection protocol model

NOTE: The physical layer is concerned with only the transmission of binary information over the physical medium (e.g. VHF radio).

**primary time source:** source of timing information local to a mobile station, capable of maintaining synchronization to Universal Coordinated Time (UTC) seconds within a prescribed tolerance

private parameters: parameters that are contained in CTRL and UCTRL DLPDUs and that are unique to the VHF digital link environment

reference signal level: signal level used in the receiver performance specifications unless otherwise stated

reference bit sequence: sequence of bits used in the transmitter performance specifications

**secondary time source:** timing source used in a failure mode, that applies when the primary time source has failed, in which a VDL Mode 4 station maintains time synchronization to the UTC second

**Self-Organizing Time Division Multiple Access (STDMA):** multiple access scheme based on time-shared use of a radio frequency (RF) channel employing:

- 1) discrete contiguous time slots as the fundamental shared resource; and
- 2) a set of operating protocols that allows users to access these time slots in an organized manner without reliance on a master control station.

slot: one of a series of consecutive time intervals of equal duration

NOTE: Each burst transmission starts at the beginning of a slot (with the exception of VDL Mode 4 delayed transmissions). In VDL Mode 4, each group of slots of one second duration is aligned to the UTC second.

station: VDL Mode 4 Specific Services (VSS)-capable entity

- NOTE: A station may be either a mobile station or a ground station. A station is a physical entity that transmits and receives bursts over the RF interface (either A/G or air-to-air (A/A)) and comprises, at a minimum:
  - a physical layer;
  - media access control sublayer; and
  - a unique VSS address.

A station which is also a DLS station has the same address.

subnetwork layer: establishes, manages, and terminates connections across a subnetwork

superframe: group of 4 500 slots that span a period of one UTC minute

NOTE: The start of the current superframe is aligned with the UTC-minute.

synchronization burst (or "sync" burst): VDL Mode 4 burst type containing, as a minimum, information on the station's identity, position and time

- NOTE 1: A synchronization burst may also carry additional data elements required for specific applications.
- NOTE 2: Ground stations announce existence, position, and the current time. Mobile stations lacking timing information can then derive the slot structure and time from ground synchronization bursts. Mobile stations lacking position information can derive position from both mobile and ground synchronization bursts. This periodic information is used in various ways including ADS-B, secondary navigation, and simplifying the LME algorithms.

**VDL Mode 4 burst:** sequence of source address, burst ID, information, slot reservation, and CRC fields, bracketed by opening and closing flag sequences, and preceded by a preamble

- NOTE 1: The start of a burst may occur only at quantized time intervals and this constraint allows the propagation delay between the transmission and reception to be derived.
- NOTE 2: The burst definitions contained within the present document consider the link layer data only (and exclude the preamble).

**VDL Mode 4 Specific Services (VSS) sublayer:** resides above the MAC sublayer and provides VDL Mode 4 specific access protocols including reserved, random and fixed protocols

VSS user: user of the VDL Mode 4 Specific Services

NOTE: The VSS user could be higher layers in the VDL Mode 4 SARPs or an external application using VDL Mode 4.

**VDL Management Entity (VME):** VDL-specific entity that provides the quality of service requested by the ATN-defined sub network system management entity

NOTE: A VME uses the LMEs (that it creates and destroys) to acquire the quality of service available from peer systems.

**VDL Mode 4:** data link using a Gaussian Filtered Frequency Shift Keying modulation scheme and self organizing time division multiple access

**VDL Mode 4 station:** physical entity that transmits and receives VDL Mode 4 bursts over the RF interface (either air-ground (A/G), air-to-air (A/A) or ground-ground (G/G)) and comprises, as a minimum: a physical layer, Media Access Control sublayer and a VSS sublayer.

NOTE: A VDL Mode 4 station may either be a mobile VDL Mode 4 station or a ground VDL Mode 4 station.

**VDL Mode 4 Station Address:** 27-bit identifier used to identify a VDL Mode 4 station, which may be unique or locally unique

NOTE: A combination of the 24 bit ICAO aircraft address plus three additional bits.

VDL Station: VDL-capable entity

- NOTE: A station may either be a mobile station or a ground station. A station is a physical entity that transmits and receives frames over the Air/Ground (A/G) interface and comprises, at a minimum:
  - a physical layer;
  - media access control sublayer; and
  - a unique DLS address.

The particular initiating process (i.e. DLE or LME) in the station cannot be determined by the source DLS address. The particular destination process cannot be determined by the destination DLS address. These can be determined only by the context of these frames as well as the current operational state of the DLEs.

VDL System: VDL-capable entity

NOTE: A system comprises one or more stations and the associated VDL management entity. A system may either be a mobile system or a ground system.

### 3.1.4 Definition of bit order

In the tables included in the present document to illustrate the format of bursts, the following order is implied:

- a) bit order in each burst subfield shall be indicated by subscript numbers. Bit 1 shall indicate the least significant bit; and
- b) bits shall be transmitted octet by octet, starting with the first octet in each table, and within each octet the rightmost bit (as shown in the tables) shall be transmitted first.

### 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| A/A     | Air/Air communications                                   |
|---------|--|
| A/G     | Air/Ground communications                                |
| ACK     | ACKnowledgement (burst)                                  |
| ADS-B   | Automatic Dependent Surveillance - Broadcast             |
| AIRSAW  | AIRborne Situational AWareness                           |
| AM(R)S  | Aeronautical Mobile (Route) Service                      |
| A-SMGCS | Advanced - Surface Movement Guidance and Control Systems |
| ATN     | Aeronautical Telecommunication Network                   |
| BITE    | Built-In Test Equipment                                  |
| BND     | Big Negative Dither                                      |
| CCI     | Co-Channel Interference                                  |
| CDTI    | Cockpit Display of Traffic Information                   |
| CG      | Conversion Gain  |
| CPDLC   | Controller Pilot Data Link Communications                |

| CPR     | Compact Position Reporting                         |
|---------|--|
| CRC     | Cyclic Redundancy Code                             |
| dB      | deciBel  |
| DLE     | Data Link Entity                                   |
| DLPDU   | Data Link Protocol Data Unit                       |
| DLS     | Data Link Service                                  |
| DOS     | Directory Of Services                              |
| erid    | extended reservation ID                            |
| EUROCAE | EURopean Organization for Civil Aviation Equipment |
| FIS-B   | Flight Information Service - Broadcast             |
| FOM     | Figure Of Merit                                    |
| G/G     | Ground-Ground communications                       |
| GFSK    | Gaussian Filtered frequency Shift Keying           |
| GNSS    | Global aeronautical Navigation Satellite System    |
| GSC     | Global Signalling Channel                          |
| hex     | hexadecimal  |
| ICAO    | International Civil Aviation Organization          |
| ID      | IDentity   |
| INFO    | INFOrmation (DLPDU)                                |

# 4 General description of VDL Mode 4 ground station link layer

18

## 4.1 General

#### 4.1.1 Overview of VDL Mode 4

VDL Mode 4 is a VHF data link, providing digital communications between mobile stations (aircraft and airport surface vehicles) and between mobile stations and fixed ground stations. It is developed for Communications, Navigation, Surveillance (CNS)/Air Traffic Management (ATM) aviation applications, including broadcast applications (e.g. ADS-B) and point-to-point communications (e.g. ADS-C, CPDLC). VDL Mode 4 protocols support ADS-B and similar broadcast applications through the broadcast of short repetitive messages, with graceful adaptation to increasing traffic loads.

VDL Mode 4 transmits digital data in a standard 25 kHz VHF communications channel and divides the communication channel into a large number of *time slots*. The start of each slot is an opportunity for a station to transmit.

VDL Mode 4 is built on the Self-organizing Time Division Multiple Access (STDMA) concept, in which the time-slots are synchronized to UTC-time, and stations advertise their intention to transmit in a specified time-slot by means of a reservation protocol carried in a prior transmission. For convenience, a group of contiguous time slots spanning a period of 60 s is termed a *superframe*. Each time slot may be used by a ground station for transmission of data. The exact timing of the slots and planned use of them for transmissions are known to all users in range of each other, so that efficient use of the data link can be made and users do not transmit simultaneously. As a result of this "self-organizing" protocol, VDL Mode 4 is capable of operating outside the coverage of a ground infrastructure and can therefore support air-air as well as ground-air data communications and applications. Under some circumstances, in e.g. high density airspace, a ground infrastructure may be used to manage the system to further improve overall performance.

In most respects, the VDL Mode 4 ground station follows the provisions of the ICAO standards material for VDL Mode 4. Within the ICAO standard, there are some requirements which apply explicitly only to airborne stations. A number of other requirements will also not apply because of the assumed services provided by the ground station. For example, it is assumed that the ground station will have no need to support net entry on a timescale shorter than one minute. The assumed services provided by the ground station and the impact on the requirements is summarized in the rest of clause 4.

19

## 4.1.2 Relationship to OSI reference model

The VDL Mode 4 sub-system implements the three lower layers of the OSI model as illustrated in figure 4.1.

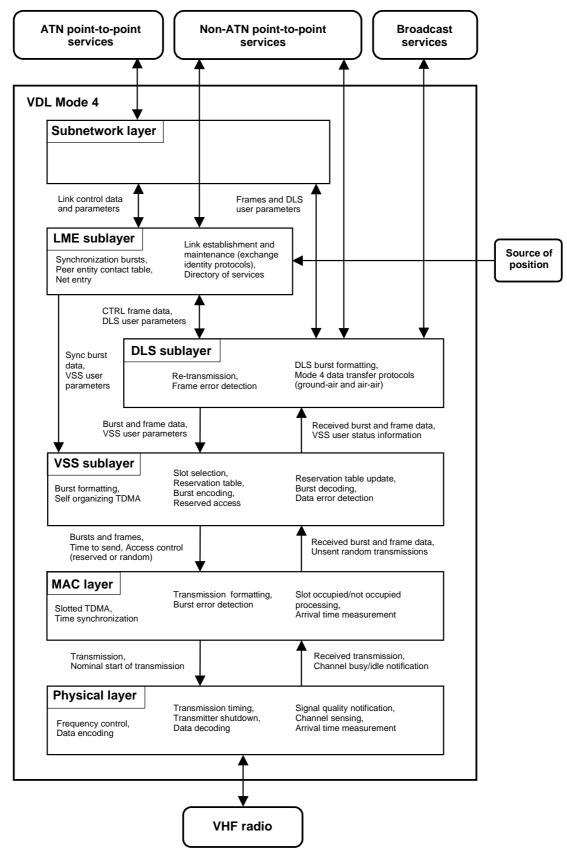

Figure 4.1: Layered structure of VDL Mode 4

Layer 1 (Physical layer): provides ground station frequency control, bit exchanges over the radio media, and notification functions. These functions are more often known as "radio" and "modulation" functions.

21

The ICAO VDL SARPs defines the physical layer for VDL Mode 4:

• The modulation scheme is Gaussian Filtered Frequency Shift Keying (GFSK), at a nominal bit rate of 19,200 bits/s.

Layer 2 (Link Layer): is split into three sublayers and a management entity:

- The Media Access Control (MAC) sublayer provides access to the Physical layer by a simple Time Division Multiple Access (TDMA) algorithm under the control of the next higher sublayer. It also provides system time functions to co-ordinate the TDMA channel access.
- The VDL Mode 4 Specific Services (VSS) sublayer provides control of channel access using a self-organizing mechanism. The VSS also supports a number of ground controlled access protocols. The basic services are built on reserved, random and fixed access to the TDMA slots and support broadcast and point-to-point communication.
- The Data Link Services (DLS) sublayer performs DLPDU exchanges, DLPDU processing and error detection. The DLS protocols are adapted to make best use of the unique VSS channel access protocols.
- The Link Management Entity (LME) is in charge of the links between peer DLS sublayers and also the maintenance of the broadcast link functions.

**Layer 3:** The VDL SARPs defines only the lowest network sublayer of layer 3 (SNAcP). It is compliant with the subnetwork sublayer requirements defined in the ATN SARPs [8]. It provides packet exchanges over a virtual circuit, error recovery, connection flow control, packet fragmentation, and subnetwork connection management functions.

NOTE: The present document is limited to the core link layer specifications for VDL Mode 4 and hence does not provide specifications for the whole of layer 2, and nor does it specify any of layer 3.

#### 4.1.3 VDL Mode 4 services

VDL Mode 4 supports two different types of communication services:

- VDL Mode 4 broadcast services;
- VDL Mode 4 point-to-point (addressed) services.

NOTE: Other networks can also be supported but has not been the focus of the ETSI standardization work.

The VDL Mode 4 specific services include air-to-air, air-to-ground, ground-to-air, and ground mobile broadcast and point-to-point communications (for link control), with a minimum of overhead information for exchange of data including time-critical data.

In addition, VDL Mode 4 is intended to operate as an ATN sub-network and to support ATN compliant air-ground data communication services, employing point-to-point links involving the DLS function.

These VDL Mode 4 services are expected to be accommodated on multiple VHF channels. While point-to-point data link channels are assumed to be separated from those supporting broadcast services, various broadcast functions and applications could share a channel. The possibilities for channel sharing depend on various constraints such as traffic densities, channel availability, certification requirements and ATS regulations, and may also differ between states and regions.

#### 4.1.4 ADS-B Function

The ADS-B function uses the VDL Mode 4 synchronization burst message formats to broadcast periodically an aircraft or vehicle's identity, position, altitude, time, intent and vector information for use by other mobiles and ground stations. Because position reporting is an integral part of communications management in VDL Mode 4, the core elements of ADS-B are already present on the link.

The size of the time slots on the data link is adapted to accommodate an ADS-B report in a transmission known as a synchronization burst. The *fixed part* of a synchronization burst contains core ADS-B information such as identity, a station's position altitude and time, but a synchronization burst may also accommodate additional ADS-B information in the *variable part* of the synchronization burst.

ADS-B supports many mobile-mobile surveillance applications such as Cockpit Display of Traffic Information (CDTI) (see note), Airborne Situational Awareness (AIRSAW), airborne separation, station-keeping and airport surface applications. When the VDL Mode 4 system also includes ground stations it is also able to support applications such as Advanced Surface Movement Guidance and Control Systems (A-SMGCS), Runway Incursion Prevention, enhanced ATC, Search And Rescue (SAR) co-ordination, etc.

NOTE: CDTI in this context means the functional capability to display position information, not the physical unit.

### 4.1.5 Operational scenarios

Three basic operational scenarios for VDL Mode 4 have been identified:

- a) Autonomous operation is defined as the situation where no VDL Mode 4 ground infrastructure exists. Surveillance by means of ADS-B and air-air communication can take place between any users with overlapping cells (radio range) by means of the self-organizing protocol, using autonomous transmissions. All activities use two globally co-ordinated Global Signalling Channels (GSCs).
- b) Single Cell operation is defined as the situation where overlapping VDL Mode 4 ground stations exist, but do not co-ordinate their operation over a ground network. Thus each single cell within the coverage of one ground station can be seen as an independently operating system. Additional local channels may be available (e.g. to support SMGCS) and channel management can be supported by the transmission of the Directory of Service (DoS) message on the GSCs. In this scenario, stations may make autonomous transmissions, or else may be directed to transmit on a particular frequency and/or in specified slots by a ground station.
- c) Multi Cell operation is defined as the situation where VDL Mode 4 ground stations co-ordinate their operation by means of ground networks. The number of VDL Mode 4 ground stations participating in multi cell operation affects overall system capacity and redundancy. Stations may make autonomous transmissions, or else may be directed by a ground station.

## 4.1.6 VDL Mode 4 fundamentals

VDL Mode 4 operation is built up from the following fundamental features which support ADS-B operation:

- A robust modulation scheme for encoding of data in each slot. VDL Mode 4 supports Gaussian Filtered Frequency Shift Keying (GFSK) with a transmission rate of 19,200 bits/s.
- A Self-organizing Time Division Multiplex Access (STDMA) structure. In VDL Mode 4, channel time is divided into fixed length time slots. A superframe consists of a group of slots that span a period of 60 s and contains 4 500 slots (equivalent to 75 slots per second).
- A timing reference providing a unique marker for the start of each communications slot. The timing concept used in VDL Mode 4 is based upon Universal Co-ordinated Time (UTC). In the event that a station loses its primary source of UTC time, it may resort to a failure mode known as secondary timing with reduced precision. A possible source of secondary time may be derived from the time of arrival of synchronization bursts received from another station declaring primary time.
- NOTE: The timing source is typically GNSS, but other sources may be used as long as they can be related to UTC.
- Position information from the aircraft's navigation system is used to organize access to the slots. If a station loses its source of position information it may continue to derive position from synchronization bursts received from other stations (known as secondary navigation) advertising certified data quality. Stations operating on secondary timing do not offer certified data quality and thus cannot be used for derivation of secondary navigation.
- A flexible message structure that can support a wide range of broadcast and data transfer protocols.

- A slot access management function, controlling the use of each slot.
- A number of link management functions that support access to data link services on a wide range of channels.

## 4.1.7 Possible configuration of ground equipment

It is not the intention of the present document to prescribe a particular physical architecture for the VDL Mode 4 ground station. It is assumed that the equipment will include all the relevant functionality defined by ICAO SARPs, as detailed in clause 5 of the present document, but that additional supporting functions such as determination of position and other data could be performed internally or externally to the VDL Mode 4 ground station. However, other architectures may be more appropriate to meet user requirements.

To meet the provisions of the present document, it is required that the equipment is tested in conjunction with all the physical units involved in the implementation of the functionality specified in clause 5, including the provision of the time reference, but excluding the derivation of data for transmission over the air-ground link. Where necessary, appropriate Points of Control and Observation (PCO) must be provided internally to the equipment to allow the tests specified in the present document to be performed.

It can be expected that VDL Mode 4 ground stations will be installed to a wide range of configurations, each having differing requirements in terms of the services to be supported by the equipment and tolerance to equipment failure. In order to reflect such differing requirements, the following guidance is offered on the equipment configurations expected to be required to meet operational requirements. Other equipment configurations are not excluded, but manufacturers will be required to demonstrate by supporting analysis that an alternative configuration is capable of meeting the appropriate operational requirements.

A number of functions in addition to those explicitly discussed here will be dependent on the equipment configuration, including slot map management, network entry support, and system management. Manufacturers should determine requirements for these functions taking into account the particular characteristics of their system design, so as to ensure that operational requirements are met.

For Air Transport applications, a dual installation of VDL 4 ground station transceivers is foreseen, each consisting of up to four receivers, all capable of simultaneous operation on independent frequencies, together with a frequency agile transmitter. For less sophisticated ground stations a simplified transceiver may be suitable, consisting of only two receivers and a single transmitter. However, such an installation could restrict the VDL Mode 4 applications and services capable of being supported.

No single ground station will be required to transmit simultaneously on two different frequencies or be required to receive whilst transmitting on any other channel in the same VDR.

## 4.1.8 Overall structure of specifications for VDL Mode 4

The specifications for VDL Mode 4 ground stations are split into four volumes as illustrated in figure 4.2.

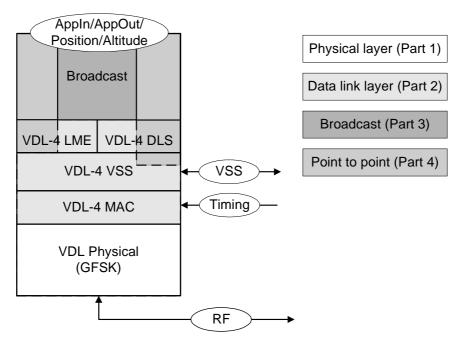

Figure 4.2: Structure of VDL Mode 4 ground station specifications

It is assumed that:

- An equipment providing broadcast services only would conform to the requirements of parts 1, 2 and 3.
- An equipment providing point to point services only would conform to the requirements of parts 1, 2 and 4.
- An equipment providing all services would conform to the requirements of parts 1, 2, 3 and 4.

Part 1 (EN for ground equipment - EN 301 842-1 [4]) provides the functions necessary to establish a physical layer link between stations.

Part 2 (General description and data link layer - the present document) provides the functions necessary to:

- Establish a stream of broadcast transmissions protected by broadcast reservation types.
- Respond correctly to all reservation types.
- Provide repetitive transmission of aircraft position.
- Provide link management services to enable a ground station to control quality of service parameters via ground broadcast transmissions.

Part 2 is based on ICAO VDL Mode 4 Technical Manual requirements [1] and includes:

- All functions associated with the MAC layer.
- All functions associated with broadcast services within the VSS layer.
- All functions associated with the receipt of point-to-point reservation types within the VSS layer.
- Station addresses and broadcast services from the DLS layer. Note that the present document provides broadcast services via single unacknowledged transmissions. The present document specifically does not implement long transmission procedures for broadcast.

- LME functions to support the repetitive broadcast of position within a synchronization burst. This includes the encoding of the fixed part of the synchronization burst and a variable part containing no further information. This is sufficient to support communication management but is supplemented in EN 301 842-3 [9] with a greater range of information to support broadcast services. The core also supports a simple synchronization burst request message making it possible for a communications manager to establish periodic reporting streams. This is again supplemented in EN 301 842-3 [9] to support a greater level of control by a ground station over the rate and content of synchronization bursts.
- Compact position reporting (CPR) encoding to support the fixed part of the synchronization burst.

In the VSS layer, the present document excludes:

- Re-transmission and associated parameters (these are contained in EN 301 842-4 [10]);
- Unicast request protocol and information transfer protocol transmission procedures (these are contained in EN 301 842-4 [10]). Note that the reception procedures for these protocols are included in the present document to support interoperability between broadcast only and point-to-point only equipment.

Part 3 (EN 301 842-3 [9]) (broadcast services) defines messages and additional protocols to support ADS-B, TIS-B and FIS-B. The main purpose of EN 301 842-3 [9] is to define message formats which are transmitted and received using the broadcast services of the DLS defined within the present document. In addition, some additional protocols are added within the ADS-B specifications.

EN 301 842-3 [9] specifications are based on:

- ICAO Technical Manual specifications for ADS-B and CPR offset encoding.
- Specifications for TIS-B, FIS-B and GNSS Augmentation adapted from material developed as part of European Commission sponsored trials of VDL Mode 4 equipment.

Part 4 (EN 301 842-4 [10]) (point-to-point services) provides air-to-ground and air-to-air point-to-point services based on the ICAO Technical Manual. EN 301 842-4 [10] includes:

- Point-to-point data and control data transfer functions from the DLS.
- Point-to-point link control within the LME.

Note that EN 301 842-4 [10] covers the establishment, termination and handover of links between ground stations and ground station coordination. Decisions to establish, terminate or handover links between ground stations are local issues and beyond the scope of these specifications.

EN 302 842 [13] parts 1 to 4 covers all VDL Mode 4 services applicable to Airborne Equipment including broadcast and point-to-point communications.

#### 4.1.9 Equipment performance verification

To test the equipment for compliance with the performance requirements, two types of test are specified:

- Bench tests.
- Environmental tests.

The performance requirements for each type of test and the corresponding test procedures are specified in the present document. The order of test suggests that the ground station be subjected to a succession of tests as it moves from design into design validation and equipment qualification. The objectives of these tests are described below.

#### **Bench tests**

The equipment will be subjected to bench test to verify compliance with the performance requirements under a controlled environment. The test results may be used as the basis for approval of equipment design, equipment qualification, and acceptance. The bench test procedures are specified in clause 7.

#### **Environmental tests**

Upon successful completion of bench tests, the equipment will be subject to environmental tests to verify compliance to the performance requirements under extreme environmental conditions expected in actual operations and abnormal conditions. The test results may be applied to equipment qualification and acceptance. The environmental requirements and tests are specified in EN 301 842-1 [4] and EN 300 676 [12], supported by test procedures from clause 7 of the present document where appropriate.

## 4.2 Ground quarantine

VDL Mode 4 includes the ability to reserve slots for ground station use only. Mobile stations will avoid use of these slots unless commanded by a ground station.

It is assumed that the ground stations are utilized as part of a coordinated network of ground stations and hence a particular ground station is able to transmit in ground reserved slots. Specific requirements are included which allows the ground station user to specify which slots should be used for a transmission or which group of candidate slots should be used for selection of slots for placing reservations. These requirements may be seen as a development of the VDL Mode 4 fixed access protocol.

Note that the standard does not cover ground stations which are not coordinated and which might be required to avoid ground reserved slots.

Note that the ground station will not take action when receiving superframe block or second frame block reservations since they are allowed to override this. Note also that a ground station will not re-transmit the block information.

## 4.3 System timing

It is assumed that the ground station will include a source of timing that is sufficient to maintain the primary time requirements for 1 hour after a GNSS outage. Furthermore, it is assumed that if primary time cannot be maintained, the ground station will switch to a time source that can support secondary time indefinitely or, if this is not possible, stop transmitting. The ground station will not derive secondary time from measurements made on bursts received from mobiles and will not support the tertiary timing mode.

The ground station will supply message time-of-arrival to the application interface, which may be used for the purpose of verification of mobile station range.

## 4.4 Net entry

It is assumed that a ground station will start operating on a particular channel by first listening to that channel for a minimum period of 1 minute so as to build up a complete picture of the reservations of other stations. Hence a ground station does not need to support entry by plea or half-slot BND.

However the ground station will recognize pleas and BND reservations made by other stations and will provide a plea response if requested by a mobile.

It is also assumed that net entry will occur only when commanded by the user and not by detection of the level of exposure to other aircraft. Hence the ground station will not maintain an exposure filter.

## 4.5 Autotune capability

Ground stations are required to:

- a) be able to issue autotune commands; and
- b) to recognize them.

However, it is assumed that an autotune will not be directed from one ground station to another and hence there are no requirements to respond to an autotune issued by another ground station.

Note that in the event of a mobile failing to respond to an autotune command from a ground station, the ground station is required in the ICAO standards to re-transmit the request using the re-transmission procedures. However, the choice of which mobiles to autotune is a dynamic process for the ground station user and, in the event that an autotune fails, it may be better to choose a different mobile. Hence it is felt to be preferable to refer a non-response back to the ground station user rather than to use the re-transmission procedures.

27

## 4.6 Autonomous and fixed access

It is assumed that the ground station is able to place reservations and select the slots for these reservations autonomously. It will also support the fixed transmission protocol.

# 5 Minimum performance specification under standard test conditions

## 5.1 MAC sublayer

#### 5.1.1 Services

| Requirement |  |
|-------------|--|
| 5.1.1.1     | The MAC sublayer shall acquire the shared communication path so as to provide the services defined in clause 5.1.2 |

#### 5.1.2 MAC sublayer services

| Requirement<br>reference |  |
|--------------------------|--|
| 5.1.2.1                  | The MAC sublayer shall accept from the physical layer a continuous indication of channel idle/busy status and signal level (see clause 5.1.5).   |
| 5.1.2.2                  | The MAC sublayer shall accept from the VSS sublayer a burst for transmission,<br>accompanied by the time to transmit it.   |
| 5.1.2.3                  | The MAC sublayer shall provide to the VSS sublayer the received burst data, slot busy/idle status, slot occupancy status, signal level and the status of bursts sent for transmission. |

## 5.1.3 MAC sublayer parameters

#### 5.1.3.1 General

| Requirement |   |
|-------------|---|
| 5.1.3.1.1   | MAC service system parameters shall be as described in table 5.1. |

| Symbol | Parameter Name  | Minimum | Maximum | Default     | Increment |
|--------|-----------------|---------|---------|-------------|-----------|
| M1     | Number of slots | n/a     | n/a     | 4 500 slots | n/a       |
|        | per superframe  |         |         |             |           |

#### Table 5.1: MAC service system parameters

## 5.1.3.2 Parameter M1 (number of slots per superframe)

| Γ | Requirement reference |   |
|---|-----------------------|---|
| Γ | 5.1.3.2.1             | The parameter M1 shall be the number of available slots per superframe. |
|   | 5.1.3.2.2             | A superframe shall span a period of 60 s.                               |

## 5.1.4 Time synchronization

#### 5.1.4.1 Primary

| Requirement reference |   |
|-----------------------|---|
|                       | Under normal operating conditions, a station shall maintain time synchronization such that the start of each successive group of M1/60 slots is synchronized with the start of any Universal Time Coordinated (UTC) second to within a two-sigma value of 400 ns. |

#### 5.1.4.2 Secondary

| Requirement<br>reference |   |
|--------------------------|---|
| 5.1.4.2.1                | A station shall be capable of maintaining time synchronization such that the start of each successive group of M1/60 slots is synchronized with the start of any UTC second to within a two-sigma value of 15 µs. |
| 5.1.4.2.2                | Only when the primary source fails shall secondary time be used.  |
| 5.1.4.2.3                | A station using secondary time shall revert to primary time whenever primary time is available.   |
| 5.1.4.2.4                | A station that is unable to support either primary or secondary time shall not transmit.  |

### 5.1.4.3 Alignment to UTC second

| Requirement<br>reference |   |
|--------------------------|---|
|                          | For stations maintaining primary or secondary time, the start of each successive group of M1/60 slots shall be aligned with a UTC second. |

#### 5.1.4.4 Data quality level

| Requirement reference |  |
|-----------------------|--|
| 5.1.4.4.1             | The certified quality level shall indicate that timing and position information provided by the station can be used by other stations as a means of deriving position information. |
|                       | the station can be used by other stations as a means of deriving position mornitation.   |
| 5.1.4.4.2             | The secondary timing level shall not indicate the certified quality level.   |

## 5.1.5 Slot idle/busy notification

#### 5.1.5.1 Slot idle detection

| Requirement reference |   |
|-----------------------|---|
|                       | A station shall consider the slot idle if the channel idle/busy status supplied by the physical layer is idle at the start of the slot. |

| Requirement reference |  |
|-----------------------|--|
|                       | A station shall consider the slot busy if the channel idle/busy status is busy at the start of the slot. |

#### 5.1.5.3 Slot occupied detection

| Requirement reference |   |
|-----------------------|---|
| 5.1.5.3.1             | A slot shall be considered occupied if the channel is considered to be continuously busy for a period of at least 5 ms during the slot. |

#### 5.1.5.4 Signal level indication

| Requirement reference |  |
|-----------------------|--|
| 5.1.5.4.1             | The MAC sublayer shall accept from the physical layer an indication of the signal level. |

## 5.1.6 Transmission processing

| Requirement reference |  |
|-----------------------|--|
| 5.1.6.1               | Bursts received from the MAC sublayer shall be forwarded to the physical layer, together with the time for transmission. |
| 5.1.6.2               | A station shall begin transmissions only at the beginning of the slot boundary as determined by its local clock.         |

## 5.1.7 Received transmission processing

| Requirement<br>reference |  |
|--------------------------|--|
| 5.1.7.1                  | Bursts with an invalid Cyclic Redundancy Code (CRC) shall be discarded.  |
|                          | Bursts with valid CRCs shall be forwarded to the VSS sublayer, along with the received time of transmission and signal quality parameters. |

# 5.2 VSS sublayer

## 5.2.1 Services

#### 5.2.1.1 Error detection

| Requirement reference |   |
|-----------------------|---|
|                       | The VSS sublayer shall compute a 16 bit CRC according to ISO/IEC 13239 [3] to facilitate detection by the MAC sublayer (see clause 5.1.7) of data corruption during transmission. |

| Requirement reference |  |
|-----------------------|--|
|                       | The VSS sublayer shall notify the LME sublayer whenever channel congestion is detected (see clauses 5.2.7.2.2 to 5.2.7.2.5). |

## 5.2.2 Burst format

#### 5.2.2.1 VSS burst structure

| Requirement reference |   |
|-----------------------|---|
|                       | VSS bursts shall conform to ISO/IEC 13239 [3] frame structure except as specified in table 5.2. |
| 5.2.2.1.2             | Bits denoted "res" shall be set to zero on transmit and ignored on receipt.                     |

| Description  | Octet    | Bit number        |                 |                 |                  |                   |                  |                 |                 |
|--|----------|-------------------|-----------------|-----------------|------------------|-------------------|------------------|-----------------|-----------------|
| Description  | Ociei    | 8                 | 7               | 6               | 5                | 4                 | 3                | 2               | 1               |
| flag   | -        | 0                 | 1               | 1               | 1                | 1                 | 1                | 1               | 0               |
| autonomous/directed flag (a/d), reservation ID (rid), version number (ver) | 1        | s <sub>27</sub>   | s <sub>26</sub> | s <sub>25</sub> | ver <sub>3</sub> | ver <sub>2</sub>  | ver <sub>1</sub> | rid             | a/d             |
|  | 2        | s <sub>24</sub>   | s <sub>23</sub> | s <sub>22</sub> | s <sub>21</sub>  | s <sub>20</sub>   | s <sub>19</sub>  | s <sub>18</sub> | s <sub>17</sub> |
| source address (s)   | 3        | s <sub>16</sub>   | s <sub>15</sub> | s <sub>14</sub> | s <sub>13</sub>  | s <sub>12</sub>   | s <sub>11</sub>  | s <sub>10</sub> | s <sub>9</sub>  |
|  | 4        | s <sub>8</sub>    | s <sub>7</sub>  | s <sub>6</sub>  | s <sub>5</sub>   | s <sub>4</sub>    | s <sub>3</sub>   | s <sub>2</sub>  | s <sub>1</sub>  |
| message ID (mi)  | 5        | mi <sub>k</sub>   |                 |                 |                  | mi <sub>4</sub>   | mi <sub>3</sub>  | mi <sub>2</sub> | mi <sub>1</sub> |
|  | 6        | in <sub>k</sub>   |                 |                 |                  |                   |                  |                 |                 |
| information  | 7 to n-5 |                   |                 |                 |                  |                   |                  |                 |                 |
|  | n-4      |                   |                 |                 |                  |                   |                  |                 |                 |

|  | n        | c <sub>1</sub>    | c <sub>2</sub>  | c <sub>3</sub>  | c <sub>4</sub>   | с <sub>5</sub>    | c <sub>6</sub>   | с <sub>7</sub>  | с <sub>8</sub>  |
| flag   | -        | 0                 | 1               | 1               | 1                | 1                 | 1                | 1               | 0               |

#### Table 5.2: Burst format

Denotes variable length field

#### 5.2.2.2 Version number

| Requirement reference |  |
|-----------------------|--|
| 5.2.2.2.1             | The version number (ver) subfield shall indicate the version of VDL Mode 4 supported by the station.   |
| 5.2.2.2.2             | It shall be set to 000 on transmit.  |
| 5.2.2.2.3             | If the station receives a burst in which the version number is non-zero, it shall inform the VSS user that a non-zero version number has been received and ignore the rest of the burst. |

| Requirement reference |  |
|-----------------------|--|
|                       | The source address (s) of the transmitting station shall be encoded in the 27-bit field as |
|                       | defined in table 5.2.  |
| 5.2.2.3.2             | The address format shall be as defined in clause 5.3.1.2.                                  |

#### 5.2.2.4 Message ID

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.2.4.1                | The message ID (mi) of the burst shall be encoded in the variable length field as defined in table 5.2. |
| 5.2.2.4.2                | The bits of the burst message ID field shall be as defined in table 5.3.                                |

#### Table 5.3: Message ID assignment

| Message ID field |                 |                 |                 |                 |                 |                 |                 |   | ¥00             |  |
|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|-----------------|--|
| mi <sub>8</sub>  | mi <sub>7</sub> | mi <sub>6</sub> | mi <sub>5</sub> | mi <sub>4</sub> | mi <sub>3</sub> | mi <sub>2</sub> | mi <sub>1</sub> | Assigned burst type                                 | VSS user        |  |
| х                | х               | х               | х               | х               | х               | х               | 0               | Autonomous synchronization burst (see clause 5.4.2) | LME             |  |
| х                | Х               | х               | х               | 1               | 1               | 0               | 1               | DLS bursts (see clause 5.3.1.3                      | DLS             |  |
| Х                | Х               | Х               | Х               | Х               | 0               | 1               | 1               | and EN 301 842-4 [10]                               |                 |  |
| Х                | Х               | Х               | Х               | Х               | 1               | 1               | 1               | clause 5.1.2.2)                                     |                 |  |
| 1                | 0               | 0               | 1               | 0               | 1               | 0               | 1               |   |                 |  |
| Х                | Х               | 1               | 0               | 0               | 1               | 0               | 1               |   |                 |  |
| Х                | Х               | х               | Х               | Х               | 0               | 0               | 1               | General request burst                               | Defined by r-mi |  |
| х                | 0               | 0               | 0               | 0               | 1               | 0               | 1               | No operation  | VSS             |  |
| Х                | 1               | 0               | 0               | 0               | 1               | 0               | 1               | Network entry burst                                 | VSS             |  |
| 0                | 0               | 0               | 1               | 0               | 1               | 0               | 1               | Message ID extension to next 4                      |                 |  |
|                  |                 |                 |                 |                 |                 |                 |                 | bits  |                 |  |
| Х                | 1               | 1               | 1               | 0               | 1               | 0               | 1               | General response burst                              | Defined by r-mi |  |
| х                | 0               | 1               | 1               | 0               | 1               | 0               | 1               | Reserved for future use                             |                 |  |
| х                | 1               | 0               | 1               | 0               | 1               | 0               | 1               | Reserved for future use                             |                 |  |

| Requirement<br>reference |   |
|--------------------------|---|
|                          | The message ID shall define the VSS user which is responsible for handling the message, following completion of processing required within the VSS. |

#### 5.2.2.5 Information field

| Requirement reference |  |
|-----------------------|--|
| 5.2.2.5.1             | The optional information field (in) shall contain VSS user defined data. |

#### 5.2.2.6 Reservation fields

| Requirement reference |   |
|-----------------------|---|
| 5.2.2.6.1             | The reservation ID (rid) of the burst shall be encoded in the 1-bit field as defined in table 5.2.  |
| 5.2.2.6.2             | If the reservation ID equals 1, this shall indicate that the reservation type is either a null reservation (see clause 5.2.9), a periodic broadcast reservation (see clause 5.2.10) or a combined periodic broadcast and incremental broadcast reservation (see clause 5.2.12) and that there is no extended reservation ID (erid). |
| 5.2.2.6.3             | Otherwise, the extended reservation ID field shall indicate other reservation types as defined in table 5.4.  |

#### Table 5.4: Extended reservation ID field (erid)

| Extended reservation ID field (erid) |       |           |       | (erid) |  |
|--------------------------------------|-------|-----------|-------|--------|--|
|                                      | (     | Octet n-2 | -     | r      | Reservation type                         |
| Bit 8                                | Bit 7 | Bit 6     | Bit 5 | Bit 4  |  |
| 0                                    | 0     | 0         | 0     | 0      | Response burst (no reservation)          |
| 0                                    | 0     | 0         | 0     | 1      | Big Negative Dither (BND) reservation    |
| 0                                    | 0     | 0         | 1     | 0      | Superframe block reservation             |
| 0                                    | 0     | 0         | 1     | 1      | Second frame block reservation           |
| 0                                    | 0     | 1         | 0     | х      | Unicast request reservation              |
| 0                                    | 0     | 1         | 1     | 0      |  |
|                                      |       | to        |       |        | Reserved for future allocation           |
| 0                                    | 1     | 0         | 0     | 1      |  |
| 0                                    | 1     | 0         | 1     | 0      | Information transfer request reservation |
| 0                                    | 1     | 0         | 1     | 1      | Reserved for future allocation           |
| 0                                    | 1     | 1         | 0     | 0      | Directed request reservation             |
| 0                                    | 1     | 1         | 0     | 1      |  |
|                                      |       | to        |       |        | Reserved for future allocation           |
| 0                                    | 1     | 1         | 1     | 1      |  |
| 1                                    | 0     | х         | х     | х      | Incremental broadcast reservation        |
| 1                                    | 1     | 0         | 0     | 0      |  |
|                                      |       | to        |       |        | Reserved for future allocation           |
| 1                                    | 1     | 1         | 1     | 1      |  |

## 5.2.2.7 Autonomous/directed flag

| Requirement<br>reference |  |  |
|--------------------------|--|--|
| 5.2.2.7.1                | The autonomous/directed (a/d) flag shall be encoded as defined in table 5.5. |  |

## Table 5.5: Autonomous/directed flag encoding

| Subfield                      | Range   | Encoding  | Notes   |
|-------------------------------|---------|---|---|
| autonomous/<br>directed (a/d) | Boolean | <ul> <li>0 = random transmission or reserved<br/>transmission in a slot selected by this<br/>station.</li> <li>1 = delayed burst transmission or<br/>reserved transmission in a slot selected<br/>by a peer station.</li> </ul> | Identifies whether the station is<br>transmitting based on its internal<br>reservation table or if it is being<br>directed by a peer. |

## 5.2.3 VSS sublayer parameters

#### 5.2.3.1 General

-

| Requirement reference |   |
|-----------------------|---|
| 5.2.3.1.1             | VSS service system parameters shall be as described in table 5.6. |

33

#### Table 5.6: VSS sublayer parameters

| Symbol | Parameter name                     | Minimum | Maximum   | Default  | Increment |
|--------|------------------------------------|---------|-----------|----------|-----------|
| VS1    | Number of ground quarantined slots | 0 slots | 15 slots  | 4 slots  | 1 slot    |
| VS2    | Minimum CCI performance            | 6 dB    | 60 dB     | 12 dB    | 1 dB      |
| VS4    | Quarantine slot re-use range       | 0 nmi   | 1 000 nmi | 300 nmi  | 10 nmi    |
| VS5    | Maximum burst length               | 1 slot  | 16 slots  | 10 slots | 1 slot    |

### 5.2.3.2 Parameter VS1 (number of ground quarantined slots)

| Requirement<br>reference |  |  |  |  |
|--------------------------|--|--|--|--|
| 5.2.3.2.1                | The parameter VS1 shall define the number of ground quarantined slots.   |  |  |  |
| 5.2.3.2.2                | Quarantined slots shall be slots which may not be used by a mobile station unless directed by a ground station.  |  |  |  |
| 5.2.3.2.3                | <ul> <li>Quarantined slots shall be established by a ground station or network of coordinated ground stations under the following circumstances: <ul> <li>a) a mobile station, A, will not reserve a slot or transmit on the slot boundary of the VS1 slots after a slot which has been reserved by a ground station, B, using a periodic broadcast reservation or which has been reserved by a mobile, C, using a burst with the autonomous/directed bit set to 1 and a periodic broadcast reservation field, unless the station (B or C) that has reserved the slot is at a range greater than VS4 from station A. In the case that station (B or C) that has reserved the slot is at a range greater than VS4 from station A. In the case that station (B or C) that has reserved the slot to be unreserved.</li> <li>b) If a mobile station receives a periodic broadcast burst with the periodic offset (po) subfield set to zero and the periodic timeout (pt) subfield set to zero, then it will maintain ground quarantine for the current slot and for M1 slots after the current slot if it had previously contained a reservation associated with the same stream. Ground quarantine behaviour for any other slots associated with the same stream.</li> <li>c) A mobile station, A, will not reserve a slot or transmit in slots which have been reserved by a ground station, B, or a mobile station, C, using a block reservation, unless the station (B or C) that has reserved the slot is at a range greater than VS4 from station A, in which case station A will consider the slot to be unreserved.</li> </ul> </li> </ul> |  |  |  |

#### 5.2.3.3 Parameter VS2 (minimum CCI performance)

| Requirement reference |   |  |
|-----------------------|---|--|
| 5.2.3.3.1             | The parameter VS2 shall be used to control the CCI conditions by which a station Y may<br>transmit given that another station X has reserved the same slot.   |  |
| 5.2.3.3.2             | In the case where a station X and Y transmit in the same slot and station X's transmission<br>is directed to another station Z, CCI conditions shall be fulfilled (a transmission from station<br>X will not interfere with the transmissions from station Y and Z) if the ratio defined below:<br>$ratio = 10 \log \left( \frac{dist(Y \mid Z)^2}{dist(X \mid Z)^2} \right)$ |  |
|                       | is greater than VS2, where dist(Y/Z) is the distance between station Y and Z and dist (X/Z) is the distance between station X and station Z   |  |

#### 5.2.3.4 Parameter VS4 (quarantine slot re-use range)

| Requirement reference |   |
|-----------------------|---|
| 5.2.3.4.1             | The parameter VS4 shall be used to control the range at which a quarantined slot may be re-used by a distant station. |

#### 5.2.3.5 Parameter VS5 (maximum burst length)

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.3.5.1                | The parameter VS5 shall define the maximum burst length in slots including flags and zero bits inserted for transparency. |

## 5.2.4 VSS quality of service parameters

#### 5.2.4.1 General

| Requirement reference |  |
|-----------------------|--|
|                       | Every burst processed by the VSS sublayer for transmission shall be associated with the parameters defined in table 5.7. |

#### Table 5.7: VSS quality of service system parameters

| Symbol | Parameter Name                              | Minimum | Maximum   | Default | Increment |
|--------|---|---------|-----------|---------|-----------|
| Q1     | Priority                                    | 0       | 15        | 11      | 1         |
| Q2a    | Slot selection range constraint for level 1 | 0       | 1 000 nmi | 150 nmi | 1 nmi     |
| Q2b    | Slot selection range constraint for level 2 | 0       | 1 000 nmi | 150 nmi | 1 nmi     |
| Q2c    | Slot selection range constraint for level 3 | 0       | 1 000 nmi | 0 nmi   | 1 nmi     |
| Q2d    | Slot selection range constraint for level 4 | 0       | 1 000 nmi | 300 nmi | 1 nmi     |
| Q3     | Replace queued data                         | FALSE   | TRUE      | FALSE   |           |
| Q4     | Number of available slots                   | 1       | 20        | 3       | 1         |

#### 5.2.4.2 Parameter Q1 (priority)

| Requirement |
|-------------|
|-------------|

| reference |  |
|-----------|--|
| 5.2.4.2.1 | The parameter Q1 shall be the priority of the transmission and shall be as defined in table 5.8. |

#### Table 5.8: Priority levels

| Message categories   | Q1 |
|--|----|
| Unassigned   | 15 |
| Network/systems management                                       | 14 |
| Distress communications  | 13 |
| Urgent communications  | 12 |
| High priority flight safety messages                             | 11 |
| Normal priority flight safety messages                           | 10 |
| Meteorological communications                                    | 9  |
| Flight regularity communications                                 | 8  |
| Aeronautical information service messages                        | 7  |
| Network/systems administration                                   | 6  |
| Aeronautical administrative messages                             | 5  |
| Unassigned   | 4  |
| Urgent priority administrative and UN charter communications     | 3  |
| High priority administrative and state/government communications | 2  |
| Normal priority administrative                                   | 1  |
| Low priority administrative                                      | 0  |

## 5.2.4.3 Parameters Q2a to Q2d (slot selection range constraint for level n)

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.4.3.1                | The parameters Q2a to Q2d shall be used to impose range constraints on the slot selection process for levels 1 to 4 defined by table 5.9. |

#### Table 5.9: Slot selection criteria

|                    | Selection conditions                                       |  |  |  |
|--------------------|--|--|--|--|
| Selection priority | Planned transmission by station A                          | Previously reserved<br>transmission by station B           | Minimum distance<br>between station A and<br>station B |  |
| Level 0            | Any  | Unreserved   | Not applicable   |  |
| Level 1            | Broadcast or CCI protected communication with station C    | CCI protected communication with station D                 | Q2a  |  |
| Level 2            | Broadcast or CCI protected<br>communication with station C | Broadcast  | Q2b  |  |
| Level 3            | Broadcast or CCI protected<br>communication with station C | Broadcast or CCI protected<br>communication with station D | Q2c  |  |
| Level 4            | Broadcast or CCI protected communication with station C    | Any transmission   | Q2d  |  |

| Requirement reference |                   |  |
|-----------------------|-------------------|--|
| 5.2.4.3.2             | In table 5.9, the | e following definitions and specifications shall apply:  |
|                       | Station A         | The station attempting to select a slot.   |
|                       | Station B         | A station that has previously reserved a slot.   |
|                       | Station C         | A station to which station A wishes to address a point-to-point communication.   |
|                       | Station D         | A station for which station B has reserved a slot for point-to-point communication.  |
|                       | CCI protected     | A point-to-point communication between two stations which fulfils the CCI conditions as defined in clause 5.2.3.3 and is therefore protected (its transmission can be heard by the intended recipient) if a third station simultaneously transmits in the same slot. |

## 5.2.4.4 Parameter Q3 (replace queued data)

| Requirement reference |   |
|-----------------------|---|
| 5.2.4.4.1             | The parameter Q3 shall be a Boolean switch that shall be used to control queuing of repeated bursts on a congested channel. |
| 5.2.4.4.2             | If Q3 = TRUE, then a new data field shall replace a queued data field of the same type.                                     |
| 5.2.4.4.3             | Otherwise, both the old and new data fields shall be transmitted.   |

#### 5.2.4.5 Parameter Q4 (number of available slots)

| Requirement<br>reference |  |
|--------------------------|--|
| 5.2.4.5.1                | The parameter Q4 shall be used to control the number of slots added to the available slot list during the slot selection process (see clause 5.2.6.2). |

## 5.2.5 Received transmission processing

| Requirement reference |   |
|-----------------------|---|
| 5.2.5.1               | Valid bursts shall be forwarded to the appropriate VSS user, along with the time of receipt of transmission.  |
| 5.2.5.2               | The received signal quality and the time of receipt of the bursts shall be passed to the VME.   |
| 5.2.5.3               | A station shall be capable of recognizing and processing all possible reservation types as defined in clauses 5.2.9 through 5.2.18.   |
| 5.2.5.4               | When a station receives a burst with an unrecognized reservation type, it shall discard the burst without updating the reservation table.   |
| 5.2.5.5               | When a station receives a known reservation type with an invalid subfield, or a known reservation type with valid subfields but an invalid combination, it shall reserve the slots indicated by the valid sub-fields, and not transmit a response, nor pass the burst to a VSS user.  |
| 5.2.5.6               | When a station receives a burst with a known reservation type and a non-zero reserved subfield, it shall ignore the data in the reserved subfield.  |
| 5.2.5.7               | The current slot for a burst shall be the slot in which the received transmission begins.   |
| 5.2.5.8               | The burst length (bl) shall be the number of slots across which the burst is transmitted.   |
| 5.2.5.9               | If the appropriate VSS user cannot be identified (i.e. the message ID is reserved or that functionality is not implemented) and the burst contains one or more reservations for the receiving station only, then the station shall transmit a General Failure (see clause 5.2.20) with an error type of 00 hex or 80 hex (i.e. unsupported function) in the first slot of each of the reservations. |

# 5.2.6 Reserved access protocol specification

# 5.2.6.1 Reservation table

| Requirement reference |   |
|-----------------------|---|
| 5.2.6.1.1             | A station shall maintain a table of all reservations in the next 4 x M1 + 128 slots.  |
| 5.2.6.1.2             | For each reserved slot, the reservation table entry shall consist of the 27-bit address of the intended transmitter, the 27-bit address of the destination (if any) and the type of reservation made.   |
| 5.2.6.1.3             | For periodic broadcast reservations (see clause 5.2.10) and directed request reservations (see clause 5.2.16), the reservation table shall also include pointers to all other reserved slots associated with the same reservation stream.       |
| 5.2.6.1.4             | For the periodic broadcast protocol (see clause 5.2.10), the reservation table shall also record potential reservations, defined as the M1, 2 M1, 3 M1 and 4 M1 slots after a slot for which no transmission has been decoded by the MAC layer. |
| 5.2.6.1.5             | For each potential reservation, the reservation table shall include the signal level (see clause 5.1.5.4) associated with the slot and the occupancy status as defined in clause 5.1.5.3.   |
| 5.2.6.1.6             | Slots containing both potential reservations and reservations resulting from decoded transmissions shall be treated as if containing reservations from the decoded transmissions only.  |
| 5.2.6.1.7             | The reservation table shall be updated before the end of the first slot after the end of the burst.   |
| 5.2.6.1.8             | With the exception of cases where a station has been directed to transmit by another station, a station shall wait for at least M1 + 128 slots after starting to listen to a channel, before starting to transmit or reserve slots.             |

### 5.2.6.2 Selecting slots for transmission or reservation

| Requirement reference |  |  |  |
|-----------------------|--|--|--|
| 5.2.6.2.1             | A station shall select slots for transmission or for reservation for later transmissions using the algorithm specified below.  |  |  |
| 5.2.6.2.2             | The VSS user shall specify one or more groups of Quality of Service parameters Q2a, Q2b, Q2c, Q2d and Q4 for slot selection.   |  |  |
| 5.2.6.2.3             | The station shall attempt to select slots using the first group of Quality of Service<br>parameters.   |  |  |
| 5.2.6.2.4             | If slot selection is unsuccessful, the station shall use the next group and continue with successive groups until a slot has been selected.  |  |  |
| 5.2.6.2.5             | If, having used all groups of Quality of Service parameters, no slot has been selected, the VSS user shall be informed that slot selection has been unsuccessful.                        |  |  |
|                       | Specification of candidate slots   |  |  |
| 5.2.6.2.6             | The VSS user shall specify one or more ranges of candidate slots for slot selection.   |  |  |
|                       | Derivation of a list of available slots  |  |  |
|                       | Slot selection criteria  |  |  |
| 5.2.6.2.7             | A list of available slots shall be chosen from the candidate slots using the following rules.  |  |  |
| 5.2.6.2.8             | All unreserved slots shall be added to the list of available slots (shown as level 0 in table 5.9).  |  |  |
| 5.2.6.2.9             | If, having completed stage a), the number of available slots is less than Q4, further available slots shall be selected from slots that have been previously reserved by other stations. |  |  |
| 5.2.6.2.10            | The station shall initially select from slots which obey conditions specified as level 1 in table 5.9 until Q4 available slots have been chosen.   |  |  |
| 5.2.6.2.11            | If, having applied level 1 conditions, the number of available slots is still less than Q4, slot selection shall continue using level 2 conditions.                                      |  |  |
| 5.2.6.2.12            | The process shall continue using subsequent levels until Q4 slots have been selected or until all levels have been applied.  |  |  |
| 5.2.6.2.13            | At each level, selection shall start with slots reserved by the most distant station and proceed in decreasing range order.  |  |  |

| Requirement reference |  |
|-----------------------|--|
|                       | Recommendation   |
| 5.2.6.2.14            | In selecting the list of available slots at level 0, priority should be given to candidate slots which are not reserved for transmission on any channel monitored by the station, and which also do not violate quarantine constraints (see clause 5.2.3.2) on the desired transmit channel. |
|                       | Selection of slots from available slots  |
| 5.2.6.2.15            | If, having completed the derivation of a list of available slots, the number of available slots is zero, no slot shall be selected and the VSS user shall be informed that slot selection was unsuccessful.  |
| 5.2.6.2.16            | If the number of available slots is greater than or equal to 1, a slot shall be chosen from the list of available slots such that the probability of choosing a given slot is the same as the probability of choosing any other slot.  |
|                       | Selection of slots for burst lengths greater than 1  |
| 5.2.6.2.17            | For burst lengths greater than 1, the process specified in clauses 5.2.6.2.7 to 5.2.6.2.14   |

| To busic lengths greater than 1, the process specified in clauses 5.2.0.2.7 to 5.2.0.2.14   |  |  |
|---|--|--|
| shall be applied to continuous blocks of slots of length equal to the burst length.   |  |  |
| A block of slots shall be regarded as available at a particular level number (see   |  |  |
| table 5.9) if all slots within the block are available at the same or lower level number.   |  |  |
| The procedure described in clauses 5.2.6.2.15 to 5.2.6.2.16 shall then be used to select  |  |  |
| one of the available blocks.  |  |  |
| Limits on selection of reserved slots   |  |  |
| A station which has selected a slot, that was reserved by another station shall not select another slot reserved by that station within M1 - 1 slots after the selected slot. |  |  |
|   |  |  |

# 5.2.6.3 Reserved transmissions

| Requirement |  |  |  |  |
|-------------|--|--|--|--|
| reference   |  |  |  |  |
| 5.2.6.3.1   | When a station has a burst to transmit for which it has a reservation, it shall transmit the |  |  |  |
|             | scheduled data in the reserved slots, except as noted below.                                 |  |  |  |
|             | Unavailable data   |  |  |  |
| 5.2.6.3.2   | If the data for a burst for which a slot was reserved is unavailable when it is time to      |  |  |  |
|             | transmit, then the station shall send a General Failure (see clause 5.2.20).                 |  |  |  |
|             | Reservation no longer valid  |  |  |  |
| 5.2.6.3.3   | A station shall check that a reservation is valid according to the procedures of             |  |  |  |
|             | clause 5.2.6.4 before transmitting.  |  |  |  |

## 5.2.6.4 Reservation conflicts

| Requirement reference |   |
|-----------------------|---|
| 5.2.6.4.1             | If a station, A, receives a burst containing a reservation from another station, B, for a slot which has already been reserved for station A to transmit, then station A shall take the following action:   |
| 5.2.6.4.2             | If the conflicting reservation from station B also requires station A to transmit, then station A shall transmit:   |
|                       | <ul> <li>(i) the response with the higher priority (as determined by Q1); or</li> <li>(ii) the first requested transmission in the case of equal priority; or else</li> </ul>   |
| 5.2.6.4.3             | If station A no longer requires to transmit in the existing reservation, or does not have the necessary information to transfer, then it shall not transmit in the slot, or else;   |
| 5.2.6.4.4             | If the existing reservation for station A to transmit was made by a station other than A (i.e. by a unicast request (sdf = 0), information transfer, or directed request reservation), then A shall transmit in the slot in accordance with the existing reservation; or else   |
| 5.2.6.4.5             | If the existing reservation for station A to transmit was made by A itself, then A shall apply the procedure described in clauses 5.2.6.2.7 to 5.2.6.2.14 to determine whether, in the knowledge of the reservation made by station B, the slot is available at any level 1, 2, 3 or 4, using the same values of Q2 and other parameters as originally used to select the slot or other VSS user supplied QoS parameters for conflict resolution; |
| 5.2.6.4.6             | If the slot is determined to be available by this process, then A shall transmit according to its existing reservation;   |
| 5.2.6.4.7             | If the slot is no longer available, the actions specified in table 5.10 shall be performed.   |

| Protocol for A's<br>existing reservation<br>(made by A)                        | Protocol for B's conflicting<br>reservation  | Action by A  |
|--|--|--|
| Slots reserved by station A<br>using ground quarantine (see<br>clause 5.2.3.2) | Any  | Transmit according to existing reservation.  |
| Periodic broadcast   | Incremental broadcast, big<br>negative dither<br>unicast request, or information<br>transfer                                     | Transmit according to existing reservation.  |
| Periodic broadcast   | Periodic broadcast<br>(autonomous/directed), directed<br>request, slots reserved by<br>ground quarantine (see<br>clause 5.2.3.2) | If the conflict occurs later than A's next<br>transmission in the stream, then select a<br>new transmission slot and reduce the<br>value of TV11 so as to cause the stream<br>to dither to the new slot prior to the<br>conflict; otherwise, set TV11 equal to 1<br>so that A's next transmission causes the<br>stream to dither to a different slot in the<br>next superframe after the superframe in<br>which the conflict first occurs. |
| Incremental broadcast  | Any  | Do not transmit in the existing<br>reservation, and make the transmission<br>in an alternative slot by random access<br>(see clause 5.2.7).  |

Table 5.10: Action in the event of reservation conflict

# 5.2.7 Random access protocol specification

### 5.2.7.1 General

| Requirement<br>reference |   |
|--------------------------|---|
|                          | The station shall implement a non-adaptive p-persistent algorithm to allow equitably all stations the opportunity to transmit while maximizing system throughput, minimizing transit delays, and minimizing collisions. |

### 5.2.7.2 Random access parameters

| Requirement reference |   |  |
|-----------------------|---|--|
| 5.2.7.2.1             | Random access parameters shall be as described in table 5.11. |  |

### Table 5.11: Random access VSS system parameters

| Symbol | Parameter name                    | Minimum  | Maximum     | Default | Increment |
|--------|-----------------------------------|----------|-------------|---------|-----------|
| TM2    | Channel busy timer                | 25 slots | 9 000 slots | 1 500   | 20 slots  |
| р      | persistence                       | 1/256    | 1           | 64/256  | 1/256     |
| VS3    | Maximum number of access attempts | 1        | 65 535      | 24      | 1         |

| Requirement reference |  |
|-----------------------|--|
|                       | Timer TM2 (channel busy timer)   |
| 5.2.7.2.2             | Timer TM2 indicates the number of slots (TM2) that a sublayer shall wait after receiving a request to transmit.  |
| 5.2.7.2.3             | This timer shall be started if it is not already running, when the VSS sublayer receives a request for random transmission.                            |
| 5.2.7.2.4             | Upon a successful random transmission access attempt, the timer shall be cleared if the random transmit queue is empty and reset if it is not empty.   |
| 5.2.7.2.5             | When the timer expires, the VSS user shall be informed that the channel is congested.  |
|                       | Parameter p (persistence)  |
| 5.2.7.2.6             | Parameter p shall be the probability that the station will transmit on any random access attempt.  |
| 5.2.7.2.7             | If the station is able to select a slot, then the station shall transmit on the slot boundary with probability p.                                      |
|                       | Counter VS3 (maximum number of access attempts)  |
| 5.2.7.2.8             | Counter VS3 shall be used to limit the maximum number of random access attempts (VS3) that a station will make for any transmission request.           |
| 5.2.7.2.9             | This counter shall be cleared upon system initialization, Timer TM2 expiring, or a successful access attempt.  |
| 5.2.7.2.10            | The counter shall be incremented after every unsuccessful random access attempt.   |
| 5.2.7.2.11            | When the counter reaches the maximum number of random access attempts, authorization to transmit shall be granted as soon as the channel is available. |

40

# 5.2.7.3 Random access procedures

| Requirement reference |   |
|-----------------------|---|
|                       | Random access procedures  |
| 5.2.7.3.1             | When the station has one or more bursts to transmit for which it does not have a reservation, it shall use a p-persistent algorithm as defined in [1], with the additional constraints defined below:                             |
| 5.2.7.3.2             | Access attempts shall only be made and transmission shall only begin on a slot boundary of available slots.   |
| 5.2.7.3.3             | A station shall regard a slot or block of slots as available for a random transmission if it conforms to the criteria of any of Levels 0 through 2 in table 5.9 using default or VSS user-supplied quality of service parameters. |
| 5.2.7.3.4             | Transmission shall not begin if the station has not previously made or received a reservation for the prior slot, and the slot is busy as defined in clause 5.1.5 at the slot boundary.   |
| 5.2.7.3.5             | If the station is unable to select a slot, this shall be regarded as an unsuccessful random access attempt.   |
|                       | Recommendation  |
| 5.2.7.3.6             | When possible, a station should use the reserved access protocols described in clause 5.2.6 to reserve slots for new transmissions by adding reservation fields to transmissions for which slots have already been reserved.      |
| 5.2.7.3.7             | The random access protocol should be used only if there is no suitable opportunity to reserve a slot.   |
|                       | Recommendation  |
| 5.2.7.3.8             | When possible, if there has been no previous reservation, a ground station should use ground quarantined slots for transmission.  |
| 5.2.7.3.9             | The random access protocol should be used only if there is no suitable opportunity to use ground quarantined slots.   |
|                       | Transmit queue management   |
| 5.2.7.3.10            | There shall be a single queue for all random transmissions which do not have reserved slots for transmission.   |
| 5.2.7.3.11            | This queue shall be sorted in priority order, with a higher value of Q1 being transmitted before a lower value of Q1.   |
| 5.2.7.3.12            | If Q3 is TRUE, then the queue shall be searched to determine if a burst of the same type has been queued.   |

### 5.2.8.1 General

| Requirement<br>reference |   |
|--------------------------|---|
|                          | A ground station shall be capable of being pre-programmed either to not transmit in certain slots with starting times expressed in UTC or to transmit specific transmissions in specific slots with starting times expressed in UTC (without necessarily announcing a reservation). |

### 5.2.8.2 Recommendation

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.8.2.1                | The user should specify the use of an appropriate reservation protocol to protect future fixed transmissions. |

# 5.2.9 Null reservation protocol specification

### 5.2.9.1 Null reservation burst format

| Requirement reference |   |
|-----------------------|---|
| 5.2.9.1.1             | A reservation ID (rid) = 1 and a reservation data (rd) field in accordance with table 5.12 shall indicate a null reservation. |

#### Table 5.12: Null reservation bit encoding

| Description                 | Octet | Bit number |   |   |   |   |   |   |   |
|-----------------------------|-------|------------|---|---|---|---|---|---|---|
| Description                 | Ociei | 8          | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| reservation data (rd) field | n-3   | Х          | х | х | х | х | х | 0 | 0 |
|                             | n-2   | 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.9.1.2                | In this case, the information field shall extend up to the last 10 bits prior to the CRC. |

# 5.2.10 Periodic broadcast protocol specification

### 5.2.10.1 Periodic broadcast reservation burst format

| Requirement<br>reference |   |
|--------------------------|---|
|                          | A reservation ID (rid) = 1 and a reservation field in accordance with table 5.13 shall indicate a periodic broadcast reservation. |
| 5.2.10.1.2               | In this case, the information field shall extend up to but excluding the last 10 bits prior to the CRC.                           |

| Description           | Octet | Bit number      |                 |                 |                 |                 |     |                 |                 |
|-----------------------|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----|-----------------|-----------------|
| Description           | Octei | 8               | 7               | 6               | 5               | 4               | 3   | 2               | 1               |
| periodic timeout (pt) | n-3   | х               | х               | х               | х               | х               | х   | pt <sub>2</sub> | pt <sub>1</sub> |
| periodic offset (po)  | n-2   | po <sub>8</sub> | po <sub>7</sub> | po <sub>6</sub> | po <sub>5</sub> | po <sub>4</sub> | po3 | po <sub>2</sub> | po <sub>1</sub> |

| Table 5.13: Periodic broad | dcast reservation bit encoding |
|----------------------------|--------------------------------|
|----------------------------|--------------------------------|

42

| Requirement reference |  |
|-----------------------|--|
| 5.2.10.1.3            | The subfields shall be as defined in table 5.14. |

#### Table 5.14: Periodic broadcast reservation field encoding

| Subfield              | Range        | Encoding                                      |
|-----------------------|--------------|---|
| periodic offset (po)  | -127 to +127 | two's complement math<br>po = -128 is invalid |
| periodic timeout (pt) | 0 to 3       |   |

# Requirement reference

| reference  |   |
|------------|---|
| 5.2.10.1.4 | po shall identify a slot relative to the first slot of the transmission in a future superframe. |
| 5.2.10.1.5 | pt shall define the number of superframes in the future for which a reservation is being        |
|            | made.   |

## 5.2.10.2 Periodic broadcast timers

| Requirement reference |  |
|-----------------------|--|
|                       | Timer TV11 (reservation hold timer)  |
|                       | The timer TV11 shall control the number of successive superframes which will use the same slot for transmission (see clause 5.2.10.5) before moving to a new slot. |
| 5.2.10.2.2            | There shall be one TV11 timer for each slot used for periodic broadcasts.  |

### 5.2.10.3 Periodic broadcast parameters

| Requirement reference |  |
|-----------------------|--|
|                       | The periodic broadcast protocol shall implement the system parameters defined in table 5.15. |

#### Table 5.15: Periodic broadcast VSS system parameters

| Symbol  | Parameter name                       | Minimum          | Maximum           | Recommended default | Increment        |
|---------|--------------------------------------|------------------|-------------------|---------------------|------------------|
| TV11min | Reservation hold timer minimum value | 0 superframes    | 15 superframes    | 4 superframes       | 1 superframe     |
| TV11max | Reservation hold timer maximum value | 1 superframe     | 16 superframes    | 8 superframes       | 1 superframe     |
| V11     | Nominal periodic rate                | 1 per superframe | 60 per superframe | 1 per superframe    | 1 per superframe |
| V12     | Periodic dither range                | (2/M1) x V11     | 1,00              | 0,10                | 0,01             |

| Requirement |   |
|-------------|---|
| reference   |   |
| 5.2.10.3.2  | TV11 min shall be less than or equal to TV11 max.   |
| 5.2.10.3.3  | The VSS user shall provide any of the parameters TV11 min, TV11 max, V11, V12 and Quality of        |
|             | Service (QoS) parameters (Q2a to Q2d and Q4) for which the default values are not desired.          |
|             | Parameters TV11min and TV11max  |
|             | (reservation hold timer minimum and maximum values)   |
| 5.2.10.3.4  | Parameters TV11min and TV11max shall be used to determine the start value for the TV11 timer,       |
|             | consistent with the procedure defined in clause 5.2.10.5.14.  |
|             | Parameter V11 (nominal periodic rate)   |
| 5.2.10.3.5  | The parameter V11 shall be the number of times per superframe that a VSS user will transmit a       |
|             | burst.  |
|             | Parameter V12 (periodic dither range)   |
| 5.2.10.3.6  | The parameter V12 shall define the range for candidate slots on either side of the nominal slot     |
|             | (see clauses 5.2.10.5.1 to 5.2.10.5.2) from which the station shall choose a slot or group of slots |
|             | to be reserved for transmission once the TV11 timer expires.  |
| 5.2.10.3.7  | V12 shall be specified as a fraction of the nominal periodic rate.                                  |

# 5.2.10.4 Periodic broadcast reception procedures

| Requirement<br>reference |   |
|--------------------------|---|
|                          | Upon receipt of a burst containing a periodic broadcast reservation, the station shall update its reservation table and carry out the actions as specified in table 5.16. |

| Table 5.16: Action on receipt of periodic broadcast reservation | on burst |
|---|----------|
|---|----------|

| Periodi   | c Periodic                          | Action   |
|-----------|-------------------------------------|--|
| offset (p | o) timeout<br>(pt)                  |  |
| 0         | 0                                   | No reservation (see note 1)  |
| Any exce  | pt 0, 1 or 2                        | Reserve the following slots for the source to broadcast:   |
| 0         |                                     | if $pt = 1$ or 2 then for $j = 1$ to $pt$ , the slots equal to $(j \times M1)$ through $(bl - 1 + (j \times M1))$<br>after the first slot of the received burst<br>AND |
|           |                                     | for $j = pt + 1$ to 4, the slots equal to $(po + (j \times M1))$ through $(bl - 1 + (po + (j \times M1)))$<br>slots after the first slot of the received burst         |
| 0         | 1 or 2                              | Reserve the following slots for the source to broadcast:   |
|           |                                     | for j = 1 to pt, the slots equal to (j x M1) through (bl - 1 + (j x M1)) after the first slot of the received burst  |
| any       | 3                                   | Reserve the following slots for the source to broadcast:   |
| ,         |                                     | for j = 1 to 4, the slots equal to (j x M1) through (bl - 1 + (j x M1)) after the first slot of the received burst.  |
|           |                                     | (see note 2)   |
| NOTE 1:   | Reservation for                     | mat is the same as null reservation (see clause 5.2.9).  |
| NOTE 2:   | The interpretation described in cla | on of the periodic offset subfield in the case of periodic timeout = 3 and io $\neq$ 0 binary is use 5.2.12.   |

| Requirement reference |  |
|-----------------------|--|
| 5.2.10.4.2            | All reservations associated with a single periodic broadcast reservation burst shall be known as a stream.   |
| 5.2.10.4.3            | The actions defined in table 5.16 shall cancel any previous reservations for the same stream.  |
| 5.2.10.4.4            | If a station was expecting to receive a transmission from a peer station containing a periodic broadcast reservation, but receives a transmission from the peer station containing an incremental reservation (see clause 5.2.11) or a unicast request with the source/destination flag set equal to 1 (see clause 5.2.14), the station shall cancel the periodic broadcast reservation stream for the peer station. |

| 5.2.10.5 | Periodic broadcast transmission procedures |
|----------|--|
|----------|--|

| Requirement reference |   |
|-----------------------|---|
|                       | Selection of nominal slots  |
| 5.2.10.5.1            | When operating without any directed-slot reservations (see clauses 5.2.16.1.7 to 5.2.16.1.9) for a given VSS User application which requires periodic broadcast transmissions, a station shall select nominal slots (n_slot) which form a periodic sequence in time, considering all frequencies used, with a variation of no more than $\pm$ slot as required to accommodate the constraints imposed by the nominal reporting rate   |
|                       | for the application and the slot rate on the channel.   |
| 5.2.10.5.2            | When operating with a mixture of directed-slot reservations, autonomous and directed rate reservations (see clauses 5.2.16.1.7 to 5.2.16.1.9) for a given VSS User application which requires periodic broadcast transmissions, a station shall select nominal slots (n_slot) for the autonomous or directed rate which form a periodic sequence in time, considering all frequencies used, with a variation of no more than ±1 slot as required to accommodate the constraints imposed by the nominal reporting rate for the application and the slot rate on the channel. |
| 504050                | Selection of slots for a periodic broadcast transmission  |
| 5.2.10.5.3            | If there is no existing periodic reservation for the VSS user, the station shall select a current transmission slot (ct_slot) corresponding to each nominal slot by inspection of the reservation table data, using the following procedure:  |
| 5.2.10.5.4            | The station shall use the slot selection procedure specified in clause 5.2.6.2 using all slots that are within truncate( $(V12/2) \times (M1/V11)$ )) of n_slot and within 127 slots of n_slot, as candidate slots, and the default or other VSS user supplied quality of servic parameters.  |
| 5.2.10.5.5            | When applying the slot selection procedure specified in clause 5.2.6.2, the station sha first select available slots at levels 0,1 and 2, excluding slots containing potential reservations associated with occupied slots as defined in clause 5.1.5.3.  |
| 5.2.10.5.6            | Selections at level 0 shall select from slots containing potential reservations associate with unoccupied slots in increasing order of signal level as defined in clause 5.1.5.4.   |
| 5.2.10.5.7            | If, on completion of the selection of available slots at level 2, less than Q4 slots have been chosen, the station shall select from slots containing potential reservations associated with occupied slots in increasing order of signal level as defined in clause 5.1.5.4.   |
| 5.2.10.5.8            | If at the end of this process, less than Q4 slots have been chosen, the station shall then continue the slot selection process at level 3.  |
|                       | Calculation of slot availability  |
| 5.2.10.5.9            | After selection of a new current transmission slot, the station shall compute the slot availability (s_avail), indicating how many consecutive superframes are available until the equivalent slot is reserved by another user.   |
| 5.2.10.5.10           | The value of s_avail shall indicate the slot (ct_slot + s_avail $\times$ M1) which is reserved b<br>another user, and range from 1 (for a slot that is reserved in the next superframe) to 4<br>(for slots that currently have no reservation for at least 3 superframes)   |
| 5.2.10.5.11           | The calculation of s_avail shall use the following rules:   |
| 5.2.10.5.12           | If the current transmission slot has not been previously reserved, s_avail shall be the number of superframes that are left before the equivalent slot is reserved;   |
| 5.2.10.5.13           | If the current transmission slot has been previously reserved by a station, s_avail shal be the number of superframes that are left before the equivalent slot is reserved by a different user.   |
| 5 2 10 5 1 <i>1</i>   | Transmission in a new slot  |
| 5.2.10.5.14           | If there is no prior reservation or if the station is using for the first time a slot for which there has been a prior reservation, the station shall start the timer TV11 at a value equal to s_avail, if s_avail = 1, 2 or 3, and otherwise equal to a random value uniforml chosen between TV11 min and TV11 max.  |
| E 0 40 E 4E           | Transmission for TV11 greater than 3  |
| 5.2.10.5.15           | If the TV11 timer is greater than 3 and there is no requirement to associate the curren transmission with an incremental reservation, the station shall transmit a burst containing a periodic broadcast reservation in the current transmission slot with io = 0 and $pt = 3$ .  |
| 5.2.10.5.16           | After transmission, the timer TV11 shall be decremented by one and the current  |
| -                     | transmission slot shall be incremented by M1.   |

| Requirement |   |
|-------------|---|
| reference   |   |
|             | Reservation of a new slot for TV11 equal to 1, 2, or 3  |
| 5.2.10.5.17 | If the TV11 timer is equal to 1, 2 or 3 and if the VSS user requires that periodic broadcast reservations are maintained after the current transmission slot reservation expires, the station shall reserve a future transmission slot (ft_slot) for subsequent transmissions.  |
| 5.2.10.5.18 | If a future transmission slot has already been selected, there shall be no further slot selection.  |
| 5.2.10.5.19 | Otherwise, selection of ft_slot shall be carried out using the procedure set out in clauses 5.2.10.5.3 to 5.2.10.5.8 using all slots that are within truncate $((V12/2) \times (M1/V11)))$ of n_slot and within 127 slots of n_slot and within 127 slots of ct_slot, except slot (ct_slot + TV11 × M1), as candidate slots. |
|             | Transmission for TV11 equal to 1, 2 or 3  |
| 5.2.10.5.20 | If the TV11 timer is equal to 1, 2 or 3 the station shall transmit a burst containing a periodic broadcast reservation in the current transmission slot with $po = (ft\_slot - ct\_slot)$ and $pt = TV11 - 1$ .   |
| 5.2.10.5.21 | If a future transmission slot has not been selected and the VSS user does not require the reservation to be maintained, the value of the po shall be set to zero.   |
| 5.2.10.5.22 | After transmission, the timer TV11 shall be decremented and the current transmission slot set equal to $ct_{slot} + M1$ .   |
|             | TV11 equal to zero  |
| 5.2.10.5.23 | If the TV11 timer is equal to zero, and the VSS user requires a reservation to be maintained, then if a new slot has not been selected for further periodic broadcasts, the station shall select a new current transmission slot using the procedures set out in clauses 5.2.10.5.3 to 5.2.10.5.8.                          |
| 5.2.10.5.24 | If a new slot has been selected for further periodic broadcasts, the station shall set the current transmission slot equal to the future transmission slot.   |
| 5.2.10.5.25 | The station shall start to transmit in the new current transmission slot carrying out the procedures set out in clauses 5.2.10.5.9 to 5.2.10.5.   |
| 5.2.10.5.26 | If the VSS user does not require a reservation to be maintained, no further action shall be taken.  |
|             | Reservation cancellation  |
| 5.2.10.5.27 | A station wishing to cancel a stream or reservations for its own transmissions, in the absence of a reservation conflict, shall transmit a periodic broadcast reservation burst with $po = 0$ and $pt = 0$ in the next reserved slot and the timer TV11 shall be cleared.   |
| 5.2.10.5.28 | A station receiving such a burst shall clear all reservations known to be associated with the stream.   |

# 5.2.11 Incremental broadcast protocol specification

### 5.2.11.1 Incremental broadcast reservation burst format

| Requirement reference |   |
|-----------------------|---|
| 5.2.11.1.1            | A reservation ID (rid) = 0 with extended reservation ID and reservation fields set in accordance with table 5.17 shall indicate an incremental broadcast reservation. |

### Table 5.17: Incremental broadcast reservation bit encoding

| Description             | Octet | Bit Number |   |                 |                 |                 |                 |                 |                 |
|-------------------------|-------|------------|---|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description             | Ociei | 8          | 7 | 6               | 5               | 4               | 3               | 2               | 1               |
|                         | n-3   | х          | х | х               | х               | х               | х               | io <sub>8</sub> | io <sub>7</sub> |
| incremental offset (io) | n-2   | 1          | 0 | io <sub>6</sub> | io <sub>5</sub> | io <sub>4</sub> | io <sub>3</sub> | io <sub>2</sub> | io <sub>1</sub> |

| Requirement reference |   |
|-----------------------|---|
|                       | In this case, the information field shall extend up to but excluding the last 10 bits prior to the CRC. |
| 5.2.11.1.3            | The subfields shall be as defined in table 5.18.  |

| Subfield                | Range    | Encoding              |
|-------------------------|----------|-----------------------|
| incremental offset (io) | 0 to 255 | (see clause 5.2.11.4) |

| Requirement |  |  |  |  |  |  |
|-------------|--|--|--|--|--|--|
| reference   |  |  |  |  |  |  |
| E 0 44 4 4  |  |  |  |  |  |  |

| 5.2.11.1.4 | io shall identify a slot relative to the first slot of the transmission. |
|------------|--|

### 5.2.11.2 Incremental broadcast parameters

| Requirement reference |   |
|-----------------------|---|
| 5.2.11.2.1            | The incremental broadcast protocol shall implement the system parameters defined in table 5.19. |

#### Table 5.19: Incremental broadcast VSS system parameters

| Symbol | Parameter name      | Minimum        | Maximum             | Recommended default   | Increment |
|--------|---------------------|----------------|---------------------|-----------------------|-----------|
| V21    | Nominal incremental | 960/M1 s       | 60 480/M1 s         | 1,0 s                 | 0,1 s     |
|        | period              |                |                     |                       |           |
| V22    | Maximum             | 720/(V21 x M1) | MIN(1,001-240/      | MIN(0,75, maximum     | 0,001     |
|        | incremental dither  |                | (V21 x M1), 61 200/ | allowed value of V22) |           |
|        | range               |                | (V21 x M1) - 0,999) |                       |           |

| Requirement reference |   |
|-----------------------|---|
| 5.2.11.2.2            | The VSS user shall provide any of the parameters V21, V22 and Quality of Service parameters (Q2a to Q2d and Q4) for which the default values are not desired.                                 |
|                       | Parameter V21 (nominal incremental period)  |
| 5.2.11.2.3            | The parameter V21 shall be the nominal time after the first slot of the incremental   |
|                       | broadcast transmission that a VSS user will transmit a burst.   |
|                       | Parameter V22 (maximum incremental dither range)  |
| 5.2.11.2.4            | The parameter V22 shall define the range for candidate slots on either side of the nominal slot from which the station shall choose a slot or group of slots to be reserved for transmission. |
| 5.2.11.2.5            | V22 shall be specified as a fraction of the nominal incremental period.   |

### 5.2.11.3 Incremental broadcast reception procedures

| Requirement<br>reference |  |
|--------------------------|--|
| 5.2.11.3.1               | Upon receipt of a burst containing an incremental broadcast reservation, a station shall reserve the slot equal to $(4 \times i0)$ through (bl - 1 + 4 × i0) after the first slot of the received burst for the source to broadcast. |
| 5.2.11.3.2               | When a burst contains an incremental broadcast reservation with io = 0, then no incremental reservation shall be placed.   |

| Requirement<br>reference |  |
|--------------------------|--|
|                          | Selection of the transmission slot for the incremental broadcast reservation   |
| 5.2.11.4.1               | If no slot or group of consecutive slots, has been reserved for transmission of an incremental reservation, and if the incremental reservation is not to be combined with a periodic broadcast reservation (see clause 5.2.12), the station shall select a slot or group of consecutive slots using the random access procedures (see clause 5.2.7).   |
| 5.2.11.4.2               | The transmission slot (t_slot) shall be the first slot of the incremental broadcast transmission.  |
|                          | Selection of the reserved slot for the incremental broadcast reservation   |
| 5.2.11.4.3               | <ul> <li>The station shall choose a slot or group of consecutive slots to reserve using the slot selection procedure specified in clause 5.2.6.2:</li> <li>a) using VSS user supplied quality of service parameters, and;</li> <li>b) candidate slots in the range (V21 × M1/60 - V22 × V21 × M1/60) through (V21 × M1/60 + V21 × M1,60 + bl - 1) such that the chosen slot, or the first slot in the chosen group of slots, is an exact modulo 4 difference from t_slot.</li> </ul> |
| 5.2.11.4.4               | The reserved slot (r_slot) shall be the chosen slot or the first slot in the chosen group of slots.  |
|                          | Incremental broadcast burst transmission   |
| 5.2.11.4.5               | The station shall transmit an incremental broadcast burst in the transmission slot with the value of io set to (r_slot - t_slot) / 4.  |

## 5.2.11.4 Incremental broadcast transmission procedures

# 5.2.12 Combined periodic broadcast and incremental broadcast protocol specification

### 5.2.12.1 Combined periodic broadcast and incremental broadcast reservation burst

| Requirement<br>reference |  |
|--------------------------|--|
|                          | A reservation ID (rid) = 1 and a reservation field in accordance with table 5.20 shall indicate a combined periodic broadcast and incremental broadcast reservation. |

#### Table 5.20: Combined periodic/incremental broadcast reservation bit encoding

| Description  | Oatat | Bit number      |                 |                 |                 |                 |                 |                 |                 |
|--|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description  | Octet | 8               | 7               | 6               | 5               | 4               | 3               | 2               | 1               |
| periodic timeout (pt) = 3  | n-3   | х               | х               | х               | х               | х               | х               | 1               | 1               |
| incremental offset (io)  | n-2   | io <sub>8</sub> | io <sub>7</sub> | io <sub>6</sub> | io <sub>5</sub> | io <sub>4</sub> | io <sub>3</sub> | io <sub>2</sub> | io <sub>1</sub> |
| NOTE: Bits denoted x are available for use within the information field. |       |                 |                 |                 |                 |                 |                 |                 |                 |

| Requirement reference |   |
|-----------------------|---|
| 5.2.12.1.2            | In this case, the information field shall extend up to the last 10 bits prior to the CRC. |
| 5.2.12.1.3            | The periodic timeout (pt) subfield shall be set to 3.                                     |
| 5.2.12.1.4            | The incremental offset subfield (io) shall be as defined in clause 5.2.11.1.              |
| 5.2.12.1.5            | All other parameters and procedures shall be as specified in clauses 5.2.10 and 5.2.11.   |

# 5.2.13 Big negative dither (BND) broadcast protocol specifications

### 5.2.13.1 BND reservation burst format

| Requirement reference |  |
|-----------------------|--|
|                       | A reservation ID (rid) = 0, an extended reservation ID (erid) = $00001$ binary, and reservation data set in accordance with table 5.21 shall indicate a Big Negative Dither (BND). |

### Table 5.21: BND broadcast reservation bit encoding

| Description   | Octet | Bit number |   |   |   |   |                 |                 |                 |
|---|-------|------------|---|---|---|---|-----------------|-----------------|-----------------|
| Description   | Ociei | 8          | 7 | 6 | 5 | 4 | 3               | 2               | 1               |
| negative dither (nd)  | n-3   | х          | х | Х | Х | х | х               | nd <sub>5</sub> | nd <sub>4</sub> |
| extended reservation ID (erid)  | n-2   | 0          | 0 | 0 | 0 | 1 | nd <sub>3</sub> | nd <sub>2</sub> | nd <sub>1</sub> |
| NOTE: Bits denoted x are not used by this reservation type and shall be available for use within the information field. |       | se         |   |   |   |   |                 |                 |                 |

| Requirement reference |  |
|-----------------------|--|
| 5.2.13.1.2            | The subfields shall be as defined in table 5.22. |

#### Table 5.22: BND broadcast reservation parameters

| Subfield             | Range   | Encoding   | Definitions   |
|----------------------|---------|------------|---|
| negative dither (nd) | 0 to 31 | See clause | nd identifies a slot relative to and earlier than the |
|                      |         | 5.2.13.3   | current slot + M1 - 128 slots.                        |

### 5.2.13.2 BND broadcast parameters

| Requirement reference |                              |
|-----------------------|------------------------------|
| 5.2.13.2.1            | There are no BND parameters. |

### 5.2.13.3 BND broadcast reception procedures

| Requirement reference |   |
|-----------------------|---|
|                       | Upon receipt of a burst containing a BND broadcast reservation, a station shall reserve the slots from (M1 - 128 - (4 × nd)) through (M1 - 128 - (4 × nd) + (bl - 1)) after the first slot of the received burst for the source to broadcast. |

# 5.2.14 Unicast request protocol specification

### 5.2.14.1 Unicast request reservation burst format

| Requirement reference |   |
|-----------------------|---|
| 5.2.14.1.1            | A reservation ID (rid) = 0 with an extended reservation ID and reservation fields set in accordance with table 5.23 shall indicate a unicast request reservation. |

| Description                   | Octet | Bit number       |                  |                  |                 |                 |                 |                 |                 |
|-------------------------------|-------|------------------|------------------|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description                   | Octei | 8                | 7                | 6                | 5               | 4               | 3               | 2               | 1               |
| destination address (d)       | n-8   | d <sub>24</sub>  | d <sub>23</sub>  | d <sub>22</sub>  | d <sub>21</sub> | d <sub>20</sub> | d <sub>19</sub> | d <sub>18</sub> | d <sub>17</sub> |
|                               | n-7   | d <sub>16</sub>  | d <sub>15</sub>  | d <sub>14</sub>  | d <sub>13</sub> | d <sub>12</sub> | d <sub>11</sub> | d <sub>10</sub> | d <sub>9</sub>  |
|                               | n-6   | d <sub>8</sub>   | d <sub>7</sub>   | d <sub>6</sub>   | d <sub>5</sub>  | d <sub>4</sub>  | d <sub>3</sub>  | d <sub>2</sub>  | d <sub>1</sub>  |
| source/destination flag (sdf) | n-5   | ro <sub>12</sub> | ro <sub>11</sub> | ro <sub>10</sub> | ro <sub>9</sub> | sdf             | d <sub>27</sub> | d <sub>26</sub> | d <sub>25</sub> |
| response offset (ro)          | n-4   | ro <sub>8</sub>  | ro <sub>7</sub>  | ro <sub>6</sub>  | ro <sub>5</sub> | ro <sub>4</sub> | ro <sub>3</sub> | ro <sub>2</sub> | ro <sub>1</sub> |
| length (lg)                   | n-3   | res              | res              | res              | res             | lg <sub>4</sub> | lg <sub>3</sub> | lg <sub>2</sub> | lg <sub>1</sub> |
| priority (pr)                 | n-2   | 0                | 0                | 1                | 0               | pr <sub>4</sub> | pr <sub>3</sub> | pr <sub>2</sub> | pr <sub>1</sub> |

#### Table 5.23: Unicast request reservation bit encoding

| Requirement reference |   |
|-----------------------|---|
| 5.2.14.1.2            | The subfields and associated actions shall be as defined in table 5.24. |

#### Table 5.24: Unicast request reservation field encoding

| Subfield                      | Range                   | Encoding/Actions  | Definitions  |
|-------------------------------|-------------------------|---|--|
| response offset (ro)          | 0 to 4 095              |   | ro identifies a slot relative to the   |
|                               |                         |   | first slot of the transmission.  |
| destination address (d)       | 0 to 2 <sup>27</sup> -1 | See clause 5.3.1.2.   | d is the 27-bit address of the   |
|                               |                         |   | destination station.   |
| source/destination flag (sdf) | Boolean                 | If $sdf = 0$ , reserve the response slot<br>for the destination station to transmit.<br>If $sdf = 1$ , reserve the response slot<br>for the source station to transmit. | sdf indicates which station will<br>respond in the reserved response<br>slot. Note that the source station<br>is the station placing the<br>reservation. |
| length (lg)                   | 0 to 15                 |   | Ig is one less than the number of slots that are reserved for the response.  |
| priority (pr)                 | 0 to 15                 | See table 5.8.  | -  |

| Requirement reference |   |
|-----------------------|---|
|                       | In the case that the address type field (see clause 5.3.1.2.1) is equal to 7, bits 1 through 24 of the destination subfield (d) shall be absent, so that the information field will extend up to the last four octets prior to the CRC. |
|                       | Otherwise, the burst shall include all of the destination subfield (d), so that the information field will extend up to the last seven octets prior to the CRC.   |

# 5.2.14.2 Unicast request reception procedures

| Requirement<br>reference |   |
|--------------------------|---|
|                          | <ul> <li>Upon receipt of a burst containing a unicast request reservation, a station shall reserve all of the slots from (1 + ro) through (1 + ro + lg) after the first slot of the received burst for:</li> <li>a) the destination to transmit a response to the source (if sdf = 0 and address type field &lt;&gt; 7); or</li> <li>b) for the source to transmit a response to the destination (if sdf = 1 and address type field &lt;&gt; 7); or</li> <li>c) for the source to make a broadcast transmission (if address type field = 7).</li> </ul> |

### 5.2.14.3 Slot selection criteria for unicast request with sdf = 1

| Requirement reference |   |
|-----------------------|---|
|                       | A station applying the slot selection criteria of clauses 5.2.6.2.7 to 5.2.6.2.13 shall exclude any slot reserved by another station using the unicast request protocol with sdf = 1. |

# 5.2.15 Information transfer request protocol specification

### 5.2.15.1 Information transfer request reservation burst format

| Requirement reference |  |
|-----------------------|--|
|                       | A reservation ID (rid) = 0 with extended reservation ID (erid) = 01010 binary and reservation fields set in accordance with table 5.25 shall indicate an information transfer request reservation. |

#### Table 5.25: Information transfer request reservation bit encoding

| Description                 | Octet | Bit number       |                  |                  |                 |                 |                 |                 |                 |
|-----------------------------|-------|------------------|------------------|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description                 | Ociei | 8                | 7                | 6                | 5               | 4               | 3               | 2               | 1               |
| acknowledgement offset (ao) | n-10  | res              | ao <sub>7</sub>  | ao <sub>6</sub>  | ao <sub>5</sub> | ao <sub>4</sub> | ao <sub>3</sub> | ao <sub>2</sub> | ao <sub>1</sub> |

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.15.1.2               | In this case, the information field shall extend up to the last nine octets prior to the CRC. |
| 5.2.15.1.3               | The subfields shall be as defined in table 5.26.  |

|                             |   | -   |
|-----------------------------|---|---|
| Subfield                    | Range   | Encoding  |
| length (lg)                 | See table 5.24.   | Ig is one less than the number of slots that are reserved for the response.   |
| acknowledgement offset (ao) | 0 to 127  | ao identifies a slot relative to the<br>end of the block of slots reserved<br>by the response offset and length<br>subfields. |
| response offset (ro)        | See table 5.24.   | ro identifies a slot relative to the first slot of the transmission.  |
| destination address (d)     | See clause 5.3.1.2.   | d is the 27-bit address of the destination station for which the block of slots is being reserved.                            |
| frequency (f)               | <ul> <li>bit 12: frequency band indicator:</li> <li>0: VHF band 108 MHz to 136,975 MHz</li> <li>1: reserved for future allocation</li> <li>bits 1 to 11: frequency allocation for bit 12 = 0.</li> <li>1 to 1 160 per frequency band in 25 kHz increments.</li> <li>1 161 to 2 047 reserved for future allocation.</li> <li>1 indicates bottom of band.</li> <li>f = 001 hex = 108,000 MHz</li> </ul> | The frequency subfield (f) identifies<br>the frequency on which the<br>reservation is to be made for the<br>response.         |
|                             | f = 000 hex if the subfield is to be ignored.   |   |

#### Table 5.26: Information transfer reservation field encoding

### 5.2.15.2 Information transfer request reception procedures

| Requirement reference |  |
|-----------------------|--|
| 5.2.15.2.1            | Upon receipt of a burst containing an information transfer request reservation, a station shall reserve on the specified frequency all of the slots from (1 + ro) through (1 + ro + lg) after the first slot of the received burst for the destination to transmit one or more information bursts to the source. |
| 5.2.15.2.2            | Also, the slot equal to (2 + ro + lg + ao) after the first slot of the received burst shall be reserved for the source to transmit an acknowledgement to the destination on the same frequency as the burst containing the information transfer request reservation.   |

# 5.2.16 Directed request protocol specification

### 5.2.16.1 Directed request reservation burst format

| Requirement reference |   |
|-----------------------|---|
|                       | A reservation ID (rid) = 0, an extended reservation ID (erid) = 01100 binary, and reservation fields set in accordance with table 5.27 shall indicate a directed request reservation. |

| Description                    | Octot | Bit number      |                 |                 |                 |                 |                 |                 |                 |
|--------------------------------|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|

| Requirement |  |
|-------------|--|
| reference   |  |
| 5.2.16.1.12 | Additional reserved slots shall be encoded as follows:   |
| 5.2.16.1.13 | Slots 1 to n shall be encoded in additional slots a1 to an;  |
| 5.2.16.1.14 | Additional slots $a_{n+1}$ to $a_{N}$ , where N is the maximum number of additional slots that can |
|             | be accommodated in the formats defined by tables 5.31 and 5.32, shall be set to zero.              |

### 5.2.16.2 Directed request parameters

# Requirement

| reference  |  |
|------------|--|
| 5.2.16.2.1 | The directed request protocol shall implement the system parameters defined in table 5.33. |

### Table 5.33: Directed request VSS system parameters

| Symbol | Parameter Name         | Minimum | Maximum   | Recommended default | Increment |
|--------|------------------------|---------|-----------|---------------------|-----------|
| V52    | Minimum response delay | 1 slot  | 500 slots | 20 slots            | 1 slot    |

| Requirement reference |  |
|-----------------------|--|
| 5.2.16.2.2            | The VSS user shall provide the destination address and any of the parameters V52 and Quality of Service parameters (Q2a to Q2d, Q4 and Q5) for which the default values are not desired. |
|                       | Parameter V52 (minimum response delay)   |
| 5.2.16.2.3            | Parameter V52 shall be the minimum time that a station will provide to a responder in order to ensure timely delivery in case a retransmission is required.                              |

### 5.2.16.3 Directed request reception procedures

| Requirement<br>reference |  |
|--------------------------|--|
|                          | Autotune reception procedures  |
| 5.2.16.3.1               | Upon receipt of a burst containing an autotune reservation (pr_flag = 0), the station shall update its reservation table and carry out the actions as specified in table 5.34. |

#### Table 5.34: Action on receipt of an autotune reservation burst

| Directed<br>offset (do) | Directed<br>timeout (dt) | Action  |
|-------------------------|--------------------------|---|
| 0                       | any                      | Operate autonomously.   |
| 1                       | any                      | Invalid   |
| 1 < do < M1             | dt < 15                  | Reserve the following slots for the destination to broadcast:<br>for j equal to 0 to 3 and k equal to 0 to nr - 1, the slots equal to<br>truncate (do + (k x M1/nr) + j x M1) through<br>(lg + truncate (do + (k x M1/nr) + j x M1)) after the first slot of<br>the received burst. |
| 1 < do < M1             | dt = 15                  | Reserve the following slots for the destination to broadcast:<br>for k equal to 0 to nr - 1, the slots equal to truncate<br>(do + (k x M1/nr)) through (lg + truncate (do + (k x M1/nr))) after<br>the first slot of the received burst.  |
| do > M1-1               | any                      | Invalid   |

| Requirement<br>reference |  |
|--------------------------|--|
| 5.2.16.3.2               | If the override (or) flag is set to 1, the destination shall cancel all previously placed autotune reservations made by the source station on frequency f (see clause 5.2.10.5).   |
| 5.2.16.3.3               | Otherwise, the station shall retain the previous reservations.   |
| 5.2.16.3.4               | The burst is invalid, and shall be handled as per clause 5.2.5, if the frequency subfield is equal to 000 hex, or fails to map to a known frequency, or indicates a frequency on which the transmitter cannot transmit.                |
|                          | Plea response reception procedures   |
| 5.2.16.3.5               | Upon receipt of a burst containing a plea response reservation (pr_flag = 1), a station shall reserve the slots equal to 'off' after the first slot of the received burst and the series of slots rj for the destination to broadcast. |
| 5.2.16.3.6               | If nr <> 'special', then rj shall be:<br>rj = (off + (j × nsr) + a <sub>i</sub> ) for j = 1 to N,  |
|                          | where N is the maximum number of additional slots defined in the additional slots subfield (see clauses 5.2.16.1.10 to 5.2.16.1.14).   |
| 5.2.16.3.7               | If nr = 'special', then rj shall be defined as:<br>rj = (off + [sum from m = 1 to j] a <sub>m</sub> ) for j = 1 to N.  |

| Requirement reference |   |
|-----------------------|---|
| Tererende             | Recommendation  |
| 5.2.16.4.1            | The directed request protocol with pr_flag = 0 (autotune reservation) should only be used by ground stations.   |
| 5.2.16.4.2            | Stations should use fixed transmission procedures to select slots for transmission of the autotune reservation burst and to form contiguous blocks of directed reservations.  |
| 5.2.16.4.3            | The transmitting station should ensure that, if two users are allocated the same slots, they are sufficiently separated and on divergent paths such that the possible loss of communications between them is not significant.   |
|                       | Autotune transmission procedures  |
| 5.2.16.4.4            | A station sending an autotune reservation $(pr_flag = 0)$ to its peer shall set the destination (d) subfield to the destination of the burst, the frequency (f) subfield to the frequency on which the responder is to transmit, the directed offset (do) subfield to either 0 (for a directed rate reservation), or the offset from the first slot of the autotune reservation burst to the first slot in which to transmit (for a directed slot reservation), the nominal rate (nr) subfield to the number of times per M1 slots that a response is requested using the encoding defined in table 5.28, and the directed time-out (dt) subfield to the span of dtxM1 slots over which the destination is to transmit. |
| 5.2.16.4.5            | The value of the directed offset (do) subfield shall be greater than V52.   |
|                       | Retransmission after no response  |
| 5.2.16.4.6            | There shall be no automatic retransmission of plea response bursts (pr_flag = 1).   |
| 5.2.16.4.7            | For autotune reservation bursts (pr_flag = 0), if a response is not received in the first directed slot after the autotune burst was transmitted, then the station shall retransmit the autotune reservation burst and inform the VSS user of the need for the re-transmission.   |
| 5.2.16.4.8            | Further re-transmission shall only be made at the request of the VSS User.  |
|                       | Cancellation of autotune reservation  |
| 5.2.16.4.9            | A station shall cancel an autotune reservation (pr_flag = 0) by transmitting an autotune reservation field with the directed time-out subfield set to 15.   |
| 5.2.16.4.10           | It shall set the destination subfield to the destination of the burst, the frequency subfield to the frequency on which the responder has previously been directed to broadcast, the directed offset (do) to the offset from the first slot of the autotune reservation burst to the first slot for which a reservation is to be cancelled and the nominal rate subfield to the number of slots per M1 slots for which a reservation is to be cancelled.  |
|                       | Plea response transmission procedures   |
| 5.2.16.4.11           | A station transmitting a plea response $(pr_flag = 1)$ shall set the destination (d) to the destination of the burst, the offset (off) subfield to the offset from the first slot of the reservation burst to the first slot in which to transmit, and the nominal rate (nr) subfield to the nominal number of times per M1 slots that a synchronization burst is to be sent on the frequency used for transmission.  |
| 5.2.16.4.12           | The value of the offset (off) subfield shall be greater than V52.   |
| 5.2.16.4.13           | A station shall ensure that the slots selected in the transmission satisfy the nominal update rate requirements and all of the requirements of clause 5.2.6.2.  |
| 5.2.16.4.14           | A station shall check to determine if a previous plea response had been sent to the mobile making the plea (i.e. the destination ID for this plea response).  |
| 5.2.16.4.15           | If a previous plea response had been sent to the mobile making the plea, the station shall begin the list of reserved slots with the remaining (future) reservations from the earlier plea response.  |
|                       | Recommendation  |
| 5.2.16.4.16           | To simplify and ease the reversion from a) directed slot operations on local channels, to b) directed rate or autonomous mode operations on another channel, ground stations should attempt to autotune mobile stations (using a directed slot reservation) to the new channel, for a period of at least 60 s, prior to release.  |

### 5.2.16.4 Directed request transmission procedures

# 5.2.17 Block reservation protocols specification

# 5.2.17.1 Superframe block reservation burst format

| Requirement reference |   |
|-----------------------|---|
|                       | A reservation ID (rid) = 0, an extended reservation ID (erid) = 110, and reservation fields set in accordance with table 5.35, with subfields defined in accordance with table 5.36, shall indicate a superframe block reservation. |

## Table 5.35: Superframe block reservation bit encoding

| Description   | Octet | Bit number        |                   |                   |                   |                   |                   |                   |                   |  |
|---|-------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|--|
| Description   | Ociei | 8                 | 7                 | 6                 | 5                 | 4                 | 3                 | 2                 | 1                 |  |
| destination address (d)                               | n-10  | d <sub>24</sub>   | d <sub>23</sub>   | d <sub>22</sub>   | d <sub>21</sub>   | d <sub>20</sub>   | d <sub>19</sub>   | d <sub>18</sub>   | d <sub>17</sub>   |  |
|   | n-9   | d <sub>16</sub>   | d <sub>15</sub>   | d <sub>14</sub>   | d <sub>13</sub>   | d <sub>12</sub>   | d <sub>11</sub>   | d <sub>10</sub>   | d <sub>9</sub>    |  |
|   | n-8   | d <sub>8</sub>    | d <sub>7</sub>    | d <sub>6</sub>    | d <sub>5</sub>    | d <sub>4</sub>    | d <sub>3</sub>    | d <sub>2</sub>    | d <sub>1</sub>    |  |
| block length (blg)                                    | n-7   | blg <sub>5</sub>  | blg <sub>4</sub>  | blg <sub>3</sub>  | blg <sub>2</sub>  | blg <sub>1</sub>  | d <sub>27</sub>   | d <sub>26</sub>   | d <sub>25</sub>   |  |
| re-broadcast offset (roff)                            | n-6   | roff <sub>8</sub> | roff <sub>7</sub> | roff <sub>6</sub> | roff <sub>5</sub> | roff <sub>4</sub> | roff <sub>3</sub> | roff <sub>2</sub> | roff <sub>1</sub> |  |
| block repeat rate (br)                                | n-5   | res               | res               | res               | res               | br <sub>4</sub>   | br <sub>3</sub>   | br <sub>2</sub>   | br <sub>1</sub>   |  |
| block start (bs)                                      | n-4   | bs <sub>8</sub>   | bs <sub>7</sub>   | bs <sub>6</sub>   | bs <sub>5</sub>   | bs <sub>4</sub>   | bs <sub>3</sub>   | bs <sub>2</sub>   | bs <sub>1</sub>   |  |
| block offset (bo)                                     | n-3   | bo <sub>8</sub>   | bo <sub>7</sub>   | bo <sub>6</sub>   | bo <sub>5</sub>   | bo <sub>4</sub>   | bo <sub>3</sub>   | bo <sub>2</sub>   | bo <sub>1</sub>   |  |
| extended reservation ID (erid),<br>block timeout (bt) | n-2   | 0                 | 0                 | 0                 | 1                 | 0                 | res               | bt <sub>2</sub>   | bt <sub>1</sub>   |  |

#### Table 5.36: Superframe reservation field encoding

| Subfield                   | Range             | Encoding  | Definitions   |
|----------------------------|-------------------|---|---|
| block timeout (bt)         | 0 to 3            |   | bt x M1 = the number of slots for<br>which the block reservation should<br>be maintained.                           |
| block repeat rate (br)     | 1 to 60           | See table 5.28. Codes<br>0111, 1110 and 1111 are<br>invalid   | Defines the number of blocks per minute.  |
| re-broadcast offset (roff) | 2 to 255          | bs = 0,1 invalid  | roff indicates the slot in which the re-<br>broadcast transmission should be<br>made.                               |
| block start (bs)           | 2 to 255          | bs = 0,1 invalid  | bs identifies a slot relative to the<br>transmission slot which is the first<br>slot of the first reserved block.   |
| block offset (bo)          | -127 to +127      | Two's complement math   | bo identifies an offset of each<br>reserved block at a future time<br>defined by bt x M1.                           |
| block length (blg)         | 0 to 31           |   | blg is one less than the number of slots reserved for the block.  |
| destination address (d)    | See<br>table 5.24 | Ignored if $ro = bs$ and octets<br>n - 10 through n - 8<br>available for use within the<br>information field. | d is the 27-bit address of the<br>destination station which is required<br>to re-broadcast the blocking<br>message. |

| Requirement reference |   |
|-----------------------|---|
| 5.2.17.1.2            | The information field shall extend up to the last nine octets prior to the CRC.                               |
|                       | A burst containing a superframe block reservation shall not exceed twenty-one octets (not including the CRC). |

| Requirement<br>reference |  |
|--------------------------|--|
|                          | A reservation ID (rid) = 0, an extended reservation ID (erid) = $00011$ , and reservation fields set in accordance with table 5.37, with subfields defined in accordance with table 5.38, shall indicate a second frame block reservation. |

#### 5.2.17.2 Second frame block reservation burst format

#### Table 5.37: Second frame block reservation bit encoding

| Description  | Ootot | Bit number      |                 |                 |                 |                 |                 |                 |                 |
|--------------|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description  | Octet | 8               | 7               | 6               | 5               | 4               | 3               | 2               | 1               |
| timeout (vt) | n - 3 | vt <sub>6</sub> | vt <sub>5</sub> | vt <sub>4</sub> | vt <sub>3</sub> | vt <sub>2</sub> | vt <sub>1</sub> | sz <sub>5</sub> | sz <sub>4</sub> |
| size (sz)    | n - 2 | 0               | 0               | 0               | 1               | 1               | sz <sub>3</sub> | sz <sub>2</sub> | sz <sub>1</sub> |

#### Table 5.38: Second frame block reservation field encoding

| Subfield     | Range   | Definitions                        |
|--------------|---------|------------------------------------|
| size (sz)    | 0 to 31 | Number of slots to block after the |
|              |         | start of each UTC second.          |
| timeout (vt) | 1 to 60 | Value of TV61.                     |

| Requirement reference |   |
|-----------------------|---|
| 5.2.17.2.2            | The information field shall extend up to the last octet prior to the CRC. |

### 5.2.17.3 Superframe block reservation parameters

| Requirement reference |  |
|-----------------------|--|
| 5.2.17.3.1            | The superframe block reservation protocol shall implement the system parameters defined in table 5.39. |

#### Table 5.39: Superframe block reservation VSS system parameters

| Symbol | Parameter name                           | Minimum | Maximum | Default | Increment                         |
|--------|--|---------|---------|---------|-----------------------------------|
| V61    | Superframe block start offset            | 2       | 255     | 20      | 1                                 |
| V62    | Superframe block length                  | 1       | 32      | 3       | 1                                 |
| V63    | Superframe block repeat rate             | 1       | 60      | 5       | See table 5.28 for allowed values |
| V64    | Superframe block<br>re-broadcast request | No      | Yes     | No      | -                                 |
| V65    | Superframe block<br>re-broadcast offset  | 2       | 255     | 10      | 1                                 |

| Requirement |  |
|-------------|--|
| reference   |  |
| 5.2.17.3.2  | For each superframe block reservation, the VSS user shall provide one or more sets of  |
|             | parameters consisting of:  |
|             | <ul> <li>a) the time of the required superframe block ground transmission;</li> </ul>  |
|             | b) the parameters V61 and V65 for which the default values are not desired;  |
|             | <ul> <li>c) Quality of Service parameters (Q2a to Q2d, Q4 and Q5) for which the default<br/>values are not desired.</li> </ul> |
| 5.2.17.3.3  | The station shall use the first set of parameters to calculate the position and subfield                                       |
|             | settings for the first ground station transmission as specified in clauses 5.2.17.7.3 to                                       |
|             | 5.2.17.7.6 and then use each following set to move the position of the reserved blocks.  |
| 5.2.17.3.4  | Where possible, the station shall pre-announce that a block is to move using the block   |
|             | offset subfield as defined in clauses 5.2.17.7.9 to 5.2.17.7.12.   |
|             | Parameter V61 (superframe block start offset)  |
| 5.2.17.3.5  | Parameter V61 shall be the offset to the start of the first reserved block from the slot                                       |
|             | containing the ground transmission.  |
|             | Parameter V62 (superframe block length)  |
| 5.2.17.3.6  | Parameter V62 shall be the length in slots of each reserved block.   |
|             | Parameter V63 (superframe block repeat rate)   |
| 5.2.17.3.7  | Parameter V63 shall be number of reserved slots per M1 slots encoded as defined in table 5.28.                                 |
|             | Parameter V64 (superframe block re-broadcast request)  |
| 5.2.17.3.8  | Parameter V64 shall determine whether the superframe block reservation request is to   |
|             | be re-broadcast by a mobile using the procedures defined in clauses 5.2.17.7.3 to  |
|             | 5.2.17.7.6.  |
|             | Parameter V65 (superframe block re-broadcast offset)   |
| 5.2.17.3.9  | Parameter V65 shall be the offset to the slot containing the re-broadcast from the slot  |
|             | containing the ground transmission.  |

## 5.2.17.4 Superframe block reservation reception procedures

| Requirement reference |   |  |
|-----------------------|---|--|
|                       | Upon receipt of a burst containing a superframe block reservation, the station shall take |  |
|                       | Ino action.   |  |

# 5.2.17.5 Second frame block reservation parameters

| Requirement reference |   |
|-----------------------|---|
|                       | The VSS user shall provide a value for the parameter TV61, defined in table 5.40, for which the default values are not desired. |

#### Table 5.40: Second frame block reservation parameters

| Symbol | Parameter Name                            | Minimum      | Maximum        | Default       | Increment                         |
|--------|---|--------------|----------------|---------------|-----------------------------------|
| TV61   | Second frame block<br>reservation timeout | 1 superframe | 60 superframes | 4 superframes | 1 superframe                      |
| V66    | Second frame block size                   | 0            | 31             | 8             | 1                                 |
| V67    | Second frame block repeat rate            | 0            | 60             | 3             | See table 5.28 for allowed values |

| Requirement<br>reference |  |
|--------------------------|--|
| 5.2.17.5.2               | For each second frame block reservation, the VSS user shall provide one or more sets of parameters consisting of the parameters V66 and V67 for which the default values are not desired and Quality of Service (QoS) parameters (Q2a to Q2d, Q4 and Q5) for which the default values are not desired. |
|                          | Timer TV61 (second frame block reservation timeout)  |
| 5.2.17.5.3               | The timer TV61 shall control the time which a second frame block reservation is valid.   |
|                          | Parameter V66 (second frame block size)  |
| 5.2.17.5.4               | Parameter V66 shall be the size of the second frame block.   |
|                          | Parameter V67 (second frame block repeat rate)   |
| 5.2.17.5.5               | Parameter V67 shall be number of times per M1 slots that a second frame reservation transmission is repeated encoded as defined in table 5.28.   |

# 5.2.17.6 Second frame block reservation reception procedures

| Requirement reference |   |
|-----------------------|---|
|                       | Upon receipt of a burst containing a second frame block reservation, the ground station shall take no action. |

| Requirement reference |  |
|-----------------------|--|
|                       | Recommendation   |
| 5.2.17.7.1            | The superframe block reservation protocol should only be used by ground stations.  |
| 5.2.17.7.2            | Stations should use fixed transmission procedures to select slots for transmission of the  |
|                       | superframe block reservation bursts  |
|                       | Procedures for establishment of reserved blocks of slots   |
| 5.2.17.7.3            | A station shall establish reserved blocks of slots by broadcasting a superframe block reservation.   |
| 5.2.17.7.4            | The station shall set the block start (bs) subfield to the offset from the first slot of the transmitted burst to the first slot of the first reserved block of slots as defined by parameter V61, the block repeat rate (br) subfield to the number of blocks per M1 slots defined by V63 using the encoding defined in table 5.28, the block length (blg) equal to one less than V62 and the block timeout (bt) subfield to the span of bt × M1 slots over which the reservations defined by bs and br are to be maintained. |
| 5.2.17.7.5            | If the value of bt is equal to zero, one or two, the value of the block offset (bo) subfield shall be set to zero if it is intended that the superframe block reservation will terminate after bt $\times$ M1 slots, or the offset from the first slot of the first reserved block if it is intended that the block reservation will move after bt $\times$ M1 slots.  |
| 5.2.17.7.6            | The value of bt shall not be set to -128.  |
|                       | Cancellation of reserved blocks of slots   |
| 5.2.17.7.7            | A station shall cancel a superframe block reservation by transmitting a superframe block reservation field with bt equal to zero, one or two and bo equal to zero, in which case the superframe block reservation will be cancelled after M1 × bt + bs slots.  |
| 5.2.17.7.8            | It shall set the block start (bs) to the offset from the first slot of the transmitted burst to the first slot of the first block for which a reservation is to be cancelled as defined by parameter V61, the block length (blg) equal to one less than V62 and the block repeat rate (br) subfield to the number of blocks per M1 slots defined by parameter V63 for which a superframe block reservation is to be cancelled, using the encoding defined in table 5.28.   |
|                       | Procedures to request re-broadcasting of a superframe block reservation  |
| 5.2.17.7.9            | To request that a station, B, re-broadcast the superframe block reservation, station A shall transmit a superframe block reservation.  |
| 5.2.17.7.10           | Station A shall set the destination (d) to the address of station B and set the re-broadcast offset (roff) subfield to the offset from the first slot of the reservation burst to the first slot in which B should transmit.   |
| 5.2.17.7.11           | The value of the re-broadcast offset (roff) subfield shall be less than the value of the block start (bs) subfield.  |
| 5.2.17.7.12           | If no re-broadcast of the superframe block message is required, the ground station shall set the re-broadcast offset (roff) subfield equal to the block start (bs) subfield and shall not include a destination (d) subfield.  |

# 5.2.17.7 Superframe block reservation transmission procedures

# 5.2.17.8 Second frame block reservation transmission procedures

| Requirement |   |
|-------------|---|
| reference   |   |
|             | Recommendation  |
| 5.2.17.8.1  | A ground station infrastructure which needs to maintain a Virtual Link Management           |
|             | Channel (VLMC) should not set the size (sz) subfield to zero.                               |
|             | Procedures for establishment of reserved blocks of slots                                    |
| 5.2.17.8.2  | When a ground station wishes to modify the length of the reserved blocks of slots in        |
|             | each second, it shall broadcast a second frame block reservation, V67 times per M1          |
|             | slots.  |
| 5.2.17.8.3  | The station shall set the block size (sz) subfield to the desired number of slots after the |
|             | start of each UTC second as defined by parameter V66.                                       |

### 5.2.18.1 Response burst format

| Requirement<br>reference |   |
|--------------------------|---|
|                          | A reservation ID (rid) = 0 with extended reservation ID (erid) = 00000binary with reservation fields set in accordance with table 5.41 shall indicate a response burst. |

#### Table 5.41: Response burst reservation bit encoding

| Description             | Octet | Bit Number      |                 |                 |                 |                 |                 |                 |                 |
|-------------------------|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Description             | Ociei | 8               | 7               | 6               | 5               | 4               | 3               | 2               | 1               |
| destination address (d) | n-5   | d <sub>24</sub> | d <sub>23</sub> | d <sub>22</sub> | d <sub>21</sub> | d <sub>20</sub> | d <sub>19</sub> | d <sub>18</sub> | d <sub>17</sub> |
|                         | n-4   | d <sub>16</sub> | d <sub>15</sub> | d <sub>14</sub> | d <sub>13</sub> | d <sub>12</sub> | d <sub>11</sub> | d <sub>10</sub> | d <sub>9</sub>  |

#### Requirement

| noquinomoni |  |
|-------------|--|
| reference   |  |
| 5.2.18.1.2  | In the case that the address type field (see clause 5.3.1.2) is equal to 7, bits 1 through   |
|             | 24 of the destination subfield (d) shall be absent.  |
| 5.2.18.1.3  | In this case the information field shall extend up to the last one octet prior to the CRC.   |
| 5.2.18.1.4  | Otherwise, the destination subfield (d) shall be the 27-bit address of the destination       |
|             | station (for which the response is addressed).   |
| 5.2.18.1.5  | In this case the information field shall extend up to the last four octets prior to the CRC. |
| 5.2.18.1.6  | No reservation shall be made as a result of receiving a response burst.                      |
| 5.2.18.1.7  | The VSS user shall provide the destination address.  |

# 5.2.19 General request protocol specification

### 5.2.19.1 General request burst format

| Requirement<br>reference |  |
|--------------------------|--|
|                          | To request a peer station to transmit a particular burst, a station shall send the burst described in table 5.42 to the desired destination station. |

#### Table 5.42: General request bit encoding

| Description                 | Octet    | Bit number        |                   |                 |  |                   |   |   |                  |  |
|-----------------------------|----------|-------------------|-------------------|-----------------|--|-------------------|---|---|------------------|--|
| Description                 | Ociei    | 8 7 6 5 4         |                   |                 |  |                   | 3 | 2 | 1                |  |
|                             | 5        | r-mi <sub>5</sub> |                   |                 |  | r-mi <sub>1</sub> | 0 | 0 | 1                |  |
| requested message ID (r-mi) | 6        | х                 | r-mi <sub>n</sub> | ni <sub>n</sub> |  |                   |   |   |                  |  |
| VSS user specific parameter | 7 to n-3 |                   |                   |                 |  |                   |   |   | prm <sub>1</sub> |  |
| (prm)                       | n-2      | prm <sub>n</sub>  | prm <sub>n</sub>  |                 |  |                   |   |   |                  |  |

|  |  | Denotes variable length field |
|--|--|-------------------------------|
|--|--|-------------------------------|

| Requirement reference |  |
|-----------------------|--|
|                       | VSS user-specific parameters shall be encoded starting in the octet following the most |
|                       | significant (high order) bit of the r-mi field.  |
| 5.2.19.1.3            | Unused bits (x) shall be filled with 0 on transmit and ignored on receive.             |
| 5.2.19.1.4            | The values of the subfields shall be computed as defined in table 5.43.                |

| Subfield                          | Range | Encoding          | Notes                             |
|-----------------------------------|-------|-------------------|-----------------------------------|
| requested message ID (r-mi)       | S     | ee clause 5.2.2.5 |                                   |
| VSS user specific parameter (prm) |       |                   | This is an optional field defined |
|                                   |       |                   | by the VSS user.                  |

| Requirement reference |   |  |
|-----------------------|---|--|
| 5.2.19.1.5            | The requested message ID (r-mi) shall define the VSS user, in accordance with |  |
|                       | table 5.3, which is responsible for handling the request.                     |  |

### 5.2.19.2 General request procedures

| Requirement reference |  |
|-----------------------|--|
|                       | Requester action   |
| 5.2.19.2.1            | For a VSS user to request that a peer VSS user transmit certain information, the VSS user shall transmit a general request burst with the requested ID (r-mi) field set to the desired response. |

# 5.2.20 General response protocol specification

# 5.2.20.1 General response burst format

| Requirement reference |   |
|-----------------------|---|
|                       | A station shall transmit a general response burst (either a General Failure or General Confirm) as defined in table 5.44 with the parameters defined in table 5.45 in response to certain requests from another station as described below. |

| Description                 | Octet    | Bit number        |                   |                  |                  |                  |                  |                  |                   |  |
|-----------------------------|----------|-------------------|-------------------|------------------|------------------|------------------|------------------|------------------|-------------------|--|
| Description                 | Ociei    | 8                 | 7                 | 6                | 5                | 4                | 3                | 2                | 1                 |  |
| confirm/failure flag (ok)   | 5        | ok                | 1                 | 1                | 1                | 0                | 1                | 0                | 1                 |  |
| requested message ID (r-mi) | 6        | res               | r-mi <sub>k</sub> |                  |                  |                  |                  |                  | r-mi <sub>1</sub> |  |
| backoff delay (bd)          | 7        | bd <sub>8</sub>   | bd <sub>7</sub>   | bd <sub>6</sub>  | bd <sub>5</sub>  | bd <sub>4</sub>  | bd <sub>3</sub>  | bd <sub>2</sub>  | bd <sub>1</sub>   |  |
| error type (err)            | 8        | err <sub>8</sub>  | err <sub>7</sub>  | err <sub>6</sub> | err <sub>5</sub> | err <sub>4</sub> | err <sub>3</sub> | err <sub>2</sub> | err <sub>1</sub>  |  |
| VSS user specific           | 9 to n-3 |                   |                   |                  |                  |                  |                  |                  | prm <sub>11</sub> |  |
| parameter (prm)             | n-2      | prm <sub>k8</sub> |                   |                  |                  |                  |                  |                  |                   |  |

Denotes variable length field

### Table 5.45: General response field encoding

| Subfield                          | Range                                      | Encoding                                   | Notes  |  |  |  |
|-----------------------------------|--|--|--|--|--|--|
| confirm/failure flag (ok)         |  | 1 = General confirm<br>0 = General failure |  |  |  |  |
| requested message ID (r-mi)       | See clause 5.2.2.4                         |  | Can extend into octet 7 for long extended ids. |  |  |  |
| backoff delay (bd)                | 0 to 255 integer seconds, FF hex = forever |  | In seconds, ignore on confirm.                 |  |  |  |
| error type (err)                  | See table 5.46                             |  |  |  |  |  |
| VSS user specific parameter (prm) | Defined by the VSS user                    |  |  |  |  |  |

| Requirement<br>reference |   |
|--------------------------|---|
| 5.2.20.1.2               | The requested message ID (r-mi) shall indicate the identity of the peer VSS user to which a response is being generated.  |
| 5.2.20.1.3               | The general response burst shall include one of the following reservation fields: unicast request reservation, information transfer request or response.  |
| 5.2.20.1.4               | The destination subfield contained in the reservation field shall indicate which VSS user is being responded to.  |
| 5.2.20.1.5               | The requested message ID (r-mi) shall define the VSS user, in accordance with table 5.3, which is responsible for handling the response.  |
| 5.2.20.1.6               | If the ok bit is set to 1 (i.e. a General Confirm), and the response does not utilize the parameter field, the information field shall contain the requested message ID (r-mi) subfield only with the remaining parameters omitted. |
| 5.2.20.1.7               | If the ok bit is set to 1 and the parameter field is used, then the bd and err fields shall be included and set to 00 hex.  |
| 5.2.20.1.8               | If the ok bit is set to zero (i.e. a General Failure), then the remaining parameters shall define the reason why the request failed.  |
| 5.2.20.1.9               | Error type (err) shall be encoded in accordance with table 5.46.  |
| 5.2.20.1.10              | Error types 00 hex to 7F hex shall apply to the responding station.   |
| 5.2.20.1.11              | Error types 80 hex to FF hex shall apply to the responding system.  |

### Table 5.46: Error type definition

| Cause   | Function  |                 | Parameter Encoding<br>(prm bits 1 to 8)                     |        |        |       |      |        |   |  |
|---|---|-----------------|---|--------|--------|-------|------|--------|---|--|
| Cause   | Function  | 8 7 6 5 4 3 2 1 |   |        |        |       |      |        |   |  |
| 00 hex  | Unsupported local function.<br>The parameters (defining the protocol options supported) will be<br>filled in when defined.                          | 0               | 0   | 0      | 0      | 0     | 0    | 0      | 0 |  |
| 01 hex  | Out of local resources.   | Res             | erve  | d.     |        |       |      |        |   |  |

| 80 hex  | Unsupported global function.<br>The parameters (defining the protocol options supported) will be<br>filled in when defined.                         | 0               | 0   | 0      | 0      | 0     | 0    | 0      | 0 |  |
| 81 hex  | Out of global resources.  | Res             | erve  | d.     |        |       |      |        |   |  |
| 82 hex  | VSS user-specific global error.   | Defi            | ned   | by the | e VS   | S use | ər.  |        |   |  |
| 83 to FC<br>hex   |   |                 |   |        |        |       |      |        |   |  |
| FD hex  | Rejected for internal policy reasons  | Set             | to ze   | ro or  | n tran | smit, | igno | ore oi | n |  |
| FE hex  | No response from VSS user.  | rece            | eipt.   |        |        |       |      |        |   |  |
| FF hex  | Other unspecified system reason.  |                 |   |        |        |       |      |        |   |  |

# 5.2.20.2 General response procedures

| Requirement reference |  |
|-----------------------|--|
|                       | If a reservation has been placed for a response or acknowledgement but the VSS sublayer has not received the response or acknowledgement from the VSS user in time for the scheduled reservation, the station shall send a General Failure (see clause 5.2.20.1.8) with cause code 7E hex or FE hex. |
| 5.2.20.2.2            | If a response is received, the VSS shall inform the VSS user.  |

# 5.3.1 Services

# 5.3.1.1 General

| Requirement<br>reference |  |
|--------------------------|--|
| 5.3.1.1.1                | The DLS shall support broadcast and multicast connectionless communications. |

### 5.3.1.2 Data transfer

| Requirement reference |  |
|-----------------------|--|
|                       | LME data shall be transferred in the information fields of UDATA data link protocol data units (DLPDUs). |
| 5.3.1.2.2             | LME data shall be contained in UCTRL DLPDUs only.  |

# 5.3.1.3 Station address encoding

| Requirement<br>reference |   |
|--------------------------|---|
|                          | Address type  |
| 5.3.1.3.1                | The address type field shall be encoded as defined in table 5.47. |

### Table 5.47: Address type field encoding

| Bit encoding |    | ding | Description type       | Bits 1 to 24                          |
|--------------|----|------|------------------------|---------------------------------------|
| 27           | 26 | 25   | Description type       | Bits 1 to 24                          |
| 0            | 0  | 0    | Mobile                 | Non-unique identity                   |
| 0            | 0  | 1    | Aircraft               | 24-bit ICAO address                   |
| 0            | 1  | 0    | Ground vehicles        | Nationally administered address space |
| 0            | 1  | 1    | Reserved               | Future use                            |
| 1            | 0  | 0    | Ground station         | ICAO-administered address space       |
| 1            | 0  | 1    | Ground station         | ICAO-delegated address space          |
| 1            | 1  | 0    | Reserved               | Future use                            |
| 1            | 1  | 1    | All stations broadcast | All stations                          |

| Requirement reference |   |
|-----------------------|---|
|                       | Non-unique identity address   |
| 5.3.1.3.2             | Mobile address types shall not be used by ground stations.  |
| 5.3.1.3.3             | When using VDL Mode 4 for ATS applications, aircraft shall use the unique 24-bit ICAO address.  |
|                       | Aircraft specific address   |
| 5.3.1.3.4             | The aircraft specific address field shall be the 24-bit ICAO aircraft address.  |
|                       | ICAO-administered ground station specific addresses   |
| 5.3.1.3.5             | The ICAO-administered ground station specific address shall consist of a variable-length country code prefix (using the same country code assignment defined in annex 10, volume III, chapter 9, appendix 1, table 1) and a suffix. |
| 5.3.1.3.6             | The appropriate authority shall assign the bits in the suffix.  |
|                       | ICAO-delegated ground station specific addresses  |
| 5.3.1.3.7             | The ICAO-delegated ground station specific address shall be determined by the organization to which the address space is delegated.   |
|                       | Broadcast and multicast addresses   |
| 5.3.1.3.8             | The broadcast and multicast addresses shall be used only as a destination address for UDATA DLPDUs.   |
|                       | Broadcast and multicast address encoding  |
| 5.3.1.3.9             | The broadcast and multicast addresses shall be encoded as in table 5.48.  |

### Table 5.48: Broadcast and multicast address encoding

| Broadcast destination                                | Type field               | Specific address field  |
|--|--------------------------|---|
| All mobiles that use non-unique addresses            | 000                      | All ones  |
| All mobiles  | 001                      | All ones  |
| All ground stations of a particular provider         | 100 or 101, as necessary | Most significant bits: Variable<br>length Provider code<br>Remaining bits: All ones |
| All ground stations with ICAO-administered addresses | 100                      | All ones  |
| All ground stations                                  | 101                      | All ones  |
| All stations   | 111                      | All ones  |

### 5.3.1.4 DLS burst formats

| Requirement reference |  |
|-----------------------|--|
|                       | UDATA DLPDU encoding   |
| 5.3.1.4.1             | A DLS station wishing to send a UDATA shall transmit one of the UDATA bursts         |
|                       | defined in tables 5.49 to 5.51 with the VSS user supplied QoS and reservation        |
|                       | parameters.  |
| 5.3.1.4.2             | The DLS station shall select between tables 5.49, 5.50 or 5.51 based on the UDATA ID |
|                       | (udid) of the message as defined by table 5.52.                                      |
| 5.3.1.4.3             | A DLS station sending a UCTRL shall set ucd to 0 and encode the appropriate ud field |
|                       | to the value of ucid per table 5.52.   |
| 5.3.1.4.4             | A DLS station sending a UINFO shall set ucd to 1 and encode the appropriate ud field |
|                       | to the value of uinf per table 5.53.   |

#### Table 5.49: One-byte UDATA burst format

| Description                | Octet | Bit Number       |                   |                  |                  |                  |     |   |   |  |  |
|----------------------------|-------|------------------|-------------------|------------------|------------------|------------------|-----|---|---|--|--|
| Description                | Ociei | 8                | 7                 | 6                | 5                | 4                | 3   | 2 | 1 |  |  |
| Message ID, UDATA ID (ud1) | 5     | ud1 <sub>5</sub> | ud1 <sub>4</sub>  | ud1 <sub>3</sub> | ud1 <sub>2</sub> | ud1 <sub>1</sub> | ucd | 1 | 1 |  |  |
|                            | 6     |                  |                   |                  |                  |                  |     |   |   |  |  |
|                            | 7     |                  |                   |                  |                  |                  |     |   |   |  |  |
| UDATA DLPDU                | 8     | Informat         | Information field |                  |                  |                  |     |   |   |  |  |

|                               | 11        |                   |                   |                   |                   |                   |                   |                   |   |  |  |  |
|                               | 12        |                   |                   |                   |                   |                   |                   |                   |   |  |  |  |
| NOTE: The UDATA DLPDU field r | nay be up | to ND4 of         | octets lo         | ng.               |                   |                   |                   |                   | NOTE: The UDATA DLPDU field may be up to ND4 octets long. |  |  |  |

#### Table 5.52: Encoding of the UDATA ID (udid) value

| UDATA ID (udid) | Encoded by  |
|-----------------|---|
| 0 to 29         | table 5.49, ud1 = udid                            |
| 30 to 285       | table 5.50, ud2 = udid - 30                       |
| 286 to 65 821   | table 5.51, ud3 = udid - 286                      |
| NOTE: The UCTRL | ID (ucid) subfield, is defined in clause 5.4.2.6. |

#### Table 5.53: UINFO ID (uinf) assignments

| UINFO ID (uinf)  | Assignment   |
|------------------|--|
| 0 to 60 000      | Reserved for future use  |
| 60 001 to 65 821 | Messages reserved for transmission by ground station only and defined by ground station operator |

# 5.3.2 DLS system parameters

| Requirement reference |   |
|-----------------------|---|
| 5.3.2.1               | The parameters needed by the DLS sublayer shall be as listed in table 5.54. |

#### Table 5.54: Data link service system parameters

| Symbol | Parameter name                | Minimum   | Maximum    | Default    | Increment |
|--------|-------------------------------|-----------|------------|------------|-----------|
| ND4    | Maximum length of UDATA burst | 23 octets | 496 octets | 271 octets | 1 octet   |

### 5.3.2.1 Parameter ND4 (maximum length of a UDATA burst)

| Requirement reference |   |
|-----------------------|---|
| 5.3.2.1.1             | The parameter ND4 shall define the maximum size in octets of a UDATA burst. |

69

# 5.3.3 DLS procedures

### 5.3.3.1 Broadcast

| Requirement<br>reference |   |
|--------------------------|---|
| 5.3.3.1.1                | Only UDATA DLPDUs shall be broadcast.   |
|                          | Action on receipt of UDATA DLPDU  |
| 5.3.3.1.2                | A station receiving a UDATA DLPDU shall forward the contents of the information field |
|                          | to the DLS user and take no further action.   |

### 5.3.3.2 DLS not supported

| Requirement<br>reference |  |
|--------------------------|--|
|                          | If the responder to a DLS DLPDU other than a UDATA DLPDU does not support the DLS, then it shall transmit a general failure (see clause 5.2.20) with an error type of 80 hex in the slot reserved by the unicast request reservation field contained in the data DLPDU transmission. |

### 5.3.3.3 User data packet reception

| Requirement<br>reference |   |
|--------------------------|---|
| 5.3.3.3.1                | When a UDATA DLPDU is received without errors from another station, it shall be |
|                          | passed to the service user as a single incoming user data packet.               |
| 5.3.3.3.2                | Otherwise it shall be discarded.  |
|                          | Unacknowledged DLPDUs   |
| 5.3.3.3.3                | UDATA DLPDUs shall be unacknowledged.   |

# 5.4 Link Management Entity sublayer

# 5.4.1 Services

| Requirement reference |  |
|-----------------------|--|
| 5.4.1.1               | The LME shall support the provision of broadcast services. |

# 5.4.2 Synchronization burst format

### 5.4.2.1 General

| Requirement<br>reference |  |
|--------------------------|--|
|                          | All VDL Mode 4 stations shall transmit synchronization bursts to support link<br>management. |

### 5.4.2.2 Fixed and variable data fields

| Requirement<br>reference |  |
|--------------------------|--|
|                          | The synchronization burst shall consist of two portions: a fixed data field containing information that is sent with each synchronization burst and a variable data field containing additional system management information that does not need to be included in each synchronization burst. |

### 5.4.2.3 Fixed data field format

| Requirement reference |   |
|-----------------------|---|
| 5.4.2.3.1             | Stations shall have fixed data fields as defined in table 5.55. |

#### Table 5.55: Synchronization burst format

| Description   | Oatat | Octet Bit number   |                    |                    |                   |                   |                   |                   |                   |

Denotes variable length field

| Requirement reference |   |
|-----------------------|---|
| 5.4.2.3.2             | The subfields shall be computed as defined in table 5.56. |

#### Table 5.56: Synchronization burst field encoding (fixed data field)

| Subfield                        | Range   | Encoding  | Notes             |
|---------------------------------|---------|---|-------------------|
| TCP/SVQ<br>change flag<br>(tqc) | Boolean | Encoded as described in clause 3.6 of<br>[1] if the message ID (see table 5.4)<br>indicates that the burst is a directed<br>synchronization burst. Otherwise<br>reserved for future definition and set<br>equal to 1. |                   |
| time figure of<br>merit (tfom)  | 0 to 3  | 0 = primary certified<br>1 = primary/non-certified<br>2 = secondary<br>3 = none of the above  | See clause 5.1.4. |

| Subfield                                  | Range          | Encoding  | Notes  |
|---|----------------|---|--|
| navigation<br>integrity<br>category (nic) | 0 to 15        | See table 5.57<br>Values 12 to 15 are reserved for future<br>definition   |  |
| latitude (lat)                            | -90° to +90°   | 12-bit low-resolution encoding according<br>to the CPR encoding algorithm adapted<br>for VDL Mode 4, as described in<br>clause 5.6  | The 12-bit CPR encoding provides<br>position to a resolution of<br>approximately ±140 m, within a<br>segment (patch) of approximately<br>600 nmi.      |
| longitude (lon)                           | -180° to +180° | 14-bit low-resolution encoding according<br>to the CPR encoding algorithm adapted<br>for VDL Mode 4, as described in<br>clause 5.6  | The 14-bit CPR encoding provides<br>position to a resolution of<br>approximately $\pm$ 120 m, within a<br>segment (patch) of approximately<br>600 nmi. |
| CPR format<br>even/odd                    | 0 to 1         | 0 = even<br>1 = odd<br>The CPR flag shall apply to all CPR<br>encoded sub-fields included in the<br>synchronization burst           |  |
| base altitude<br>(balt)                   | 0 to 4 095     | Base altitude is reported as specified in table 5.58  |  |
| baro/geo<br>altitude (b/g)                | 0 to 1         | 0 = barometric<br>1 = geometric   | Indicates whether barometric or geometric base altitude is reported.   |
| data age (da)                             | 0 to 15        | See table 5.59  |  |
| information<br>field ID (id)              | 0 to 15        | As defined by application standards.<br>Some values for the information field ID<br>are pre-reserved and defined in<br>clause 5.4.5 | Provides the information field identity contained in the variable data field (see clause 5.4.2.4).   |
| ID extension                              | 0 to 15        | See clauses 5.4.2.3.3 to 5.4.2.3.9  | Provides a means of increasing the<br>number of variable fields that can be<br>accommodated.   |
| information<br>field (in)                 | -              | As defined by application standards   | The information field contained in the variable data field (see clause 5.4.2.4).   |

| Requirement reference |  |
|-----------------------|--|
| 5.4.2.3.3             | The information field ID (id) and ID extension (idn) subfields shall provide addresses for information fields (in) as follows:   |
| 5.4.2.3.4             | <ol> <li>An information field ID (id) equal to F hex shall indicate that no information field<br/>is present.</li> </ol>   |
| 5.4.2.3.5             | <ol> <li>An information field ID (id) subfield equal to 0 hex to 9 hex or B hex to E hex<br/>shall indicate one of 14 information fields of length 54 bits.</li> </ol> |
| 5.4.2.3.6             | <ol> <li>ID extension 1 (id1) subfield shall only be present if the information field ID (id) is<br/>equal to A hex.</li> </ol>  |
| 5.4.2.3.7             | 4) An ID extension 1 (id1) subfield equal to 0 hex to 9 hex or B hex to F hex shall<br>indicate one of 15 information fields of length 50 bits.                        |
| 5.4.2.3.8             | <ol> <li>ID extension n (idn) subfield shall only be present if the ID extension n-1 (idn - 1)<br/>subfield is equal to A hex.</li> </ol>                              |
| 5.4.2.3.9             | An ID extension n (idn) subfield equal to 0 hex to 9 hex or B hex to F hex shall indicate one of 15 information fields of length 54 - 4n bits.                         |
| 5.4.2.3.10            | The station shall encode its navigation integrity (nic) in accordance with table 5.57.   |

| NIC | Required Navigation Performance (RNP) class | Horizontal and Vertical containment radius (R <sub>c</sub> ) |
|-----|---|--|
| 0   | Unknown integrity                           | R <sub>c</sub> ≥ 20 nmi                                      |
| 1   | RNP-10                                      | R <sub>c</sub> < 20 nmi                                      |
| 2   | RNP-4                                       | R <sub>c</sub> < 8 nmi                                       |
| 3   | RNP-2                                       | R <sub>c</sub> < 4 nmi                                       |
| 4   | RNP-1                                       | R <sub>c</sub> < 2 nmi                                       |
| 5   | RNP-0,5                                     | R <sub>c</sub> < 1 nmi                                       |
| 6   | RNP-0,3                                     | R <sub>c</sub> < 0,6 nmi                                     |
| 7   | RNP-0,1                                     | R <sub>c</sub> < 0,2 nmi                                     |
| 8   | RNP-0,05                                    | R <sub>c</sub> < 0,1 nmi                                     |
| 9   | Undefined                                   | R <sub>c</sub> < 75 m  |
| 10  | Undefined                                   | R <sub>c</sub> < 25 m  |
| 11  | Undefined                                   | R <sub>c</sub> < 7,5 m                                       |
| 12  | Reserved for future definition              | 6  |
| 13  | Reserved for future definition              |  |
| 14  | Reserved for future definition              |  |
| 15  | Reserved for future definition              |  |

### Table 5.57: Encoding of position Navigation Integrity Category (NIC)

| Requirement reference |   |  |
|-----------------------|---|--|
| 5.4.2.3.11            | The station shall encode base altitude in accordance with table 5.58. |  |

| Actual base altitude of transmitting station (feet) | Transmitted value of altitude | Decoded base altitude<br>(feet) (geo = WGS84<br>height except as noted) |
|---|-------------------------------|---|
| Unknown   | 0                             | altitude unknown  |
| altitude < -1 305                                   | 1                             | less than -1 300  |
| -1 305 ≤ altitude < -1 295                          | 2                             | -1 300  |
| -1 295 ≤ altitude < -1 285                          | 3                             | -1 290  |
| $\downarrow$  | $\downarrow$                  | $\downarrow$  |
| -15 ≤ altitude < -5                                 | 131                           | -10   |
| -5 ≤ altitude < 5                                   | 132                           | 0   |
| $5 \le $ altitude < 15                              | 133                           | 10  |
| $\downarrow$  | $\downarrow$                  | $\downarrow$  |
| 7 995 ≤ altitude < 8 005                            | 932                           | 8 000   |
| 8 005 ≤ altitude < 8 015                            | 933                           | 8 010   |

| 129 950 ≤ altitude < 130 050                        | 4 072                         | 130 000   |
| 130 050 ≤ altitude                                  | 4 073                         | more than or equal to<br>130 100  |
|   | 4 074 to 4 094                | reserved  |
| station on ground                                   | 4 095                         | station at 0 AGL  |

| Requirement<br>reference |  |
|--------------------------|--|
|                          | The data age (da) subfield shall be encoded based on the report latency which shall be the difference between the time of validity of the horizontal position data (latitude and longitude) and the time of transmission, in accordance with table 5.59. |

| Report latency (ms)           | Transmitted value of data age (da) | Decoded latency (ms) |
|-------------------------------|------------------------------------|----------------------|
| difference < 100              | 0                                  | 50                   |
| $100 \le difference < 200$    | 1                                  | 150                  |
| $200 \le difference < 300$    | 2                                  | 250                  |
| $\downarrow$                  | $\downarrow$                       | $\downarrow$         |
| 900 ≤ difference < 1 000      | 9                                  | 950                  |
| 1 000 ≤ difference < 1 200    | 10                                 | 1 100                |
| 1 200 ≤ difference < 1 500    | 11                                 | 1 350                |
| 1 500 ≤ difference < 2 000    | 12                                 | 1 750                |
| 2 000 ≤ difference < 3 000    | 13                                 | 2 500                |
| 3 000 ≤ difference < 4 000    | 14                                 | 3 500                |
| 4 000 ≤ difference or unknown | 15                                 | unknown              |

| Requirement reference |  |
|-----------------------|--|
| 5.4.2.3.13            | If the report latency is greater than 4 s, then nic shall be set to 0. |

## 5.4.2.4 Variable data field format

| Requirem | ent |
|----------|-----|
| -        |     |

| reference |  |
|-----------|--|
| 5.4.2.4.1 | The variable data field shall be available to carry additional information as may be       |
|           | required by another VSS user or application.   |
| 5.4.2.4.2 | The content and format of the variable data field shall be identified by the information   |
|           | field ID (id).   |
| 5.4.2.4.3 | The format of the variable data field corresponding to a given id shall be as specified in |
|           | the appropriate application standard.  |

## 5.4.2.5 Synchronization burst request

| Requirement<br>reference |   |
|--------------------------|---|
|                          | To request that a station transmit a synchronization burst with a specific information field, a station shall transmit a general request burst to the appropriate application process (see clause 5.4.5.2). |

## 5.4.2.6 Link management burst

| Requirement reference |   |
|-----------------------|---|
|                       | Link management data shall be contained within the information field of a UCTRL DLPDU as defined in table 5.60. |

| Description                    | Octot    | Bit Number        |                   |                   |                   |                   |                  |                  |                  |
|--------------------------------|----------|-------------------|-------------------|-------------------|-------------------|-------------------|------------------|------------------|------------------|
| Description                    | Octet    | 8                 | 7                 | 6                 | 5                 | 4                 | 3                | 2                | 1                |
| UCTRL DLPDU header             | n        | ucid <sub>5</sub> | ucid <sub>4</sub> | ucid <sub>3</sub> | ucid <sub>2</sub> | ucid <sub>1</sub> | 1                | 0                | 0                |
| CTRL parameter 1: Parameter ID | n+1      | id <sub>8</sub>   | id <sub>7</sub>   | id <sub>6</sub>   | id <sub>5</sub>   | id <sub>4</sub>   | id <sub>3</sub>  | id <sub>2</sub>  | id <sub>1</sub>  |
| Parameter length               | n+2      | lg <sub>8</sub>   | lg <sub>7</sub>   | lg <sub>6</sub>   | lg <sub>5</sub>   | lg <sub>4</sub>   | lg <sub>3</sub>  | lg <sub>2</sub>  | lg <sub>1</sub>  |

|                                | to       |                   |                   |                   | to                |                   |                  |                  |                  |
|                                | n+2 + lg | qlg <sub>8</sub>  | qlg <sub>7</sub>  | qlg <sub>6</sub>  | qlg <sub>5</sub>  | qlg <sub>4</sub>  | qlg <sub>3</sub> | qlg <sub>2</sub> | qlg <sub>1</sub> |
|                                |          |                   |                   | more              | CTRL p            | aramet            | ers              |                  |                  |
|                                |          | _                 |                   |                   |                   |                   |                  |                  |                  |
|                                |          | _                 |                   |                   |                   |                   |                  |                  |                  |
|                                |          |                   |                   |                   |                   |                   |                  |                  |                  |

#### Table 5.60: UCTRL DLPDU burst format

74

| Requirement reference |   |
|-----------------------|---|
| 5.4.2.6.2             | ucid = 0 shall indicate that the UCTRL DLPDU is a GSIF containing any of the CTRL |
|                       | parameters defined in clause 5.4.3.   |
| 5.4.2.6.3             | ucid = 1 shall indicate that the UCTRL DLPDU is a GSIF containing a CTRL DOS      |
|                       | parameter only as defined in clause 5.4.3.  |
| 5.4.2.6.4             | ucid = 5 to 31 are currently unassigned and available for future definition.      |

## 5.4.3 Control (CTRL) parameter formats

## 5.4.3.1 Encoding

| Requirement reference |   |
|-----------------------|---|
| 5.4.3.1.1             | The CTRL parameters described in this section shall be included in the user data field of UCTRL DLPDUs.                             |
| 5.4.3.1.2             | Except for parameter ID00 (which must appear last), the parameters in a CTRL DLPDU shall be listed in non-decreasing numeric order. |

## 5.4.3.2 VDL Mode 4 parameter identification

| Requirement reference |  |
|-----------------------|--|
|                       | Bits 7 and 8 of the parameter ID field shall allow simple identification of the purpose of the parameter as defined in table 5.61. |

#### Table 5.61: VDL Mode 4 parameter identifier purpose

| Bit 8 | Bit 7 | Purpose                                 |
|-------|-------|---|
| 0     | 0     | General purpose information parameter   |
| 0     | 1     | Ground-initiated modification parameter |
| 1     | 0     | Mobile-initiated information parameter  |
| 1     | 1     | Ground-initiated information parameter  |

| Requirement<br>reference |   |
|--------------------------|---|
| 5.4.3.3.1                | A ground LME shall use the ground-initiated modification parameters to change the                             |
|                          | value of various parameters in one or more mobiles.   |
|                          | VSS sublayer parameter  |
| 5.4.3.3.2                | This parameter defines the value of VS1, VS2, VS4 and VS5 that a mobile shall use, encoded as per table 5.62. |

## 5.4.3.3 Ground-initiated modification parameters

### Table 5.62: VSS sublayer parameter encoding

| Field            |      |      |                  | Notes            |                  |                  |                  |                  |                        |
|------------------|------|------|------------------|------------------|------------------|------------------|------------------|------------------|------------------------|
| Parameter ID     | 0    | 1    | 0                | 0                | 0                | 0                | 0                | 1                | VSS sublayer parameter |
| Parameter length | 0    | 0    | 0                | 0                | 0                | 0                | 1                | 1                |                        |
| Parameter value  | VS54 | VS53 | VS5 <sub>2</sub> | VS5 <sub>1</sub> | VS1 <sub>4</sub> | VS1 <sub>3</sub> | VS1 <sub>2</sub> | VS1 <sub>1</sub> | VS1, VS5 (dB)          |
|                  | 0    | 0    | VS2 <sub>6</sub> | VS25             | VS2 <sub>4</sub> | VS23             | VS22             | VS2 <sub>1</sub> | VS2 (dB)               |
|                  | 0    | VS47 | VS4 <sub>6</sub> | VS4 <sub>5</sub> | VS4 <sub>4</sub> | VS4 <sub>3</sub> | VS4 <sub>2</sub> | VS4 <sub>1</sub> | VS4 (nmi)              |

| Requirement<br>reference |   |
|--------------------------|---|
|                          | Quality of service parameter  |
| 5.4.3.3.3                | This parameter defines the quality of service parameters that a mobile shall use for priority levels Q1min to Q1max, encoded as per table 5.63. |

### Table 5.63: Quality of service parameter encoding

| Field            |                    | Bit position       |                    |                    |                    |                    |                    |                    |                                 |  |  |  |  |  |
|------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------------------|--|--|--|--|--|
| Parameter ID     | 0                  | 1                  | 0                  | 0                  | 0                  | 0                  | 1                  | 0                  | Quality of Service<br>parameter |  |  |  |  |  |
| Parameter length | lg <sub>8</sub>    | lg <sub>7</sub>    | lg <sub>6</sub>    | lg <sub>5</sub>    | lg <sub>4</sub>    | lg <sub>3</sub>    | lg <sub>2</sub>    | lg <sub>1</sub>    |                                 |  |  |  |  |  |
| Parameter value  | Q1max <sub>4</sub> | Q1max <sub>3</sub> | Q1max <sub>2</sub> | Q1max <sub>1</sub> | Q1min <sub>4</sub> | Q1min <sub>3</sub> | Q1min <sub>2</sub> | Q1min <sub>1</sub> |                                 |  |  |  |  |  |
|                  | Q2a <sub>8</sub>   | Q2a <sub>7</sub>   | Q2a <sub>6</sub>   | Q2a <sub>5</sub>   | Q2a <sub>4</sub>   | Q2a <sub>3</sub>   | Q2a <sub>2</sub>   | Q2a <sub>1</sub>   | Q2a (nmi)                       |  |  |  |  |  |
|                  | Q2b <sub>8</sub>   | Q2b <sub>7</sub>   | Q2b <sub>6</sub>   | Q2b <sub>5</sub>   | Q2b <sub>4</sub>   | Q2b <sub>3</sub>   | Q2b <sub>2</sub>   | Q2b <sub>1</sub>   | Q2b (nmi)                       |  |  |  |  |  |
|                  | Q2c <sub>8</sub>   | Q2c <sub>7</sub>   | Q2c <sub>6</sub>   | Q2c <sub>5</sub>   | Q2c <sub>4</sub>   | Q2c <sub>3</sub>   | Q2c <sub>2</sub>   | Q2c <sub>1</sub>   | Q2c (nmi)                       |  |  |  |  |  |
|                  | Q2d <sub>8</sub>   | Q2d <sub>7</sub>   | Q2d <sub>6</sub>   | Q2d <sub>5</sub>   | Q2d <sub>4</sub>   | Q2d <sub>3</sub>   | Q2d <sub>2</sub>   | Q2d <sub>1</sub>   | Q2d (nmi)                       |  |  |  |  |  |
|                  | Q2d <sub>10</sub>  | Q2d <sub>9</sub>   | Q2c <sub>10</sub>  | Q2c <sub>9</sub>   | Q2b <sub>10</sub>  | Q2b <sub>9</sub>   | Q2a <sub>10</sub>  | Q2a <sub>9</sub>   |                                 |  |  |  |  |  |
|                  | 0                  | 0                  | 0                  | Q4 <sub>5</sub>    | Q4 <sub>4</sub>    | Q4 <sub>3</sub>    | Q4 <sub>2</sub>    | Q4 <sub>1</sub>    | Q4                              |  |  |  |  |  |

| Requirement reference |  |
|-----------------------|--|
|                       | m2 filter parameters   |
| 5.4.3.3.4             | Table 5.64 shall define the encoding of parameters for the m2 filter [1] to be used by a mobile. |

### Table 5.64: m2 filter parameter encoding

| Field                   |                 |                 |                 | Notes           |                 |                 |                 |                |                      |
|-------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|----------------|----------------------|
| Parameter ID            | 0               | 1               | 0               | 0               | 0               | 0               | 1               | 1              | m2 filter parameters |
| Parameter length        | 0               | 0               | 0               | 0               | 0               | 0               | 1               | 1              |                      |
| M2inc parameter value   | i <sub>8</sub>  | i <sub>7</sub>  | i <sub>6</sub>  | i <sub>5</sub>  | i <sub>4</sub>  | i <sub>3</sub>  | i <sub>2</sub>  | i <sub>1</sub> | M2inc                |
| M2limit parameter value | I <sub>16</sub> | ۱ <sub>15</sub> | I <sub>14</sub> | I <sub>13</sub> | I <sub>12</sub> | I <sub>11</sub> | I <sub>10</sub> | ۱ <sub>9</sub> | M2limit              |
|                         | ۱ <sub>8</sub>  | ۱ <sub>7</sub>  | I <sub>6</sub>  | I <sub>5</sub>  | I <sub>4</sub>  | l <sub>3</sub>  | l <sub>2</sub>  | I <sub>1</sub> |                      |

| Requirement<br>reference |  |
|--------------------------|--|
| 5.4.3.3.5                | M2inc shall be encoded as an 8-bit unsigned integer.   |
| 5.4.3.3.6                | M2limit shall be encoded as a 16-bit unsigned integer.   |
|                          | CG1 filter parameters  |
| 5.4.3.3.7                | The values of parameters used by mobiles for the CG1 [1] filter shall be as defined in table 5.65. |
| 5.4.3.3.8                | CG1_plea shall be encoded as an 8-bit unsigned integer.  |
| 5.4.3.3.9                | CG1_range shall be encoded as an 8-bit unsigned integer.   |
| 5.4.3.3.10               | TL4 shall be encoded as an 8-bit unsigned integer.   |
| 5.4.3.3.11               | CG1_inc shall be encoded as an 8-bit unsigned integer.   |
| 5.4.3.3.12               | 1/CG1_decay shall be encoded as an 8-bit unsigned integer.   |
| 5.4.3.3.13               | CG1_limit shall be encoded as a 16-bit unsigned integer.   |

### Table 5.65: CG1 filter parameter encoding

| Field                       |                 |                 |                 | Notes           |                 |                 |                 |                |                       |
|-----------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|----------------|-----------------------|
| Parameter ID                | 0               | 1               | 0               | 0               | 0               | 1               | 0               | 0              | CG1 filter parameters |
| Parameter length            | 0               | 0               | 0               | 0               | 0               | 1               | 1               | 1              |                       |
| CG1_plea parameter value    | p <sub>8</sub>  | р <sub>7</sub>  | р <sub>6</sub>  | р <sub>5</sub>  | p <sub>4</sub>  | p <sub>3</sub>  | p <sub>2</sub>  | p <sub>1</sub> | CG1_plea              |
| CG1_range parameter value   | r <sub>8</sub>  | r <sub>7</sub>  | r <sub>6</sub>  | r <sub>5</sub>  | r <sub>4</sub>  | r <sub>3</sub>  | r <sub>2</sub>  | r <sub>1</sub> | CG1_range             |
| TL4 parameter value         | t <sub>8</sub>  | t <sub>7</sub>  | t <sub>6</sub>  | t <sub>5</sub>  | t <sub>4</sub>  | t <sub>3</sub>  | t <sub>2</sub>  | t <sub>1</sub> | TL4                   |
| CG1_limit parameter value   | Ι <sub>16</sub> | I <sub>15</sub> | I <sub>14</sub> | I <sub>13</sub> | I <sub>12</sub> | I <sub>11</sub> | I <sub>10</sub> | ۱ <sub>9</sub> | CG1_limit             |
|                             | ۱ <sub>8</sub>  | ۱ <sub>7</sub>  | I <sub>6</sub>  | ۱ <sub>5</sub>  | I <sub>4</sub>  | l <sub>3</sub>  | l <sub>2</sub>  | l <sub>1</sub> |                       |
| CG1_inc parameter value     | i <sub>8</sub>  | i <sub>7</sub>  | i <sub>6</sub>  | i <sub>5</sub>  | i <sub>4</sub>  | i <sub>3</sub>  | i <sub>2</sub>  | i <sub>1</sub> | CG1_inc               |
| 1/CG1_decay parameter value | d <sub>8</sub>  | d <sub>7</sub>  | d <sub>6</sub>  | d <sub>5</sub>  | d <sub>4</sub>  | d <sub>3</sub>  | d <sub>2</sub>  | d <sub>1</sub> | 1/CG1_decay           |

| Requirement reference |   |
|-----------------------|---|
|                       | Random access parameter   |
| 5.4.3.3.14            | The random access parameter shall define p, VS3 and TM2 used within the random access protocol, encoded as per table 5.66 (see note). |
| NOTE. piser           | ncoded as hexadecimal 00 (= decimal 1/256) to hexadecimal FF (= decimal 256/256).   |

#### Table 5.66: Random access parameter encoding

| Field            |                   |                   |                   | Bit po            | Notes             |                   |                   |                  |                                  |

## 5.4.3.4 Ground-initiated information parameters

| Requirement<br>reference |  |
|--------------------------|--|
| 5.4.3.4.1                | A ground LME shall use ground initiated information parameters to inform one or more |
|                          | mobile LMEs about that ground-based system's capabilities.                           |
|                          | Directory of Service (DOS) parameter   |
| 5.4.3.4.2                | The Directory of Service parameter shall be encoded as defined in table 5.67.        |

| Field           | Bit position     |                  |                  |                  |                   |                   |                   | Notes             |  |
|-----------------|------------------|------------------|------------------|------------------|-------------------|-------------------|-------------------|-------------------|--|
|                 | 8                | 7                | 6                | 5                | 4                 | 3                 | 2                 | 1                 |  |

|                 | a <sub>k8</sub>  | a <sub>k7</sub>  | a <sub>k6</sub>  | a <sub>k5</sub>  | a <sub>k4</sub>   | a <sub>k3</sub>   | a <sub>k2</sub>   | a <sub>k1</sub>   | application k (a <sub>k</sub> )  |
|                 | sit <sub>6</sub> | sit <sub>5</sub> | sit <sub>4</sub> | sit <sub>3</sub> | sit <sub>2</sub>  | sit <sub>1</sub>  | х                 | х                 | service information type (sit)   |
| NOTE: Bits den  | oted "x"         | may be           | e used v         | within t         | he reserva        | tion field.       |                   |                   |  |

#### Table 5.67: Directory of service message encoding

| Requirement reference |  |
|-----------------------|--|
| 5.4.3.4.3             | If the DOS parameter is included within a UCTRL DLPDU with the ucid subfield set to 1, then the DOS parameter ID and parameter length shall be omitted and no other parameter included in the UCTRL. |
| 5.4.3.4.4             | The current channel subfield shall always be present.  |
| 5.4.3.4.5             | One, two, or more other channel subfields (channel 1, channel 2, etc.) shall be added as required in a continuous bit sequence.  |
| 5.4.3.4.6             | The contents of the channel subfields shall be determined by the ai subfield as defined in table 5.68.   |

| Subfield                     | Range                          | Encoding  | Notes   |
|------------------------------|--------------------------------|---|---|
| entry number (ent)           | 0 to 15                        | ent = entry number of Directory of Services message.                                      | up to 16 different DOS<br>messages can be<br>accommodated associated with |
|                              |                                |   | each ground station transmitting DOS messages.                            |
| frequency (f)                |                                | See table 5.26  | indicates the channel on which the DOS service is provided.               |
|                              |                                | Absent in current channel subfield.   |   |
| GSC flag (gsc)               | 0 to 1                         | set to 1 if channel is a GSC  |   |
| additional service           | 0 to 7                         | bit 1: set to 1 if si field included  |   |
| information (ai)             |                                | bit 2: set to 1 if anum field present.  |   |
|                              |                                | bit 3: set to 1 if application (a) subfield(s) present.                                   |   |
| service information          | 0 to 63                        | Defines services indicated by each bit in   |   |
| type (sit)                   |                                | the service information field.  |   |
|                              |                                | As defined by application standards.  |   |
| service information<br>(si)  | Contains 8 single<br>bit flags | Bits indicate the services provided on the indicated channel.                             |   |
|                              |                                | bit set if service is available.  |   |
|                              |                                | Meaning of bits defined by application standards.   |   |
|                              |                                | field absent if ai bit $1 = 0$ .  |   |
| application number<br>(anum) | 0 to 15                        | Indicates the number of application fields present.                                       |   |
|                              |                                | field absent if ai bit $2 = 0$ .  |   |
| application (a)              | 0 to 255                       | Identifies a single service defined by  |   |
|                              |                                | application standards   |   |
|                              |                                | field absent if ai bit $3 = 0$  |   |
|                              |                                | if ai bit $1 = 0$ and ai bit $2 \neq 0$ , only one application subfield shall be present. |   |

Table 5.68: Directory of service message subfield encoding

| Requirement reference |  |
|-----------------------|--|
| 5.4.3.4.7             | The service information type (sit) subfield shall follow the last channel subfield.  |
| 5.4.3.4.8             | The subfields within each channel subfield shall be computed as defined in table 5.68.   |
| 5.4.3.4.9             | Each DOS parameter shall override any previous DOS parameter from the same ground station with the same entry number (ent).  |
| 5.4.3.4.10            | The upper bit of the application field shall be used as an extension field, so that a 0 indicates a one octet field and a 1 indicates that the ID continues in the next octet. |
| 5.4.3.4.11            | Application fields shall be allocated as defined in table 5.69.  |

### Table 5.69: Allocation of application fields

| Encoding<br>(decimal equivalent) | Allocation   |
|----------------------------------|--|
| 0 to 3                           | Defined for broadcast services (EN 301 842-3 [9])          |
| 4 to 31                          | Reserved for future allocation by ICAO                     |
| 32 to 63                         | Reserved for private allocation by service provider        |
| 64 to127                         | Reserved for future allocation by ICAO delegated authority |
| 128 to 255                       | Reserved for future use (extension of application field)   |

| Table 5.70: All | ocation of se | rvice informa | tion type fields |
|-----------------|---------------|---------------|------------------|
|-----------------|---------------|---------------|------------------|

| Encoding<br>(decimal equivalent) | Allocation   |
|----------------------------------|--|
| 0 to 3                           | Defined for broadcast services (EN 301 842-3 [9])          |
| 4 to 31                          | Reserved for future allocation by ICAO                     |
| 32 to 47                         | Reserved for private allocation by service provider        |
| 48 to 63                         | Reserved for future allocation by ICAO delegated authority |

## 5.4.4 LME procedures

## 5.4.4.1 Synchronization burst procedures

| Requirement<br>reference |  |
|--------------------------|--|
| 5.4.4.1.1                | All stations shall transmit the appropriate synchronization burst defined in clause 5.4.2 depending on whether it is a mobile station or a ground station.   |
| 5.4.4.1.2                | If the synchronization burst is transmitted with a periodic broadcast protocol, it shall use default QoS parameters except as defined in table 5.71.   |
| 5.4.4.1.3                | If the synchronization burst is not transmitted with a periodic broadcast protocol, slot selection shall use the default QoS parameters defined for the selected reservation protocol or user supplied QoS parameters. |

#### Table 5.71: Synchronization burst parameters

| Symbol | Parameter name                              | Default |
|--------|---|---------|
| V11    | Nominal periodic rate                       | 6       |
| Q1     | Priority                                    | 14      |
| Q2a    | Slot selection range constraint for level 1 | 380 nmi |
| Q2b    | Slot selection range constraint for level 2 | 380 nmi |
| Q2c    | Slot selection range constraint for level 3 | 0 nmi   |
| Q2d    | Slot selection range constraint for level 4 | 380 nmi |
| Q3     | Replace queued data                         | TRUE    |

| Requirement | 7   |
|-------------|---|
| reference   |   |
| 5.4.4.1.4   | The values of the subfields shall be the latest available data that can be obtained by the station at the start of the slot that is two slots before the first slot of the intended transmission. |
| 5.4.4.1.5   | Where time is used to calculate fields in the transmission, it shall be the time associated with the latitude and longitude data contained in the transmission.                                   |
|             | Transmission of synchronization bursts supporting applications  |
| 5.4.4.1.6   | The station shall transmit additional synchronization bursts required to meet the   |
|             | demands of any application.   |
|             | Ground stations   |
|             | Recommendation  |
| 5.4.4.1.7   | A set of ground stations should ensure that sufficient synchronization bursts are   |
|             | available to support the derivation of secondary timing.  |
|             | Procedures for conflict resolution  |
| 5.4.4.1.8   | For the purposes of assessing whether another reservation conflicts with a reservation for a synchronization burst, the station shall apply the procedures defined in clause 5.2.6.4.             |
| 5.4.4.1.9   | In this case, the quality of service parameters defined in table 5.72 or user supplied  |

### Table 5.72: Synchronization burst parameters for conflict resolution

| Symbol | Parameter name                              | Value                    |
|--------|---|--------------------------|
| Q1     | Priority                                    | As per information field |
| Q2a    | Slot selection range constraint for level 1 | 360 nmi                  |
| Q2b    | Slot selection range constraint for level 2 | 360 nmi                  |
| Q2c    | Slot selection range constraint for level 3 | 360 nmi                  |
| Q2d    | Slot selection range constraint for level 4 | 360 nmi                  |

## 5.4.4.2 Peer entity contact table (PECT)

| Requirement reference |  |
|-----------------------|--|
| 5.4.4.2.1             | Every station shall maintain a table of all known stations.  |
|                       | For each station, the table shall include the type of the station, a copy of the last of each type of broadcast burst, the time of the last transmission and a L1 counter. |
| 5.4.4.2.3             | The ability to reach a peer station shall be assumed lost after L1 missed reservations.  |

| Requirement reference |   |  |  |  |  |
|-----------------------|---|--|--|--|--|
|                       | Parameter TL4 (maximum delay for plea response)   |  |  |  |  |
| 5.4.4.3.1             | TL4 shall specify the maximum allowed time interval between receiving a plea and transmitting a plea response.  |  |  |  |  |
| 5.4.4.3.2             | A station receiving a plea shall attempt to respond as quickly as possible.   |  |  |  |  |
| 5.4.4.3.3             | If a response cannot be generated in TL4 s, the station shall purge the plea and not respond.   |  |  |  |  |
|                       | Conditions for application of network entry procedures  |  |  |  |  |
| 5.4.4.3.4             | When entering the network, a VSS user shall apply the network entry procedures defined in clauses 5.4.4.3.5 to 5.4.4.3.13.  |  |  |  |  |
|                       | Network entry using plea/response procedures  |  |  |  |  |
|                       | Plea response transmission procedures   |  |  |  |  |
| 5.4.4.3.5             | Upon receiving a network entry burst with a response reservation addressed to itself (i.e. a plea), a station shall take the following actions.   |  |  |  |  |
| 5.4.4.3.6             | If the station has observed the given frequency for at least the previous 60 s, and has<br>not initiated a network entry or re-entry procedure within the previous 60 s, it shall<br>transmit a plea response burst as defined in clauses 5.2.16.1.10 to 5.2.16.1.14<br>containing min (12, number of reservations required to allow one minute of<br>transmissions at the default sync burst rate for this channel) reservations or else if the<br>transmission rate is not known once per 10 s reservations.  |  |  |  |  |
| 5.4.4.3.7             | <ul> <li>These reservations shall be identified as follows: <ol> <li>unexpired reservations from any prior plea response addressed to the requesting station;</li> <li>any periodic reservations for the requesting station, not otherwise contained in a prior plea response and which a) do not conflict with other known reservations, and b) can be appended to a possible list of reservations in accordance with item (1) above (considering the encoding constraints of the plea response);</li> <li>additional reservations as required, using the selection parameters of table 5.73.</li> </ol> </li> </ul> |  |  |  |  |

## 5.4.4.3 Network entry protocol specifications

#### Table 5.73: Plea response parameters

| Symbol | Parameter name                              | Default |
|--------|---|---------|
| Q1     | Priority                                    | 2       |
| Q2a    | Slot selection range constraint for level 1 | 150 nmi |
| Q2b    | Slot selection range constraint for level 2 | 150 nmi |
| Q2c    | Slot selection range constraint for level 3 | 0 nmi   |
| Q2d    | Slot selection range constraint for level 4 | 300 nmi |
| Q3     | Replace queued data                         | TRUE    |
| Q4     | Number of available slots                   | 3       |

| Requirement reference |  |
|-----------------------|--|
| 5.4.4.3.8             | Otherwise the station shall ignore the burst.  |
| 5.4.4.3.9             | If the station cannot transmit the plea response within TL4 s of receiving the plea, the plea response shall be purged and not transmitted.  |
|                       | Recommendation   |
| 5.4.4.3.10            | The station should attempt to transmit the plea response as soon as possible following the plea (while still selecting the transmit slot randomly).  |
| 5.4.4.3.11            | The first reservation contained in the plea response should occur as soon as possible in time following the plea response, but not sooner than V52 slots.  |
| 5.4.4.3.12            | The station should attempt to reserve slots which are currently unreserved.  |
|                       | Network entry by full-slot random transmission   |
| 5.4.4.3.13            | In the event that a station has listened to a channel for a full minute prior to net entry, a station shall use default random transmission protocols with combined periodic/incremental reservation types to place each new periodic reservation and to simultaneously reserve the next selected slot in the same superframe for the transmission containing the next periodic reservation. |

## 5.4.5 Additional material for ADS-B applications

## 5.4.5.1 Information field formats

| Requirement reference |  |
|-----------------------|--|
| 5.4.5.1.1             | The information field formats shall be as defined in table 5.74. |

#### Table 5.74: ADS-B information fields

| Information field ID (id) | ID extension 1 (id1) | ID extension 2 (id2) | Information field name        |
|---------------------------|----------------------|----------------------|-------------------------------|
| B to E hex                | Not present          | not present          | Available for future use      |
| F hex                     | Not present          | not present          | No information field provided |

## 5.4.5.2 ADS-B request format

| Requirement<br>reference |   |
|--------------------------|---|
|                          | To request that a station transmit an ADS-B report consisting of a synchronization burst, a station shall transmit a general request burst with $r-mi1 = 0$ , and include the information as shown in table 5.75. |
| 5.4.5.2.2                | The information subfields shall be encoded according to table 5.76.   |

#### Table 5.75: ADS-B request bit encoding

| Description   | Ootot | Bit number |   |                    |                    |   |   |   |   |
|---|-------|------------|---|--------------------|--------------------|---|---|---|---|
| Description   | Octet | 8          | 7 | 6                  | 5                  | 4 | 3 | 2 | 1 |
| requested base altitude (r-b/a),<br>r-mi <sub>1</sub> (bit $8 = 0$ ), burst ID. | 5     | 0          | 0 | r-b/a <sub>2</sub> | r-b/a <sub>1</sub> | 0 | 0 | 0 | 1 |

#### Table 5.76: ADS-B request field encoding

| Subfield                            | Range  | Encoding   | Out of Scale | Notes |
|-------------------------------------|--------|--|--------------|-------|
| Requested base<br>altitude (r-b/a). | 0 to 3 | <ul> <li>0 = report either barometric or<br/>geometric.</li> <li>1 = report barometric or, if not<br/>available, report geometric.</li> <li>2 = report geometric or, if not<br/>available, report barometric.</li> <li>3 = reserved for future use.</li> </ul> |              |       |

## 5.5 Additional requirements for ground stations

## 5.5.1 System timing requirements

## 5.5.1.1 Maintenance of Primary time

| Requirement<br>reference |   |
|--------------------------|---|
| 5.5.1.1.1                | The ground station shall be capable of maintaining primary time for 1 hour after a GNSS outage. |

### 5.5.2.1 Ground station coordination

| Requirement reference |  |
|-----------------------|--|
|                       | The ground station shall be capable of coordinating its transmissions with other ground stations using an absolute time reference based on the UTC minute co-ordination frame. |

83

### 5.5.2.2 Network timing requirements

| Requirement reference |  |
|-----------------------|--|
| 5.5.2.2.1             | To co-ordinate transmissions between different ground stations or between different service providers, or between different nations, all transmission timings shall be defined in a UTC minute co-ordination frame, which is fixed to absolute UTC time. |
| 5.5.2.2.2             | The UTC minute co-ordination frame shall be used for the co-ordination of reservation<br>blocks.   |
| 5.5.2.2.3             | The start of the UTC minute co-ordination frame shall be aligned with the start of a UTC minute.   |
| 5.5.2.2.4             | The length of the UTC minute co-ordination frame shall be 60 s.  |
| 5.5.2.2.5             | The UTC minute co-ordination frame shall consist of 4 500 time slots.  |
| 5.5.2.2.6             | Positive leap seconds shall not be included within the UTC minute co-ordination frame.   |

## 5.5.2.3 Application interface requirements

| Requirement reference |  |
|-----------------------|--|
| 5.5.2.3.1             | <ul> <li>The ground station shall provide an interface for the input of user data as follows:</li> <li>message type (e.g. ADS-B, TIS-B, FIS-B);</li> <li>message content as required by each message type;</li> <li>link control information consisting of the location of slots reserved for transmission by the ground station and the frequency of transmission of superframe and second frame block reservations;</li> <li>the applicable reservation protocol and quality of service parameters associated with each message;</li> <li>transmission control information consisting of the time to transmit a message or the message repeat rate and indication whether the message is to be transmitted within a ground reserved slot.</li> </ul> |
| 5.5.2.3.2             | <ul> <li>The ground station shall provide an interface for the output of user data as follows:</li> <li>received message type;</li> <li>message content;</li> <li>time-of-arrival of received message.</li> </ul>  |

### 5.5.2.4 Transmission control requirements

| Requirement reference |   |
|-----------------------|---|
|                       | If no transmission control information is specified for a particular message, the ground station shall transmit the message within ground quarantined slots if available. |
| 5.5.2.4.2             | Otherwise it shall transmit the message in slots which have not been ground quarantined.  |

| Requirement reference |  |
|-----------------------|--|
| 5.5.2.5.1             | The ground station shall establish and maintain reserved blocks, based on transmission rate and size of blocks.  |
| 5.5.2.5.2             | The ground station shall choose mobiles for relaying of superframe block messages.   |
| 5.5.2.5.3             | The ground station shall accept control instructions from the ground server related to the establishment of reserved blocks of slots (blocking protocol to use, location of blocks on a UTC minute co-ordination frame, time for transmitting blocking message, control of relaying of blocking messages, etc.). |
| 5.5.2.5.4             | When a ground station wishes to request a rebroadcast of a superframe block reservation, it shall select a mobile, giving priority to those mobiles higher than FL200 and within 50 nm.  |
| 5.5.2.5.5             | No mobile shall be selected for rebroadcast more than once per minute unless there are insufficient mobiles within the coverage of the ground station.   |
| 5.5.2.5.6             | If suitable slots are available, the ground station shall allocate slots for the rebroadcast within a ground reserved block.   |

### 5.5.2.5 Superframe block reservation rebroadcast procedures

### 5.5.2.6 Fixed transmission parameters

| Require<br>refere   |     |  |
|---|-----|--|
| 5.5.2.  | 6.1 | To support the use of the fixed transmission protocol, the ground station shall allow a user to define the contents of the fields used in all reservation protocol burst formats and to specify the absolute time position of candidate slots used in the reserved access protocols. |
| NOTE: For the mobile, the user interacts via the VSS user parameters. However, in the ground station, the user can specify specific times and requires the ability to set reservation parameters to protect future transmissions. Hence, for example, if a user plans two transmission in sequence, positioned using fixed access, the user needs to be able to specific times first transmission where the second one will go via an appropriate reservation block containing user specified reservation parameters. |     |  |

## 5.5.2.7 Protection of fixed access protocol transmissions by ground quarantine

| Requirement reference  |   |
|--|---|
| 5.5.2.7.1  | If required by the user, the ground station shall position fixed access protocol transmissions within a slot or slots protected by pre-established ground quarantine. |
| NOTE: This requirement is a more flexible extension of the general requirement to allow users t specify a time for ground transmissions. The ground station decides the exact position o transmission. |   |

# 5.5.2.8 Protection of fixed access protocol transmissions by use of appropriate reservation protocols

| Requirement<br>reference  |  |
|---|--|
|   | If required by the user, the ground station shall append appropriate reservation blocks to protect each transmission within a series of ground transmissions. Alternatively the user shall be able to specify appropriate reservation protocols. |
| NOTE: This requirement is in addition to the general recommendation to allow users to specify an<br>appropriate reservation protocol. |  |

### 5.5.2.9 Restriction of autotune reservations

| Requirement reference |   |
|-----------------------|---|
| 5.5.2.9.1             | <ul> <li>The user shall be able to control which mobiles are placed under ground direction using the autotune reservation protocol via the following user options:</li> <li>1) Selection by mobile aircraft address;</li> <li>2) Selection of a fraction of all mobiles within a defined geographical area including ground position and altitude.</li> </ul> |

### 5.5.2.10 Transmission time for autotune reservations

| Requirement reference |  |
|-----------------------|--|
|                       | The user shall be able to restrict the timing of autotune transmission by the ground station to specified pre-existing quarantined blocks. |

### 5.5.2.11 Reporting of channel usage

| Requirement<br>reference |  |
|--------------------------|--|
| 5.5.2.11.1               | A ground station shall be able to report its current view of the reservation table for each channel to a local and/or remote management entity. The following options shall be available:  |
|                          | <ol> <li>a list of the current ground quarantined blocks established by the ground station;</li> <li>a list of the current blocks of slots that are known to be used by other ground stations (and hence avoided by the ground station);</li> </ol>  |
|                          | <ol> <li>statistics on the channel usage including percentage of slots for which there are<br/>reservations;</li> </ol>  |
|                          | <ol> <li>a list of mobiles currently under the direction of the ground station including<br/>identity, position and slots used;</li> </ol>   |
|                          | <ol> <li>data on specific mobiles within defined geographical regions including identity,<br/>position and slots reserved.</li> </ol>  |
| NOTE: This               | is an initial list which establishes the principle of "real time" monitoring of the ground   |
| stati<br>netv<br>coul    | on. Some of this information may be useful to other ground stations via a managed<br>ork. For example, the existence of mobiles in regions hidden to other ground stations<br>d be used to avoid garbled slots. The information could be used to supplement a ground<br>ons Peer Entity Contact table. |

## 5.6 Definitions for compact position reporting

## 5.6.1 Introduction

Void.

- 5.6.2 Parameter symbols, data types, constants and variables
- 5.6.2.1 Parameter symbols

| Parameter | Name                                 | Clause or table defined in     |
|-----------|--------------------------------------|--------------------------------|
| TR1       | Maximum age for use in global decode | Clauses 5.6.6.2.2 to 5.6.6.2.4 |
| TR2       | Maximum time between global updates  | Clauses 5.6.6.2.5 to 5.6.6.2.6 |

#### Table 5.77: Summary of parameter symbols for CPR

| Requirement reference |  |
|-----------------------|--|
| 5.6.2.2.1             | All calculations in this section shall use signed integers.  |
|                       | Results of calculations to perform encoding and decoding shall match the results when performed with 64-bit signed integer operations. |

#### 5.6.2.3 Constants

| Requirement<br>reference |   |
|--------------------------|---|
| 5.6.2.3.1                | Constants used in the description of CPR shall have the values defined in table 5.78. |

### Table 5.78: Constants used in CPR calculations

| Туре    | Name             | Value              | Description                              |
|---------|------------------|--------------------|--|
| Integer | LAT <sub>z</sub> | 9                  | Number of zones from 0° to 90° latitude  |
| Integer | MAX <sub>c</sub> | 2 <sup>51</sup>    | Maximum value for longitude and latitude |
| Integer | MAX <sub>c</sub> | 2 <sup>12</sup> -1 | Maximum transmitted latitude value       |
| Integer | $MAX_T^{lon}$    | 2 <sup>14</sup> -1 | Maximum transmitted longitude value      |

### 5.6.2.4 Variables

| Requirement reference |  |
|-----------------------|--|
| 5.6.2.4.1             | Variables used in CPR calculations shall have the type and range restrictions defined in |
|                       | table 5.79.  |
| 5.6.2.4.2             | [A,B] shall mean greater than or equal to A and less than or equal to B.                 |
| 5.6.2.4.3             | [A,B) shall mean greater than or equal to A and less than B.                             |

| Туре              | Name   | Range                         | Description   |
|-------------------|--|-------------------------------|---|
| External represe  | ntation  |                               |   |
| Real              | latitude   | [0,90], [270,360)             | The input latitude Note that a latitude of [-90,0] maps to [270,360]                    |
| Real              | longitude  | [0,360)                       | The input longitude   |
| Internal represen | tation   |                               |   |
| Integer           | type, type <sub>last</sub>                               | 0 or 1                        | The type of CPR ( $0 = even, 1 = odd$ )   |
| Integer           | clat <sub>in</sub> , clon <sub>in</sub>                  | [0, Max <sub>c</sub> ]        | Latitude and longitude to be encoded  |
| Integer           | tmp <sub>n</sub>   | [0, Max <sub>c</sub> ]        | Temporary variable number n. Only used to make expressions and functions more readable. |
| Integer           | clat <sub>ref</sub> , clon <sub>ref</sub>                | [0, Max <sub>c</sub> ]        | Reference latitude and longitude for local decoding.                                    |
| Integer           | X  |                               | Any integer   |
| Integer           | pos <sub>1</sub> , pos <sub>2</sub>                      | [0, Max <sub>c</sub> ]        | A latitude or longitude.  |
| Integer           | clat <sub>dec</sub> , clon <sub>dec</sub>                | [0, Max <sub>c</sub> ]        | Decoded latitude and longitude.   |
| Integer           | bits   | 3,5 or 7                      | Number of bits for the magnitude offset.  |
| Integer           | lat <sub>offs</sub> , lon <sub>offs</sub>                | [0,2 <sup>bits</sup> -1]      | Latiude and Longitude offset.   |
| Integer           | s <sub>lat</sub> , s <sub>lon</sub>                      | 0 or 1                        | Sign of the latitude and longitude offset.  |
| Integer           | lat <sub>p</sub>   | [0, 18]                       | The latitude patch.   |
| Integer           | lonp   | [0, 35]                       | The longitude patch.  |
| Link representati |  | 1                             |   |
| Integer           | cprf   | 0 or 1                        | CPR format even/odd.  |
| Integer           | lat  | $0, MAX_T^{lat}$              | Encoded latitude.   |
| Integer           | lon  | $[0, MAX_T^{lat}]$            | Encoded longitude.  |
| Integer           | lat <sub>ref</sub> , lat <sub>0</sub> , lat <sub>1</sub> | $[0, MAX_T^{lat}]$            | Encoded latitude.   |
| Integer           | lon <sub>ref</sub> , lon <sub>0</sub> , lon <sub>1</sub> | $[0, MAX_T^{lat}]$            | Encoded longitude.  |
| Integer           | lat4, lat6, lat8   | [0, 2 <sup>bits + 1</sup> -1] | Encoded latitude offset.  |
| Integer           | lon4, lon6, lon8   | [0, 2 <sup>bits + 1</sup> -1] | Encoded longitude offset.   |
| Integer           | pid  | [0, 179]                      | Encoded patch ID.   |

## 5.6.2.5 Functions

| Requirement |  |
|-------------|--|
| reference   |  |
| 5.6.2.5.1   | Functions used in CPR shall have the input parameters and return values defined in table 5.80. |

| Туре       | Name   | Description   |
|------------|--|---|
|            | eturns value in internal representation  | •   |
| Integer    | nz (type)  | Number of zones depending on the type (odd/even) of CPR format.                                     |
| Integer    | dlat (type)  | Latitude patch size for type type.  |
| Integer    | nl (clat <sub>dec</sub> , type)  | Looks up the value in the transition level table 5.81.  |
| Integer    | dlon (clat <sub>dec</sub> , type)  | Longitude patch size at latitude clatdec for type type.   |
| Integer    | lat <sub>offs</sub> (lat, lat <sub>ref</sub> )   | Latitude zone offset  |
| Integer    | lon <sub>offs</sub> (lon, lon <sub>ref</sub> )   | Longitude zone offset   |
| Integer    | dec <sub>lat</sub> (clat <sub>ref</sub> , lat, lat <sub>ref</sub> , type)                              | Local latitude decoding.  |
| Integer    | dec <sub>lon</sub> (clat <sub>dec</sub> , clon <sub>ref</sub> , lon, lon <sub>ref</sub> , type)        | Local longitude decoding.   |
| Integer    | $lat_{seg}$ ( $lat_0$ , $lat_1$ , type <sub>last</sub> )   | Latitude segment for global decoding.   |
| Integer    | lon <sub>seg</sub> (lon <sub>0</sub> , lon <sub>1</sub> , clat <sub>dec</sub> , type <sub>last</sub> ) | Longitude segment for global decoding.  |
| Integer    | $globalDec_{lat}$ (lat <sub>0</sub> , lat <sub>1</sub> , type <sub>last</sub> )                        | Global latitude global.   |
| Integer    | $globalDec_{lon}$ ( $lon_0$ , $lon_1$ , $clat_{dec}$ , $type_{last}$ )                                 | Global longitude global.  |
| Integer    | fix (x)  | Converts negative co-ordinates to positive.   |
| Integer    | lookup (clat <sub>in</sub> , type)   | The value that corresponds to c <i>lat<sub>in</sub></i> and <i>type</i> in the                      |
|            |  | transition level table.   |
| Integer    | diff (pos <sub>1</sub> , pos <sub>2</sub> )  | The (shortest) distance between $pos_1$ and $pos_2$ .   |
| Integer    | sign (pos <sub>1</sub> , pos <sub>2</sub> )  | The sign of <i>diff (pos<sub>1</sub>, pos<sub>2</sub>)</i> .  |
| Integer    | $offset_{dec}^{hat}(lat_{offs}, s_{hat}, bits, type)$  | Calculates the true offset for the latitude offset given in <i>bits</i> bits.                       |
| Integer    | $offset_{dec}^{lon}(clat_{dec}, lon_{offs}, s_{lon}, bits, type)$                                      | Calculates the true offset for the longitude offset given in <i>bits</i> bits.                      |
| Integer    | fullDec <sub>lat</sub> (lat, lat <sub>p</sub> , type)  | Decodes full position latitude.   |
| Integer    | fullDec <sub>lon</sub> (clat <sub>dec</sub> , lon, lon <sub>p</sub> , type)                            | Decodes full position longitude.  |
| Function r | eturns value in link representation  |   |
| Integer    | enc <sub>lat</sub> (clat <sub>in</sub> , type)   | Returns the CPR encoded value for clat <sub>in</sub> using type <i>type</i> .                       |
| Integer    | enc <sub>lon</sub> (clat <sub>dec</sub> , clon <sub>in,</sub> type)                                    | Returns the CPR encoded value for clon <sub>in</sub> using type <i>type</i> .                       |
| Integer    | $offset_{enc}^{lat}(clat_{in}, clat_{dec}, bits, type)$  | The difference between clat <sub>in</sub> and clat <sub>dec</sub> expressed using <i>bits</i> bits. |
| Integer    | $offset_{enc}^{lon}(clat_{dec}, clon_{in}, clon_{dec}, bits, type)$                                    | The difference between lon <sub>in</sub> and clon <sub>dec</sub> expressed using <i>bits</i> bits.  |
| Integer    | enc <sub>patch</sub> (lat <sub>p</sub> , lon <sub>p</sub> )  | Encode the patch id.  |

Table 5.80: Input parameters and return values for functions used in CPR calculations

88

## 5.6.2.6 Patch constants

| Requirement<br>reference |  |
|--------------------------|--|
|                          | Transition table   |
| 5.6.2.6.1                | The function <i>lookup(clatin, type)</i> shall return the value in the number of zones (even or odd, depending on <i>type</i> ) column in table 5.81 for which the <i>clatin</i> value satisfies the restriction in the Range(integer) column. |

| Range (degrees)                         | Range (integer)                   | Number of<br>zones<br>Even | Number of<br>zones<br>Odd |

### Table 5.81: Transition table for *lookup* function

| Patch size functions   |
|--|
| The size of a latitude and longitude patch shall be:<br>$nz(type) = 4 \cdot LAT_Z - type$<br>$dlat(type) = \frac{MAX_C}{nz(type)}$<br>$nl(clat_{in}, type) = \begin{cases} lookup(clat_{in}, type) & \text{if } clat_{in} < MAX_C/2 \\ lookup(MAX_C - clat_{in}, type) & \text{else} \end{cases}$<br>$dlon(clat_{in}, type) = \frac{MAX_C}{nl(clat_{in}, type)}$ |
|  |

## 5.6.3 Fixed data field position encoding

## 5.6.3.1 General

| Requirement<br>reference |   |
|--------------------------|---|
|                          | Given an arbitrary position <i>latitude</i> and <i>longitude</i> and a desired <i>type</i> (odd or even), the <i>lat</i> , <i>lon</i> and <i>cprf</i> sub-fields in the fixed data field of the synchronization burst shall be set to the value of $enc_{lat}()$ and $enc_{lon}()$ computed as defined in clauses 5.6.3.2.1 to 5.6.3.3.2. |

### 5.6.3.2 Input parameters

| Requirement reference |  |
|-----------------------|--|
| 5.6.3.2.1             | The input parameters used for fixed data field encoding shall be defined as follows:<br>latitude = latitude to be encoded.<br>longitude = longitude to be encoded.<br>type = type of encoding (odd or even). |

### 5.6.3.3 Calculations

E

| Requirement<br>reference |  |
|--------------------------|--|
|                          | Latitude   |
| 5.6.3.3.1                | The encoded fixed latitude component shall be calculated as follows:   |
|                          | $clat_{in} = \frac{(latitude) \cdot (MAX_C + 1)}{360}$   |
|                          | $lat = enc_{lat}(clat_{in}, type) = \frac{\left(nz(type) \cdot mod(clat_{in}, dlat(type)) + \frac{MAX_{C}}{2 \cdot MAX_{T}^{lat}}\right)}{\left(\frac{MAX_{C}}{MAX_{T}^{lat}}\right)}$                                     |
|                          | Longitude  |
| 5.6.3.3.2                | The encoded fixed longitude component shall be calculated as follows:  |
|                          | $clon_{in} = \frac{(longitude) \cdot (MAX_C + 1)}{360}$  |
|                          | $lon = enc_{lon}(clat_{dec}, clon_{in}, type) = \frac{\left(nl(clat_{dec}, type) \cdot mod(clon_{in}, dlon(clat_{dec}, type)) + \frac{MAX_{C}}{2 \cdot MAX_{T}^{lon}}\right)}{\left(\frac{MAX_{C}}{MAX_{T}^{lon}}\right)}$ |

## 5.6.4 Fixed data field position local decoding

## 5.6.4.1 General

| Requirement reference |   |
|-----------------------|---|
|                       | When the position report processing state machine (see clause 5.6.6.3.6) indicates that local decoding is to be performed, then the fixed data field position shall be decoded using a single position report and an unambiguous global reference location. |
| 5.6.4.1.2             | The calculation shall return the latitude, longitude and type sub-fields.   |

## 5.6.4.2 Input parameters

| Requirement<br>reference |  |
|--------------------------|--|
| 5.6.4.2.1                | The input parameters used for fixed data field decoding shall be defined as follows:<br><i>clat</i> <sub>ref</sub> = reference latitude. |
|                          | <i>clon<sub>ref</sub></i> = reference longitude.   |
|                          | lat = CPR encoded latitude to be decoded.  |
|                          | <i>lon</i> = CPR encoded longitude to be decoded.  |
|                          | <i>cprf</i> = CPR format even/odd.   |

## 5.6.4.3 Calculations

| Requirement reference |   |
|-----------------------|---|
| Telefence             | Supporting Function   |
| 5.6.4.3.1             | The supporting function for calculating the decoded fixed position field shall be as follows:   |
|                       | $fix(x) = \begin{cases} x + 1 + MAX_c & \text{if } x < 0 \\ x & \text{else} \end{cases}$  |
|                       | $\int x = \begin{cases} x & \text{else} \end{cases}$  |
|                       | Latitude  |
| 5.6.4.3.2             | The decoded fixed latitude component shall be calculated as follows:<br>type = cprf   |
|                       | $lat_{ref} = enc_{lat}(clat_{ref}, type)$   |
|                       | $\left(1 \text{ if } \left(lat_{ref} - lat\right) > \frac{MAX_T^{lat}}{2}\right)$   |
|                       | $lat_{offs}(lat, lat_{ref}) = \left\{ -1 \text{ if } (lat_{ref} - lat) < -\frac{MAX_T^{lat}}{2} \right\}$   |
|                       | $lat_{offs}(lat, lat_{ref}) = \begin{cases} 1 \text{ if } (lat_{ref} - lat) > \frac{MAX_T^{lat}}{2} \\ -1 \text{ if } (lat_{ref} - lat) < -\frac{MAX_T^{lat}}{2} \\ 0 \text{ else} \end{cases}$ |
|                       | $tmp_{1} = dlat(type) \cdot \left(\frac{clat_{ref}}{dlat(type)} + lat_{offs}(lat, lat_{ref})\right)$  |
|                       | $clat_{dec} = dec_{lat} \left( clat_{ref}, lat, lat_{ref}, type \right) = fix \left( \frac{\left( \frac{MAX_C}{MAX_T^{lat}} \right) \cdot lat}{nz(type)} + tmp_1 \right)$                       |
|                       | $latitude = \frac{\left(clat_{dec} + offset_{dec}^{lat}\left(lat_{offs}, s_{lat}, bits, type\right)\right) \cdot 360}{\left(MAX_{C} + 1\right)}$  |

| Requirement<br>reference |   |
|--------------------------|---|
|                          | Longitude   |
| 5.6.4.3.3                | The decoded fixed longitude component shall be calculated as follows:   |
|                          | $lon_{ref} = enc_{lon}(clat_{dec}, clon_{ref}, type)$   |
|                          | $lon_{offs}(lon, lon_{ref}) = \begin{cases} 1 \text{ if } (lon_{ref} - lon) > \frac{MAX_T^{lon}}{2} \\ -1 \text{ if } (lon_{ref} - lon) < -\frac{MAX_T^{lon}}{2} \\ 0 \text{ else} \end{cases}$                 |
|                          | $lon_{offs}(lon, lon_{ref}) = \left\{ -1 \text{ if } (lon_{ref} - lon) < -\frac{MAX_T^{lon}}{2} \right\}$   |
|                          | 0 else  |
|                          | $tmp_{2} = dlon(clat_{dec}, type) \cdot \left(\frac{clon_{ref}}{dlon(clat_{dec}, type)} + lon_{offs}(lon, lon_{ref})\right)$  |

|                          | $longitude = \frac{\left(clon_{dec} + offset_{dec}^{lon}\left(clat_{dec}, lon_{offs}, s_{lon}, bits, type\right)\right) \cdot 360}{\left(MAX_{C} + 1\right)}$   |
|                          | $(MAX_C + 1)$   |

## 5.6.5 Fixed data field position global decoding

### 5.6.5.1 General

| Requirement<br>reference |   |
|--------------------------|---|
| 5.6.5.1.1                | When the position report processing state machine (see clause 5.6.6.3.6) indicates that global decoding is to be performed, then the fixed data field position shall be decoded using the most recently received odd and even fixed data field positions. |
| 5.6.5.1.2                | The calculation shall return the latitude, longitude and type fields.   |

## 5.6.5.2 Input parameters

| Requirement<br>reference |  |
|--------------------------|--|
| 5.6.5.2.1                | The input parameters used for fixed data field global decoding shall be defined as |
|                          | follows:   |
|                          | $lat_0$ = even CPR encoded latitude to be decoded.                                 |
|                          | <i>lon</i> <sub>0</sub> = even CPR encoded longitude to be decoded.                |
|                          | $lat_1 = odd CPR$ encoded latitude to be decoded.                                  |
|                          | <i>lon</i> <sub>1</sub> = odd CPR encoded longitude to be decoded.                 |
|                          | cprf = type of encoding (odd or even) for the most recent of the two CPR reports.  |

## 5.6.5.3 Transition level straddling

| Requirement reference |  |
|-----------------------|--|
| 5.6.5.3.1             | If, $nl(globalDec_{lat}(lat_0, lat_1, 1, 0) \neq nl(globalDec_{lat}(lat_0, lat_1, 0), 0)$ then decoding as |
|                       | defined in clause 4.10.3.3 shall be computed instead of a global decode.                                   |

### 5.6.5.4 Calculations

| Requirement reference |   |  |  |
|-----------------------|---|--|--|
| Telefelice            | Latitude  |  |  |
| 5.6.5.4.1             | The globally decoded fixed latitude component shall be calculated as follows:   |  |  |
|                       | $type_{last} = cprf$ $tmp_{3} = \frac{\left(lat_{0} \cdot nz(1) + 2 \cdot nz(type_{last}) \cdot MAX_{T}^{lat} + \frac{MAX_{T}^{lat}}{2} - lat_{1} \cdot nz(0)\right)}{MAX_{T}^{lat}}$ $lat_{seg}(lat_{0}, lat_{1}, type_{last}) = mod(tmp_{3}, nz(type_{last}))$ $tmp_{4} = lat_{seg}(lat_{0}, lat_{1}, type_{last}) \cdot dlat(type_{last})$ $((MAX_{T}))$ |  |  |
|                       | $clat_{dec} = globalDec_{lat}(lat_0, lat_1, type_{last}) = tmp_4 + \frac{\left(\left(\frac{MAX_C}{MAX_T^{lat}}\right) \cdot lat_{type_{last}}\right)}{nz(type_{last})}$   |  |  |
| 5.6.5.4.2             | Longitude The globally decoded fixed longitude component shall be calculated as follows:  |  |  |
| 0.0.0.4.2             | $tmp_{5} = \frac{\left(lon_{0} \cdot nl(clat_{dec}, 1) + 2 \cdot nl(clat_{dec}, type_{last}) \cdot MAX_{T}^{lon} + \frac{MAX_{T}^{lon}}{2} - lon_{1} \cdot nl(clat_{dec}, 0)\right)}{MAX_{T}^{lon}}$  |  |  |
|                       | MAX <sub>T</sub> <sup>ion</sup>   |  |  |
|                       | $lon_{seg}(lon_0, lon_1, clat_{dec}, type_{last}) = mod(tmp_5, nl(clat_{dec}, type_{last}))$  |  |  |
|                       | $tmp_{6} = lon_{seg} (lon_{0}, lon_{1}, clat_{dec}, type_{last}) \cdot dlon(clat_{dec}, type_{last})$   |  |  |
|                       | $clon_{dec} = globalDec_{lon}(lon_0, lon_1, clat_{dec}, type_{last}) = tmp_6 + \frac{\left(\left(\frac{MAX_C}{MAX_T^{lon}}\right) \cdot lon_{type_{last}}\right)}{nl(clat_{dec}, type_{last})}$   |  |  |

## 5.6.6 Position report processing

### 5.6.6.1 Services

| Requirement reference |   |
|-----------------------|---|
|                       | The PECT (see clause 5.4.4.2) shall maintain sufficient history of received targets to enable unambiguous global position to be determined. |

## 5.6.6.2 Position report parameters

| Requirement<br>reference |   |
|--------------------------|---|
| 5.6.6.2.1                | The position report parameters shall be as defined in table 5.82. |

### Table 5.82: Position report processing parameters

| Symbol | Parameter name                       | Minimum | Maximum | Default | Increment |
|--------|--------------------------------------|---------|---------|---------|-----------|
| TR1    | Maximum age for use in global decode | 1 s     | 60 s    | 30 s    | 1 s       |
| TR2    | Maximum time between global updates  | 1 s     | 240 s   | 60 s    | 1 s       |

| Parameter TR1 (maximum age for use in global decode)                                   |
|--|
| The parameter TR1 shall be the maximum age of a report for its use in a global decode. |
| The timer shall be started (or restarted) as defined in table 5.83.                    |
| f it expires the report shall not be valid for use in a global decode.                 |
| Parameter TR2 (maximum time between global updates)                                    |
| The parameter TR2 shall be the maximum time between global updates.                    |
| The timer shall be started (or restarted) as defined in table 5.83.                    |
| Г<br>f   |

## 5.6.6.3 Position report processing procedures

| Requirement<br>reference |  |
|--------------------------|--|
| Telefence                | Position report processing state machine   |
| 5.6.6.3.1                | For each station maintained in the PECT (see clause 5.4.4.2), the station shall maintain the record of the last received position report and a position report processing state machine with the following states: |
| 5.6.6.3.2                | <ul> <li>a) State 1 shall indicate that no position report has been received and represents<br/>the initial state of the position report processing state machine;</li> </ul>                                      |
| 5.6.6.3.3                | <ul> <li>b) State 2 shall indicate that a position report has been received but that no position<br/>has been decoded;</li> </ul>  |
| 5.6.6.3.4                | <ul> <li>c) State 3 shall indicate that a position report has been received and that a local<br/>position has been decoded;</li> </ul>   |
| 5.6.6.3.5                | <ul> <li>d) State 4 shall indicate that a position report has been received and that a global<br/>position has been decoded.</li> </ul>  |
|                          | Position report processing state machine transitions   |
| 5.6.6.3.6                | On receipt of a position report, the station shall update its state machine as defined in table 5.83 and report target position quality to the application.  |

#### Table 5.84: State transitions for position report processing (transition level straddling)

96

## 6 General design requirements

## 6.1 Controls and indicators

The equipment shall meet the requirements of EN 301 842-1 [4], clause 7.1.

## 6.2 Operation of controls

The operation of controls intended for use during normal operation, in all possible positions, combinations and sequences, shall not result in a condition whose presence or continuation would be detrimental to the continued performance of the equipment.

## 6.3 Warm up

The equipment shall meet the requirements of EN 301 842-1 [4], clause 7.3.

## 6.4 Effects of tests

Unless otherwise stated, the design of the equipment shall be such that, during and after the application of the specified tests, no condition exists which would be detrimental to the subsequent performance of the equipment.

## 6.5 Software management

The software criticality of the VDL Mode 4 equipment shall be determined from the intended use and the safety criticality required for the applications. It is recommended that equipment shall comply with the Eurocontrol document ESARR 6, Software in ATM Systems [11].

97

## 6.6 Recovery from failure

### 6.6.1 Failure of the VDL equipment

If a failure within the VDL Mode 4 Ground station occurs, it may be necessary to perform a power up restart, which ensures that the equipment is in the initialization state and re-acquires a reservation table prior to re-establishing synchronization bursts, after the problem has been resolved. Such a restart is likely to result in a delay before ADS-B information becomes available again, due to the time needed to re-acquire the reservation table. A ground station shall therefore include an uninterruptable power supply and to maintain the ground stations knowledge of the reservation table for as long as is compatible with application requirements during a failure condition.

For ground stations providing time reference information at the certified level, it shall be required to provide multiple redundant VDL Mode 4 receivers and transmitters (i.e. a "hot" standby unit) with crosslinks between them.

Failure of the VDL Mode 4 ground equipment shall not impair the function of other VDL Mode 4 stations.

## 6.7 Monitoring of proper operation

The VDL Mode 4 Ground station shall contain Built-in Test Equipment (BITE) which shall test the equipment upon power up and at other times when commanded by the system operator.

Automatic monitoring of correct operation of the equipment shall take place continuously throughout the flight, reflecting any impaired functionality of associated equipment (i.e. sources of position and time).

An indication shall be given to a local and/or remote management entity of any failure.

- NOTE: An acceptable means of compliance would be to provide system status monitor(s) and built-in test functions which would detect and indicate to the system operator a failure of the VDL Mode 4 system due to any of the following:
  - a) loss of system electrical power;
  - b) failure of digital interfaces;
  - c) failure of the equipment to perform intended functions;
  - d) removal of the equipment from the ground station.

## 7 Protocol test procedures

## 7.1 General

### 7.1.1 Input voltage

The equipment shall meet the requirements of EN 301 842-1 [4], clause 8.1.

### 7.1.2 Power input frequency

The equipment shall meet the requirements of EN 301 842-1 [4], clause 8.4.1.

## 7.1.3 Adjustment of equipment

The circuits of the equipment under test shall be properly aligned and otherwise adjusted in accordance with the manufacturer's recommended practices prior to application of the specified tests. Unless otherwise specified, no adjustments may be made once the test procedures have started.

## 7.1.4 Equipment configuration

Replacement or substitution of components or circuit modules within the equipment under test is not permitted once the test procedures have started.

The VDL Mode 4 Ground station shall undergo all testing with its operational software installed in the equipment. The software version number shall reflect the revision that is intended for approval.

The configuration data shall be set up so as to be representative of a real ground installation. This configuration data set shall be completely documented. The configuration setup shall not be altered during the entire testing procedure.

## 7.1.5 Test equipment

All equipment used in the performance of the tests should be identified by make, model and serial number where appropriate, and its latest calibration date. The specification of the accuracy of the test equipment is left to the calibration process prescribed by the agency which certifies the testing facility.

## 7.1.6 Test equipment precautions

Precautions shall be taken during conduct of the tests to prevent the introduction of errors resulting from the improper connection of test instruments across the input and/or output impedances of the equipment under test.

If used to terminate the input or output of the equipment under test, the test instruments shall present the equivalent impedance to the equipment under test for which it was designed. Otherwise, the equipment under test shall be connected to loads having the impedance values for which it was designed.

## 7.1.7 Ambient conditions

Unless otherwise specified, all tests should be conducted under conditions of ambient room temperature, pressure and humidity, as defined in EN 301 842-1 [4], clause 8.4.1.

## 7.1.8 Connected loads

Unless otherwise specified, all tests shall be performed with the equipment connected to loads having the impedance values for which it is designed.

## 7.1.9 Warm-up period

Unless otherwise specified, all tests shall be conducted after a warm-up period of not less than 5 minutes.

## 7.2 Required test rig

An overview of the PCOs identified as required for the conduct of test cases is illustrated in figure 7.1.

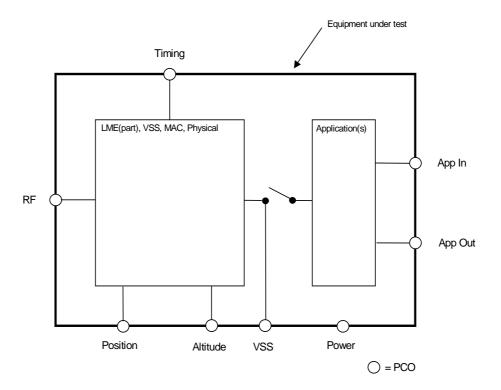

Figure 7.1: Location of PCOs

In addition, it shall be possible to verify that the equipment under test has passed the self test procedure.

The PCOs identified in this figure are each associated with a test set which shall support the following:

RF:

- input to the equipment under test of a single burst or sequence of bursts, of specified content, one or more slots in length, commencing in a slot at a specified time, on a specified channel;
- recording of the time at which a burst containing specified content (per field) is output by the equipment under test, on any of three channels;
- simultaneous input to the equipment of bursts of specified content, commencing in a slot at a specified time, on two separate channels.

Timing:

- input of a reference time source compliant with the requirements of the present document;
- disabling of the input of reference time.

NOTE 1: Disabling of the timing source is required to force the equipment under test into secondary timing mode.

NOTE 2: In certain equipment architectures, the reference timing source may be incorporated internally within the equipment under test. Under such conditions, there is no requirement to expose the timing source itself, but a means must be provided to disable it as identified above.

Position:

- input to the equipment under test of a specified geographical position at a specified time;
- input to the equipment under test of position validity/quality to allow determination of position integrity (nic);
- disabling of the position source.
- NOTE 3: Disabling of the position source is required to demonstrate that appropriate notification is provided by means of the Navigation Integrity Category (NIC) field.

NOTE 4: In certain equipment architectures, the position source may be incorporated internally into the equipment under test. Under such conditions, manufacturers will be required to perform alternative tests to those specified in the present document to demonstrate correct operation of the position encoding/decoding algorithms. In addition, a means must be provided to disable the position source as stated above.

#### Altitude:

- input to the equipment under test of a specified altitude at a specified time;
- disabling of the altitude source;
- configuration information identifying whether geometric or barometric altitude is provided.
- NOTE 5: Disabling of the altitude source is required to demonstrate that appropriate notification is provided by means of the fixed synchronization burst.
- NOTE 6: In certain equipment architectures, the altitude source may be incorporated internally into the equipment under test. Under such conditions, manufacturers will be required to perform alternative tests to those specified in the present document to demonstrate correct operation of the position encoding/decoding algorithms. In addition, a means must be provided to disable the position source as stated above.

#### VSS:

- The VSS User PCO is not normally exposed during operational use of the VDL Mode 4 ADS-B system. It is available only during test mode, in which the internal application(s) are disconnected from the VSS and lower layers, as illustrated above.
- The VSS User PCO is intended to provide a means to stimulate the VDL Mode 4 system independently of the internal applications, and to offer a mechanism to use test such features of the VSS sub-layer such as slot selection and reservation conflict processing which could not be tested adequately by any other means. At this PCO, functionality shall be provided to allow the User (i.e. test set) to:
  - enable/disable autonomous synch bursts, and control of parameters TV11 min, TV11 max and V11 associated with their transmission;
  - maintain a queue of random access transmissions, of user specified content, such that at least one burst is always in the transmit queue;
  - establish a sequence of streams of periodic broadcasts, of user specified content, defined by parameters TV11 min, TV11 max, V11, V12, together with Quality of Service parameters Q2a to Q2d, Q4 and Q5;
  - cancel an existing sequence of periodic streams;
  - establish a sequence of incremental broadcasts, of user specified content, defined by parameters V21, V22, together with Quality of Service parameters Q2a to Q2d, Q4 and Q5;
  - receive a notification that a non-zero version number has been detected;
  - receive a notification in response to a request for transmission that no slot was available for selection.

#### AppIn:

• Input to the equipment under test of any additional data required to support any internal applications. Tests for application functionality are outside the scope of the present document, and manufacturers are required to specify tests to demonstrate correct operation of any applications supported, including appropriate inputs via this PCO.

#### AppOut:

• Output from the equipment under test of any data associated with internal application(s). Examples include ADS-B, TIS-B, FIS-B data for output to the crew. Tests for application functionality are outside the scope of the present document, and manufacturers are required to specify such tests to demonstrate correct operation of any applications supported, including appropriate outputs via this PCO.

NOTE 7: A display of ADS-B data built into the equipment may represent this PCO.

Power:

• Power shall be applied at this PCO in accordance with clauses 7.1.1 and 7.1.2. The facility shall be provided to interrupt the power supply for a period between 150 ms and 15 s, upon an event being signalled from the surrounding test harness.

101

## 7.3 Protocol test-suite description methodology

The precise rules which control the functions of computer based equipment like the VDL Mode 4 ground station, which involve sequential logic, require a rigorous interpretation which cannot always be readily achieved by plain text description. Therefore, a formal description has been used based on ISO/IEC 9646 [7]. The concepts of ISO/IEC 9646 [7] were, to maximum extent, applied to the VDL Mode 4 test procedures included in the present document. For convenience the underlying basic concepts are described in annex B.

## 7.4 Detailed protocol test procedures

The test procedures set forth below constitute a satisfactory method of determining the required VDL Mode 4 ground station performance. Although specific test procedures are cited, it is recognized that other methods may be preferred. Such alternate methods may be used if the manufacturer can show that they provide at least equivalent information. Therefore, the procedures cited herein should be used as one criterion in evaluating the acceptability of the alternate procedures.

## 7.4.1 Test-suite overview

The test-suite overview shown in table 7.1 on the following pages lists the test cases by their name. The second column holds a short description of the test case objective. A cross reference between the test case names and the applicable requirements is provided in annex A.

| Test Case Name           | Description   |  |  |  |  |
|--------------------------|---|--|--|--|--|
| Physical_SysParams       | To demonstrate that a station operates correctly at the limits of the physical layer system parameters.   |  |  |  |  |
| Timing_Primary           | To demonstrate that when primary timing is available, a transmission from the station complies with primary timing performance.   |  |  |  |  |
| Timing_Secondary         | To demonstrate that when primary timing is unavailable, a transmission from the station complies with secondary timing performance.   |  |  |  |  |
| Timing_Secondary_Recover | To demonstrate that when primary timing becomes available to a station which is transmitting on secondary time, it reverts to using primary time.   |  |  |  |  |
| CRC_Norm                 | To demonstrate that a station transmitting a burst will insert a valid CRC.   |  |  |  |  |
| CRC_Rej                  | To demonstrate that a station receiving a burst with an invalid CRC will reject the burst.  |  |  |  |  |
| Version_NonZero          | To demonstrate that a station receiving a burst containing a non-zero version number will ignore the burst and inform the VSS user.   |  |  |  |  |
| Queue_Replace            | To demonstrate that a burst submitted to the VSS layer with Q3 set to TRUE will<br>replace any queued data of the same type.  |  |  |  |  |
| Queue_Norm               | To demonstrate that a burst submitted to the VSS layer with Q3 set to FALSE will not replace any queued data of the same type.  |  |  |  |  |
| MessageID_Invalid_A      | To demonstrate that a unicast burst received with an invalid message ID will cause a General Failure burst to be transmitted.   |  |  |  |  |
| MessageID_Invalid_B      | To demonstrate that a burst with an invalid message ID not making a reservation for reply, causes no response to be made.   |  |  |  |  |
| Reservation_Unrecognized | To demonstrate that an unrecognized reservation type will cause the packet to be rejected and an error logged.  |  |  |  |  |
| Reservation_Invalid      | To demonstrate that reception of a known reservation type with an invalid subfield causes the appropriate slots to be reserved, but not to transmit a response, nor pass the burst to a VSS user. |  |  |  |  |
| Reservation_Recognition  | To demonstrate that a reservation will be recognized prior to the end of the slot following the transmission in which it was carried.   |  |  |  |  |
| SlotSel_Level0_A         | To demonstrate that a station will select a slot at level 0 when no slots are reserved.   |  |  |  |  |

#### Table 7.1: Protocol test-suite overview

| Test Case Name           | Description  |
|--------------------------|--|
| SlotSel_Level0_B         | To demonstrate that a station will select a slot at level 0, excluding those not meeting the criteria of any other level.  |
| SlotSel_Level0_C         | To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 1.   |
| SlotSel_Level0_D         | To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 2.   |
| SlotSel_Level0_E         | To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 3.   |
| SlotSel_Level0_F         | To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 4.   |
| SlotSel_Level1_A         | To demonstrate that a station will select a slot at level 1 when the appropriate criteria are satisfied.   |
| SlotSel_Level1_B         | To demonstrate that a station will select a slot at level 1, excluding those slots not meeting the criteria of level 1 or any lower priority level.  |
| SlotSel_Level1_C         | To demonstrate that a station will select a slot at level 1 in preference to those available at level 2.   |
| SlotSel_Level1_D         | To demonstrate that a station will select a slot at level 1 in preference to those available at level 3.   |
| SlotSel_Level1_E         | To demonstrate that a station will select a slot at level 1, in preference to those available at level 4.  |
| SlotSel_Level1_F         | To demonstrate that a station will select slots at level 1 from a more distant station in preference to a closer station.  |
| SlotSel_Level2_A         | To demonstrate that a station will select a slot at level 2 when the appropriate criteria are satisfied.   |
| SlotSel_Level2_B         | To demonstrate that a station will select a slot at level 2, excluding those slots not meeting the criteria of level 2 or any lower priority level.  |
| SlotSel_Level2_C         | To demonstrate that a station will select a slot at level 2 in preference to those available at level 3.   |
| SlotSel_Level2_D         | To demonstrate that a station will select a slot at level 2 in preference to those available at level 4.   |
| SlotSel_Level2_E         | To demonstrate that a station will select slots at level 2 from a more distant station in preference to a closer station.  |
| SlotSel_Level3_A         | To demonstrate that a station will select a slot at level 3 when the appropriate criteria are satisfied.   |
| SlotSel_Level3_B         | To demonstrate that a station will select a slot at level 3, excluding those slots not meeting the criteria of level 3 or any lower priority level.  |
| SlotSel_Level3_C         | To demonstrate that a station will select a slot at level 3 in preference to those available at level 4.   |
| SlotSel_Level3_D         | To demonstrate that a station will select slots at level 3 from a more distant station in preference to a closer station.  |
| SlotSel_Level4_A         | To demonstrate that a station will select a slot at level 4 when the appropriate criteria are satisfied.   |
| SlotSel_Level4_B         | To demonstrate that a station will select a slot at level 4, excluding those slots not meeting the criteria of level 4.  |
| SlotSel_Level4_C         | To demonstrate that a station will select a slot at level 4 from a more distant station in preference to a closer station.   |
| SlotSel_Block_Level0_A   | To demonstrate that a station will select a block of slots at level 0 when no slots are reserved.  |
| SlotSel_Block_Level0_B   | To demonstrate that a station will select a block of slots at level 0, excluding those   |
| SlotSel_Block_MixedLevel | not meeting the criteria of any other level.<br>To demonstrate that a station will select a block of slots from slots available at different levels.   |
| SlotSel_Reselection      | To demonstrate that a station after selecting a slot which has been reserved by another station will not select a slot which has been reserved by the same station within the next M1-1 slots. |
| SlotSel_Unsuccessful     | To demonstrate that a station will fail to select a slot when no slots are available which are compatible with the QoS parameters.   |
| SlotSel_QoSGroup         | To demonstrate that a station will select a slot using a second group of QoS parameters when no slot has been selected by means of the first group.  |
| Conflict_Periodic_A      | To demonstrate that a station will continue to transmit a periodic stream without action in the event of a conflicting non-periodic transmission from another station.                         |
| Conflict_Periodic_B      | To demonstrate that a station will dither a periodic stream to resolve a conflict with   |

| Test Case Name              | Description   |
|-----------------------------|---|
| Conflict_Periodic_C         | To demonstrate that a station will move a periodic stream to a new location in the event of a conflict with a periodic stream from another station that does not allow the original stream to be dithered.  |
| Conflict_NoAction           | To demonstrate that a station will continue to transmit a periodic stream without action in the event of receiving a conflicting reservation such that the slot remains available.  |
| Conflict_Incremental        | To demonstrate that a station will not transmit in a slot previously reserved by an incremental broadcast reservation in the event of receiving a conflicting reservation, and will make the broadcast in an alternative slot by random access.               |
| Conflict_Priority           | To demonstrate that a station required to transmit in the same slot by conflicting requests will transmit the response of highest priority.   |
| Conflict_FirstRequest       | To demonstrate that a station required to transmit in the same slot by conflicting requests of equal priority will transmit the response to the first request.  |
| Slot_Boundary               | To demonstrate that a transmission from the station complies with timing performance requirements at the slot boundary.   |
| Rand_Busy                   | To demonstrate that a station will not make a random access transmission in a slot perceived to be busy at the start of the slot (e.g. a transmission which extends beyond the guard time).   |
| Rand_Congestion             | To demonstrate that the VSS User is informed if a request to make a random transmission is not successful within TM2 slots.   |
| Rand_Persistence            | To demonstrate that a random transmission is made with probability p.   |
| Rand_MaxAttempts            | To demonstrate that the station will authorize a random transmission as soon as the channel is available after VS3 unsuccessful attempts  |
| Rand_Priority               | To demonstrate that bursts queued for transmission by random access are transmitted in order of priority.   |
| Rand_TM2Reset               | To demonstrate that timer TM2 is reset following a successful random transmission when a further burst is queued for transmission.  |
| Rand_TM2Clear               | To demonstrate that timer TM2 is cleared following a successful random transmission when no further bursts are queued for transmission.   |
| Rand_VS3Clear               | To demonstrate that if a request to make a random transmission is not successful within TM2 slots then the VS3 counter is cleared and no transmission is made.  |
| Rand_Availability           | To demonstrate that a station makes random access attempts in slots available only at levels 0 to 2.  |
| Null_Reservation            | To demonstrate that no slot is reserved following the receipt of a null reservation.  |
| Periodic_InitialRes         | To demonstrate that in the absence of any conflicting reservation, a station will maintain a periodic reservation in a constant position in the superframe, with $pt = 3$ and $po = 0$ , until announcing a further dither.                                   |
| Periodic_NonDitherRes       | To demonstrate that a station receiving a periodic broadcast reservation specifying no dither will reserve the appropriate slots.   |
| Periodic_DitherRes          | To demonstrate that a station receiving a periodic broadcast reservation specifying dither will reserve the appropriate slots.  |
| Periodic_DitherRange        | To demonstrate that a station will maintain a periodic stream within the dither range in accordance with the V11 and V12 parameters.  |
| Periodic_DitherOffset_A     | To demonstrate that in the absence of a conflicting reservation, a station will announce a dither to a periodic stream three superframes before the dither occurs.  |
| Periodic_DitherOffset_B     | To demonstrate that in the absence of a conflicting reservation, following<br>announcement of a dither to a periodic stream, the same dithered slot will be<br>reserved by each of the subsequent two transmissions, containing decrementing<br>values of pt. |
| Periodic_DitherOffset_C     | To demonstrate that a station will always dither away from the current transmission slot.   |
| Periodic_DitherOffset_D     | To demonstrate that following announcement of a dither to a periodic stream, the transmission slot will be adjusted to occupy the reserved slot.  |
| Periodic_IndependentStreams | To demonstrate that separate streams of periodic broadcasts dither independently.   |
| Periodic_Replacement        | To demonstrate that a station receiving a periodic broadcast reservation in a slot previously by a periodic broadcast will replace the previous reservations by those carried in the new transmission.  |
| Periodic_Availability_A     | To demonstrate that a station will take account of the availability of the current transmission slot when dithering to a new slot.  |
| Periodic_Availability_B     | To demonstrate that when the current transmission slot is occupied at the dither of a periodic broadcast, the slot availability is determined from the first occupancy of the slot by a different station.  |

| Test Case Name              | Description   |  |  |  |  |
|-----------------------------|---|--|--|--|--|
| Periodic_Rate               | To demonstrate that the station will establish a set of periodic streams at a nominal periodic rate according to the V11 parameter.   |  |  |  |  |
| Periodic_TV11               | To demonstrate that in the absence of any conflicting reservation a station will set<br>the value of TV11 uniformly between the minimum and maximum values.   |  |  |  |  |
| Periodic_Cancel             | To demonstrate that a station receiving a periodic broadcast cancellation in a slot previously reserved for a periodic broadcast will cancel the periodic stream.   |  |  |  |  |
| Periodic_CancelIncremental  | To demonstrate that upon receipt of an incremental broadcast in a slot expected to contain a periodic broadcast from the same peer station, the periodic stream is cancelled.   |  |  |  |  |
| Periodic_CancelUnicast      | To demonstrate that upon receipt of a unicast request with source/destination flag set to 1 in a slot expected to contain a periodic broadcast from the same peer station, the periodic stream is cancelled.            |  |  |  |  |
| Incremental_Reservation_A   | To demonstrate that a station receiving an incremental broadcast reservation will reserve the appropriate slots.  |  |  |  |  |
| Incremental_Reservation_B   | To demonstrate that an incremental broadcast with io= 0 causes no reservation to be made.   |  |  |  |  |
| Incremental_Request         | To demonstrate that a station will select and reserve a series of future transmission slots by means of the incremental broadcast protocol.   |  |  |  |  |
| Incremental_SlotSel         | To demonstrate that a slot is selected for an incremental broadcast reservation from the appropriate candidate range.   |  |  |  |  |
| Combined_Reservation        | To demonstrate that receipt of a combined periodic and incremental broadcast reservation causes the appropriate slots to be reserved.   |  |  |  |  |
| BND_Reservation             | To demonstrate that reception of a BND reservation causes the appropriate slots to be reserved.   |  |  |  |  |
| Unicast_Reservation_A       | To demonstrate that reception of a point-to-point unicast reservation for the destination station to transmit causes the appropriate slots to be reserved.  |  |  |  |  |
| Unicast_Reservation_B       | To demonstrate that a reception of a point-to-point unicast reservation for the source station to transmit causes the appropriate slots to be reserved.   |  |  |  |  |
| Unicast_Reservation_C       | To demonstrate that a reception of a broadcast unicast reservation causes the appropriate slots to be reserved.   |  |  |  |  |
| Unicast_Reservation_D       | To demonstrate that a station applying the slot selection criteria will exclude any slot reserved by another station using the unicast request protocol with $sdf = 1$ .  |  |  |  |  |
| Info_Reservation            | To demonstrate that a station receiving a burst containing an information transfer request reservation addressed to another station will reserve the slots identified for the information transfer and acknowledgement. |  |  |  |  |
| Autotune_Reservation        | To demonstrate that a station receiving a directed request from a ground station addressed to another station will reserve the directed slots.  |  |  |  |  |
| Autotune_CancelAbsent       | To demonstrate that a station receiving a directed request addressed to another station will take no action upon receipt of a directed cancellation from the directing station alone.                                   |  |  |  |  |
| PleaResponse_Reservation_A  | To demonstrate that receipt of a plea response with a standard nominal rate causes the appropriate slots to be reserved.  |  |  |  |  |
| PleaResponse_Reservation_B  | To demonstrate that receipt of a plea response with a special nominal rate causes the appropriate slots to be reserved.   |  |  |  |  |
| PleaResponse_Transmission_A | To demonstrate that receipt of a plea addressed to a station results in transmission of a plea response of the appropriate format.  |  |  |  |  |
| PleaResponse_Transmission_B | To demonstrate that a second plea addressed to a station results in transmission<br>of a plea response containing the remaining future slots from the previous plea<br>response.  |  |  |  |  |
| PleaResponse_Retransmission | To demonstrate that a plea response is not re-transmitted.  |  |  |  |  |
| Response_Reservation        | To demonstrate that a response reservation field is recognized and causes no reservation to be made.  |  |  |  |  |
| Request_Unsupported         | To demonstrate that a station will respond to a general request burst that cannot be supported with a general failure burst.  |  |  |  |  |
| Sync_Format                 | To demonstrate that a station will broadcast a sync burst with the correct format.  |  |  |  |  |
| Sync_Format_Rec             | To demonstrate that a station will correctly process a received sync burst.   |  |  |  |  |
| Sync_Latency                | To demonstrate that the latency of ADS data reported by the station is within acceptable limits.  |  |  |  |  |
| Sync_Interval               | To demonstrate that a station outputs autonomous sync bursts with a uniform interval between nominal slots on each GSC.   |  |  |  |  |
| Sync_Fixed_NIC              | To demonstrate that a station sets the navigation uncertainty category appropriately.   |  |  |  |  |
| Sync_Fixed_BaseAlt          | To demonstrate that a station sets the base altitude in the fixed part of the sync<br>burst in accordance with the input altitude data.   |  |  |  |  |

| Test Case Name          | Description  |
|-------------------------|--|
| Sync_Fixed_DataAge      | To demonstrate that a station sets the data age subfield of a sync burst appropriately.  |
| NetEntry_Periodic       | To demonstrate that a station which desires to gain entry to a network using the combined periodic and incremental broadcast protocols is able to set up a series of regularly spaced streams.   |
| NetEntry_Receive        | To demonstrate that a station in receipt of a delayed transmission containing a plea will generate a reply to the source station with slots for it to transmit in, if it has some slots which it could make available.   |
| NetEntry_OneMinute      | To demonstrate that a station which desires to transmit for the first time without using network entry protocols, will listen to the channel on which it desires to transmit for 1 minute prior to making any transmissions.   |
| ADS_Report_Receive      | To demonstrate that a station receiving a sequence of ADS reports from a peer station will generate an appropriate output.   |
| ADS_Report_Simultaneous | To demonstrate that a station is capable of receiving ADS reports simultaneously on both GSCs.   |
| ADSB_Request_Send_A     | To demonstrate that a station which desires another station to transmit a single autonomous synchronization burst will transmit an ADS-B request burst.  |
| COORD_Quarantine_A      | To demonstrate that if no transmission control information is specified for a message, the ground station will transmit the message within ground quarantined slots where available.   |
| COORD_Quarantine_B      | To demonstrate that if no transmission control information is specified for a message, and if insufficient ground quarantined slots are available, the ground station will transmit the message in non-quarantined slots.  |
| COORD_Block_A           | To demonstrate that a station will establish and maintain reserved blocks of slots with the second frame block protocol.   |
| COORD_Block_B           | To demonstrate that a station will establish and maintain reserved blocks of slots with the superframe block protocol.   |
| COORD_Block_C           | To demonstrate that while maintaining reserved blocks of slots with the<br>superframe block protocol, a ground station will not select any mobile for re-<br>broadcast more than once per minute unless there are insufficient mobiles within<br>the coverage of the ground station. |
| COORD_Block_D           | To demonstrate that while maintaining reserved blocks of slots with the superframe block protocol, a ground station will select a mobile for re-broadcast more than once per minute if there are insufficient mobiles within the coverage of the ground station.                     |
| COORD_UTC_A             | To demonstrate that the number of slots per superframe is set at 4500.   |
| CPR_Encode              | To demonstrate that a series of latitude and longitude positions may be correctly encoded in the sync burst using the CPR algorithm.   |
| CPR_Decode              | To demonstrate that a series of latitude and longitude positions may be correctly decoded from the sync burst using the CPR algorithm.   |
| DLS_NotSupported        | To demonstrate that a station in receipt of a CTRL_RTS transmits a general failure with an error type of 80 hex when it does not support the DLS.  |
| DLS_UDATA_Send_A        | To demonstrate that a station will broadcast a UINFO burst with the correct format.  |
| DLS_UDATA_Send_B        | To demonstrate that a station will broadcast a UCTRL burst with the correct format.  |
| DLS_UDATA_ND4           | To demonstrate that a station requested to broadcast data requiring a UDATA burst in excess of ND4 octets will discard the burst.  |
| DLS_UDATA_Receive       | To demonstrate that a UDATA DLPDU received from another station will be forwarded to the DLS user.   |

#### 7.4.2 Declarations

For the performance of the tests, stimuli are applied and test results are observed at the Points of Control and Observation (PCO) as defined in clause 7.2.

### 7.4.3.1 Abbreviations

#### 7.4.3.1.1 Subfield mnemonics

#### Table 7.2: Subfield mnemonics

| Mnemonic  | Meaning                             |  |  |  |  |
|-----------|-------------------------------------|--|--|--|--|
| а         | Additional slots                    |  |  |  |  |
| a/d       | Autonomous/directed flag            |  |  |  |  |
| auto      | Autonomous information              |  |  |  |  |
| balt      | Base altitude                       |  |  |  |  |
| b/g       | Baro/geo altitude                   |  |  |  |  |
| blg       | Block length                        |  |  |  |  |
| big       | Block offset                        |  |  |  |  |
| br        | Block repeat rate                   |  |  |  |  |
| bi        | Block start                         |  |  |  |  |
| bs        | Block timeout                       |  |  |  |  |
|           | CRC                                 |  |  |  |  |
| C         | CPR format even/odd                 |  |  |  |  |
| cprf<br>d | Destination address                 |  |  |  |  |
| -         |                                     |  |  |  |  |
| da        | Data age                            |  |  |  |  |
| dos       | Directory of services flag          |  |  |  |  |
| erid      | Extended reservation ID             |  |  |  |  |
| f         | Frequency                           |  |  |  |  |
| flag      | Flag delimiting burst               |  |  |  |  |
| id        | Information field identity          |  |  |  |  |
| in        | Information field                   |  |  |  |  |
| io        | Incremental offset                  |  |  |  |  |
| lat       | Latitude                            |  |  |  |  |
| lon       | Longitude                           |  |  |  |  |
| mi        | Message ID                          |  |  |  |  |
| nd        | Negative dither                     |  |  |  |  |
| nr        | Nominal update rate                 |  |  |  |  |
| nic       | Position integrity category         |  |  |  |  |
| off       | Offset to first reserved slot       |  |  |  |  |
| ok        | Confirm/failure flag                |  |  |  |  |
| ро        | Periodic offset                     |  |  |  |  |
| pr        | Priority                            |  |  |  |  |
| pr_flag   | Plea response flag                  |  |  |  |  |
| pt        | Periodic timeout                    |  |  |  |  |
| r-b/a     | Requested baro/geo altitude         |  |  |  |  |
| r-mi      | Requested message ID                |  |  |  |  |
| rcvr      | Receiver control                    |  |  |  |  |
| rd        | Reservation data                    |  |  |  |  |
| res       | Reserved bit                        |  |  |  |  |
| rid       | Reservation ID                      |  |  |  |  |
| ro        | Response offset                     |  |  |  |  |
| roff      | Re-broadcast offset                 |  |  |  |  |
| S         | Source address                      |  |  |  |  |
| sdf       | Source/destination flag             |  |  |  |  |
| sleep     | Autonomous monitoring               |  |  |  |  |
| SZ        | Size                                |  |  |  |  |
| tc        | Trajectory Change Point change flag |  |  |  |  |
| tfom      | Time FOM                            |  |  |  |  |
| ver       | Version number                      |  |  |  |  |
| vt        | Timeout                             |  |  |  |  |

#### 7.4.3.1.2 Special characters used in the subfield definitions

Table 7.3: Special characters used in the subfield definitions

| Character | Meaning                                   |  |  |
|-----------|---|--|--|
| -         | - Subfield not applicable (0 bit length)  |  |  |
| х         | the value of this subfield is do not care |  |  |
|           | The subfield is defined in an extra table |  |  |

#### 7.4.3.1.3 Station addresses and positions

Station addresses are referred to in the test cases in the following format:

- add\_A = address of the station under test (station A);
- add\_B = address of simulated station B (simulated by the test equipment);
- add\_C = address of simulated station C;
- with the pattern continuing for other stations. A simulated ground station is normally named G, with address 'add\_G'.

The test station (station A) is assumed to be at  $0^{\circ}$  latitude and at  $0^{\circ}$  longitude. The positions of other stations are given in terms of the direction (East, E, is used for all cases) and distance in nautical miles with respect to the position of station A.

The following functions:

- $lat:= CPR\_LAT(y);$
- $lon:= CPR\_LON(x);$

are used to indicate that the given position will need to be encoded using the CPR encoding algorithm, defined in Section 4 of the VDL Mode 4 Technical Manual [1].

For example, the encoded position of the test station (station A) is:

- lat:=  $CPR\_LAT(0)$ ;
- $lon:= CPR\_LON(0);$

while the encoded position of a simulated station B, that is 325 NM away from A, will be expressed as:

- $lat:= CPR\_LAT(0);$
- lon:= CPR\_LON(E 325 NM).

The positions of the simulated stations in the tests have been given on the basis of the following set of values of the Q2 parameters. This set is used as the default in the tests and referred to as Q2 Set 1. The ICAO VDL Mode 4 Technical Manual [1] default values are used for the parameters Q2a, Q2b, and Q2d. A value of Q2c = 120 NM is used in order to allow testing of conditions it would not be possible to test if Q2c = 0.

| Symbol | Parameter Name                              | Value  | Notes                                     |
|--------|---|--------|---|
| Q2a    | Slot selection range constraint for level 1 | 150 NM |   |
| Q2b    | Slot selection range constraint for level 2 | 150 NM |   |
| Q2c    | Slot selection range constraint for level 3 | 120 NM | Not a VDL4 Technical Manual default value |
| Q2d    | Slot selection range constraint for level 4 | 300 NM |   |

Table 7.4: Q2 Parameters: Q2 Set 1 (Default for all tests)

For some tests, a second less stringent set of values for the Q2 parameters is specified, to be used when slot selection fails using Set 1. This set is defined below and referred to as Q2 Set 2.

| Symbol | Parameter Name                              | Value  |
|--------|---|--------|
| Q2a    | Slot selection range constraint for level 1 | 100 NM |
| Q2b    | Slot selection range constraint for level 2 | 100 NM |
| Q2c    | Slot selection range constraint for level 3 | 80 NM  |
| Q2d    | Slot selection range constraint for level 4 | 200 NM |

#### Table 7.5: Q2 Parameters: Q2 Set 2

For some tests, the following set of values for the Q2 parameters is used.

Table 7.6: Q2 Parameters: Q2 Set 3

| Symbol | Parameter Name                              | Value  |
|--------|---|--------|
| Q2a    | Slot selection range constraint for level 1 | 150 NM |
| Q2b    | Slot selection range constraint for level 2 | 150 NM |
| Q2c    | Slot selection range constraint for level 3 | 120 NM |
| Q2d    | Slot selection range constraint for level 4 | 120 NM |

For assessment of conflict resolution, the following set of values for the Q2 parameters is used, as specified in ICAO VDL Mode 4 Technical Manual [1], clause 1.5.5.1.4.

| Table 7.7: Q2 Parameters: Q2 Set 4 | Table | 7.7: | Q2 | Parameters: | Q2 | Set 4 |
|------------------------------------|-------|------|----|-------------|----|-------|
|------------------------------------|-------|------|----|-------------|----|-------|

| Symbol | Parameter Name                              | Value  |
|--------|---|--------|
| Q2a    | Slot selection range constraint for level 1 | 360 NM |
| Q2b    | Slot selection range constraint for level 2 | 360 NM |
| Q2c    | Slot selection range constraint for level 3 | 360 NM |
| Q2d    | Slot selection range constraint for level 4 | 360 NM |

## 7.4.3.1.4 Tables of values for use in CPR test cases

Tables 7.8 to 7.10 are used in the CPR test cases.

|                                 | In St                  | ate                    |                        | 1  |  | 2  |  | 3  |  | 4  |
|---------------------------------|------------------------|------------------------|------------------------|--|--|--|--|--|--|--|
|                                 | Last re                |                        |                        | None   | Even   | Odd  | Even   | Odd  | Even   | Odd  |

### Table 7.9: CPR state machine for position report processing (transition level straddling)

### Table 7.10: Key to CPR encoding table in following section

| Table heading | Description  |
|---------------|--|
| latitude      | latitude to be encoded   |
| longitude     | longitude to be encoded  |
| cpr_type      | CPR type of position report                                    |
| lat_enc       | encoded latitude for transmission in fixed part of sync burst  |
| lon_enc       | encoded longitude for transmission in fixed part of sync burst |

### 7.4.3.1.4.1 Test values for CPR report encoding CPR\_ENC\_TABLE (row, column) (CE(r, c))

(For the key to this table see the clause above.)

The CPR test values have been designed assuming an aircraft travelling at constant velocity in a north-easterly direction and transmitting its position with a CPR report every 10 seconds. The receiving station is assumed to miss many of the transmitted reports, and in a way which allows this test to pass through all the various operations of the state machine during the decoding process (see table 7.14). The missed positions, which are not relevant here, are excluded from the encoding table 7.11 and from the decoding table in clause 7.4.3.1.4.4 for clarity.

The input latitude and longitude values in the first two columns of the encoding table 7.11 (and in the first four columns of the table 7.14) vary for the purpose of the test up to the fourth decimal place, but are required to be accurate to 9 decimal places as shown, in order to achieve the given encoded values.

### 7.4.3.1.4.2 CPR test value tolerances

The number of decimal places afforded to the decoded latitude and longitude values in the last eight columns of the previous tables varies according to the resolution expected from the decoding algorithm (see table 7.12). When using the tables to test the validity of an installed algorithm, the given decoded latitude and longitude values should be interpreted using the tolerances given in the last column of the table 7.12.

### Table 7.12: CPR test value tolerances

| Decoded<br>Parameter | Total number of<br>bits used to<br>encode        | Approximate max<br>decoded error<br>(degrees) | Number of decimal<br>places given to<br>decoded values | Tolerance to be given on<br>decoded values during<br>test of algorithm (degrees) |  |  |
|----------------------|--|---|--|--|--|--|
| Decoded lat          | 12   | ±0,0012                                       | 4  | ±0,0003  |  |  |
| Decoded lon          | 14   | ±0,0012 (see note)                            | ±0,0003  |  |  |  |
|                      | se figures take into ac<br>four times greater at |   | f longitude the maximum                                | error in the decoded value is  |  |  |

NOTE: Since the figures given in table 7.11 are designed to be used to test the CPR algorithm, the decoded figures in the last two columns of table 7.14 are given to more decimal places than the number of decimal places to which the decoded results may be relied upon for position reporting.

# Key to CPR decoding table in following section

| Table 7.13: Key | to CPR dec | coding table in | following section |
|-----------------|------------|-----------------|-------------------|
|-----------------|------------|-----------------|-------------------|

| Table heading | Description  |
|---------------|--|
| lat last      | input latitude from last position  |
| lat prev      | input latitude from previous (last but one) position                           |
| lon last      | input longitude from last position   |
| lon prev      | input longitude from previous (last but one) position                          |
| tl            | input CPR type from last position  |
| tp            | input CPR type from previous (last but one) position                           |
| tr            | indicates 1 if the two points straddle a transition latitude (and 0 otherwise) |
| i             | initial state in CPR state machine   |
| tim           | time in seconds since last report received                                     |
| 0             | indicates whether the receiver knows its own position                          |
| ор            | state machine operation used (see Op field in state machine tables above)      |
| cal           | calculation determined by state machine operation                              |
| f             | final state in CPR state machine   |
| decoded lat   | decoded latitude without high resolution offset                                |
| decoded lon   | decoded longitude without high resolution offset                               |

### 7.4.3.1.4.4 Test values for CPR report decoding CPR\_DEC\_TABLE (row, column) (CD(r, c))

(For the key to this table see the clause above.)

The encoding for the latitude and longitude values contained in the first four columns of the decoding table 7.14 is given in the encoding table 7.13.

The decoding operation used in table 7.14 is determined by the state machine tables, and referred to in table 7.14 using the column with heading "op". The time since a report was last received is indicated by the column headed "tim". When plotted, the decoded positions form a straight line in a north-easterly direction (allowing for the expected decoding errors), with gaps in the line corresponding to the missed reports.

### 7.4.3.1.6 VDL4 burst formats

In the following definitions, the function int(x) shall be taken to mean the largest integer less than or equal to x.

A subfield value of "x" shall mean that the parameter value may be ignored for the purpose of the particular test.

The following burst formats do not include the effect of bit stuffing. On generation of a burst at the RF PCO by the test harness, a logical 0 shall be inserted following a consecutive sequence of five logical 1s, except when arising in a flag. During recording of a burst by the test harness at the RF PCO, a sequence of five logical 1s followed by a 0 shall cause the 0 to be removed.

On generation of a burst, the test harness shall insert the value of the CRC field in accordance with clause 5.2.1.1.

## 7.4.3.2 Test cases

The equipment under test must be brought into the defined idle state before the performance of the individual test cases. Each test case starts in this state and leaves the equipment in that state after completion. The idle state is the state which the equipment enters after successful completion of the power up sequence. To perform several test cases in sequence the power on macro M\_POWER\_UP must only be executed at the beginning.

140

All protocol test cases shall be performed on a GSC channel (GSC1 or GSC2) unless stated otherwise in the test case itself.

Whenever a burst is specified in a test without values being given for all the parameters in a burst, and where the test does not instantiate the values, then the values of these parameters may be ignored.

If an expected test result mentioned in a test step is not observed during the execution of a test case, then the test case must be terminated and the equipment initialized before a new test case is executed. Further verification in that test case may not provide any valid results.

### 7.4.3.2.1 Test case macros

The following macros are used in several test cases.

DATA\_a(m) (Da(m)): Definition: Fill m bits of data with "0"s followed by "1"s. Bit number 1 is "0".

m odd

| bit <sub>m</sub> | bit <sub>m-1</sub> | bit <sub>m-2</sub> | bit <sub>4</sub> | bit <sub>3</sub> | bit <sub>2</sub> | bit <sub>1</sub> |
|------------------|--------------------|--------------------|------------------|------------------|------------------|------------------|
| 0                | 1                  | 0                  | 1                | 0                | 1                | 0                |

m even

| bit <sub>m</sub> | bit <sub>m-1</sub> | bit <sub>m-2</sub> | bit <sub>4</sub> | bit <sub>3</sub> | bit <sub>2</sub> | bit <sub>1</sub> |
|------------------|--------------------|--------------------|------------------|------------------|------------------|------------------|
| 1                | 0                  | 1                  | 1                | 0                | 1                | 0                |

|             | Macro N   | ame: M_P   | OWER_UP   | VDL4 ground station power up.                         |            |   |
|-------------|-----------|------------|-----------|---|------------|---|
| Parameters: | -         | -          |           |   | -          |   |
| Context     | Step      | Action     | PCO       | Action Qualifier                                      | Ref        | Comment   |
| nacro       | 1         | do         |           | Switch on VDL4 ground station                         |            |   |
|             | 2         | verify     | Self test | Successful VDL4 ground station BITE self test         |            | Verify that the VDL4 ground station has successfully passed BITE power-up test.   |
|             | 3         | wait       |           | 3 minutes   |            | Wait for ground station to acquire reservation table and default into idle state. |
|             | 4         | send       | Position  | Input test station's ADS position                     |            | Inform station under test of its own position.                                    |
|             | 5         | record     |           | add_A:= address of station under test                 |            |   |
|             | 6         | send       | VSS       | SET PARAMETERS (V66:= 0)                              |            | Set the second frame block reservation to 0.                                      |
| comments:   | This macr | o prepares | the VDL4  | ground station for testing. It brings the VDL4 ground | station in | to the defined idle state.  |

Macro Name: M\_RAND\_ACC\_SU (sf) Establish a queue of random access transmissions over a number of superframes.

| Parameters: (s | Parameters: (sf = number of superframes to transmit over) |        |     |   |     |  |  |  |  |
|----------------|---|--------|-----|---|-----|--|--|--|--|
| Context        | Step  | Action | PCO | Action Qualifier                                | Ref | Comment  |  |  |  |
| macro          | 1   | repx   |     | n:= 0; sf:= no. of superframes to transmit over |     | Maintains transmissions over sf superframes.   |  |  |  |
|                | 2   | queue  | VSS | DATA_a(m)                                       | . , | Send packets of data (labelled DATA_a) to the station under test for subsequent transmission by the random access protocol. Identify packets with repeating 10101010 bit sequence over m bits. |  |  |  |
|                | 3   | until  |     | n = sf x M1; n:= n + 1                          |     | Send M1 x sf random access transmissions.  |  |  |  |

**Comments:** Establishes a queue of random access transmissions over a defined number of superframes. Each random access is transmitted as a discrete burst, requiring the station under test to verify the state of the channel at the slot boundary prior to transmission. Flow control must be implemented at the VSS User PCO to ensure that the station under test is not flooded.

This macro tests which slots the station considers occupied. It is acceptable for implementations to use other means to provide this information

(e.g. with a command on the VSS PCO).

| Macro         | o Name:  | M_RAND_ | ACC_SL (s | lots) Establish a queue of random acc        | ess transmiss | sions over a number of slots.  |  |  |  |  |
|---------------|--|---------|-----------|--|---------------|--|--|--|--|--|
| Parameters: ( | Parameters: (slots = number of slots to transmit over) |         |           |  |               |  |  |  |  |  |

|                    | 6   | record         | RF   | t:= time at which first data is transmitted in the slot<br>containing the sync burst, measured from the test<br>equipment's UTC slot start time |     |   |  |  |  |  |
|                    | 7   | verify         | RF   | t = 2083,3 ± 1,1 μs   |     | Verify that the time at which data is first transmitted in the slot is compliant with the requirements of primary timing.   |  |  |  |  |
|                    | 8   | endrep         |      | n:= n + 1   |     |   |  |  |  |  |
| postamble          | 9   |                |      |   |     |   |  |  |  |  |

**Comments:** The first bit of data is required to be transmitted within  $\pm 0.6 \ \mu s$  from the start of the slot. The primary time source is required to be synchronized to UTC time with a precision of 0.4  $\mu s$  two sigma, and can thus be expected to be within 0.5  $\mu s$  on 99 % of occasions. Thus, the worst case timing error at the RF PCO is expected to be within 0.6 + 0.5 = 1.1  $\mu s$ .

Note that the test equipment's UTC time needs to be certified to be accurate by some means.

## Annex A (informative): Cross reference matrix

Table A.1 outlines the mapping between the VDL Mode 4 Ground station requirements and the related test procedures. The table also provides a cross reference to the ICAO reference material from which many of the requirements within the present document are derived. In these tables:

- column 1 is a reference to the requirement in the present document;
- column 2 is a reference to the equivalent requirements in [1];
- column 3 identifies individual requirements within [1];
- column 4 identifies clause titles taken from the present document;
- column 5 is a reference to testing requirements specified elsewhere in the present document. Several tests verify a whole group of requirements. They are only mentioned in the first row of such a group, usually a headline. The applicability of these tests to the subordinated requirements is indicated by ditto marks (") in the rows following the first instance of a test case name. Amplification of individual entries is provided by the following notes.
- NOTE 1: The clause number in column 1 is a headline or an introduction to requirements that are detailed in subsequent clauses. No test can be applied.
- NOTE 1a: The clause number in column 1 is a definition. No test can be applied.
- NOTE 2: The requirement listed in column 1 does not allow definition of a satisfactory go/no go test, for example, because it would be technically infeasible, or economically unreasonable. There are circumstances where the implementor can provide reasoned argument or test evidence that the implementation under test does conform to the requirements in column 1. For each of these circumstances the implementor may be required to satisfy the authorities by separate technical evidence.
- NOTE 3: The requirement listed in column 1 is applicable only to VDL Mode 4 airborne equipment. No ground equipment test is required.
- NOTE 4: This topic is heavily dependent on the implementation or results from a recommendation. No particular test is therefore provided in the present document.

### B.1 Overview of the structure of the ISO/IEC 9646 Test-Suites

A test-suite covers all tests required to test a piece of equipment. In the ISO/IEC 9646 [7] sense it should consist of the following elements:

#### Test-Suite Overview

The Test-Suite Overview presents the general structure of the test-suite. This part primarily contains an index in which the reference between the requirements and the related test cases is outlined.

#### **Declarations Part**

The Declarations Part outlines the test environment. Here the test equipment is defined. It also introduces the Points of Control and Observation (PCOs). These points are defined in the test setup where stimuli are injected and were the test results are observed.

#### **Constraints Part**

The Constraints Part contains the definitions of the packets and parameters which are used in the test steps. The individual fields of the packets are defined there.

#### Detailed Test Cases (Dynamic Part)

The Detailed Test Cases Part provides the actual test cases. Each test case is designed for the verification of a distinct function of the test object. In order to allow the performance of individual test cases in any sequence, the test cases are designed to be independent from the history of the test campaign (i.e. they contain all necessary steps required to reach the test objective). Each test case therefore starts at a well defined idle state of the test object. In order to avoid effects on successive test cases each test case must leave the test object in the defined idle state after the execution of the test case.

A test case consists of a sequence of test steps. Some steps in the beginning of the test case are required to prepare the test object for the actual verification. These steps form the preamble of the test case. The successive steps which perform the actual verification belong to the test body. The steps which bring the equipment under test back to the defined idle state make up the postamble.

### B.2 Test case description

ISO/IEC 9646 [7] provides a formal syntax to describe test-suites for communication equipment. This syntax is called the Tree and Tabular Combined Notation (TTCN). The use of TTCN is recommended by ISO/IEC 9646 [7] but not mandated. TTCN is a powerful semi-formal language defined to facilitate computerized test tools for any kind of communication equipment. However, TTCN is, due to its abstractness, not so human friendly as plain text. In order to keep the test cases readable to a maximum extent while making them as formal as necessary, it has been decided to use a simpler formal notation in the description of the test cases.

A more comprehensive description of the syntax follows on the next pages. It is important for the understanding of the test cases to be familiar with the syntax. The following table defines the meaning of entries in individual test cases.

Meaning of entries in the test case table:

| field name      | Description   |   |  |
|-----------------|---|---|--|
| Test Case Name  | the name of the test case. This name is used to reference a specific test case in the test-suite. |   |  |
| Long Designator | the long designator directly following the test case name provides the test case scope.           |   |  |
| Purpose         | describes the intention of the test case  |   |  |
| Reference       | provides the reference to the clauses of the requirements which are addressed by the tests.       |   |  |
| Context         | indicates wh  | ich part of the test case is executed. The following entries are foreseen:  |  |
|                 | preamble:   | in this part of the test case the equipment under test is brought into an appropriate state to begin the actual verification                                    |  |
|                 | test body:  | in this part of the test case the actual test steps required for the verification objective are executed  |  |
|                 | postamble:  | in this part of the test case the equipment under test is brought into the defined idle state   |  |
| Step            | numbers the   | individual test steps   |  |
| Action          |   | tion to be performed during the test.   |  |
|                 | send:   | send a the specified entity   |  |
|                 | queue:  | maintain a queue for input at the specified PCO, respecting any local flow control procedures, so that at least one of the specified entity is always available |  |
|                 | verify:   | verify that a result matches a given outcome (if an outcome is not observed, then the test has failed and the test case must be abandoned !)                    |  |
|                 | record:   | record a value  |  |
|                 | await:  | wait until a certain event takes place (the test step has failed if more than 30 s expire before the event is observed !)                                       |  |
|                 | wait:   | wait a specified time   |  |
|                 | macro:  | execute a named macro   |  |
|                 | do:   | do something special which is described in the Action Qualifier column  |  |
|                 | rep <i>x:</i>   | repeat the following steps x times in a loop  |  |
|                 | endrep:   | indicates the end of the loop statements  |  |
|                 | rep <i>x:</i>   | repeat the following steps in a loop until a condition is true  |  |
|                 | until:  | indicates the end of the loop statements and holds the termination condition  |  |
| PCO             | Point of Con  | trol and Observation, which indicates where in the test setup the action shall  |  |
|                 | be performed. The following entries are used:   |   |  |
|                 | RF  | RF antenna connection   |  |
|                 | Timing  | Timing source input   |  |
|                 | Position  | Position source input   |  |
|                 | Altitude  | Altitude source input   |  |
|                 | VSS   | VSS user  |  |
|                 | App in  | Application data input  |  |

### Table B.1: Test case format

| field name       | description   |  |  |
|------------------|---|--|--|
| Action Qualifier | further qualifies the action. It either holds one or more of the entries shown below:   |  |  |
|                  | the transaction type to be used together with specific field values. Principally the field values are those presented in the constraints clause. Different field values are stated explicitly like (LCI:= 316 or UD:= [5]{15}). The content of data fields which normally consist of several bytes is written like:   |  |  |
|                  | <ul> <li>[n]{val} (e.g. [20]{85}): n bytes with byte value val (decimal values only)</li> <li>[n]{n1n2} (e.g. [128]{0127}): n bytes in ascending order from n1 to n2 (decimal values only)</li> <li>[n]{k1,k2,k3,k4,,kn} (e.g. [5]{4,6,8,10,12}): n bytes according to explicit list (decimal values only)</li> </ul> |  |  |
|                  | the name of a macro plus one or more parameter values required by the macro like: M-NAME (LCI:= 316,CH:= 15)  |  |  |
|                  | a time to wait  |  |  |
|                  | none, timeout = x s no event to be expected, do not wait longer than x s  |  |  |
|                  | an event to await   |  |  |
|                  | parameters of a rep construct in the row with action repx or endrep   |  |  |
|                  | any free text which further qualifies the action  |  |  |
|                  | if alternative events are expected in one test step, then they are presented in individual lines but in one row of the table (i.e. only one step number is allocated). Two different cases need to be distinguished:  |  |  |
|                  | <ol> <li>Several events stated in one row without an additional keyword must all appear.<br/>Any sequence of the results is valid.</li> </ol>   |  |  |
|                  | <ol> <li>Several events combined with an OR may appear alternatively either one or more.<br/>Any sequence of the results is valid.</li> </ol>   |  |  |
| Ref              | A reference to the definition of a basic version of a packet as described in the constraints clause   |  |  |
| Comment          | A comment which adds information for understanding of the actual step   |  |  |
| Comments         | Overall Comments on the test case, if necessary   |  |  |

## B.3 Queue action

The action "queue" is applied to the VSS User PCO to maintain a constant stream of random access requests. Each request represents a discrete request and results in a single burst with a transmitter ramp up and down at the start and end of the burst. It is not expected that the item under test should be capable of buffering all the random access transmissions demanded by this procedure. The test set should provide a suitable mechanism (e.g. buffer) to maintain a stream of inputs through the VSS User PCO, subject only to the flow control imposed by the item under test.

## B.4 Repeat construct

To express test steps which need to be executed repetitively in a loop, the repeat construct is used. A repeat construct consists of the two delimiting keywords:

- repx; and
- endrep.

In this the parameter "x" stands for the number of loops to be performed. "x" may either be an integer constant or an integer expression. In order to provide the test steps of the loop with possibly required variables, an arbitrary number of variables may be initialized in the Action Qualifier column in the row of the **repx** keyword like:

In the above statements n is initialized to 1. In the second line a vector p(), holding packets to be used during the loop, is Initialized. Each element of the vector may be addressed by an integer index. The first element is addressed by the index 1.

A **rep** statement is used to prepare for a loop of successive statements. There is no test step executed in the rep statement line itself. The loop defined by rep and endrep actually begins in the line following the rep statement line (i.e. the initialization in the rep statement line is only performed once !).

In most loops certain variables need to be modified while the loop is performed several times. The modification is stated by one ore more equation(s) in the **endrep** line, like:

n := n + 1; i := i - 1

Nested loops are allowed.

An alternative to the repeat construct which ends after a certain number of loops have been performed is the **repeat until** construct, which consists of the two delimiting keywords:

- **rep***x*; and
- until.

In the line with the keyword until the condition is mentioned which terminates the loop. This condition is enclosed by brackets (). The parameter x may still be used to indicate a maximum number of loops to be performed. This allows to terminate possible endless loops if the termination condition is not reached due to an error. In such a case the test has failed and must be abandoned!

### B.5 Macro definitions

Macros are used to express sequences of steps which are used frequently. A macro may not include verification statements. A macro name is preceded by 'M-' for distinction from normal test cases. Macros may be called with parameters. The parameters are mentioned in () behind the macro name the macro is called.

### B.6 Test case naming

The individual test cases are named for reference. In order to obtain a systematic name, the name is composed in a hierarchical manner, with subsidiary naming levels separated by the underscore character.
