Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Access, Terminals, Transmission and Multiplexing (ATTM), and is now submitted for the ETSI standards One-step Approval Procedure.

The present document is part 1 of a multi-part deliverable covering the Fixed Radio Systems; Characteristics and requirements for point-to-point equipment and antennas, as identified below:

- Part 1: "Overview and system-independent common characteristics";
- Part 2-1: "System-dependent requirements for digital systems operating in frequency bands where frequency co-ordination is applied";
- Part 2-2: "Digital systems operating in frequency bands where frequency co-ordination is applied; Harmonized EN covering the essential requirements of Article 3.2 of the R&TTE Directive";
- Part 3: "Equipment operating in frequency bands where both frequency coordinated or uncoordinated deployment might be applied; Harmonized EN covering the essential requirements of article 3.2 of the R&TTE";
- Part 4-1: "System-dependent requirements for antennas";
- Part 4-2: "Antennas; Harmonized EN covering the essential requirements of Article 3.2 of R&TTE Directive".

Proposed national transposition dates							
Date of latest announcement of this EN (doa):	3 months after ETSI publication						
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	6 months after doa						
Date of withdrawal of any conflicting National Standard (dow):	6 months after doa						

Introduction

Generality and historical background

Digital Fixed Radio Systems (DFRS), used in European countries, had been historically specified in a relatively large number of specific European Norms produced by ETSI.

Those previous documents, already superseded by first version of this EN 302 217 series, contained both essential requirements and other requirements that, even if not considered essential under the Directive 1999/5/EC [1] of the European Parliament and of the Council of 9 March 1999 on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity (hereafter mentioned as the R&TTE Directive) [1], may be applicable.

Standards for point-to-point systems, including antennas, cover a very large range of traffic capacities, channel separations, modulation formats and applications over a very wide range of frequency bands that are summarized in table 1.

Parameter	Range
Frequency bands	from 1 GHz to 86 GHz
Traffic capacities	from 9,6 kbit/s to 622 Mbit/s and to Gigabit/s and above in the highest bands
Channel separations	from 25 kHz to 112 MHz and to Gigahertz and above in the highest bands
Modulation formats	from 2 to 512 states (amplitude and/or phase and/or frequency modulated states)
Typical applications	POINT-TO-POINT (P-P) CONNECTIONS: rural and urban low/medium/high capacity links for mobile infrastructure, transport/trunk (long haul), FWA/BWA/MWA backhaul, access, governmental (non-military) links, private fixed networks, SAP/SAB P to P audio and video links STAND ALONE ANTENNAS: for all of the above applications when integral antennas are not employed

Table 1: Digital Fixed Radio Systems (DFRS) parameters

The regulatory framework for placing radio systems on the market, established by the R&TTE Directive [1] also requires the availability of Harmonized ENs covering the essential requirements under article 3.2 of the R&TTE Directive [1]. EN 302 217 series meet this demand by providing a rational subdivision of requirements into general, system dependent "not essential" and "essential" requirements from the perspective of the R&TTE Directive [1].

Part 1 includes system-independent common characteristics; these requirements are not essential under article 3.2 of the R&TTE Directive [1].

EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37] relevant to essential requirements under article 3.2 of the R&TTE Directive [1]. Additional system can be added for new available FS bands and for completing market available options.

In the present document, equipment are grouped into families of either similar frequency bands or applications. Five families are identified for frequency bands where frequency co-ordination is applied, corresponding, in both EN 302 217-2-1 [i.33] and EN 302 217-2-2 [i.34], to annexes referenced from A to E and one family associated with applications of packet data and combination of other signals mapped into proprietary transport modules, detailed in annex F.

- A frequency bands from 1,4 GHz to 2,7 GHz;
- B frequency bands from 3 GHz to 11 GHz (channel separation up to around 30 MHz);
- C frequency bands from 3 GHz to 11 GHz (channel separation 40 MHz);
- D frequency bands 13 GHz, 15 GHz and 18 GHz;
- E frequency bands from 23 GHz to 55 GHz;
- F transmission of Packet Data and combination of other signals.

In the same way EN 302 217-3 [i.35] three families are identified for frequency bands where either co-ordinated or uncoordinated deployment might be applied (see note), corresponding to annexes referenced from UA to UC.

- UA frequency band from 57 GHz to 59 GHz;
- UB frequency band from 64 GHz to 66 GHz;
- UBa frequency band from 57 GHz to 66 GHz (alternative, in overlapping bands, to UA and UB);
- UC frequency bands from 71 GHz to 76 GHz and 81 GHz to 86 GHz.

NOTE: In these bands, CEPT administrations might have different views on the licensing and deployment requirements, ranging among uncoordinated, user self coordination (sometimes called "light licensing") or conventional link-by-link coordination. Therefore, from R&TTE Directive [1] point of view, the minimum of characteristics are considered among essential requirements.

Cross references to previously relevant ENs and TSs

The EN 302 217 series replaced and superseded the standards that are listed in table 2; they have been labelled as "historical" in the ETSI data base. Table 2 provides also an overview of the correspondence between equipment considered in those ENs and part/annexes in the present document.

Requirements have been rationalized and redistributed in the present document according to a logic subdivision dictated by the coming into force of the R&TTE Directive [1]:

- requirements considered essential under article 3.2 of the R&TTE Directive [1] have been placed in the relevant harmonized ENs EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37];
- other requirements that, even if not considered essential under the R&TTE Directive [1], may be applicable, on a voluntary basis, as a common basis for maintaining performance and operability of DFRS in typical deployment, have been placed in the present document or in other relevant parts EN 302 217-2-1 [i.33] and EN 302 217-4-1 [i.36].

NOTE 1: The frequency band identification is taken from the approximate centre frequency as commonly used in Fixed Service ITU-R Recommendations; it also includes national frequency bands that may slightly differ from each other but are commonly referred to by the same term.

Table 3 summarizes the relevant cross-reference between radio frequency and other requirements of equipment in various Fixed Service frequency bands and the relevant sub-parts and annexes of this EN 302 217 series.

NOTE 2: The reference of the annex where system specific requirements and characteristics are introduced is the same for EN 302 217-2-1 [i.33] and EN 302 217-2-2 [i.34], respectively.

NOTE 3: All references in this table are found in the clause 2.2.

NOTE 4: This TS might be withdrawn in due time.

User's guide

With reference to the former standards listed in table 2, the EN 302 217 series provides the same set of characteristics and requirements, with the same values. However, this information is presented differently, spread across six parts corresponding to three categories.

The first category (the present document) corresponds to characteristics which are either common to the whole family of equipment or are provided in a comprehensive list, i.e. performance and availability, environmental profiles, power supply, system block diagram, TMN interface, mechanical characteristics and baseband interfaces and parameters. The symbols and abbreviations, which apply to the EN 302 217 series, are listed in the present document. The present document defines those requirements and characteristics set out in the other parts of this EN 302 217 series.

The second category (EN 302 217-2-1 [i.33] and EN 302 217-4-1 [i.36]) corresponds to characteristics and requirements, which are not relevant to article 3.2 of the R&TTE Directive [1]. Nevertheless, compliance to all or some of these requirements is mandatory in order to claim compliance with the relevant part of the EN 302 217 series. Requirements are either "main requirements" or "complementary requirements". Even though compliance to these parts is not mandatory for the R&TTE Directive [1] conformity, compliance may be claimed to all or some requirements of these parts.

EN 302 217-2-1 [i.33] and EN 302 217-4-1 [i.36] provide a description of the main and complementary requirements, for equipment operating in co-ordinated frequency bands and for antennas.

Main requirements are requirements that are also related to the "essential requirements" under article 3.2 of the R&TTE Directive [1] and are further detailed in EN 302 217-2-2 [i.34] and EN 302 217-4-2 [i.37] of this EN 302 217 series; for equipment operating in co-ordinated frequency bands (EN 302 217-2-2 [i.34]) and for antennas (EN 302 217-4-2 [i.37]), respectively.

Complementary requirements are requirements that are not related to essential requirements under article 3.2 of the R&TTE Directive [1]. Nevertheless they are considered, having been commonly agreed for proper system operation and deployment when specific deployment conditions or compatibility requirements are present. Compliance to all or some of these requirements is made on a voluntary basis.

The limiting values for main and complementary requirements that are not common to all of the equipment covered by one part, but specific to one frequency range, one hierarchy (PDH or SDH), one capacity, etc, are located in annexes which may be further divided into sub-annexes. A sub-annex, when created, is dedicated to one system, described by the association of the range of capacities, the range of frequencies and the range of channel separations.

The third category (EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37]) corresponds to essential phenomena, with respect to article 3.2 of the R&TTE Directive [1] and are consequently harmonized standards. The requirements are provided in the same way as in EN 302 217-2-1 [i.33] and EN 302 217-4-1 [i.36]. The limiting values associated with the essential requirements which are not common to all of the equipment covered by one part, but specific to one frequency range, one hierarchy (PDH or SDH), one capacity, etc, are located in annexes which may be further divided into sub-annexes. Reference to each annex is the same for EN 302 217-2-1 [i.33] as in EN 302 217-2-2 [i.34]. An HS-RTT (requirements table) summarizes those requirements to be addressed in order to claim compliance.

To conclude, this EN 302 217 series shall be used as a decision tree, from the present document down to the relevant annexes/sub-annexes of parts EN 302 217-2-1 [i.33] and EN 302 217-2-2 [i.34]. At every level, a check of compliance shall be performed.

EN 302 217-2-1

System dependent requirements for digital systems operating in frequency bands where frequency co-ordination is applied

- 4 General characteristics
- 5 Main requirements
- 6 Complementary requirements
- Annex A: Frequency bands 1,4 GHz to 2,7 GHz
- Annex B: Frequency bands from 3 Ghz to 11 GHz (CS up to 30 MHz)
- Annex C: Frequency bands from 3 GHz to 11 GHz (CS 40 MHz)
- Annex D: Frequency bands from 13 GHz, 15 GHz and 18 GHz
- Annex E: Frequency bands from 23 GHz to 55 GHz
- Annex F: Transmission of Packet Data
- Annex G (informative): Additional information

EN 302 217-3

Equipment operating in frequency bands where both frequency coordinated or uncoordinated deployment might be applied. Harmonized EN covering essential requirements of Article 3.2 of R&TTE Directive

- 4.1 Environmental profile
- 4.2 RF channel selection
- 4.3 Transmitter requirements
- 4.4 Receiver requirements
- 5 Testing for compliance to technical requirements
- Annex A (normative): HS Requirement & conformance

Test specifications (HS-RTT)

Annex B (normative): Wide radio frequency band covering

units and multirate equipment specification and tests

Annex UA (normative): Frequency band around 58 GHz

Annex UB (normative): Frequency band 64-66 GHz

Annex UBa (normative): Frequency band 57-66 GHz

Annex UC (normative): Frequency bands 71-76 GHz and 81-86 GHz

Annex UD (informative): Rationale for the interference limit formula

Annex UE (informative): Capacity and Receiver characteristics in the bands 64-66 GHz, 71-76 GHz and 81-86 GHz

EN 302 217-2-2

Digital systems operating in frequency bands where frequency co-ordination is applied; Harmonized EN covering the essential requirements of Article 3.2 of the R&TTE Directive

- 4 Technical requirements specifications
- 4.1 Environmental profile
- 4.2 Transmitter requirements
- 4.3 Receiver requirements
- 4.4 Antenna directional requirements
- 5 Testing for compliance with technical requirements

Annex A: Frequency bands 1.4 GHZ to 2.7 GHz)

Annex B: Frequency bands from 3 GHz to 1 1 GHz (CS up to 30 MHz and 56/60 MHz)

Annex C: Frequency bands from 3 GHz to 11 GHz (CS 40 MHz)

Annex D: Frequency bands 13 GHz, 15 GHz and 18 GHz

Annex E: Frequency bands from 23 GHz to 55 GHz

Annex F: Transmission of Packet Data

Annex G (normative): Test report in relation to flexible systems applications

Annex H (normative): HS Requirement & conformance Test specifications (HS-RTT)

Annex | (informative): Spectrum mask requirements when ATPC and/or

RTPC are implemented and mixed-mode operation is

concerned

Annex J (informative): Typical interference sensitivity behaviour for

frequency planning purpose

EN 302 217-4-1

System dependent requirements for antennas

- 4 Frequency bands
- 5 Classification of antennas
- 6 Electrical characteristics

Annex A (normative): Standardized RPE for Class 1 antennas in

bands 3 to 86 GHz

Annex B (informative): Additional information

Annex C (informative): Antenna gain and RPE information

EN 302 217-4-2

Antennas; Harmonized EN covering the essential requirements of article 3.2 of R&TTE Directive

- 4 Technical requirements specifications
- 4.1 Environmental profile
- 4.2 Radiation Pattern Envelope (RPE)
- 4.3 Cross-Polar Discrimination (XPD)
- 4 4 Antenna gain
- 5 Testing for compliance with technical requirements

Annex A (normative): HS Requirement & conformance Test specifications (HS-RTT)

Figure 0: Structure of this EN 302 217 series

1 Scope

The present document applies to the following digital fixed radio systems (DFRS), including equipment with integral antenna, and antenna types:

- point-to-point systems intended for operation in frequency bands that require co-ordination;
- point-to-point systems intended for operation in frequency bands that do not require co-ordination;
- antennas for point-to-point operation.

The present document summarizes all characteristics, principles and definitions that are common to all P-P equipment and antennas, EN 302 217-2-1 [i.33] and EN 302 217-4-1 [i.36] summarize the other system dependent characteristics and include limits for "non-essential" requirements, EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37] contain the whole description and limits of "essential" requirements under article 3.2 of the R&TTE Directive [1].

Health and safety requirements, relevant to article 3.1a of the R&TTE Directive [1] are not considered in any part of this EN 302 217 series. CENELEC is responsible for the relevant standards.

EMC conditions and requirements, relevant to article 3.1b of the R&TTE Directive [1] and any other essential requirement relevant to article 3.3 of the R&TTE Directive [1] are not in the scope of any part of this EN 302 217 series. They may be found in EN 301 489-1 [i.26] and EN 301 489-4 [i.27].

NOTE: A list of such ENs is available on the web site http://www.newapproach.org.

For administration's guidance when notifying their regulated interfaces in accordance with article 4.1 of the R&TTE Directive [1], annex B provides explanatory considerations on the applicability of the TCAM-RIG format for P-P fixed links. An example of such a notification is also provided. Annex B has been elaborated in co-ordination with the CEPT ECC WG SE.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:
 - if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document;
 - for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at http://docbox.etsi.org/Reference.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document and of the whole EN 302 217 series, the following terms and definitions apply:

allocated radio frequency band: derived from the definition of "allocation (of a frequency band)" (Radio Regulations, article 1.16): "entry in the Table of Frequency Allocations of a given frequency band for the purpose of its use by one or more terrestrial or space radiocommunication services or the radio astronomy service under specific conditions. This term shall also be applied to the frequency band concerned"

From the regulatory point of view two different applications might be envisaged:

- Frequency band where frequency co-ordination is applied: in these bands, in the licensing process, regulatory bodies enforce co-ordination rules to ensure that all links work on an "acceptable interference" bases.
- Frequency band where frequency co-ordination is not applied: in these bands, irrespective of any licensing process or with no licensing at all, the deployment is freely made by the user on a "first on-first served" bases without any warrantee of "acceptable interference" from the regulatory body.

antenna: part of the transmitting or receiving system that is designed to radiate and/or receive electromagnetic waves

NOTE: Antenna directional characteristics are part of essential requirements under article 3.2 of the R&TTE Directive [1].

Automatic Transmit Power Control (ATPC): function implemented to offer a dynamic power control that delivers maximum power only during deep fading; in this way for most of the time the interference is reduced and the transmitter operates in a higher linearity mode

NOTE 1: When this function is used, the transmit power is dynamically changed with respect to the propagation conditions. In principle, when ATPC is implemented, three different level of power may be identified:

- maximum available power (delivered only in conditions of deep fading);
- maximum nominal power (useable on a permanent basis when ATPC is disabled); it should be noted that this power is "nominal for the equipment" and is not to be confused with the "nominal level set link by link" by the frequency co-ordinating body. This is achieved through passive RF attenuators or use of the RTPC function;
- **minimum power** (delivered in unfaded conditions).

NOTE 2: Maximum nominal and maximum available power levels may be coincident or, in case of multi-state modulation formats, the maximum available power may be used to overdrive the transmitter (loosing linearity but gaining fade margin when the fade conditions have already impaired the expected RBER). Performance predictions are usually made with the maximum "available power".

bandwidth adaptive systems: a system, the capacity of which may be dynamically changed by mean of bandwidth reduction during adverse propagation conditions

block assignment: application of block of spectrum assigned to one or more stations of an operator under a single exclusive licence

conformity assessment procedure: See R&TTE Directive [1] annexes II to V.

co-polar pattern: diagram representing the radiation pattern of a test antenna when the reference antenna is similarly polarized, scaled in dBi or dB relative to the measured antenna gain

cross-Polar Discrimination (XPD): difference in dB between the co-polarized main beam gain and the cross-polarized one, measured within a defined angular region

cross-polar pattern: diagram representing the radiation pattern of a test antenna when the reference antenna is orthogonally polarized, scaled in dBi or dB relative to the measured antenna gain

environmental profile: range of environmental conditions under which equipment within the scope of the EN 302 217 series is required to comply with the provisions of the EN 302 217 series

essential phenomenon: radio frequency phenomenon related to the essential requirements under article 3.2 of the R&TTE Directive [1] that is capable of expression in terms of quantifiable technical parameters

frequency band: band of frequencies over which the performance characteristics of the equipment/antenna are set within specified limits

frequency block: portion of a radio-frequency band licensed or auctioned to a user

NOTE: It is commonly assumed that the user can freely deploy radio systems inside the block, complying only with few interblock coexistence rules and possibly with operational constraints given in the license/auction.

frequency slot: basis on which one or more slots can be aggregated to form a channel or a block

gain (of an antenna): ratio of the radiation intensity, in a given direction, to the radiation intensity that would be obtained if the power accepted by the antenna were radiated isotropically

NOTE: Value measured in dBi.

half power beamwidth (of an antenna): angle, relative to the main beam axis, between the two directions at which the measured co-polar pattern is 3 dB below the value on the main beam axis

harmonized radio frequency band: commonly referred to as a portion of the frequency spectrum that CEPT/ECC (formerly CEPT/ERC) allocates to a specific service through a CEPT/ECC Decision (proper definition is currently under study by CEPT/ECC)

NOTE: Presently, radio frequency bands allocated to the Fixed Service are not harmonized.

input port(s): flange(s) or connector(s) through which access to the antenna system is provided

NOTE1: These are shown in the following figure 1 at points D and D'.

NOTE 2: The points in figure 1 are reference points only; points B, C and D, B', C' and D' may coincide.

integral antenna: antenna which is declared as part of the radio equipment by the supplier

NOTE: Even when equipment with integral antenna is concerned, it might still be possible to separate the antenna from the equipment using a special tool. In such cases the assessment of the radio equipment and of the antenna against requirements of this EN 302 217 series could be done separately by the actual supplier(s).

Inter Port Isolation (IPI) (of an antenna): ratio in dB of the power level applied to one port of a multi-port antenna (e.g. dual polarization ports or multi-band ports) to the power level received in any other port of the same antenna as a function of frequency

isotropic radiator: hypothetical, lossless antenna having equal radiation intensity in all directions

main beam (of an antenna): radiation lobe containing the direction of maximum radiation

main beam axis (of an antenna): direction for which the radiation intensity is the maximum

maximum available power: See Automatic Transmit Power Control (ATPC).

maximum nominal power: See Automatic Transmit Power Control (ATPC).

mixed-mode (adaptive) system: system having the capability for stations to operate, according network and operator needs (e.g. according propagation variations), on different modulation orders switching dynamically between them within the same assigned radio frequency channel, adapting the system capacity accordingly (*multirate* operation)

NOTE: This capability may be used to improve capacity capabilities, with variable availability objectives, by adaptive adjustment for time-variant channel impairments. The switching between modulation orders may occur as frequently as the propagation conditions dictate and as appropriate to the system dynamic behaviour management, (e.g. on a per-symbol and/or, in multicarrier systems, per-carrier basis).

multirate systems: systems that can operate with multiple payload rates; the actual rate can either be statically preset (possibly coupled also with *Preset-mode* operation) or, when coupled with *Mixed-mode* operation, dynamically change according to the change in modulation format

national radio frequency channel arrangement: predefined centre frequencies raster for a number of radio frequency channels, covered by a national regulation in a non harmonized frequency band and used on a national basis

NOTE: May all or in part overlap with other national or recommended radio frequency channel arrangements.

Network Interface Capacity (NIC): sum of the maximum bit rates of the implemented base band interfaces at reference point X/X'

nominal (channel) bandwidth: bandwidth, defined by the supplier, which the system will use when deployed in bands where no specific radio frequency channel arrangement is defined (or it is defined only in term of aggregation of basic slots)

NOTE: Its value can be defined as a free value (nominal bandwidth) or in term of the used aggregation of basic frequency slots to form the used channel (nominal channel bandwidth). This value, if required, may represent the reference for defining parametric requirements (e.g. spectrum density mask, spectrum efficiency etc.).

occupied bandwidth: width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to a specified percentage $\beta/2$ of the total mean power of a given emission (Radio Regulations, article 1.153)

NOTE: For the purpose of the present document, $\beta/2$ shall be equal to 0,5 % (ITU-R Recommendation F.1191 [i.43]).

operating frequency range: range(s) of radio frequency channels covered by the Equipment Under Test (EUT) without any change of HardWare (HW) units

preset-mode system: multi-rate and multi-format system that can be statically configured or preset to operate on a semi-permanent basis with one among several possible modulation orders within the same assigned radio frequency channel, changing consequently the payload rate

NOTE: Signals transmitted from any station use the single modulation order which has been preset. The presetting, if the licence permits, may be changed from time to time according to the operator's needs.

radiation pattern (of an antenna): diagram relating power flux density at a constant distance from the antenna at off-axis angles (non intentional antenna radiation) relative to a direction of the antenna main beam axis (intentional antenna radiation)

Radiation Pattern Envelope (RPE) (of an antenna): envelope below which the radiation pattern shall fit; diagrams representing the radiation pattern of a test antenna measured with a reference antenna, scaled in dBi or dB relative to the measured antenna gain

NOTE: For linearly polarized antennas, two different RPE are generally identified:

- co-polar radiation pattern envelope: diagram representing the radiation pattern of a test antenna
 when the reference antenna is similarly polarized, scaled in dBi or dB relative to the measured
 antenna gain;
- cross-polar radiation pattern envelope: diagram representing the radiation pattern of a test antenna when the reference antenna is orthogonally polarized, scaled in dBi, or dB relative to the measured antenna gain.

radio equipment: product, or relevant component thereof, capable of communication by means of the emission and/or reception of radio waves utilizing the spectrum allocated to terrestrial/space radiocommunication

NOTE: As defined in the R&TTE Directive [1].

radio frequency channel arrangement: predefined (centre frequencies) raster for a number of radio frequency channels

NOTE 1: Used by administrations for co-ordination in the same geographical area.

NOTE 2: As defined by ITU-R Recommendation F.746 [20].

radio frequency channel: portion of a radio frequency band, where a radio frequency channel arrangement has been established, dedicated to one fixed radio link

Radio Interface Capacity (RIC): maximum user net capacity (in term of system capability), defined at Z/Z' reference points, that can be transmitted over the radio interface defined at reference point C'

NOTE: RIC is defined at Z/Z' reference points and includes additional capacity added for framing and multiplexing/demultiplexing different baseband signals (at X/X' points) into a transport module, eventually integrated in the baseband processing of the radio system, virtually defined at the Z/Z' reference points (e.g. the STM-N for the standardized SDH case or the higher level PDH frames for the transport of N x 2 Mbit/s or similar declared proprietary multiplexing frames of different signals). It does not include other additional proprietary algorithms and signals used for specific radio systems purposes (typically error correction codes and radio system service channels).

radome (of an antenna): cover of dielectric material, intended to protect an antenna from the effects of its physical environment

recommended radio frequency channel arrangement: predefined centre frequencies raster for a number of radio frequency channels, covered by a CEPT/ECC Recommendation in a non harmonized frequency band (not used for the same purpose by all administrations) that is recommended to the member countries where they use the relevant frequency band for the Fixed Service

reference mode (reference equipment class): in mixed-mode systems, it identifies the operative mode which characteristics (i.e. system capacity, spectrum efficiency class over a given channel separation) are used (i.e. declared in the licensing process) in the link per link coordination analysis, made for offering the reference availability objective commonly used for the whole network (i.e. the typical 99,99 % or any other generally used by the administration concerned for the frequency coordination of licensed P-P links)

Remote Frequency Control (RFC): many fixed digital radio systems offer this functionality as a qualifying aid to deployment

NOTE: When this function is used, the transmit centre frequency/channel can be set either by a local control unit, connected to the system control unit, or by a remote network management terminal. The frequency variation is static and usually made at the activation or re-commissioning of links in order to easily obtain the licensed frequency assigned by the co-ordinating body to the network operator for that link, in order to control network interference in the same geographical area.

Remote Transmit Power Control (RTPC): many fixed digital radio systems offer this functionality as a qualifying aid to the deployment

NOTE: When this function is used, the transmit power can be set either by a local control unit, connected to the system control unit, or by a remote network management terminal. The power variation is static and usually made at the activation or re-commissioning of links in order to easily obtain the EIRP required by the frequency co-ordinating body for that link, to control co-channel and adjacent channel interference in the same geographical area. In principle, this function is equivalent to the requirement power regulation capability (e.g. by fixed attenuators) commonly required in fixed systems.

single-mode system: system designed to operate with a single modulation order only

spectral efficiency: defined as the ratio between the peak gross-bit-rate and the Occupied Bw or occupied ChS (whichever is applicable)

NOTE: The gross-bit rate is defined as transmission bit rate over the air. In case of a transmitter working in burst mode, the gross bit rate is the instantaneous maximum transmission bit rate during the burst

stand-alone antenna: antenna delivered independently from the fixed radio equipment, by the same or a different supplier and connected to the radio equipment on the field

sub-STM-1: old terminology for medium capacity Synchronous Transport Module at 51,84 Mbit/s defined as STM-0 by ITU-T Recommendation G.707 [31] and ITU-R Recommendation F.750 [21]

sub-STM-0: set of SDH transmission interfaces, defined in ITU-T Recommendation G.708 [32] which transport one or more TU Group(s)-2 (sSTM-2n interface) or one or more TU-12 (sSTM-1k interface) as defined by ITU-T Recommendation G.707 [31], with Section OverHead (9 bytes per frame)

NOTE: The sSTM-2n interfaces may be defined for optical, electrical or radio transport technologies. The sSTM-1k interfaces are defined for radio transport technologies; the sSTM-11 interface may also be used for reduced functionality, intra-station cable connections for VC11/VC12 payloads. The number (k) of TU-12 in sSTM-1k interfaces provided by ITU-T Recommendation G.708 [32] is limited to k = 1, 2, 4, 8 and 16.

3.2 Symbols

For the purposes of the present document and of the whole EN 302 217 series, the following symbols apply:

0	or the purposes of	the present document and of the whole EN 302 217 series, the following symbols apply:
	0	degree
	Ω	Ohm
	CSmin	minimum practical Channel Separation (for a given radio-frequency channel arrangement)
	dB	deciBel
	dBc	deciBel relative to mean carrier power
	dBi	deciBel relative to an isotropic radiator
	dBm	deciBel relative to 1 mW
	dBu	deciBel relative to 1 microVolt
	dBW	deciBel relative to 1 Watt
	GHz	GigaHertz
	kg	kilogramme
	kHz	kiloHertz
	km	kilometre
	kN	kiloNewton
	m/s	metres per second
	Mbit/s	Mega-bits per second
	MHz	MegaHertz

MHz MegaHertz
mW milliWatt
ns nanosecond
ppm parts per million

V Volts

W/m² Watts per square metre

3.3 Abbreviations

For the purposes of the present document and of the whole EN 302 217 series, the following abbreviations apply:

AC	Alternating Current
ACAP	Adjacent Channel Alternate Polarization
ACCP	Adjacent Channel Co-Polarization
ACDP	Adjacent Channel Dual Polarized
APSK	Amplitude and Phase Shift Keying (modulation)

4 General characteristics

4.1 Performance and availability requirements

Equipment shall be designed in order to meet network performance and availability requirements appropriate for the type of traffic carried in a multimedia network. These network requirements (see note) are foreseen by ITU-T Recommendations G.826 [33] and G.828 [34], by ITU-T Recommendations I.356 [37] and I.357 [38] for ATM transmission and Y.1540 [43] for IP transmission. For transmission of Ethernet frames, network performance requirements of ISO/IEC 8802-3 [19] for 10 Mbit/s Medium Attachment Units and IEEE 802.3 [18] for 100 Mbit/s and 1 000 Mbit/s Physical Layer Devices shall be referred to.

The events for SDH multiplex and regenerator sections have to be measured according to ITU-T Recommendation G.829 [35].

The performance and availability objectives for any overall radio connections, used in the international or national portion of the digital path, have to be based on the criteria defined in ITU-R Recommendations F.1668 [26] and F.1703 [27].

The effect of the link design on performance is recognized and the general design criteria specified in ITU-R Recommendations F.752 [22], F.1093 [23], F.1101 [24] and F.1102 [25] are to be applied to the digital connection with respect to the propagation scenarios set out in ITU-R Recommendation P.530 [28].

NOTE: An exhaustive list of recommendations for network performance and availability requirements is not in the scope of the present document. The Recommendations referred in this clause are the basic ones for the most common applications in the fixed networks. Due to continuous evolution of the communication technology, other payloads/network applications might require different or new requirements that should be taken into due account in the equipment and link design for such applications.

4.2 Environmental profiles

There are three environmental profiles to be considered:

• environmental profile declared under the R&TTE Directive [1];

NOTE: With the generic term of environmental profile, it is here intended any variation of the "external" conditions (e.g. climatic and external primary/secondary power supply sources feeding the equipment to be assessed) that might affect the system parameters relevant to the "essential requirements" of article 3.2 of the R&TTE Directive [1].

- voluntary ETSI environmental profile;
- test environmental profiles.

4.2.1 Environmental profile declared under the R&TTE Directive

From the point of view of the R&TTE Directive [1], the essential requirements of EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37] apply under the environmental profile for intended operation of the equipment and antennas, which shall be declared by the supplier.

4.2.2 ETSI environmental profiles

If conformance is voluntarily sought also to an ETSI standardized environmental profile, the radio equipment shall be required to meet the environmental conditions set out in the appropriate part(s) of the multipart standard EN 300 019-1-0 [2] to EN 300 019-2-4 [11], which defines weather protected and non-weather protected locations, classes and test severity.

NOTE: The environmental profile declared for the R&TTE Directive conformance may be different from any ETSI standardized one.

Environmental conditions for antennas are not generally included in EN 300 019-1-0 [2] to EN 300 019-2-4 [11] scope, environmental profiles are left to supplier declaration only; however annex A of EN 302 217-4-1 [i.36] gives some generic guidance.

The equipment shall comply with all of the requirements of the EN 302 217 series at all times when operating within the boundary limits of the operational environmental profile of the equipment.

4.2.2.1 Equipment within weather-protected locations (indoor locations)

Equipment intended for telecommunications applications and operating inside weather protected locations shall meet the requirements of an appropriate environmental class characterized in the EN 300 019-1-3 [8] for such purpose. The supplier shall declare the selected class(es).

4.2.2.2 Equipment for not-weather-protected locations (outdoor locations)

Equipment intended for telecommunications applications and operating in non-weather protected locations shall meet the requirements of an appropriate environmental class characterized in the EN 300 019-1-4 [10] for such purpose. The supplier shall declare the selected class(es).

4.2.3 Test environment profiles

In the case of the R&TTE Directive [1], any test, carried out to generate the test report and/or declaration of conformity, required to fulfil any conformity assessment procedure set out by the R&TTE Directive [1] for radio equipment, shall be carried-out with the same principles and procedures, for reference and extreme conditions, specified in:

- clause 4.4 of EN 301 126-1 [15] for climatic conditions
- table 1 of EN 301 126-1 [15] and relevant clauses of EN 302 217-2-2 [i.34] or EN 302 217-3 [i.35] for power supply conditions.

Requirements for testing at reference or extreme conditions, specified in relevant clauses of the EN 302 217 series, are set out according to the principles for similar requirements in EN 301 126-1 [15].

In the case of voluntary ETSI environmental profiles, the technical requirements of the EN 302 217 series apply under the environmental profile for operation of the equipment, which shall be determined by the environmental class of the equipment according to clause 4.4 of EN 301 126-1 [15]. Testing shall be in accordance with EN 300 019-2-3 [9] or EN 300 019-2-4 [11] for weather-protected and not-weather-protected profiles, respectively.

Any test, carried out to generate the test report and/or declaration of conformity, required to fulfil any conformity assessment procedure specification by the R&TTE Directive [1] for integral or stand-alone DFRS antennas (directional phenomena of EN 302 217-4-2 [i.37]), shall be carried-out at reference environmental conditions at the test field according to clause 4.1 of EN 301 126-3-1 [17].

The test report shall be produced according to the procedure specified by article 10 of the Directive 1999/5/EC [1].

4.3 Power supply

There are two power supply profiles to be considered:

- power supply profile declared under the R&TTE Directive [1];
- voluntary ETSI power supply profile.

4.3.1 Power supply profile declared under the R&TTE Directive

From the point -of-view of the R&TTE Directive [1], the essential requirements of EN 302 217-2-2 [i.34], EN 302 217-3 [i.35] and EN 302 217-4-2 [i.37] apply under the limits of any primary/secondary power supply external to the equipment under assessment, in accordance with the environment profile for intended operation of the equipment, which shall be declared by the supplier. See clauses 4.2.1 and 4.2.3.

4.3.2 ETSI power supply profile

If conformance is voluntarily sought also to an ETSI standardized power supply profile, the power supply interface shall be in accordance with the characteristics of one or more of the secondary voltages specified in EN 300 132-2 [12] and EN 300 132-3 [13]. When appropriate, in case of remote or local powering of user stations, also EN 302 099 [16] shall apply.

4.4 System block diagram

The reference points of the system block diagram below will be used in the descriptions of requirements and of test points in the other parts of EN 302 217 series [i.33], [i.34] and [i.35].

- NOTE 1: For the purpose of defining the measurement points, the branching network does not include a combiner.
- NOTE 2: The points shown above are reference points only and do not mandate any implementation; points C and C'. D and D' in general coincide.
- NOTE 3: Points B, C, B' and C' may coincide when a simple duplexer is used.
- NOTE 4: Points X1, X2, ... Xn and points X'1, X'2, ... X'n correspond to one or more digital or analogue signal input reference points. They are generically referred to as X and X'.
- NOTE 5: The subdivision of "Payload processing" and the "Modulator/demodulator" blocks is functional and not physical. The first functionally contains the payload processing needed for building up the transport module (e.g. framing, multiplexing and or concentration), the latter functionally contains mo-demodulation, coding-decoding and service signals processing needed for transmission (e.g. error correction algorithms and service channels). Points Z and Z', that might not be physically available, represent the virtual points where the radio interface capacity (RIC), referred in the provisions of annexes F of EN 302 217-2-1 [i.33] and EN 302 217-2-2 [i.34], shall be defined.
- NOTE 6: No filtering included.
- NOTE 7: Alternative connection AT, RF, IF or Baseband.

Figure 1: System block diagram

5 Baseband interfaces and parameters

The baseband parameters, specified in following clauses, refer to point X and X' of figure 1. Parameters for service channels and wayside traffic channels are outside the scope of the EN 302 217 series.

One or more of the following clauses will be applicable.

5.1 Plesiochronous interfaces

If applicable, Plesiochronous interfaces at 2 Mbit/s, 8 Mbit/s, 34 Mbit/s and 140 Mbit/s shall comply with ITU-T Recommendation G.703 [29]. Parameters for service channels and wayside traffic channels are outside the scope of this EN 302 217 series.

5.2 ISDN interfaces

If applicable, the transmission of 2 Mbit/s signals using the structure and functions of ISDN primary multiplex signals is to be in accordance with ITU-T Recommendations G.703 [29], G.704 [30], I.412 [39] and ETS 300 233 [14].

5.3 Synchronous digital hierarchy interfaces

If applicable, the SDH baseband interface shall be in accordance with ITU-T Recommendations G.703 [29], G.707 [31], G.708 [32], G.783 [i.45], G.784 [i.46] and G.957 [36].

The following STM-N physical interfaces are possible:

- sSTM-1k (ITU-T Recommendation G.708 [32]);
- STM-0 CMI, HDB2, HDB3 electrical (ITU-T Recommendation G.703 [29]);
- STM-1 CMI electrical (ITU-T Recommendation G.703 [29]);
- STM-N optical (ITU-T Recommendation G.957 [36]).

The use of reserved bytes contained in the Section OverHead (SOH), and their termination shall be in accordance with ITU-R Recommendation F.750 [21]. Further details on the possible use of the SOH bytes including additional RFCOH or RCSOH are given in TR 101 035 [i.1].

5.4 Other baseband data interfaces

Other standardized base band data interfaces are possible; for equipment assessment when other base band interfaces are foreseen see annexes F in EN 302 217-2-1 [i.33] and EN 302 217-2-2 [i.34]. Those annexes provide the conditions under which current PDH/SDH specifications can be used for systems with traffic interface combinations other than those mentioned in the PDH/SDH specifications.

Examples of most common such interfaces are:

- low speed data interfaces in accordance to ITU-T Recommendations V.11 [40], V.24 [41] and/or V.28 [42];
- Ethernet data interface: 10 Mbit/s, 100 Mbit/s and 1 000 Mbit/s interfaces in accordance with the OSI physical layer requirements of ISO/IEC 8802-3 [19] and IEEE 802.3 [18] respectively.

The data interface offered by the equipment shall be declared by the supplier together with the relevant set of applicable international standards in agreement with the network operator.

Annex A (informative): Miscellaneous characteristics

A.1 Telecommunications Management Network (TMN) interface

If provided, the Telecommunications Management Network (TMN) interface should be in accordance with ITU-T Recommendations G.773 [i.44] and G.784 [i.46].

NOTE 1: ITU-R Recommendations, ETSI ETSs and ENs may also be relevant; the complete list is outside the scope of the present document.

NOTE 2: For SDH equipment the general requirements for TMN interface and functionality are given by:

- EN 300 417 series [i.9], EN 301 167 [i.21], ETS 300 635 [i.39] and EN 300 645 [i.16];
- ITU-T Recommendations G.784 [i.46] and G.773 [i.44];
- ITU-R Recommendations F.750 [21] and F.751 [i.42].

NOTE 3: The standardization of TMN interface functionalities is not under the responsibility of ETSI TC-TM; new TMN standards may become applicable with respect to the fixed digital radio systems considered in this EN 302 217 series.

A.2 Mechanical characteristics

The mechanical dimensions for indoor installations should be in agreement with EN 300 119 [i.38].

For outdoor installations each of the outdoor units should be weatherproof or weather protected.

NOTE: The following parameters should be taken into account in the design of equipment incorporating an external unit:

- a) maximum weight of external unit;
- b) size of external unit for wind loading considerations;
- c) maximum weight of replaceable units;
- d) ease of access of replaceable units.

Annex B (informative):

Notification of interfaces under article 4.1 of the R&TTE Directive

This informative annex provides in table B.1 explanations on the applicability of the TCAM-RIG format to the notification of the regulated P-P fixed links Interfaces by the Administrations. Table B.2 gives an illustrative example of such a notification.

B.1 Applicability of TCAM-RIG format of radio interface specifications to Fixed Services

Table B.1: Compliance of TCAM-RIG format for P-P fixed links

Applicable, for FS should mean limits of allocated band, which e.g. may include guard bands of the channel plan and duplex centre gap. Radio service (some countries put this only in a separate allocation table) Application Application Application Applicable, for FS should be set to "Fixed Service" in this case. Application Application Applicable, for FS should specify whether this frequency band is assigned for P-P, P-MP, MP-MP; for infrastructure, access or other, or combination. Channelling only - the channelling arrangements should be specified, e.g. ref. to CEPT/ITU recommendation/annex and/or National (the latter to be explained or attached). National restrictions/modifications to CEPT/ITU plans to be described. Modulation for FS is technology specific, so should not be mentioned as a requirement, but suitable modulations may be derived from channel arrangements/EN classes, see also "Channel occupation rules". Transmit power limit Applicable, depends on type of FS application, etc. Actual meaning (output power and/or EIRP) may vary. Channel occupation rules Applicable, depends on type of FS application, etc. Actual meaning (output power and/or EIRP) may vary. Channel occupation rules Applicable, for FS should read "Duplex type/spacing", in some cases reference to the specified channel arrangement may be sufficient, in other - should be explained, for FDD MP systems the uplink/downlink bands could be specified. Applicable, for FS could be Individual licence, block assignment, general licence. Other peculiarities should be mentioned if any (e.g. geographical limitations). Applicable, for FS could be expanded into: Antenna radiation pattern (ref EN), Emission spectrum mask (ref EN), Receiver parameters (ref EN), Minimum antenna gain, ATPC. Reference Applicable.	Nr.	TCAM-RIG proposed parameter	CEPT ECC WGSE conclusions on applicability to FS
2 Radio service (some countries put this only in a separate allocation table) 3 Application Applicable, should be set to "Fixed Service" in this case. Application Channelling only - the channelling arrangements should be specified, e.g. ref. to CEPT/ITU recommendation/annex and/or National (the latter to be explained or attached). National restrictions/modifications to CEPT/ITU plans to be described. Modulation for FS is technology specific, so should not be mentioned as a requirement, but suitable modulations may be derived from channel arrangements/EN classes, see also "Channel occupation rules". 5 Transmit power limit Applicable, depends on type of FS application, etc. Actual meaning (output power and/or EIRP) may vary. 6 Channel occupation rules Applicable in some cases (not for block assignments), may mean transmission capacity, minimum hop length, etc. 7 Duplex direction/separation Applicable, for FS should read "Duplex type/spacing", in some cases reference to the specified channel arrangement may be sufficient, in other - should be explained, for FDD MP systems the uplink/downlink bands could be specified. 8 Licensing regime Applicable, for FS could be Individual licence, block assignment, general licence. Other peculiarities should be mentioned if any (e.g., geographical limitations). Not applicable for FS for the time being. Applicable, for FS could be expanded into: Antenna radiation pattern (ref EN), Emission spectrum mask (ref EN), Receiver parameters (ref EN) Minimum antenna gain, ATPC. Applicable.	1	Frequency band	
2 Radio service (some countries put this only in a separate allocation table) Applicable, should be set to "Fixed Service" in this case. 3 Application Applicable, for FS should specify whether this frequency band is assigned for P-P, P-MP, MP-MP; for infrastructure, access or other, or combination. 4 Channelling/modulation Channelling only - the channelling arrangements should be specified, e.g. ref. to CEPT/ITU recommendation/annex and/or National (the latter to be explained or attached). National restrictions/modifications to CEPT/ITU plans to be described. Modulation for FS is technology specific, so should not be mentioned as a requirement, but suitable modulations may be derived from channel arrangements/EN classes, see also "Channel occupation rules". 5 Transmit power limit Applicable, depends on type of FS application, etc. Actual meaning (output power and/or EIRP) may vary. 6 Channel occupation rules Applicable, depends on type of FS application, etc. Actual meaning (output power and/or EIRP) may vary. 7 Duplex direction/separation Applicable, for FS should read "Duplex type/spacing", in some cases reference to the specified channel arrangement may be sufficient, in other - should be explained, for FDD MP systems the uplink/downlink bands could be specified. 8 Licensing regime Applicable, for FS could be Individual licence, block assignment, general licence. Other peculiarities should be mentioned if any (e.g. geographical limitations). 9 Additional essential requirements (ref EN), Emi

B.2 Proposed list of radio interface specifications for Fixed Services

It should be noted that the proposed below list of radio interface specifications should be used in the framework of R&TTE Directive [1], that is when deciding on eligibility of FS equipment to be placed on the market and brought into service.

The list of parameters that are relevant to national spectrum management functions (e.g. for frequency assignment process) is wider/different, as e.g. described in ECC Recommendation CEPT/ECC/REC 01-05 [i.2] "List of parameters of digital point-to-point fixed links used for national planning". Administrations may request those parameters from the applicant/licensee during the licensing procedure.

It is understood that the proposed FS radio interface requirements provide a list of parameters, allowing individual Administrations to select those parameters necessary to the case, depending on the information in the European harmonized standards and the level of detail in their national frequency allocation tables.

Table B.2: Example of interface requirements for P-P fixed links notification

Parameter	Value (examples)	Filling instructions
Frequency band (GHz)	17,7-19,7	Limits of FS allocated band.
Radio service	Fixed Service	
Application/ System type	Infrastructure P-P	Infrastructure, access or other, or combination, etc.; P-P, P-MP, MP-MP.
Channelling	CEPT/ERC/REC 12-03 [i.3] 27,5 MHz channels only	Either reference to CEPT/ITU recommendation/annex and/or National plan (the latter to be explained or attached). National restrictions/modifications to CEPT/ITU plans to be described.
Transmit power limit	XX dBm EIRP	Should be specified whether it is an output power and/or EIRP; in accordance with RR provisions. For block assignment it may be complemented by additional provisions (e.g. border PFD limits).
Channel occupation rules	Min hop 10 km	May mean transmission capacity (possibly linked to channel width), minimum hop length, equipment class, etc.
Duplex type / spacing	CEPT/ERC/REC 12-03 [i.3] FDD	Either reference to the specified channel arrangement or explained, for FDD MP systems the uplink/downlink bands could be specified.
Licensing regime	Link-by-link assignment	Could be Link-by-link assignment, block assignment, and general licence. Other specifics should be mentioned, if any (e.g. geographical limitations).
Frequency planning assumptions	ATPC: XX dB	Could include requirements in accordance with articles 3.2 and 7.2 of the R&TTE Directive [1]: Antenna radiation pattern (ref EN), Emission spectrum mask (ref EN), Receiver parameters (ref EN), Minimum antenna gain, ATPC. For block assignment additional/alternative provisions may be set: PFD masks/limits, inter-operator co-ordination procedures, block edge mask, etc.
Reference	EN 302 217-2-2 [i.34]	Reference to harmonized standard, selected equipment class, etc.
Remarks		Any relevant remarks, additional info.
Notification number		For administrative reference purposes.
NOTE: References in	n the table are found in the [i.3	and [i.34] of clause 2.2.
