# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Electromagnetic compatibility and Radio spectrum Matters (ERM), and is now submitted for the Public Enquiry phase of the ETSI standards Two-step Approval Procedure.

The present document is part 2 of a multi-part deliverable covering the VHF air-ground and air-air Digital Link (VDL) Mode 4 radio equipment; Technical characteristics and methods of measurement for aeronautical mobile (airborne) equipment, as identified below:

Part 1: "Physical layer";

**Part 2: "General description and data link layer";**

Part 3: "Additional broadcast aspects";

Part 4: "Point to point functions".

The present document is accompanied by an equivalent ground-based standard, EN 301 842 [14] Parts 1 to 4, covering the VHF air-ground Data Link (VDL) Mode 4 radio equipment; Technical characteristics and methods of measurement for ground-based equipment.

Proposed national transposition dates	
Date of latest announcement of this EN (doa):	3 months after ETSI publication
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	6 months after doa
Date of withdrawal of any conflicting National Standard (dow):	6 months after doa

---

# Introduction

The present document states the technical specifications for Very High Frequency (VHF) Digital Link (VDL) Mode 4 aeronautical mobile (airborne) radio transmitters, transceivers and receivers for air-ground and air-air communications operating in the VHF band, using Gaussian-filtered Frequency Shift Keying (GFSK) modulation with 25 kHz channel spacing and capable of tuning to any of the 25 kHz channels from 118,000 MHz to 136,975 MHz as defined in ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs).

The present document may be used to produce tests for the assessment of the performance of the equipment. The performance of the equipment submitted for type testing should be representative of the performance of the corresponding production model.

The present document has been written on the assumption that:

- the type test measurements will be performed only once, in an accredited test laboratory and the measurements accepted by the various authorities in order to grant type approval;
- if equipment available on the market is required to be checked it will be tested in accordance with the methods of measurement specified in the present document or a documented alternative approved by the certifying authority;
- equipment comply with EN 302 842-1 [4].

NOTE: The present document has been produced with a view to maintaining consistency of numbering with the equivalent standard for ground equipment (EN 301 842 [14]). Where requirements are the same, they have been given the same number. This has lead to a non-standard form of numbering for new requirements. In addition, a key normative reference, the ICAO Technical Manual, is currently undergoing preparation for publication. It is already known that the numbering in has substantially changed. Hence it is proposed that a revision exercise is carried out after the ETSI public enquiry and before ETSI publication, under the auspices of the appropriate ETSI technical group, with the purpose of reviewing requirement numbering and ensuring consistency with EN 301 842 [14], ICAO material and ETSI drafting guidelines.

---

# 1 Scope

The present document states the technical specifications for Very High Frequency (VHF) Digital Link (VDL) Mode 4 aeronautical mobile (airborne) radio transmitters, transceivers and receivers for air-ground and air-air communications operating in the VHF band, using Gaussian-filtered Frequency Shift Keying (GFSK) modulation with 25 kHz channel spacing and capable of tuning to any of the 25 kHz channels from 118,000 MHz to 136,975 MHz as defined in ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs).

The present document is designed to ensure that equipment certified to it will be compatible with the relevant ICAO VHF Digital Link (VDL) Standards and Recommended Practices (SARPs) and VDL Mode 4 Technical Manual (TM) [1].

NOTE: In clause 5.1.4, Tertiary time, as described by the VDL Mode 4 Technical Manual [1], has not been included as a requirement in the present document due to the opinion of the ETSI Working Group that insufficient evidence was available to be able to verify that a "floating network" of stations operating on tertiary time would safely be restored to primary or secondary time upon resumption of the availability of primary time sources.

Manufacturers should note that in future the tuning range for the transmitter may also cover any 25 kHz channel from 112,000 MHz to 117,975 MHz and the receiver(s) may cover any 25 kHz channel from 108,000 MHz to 117,975 MHz.

The present document applies to "aeronautical mobile (airborne)" equipment which will hereinafter be referred to as "mobile" equipment.

The scope of the present document is limited to mobile stations. The equivalent specification for ground stations is EN 301 842 [14].

The VDL Mode 4 system provides digital communication exchanges between aircraft and ground based systems and other aircraft supporting surveillance and communication applications. The supported modes of communication include:

- broadcast and point-to-point communication;
- broadcast services including Automatic Dependent Surveillance - Broadcast (ADS-B), Traffic Information Service - Broadcast (TIS-B), Flight Information Service - Broadcast (FIS-B) capabilities and GNSS Augmentation Service - Broadcast (GNS-B);
- air-air and ground-air services;
- operation without ground infrastructure.

VDL Mode 4 is designed to be an Air/Ground subsystem of the Aeronautical Telecommunication Network (ATN) [8] using the AM(R)S band and it is organized according to the Open Systems Interconnection (OSI) model (defined by ISO). It provides reliable sub network services to the ATN system. Other networks can also be supported but have not been the focus of the present document.

The present document is derived from the standards and specifications in:

- VDL Mode 4 standards produced under the auspices of the International Civil Aviation Organization (ICAO) [1].
- Other relevant standards as defined in clause 2.

It is envisaged that manufacturers may provide equipment supporting:

- broadcast services only;
- point-to-point services only;
- both broadcast and point-to-point services.

EN 302 842-1 [4] deals with tests of the physical layer. The present document defines the core link layer requirements for the VDL Mode 4 mobile station necessary to support all types of equipment. This includes a simple position broadcast functionality.

The present document deals with tests of the link layer sufficient to support core link layer functionality, and it also includes requirements and tests sufficient to recognize and respond to transmissions associated with point-to-point communication. The present document does not address requirements for the full ADS-B message set, or for other broadcast applications that can be supported by the VDL Mode 4 equipment. These are covered by EN 302 842-3 [9]. Detailed requirements for point-to-point communication are beyond the scope of the present document, but can be found in EN 302 842-4 [10]. EN 302 842-4 [10] also includes the interface to the Aeronautical Telecommunication Network (ATN) as defined in ATN SARPs [8].

As the measured values of equipment performance may be a function of the method of measurement, standard test conditions and methods of test are recommended in the present document.

The present document is organized as follows:

- references, definitions, abbreviations and symbols are provided in clauses 2 and 3;
- clause 4 describes the VDL Mode 4 mobile station link layer;
- clause 5 performance specifications for the VDL Mode 4 mobile station and any additional mobile functions necessary to support ground station co-ordination;
- clause 6 provides general design requirements;
- clause 7 provides protocol tests for core link layer functions;
- a document history is contained in clause 8;
- clause A provides a detailed cross-reference to the relevant requirements contained in reference [1];
- annex B provides a description of the ISO/IEC 9646 [7] Test Methodology.

Note that the system can support a very wide range of functions. It is not practical to provide specific tests for all aspects of its functionality. The approach used is to provide detailed tests for the core link layer functionality and to provide tests of those remaining requirements which, if wrongly implemented, could cause a deterioration in the service offered by other VDL Mode 4 stations. Therefore:

- a detailed set of protocol tests are provided for the core link layer functionality necessary to support broadcast functions;
- a detailed test of position encoding and decoding is provided because of the importance of position in the management of the VDL Mode 4 link specifically and the need to support ADS-B applications in general.

### **Mandating and Recommendation Phrases**

a) "Shall":

- the use of the word "Shall" indicates a mandated criterion; i.e. compliance with the particular procedure or specification is mandatory and no alternative may be applied.

b) "Should":

- the use of the word "Should" (and phrases such as "It is recommended that...", etc.) indicates that though the procedure or criterion is regarded as the preferred option, alternative procedures, specifications or criteria may be applied, provided that the manufacturer, installer or tester can provide information or data to adequately support and justify the alternative.

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

## 3 Definitions and abbreviations

### 3.1 Definitions

#### 3.1.1 Basic reference model definitions

The present document is based on the concepts developed in the open systems interconnect basic reference model. For the purposes of the present document, the terms and definitions given in ISO/IEC 7498-1 [5] apply:

- layer;
- sublayer;
- entity;
- service;
- physical layer;
- data link layer.

#### 3.1.2 Service conventions definitions

For the purposes of the present document, the terms and definitions given in ISO/IEC 10731 [6] applies for:

- service provider;
- request;
- indication;
- confirm.

#### 3.1.3 General definitions

For the purposes of the present document, the terms and definitions given in EN 302 842-1 [4], clause 3.1.3 and the following apply:

**Aeronautical Mobile Service (AMS):** mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate

**Aeronautical Telecommunications Network (ATN):** internetwork architecture that allows ground, air/ground, and aircraft data sub networks to interoperate by adopting common interface services and protocols based on the International Organization for Standardization Open Systems Interconnection Reference Model

**aircraft address:** unique combination of 24 bits available for assignment to an aircraft for the purpose of air-ground communications, navigation and surveillance

NOTE: An aircraft may choose not to use this unique address and can use instead a non-unique address.

**Automatic Dependent Surveillance-Broadcast (ADS-B):** surveillance application transmitting parameters, such as position, track, ground speed and time via a broadcast mode data link for use by any air and/or ground users requiring it

NOTE: ADS-B is a surveillance service based on aircraft self-determination of position/velocity/time and automatic, periodic, broadcast of this information along with auxiliary data such as aircraft identity (ID), intent information and communications control parameters, etc. ADS-B is intended to support multiple high-level applications and associated services such as cockpit display of traffic information, traffic situation awareness functionality, enhanced traffic management in the air and on the ground, search and rescue support and others.

**autotune:** procedure by which a VDL Mode 4 ground station may direct a mobile VDL Mode 4 station to transmit on a specified frequency, and with certain characteristics, by sending an uplink burst containing an autotune reservation

**Big Negative Dither (BND):** reservation protocol by which a station may establish a reservation in the following superframe outside the range of the maximum dither allowed by periodic broadcasts. It is intended to be used by a station entering the network after listening to the channel for a few seconds, and allows such a station to reserve a slot which is likely to be unreserved

**burst:** VHF Digital Link (VDL) specific services burst is composed of a sequence of source address, burst ID, information, slot reservation, and Cyclic Redundancy Code (CRC) fields, bracketed by opening and closing flag sequences.

NOTE: The start of a burst may occur only at quantized time intervals and this constraint allows the propagation delay between the transmission and reception to be derived.

**burst length:** number of slots across which the VDL Mode 4 burst is transmitted

**CTRL DLDPDU:** basic unit of transmission at the LME and VME

**current slot:** slot in which a received transmission begins

**Data Link Entity (DLE):** protocol state machine capable of setting up and managing a single data link connection

**Data Link Protocol Data Unit (DLDPDU):** general burst format used by the Data Link Service (DLS) sublayer

**Data Link Service (DLS) Sublayer:** sublayer that resides above the VDL Mode 4 Specific Services (VSS) and the MAC sublayers. The Data Link Service (DLS) manages the transmit queue, creates and destroys Data Link Entities (DLEs) for connection-oriented communications, provides facilities for the Link Management Entity (LME) to manage the DLS, and provides facilities for connection-less communications.

**delayed burst:** VDL Mode 4 burst that begins sufficiently after the beginning of a slot so that the transmitting VDL Mode 4 station is confident that no other VDL Mode 4 station that it could receive from and is within the guard range is transmitting in the slot. The delayed VDL Mode 4 burst terminates by the end of the slot in which it began (its length is shortened to ensure completion by the nominal time)

**Global Signalling Channel (GSC):** channel available on a world-wide basis for VDL Mode 4 based services

**ground base station:** aeronautical station equipment, in the aeronautical mobile service, for use with an external antenna and intended for use at a fixed location

**link:** link connects a mobile DLE and a ground DLE and is uniquely specified by the combination of mobile DLS address and the ground DLS address

NOTE: A different sub network entity resides above every link endpoint.

**link establishment:** link establishment is the process by which two stations discover each other, determine to communicate with each other, decide upon the communication parameters, create a link and initialize its state before beginning communications. For air-ground links, this process involves ground LME protocols. For air-air links, link establishment is achieved using mobile ZOCOP protocols

**link handoff:** process by which peer LMEs, already in communication with each other, create a link between an aircraft and a new ground station before disconnecting the old link between the aircraft and the current ground station

**link layer:** layer that lies immediately above the physical layer in the Open Systems Interconnection protocol model

NOTE: The link layer provides for the reliable transfer of information across the physical media. It is subdivided into the data link sublayer and the media access control sublayer.

**Link Management Entity (LME):** protocol state machine capable of acquiring, establishing, and maintaining a connection to a single peer system. In addition, in VDL Mode 4, the LME generates synchronization bursts for transmission, either autonomously, or in accordance with a request from a peer station and/or local application

**NOTE:** A LME establishes data link and sub network connections, "hands-off" those connections, and manages the media access control sublayer and physical layer. An aircraft LME tracks how well it can communicate with the ground stations of a single ground system. An aircraft VDL Management Entity (VME) instantiates an LME for each ground station that it monitors. Similarly, the ground VME instantiates an LME for each aircraft that it monitors. An LME is deleted when communication with the peer system is no longer viable.

**Media Access Control (MAC):** sublayer that acquires the data path and controls the movement of bits over the data path

**physical layer:** lowest level layer in the Open Systems Interconnection protocol model

**NOTE:** The physical layer is concerned with only the transmission of binary information over the physical medium (e.g. VHF radio).

**primary time source:** source of timing information local to a mobile station, capable of maintaining synchronization to Universal Coordinated Time (UTC) seconds within a prescribed tolerance

**private parameters:** parameters that are contained in CTRL and UCTRL DLPDUs and that are unique to the VHF digital link environment

**reference signal level:** reference signal level is the signal level used in the receiver performance specifications unless otherwise stated

**reference bit sequence:** sequence of bits used in the transmitter performance specifications

**secondary time source:** timing source used in a failure mode, that applies when the primary time source fails, in which a VDL Mode 4 station maintains time synchronization to the UTC second

**Self-Organizing Time Division Multiple Access (STDMA):** multiple access scheme based on time-shared use of a radio frequency (RF) channel employing: (1) discrete contiguous time slots as the fundamental shared resource; and (2) a set of operating protocols that allows users to access these time slots in an organized manner without reliance on a master control station

**slot:** one of a series of consecutive time intervals of equal duration. Each burst transmission starts at the beginning of a slot (with the exception of VDL Mode 4 delayed transmissions). In VDL Mode 4, each group of slots of one second duration is aligned to the UTC second.

**station:** VDL Mode 4 Specific Services (VSS)-capable entity

**NOTE:** A station may be either a mobile station or a ground station. A station is a physical entity that transmits and receives bursts over the RF interface (either A/G or air-to-air (A/A)) and comprises, at a minimum: a physical layer, media access control sublayer, and a unique VSS address. A station which is also a DLS station has the same address.

**subnetwork layer:** layer that establishes, manages, and terminates connections across a subnetwork

**superframe:** group of slots that span a period of one UTC minute

**NOTE:** The start of the current superframe is aligned with the UTC-minute.

**synchronization burst (or "sync" burst):** VDL Mode 4 burst type containing, as a minimum, information on the station's identity, position and time. A synchronization burst may also carry additional data elements required for specific applications

**NOTE:** Ground stations announce existence, position, and the current time. Mobile stations lacking timing information can then derive the slot structure and time from ground synchronization bursts. Mobile stations lacking position information can derive position from both mobile and ground synchronization bursts. This periodic information is used in various ways including ADS-B, secondary navigation, and simplifying the LME algorithms.

**Time Division Multiple Access (TDMA):** multiple access scheme based on time-shared use of an RF channel employing: (1) discrete contiguous time slots as the fundamental shared resource; and (2) a set of operating protocols that allows users to interact with a master control station to mediate access to the channel

**VDL Management Entity (VME):** VDL-specific entity that provides the quality of service requested by the ATN-defined sub network system management entity

NOTE: A VME uses the LMEs (that it creates and destroys) to acquire the quality of service available from peer systems.

**VDL Mode 4:** data link using a Gaussian Filtered Frequency Shift Keying modulation scheme and self organizing time division multiple access

**VDL Mode 4 Burst:** sequence of source address, burst ID, information, slot reservation, and CRC fields, bracketed by opening and closing flag sequences

NOTE: The start of a burst may occur only at quantized time intervals and this constraint allows the propagation delay between the transmission and reception to be derived.

**VDL Mode 4 Specific Services (VSS) sublayer:** sublayer that resides above the MAC sublayer and provides VDL Mode 4 specific access protocols including reserved, random and fixed protocols

**VDL Mode 4 station:** physical entity that transmits and receives VDL Mode 4 bursts over the RF interface (either air-ground (A/G), air-to-air (A/A) or ground-ground (G/G)) and comprises, as a minimum: a physical layer, Media Access Control sublayer and a VSS sublayer

NOTE: A VDL Mode 4 station may either be a mobile VDL Mode 4 station or a ground VDL Mode 4 station.

**VDL Mode 4 Station Address:** 27-bit identifier used to identify a VDL Mode 4 station, which may be unique or locally unique. A combination of the 24 bit ICAO aircraft address plus 3 additional bits

**VDL Station:** VDL-capable entity.

NOTE: A station may either be a mobile station or a ground station. A station is a physical entity that transmits and receives frames over the Air/Ground (A/G) interface and comprises, at a minimum: a physical layer, media access control sublayer, and a unique DLS address. The particular initiating process (i.e. DLE or LME) in the station cannot be determined by the source DLS address. The particular destination process cannot be determined by the destination DLS address. These can be determined only by the context of these frames as well as the current operational state of the DLEs.

**VDL System:** VDL-capable entity

NOTE: A system comprises one or more stations and the associated VDL management entity. A system may either be a mobile system or a ground system.

**VSS user:** user of the VDL Mode 4 Specific Services. The VSS user could be higher layers in the VDL Mode 4 SARPs or an external application using VDL Mode 4

**Zero-Overhead Connection-Oriented Protocol (ZOCOP):** protocol which enables an air-air link between mobiles

### 3.1.4 Definition of bit order

In the tables included in the present document to illustrate the format of bursts, the following order is implied:

- a) bit order in each burst subfield shall be indicated by subscript numbers. Bit 1 shall indicate the least significant bit; and
- b) bits shall be transmitted octet by octet, starting with the first octet in each table, and within each octet the rightmost bit (as shown in the tables) shall be transmitted first.

## 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

A/A	Air/Air communications
A/G	Air/Ground communications
ACK	Acknowledgement (burst)
ADS-B	Automatic Dependent Surveillance Broadcast
AIRSAW	AIRborne Situational AWAREness
AM(R)S	Aeronautical Mobile (Route) ServiceA-SMGCS Advanced Surface Movement Guidance and Control Systems
ATN	Aeronautical Telecommunication Network
BITE	Built-In Test Equipment
BND	Big Negative Dither
CCI	Co-Channel Interference
CDTI	Cockpit Display of Traffic Information
CPR	Compact Position Reporting
CRC	Cyclic Redundancy Code
dB	deciBel
DLE	Data Link Entity
DLPDU	Data Link Protocol Data Unit
DLS	Data Link Service
DOS	Directory Of Services
erid	extended reservation ID
EUROCAE	EUROpean Organization for Civil Aviation Equipment
FCS	Frame Check Sequence
FOM	Figure Of Merit
G/G	Ground-Ground communications
GFSK	Gaussian Filtered frequency Shift Keying
GNSS	Global aeronautical Navigation Satellite System
GSC	Global Signalling Channel
hex	hexadecimal
ICAO	International Civil Aviation Organization
ID	IDentity
INFO	INFOrmation (DLPDU)
ISO	International Organization for Standardization
LCI	Logical Channel Identifier
LME	Link Management Entity
MAC	Media Access Control
MOPS	Minimum Operational Performance Specification
NIC	Navigation Integrity Category
NM	Nautical Mile
OSI	Open Systems Interconnection
PCO	Point of Control and Observation
PECT	Peer Entity Contact Table
QoS	Quality of Service
RF	Radio Frequency
rid	reservation ID
RNP	Required Navigation Performance
RTS	Request To Send (DLPDU)
SAR	Search and Rescue
SARPs	Standards And Recommended Practices
SNAcP	Sub-Network Access control Protocol
STDMA	Self-organizing Time Division Multiple Access
TCP	Trajectory Change Point
TDMA	Time Division Multiple Access
TTCN	Tree and Tabular Combined Notation
UTC	Universal Time Coordinated

VDL	VHF Digital Link
VDR	VHF Digital Radio
VHF	Very High Frequency
VME	VDL Management Entity
VSS	VDL Mode 4 Specific Services
ZOCOP	Zero Overhead Connection-Orientated Protocol

---

## 4 General description of VDL Mode 4 mobile station link layer

### 4.1 General

#### 4.1.1 Overview of VDL Mode 4

VDL Mode 4 is a VHF data link, providing digital communications between mobile stations (aircraft and airport surface vehicles) and between mobile stations and fixed ground stations. It is developed for Communications, Navigation, Surveillance (CNS)/Air Traffic Management (ATM) aviation applications, including broadcast applications (e.g. ADS-B) and point-to-point communications (e.g. ADS-C, CPDLC). VDL Mode 4 protocols support ADS-B and similar broadcast applications through the broadcast of short repetitive messages, with graceful adaptation to increasing traffic loads.

VDL Mode 4 transmits digital data in a standard 25 kHz VHF communications channel and divides the communication channel into a large number of *time slots*. The start of each slot is an opportunity for a station to transmit.

VDL Mode 4 is built on the Self-organizing Time Division Multiple Access (STDMA) concept, in which the time-slots are synchronized to UTC-time, and stations advertise their intention to transmit in a specified time-slot by means of a reservation protocol carried in a prior transmission. For convenience, a group of contiguous time slots spanning a period of 60 s is termed a *superframe*. Each time slot may be used by a station for transmission of data. The exact timing of the slots and planned use of them for transmissions are known to all users in range of each other, so that efficient use of the data link can be made and users do not transmit simultaneously. As a result of this "self-organizing" protocol, VDL Mode 4 is capable of operating outside the coverage of a ground infrastructure and can therefore support air-air as well as ground-air data communications and applications. Under some circumstances, in e.g. high density airspace, a ground infrastructure may be used to manage the system to further improve overall performance.

In most respects, the VDL Mode 4 mobile station follows the provisions of the ICAO standards material for VDL Mode 4. Within the ICAO standard, there are some requirements which apply explicitly only to ground stations. A number of other requirements will also not apply because of the assumed services provided by the mobile station. The assumed services provided by the mobile station and the impact on the requirements is summarized in this clause.

#### 4.1.2 Relationship to OSI reference model

The VDL Mode 4 sub-system implements the three lower layers of the OSI model as illustrated in figure 4.1.

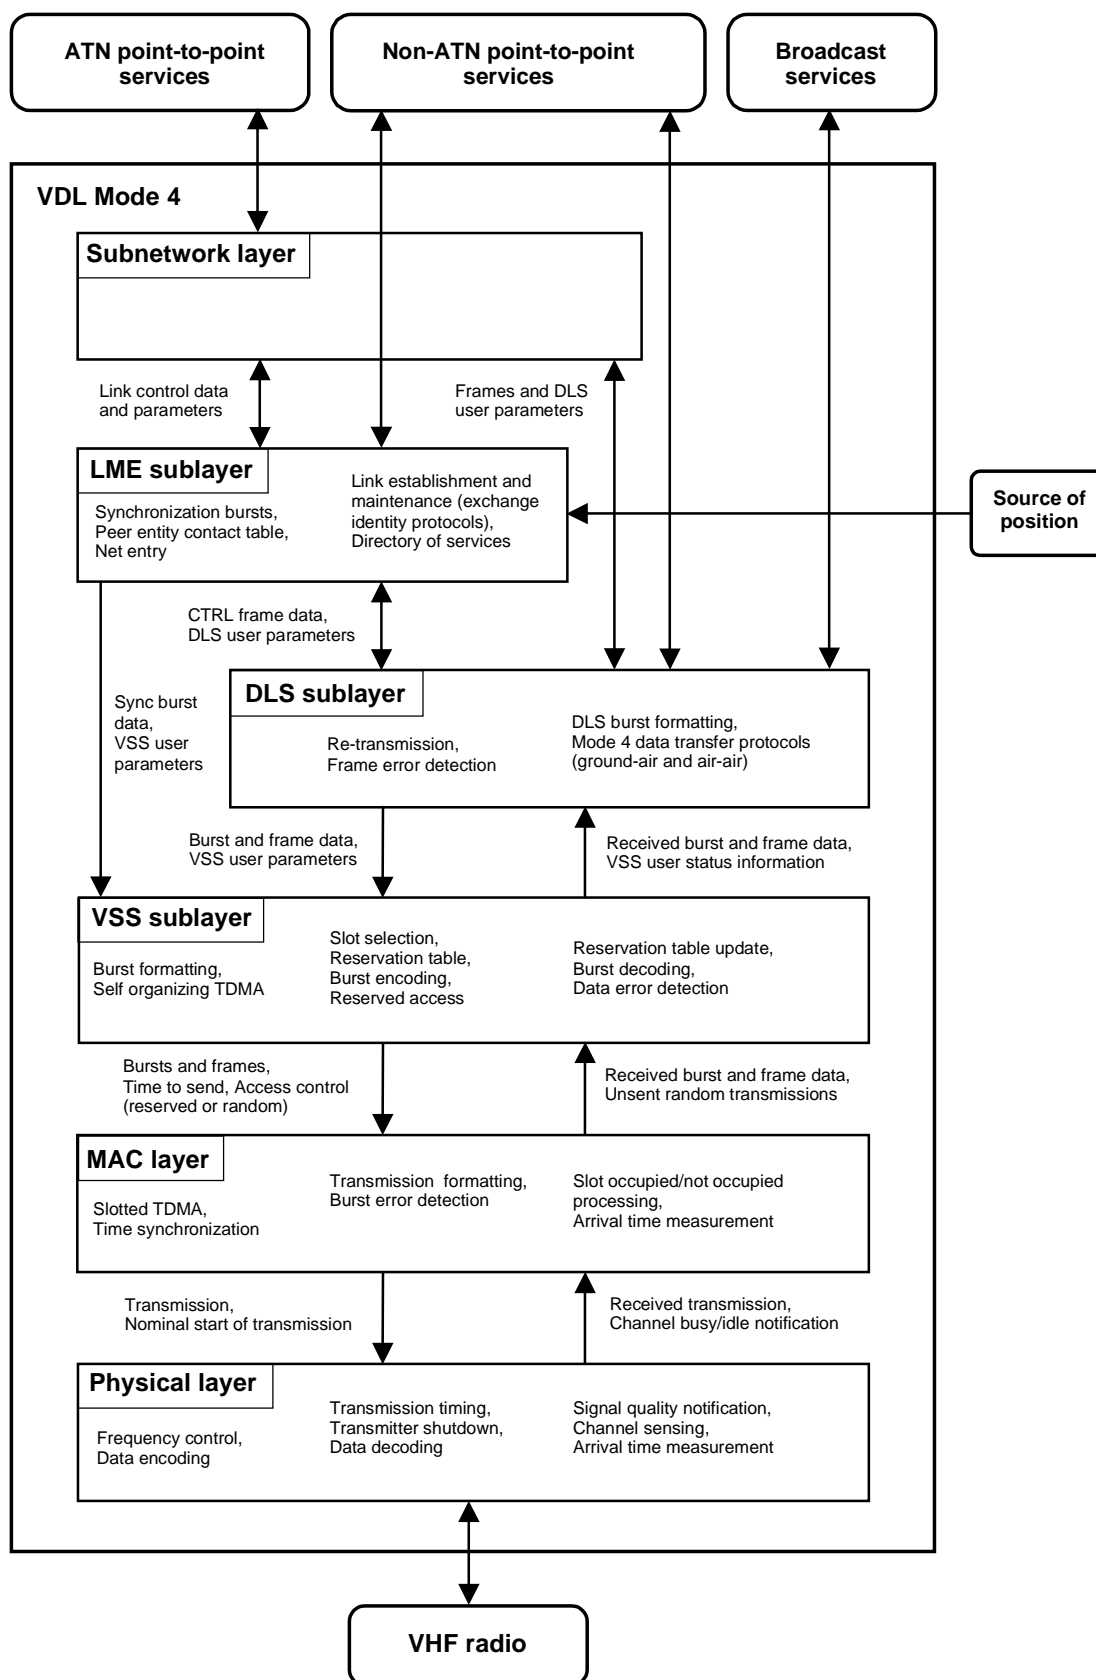

Figure 4.1: LAYERED STRUCTURE OF VDL MODE 4

**Layer 1 (Physical layer):** provides transceiver frequency control, bit exchanges over the radio media, and notification functions. These functions are more often known as "radio" and "modulation" functions.

The ICAO VDL SARP defines the physical layer for VDL Mode 4: The modulation scheme is Gaussian Filtered Frequency Shift Keying (GFSK), at a nominal bit rate of 19,200 bits/second.

Layer 2 (Link Layer): is split into three sublayers and a management entity:

- The Media Access Control (MAC) sublayer provides access to the Physical layer by a simple Time Division Multiple Access (TDMA) algorithm under the control of the next higher sublayer. It also provides system time functions to co-ordinate the TDMA channel access.
- The VDL Mode 4 specific services (VSS) sublayer provides control of channel access using a self-organizing mechanism. The VSS also supports a number of ground controlled access protocols. The basic services are built on reserved, random and fixed access to the TDMA slots and support broadcast and point-to-point communication.
- The Data Link Services (DLS) sublayer performs frame exchanges, frame processing and error detection. The DLS protocols are adapted to make best use of the unique VSS channel access protocols.
- The Link Management Entity (LME) is in charge of the links between peer DLS sublayers and also the maintenance of the broadcast link functions.

Layer 3: the VDL SARP defines only the lowest network sublayer of layer 3 (SNACp). It is compliant with the subnetwork sublayer requirements defined in the ATN SARP [8]. It provides packet exchanges over a virtual circuit, error recovery, connection flow control, packet fragmentation, and subnetwork connection management functions.

NOTE: The present document is limited to the core link layer specifications for VDL Mode 4 and hence does not provide specifications for the whole of layer 2, and nor does it specify any of layer 3.

### 4.1.3 VDL Mode 4 Services

VDL Mode 4 supports two different types of communication services:

- VDL Mode 4 broadcast services;
- VDL Mode 4 point-to-point services.

NOTE: Other networks can also be supported but this has not been the focus of the ETSI standardization work.

The VDL Mode 4 specific services include air-to-air, air-to-ground and ground-ground broadcast, and ground-to-air point-to-point (addressed) communications (for link control), with a minimum of overhead information for exchange of data including time-critical data.

In addition, VDL Mode 4 is intended to operate as an ATN sub-network and to support ATN compliant air-ground data communication services, employing point-to-point links involving the DLS function.

These VDL Mode 4 services are expected to be accommodated on multiple VHF channels. While data link channels is assumed to be separated from those supporting broadcast services, various broadcast functions and applications could share a channel. The possibilities for channel sharing depend on various constraints such as traffic densities, channel availability, certification requirements and ATS regulations, and may also differ between states and regions.

### 4.1.4 ADS-B Function

The ADS-B function uses the VDL Mode 4 synchronization burst message formats to broadcast periodically an aircraft or vehicle's identity, position, altitude, time, intent and vector information for use by other mobiles and ground stations. Because position reporting is an integral part of communications management in VDL Mode 4, the core elements of ADS-B are already present on the link.

The size of the time slots on the data link is adapted to accommodate an ADS-B report in a transmission known as a synchronization burst. The *fixed part* of a synchronization burst contains core ADS-B information such as identity, a station's position altitude and time, but a synchronization burst may also accommodate additional ADS-B information in the *variable part* of the synchronization burst.

ADS-B supports many mobile-mobile surveillance applications such as Cockpit Display of Traffic Information (CDTI) (see note), Airborne Situational Awareness (AIRSAW), airborne separation, station-keeping and airport surface applications. When the VDL Mode 4 system also includes ground stations it is also able to support applications such as Advanced Surface Movement Guidance and Control Systems (A-SMGCS), Runway Incursion Prevention, enhanced ATC, Search And Rescue (SAR) co-ordination, etc.

NOTE: CDTI in this context means the functional capability to display position information, not the physical unit.

### 4.1.5 Operational Scenarios

Three basic operational scenarios for VDL Mode 4 have been identified:

- a) Autonomous operation is defined as the situation where no VDL Mode 4 ground infrastructure exists. Surveillance by means of ADS-B and air-air communication can take place between any users with overlapping cells by means of the self-organizing protocol, using autonomous transmissions. All activities use two globally co-ordinated Global Signalling Channels (GSCs).
- b) Single Cell operation is defined as the situation where overlapping VDL Mode 4 ground stations exist, but do not co-ordinate their operation over a ground network. Thus each single cell within the coverage of one ground station can be seen as an independently operating system. Additional local channels may be available (e.g. to support SMGCS) and channel management can be supported by the transmission of the Directory of Service (DoS) message on the GSCs. In this scenario, stations may make autonomous transmissions, or else may be directed to transmit on a particular frequency and/or in specified slots by a ground station.
- c) Multi Cell operation is defined as the situation where VDL Mode 4 ground stations co-ordinate their operation by means of ground networks. The number of VDL Mode 4 ground stations participating in multi cell operation affects overall system capacity and redundancy. Stations may make autonomous transmissions, or else may be directed by a ground station.

### 4.1.6 VDL Mode 4 fundamentals

VDL Mode 4 operation is built up from the following fundamental features which support ADS-B operation:

- A robust modulation scheme for encoding of data in each slot. VDL Mode 4 supports Gaussian Filtered Frequency Shift Keying (GFSK) with a transmission rate of 19,200 bits/second.
- A Self-Organizing Time Division Multiplex access (STDMA) structure. In VDL Mode 4, channel time is divided into fixed length time slots. A superframe consists of a group of slots that span a period of 60 s and contains 4 500 slots (equivalent to 75 slots per second).
- A timing reference providing a unique marker for the start of each communications slot. The timing concept used in VDL Mode 4 is based upon Universal Co-ordinated Time (UTC). In the event that a station loses its primary source of UTC time, it may resort to a failure mode known as secondary timing with reduced precision. A possible source of secondary time may be derived from the time of arrival of synchronization bursts received from another station declaring primary time.

NOTE: The timing source is typically GNSS, but other sources may be used as long as they can be related to UTC.

- Position information from the aircraft's navigation system or internal GNSS unit is used to organize access to the slots. If a station loses its source of position information it may continue to derive position from synchronization bursts received from other stations (known as secondary navigation) advertising certified data quality. Stations operating on secondary timing do not offer certified data quality and thus cannot be used for derivation of secondary navigation.
- A flexible message structure that can support a wide range of broadcast and data transfer protocols.
- A slot selection function that determines when a station can access the channel and maintains information on the current and planned slot assignments.

- A slot access management function, controlling the use of each slot.
- A number of link management functions that support access to data link services on a wide range of channels.

#### 4.1.7 Possible configuration of airborne equipment

It is not the intention of the present document to prescribe a particular physical architecture for the VDL Mode 4 mobile station. It is assumed that the equipment will include all the relevant functionality defined by ICAO SARPs, as detailed in clause 5 of the present document, but that additional supporting functions such as determination of position and other data could be performed internally or externally to the VDL Mode 4 mobile station. However, other architectures may be more appropriate to meet user requirements.

To meet the provisions of the present document, it is required that the equipment is tested in conjunction with all the physical units involved in the implementation of the functionality specified in clause 5, including the provision of the time reference, but excluding the derivation of data for transmission over the air-ground link. Where necessary, appropriate Points of Control and Observation (PCO) must be provided internally to the equipment to allow the tests specified in the present document to be performed.

It can be expected that VDL Mode 4 mobile stations will be installed to a wide range of configurations, each having differing requirements in terms of the services to be supported by the equipment and tolerance to equipment failure. In order to reflect such differing requirements, the following guidance is offered on the equipment configurations expected to be required to meet operational requirements. Other equipment configurations are not excluded, but manufacturers will be required to demonstrate by supporting analysis that an alternative configuration is capable of meeting the appropriate operational requirements.

A number of functions in addition to those explicitly discussed here will be dependent on the equipment configuration, including slot map management, network entry support, and system management. Manufacturers should determine requirements for these functions taking into account the particular characteristics of their system design, so as to ensure that operational requirements are met.

For Air Transport applications, a dual installation of VDL 4 transceivers is foreseen, each consisting of three or more receivers, all capable of simultaneous operation on independent frequencies, together with a frequency agile transmitter. For less sophisticated aircraft a simplified transceiver may be suitable, consisting of only two receivers and a single transmitter. However, such an installation could restrict the VDL Mode 4 applications and services capable of being supported and will provide lower system availability.

No single transceiver will be required to transmit simultaneously on two different frequencies or be required to receive whilst transmitting on any other channel in the same VDR.

A discussion of possible aircraft architectures is provided in the Eurocontrol VDL Mode 4 Airborne Architecture study [13] where it is assumed that VDL Mode 4 functionality is located in the VHF Digital Radio (VDR) with external functional interfaces providing:

- VHF antenna;
- UTC second timing;
- position/velocity/time;
- surveillance data management, including data required for broadcast services;
- data communications management, including connection to the Aircraft data subnetwork;
- connections between VDL Mode 4 functions in different VDRs (these links are discussed in clause 4.1.9).

A possible aircraft architecture is illustrated for guidance in figure 4.2. However it should be noted that the final architecture will be up to the industry.

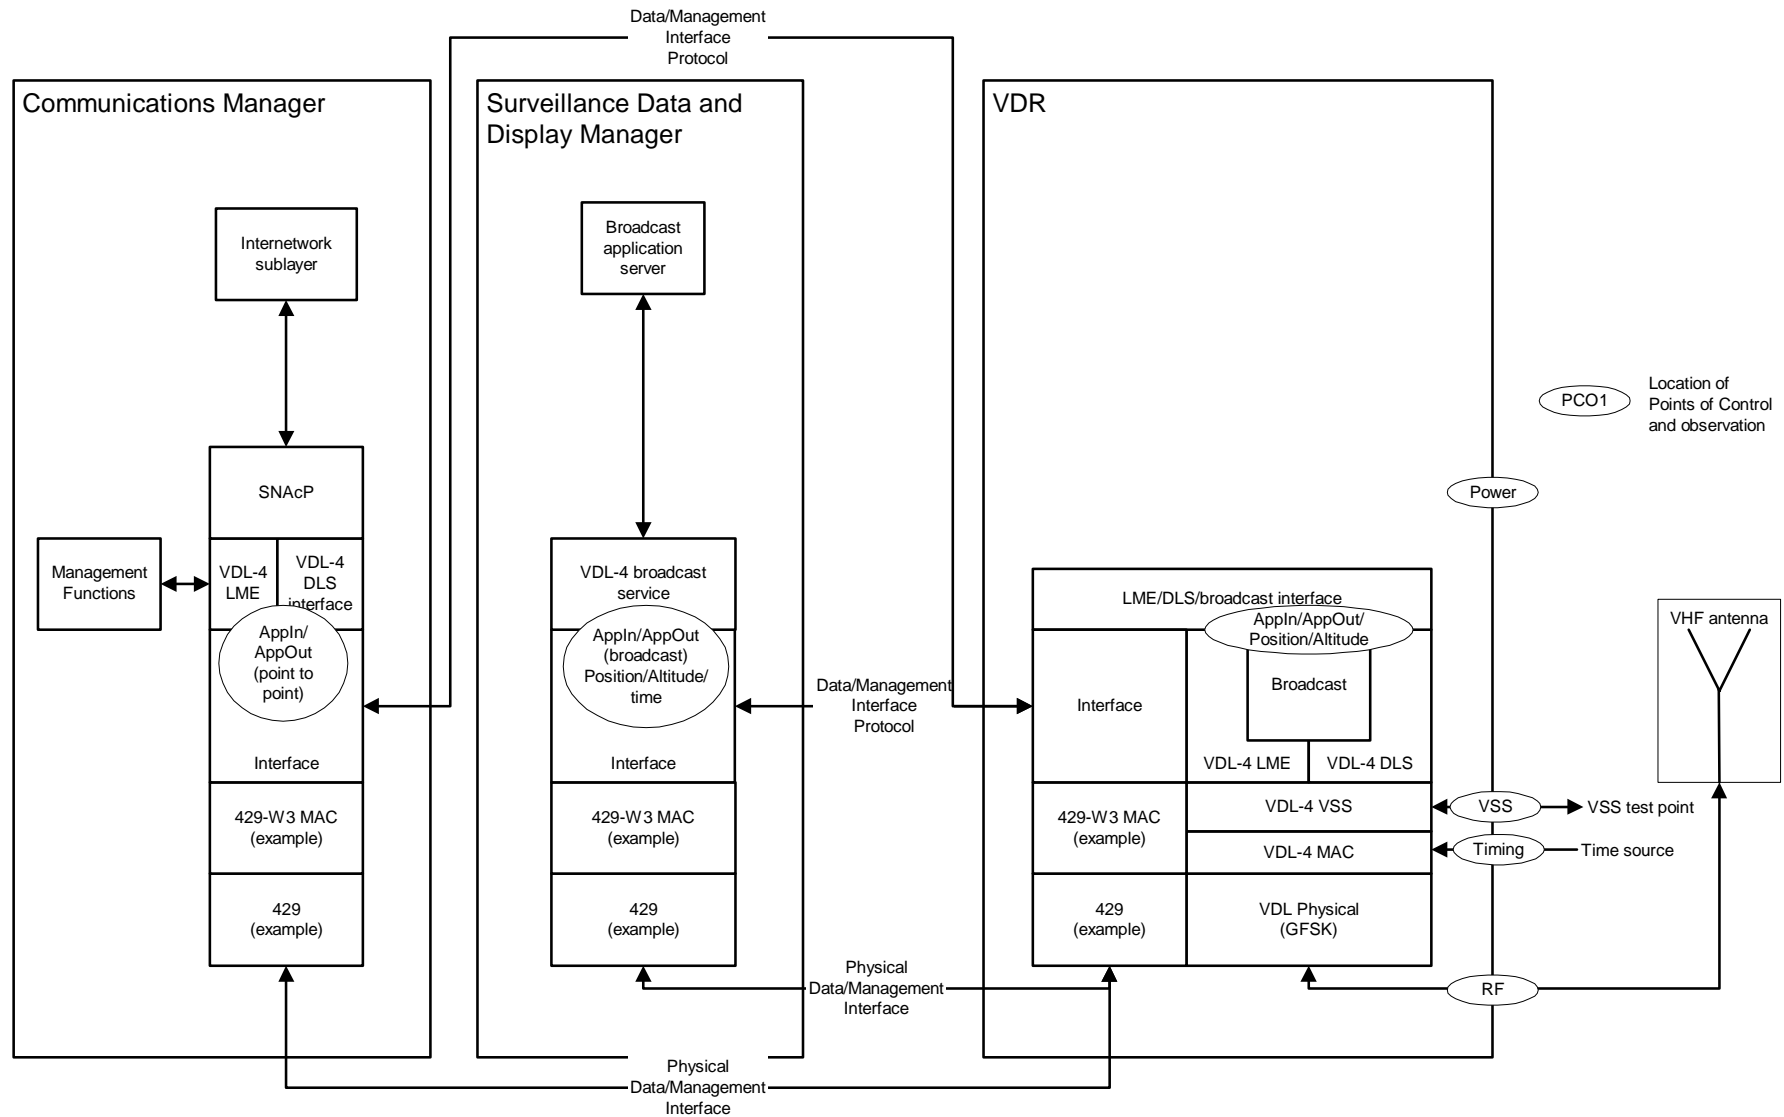

Figure 4.2: Possible VDL Mode 4 Aircraft architecture

The VDR interfaces via an appropriate interworking protocol such as ARINC 429 to:

- a surveillance data manager, providing broadcast data including position, velocity and time;
- a communication manager, providing connection to the subnetwork.

A direct source of UTC second timing is provided via a separate link.

NOTE: It is assumed that timing requirements could not be met via an ARINC 429 connection.

Figure 4.2 also illustrates the location of points of control and observation (these are discussed in more detail in clause 7.2).

### 4.1.8 Classes of Equipment

Two types of transmitter are specified in the present document (see [4] clause 6.2.3). Type A transmitters comply with the power budget required to meet foreseen operational requirements. Wherever practicable, manufacturers should specify a Type A transmitter. For small aircraft (e.g. light general aviation and gliders) or ground vehicles, a reduced power Type B transmitter is defined, capable of supporting a restricted range ADS-B service, for use where considerations of size, weight or power consumption prevent implementation of a Type A transmitter.

### 4.1.9 Transceiver cross-links

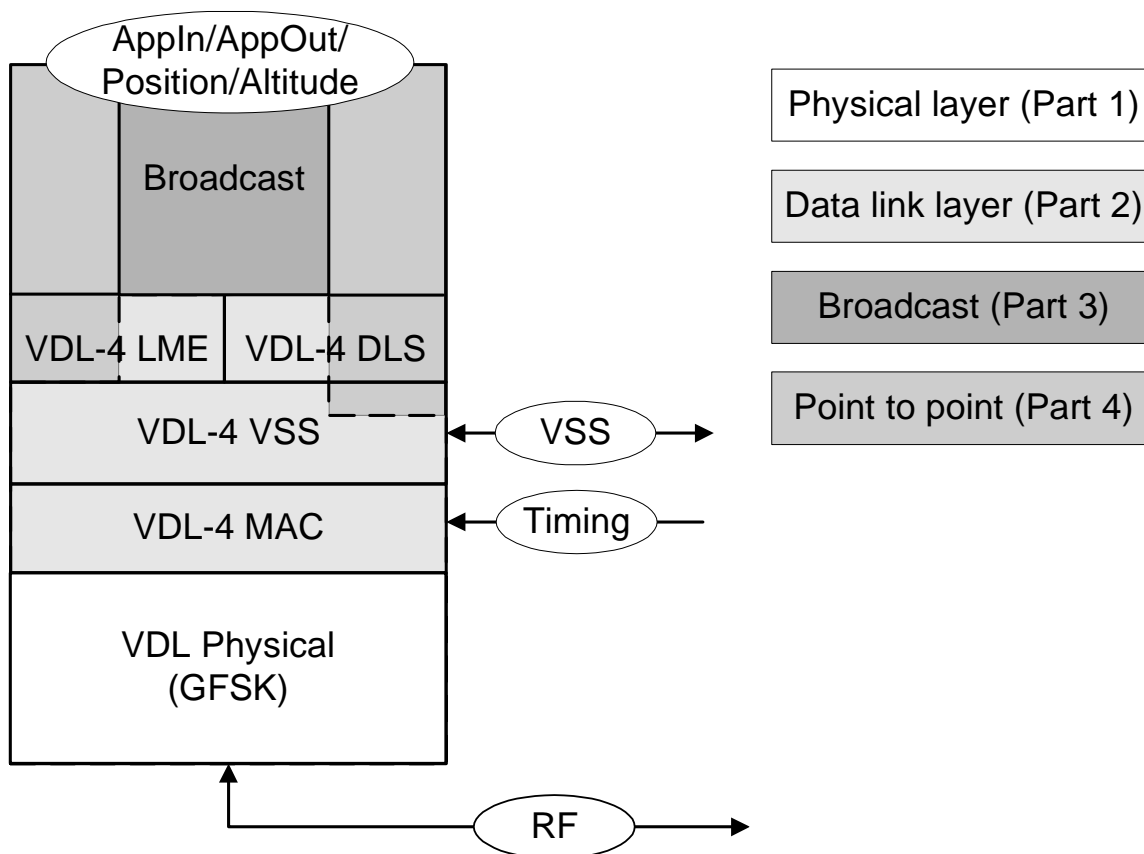

Access to the widest range of VDL Mode 4 applications, and the highest tolerance to failure will be provided by a multiple installation of VDL Mode 4 transceivers with cross-links for the exchange of information among the transceivers (see clause 6.8.3). Such cross-links are intended to support exchange of reservation information between transceivers to allow one transceiver to continue operation on a channel previously monitored by the other transceiver under failure conditions, as well as to support co-ordination of channels and applications supported by each transceiver in normal operation.

Information transferred by such cross-links may also be required to co-ordinate the selection of slots for transmission by a transceiver, so as to avoid interference with reception by another transceiver on the aircraft, in the event that adequate RF isolation between transceivers cannot be achieved.

The behaviour and testing of cross-links between VDL Mode 4 transceivers is outside the scope of the present document.

### 4.1.10 Overall structure of specifications for VDL Mode 4

The specifications for VDL Mode 4 mobile stations are split into four volumes as illustrated in figure 4.3.

**Figure 4.3: Structure of VDL Mode 4 mobile station specifications**

It is assumed that:

- An equipment providing broadcast services only would conform to the requirements of Parts 1, 2 and 3.
- An equipment providing point-to-point services only would conform to the requirements of Parts 1, 2 and 4.
- An equipment providing all services would conform to the requirements of Parts 1, 2, 3 and 4.

Part 1 (Physical layer - EN 302 842-1) [4] provides the functions necessary to establish a physical layer link between stations.

Part 2 (Data link layer - the present document) provides the functions necessary to:

- Establish a stream of broadcast transmissions protected by broadcast reservation types.
- Respond correctly to all reservation types.
- Provide repetitive transmission of aircraft position.
- Provide link management services to enable a ground station to control quality of service parameters via ground broadcast transmissions.

The present document is based on ICAO VDL Mode 4 Technical Manual requirements [1] and includes:

- **All functions associated with the MAC layer.**
- **All functions associated with broadcast services within the VSS layer.**
- **All functions associated with the receipt of point-to-point reservation types within the VSS layer.**
- **Station addresses and broadcast services from the DLS layer.** Note that the present document provides broadcast services via single unacknowledged transmissions. The present document specifically does not implement long transmission procedures for broadcast.

- **LME functions to support the repetitive broadcast of position within a synchronization burst.** This includes the encoding of the fixed part of the synchronization burst and a variable part containing no further information. This is sufficient to support communication management but is supplemented in Part 3 with a greater range of information to support broadcast services. The core also supports a simple synchronization burst request message making it possible for a communications manager to establish periodic reporting streams. This is again supplemented in EN 302 842-3 [9] to support a greater level of control by a ground station over the rate and content of synchronization bursts.
- **Compact position reporting (CPR) encoding to support the fixed part of the synchronization burst.**

In the VSS layer, the present document excludes:

- Re-transmission and associated parameters (these are contained in EN 302 842-4 [10]);
- Unicast request protocol and information transfer protocol transmission procedures (these are contained in EN 302 842-4 [10]). Note that the reception procedures for these protocols are included in ETSI EN Part 2 to support interoperability between broadcast only and point-to-point only equipment.

Part 3 (EN 302 842-3 [9]) (broadcast services) defines messages and additional protocols to support ADS-B, TIS-B and FIS-B. The main purpose of EN 302 842-3 [9] is to define message formats which are transmitted and received using the broadcast services of the DLS defined within ETSI EN Part 2. In addition, some additional protocols are added within the ADS-B specifications.

EN 302 842-3 [9] specifications are based on:

- ICAO Technical Manual specifications for ADS-B and CPR offset encoding.
- Specifications for TIS-B, FIS-B and GNSS Augmentation adapted from material developed as part of European Commission sponsored trials of VDL Mode 4 equipment.

Part 4 (EN 302 842-4 [10]) (point-to-point services) provides air-to-ground and air-to-air point-to-point services based on the ICAO Technical Manual [1]. EN 302 842-4 [10] includes:

- Point-to-point data and control data transfer functions from the DLS.
- Point-to-point link control within the LME.

Note that EN 302 842-4 [10] covers the establishment, termination and handover of links between ground and mobile stations and ground station coordination. Decisions to establish, terminate or handover links between ground stations are local issues and beyond the scope of these specifications.

ETSI EN 301 842 parts 1 to 4 [14] covers all VDL Mode 4 services applicable to ground-based equipment including broadcast and point to point communications.

#### 4.1.11 Equipment performance verification

To test the equipment for compliance with the performance requirements, three types of test are specified:

- bench tests;
- environmental tests;
- installed equipment tests.

The performance requirements for each type of test and the corresponding test procedures are specified in the present document. The order of test suggests that the mobile station be subjected to a succession of tests as it moves from design into design validation and equipment qualification. The objectives of these tests are described below.

##### **Bench tests**

The equipment will be subjected to bench test to verify compliance with the performance requirements under a controlled environment. The test results may be used as the basis for approval of equipment design, equipment qualification, and acceptance. The bench test procedures are specified in clause 7.

## Environmental tests

Upon successful completion of bench tests, the equipment will be subject to environmental tests to verify compliance to the performance requirements under extreme environmental conditions expected in actual operations and abnormal conditions. The test results may be applied to equipment qualification and acceptance. The environmental requirements and tests are specified in EN 302 842-1 [4], and EUROCAE ED-14D / RTCA DO-160D [12], supported by test procedures from clause 7 of the present document where appropriate.

## Installed equipment tests

After successful completion of the environmental tests, the equipment will be installed in the aircraft for further testing to verify compliance with the performance specifications of [4] clause 8 in the aircraft environment. The installed equipment tests will be conducted primarily with the aircraft on the ground using simulated or operational system inputs and may be supplemented with flight tests. The test results may be used to isolate design faults that are traceable to the general aircraft environment, e.g. radio frequency interference and the aircraft power supply system. As in the case of bench and environmental tests, installed equipment tests are critical to equipment qualification and acceptance. The installed equipment tests are specified in clause 6.24 to 6.26.

---

# 5 Minimum performance specification under standard test conditions

## 5.1 MAC sublayer

### 5.1.1 Services

Requirement reference	
5.1.1.1	The MAC sublayer shall acquire the shared communication path so as to provide the services defined in clause 5.1.2.

### 5.1.2 MAC sublayer services

Requirement reference	
5.1.2.1	The MAC sublayer shall accept from the physical layer a continuous indication of channel idle/busy status and signal level (see clause 5.1.5).
5.1.2.2	The MAC sublayer shall accept from the VSS sublayer a burst for transmission, accompanied by the time to transmit it.
5.1.2.3	The MAC sublayer shall provide to the VSS sublayer the received burst data, slot busy/idle status, slot occupancy status, signal level and the status of bursts sent for transmission.

### 5.1.3 MAC sublayer parameters

#### 5.1.3.1 General

Requirement reference	
5.1.3.1.1	MAC service system parameters shall be as described in table 5.1.

**Table 5.1: MAC service system parameters**

Symbol	Parameter Name	Minimum	Maximum	Default	Increment
M1	Number of slots per superframe	n/a	n/a	4 500 slots	n/a

### 5.1.3.2 Parameter M1 (number of slots per superframe)

Requirement reference	
5.1.3.2.1	The parameter M1 shall be the number of available slots per superframe.
5.1.3.2.2	A superframe shall span a period of 60 s.

### 5.1.3.3 Parameter M2\_inc and M2\_limit (MAC layer control parameters for network entry)

Requirement reference	
5.1.3.3.1	An m2 filter shall be maintained by a station for each active channel as a measure of the uncertainty of the reservation data.
5.1.3.3.2	Each m2 filter is controlled by parameters M2_inc and M2_limit, which, in turn, define the parameters of the following algorithm in which m2 is updated after every slot: $m2_{k+1} = m2_k + M2\_inc$ if receiver function on the channel is blocked by the transmission of the same station on the same channel (e.g. through a common antenna) $m2_{k+1} = \max[(m2_k - 1), 0]$ if receiver function is not blocked
5.1.3.3.3	If $m2 \geq M2\_limit$ , m2 shall be reset to zero ( $m2 = 0$ ) and the station shall execute a network entry procedure.

## 5.1.4 Time synchronization

### 5.1.4.1 Primary

Requirement reference	
5.1.4.1.1	Under normal operating conditions, a station shall maintain time synchronization such that the start of each successive group of M1/60 slots is synchronized with the start of any Universal Time Coordinated (UTC) second to within a two-sigma value of 400 ns.

### 5.1.4.2 Secondary

Requirement reference	
5.1.4.2.1	A station shall be capable of maintaining time synchronization such that the start of each successive group of M1/60 slots is synchronized with the start of any UTC second to within a two-sigma value of 15 $\mu$ s.
5.1.4.2.2	Only when the primary source fails shall secondary time be used.
5.1.4.2.3	A station using secondary time shall revert to primary time whenever primary time is available.
5.1.4.2.4	A station that is unable to support either primary or secondary time shall not transmit on any VDL Mode 4 frequency.
5.1.4.2.5	A station which regains primary or secondary time after a period not maintaining either primary or secondary time shall be required to re-enter the network using an appropriate procedure.
NOTE: Tertiary time, as described by the VDL Mode 4 Technical Manual [1], has not been included as a requirement in the present document due to the opinion of the ETSI Working Group that insufficient evidence was available to be able to verify that a "floating network" of stations operating on tertiary time would safely be restored to primary or secondary time upon resumption of the availability of primary time sources.	

### 5.1.4.3 Alignment to UTC second

Requirement reference	
5.1.4.3.1	For stations maintaining primary or secondary time, the start of each successive group of M1/60 slots shall be aligned with a UTC second.

### 5.1.4.4 Data quality level

Requirement reference	
5.1.4.4.1	The certified quality level shall indicate that timing and position information provided by the station can be used by other stations as a means of deriving position information.
5.1.4.4.1a	When a station is deriving position information from the transmissions of other stations, it shall only use data from stations that have declared the certified data quality level.
5.1.4.4.2	The secondary timing level shall not indicate the certified quality level.

## 5.1.5 Slot idle/busy notification

### 5.1.5.1 Slot idle detection

Requirement reference	
5.1.5.1.1	A station shall consider the slot idle if the channel idle/busy status supplied by the physical layer is idle at the start of the slot.

### 5.1.5.2 Slot busy detection

Requirement reference	
5.1.5.2.1	A station shall consider the slot busy if the channel idle/busy status is busy at the start of the slot.

### 5.1.5.3 Slot occupied detection

Requirement reference	
5.1.5.3.1	A slot shall be considered occupied if the channel is considered to be continuously busy for a period of at least 5 ms during the slot.

### 5.1.5.4 Signal level indication

Requirement reference	
5.1.5.4.1	The MAC sublayer shall accept from the physical layer an indication of the signal level.

## 5.1.6 Transmission processing

Requirement reference	
5.1.6.1	Bursts received from the MAC sublayer shall be forwarded to the physical layer, together with the time for transmission.
5.1.6.2	A station shall begin transmissions only at the beginning of the slot boundary as determined by its local clock.
5.1.6.3	Delayed bursts shall begin 4 ms after the start of the slot boundary, if the slot is idle at that point.

## 5.1.7 Received transmission processing

Requirement reference	
5.1.7.1	Bursts with an invalid Cyclic Redundancy Code (CRC) shall be discarded.
5.1.7.2	Bursts with valid CRCs shall be forwarded to the VSS sublayer, along with the received time of transmission and signal quality parameters.

## 5.2 VSS sublayer

### 5.2.1 Services

#### 5.2.1a Multiple access

Requirement reference	
5.2.1.a.1	<p>The VSS sub-layer implements protocols that enable all stations to transmit while at the same time, maintaining high system throughput, low transit delays and low probability of collisions. These protocols shall include:</p> <ul style="list-style-type: none"> <li>a) reserved access (see clause 5.2.6);</li> <li>b) null reservation (see clause 5.2.9);</li> <li>c) periodic broadcast (see clause 5.2.10);</li> <li>d) incremental broadcast (see clause 5.2.11);</li> <li>e) combined periodic broadcast and incremental broadcast (see clause 5.2.12);</li> <li>f) Big Negative Dither (BND) broadcast (see clause 5.2.13);</li> <li>g) unicast request (see clause 5.2.14);</li> <li>h) information transfer request (see clause 5.2.15);</li> <li>i) directed request (see clause 5.2.16);</li> <li>j) block reservation (see clause 5.2.17);</li> <li>k) response (see clause 5.2.18).</li> <li>l) random access (see clause 5.2.7); and</li> <li>m) fixed access (see clause <b>Error! Reference source not found.</b>).</li> </ul>

### 5.2.1.1 Error detection

Requirement reference	
5.2.1.1.1	The VSS sublayer shall compute a 16 bit CRC according to ISO/IEC 13239 [3] to facilitate detection by the MAC sublayer (see clause 5.1.7) of data corruption during transmission.

### 5.2.1.2 Channel congestion

Requirement reference	
5.2.1.2.1	The VSS sublayer shall notify the LME sublayer whenever channel congestion is detected (see clauses 5.2.7.2.2 to 5.2.7.2.5).

## 5.2.2 Burst format

### 5.2.2.1 VSS burst structure

Requirement reference	
5.2.2.1.1	VSS bursts shall conform to ISO/IEC 13239 [3] frame structure except as specified in table 5.2.
5.2.2.1.2	Bits denoted "res" shall be set to zero on transmit and ignored on receipt.

**Table 5.2: Burst format**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
flag	-	0	1	1	1	1	1	1	0
autonomous/directed flag (a/d), reservation ID (rid), version number (ver)	1	s <sub>27</sub>	s <sub>26</sub>	s <sub>25</sub>	ver <sub>3</sub>	ver <sub>2</sub>	ver <sub>1</sub>	rid	a/d
source address (s)	2	s <sub>24</sub>	s <sub>23</sub>	s <sub>22</sub>	s <sub>21</sub>	s <sub>20</sub>	s <sub>19</sub>	s <sub>18</sub>	s <sub>17</sub>
	3	s <sub>16</sub>	s <sub>15</sub>	s <sub>14</sub>	s <sub>13</sub>	s <sub>12</sub>	s <sub>11</sub>	s <sub>10</sub>	s <sub>9</sub>
	4	s <sub>8</sub>	s <sub>7</sub>	s <sub>6</sub>	s <sub>5</sub>	s <sub>4</sub>	s <sub>3</sub>	s <sub>2</sub>	s <sub>1</sub>
message ID (mi)	5	mi <sub>k</sub>	.....			mi <sub>4</sub>	mi <sub>3</sub>	mi <sub>2</sub>	mi <sub>1</sub>
information	6	in <sub>k</sub>							
	7 to n - 5								
	n - 4								
reservation data (rd)	n - 3		in <sub>1</sub>	rd <sub>k</sub>					
extended reservation ID (erid)	n - 2	erid <sub>k</sub>				erid <sub>1</sub>			rd <sub>1</sub>
CRC (c)	n - 1	c <sub>9</sub>	c <sub>10</sub>	c <sub>11</sub>	c <sub>12</sub>	c <sub>13</sub>	c <sub>14</sub>	c <sub>15</sub>	c <sub>16</sub>
	n	c <sub>1</sub>	c <sub>2</sub>	c <sub>3</sub>	c <sub>4</sub>	c <sub>5</sub>	c <sub>6</sub>	c <sub>7</sub>	c <sub>8</sub>
flag	-	0	1	1	1	1	1	1	0

! ..... ! [Denotes variable length field]

## 5.2.2.2 Version number

Requirement reference	
5.2.2.2.1	The version number (ver) subfield shall indicate the version of VDL Mode 4 supported by the station.
5.2.2.2.2	It shall be set to 000 on transmit.
5.2.2.2.3	If the station receives a burst in which the version number is non-zero, it shall inform the VSS user that a non-zero version number has been received and ignore the rest of the burst.

## 5.2.2.3 Source address

Requirement reference	
5.2.2.3.1	The source address (s) of the transmitting station shall be encoded in the 27-bit field as defined in table 5.2.
5.2.2.3.2	The address format shall be as defined in clause 5.3.1.2.

## 5.2.2.4 Message ID

Requirement reference	
5.2.2.4.1	The message ID (mi) of the burst shall be encoded in the variable length field as defined in table 5.2.
5.2.2.4.2	The bits of the burst message ID field shall be as defined in table 5.3.

Table 5.3: Message ID assignment

Message ID field								Assigned burst type	VSS user
mi <sub>8</sub>	mi <sub>7</sub>	mi <sub>6</sub>	mi <sub>5</sub>	mi <sub>4</sub>	mi <sub>3</sub>	mi <sub>2</sub>	mi <sub>1</sub>		
x	x	x	x	x	x	x	0	Autonomous synchronization burst (see clause 5.4.2)	LME
x	x	x	x	1	1	0	1	DLS bursts (see clause 5.3.1.3 and [10] clause 5.1.2.2)	DLS
x	x	x	x	x	0	1	1		
x	x	x	x	x	1	1	1		
1	0	0	1	0	1	0	1		
x	x	1	0	0	1	0	1		
x	x	x	x	x	0	0	1	General request burst	Defined by r-mi
x	0	0	0	0	1	0	1	No operation	VSS
x	1	0	0	0	1	0	1	Network entry burst	VSS
0	0	0	1	0	1	0	1	Message ID extension to next 4 bits	
x	1	1	1	0	1	0	1	General response burst	Defined by r-mi
x	0	1	1	0	1	0	1	Reserved for future use	
x	1	0	1	0	1	0	1	Reserved for future use	

Requirement reference	
5.2.2.4.3	The message ID shall define the VSS user which is responsible for handling the message, following completion of processing required within the VSS.

## 5.2.2.5 Information field

Requirement reference	
5.2.2.5.1	The optional information field (in) shall contain VSS user defined data.

## 5.2.2.6 Reservation fields

Requirement reference	
5.2.2.6.1	The reservation ID (rid) of the burst shall be encoded in the 1-bit field as defined in table 5.2.
5.2.2.6.2	If the reservation ID equals 1, this shall indicate that the reservation type is either a null reservation (see clause 5.2.9), a periodic broadcast reservation (see clause 5.2.10) or a combined periodic broadcast and incremental broadcast reservation (see clause 5.2.12) and that there is no extended reservation ID (erid).
5.2.2.6.3	Otherwise, the extended reservation ID field shall indicate other reservation types as defined in table 5.4

Table 5.4: Extended reservation ID field (erid)

Extended reservation ID field (erid)					Reservation type
Octet n - 2					
Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	
0	0	0	0	0	Response burst (no reservation)
0	0	0	0	1	Big negative dither (BND) reservation
0	0	0	1	0	Superframe block reservation
0	0	0	1	1	Second frame block reservation
0	0	1	0	x	Unicast request reservation
0	0	1	1	0	Reserved for future allocation
to					
0	1	0	0	1	Information transfer request reservation
0	1	0	1	0	
0	1	0	1	1	Reserved for future allocation
0	1	1	0	0	Directed request reservation
0	1	1	0	1	Reserved for future allocation
to					
0	1	1	1	1	Incremental broadcast reservation
1	0	x	x	x	
1	1	0	0	0	Reserved for future allocation
to					
1	1	1	1	1	

## 5.2.2.7 Autonomous/directed flag

Requirement reference	
5.2.2.7.1	The autonomous/directed (a/d) flag shall be encoded as defined in table 5.5.

Table 5.5: Autonomous/directed flag encoding

Subfield	Range	Encoding	Notes
autonomous/directed (a/d)	Boolean	0 = random transmission or reserved transmission in a slot selected by this station. 1 = delayed burst transmission or reserved transmission in a slot selected by a peer station.	Identifies whether the station is transmitting based on its internal reservation table or if it is being directed by a peer.

## 5.2.3 VSS sublayer parameters

### 5.2.3.1 General

Requirement reference	
5.2.3.1.1	VSS service system parameters shall be as described in table 5.6.

**Table 5.6: VSS sublayer parameters**

Symbol	Parameter name	Minimum	Maximum	Default	Increment
VS1	Number of ground quarantined slots	0 slots	15 slots	4 slots	1 slot
VS2	Minimum CCI performance	6 dB	60 dB	12 dB	1 dB
VS4	Quarantine slot re-use range	0	1 000 nmi	300 nmi	10 nmi
VS5	Maximum burst length	1 slot	16 slots	10 slots	1 slot

### 5.2.3.2 Parameter VS1 (number of ground quarantined slots)

Requirement reference	
5.2.3.2.1	The parameter VS1 shall define the number of ground quarantined slots.
5.2.3.2.2	Quarantined slots shall be slots which may not be used by a mobile station unless directed by a ground station.
5.2.3.2.3	<p>Quarantined slots shall be established by a ground station or network of coordinated ground stations under the following circumstances:</p> <ul style="list-style-type: none"> <li>a) A mobile station, A, will not reserve a slot or transmit on the slot boundary of the VS1 slots after a slot which has been reserved by a ground station, B, using a periodic broadcast reservation or which has been reserved by a mobile, C, using a burst with the autonomous/directed bit set to 1 and a periodic broadcast reservation field, unless the station (B or C) that has reserved the slot is at a range greater than VS4 from station A. In the case that station (B or C) that has reserved the slot is at a range greater than VS4 from station A, then station A will consider the slot to be unreserved.</li> <li>b) If a mobile station receives a periodic broadcast burst with the periodic offset (po) subfield set to zero and the periodic timeout (pt) subfield set to zero, then it will maintain ground quarantine for the current slot and for M1 slots after the current slot if it had previously contained a reservation associated with the same stream. Ground quarantine behaviour for any other slots associated with the same stream will be cancelled.</li> <li>c) A mobile station, A, will not reserve a slot or transmit in slots which have been reserved by a ground station, B, or a mobile station, C, using a block reservation, unless the station (B or C) that has reserved the slot is at a range greater than VS4 from station A, in which case station A will consider the slot to be unreserved.</li> </ul>

### 5.2.3.3 Parameter VS2 (minimum CCI performance)

Requirement reference	
5.2.3.3.1	The parameter VS2 shall be used to control the CCI conditions by which a station Y may transmit given that another station X has reserved the same slot.
5.2.3.3.2	<p>In the case where a station X and Y transmit in the same slot and station X's transmission is directed to another station Z, CCI conditions shall be fulfilled (a transmission from station X will not interfere with the transmissions from station Y and Z) if the ratio defined below:</p> $ratio = 10 \log \left( \frac{dist(Y   Z)^2}{dist(X   Z)^2} \right)$ <p>is greater than VS2, where dist(Y/Z) is the distance between station Y and Z and dist(X/Z) is the distance between station X and station Z</p>

### 5.2.3.4 Parameter VS4 (quarantine slot re-use range)

Requirement reference	
5.2.3.4.1	The parameter VS4 shall be used to control the range at which a quarantined slot may be re-used by a distant station.

### 5.2.3.5 Parameter VS5 (maximum burst length)

Requirement reference	
5.2.3.5.1	The parameter VS5 shall define the maximum burst length in slots including flags and zero bits inserted for transparency.

## 5.2.4 VSS quality of service parameters

### 5.2.4.1 General

Requirement reference	
5.2.4.1.1	Every burst processed by the VSS sublayer for transmission shall be associated with the parameters defined in table 5.7.

**Table 5.7: VSS quality of service system parameters**

Symbol	Parameter Name	Minimum	Maximum	Default	Increment
Q1	Priority	0	15	11	1
Q2a	Slot selection range constraint for level 1	0	1 000 nmi	150 nmi	1 nmi
Q2b	Slot selection range constraint for level 2	0	1 000 nmi	150 nmi	1 nmi
Q2c	Slot selection range constraint for level 3	0	1 000 nmi	0 nmi	1 nmi
Q2d	Slot selection range constraint for level 4	0	1 000 nmi	300 nmi	1 nmi
Q3	Replace queued data	FALSE	TRUE	FALSE	--
Q4	Number of available slots	1	20	3	1

## 5.2.4.2 Parameter Q1 (priority)

Requirement reference	
5.2.4.2.1	The parameter Q1 shall be the priority of the transmission and shall be as defined in table 5.8.

Table 5.8: Priority levels

Message categories	Q1
Unassigned	15
Network/systems management	14
Distress communications	13
Urgent communications	12
High priority flight safety messages	11
Normal priority flight safety messages	10
Meteorological communications	9
Flight regularity communications	8
Aeronautical information service messages	7
Network/systems administration	6
Aeronautical administrative messages	5
Unassigned	4
Urgent priority administrative and UN charter communications	3
High priority administrative and state/government communications	2
Normal priority administrative	1
Low priority administrative	0

## 5.2.4.3 Parameters Q2a to Q2d (slot selection range constraint for level n)

Requirement reference	
5.2.4.3.1	The parameters Q2a to Q2d shall be used to impose range constraints on the slot selection process for levels 1 to 4 defined by table 5.9.

Table 5.9: Slot selection criteria

Selection priority	Selection conditions		
	Planned transmission by station A	Previously reserved transmission by station B	Minimum distance between station A and station B
Level 0	Any	Unreserved	Not applicable
Level 1	Broadcast or CCI protected communication with station C	CCI protected communication with station D	Q2a
Level 2	Broadcast or CCI protected communication with station C	Broadcast	Q2b
Level 3	Broadcast or CCI protected communication with station C	Broadcast or CCI protected communication with station D	Q2c
Level 4	Broadcast or CCI protected communication with station C	Any transmission	Q2d

Requirement reference	
5.2.4.3.2	In table 5.9, the following definitions and specifications shall apply: Station A      The station attempting to select a slot. Station B      A station that has previously reserved a slot. Station C      A station to which station A wishes to address a point-to-point communication. Station D      A station for which station B has reserved a slot for point-to-point communication. CCI protected   A point-to-point communication between two stations which fulfils the CCI conditions as defined in clause 5.2.3.3 and is therefore protected (its transmission can be heard by the intended recipient) if a third station simultaneously transmits in the same slot.

#### 5.2.4.4 Parameter Q3 (replace queued data)

Requirement reference	
5.2.4.4.1	The parameter Q3 shall be a Boolean switch that shall be used to control queuing of repeated bursts on a congested channel.
5.2.4.4.2	If Q3 = TRUE, then a new data field shall replace a queued data field of the same type.
5.2.4.4.3	Otherwise, both the old and new data fields shall be transmitted.

#### 5.2.4.5 Parameter Q4 (number of available slots)

Requirement reference	
5.2.4.5.1	The parameter Q4 shall be used to control the number of slots added to the available slot list during the slot selection process (see clause 5.2.6.2).

### 5.2.5 Received transmission processing

Requirement reference	
5.2.5.1	Valid bursts shall be forwarded to the appropriate VSS user, along with the time of receipt of transmission.
5.2.5.2	The received signal quality and the time of receipt of the bursts shall be passed to the VME.
5.2.5.3	A station shall be capable of recognizing and processing all possible reservation types as defined in clauses 5.2.9 through 5.2.18.
5.2.5.4	When a station receives a burst with an unrecognized reservation type, it shall discard the burst without updating the reservation table.
5.2.5.5	When a station receives a known reservation type with an invalid subfield, or a known reservation type with valid subfields but an invalid combination, it shall reserve the slots indicated by the valid sub-fields, and not transmit a response, nor pass the burst to a VSS user.
5.2.5.6	When a station receives a burst with a known reservation type and a non-zero reserved subfield, it shall ignore the data in the reserved subfield.
5.2.5.7	The current slot for a burst shall be the slot in which the received transmission begins.
5.2.5.8	The burst length (bl) shall be the number of slots across which the burst is transmitted.
5.2.5.9	If the appropriate VSS user cannot be identified (i.e. the message ID is reserved or that functionality is not implemented) and the burst contains one or more reservations for the receiving station only, then the station shall transmit a General Failure (see clause 5.2.20) with an error type of 00 hex or 80 hex (i.e. unsupported function) in the first slot of each of the reservations.

## 5.2.6 Reserved access protocol specification

### 5.2.6.1 Reservation table

Requirement reference	
5.2.6.1.1	A station shall maintain a table of all reservations in the next $4 \times M1 + 128$ slots.
5.2.6.1.2	For each reserved slot, the reservation table entry shall consist of the 27-bit address of the intended transmitter, the 27-bit address of the destination (if any) and the type of reservation made.
5.2.6.1.3	For periodic broadcast reservations (see clause 5.2.10) and directed request reservations (see clause 5.2.16), the reservation table shall also include pointers to all other reserved slots associated with the same reservation stream.
5.2.6.1.4	For the periodic broadcast protocol (see clause 5.2.10), the reservation table shall also record potential reservations, defined as the M1, 2 M1, 3 M1 and 4 M1 slots after a slot for which no transmission has been decoded by the MAC layer.
5.2.6.1.5	For each potential reservation, the reservation table shall include the signal level (see clause 5.1.5.4) associated with the slot and the occupancy status as defined in clause 5.1.5.3.
5.2.6.1.6	Slots containing both potential reservations and reservations resulting from decoded transmissions shall be treated as if containing reservations from the decoded transmissions only.
5.2.6.1.7	The reservation table shall be updated before the end of the first slot after the end of the burst.
5.2.6.1.8	With the exception of cases where a station has been directed to transmit by another station, a station shall wait for at least $M1 + 128$ slots after starting to listen to a channel, before starting to transmit or reserve slots.

### 5.2.6.2 Selecting slots for transmission or reservation

Requirement reference	
5.2.6.2.1	A station shall select slots for transmission or for reservation for later transmissions using the algorithm specified below.
5.2.6.2.2	The VSS user shall specify one or more groups of Quality of Service parameters Q2a, Q2b, Q2c, Q2d and Q4 for slot selection.
5.2.6.2.3	The station shall attempt to select slots using the first group of Quality of Service parameters.
5.2.6.2.4	If slot selection is unsuccessful, the station shall use the next group and continue with successive groups until a slot has been selected.
5.2.6.2.5	If, having used all groups of Quality of Service parameters, no slot has been selected, the VSS user shall be informed that slot selection has been unsuccessful.
	<b>Specification of candidate slots</b>
5.2.6.2.6	The VSS user shall specify one or more ranges of candidate slots for slot selection.
	<b>Derivation of a list of available slots</b>
	<b>Slot selection criteria</b>
5.2.6.2.7	A list of available slots shall be chosen from the candidate slots using the following rules:
5.2.6.2.8	All unreserved slots shall be added to the list of available slots (shown as level 0 in table 5.9).
5.2.6.2.9	If, having completed stage a), the number of available slots is less than Q4, further available slots shall be selected from slots that have been previously reserved by other stations.
5.2.6.2.10	The station shall initially select from slots which obey conditions specified as level 1 in table 5.9 until Q4 available slots have been chosen.
5.2.6.2.11	If, having applied level 1 conditions, the number of available slots is still less than Q4, slot selection shall continue using level 2 conditions.
5.2.6.2.12	The process shall continue using subsequent levels until Q4 slots have been selected or until all levels have been applied.
5.2.6.2.13	At each level, selection shall start with slots reserved by the most distant station and proceed in decreasing range order.

Requirement reference	
	<b>Recommendation</b>
5.2.6.2.14	In selecting the list of available slots at level 0, priority should be given to candidate slots which are not reserved for transmission on any channel monitored by the station, and which also do not violate quarantine constraints (see clause 5.2.3.2) on the desired transmit channel.
5.2.6.2.14aa	A mobile station should exclude from consideration any slots which have been previously reserved for a point-to-point transmission, on any channel, where it is the intended destination.
	<b>Additional considerations for slot selection for transmission</b>
5.2.6.2.14a	When selecting the list of available slots for transmission in a channel for mobile station A or for another mobile station B, station A shall exclude from consideration the specific slots which it knows are reserved for transmission for the intended station (either A or B) on other channels monitored by station A.
	<b>Additional constraints applying to Global Signalling Channels (GSCs)</b>
5.2.6.2.14b	On channels designated as GSCs (see Annex 10 - Aeronautical Telecommunications, Volume III, Part I Digital Data Communication System, chapter 6, 6.9.2.2.1), mobile stations maintaining primary or secondary time shall exclude the first V66 (see clause 5.2.17.5.4) slots of every UTC second.
5.2.6.2.14c	The first V66 slots after every UTC second shall comprise the Virtual Link Management Channel (VLMC) and shall be allocated for ground station use only.
	<b>Selection of slots from available slots</b>
5.2.6.2.15	If, having completed the derivation of a list of available slots, the number of available slots is zero, no slot shall be selected and the VSS user shall be informed that slot selection was unsuccessful.
5.2.6.2.16	If the number of available slots is greater than or equal to 1, a slot shall be chosen from the list of available slots such that the probability of choosing a given slot is the same as the probability of choosing any other slot.
	<b>Selection of slots for burst lengths greater than 1</b>
5.2.6.2.17	For burst lengths greater than 1, the process specified in clauses 5.2.6.2.7 to 5.2.6.2.14 shall be applied to continuous blocks of slots of length equal to the burst length.
5.2.6.2.18	A block of slots shall be regarded as available at a particular level number (see table 5.9) if all slots within the block are available at the same or lower level number.
5.2.6.2.19	The procedure described in clauses 5.2.6.2.15 to 5.2.6.2.16 shall then be used to select one of the available blocks.
	<b>Limits on selection of reserved slots</b>
5.2.6.2.20	A station which has selected a slot, that was reserved by another station shall not select another slot reserved by that station within M1 - 1 slots after the selected slot.

### 5.2.6.3 Reserved transmissions

Requirement reference	
5.2.6.3.1	When a station has a burst to transmit for which it has a reservation, it shall transmit the scheduled data in the reserved slots, except as noted below.
	<b>Unavailable data</b>
5.2.6.3.2	If the data for a burst for which a slot was reserved is unavailable when it is time to transmit, then the station shall send a General Failure (see clause 5.2.20).
	<b>Reservation no longer valid</b>
5.2.6.3.3	A station shall check that a reservation is valid according to the procedures of clause 5.2.6.4 before transmitting.

#### 5.2.6.4 Reservation conflicts

Requirement reference	
5.2.6.4.1	If a station, A, receives a burst containing a reservation from another station, B, for a slot which has already been reserved for station A to transmit, then station A shall take the following action:
5.2.6.4.2	If the conflicting reservation from station B also requires station A to transmit, then station A shall transmit (i) the response with the higher priority (as determined by Q1), or (ii) the first requested transmission in the case of equal priority, or else;
5.2.6.4.3	If station A no longer requires to transmit in the existing reservation, or does not have the necessary information to transfer, then it shall not transmit in the slot, or else;
5.2.6.4.4	If the existing reservation for station A to transmit was made by a station other than A (i.e. by a unicast request (sdf = 0), information transfer, or directed request reservation), then A shall transmit in the slot in accordance with the existing reservation, or else;
5.2.6.4.5	If the existing reservation for station A to transmit was made by A itself, then A shall apply the procedure described in clauses 5.2.6.2.7 to 5.2.6.2.14 to determine whether, in the knowledge of the reservation made by station B, the slot is available at any level 1, 2, 3 or 4, using the same values of Q2 and other parameters as originally used to select the slot or other VSS user supplied QoS parameters for conflict resolution;
5.2.6.4.6	If the slot is determined to be available by this process, then A shall transmit according to its existing reservation;
5.2.6.4.7	If the slot is no longer available, the actions specified in table 5.10 shall be performed.

#### 5.2.6.5 Transmission conflicts for mobile stations

Requirement reference	
5.2.6.5.1	If a mobile station is requested to transmit in the same slot on different channels, then the station shall take the following action:
5.2.6.5.2	a) If there is only one transmission with the highest priority among the required transmissions, then the station shall transmit this highest priority transmission.
5.2.6.5.3	b) If there is only one ground-initiated transmission among the transmissions with the same highest priority, then the station shall transmit this ground-initiated transmission.
5.2.6.5.4	c) If there is more than one ground-initiated transmission among the transmissions with the same highest priority, then the station shall transmit the last requested of these ground-initiated transmissions.
5.2.6.5.5	d) If there are no ground-initiated transmissions among the transmissions with the same highest priority, then the station shall transmit the first requested transmission.

Table 5.10: Action in the event of reservation conflict

Protocol for A's existing reservation (made by A)	Protocol for B's conflicting reservation	Action by A
Slots reserved by station A using ground quarantine (see clause 5.2.3.2)	Any	Transmit according to existing reservation.
Periodic broadcast	Incremental broadcast, big negative dither unicast request, or information transfer	Transmit according to existing reservation.
Periodic broadcast	Periodic broadcast (autonomous/directed), directed request, slots reserved by ground quarantine (see clause 5.2.3.2)	If the conflict occurs later than A's next transmission in the stream, then select a new transmission slot and reduce the value of TV11 so as to cause the stream to dither to the new slot prior to the conflict; otherwise, set TV11 equal to 1 so that A's next transmission causes the stream to dither to a different slot in the next superframe after the superframe in which the conflict first occurs.
Incremental broadcast	Any	Do not transmit in the existing reservation, and make the transmission in an alternative slot by random access (see clause 5.2.7).

## 5.2.7 Random access protocol specification

### 5.2.7.1 General

Requirement reference	
5.2.7.1.1	The station shall implement a non-adaptive p-persistent algorithm to allow equitably all stations the opportunity to transmit while maximizing system throughput, minimizing transit delays, and minimizing collisions.

### 5.2.7.2 Random access parameters

Requirement reference	
5.2.7.2.1	Random access parameters shall be as described in table 5.11.

Table 5.11: Random access VSS system parameters

Symbol	Parameter name	Minimum	Maximum	Default	Increment
TM2	Channel busy timer	25 slots	9 000 slots	1 500 slots	20 slots
p	persistence	1 / 256	1	64 / 256	1 / 256
VS3	Maximum number of access attempts	1	65 535	24	1

Requirement reference	
	<b>Timer TM2 (channel busy timer)</b>
5.2.7.2.2	Timer TM2 indicates the number of slots (TM2) that a sublayer shall wait after receiving a request to transmit.
5.2.7.2.3	This timer shall be started if it is not already running, when the VSS sublayer receives a request for random transmission.
5.2.7.2.4	Upon a successful random transmission access attempt, the timer shall be cleared if the random transmit queue is empty and reset if it is not empty.
5.2.7.2.5	When the timer expires, the VSS user shall be informed that the channel is congested.
	<b>Parameter p (persistence)</b>
5.2.7.2.6	Parameter p shall be the probability that the station will transmit on any random access attempt.
5.2.7.2.7	If the station is able to select a slot, then the station shall transmit on the slot boundary with probability p.
	<b>Counter VS3 (maximum number of access attempts)</b>
5.2.7.2.8	Counter VS3 shall be used to limit the maximum number of random access attempts (VS3) that a station will make for any transmission request.
5.2.7.2.9	This counter shall be cleared upon system initialization, Timer TM2 expiring, or a successful access attempt.
5.2.7.2.10	The counter shall be incremented after every unsuccessful random access attempt.
5.2.7.2.11	When the counter reaches the maximum number of random access attempts, authorization to transmit shall be granted as soon as the channel is available.

### 5.2.7.3 Random access procedures

Requirement reference	
<b>Random access procedures</b>	
5.2.7.3.1	When the station has one or more bursts to transmit for which it does not have a reservation, it shall use a p-persistent algorithm as defined in [1], with the additional constraints defined below:
5.2.7.3.2	Access attempts shall only be made and transmission shall only begin on a slot boundary of available slots.
5.2.7.3.3	A station shall regard a slot or block of slots as available for a random transmission if it conforms to the criteria of any of Levels 0 through 2 in table 5.9 using default or VSS user-supplied quality of service parameters.
5.2.7.3.4	Transmission shall not begin if the station has not previously made or received a reservation for the prior slot, and the slot is busy as defined in clause 5.1.5 at the slot boundary.
5.2.7.3.5	If the station is unable to select a slot, this shall be regarded as an unsuccessful random access attempt.
<b>Random access procedures for delayed transmissions</b>	
5.2.7.3.5a	Delayed transmissions shall use a p-persistent algorithm defined as follows:
5.2.7.3.5b	a) transmissions shall be delayed relative to the slot boundary in accordance with 5.1.6.3; and
5.2.7.3.5c	b) a station shall not start a transmission if the channel idle/busy status (see VDL SARPs clause 6.9.5.3) is busy at the intended (delayed) start time.
5.2.7.3.5d	If the station is unable to select a slot, this shall be regarded as an unsuccessful random access attempt.
5.2.7.3.5e	If the station is able to select a slot, then the station shall transmit on the slot boundary with probability p (as defined in clause 5.2.7.2.6).
<b>Recommendation</b>	
5.2.7.3.6	When possible, a station should use the reserved access protocols described in clause 5.2.6 to reserve slots for new transmissions by adding reservation fields to transmissions for which slots have already been reserved.
5.2.7.3.7	The random access protocol should be used only if there is no suitable opportunity to reserve a slot.
<b>Recommendation</b>	
5.2.7.3.8	When possible, if there has been no previous reservation, a ground station should use ground quarantined slots for transmission.
5.2.7.3.9	The random access protocol should be used only if there is no suitable opportunity to use ground quarantined slots.
<b>Transmit queue management</b>	
5.2.7.3.10	There shall be a single queue for all random transmissions which do not have reserved slots for transmission.
5.2.7.3.11	This queue shall be sorted in priority order, with a higher value of Q1 being transmitted before a lower value of Q1.
5.2.7.3.12	If Q3 is TRUE, then the queue shall be searched to determine if a burst or frame of the same type has been queued.

### 5.2.8 Void

### 5.2.9 Null reservation protocol specification

#### 5.2.9.1 Null reservation burst format

Requirement reference	
5.2.9.1.1	A reservation ID (rid) = 1 and a reservation data (rd) field in accordance with table 5.12 shall indicate a null reservation.

**Table 5.12: Null reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
reservation data (rd) field	n - 3	x	x	x	x	x	x	0	0
	n - 2	0	0	0	0	0	0	0	0

Requirement reference	
5.2.9.1.2	In this case, the information field shall extend up to the last 10 bits prior to the CRC.

## 5.2.10 Periodic broadcast protocol specification

### 5.2.10.1 Periodic broadcast reservation burst format

Requirement reference	
5.2.10.1.1	A reservation ID (rid) = 1 and a reservation field in accordance with table 5.13 shall indicate a periodic broadcast reservation.
5.2.10.1.2	In this case, the information field shall extend up to but excluding the last 10 bits prior to the CRC.

**Table 5.13: Periodic broadcast reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
periodic timeout (pt)	n - 3	x	x	x	x	x	x	pt <sub>2</sub>	pt <sub>1</sub>
periodic offset (po)	n - 2	po <sub>8</sub>	po <sub>7</sub>	po <sub>6</sub>	po <sub>5</sub>	po <sub>4</sub>	po <sub>3</sub>	po <sub>2</sub>	po <sub>1</sub>

Requirement reference	
5.2.10.1.3	The subfields shall be as defined in table 5.14.

**Table 5.14: Periodic broadcast reservation field encoding**

Subfield	Range	Encoding
periodic offset (po)	-127 to +127	two's complement math po = -128 is invalid
periodic timeout (pt)	0 to 3	

Requirement reference	
5.2.10.1.4	po shall identify a slot relative to the first slot of the transmission in a future superframe.
5.2.10.1.5	pt shall define the number of superframes in the future for which a reservation is being made.

### 5.2.10.2 Periodic broadcast timers

Requirement reference	
	<b>Timer TV11 (reservation hold timer)</b>
5.2.10.2.1	The timer TV11 shall control the number of successive superframes which will use the same slot for transmission (see clause 5.2.10.5) before moving to a new slot.
5.2.10.2.2	There shall be one TV11 timer for each slot used for periodic broadcasts.

## 5.2.10.3 Periodic broadcast parameters

Requirement reference	
5.2.10.3.1	The periodic broadcast protocol shall implement the system parameters defined in table 5.15.

Table 5.15: Periodic broadcast VSS system parameters

Symbol	Parameter name	Minimum	Maximum	Recommended default	Increment
TV11min	Reservation hold timer minimum value	0 superframes	15 superframes	4 superframes	1 superframe
TV11max	Reservation hold timer maximum value	1 superframe	16 superframes	8 superframes	1 superframe
V11	Nominal periodic rate	1 per superframe	60 per superframe	1 per superframe	1 per superframe
V12	Periodic dither range	$(2/M1) \times V11$	1,00	0,10	0,01

Requirement reference	
5.2.10.3.2	TV11 min shall be less than or equal to TV11 max.
5.2.10.3.3	The VSS user shall provide any of the parameters TV11 min, TV11 max, V11, V12 and Quality of Service parameters (Q2a to Q2d and Q4) for which the default values are not desired.
	<b>Parameters TV11min and TV11max (reservation hold timer minimum and maximum values)</b>
5.2.10.3.4	Parameters TV11min and TV11max shall be used to determine the start value for the TV11 timer, consistent with the procedure defined in clause 5.2.10.5.14.
	<b>Parameter V11 (nominal periodic rate)</b>
5.2.10.3.5	The parameter V11 shall be the number of times per superframe that a VSS user will transmit a burst.
	<b>Parameter V12 (periodic dither range)</b>
5.2.10.3.6	The parameter V12 shall define the range for candidate slots on either side of the nominal slot (see clauses 5.2.10.5.1 to 5.2.10.5.2) from which the station shall choose a slot or group of slots to be reserved for transmission once the TV11 timer expires.
5.2.10.3.7	V12 shall be specified as a fraction of the nominal periodic rate.

## 5.2.10.4 Periodic broadcast reception procedures

Requirement reference	
5.2.10.4.1	Upon receipt of a burst containing a periodic broadcast reservation, the station shall update its reservation table and carry out the actions as specified in table 5.16.

**Table 5.16: Action on receipt of periodic broadcast reservation burst**

Periodic offset (po)	Periodic timeout (pt)	Action
0	0	No reservation (see note 1)
Any except 0	0, 1 or 2	Reserve the following slots for the source to broadcast: if $pt = 1$ or $2$ then for $j = 1$ to $pt$ , the slots equal to $(j \times M1)$ through $(bl - 1 + (j \times M1))$ after the first slot of the received burst AND for $j = pt + 1$ to $4$ , the slots equal to $(po + (j \times M1))$ through $(bl - 1 + (po + (j \times M1)))$ slots after the first slot of the received burst
0	1 or 2	Reserve the following slots for the source to broadcast: for $j = 1$ to $pt$ , the slots equal to $(j \times M1)$ through $(bl - 1 + (j \times M1))$ after the first slot of the received burst
any	3	Reserve the following slots for the source to broadcast: for $j = 1$ to $4$ , the slots equal to $(j \times M1)$ through $(bl - 1 + (j \times M1))$ after the first slot of the received burst (see note 2)
NOTE 1: Reservation format is the same as null reservation (see clause 5.2.9).		
NOTE 2: The interpretation of the periodic offset subfield in the case of periodic timeout = 3 and $io \neq 0$ binary is described in clause 5.2.12.		

Requirement reference	
5.2.10.4.2	All reservations associated with a single periodic broadcast reservation burst shall be known as a stream.
5.2.10.4.3	The actions defined in table 5.16 shall cancel any previous reservations for the same stream.
5.2.10.4.4	If a station was expecting to receive a transmission from a peer station containing a periodic broadcast reservation, but receives a transmission from the peer station containing an incremental reservation (see clause 5.2.11) or a unicast request with the source/destination flag set equal to 1 (see clause 5.2.14), the station shall cancel the periodic broadcast reservation stream for the peer station.

## 5.2.10.5 Periodic broadcast transmission procedures

Requirement reference	
<b>Selection of nominal slots</b>	
5.2.10.5.1	When operating without any directed-slot reservations (see clauses 5.2.16.1.7 to 5.2.16.1.9) for a given VSS User application which requires periodic broadcast transmissions, a station shall select nominal slots ( $n\_slot$ ) which form a periodic sequence in time, considering all frequencies used, with a variation of no more than $\pm 1$ slot as required to accommodate the constraints imposed by the nominal reporting rate for the application and the slot rate on the channel.
5.2.10.5.2	When operating with a mixture of directed-slot reservations, autonomous and directed-rate reservations (see clauses 5.2.16.1.7 to 5.2.16.1.9) for a given VSS User application which requires periodic broadcast transmissions, a station shall select nominal slots ( $n\_slot$ ) for the autonomous or directed rate which form a periodic sequence in time, considering all frequencies used, with a variation of no more than $\pm 1$ slot as required to accommodate the constraints imposed by the nominal reporting rate for the application and the slot rate on the channel.
<b>Selection of slots for a periodic broadcast transmission</b>	
5.2.10.5.3	If there is no existing periodic reservation for the VSS user, the station shall select a current transmission slot ( $ct\_slot$ ) corresponding to each nominal slot by inspection of the reservation table data, using the following procedure:
5.2.10.5.4	The station shall use the slot selection procedure specified in clause 5.2.6.2 using all slots that are within $\text{truncate}((V12/2) \times (M1/V11))$ of $n\_slot$ and within 127 slots of $n\_slot$ , as candidate slots, and the default or other VSS user supplied quality of service parameters.
5.2.10.5.5	When applying the slot selection procedure specified in clause 5.2.6.2, the station shall first select available slots at levels 0,1 and 2, excluding slots containing potential reservations associated with occupied slots as defined in clause 5.1.5.3.
5.2.10.5.6	Selections at level 0 shall select from slots containing potential reservations associated with unoccupied slots in increasing order of signal level as defined in clause 5.1.5.4.
5.2.10.5.7	If, on completion of the selection of available slots at level 2, less than Q4 slots have been chosen, the station shall select from slots containing potential reservations associated with occupied slots in increasing order of signal level as defined in clause 5.1.5.4.
5.2.10.5.8	If at the end of this process, less than Q4 slots have been chosen, the station shall then continue the slot selection process at level 3.

Requirement reference	
	<b>Calculation of slot availability</b>
5.2.10.5.9	After selection of a new current transmission slot, the station shall compute the slot availability ( $s\_avail$ ), indicating how many consecutive superframes are available until the equivalent slot is reserved by another user.
5.2.10.5.10	The value of $s\_avail$ shall indicate the slot ( $ct\_slot + s\_avail \times M1$ ) which is reserved by another user, and range from 1 (for a slot that is reserved in the next superframe) to 4 (for slots that currently have no reservation for at least 3 superframes)
5.2.10.5.11	The calculation of $s\_avail$ shall use the following rules:
5.2.10.5.12	If the current transmission slot has not been previously reserved, $s\_avail$ shall be the number of superframes that are left before the equivalent slot is reserved;
5.2.10.5.13	If the current transmission slot has been previously reserved by a station, $s\_avail$ shall be the number of superframes that are left before the equivalent slot is reserved by a different user.
	<b>Transmission in a new slot</b>
5.2.10.5.14	If there is no prior reservation or if the station is using for the first time a slot for which there has been a prior reservation, the station shall start the timer TV11 at a value equal to $s\_avail$ , if $s\_avail = 1, 2$ or $3$ , and otherwise equal to a random value uniformly chosen between TV11 min and TV11 max.
	<b>Transmission for TV11 greater than 3</b>
5.2.10.5.15	If the TV11 timer is greater than 3 and there is no requirement to associate the current transmission with an incremental reservation, the station shall transmit a burst containing a periodic broadcast reservation in the current transmission slot with $io = 0$ and $pt = 3$ .
5.2.10.5.16	After transmission, the timer TV11 shall be decremented by one and the current transmission slot shall be incremented by $M1$ .
	<b>Reservation of a new slot for TV11 equal to 1, 2, or 3</b>
5.2.10.5.17	If the TV11 timer is equal to 1, 2 or 3 and if the VSS user requires that periodic broadcast reservations are maintained after the current transmission slot reservation expires, the station shall reserve a future transmission slot ( $ft\_slot$ ) for subsequent transmissions.
5.2.10.5.18	If a future transmission slot has already been selected, there shall be no further slot selection.
5.2.10.5.19	Otherwise, selection of $ft\_slot$ shall be carried out using the procedure set out in clauses 5.2.10.5.3 to 5.2.10.5.8 using all slots that are within $\text{truncate}((V12/2) \times (M1/V11))$ of $n\_slot$ and within 127 slots of $n\_slot$ and within 127 slots of $ct\_slot$ , except slot ( $ct\_slot + TV11 \times M1$ ), as candidate slots.
	<b>Transmission for TV11 equal to 1, 2 or 3</b>
5.2.10.5.20	If the TV11 timer is equal to 1, 2 or 3 the station shall transmit a burst containing a periodic broadcast reservation in the current transmission slot with $po = (ft\_slot - ct\_slot)$ and $pt = TV11 - 1$ .
5.2.10.5.21	If a future transmission slot has not been selected and the VSS user does not require the reservation to be maintained, the value of the $po$ shall be set to zero.
5.2.10.5.22	After transmission, the timer TV11 shall be decremented and the current transmission slot set equal to $ct\_slot + M1$ .
	<b>TV11 equal to zero</b>
5.2.10.5.23	If the TV11 timer is equal to zero, and the VSS user requires a reservation to be maintained, then if a new slot has not been selected for further periodic broadcasts, the station shall select a new current transmission slot using the procedures set out in clauses 5.2.10.5.3 to 5.2.10.5.8.
5.2.10.5.24	If a new slot has been selected for further periodic broadcasts, the station shall set the current transmission slot equal to the future transmission slot.
5.2.10.5.25	The station shall start to transmit in the new current transmission slot carrying out the procedures set out in clauses 5.2.10.5.9 to 5.2.10.5.
5.2.10.5.26	If the VSS user does not require a reservation to be maintained, no further action shall be taken.
	<b>Reservation cancellation</b>
5.2.10.5.27	A station wishing to cancel a stream or reservations for its own transmissions, in the absence of a reservation conflict, shall transmit a periodic broadcast reservation burst with $po = 0$ and $pt = 0$ in the next reserved slot and the timer TV11 shall be cleared.
5.2.10.5.28	A station receiving such a burst shall clear all reservations known to be associated with the stream.

## 5.2.11 Incremental broadcast protocol specification

### 5.2.11.1 Incremental broadcast reservation burst format

Requirement reference	
5.2.11.1.1	A reservation ID (rid) = 0 with extended reservation ID and reservation fields set in accordance with table 5.17 shall indicate an incremental broadcast reservation.

**Table 5.17: Incremental broadcast reservation bit encoding**

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
	n - 3	x	x	x	x	x	x	io <sub>8</sub>	io <sub>7</sub>
incremental offset (io)	n - 2	1	0	io <sub>6</sub>	io <sub>5</sub>	io <sub>4</sub>	io <sub>3</sub>	io <sub>2</sub>	io <sub>1</sub>

Requirement reference	
5.2.11.1.2	In this case, the information field shall extend up to but excluding the last 10 bits prior to the CRC.
5.2.11.1.3	The subfields shall be as defined in table 5.18.

**Table 5.18: Incremental broadcast reservation field encoding**

Subfield	Range	Encoding
incremental offset (io)	0 to 255	(see clause 5.2.11.4)

Requirement reference	
5.2.11.1.4	io shall identify a slot relative to the first slot of the transmission.

### 5.2.11.2 Incremental broadcast parameters

Requirement reference	
5.2.11.2.1	The incremental broadcast protocol shall implement the system parameters defined in table 5.19.

**Table 5.19: Incremental broadcast VSS system parameters**

Symbol	Parameter name	Minimum	Maximum	Recommended default	Increment
V21	Nominal incremental period	960/M1 s	60 480/M1 s	1,0 s	0,1 s
V22	Maximum incremental dither range	720/(V21 x M1)	MIN(1.001-240/ (V21 x M1), 61 200/ (V21 x M1) - 0,999)	MIN(0,75, maximum allowed value of V22)	0,001

Requirement reference	
5.2.11.2.2	The VSS user shall provide any of the parameters V21, V22 and Quality of Service parameters (Q2a to Q2d and Q4) for which the default values are not desired.
	<b>Parameter V21 (nominal incremental period)</b>
5.2.11.2.3	The parameter V21 shall be the nominal time after the first slot of the incremental broadcast transmission that a VSS user will transmit a burst.
	<b>Parameter V22 (maximum incremental dither range)</b>
5.2.11.2.4	The parameter V22 shall define the range for candidate slots on either side of the nominal slot from which the station shall choose a slot or group of slots to be reserved for transmission.
5.2.11.2.5	V22 shall be specified as a fraction of the nominal incremental period.

### 5.2.11.3 Incremental broadcast reception procedures

Requirement reference	
5.2.11.3.1	Upon receipt of a burst containing an incremental broadcast reservation, a station shall reserve the slot equal to $(4 \times io)$ through $(bl - 1 + 4 \times io)$ after the first slot of the received burst for the source to broadcast.
5.2.11.3.2	When a burst contains an incremental broadcast reservation with $io = 0$ , then no incremental reservation shall be placed.

### 5.2.11.4 Incremental broadcast transmission procedures

Requirement reference	
	<b>Selection of the transmission slot for the incremental broadcast reservation</b>
5.2.11.4.1	If no slot or group of consecutive slots, has been reserved for transmission of an incremental reservation, and if the incremental reservation is not to be combined with a periodic broadcast reservation (see clause 5.2.12), the station shall select a slot or group of consecutive slots using the random access procedures (see clause 5.2.7).
5.2.11.4.2	The transmission slot ( $t\_slot$ ) shall be the first slot of the incremental broadcast transmission.
	<b>Selection of the reserved slot for the incremental broadcast reservation</b>
5.2.11.4.3	The station shall choose a slot or group of consecutive slots to reserve using the slot selection procedure specified in clause 5.2.6.2: a) using VSS user supplied quality of service parameters, and; b) candidate slots in the range $(V21 \times M1/60 - V22 \times V21 \times M1/60)$ through $(V21 \times M1/60 + V21 \times M1/60 + bl - 1)$ such that the chosen slot, or the first slot in the chosen group of slots, is an exact modulo 4 difference from $t\_slot$ .
5.2.11.4.4	The reserved slot ( $r\_slot$ ) shall be the chosen slot or the first slot in the chosen group of slots.
	<b>Incremental broadcast burst transmission</b>
5.2.11.4.5	The station shall transmit an incremental broadcast burst in the transmission slot with the value of $io$ set to $(r\_slot - t\_slot) / 4$ .

## 5.2.12 Combined periodic broadcast and incremental broadcast protocol specification

### 5.2.12.1 Combined periodic broadcast and incremental broadcast reservation burst

Requirement reference	
5.2.12.1.1	A reservation ID ( $rid$ ) = 1 and a reservation field in accordance with table 5.20 shall indicate a combined periodic broadcast and incremental broadcast reservation.

**Table 5.20: Combined periodic/incremental broadcast reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
periodic timeout (pt) = 3	n - 3	x	x	x	x	x	x	1	1
incremental offset (io)	n - 2	io <sub>8</sub>	io <sub>7</sub>	io <sub>6</sub>	io <sub>5</sub>	io <sub>4</sub>	io <sub>3</sub>	io <sub>2</sub>	io <sub>1</sub>
NOTE: Bits denoted x are available for use within the information field.									

Requirement reference	
5.2.12.1.2	In this case, the information field shall extend up to the last 10 bits prior to the CRC.
5.2.12.1.3	The periodic timeout (pt) subfield shall be set to 3.
5.2.12.1.4	The incremental offset subfield (io) shall be as defined in clause 5.2.11.1.
5.2.12.1.5	All other parameters and procedures shall be as specified in clauses 5.2.10 and 5.2.11.

## 5.2.13 Big negative dither (BND) broadcast protocol specifications

### 5.2.13.1 BND reservation burst format

Requirement reference	
5.2.13.1.1	A reservation ID (rid) = 0, an extended reservation ID (erid) = 00001 binary, and reservation data set in accordance with table 5.21 shall indicate a Big Negative Dither (BND).

**Table 5.21: BND broadcast reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
negative dither (nd)	n - 3	x	x	x	x	x	x	nd <sub>5</sub>	nd <sub>4</sub>
extended reservation ID (erid)	n - 2	0	0	0	0	1	nd <sub>3</sub>	nd <sub>2</sub>	nd <sub>1</sub>
NOTE: Bits denoted x are not used by this reservation type and shall be available for use within the information field.									

Requirement reference	
5.2.13.1.2	The subfields shall be as defined in table 5.22.

**Table 5.22: BND broadcast reservation parameters**

Subfield	Range	Encoding	Definitions
negative dither (nd)	0 to 31	See clause 5.2.13.3	nd identifies a slot relative to and earlier than the current slot + M1 - 128 slots.

### 5.2.13.2 BND broadcast parameters

Requirement reference	
5.2.13.2.1	There are no BND parameters.

### 5.2.13.3 BND broadcast reception procedures

Requirement reference	
5.2.13.3.1	Upon receipt of a burst containing a BND broadcast reservation, a station shall reserve the slots from $(M1 - 128 - (4 \times nd))$ through $(M1 - 128 - (4 \times nd) + (bl - 1))$ after the first slot of the received burst for the source to broadcast.

## 5.2.14 Unicast request protocol specification

### 5.2.14.1 Unicast request reservation burst format

Requirement reference	
5.2.14.1.1	A reservation ID (rid) = 0 with an extended reservation ID and reservation fields set in accordance with table 5.23 shall indicate a unicast request reservation.

**Table 5.23: Unicast request reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
destination address (d)	n - 8	d <sub>24</sub>	d <sub>23</sub>	d <sub>22</sub>	d <sub>21</sub>	d <sub>20</sub>	d <sub>19</sub>	d <sub>18</sub>	d <sub>17</sub>
	n - 7	d <sub>16</sub>	d <sub>15</sub>	d <sub>14</sub>	d <sub>13</sub>	d <sub>12</sub>	d <sub>11</sub>	d <sub>10</sub>	d <sub>9</sub>
	n - 6	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>
source/destination flag (sdf)	n - 5	ro <sub>12</sub>	ro <sub>11</sub>	ro <sub>10</sub>	ro <sub>9</sub>	sdf	d <sub>27</sub>	d <sub>26</sub>	d <sub>25</sub>
response offset (ro)	n - 4	ro <sub>8</sub>	ro <sub>7</sub>	ro <sub>6</sub>	ro <sub>5</sub>	ro <sub>4</sub>	ro <sub>3</sub>	ro <sub>2</sub>	ro <sub>1</sub>
length (lg)	n - 3	res	res	res	res	lg <sub>4</sub>	lg <sub>3</sub>	lg <sub>2</sub>	lg <sub>1</sub>
priority (pr)	n - 2	0	0	1	0	pr <sub>4</sub>	pr <sub>3</sub>	pr <sub>2</sub>	pr <sub>1</sub>

Requirement reference	
5.2.14.1.2	The subfields and associated actions shall be as defined in table 5.24.

**Table 5.24: Unicast request reservation field encoding**

Subfield	Range	Encoding/Actions	Definitions
response offset (ro)	0 to 4 095		ro identifies a slot relative to the first slot of the transmission.
destination address (d)	0 to 2 <sup>27</sup> -1	See clause 5.3.1.2.	d is the 27-bit address of the destination station.
source/destination flag (sdf)	Boolean	If sdf = 0, reserve the response slot for the destination station to transmit. If sdf = 1, reserve the response slot for the source station to transmit.	sdf indicates which station will respond in the reserved response slot. Note that the source station is the station placing the reservation.
length (lg)	0 to 15		lg is one less than the number of slots that are reserved for the response.
priority (pr)	0 to 15	See table 5.8.	

Requirement reference	
5.2.14.1.3	In the case that the address type field (see clause 5.3.1.2.1) is equal to 7, bits 1 through 24 of the destination subfield (d) shall be absent, so that the information field will extend up to the last four octets prior to the CRC.
5.2.14.1.4	Otherwise, the burst shall include all of the destination subfield (d), so that the information field will extend up to the last seven octets prior to the CRC.

### 5.2.14.2 Unicast request reception procedures

Requirement reference	
5.2.14.2.1	Upon receipt of a burst containing a unicast request reservation, a station shall reserve all of the slots from (1 + ro) through (1 + ro + lg) after the first slot of the received burst for: a) the destination to transmit a response to the source (if sdf = 0 and address type field <> 7); b) or for the source to transmit a response to the destination (if sdf = 1 and address type field <> 7); c) or for the source to make a broadcast transmission (if address type field = 7).

### 5.2.14.3 Slot selection criteria for unicast request with sdf = 1

Requirement reference	
5.2.14.3.1	A station applying the slot selection criteria of clause 5.2.6.2.7 to 5.2.6.2.13 shall exclude any slot reserved by another station using the unicast request protocol with sdf = 1.

## 5.2.15 Information transfer request protocol specification

### 5.2.15.1 Information transfer request reservation burst format

Requirement reference	
5.2.15.1.1	A reservation ID (rid) = 0 with extended reservation ID (erid) = 01010 binary and reservation fields set in accordance with table 5.25 shall indicate an information transfer request reservation.

**Table 5.25: Information transfer request reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
acknowledgement offset (ao)	n - 10	res	ao <sub>7</sub>	ao <sub>6</sub>	ao <sub>5</sub>	ao <sub>4</sub>	ao <sub>3</sub>	ao <sub>2</sub>	ao <sub>1</sub>
length (lg)	n - 9	res	res	res	res	lg <sub>4</sub>	lg <sub>3</sub>	lg <sub>2</sub>	lg <sub>1</sub>
response offset (ro)	n - 8	ro <sub>8</sub>	ro <sub>7</sub>	ro <sub>6</sub>	ro <sub>5</sub>	ro <sub>4</sub>	ro <sub>3</sub>	ro <sub>2</sub>	ro <sub>1</sub>
	n - 7	ro <sub>12</sub>	ro <sub>11</sub>	ro <sub>10</sub>	ro <sub>9</sub>	f <sub>12</sub>	f <sub>11</sub>	f <sub>10</sub>	f <sub>9</sub>
frequency (f)	n - 6	f <sub>8</sub>	f <sub>7</sub>	f <sub>6</sub>	f <sub>5</sub>	f <sub>4</sub>	f <sub>3</sub>	f <sub>2</sub>	f <sub>1</sub>
destination address (d)	n - 5	d <sub>24</sub>	d <sub>23</sub>	d <sub>22</sub>	d <sub>21</sub>	d <sub>20</sub>	d <sub>19</sub>	d <sub>18</sub>	d <sub>17</sub>
	n - 4	d <sub>16</sub>	d <sub>15</sub>	d <sub>14</sub>	d <sub>13</sub>	d <sub>12</sub>	d <sub>11</sub>	d <sub>10</sub>	d <sub>9</sub>
	n - 3	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>
	n - 2	0	1	0	1	0	d <sub>27</sub>	d <sub>26</sub>	d <sub>25</sub>

Requirement reference	
5.2.15.1.2	In this case, the information field shall extend up to the last nine octets prior to the CRC.
5.2.15.1.3	The subfields shall be as defined in table 5.26.

**Table 5.26: Information transfer reservation field encoding**

Subfield	Range	Encoding
length (lg)	See table 5.24	lg is one less than the number of slots that are reserved for the response.
acknowledgement offset (ao)	0 to 127	ao identifies a slot relative to the end of the block of slots reserved by the response offset and length subfields.
response offset (ro)	See table 5.24	ro identifies a slot relative to the first slot of the transmission.
destination address (d)	See clause 5.3.1.2	d is the 27-bit address of the destination station for which the block of slots is being reserved.
frequency (f)	bit 12: frequency band indicator: 0: VHF band 108 MHz to 137,000 MHz 1: reserved for future allocation  bits 1 to 11: frequency allocation for bit 12 = 0: 1 to 1 160 per frequency band in 25 kHz increments. 1 161 to 2 047 reserved for future allocation. 1 indicates bottom of band. f = 001 hex = 108,000 MHz  f = 000 hex if the subfield is to be ignored.	The frequency subfield (f) identifies the frequency on which the reservation is to be made for the response.

### 5.2.15.2 Information transfer request reception procedures

Requirement reference	
5.2.15.2.1	Upon receipt of a burst containing an information transfer request reservation, a station shall reserve on the specified frequency all of the slots from $(1 + ro)$ through $(1 + ro + lg)$ after the first slot of the received burst for the destination to transmit one or more information bursts to the source.
5.2.15.2.2	Also, the slot equal to $(2 + ro + lg + ao)$ after the first slot of the received burst shall be reserved for the source to transmit an acknowledgement to the destination on the same frequency as the burst containing the information transfer request reservation.

### 5.2.16 Directed request protocol specification

#### 5.2.16.1 Directed request reservation burst format

Requirement reference	
5.2.16.1.1	A reservation ID (rid) = 0, an extended reservation ID (erid) = 01100 binary, and reservation fields set in accordance with table 5.27 shall indicate a directed request reservation.

Table 5.27: Directed request reservation bit encoding

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
identification of additional reservation data	n - 15								
	n - 14								
	n - 13								
	n - 12								
	n - 11	per table 5.29, table 5.31 through table 5.32							
	n - 10								
	n - 9								
	n - 8								
	n - 7								
nominal update rate (nr); plea response flag (pr_flag)	n - 6				pr_flag	nr <sub>4</sub>	nr <sub>3</sub>	nr <sub>2</sub>	nr <sub>1</sub>
destination address (d)	n - 5	d <sub>24</sub>	d <sub>23</sub>	d <sub>22</sub>	d <sub>21</sub>	d <sub>20</sub>	d <sub>19</sub>	d <sub>18</sub>	d <sub>17</sub>
	n - 4	d <sub>16</sub>	d <sub>15</sub>	d <sub>14</sub>	d <sub>13</sub>	d <sub>12</sub>	d <sub>11</sub>	d <sub>10</sub>	d <sub>9</sub>
	n - 3	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>
extended reservation ID (erid)	n - 2	0	1	1	0	0	d <sub>27</sub>	d <sub>26</sub>	d <sub>25</sub>

Requirement reference	
5.2.16.1.2	The length of the reservation field shall be determined by the value of the plea response flag (pr_flag).
5.2.16.1.3	For the case of pr_flag = 1, the information field shall extend up to the last fourteen octets prior to the CRC.
5.2.16.1.4	For the case of pr_flag = 0, the information field shall extend up to the last ten octets prior to the CRC.
5.2.16.1.5	The nominal update rate (nr) field shall be encoded in accordance with table 5.28.

Table 5.28: Nominal update rate encoding

Encoded data				Nominal update rate (transmissions per minute)
nr <sub>4</sub>	nr <sub>3</sub>	nr <sub>2</sub>	nr <sub>1</sub>	nr
0	0	0	0	1
0	0	0	1	2
0	0	1	0	3
0	0	1	1	4
0	1	0	0	5
0	1	0	1	6
0	1	1	0	8
0	1	1	1	Invalid
1	0	0	0	10
1	0	0	1	12
1	0	1	0	15
1	0	1	1	20
1	1	0	0	30
1	1	0	1	60
1	1	1	0	0
1	1	1	1	Special

Requirement reference	
5.2.16.1.6	The 27-bit destination address (d) shall be the 27-bit address of the destination station for whom reservations are being created.
<b>Autotune reservation burst format</b>	
5.2.16.1.7	A directed request reservation burst with pr_flag = 0 shall indicate an autotune reservation.
5.2.16.1.8	Additional reservation data shall be set in accordance with table 5.29 with subfields defined in accordance with table 5.30.

**Table 5.29: Encoding of additional data in autotune reservation burst**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
directed timeout (dt)	n - 11	dt <sub>4</sub>	dt <sub>3</sub>	dt <sub>2</sub>	dt <sub>1</sub>	f <sub>12</sub>	f <sub>11</sub>	f <sub>10</sub>	f <sub>9</sub>
frequency (f)	n - 10	f <sub>8</sub>	f <sub>7</sub>	F <sub>6</sub>	f <sub>5</sub>	f <sub>4</sub>	f <sub>3</sub>	f <sub>2</sub>	f <sub>1</sub>
length (lg)	n - 9	res	res	res	res	lg <sub>4</sub>	lg <sub>3</sub>	lg <sub>2</sub>	lg <sub>1</sub>
transmit control (trmt)	n - 8	res	res	trmt	res	do <sub>12</sub>	do <sub>11</sub>	do <sub>10</sub>	do <sub>9</sub>
directed offset (do)	n - 7	do <sub>8</sub>	do <sub>7</sub>	do <sub>6</sub>	do <sub>5</sub>	do <sub>4</sub>	do <sub>3</sub>	do <sub>2</sub>	do <sub>1</sub>
override flag (or); receiver control (rcvr); nominal update rate (nr); pr_flag = 0	n - 6	or	rcvr <sub>2</sub>	rcvr <sub>1</sub>	0	nr <sub>4</sub>	nr <sub>3</sub>	nr <sub>2</sub>	nr <sub>1</sub>

**Table 5.30: Directed request reservation field encoding**

Subfield	Range	Encoding	Definitions
length (lg)	0 to 15	See table 5.24	lg is one less than the number of slots that are reserved.
directed timeout (dt)	0 to 15	A value of 15 cancels the reservation	dt = the number of planned future transmissions reserved in slots spaced M1 slots apart.
nominal rate (nr)	0 to 60	See table 5.28 When pr_flag = 0, nr = special is invalid	See table 5.28.
override flag (or)	0 to 1	See clause 5.2.16.3.1	or indicates whether the current directed request reservation burst overrides all previous directed request reservations issued by the station on the indicated frequency.
receiver control (rcvr)	0 to 3	00 = Station must continue to monitor the current frequency; 01 = Station must monitor the indicated frequency; 10 = Autonomous decision; 11 = Station must continue to monitor the current frequency and also the indicated frequency	Defines handling of receiver tuned to frequency used to receive this burst.
transmit control (trmt)	0 to 1	0 = cancel transmissions on the current frequency (see clauses 5.2.10.5.27 to 5.2.10.5.28) 1 = continue transmission on the current frequency	
directed offset (do)	0 or 2 to 2 <sup>12</sup> - 1	do = 1: invalid	do = 0 implies directed rate reservation. do > 1 implies directed slot reservation. For do > 1, do = the first slot in which to transmit.
offset to first reserved slot (off)	2 to 2 <sup>9</sup> - 1	off = 0,1: invalid	off = the first slot in which to transmit (for plea response)

Subfield	Range	Encoding	Definitions
additional slots ( $a_j$ )	1 to $2^k - 1$ ( $k = 6, 12$ )	$a_j = 20$ hex and $nr$ not equal to special: invalid  Note: $k$ is the number of bits in each $a_j$ . $k = 6$ for $nr$ not equal to "special", and $k = 12$ for $nr =$ "special". $j$ is the number of additional slots.	For $nr$ not equal to "special", $a_j$ is encoded as two's complement offset about a nominal slot defined by the offset to the first slot, and the nominal rate. For $nr =$ special, $a$ is encoded as a binary increment from the previously-reserved slot. $a_j$ refers to the additional slot.
frequency ( $f$ )	See table 5.26	See table 5.26	Defines new frequency for transmissions of required data.
plea response flag ( $pr\_flag$ )	See clause 5.2.16.1.2		

Requirement reference	
5.2.16.1.9	A reservation with $do = 0$ , $rcvr = 00$ binary and $f \neq$ current frequency is invalid and shall be handled as per clause 5.2.5.
<b>Plea response burst format</b>	
5.2.16.1.10	A directed request reservation with $pr\_flag = 1$ shall indicate a network entry plea response.
5.2.16.1.11	In this case, the reservation data not previously defined shall be encoded as indicated in tables 5.31 and 5.32 with subfields set in accordance with table 5.30, consisting of: a) the offset to a first reserved slot; and b) offsets to an additional $n$ reserved slots as appropriate.

Table 5.31: Encoding of additional data with  $nr \neq$  "special"

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
additional slots ( $a_j$ )	$n - 15$	$a_{11,6}$	$a_{11,5}$	$a_{8,6}$	$a_{8,5}$	$a_{8,4}$	$a_{8,3}$	$a_{8,2}$	$a_{8,1}$
	$n - 14$	$a_{11,4}$	$a_{11,3}$	$a_{7,6}$	$a_{7,5}$	$a_{7,4}$	$a_{7,3}$	$a_{7,2}$	$a_{7,1}$
	$n - 13$	$a_{11,2}$	$a_{11,1}$	$a_{6,6}$	$a_{6,5}$	$a_{6,4}$	$a_{6,3}$	$a_{6,2}$	$a_{6,1}$
	$n - 12$	$a_{10,6}$	$a_{10,5}$	$a_{5,6}$	$a_{5,5}$	$a_{5,4}$	$a_{5,3}$	$a_{5,2}$	$a_{5,1}$
	$n - 11$	$a_{10,4}$	$a_{10,3}$	$a_{4,6}$	$a_{4,5}$	$a_{4,4}$	$a_{4,3}$	$a_{4,2}$	$a_{4,1}$
	$n - 10$	$a_{10,2}$	$a_{10,1}$	$a_{3,6}$	$a_{3,5}$	$a_{3,4}$	$a_{3,3}$	$a_{3,2}$	$a_{3,1}$
	$n - 9$	$a_{9,6}$	$a_{9,5}$	$a_{2,6}$	$a_{2,5}$	$a_{2,4}$	$a_{2,3}$	$a_{2,2}$	$a_{2,1}$
	$n - 8$	$a_{9,4}$	$a_{9,3}$	$a_{1,6}$	$a_{1,5}$	$a_{1,4}$	$a_{1,3}$	$a_{1,2}$	$a_{1,1}$
offset to first reserved slot (off)	$n - 7$	$a_{9,2}$	$a_{9,1}$	$off_9$	$off_8$	$off_7$	$off_6$	$off_5$	$off_4$
nominal rate( $nr$ ); $pr\_flag = 1$	$n - 6$	$off_3$	$off_2$	$off_1$	1	$nr_4$	$nr_3$	$nr_2$	$nr_1$

Table 5.32: Encoding of additional data for  $nr =$  "special"

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
additional slots ( $a_j$ )	$n - 15$	res	res	res	res	$a_{5,12}$	$a_{5,11}$	$a_{5,10}$	$a_{5,9}$
	$n - 14$	$a_{5,8}$	$a_{5,7}$	$a_{5,6}$	$a_{5,5}$	$a_{5,4}$	$a_{5,3}$	$a_{5,2}$	$a_{5,1}$
	$n - 13$	$a_{4,8}$	$a_{4,7}$	$a_{4,6}$	$a_{4,5}$	$a_{4,4}$	$a_{4,3}$	$a_{4,2}$	$a_{4,1}$
	$n - 12$	$a_{4,12}$	$a_{4,11}$	$a_{4,10}$	$a_{4,9}$	$a_{3,12}$	$a_{3,11}$	$a_{3,10}$	$a_{3,9}$
	$n - 11$	$a_{3,8}$	$a_{3,7}$	$a_{3,6}$	$a_{3,5}$	$a_{3,4}$	$a_{3,3}$	$a_{3,2}$	$a_{3,1}$
	$n - 10$	$a_{2,8}$	$a_{2,7}$	$a_{2,6}$	$a_{2,5}$	$a_{2,4}$	$a_{2,3}$	$a_{2,2}$	$a_{2,1}$
	$n - 9$	$a_{2,12}$	$a_{2,11}$	$a_{2,10}$	$a_{2,9}$	$a_{1,12}$	$a_{1,11}$	$a_{1,10}$	$a_{1,9}$
	$n - 8$	$a_{1,8}$	$a_{1,7}$	$a_{1,6}$	$a_{1,5}$	$a_{1,4}$	$a_{1,3}$	$a_{1,2}$	$a_{1,1}$
offset to first reserved slot (off)	$n - 7$	res	res	$off_9$	$off_8$	$off_7$	$off_6$	$off_5$	$off_4$
nominal rate ( $nr$ ); $pr\_flag = 1$	$n - 6$	$off_3$	$off_2$	$off_1$	1	1	1	1	1

Requirement reference	
5.2.16.1.12	Additional reserved slots shall be encoded as follows:
5.2.16.1.13	Slots 1 to n shall be encoded in additional slots a1 to an;
5.2.16.1.14	Additional slots $a_{n+1}$ to $a_N$ , where N is the maximum number of additional slots that can be accommodated in the formats defined by tables 5.31 and 5.32, shall be set to zero.

### 5.2.16.2 Directed request parameters

Requirement reference	
5.2.16.2.1	The directed request protocol shall implement the system parameters defined in table 5.33.

**Table 5.33: Directed request VSS system parameters**

Symbol	Parameter Name	Minimum	Maximum	Recommended default	Increment
V52	Minimum response delay	1 slot	500 slots	20 slots	1 slot

Requirement reference	
5.2.16.2.2	The VSS user shall provide the destination address and any of the parameters V52 and Quality of Service parameters (Q2a to Q2d, Q4 and Q5) for which the default values are not desired.
<b>Parameter V52 (minimum response delay)</b>	
5.2.16.2.3	Parameter V52 shall be the minimum time that a station will provide to a responder in order to ensure timely delivery in case a retransmission is required.

### 5.2.16.3 Directed request reception procedures

Requirement reference	
<b>Autotune reception procedures</b>	
5.2.16.3.1	Upon receipt of a burst containing an autotune reservation ( $pr\_flag = 0$ ), the station shall update its reservation table and carry out the actions as specified in table 5.34.

**Table 5.34: Action on receipt of an autotune reservation burst**

Directed offset (do)	Directed timeout (dt)	Action
0	any	Operate autonomously.
1	any	Invalid
$1 < do < M1$	$dt < 15$	Reserve the following slots for the destination to broadcast:  for j equal to 0 to 3 and k equal to 0 to $nr - 1$ , the slots equal to $\text{truncate}(do + (k \times M1/nr) + j \times M1)$ through $(lg + \text{truncate}(do + (k \times M1/nr) + j \times M1))$ after the first slot of the received burst
$1 < do < M1$	$dt = 15$	Reserve the following slots for the destination to broadcast:  for k equal to 0 to $nr - 1$ , the slots equal to $\text{truncate}(do + (k \times M1/nr))$ through $(lg + \text{truncate}(do + (k \times M1/nr)))$ after the first slot of the received burst
$do > M1-1$	any	Invalid

Requirement reference	
5.2.16.3.2	If the override (or) flag is set to 1, the destination shall cancel all previously placed autotune reservations made by the source station on frequency $f$ (see clause 5.2.10.5).
5.2.16.3.3	Otherwise, the station shall retain the previous reservations.
5.2.16.3.4	The burst is invalid, and shall be handled as per clause 5.2.5, if the frequency subfield is equal to 000 hex, or fails to map to a known frequency, or indicates a frequency on which the transmitter cannot transmit.
<b>Plea response reception procedures</b>	
5.2.16.3.5	Upon receipt of a burst containing a plea response reservation ( $pr\_flag = 1$ ), a station shall reserve the slots equal to "off" after the first slot of the received burst and the series of slots $r_j$ for the destination to broadcast.
5.2.16.3.6	If $nr \neq \text{"special"}$ , then $r_j$ shall be: $r_j = (\text{off} + (j \times nsr) + a_j)$ for $j = 1$ to $N$ , where $N$ is the maximum number of additional slots defined in the additional slots subfield (see clauses 5.2.16.1.10 to 5.2.16.1.14).
5.2.16.3.7	If $nr = \text{"special"}$ , then $r_j$ shall be defined as: $r_j = (\text{off} + [\text{sum from } m = 1 \text{ to } j] a_m)$ for $j = 1$ to $N$ .

#### 5.2.16.4 Directed request transmission procedures

Requirement reference	
<b>Recommendation</b>	
5.2.16.4.1	Void
5.2.16.4.2	Void
5.2.16.4.3	Void
<b>Autotune transmission procedures</b>	
5.2.16.4.4	Void
5.2.16.4.5	Void
<b>Retransmission after no response</b>	
5.2.16.4.6	There shall be no automatic retransmission of plea response bursts ( $pr\_flag = 1$ ).
5.2.16.4.7	Void
5.2.16.4.8	Void
<b>Cancellation of autotune reservation</b>	
5.2.16.4.9	Void
5.2.16.4.10	Void
<b>Plea response transmission procedures</b>	
5.2.16.4.11	A station transmitting a plea response ( $pr\_flag = 1$ ) shall set the destination ( $d$ ) to the destination of the burst, the offset ( $off$ ) subfield to the offset from the first slot of the reservation burst to the first slot in which to transmit, and the nominal rate ( $nr$ ) subfield to the nominal number of times per $M1$ slots that a synchronization burst is to be sent on the frequency used for transmission.
5.2.16.4.12	The value of the offset ( $off$ ) subfield shall be greater than $V52$ .
5.2.16.4.13	A station shall ensure that the slots selected in the transmission satisfy the nominal update rate requirements and all of the requirements of clause 5.2.6.2.
5.2.16.4.14	A station shall check to determine if a previous plea response had been sent to the mobile making the plea (i.e. the destination ID for this plea response).
5.2.16.4.15	If a previous plea response had been sent to the mobile making the plea, the station shall begin the list of reserved slots with the remaining (future) reservations from the earlier plea response.
<b>Recommendation</b>	
5.2.16.4.16	To simplify and ease the reversion from a) directed slot operations on local channels, to b) directed rate or autonomous mode operations on another channel, ground stations should attempt to autotune mobile stations (using a directed slot reservation) to the new channel, for a period of at least 60 s, prior to release.
5.2.16.4.17	The mobile station should then use the BND reservation to continue the stream while it is building the reservation table and operating under ground control.
<b>Response to an autotune reservation with directed offset equal to zero</b>	
5.2.16.4.18	If the directed offset ( $do$ ) subfield is equal to zero ( $do = 0$ ), the responder station shall operate autonomously by using the periodic broadcast procedures with the nominal periodic rate ( $V11$ ) set to the nominal update rate ( $nr$ ) in the autotune reservation transmission for the next ( $dt \times M1$ ) slots, with the first two bits of the message ID ( $mi$ ) field set to "00".

Requirement reference	
5.2.16.4.19	Upon cessation of directed transmissions, the responder shall resume default autonomous behaviour on the GSCs, reserving new slots as required.
<b>Cancellation of autonomous periodic broadcasts</b>	
5.2.16.4.20	If transmit control (trmt) = 0 and if the responder was transmitting autonomously the VSS user data for which a directed request reservation has been received, then the responder shall cancel its existing reservations in accordance with 5.2.10.5.27 and 5.2.10.5.28, and operate in accordance with the parameters of the directed request.
5.2.16.4.21	If transmit control (trmt) = 1 and if the responder was transmitting autonomously on the channel on which a directed request reservation was received, then the responder shall maintain its autonomous transmissions on the channel.
<b>Cancellation of directed request broadcasts</b>	
5.2.16.4.22	If the responder receives a directed request reservation burst with the directed time out (dt) subfield set to 15 (dt = 15), then it shall cancel its existing reservations in accordance with 5.2.10.5.27 and 5.2.10.5.28.
<b>Response if unable to support directed request</b>	
5.2.16.4.23	If the responder is unable to support the directed request, it shall transmit a GENERAL FAILURE (see clause 5.2.20.1) with error type (err) = 05 hex.
5.2.16.4.24	If there are insufficient receiver resources to meet the request, it shall set bit 1 of the parameter subfield to one.
5.2.16.4.25	All other bits in the parameter subfield shall be set to zero.
<b>Recommendation</b>	
5.2.16.4.26	If possible, a responder sending a GENERAL FAILURE should use slots reserved by the ground station on the channel as indicated in the directed request.
5.2.16.4.27	Otherwise, the station should use the combined periodic/incremental reservation protocol to place the transmission on the channel on which the directed request was received.

## 5.2.17 Block reservation protocols specification

### 5.2.17.1 Superframe block reservation burst format

Requirement reference	
5.2.17.1.1	A reservation ID (rid) = 0, an extended reservation ID (erid) = 110, and reservation fields set in accordance with table 5.35, with subfields defined in accordance with table 5.36, shall indicate a superframe block reservation.

**Table 5.35: Superframe block reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
destination address (d)	n - 10	d <sub>24</sub>	d <sub>23</sub>	d <sub>22</sub>	d <sub>21</sub>	d <sub>20</sub>	d <sub>19</sub>	d <sub>18</sub>	d <sub>17</sub>
	n - 9	d <sub>16</sub>	d <sub>15</sub>	d <sub>14</sub>	d <sub>13</sub>	d <sub>12</sub>	d <sub>11</sub>	d <sub>10</sub>	d <sub>9</sub>
	n - 8	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>
block length (blg)	n - 7	blg <sub>5</sub>	blg <sub>4</sub>	blg <sub>3</sub>	blg <sub>2</sub>	blg <sub>1</sub>	d <sub>27</sub>	d <sub>26</sub>	d <sub>25</sub>
re-broadcast offset (roff)	n - 6	roff <sub>8</sub>	roff <sub>7</sub>	roff <sub>6</sub>	roff <sub>5</sub>	roff <sub>4</sub>	roff <sub>3</sub>	roff <sub>2</sub>	roff <sub>1</sub>
block repeat rate (br)	n - 5	res	res	res	res	br <sub>4</sub>	br <sub>3</sub>	br <sub>2</sub>	br <sub>1</sub>
block start (bs)	n - 4	bs <sub>8</sub>	bs <sub>7</sub>	bs <sub>6</sub>	bs <sub>5</sub>	bs <sub>4</sub>	bs <sub>3</sub>	bs <sub>2</sub>	bs <sub>1</sub>
block offset (bo)	n - 3	bo <sub>8</sub>	bo <sub>7</sub>	bo <sub>6</sub>	bo <sub>5</sub>	bo <sub>4</sub>	bo <sub>3</sub>	bo <sub>2</sub>	bo <sub>1</sub>
extended reservation ID (erid), block timeout (bt)	n - 2	0	0	0	1	0	res	bt <sub>2</sub>	bt <sub>1</sub>

**Table 5.36: Superframe reservation field encoding**

Subfield	Range	Encoding	Definitions
block timeout (bt)	0 to 3		bt x M1 = the number of slots for which the block reservation should be maintained.
block repeat rate (br)	1 to 60	See table 5.28. Codes 0111, 1110 and 1111 are invalid	Defines the number of blocks per minute.
re-broadcast offset (roff)	2 to 255	bs = 0,1 invalid	roff indicates the slot in which the re-broadcast transmission should be made.
block start (bs)	2 to 255	bs = 0,1 invalid	bs identifies a slot relative to the transmission slot which is the first slot of the first reserved block.
block offset (bo)	-127 to +127	Two's complement math	bo identifies an offset of each reserved block at a future time defined by bt x M1.
block length (blg)	0 to 31		blg is one less than the number of slots reserved for the block.
destination address (d)	See table 5.24	Ignored if ro = bs and octets n - 10 through n - 8 available for use within the information field.	d is the 27-bit address of the destination station which is required to re-broadcast the blocking message.

Requirement reference	
5.2.17.1.2	The information field shall extend up to the last nine octets prior to the CRC.

### 5.2.17.2 Second frame block reservation burst format

Requirement reference	
5.2.17.2.1	A reservation ID (rid) = 0, an extended reservation ID (erid) = 00011, and reservation fields set in accordance with table 5.37, with subfields defined in accordance with table 5.38, shall indicate a second frame block reservation.

**Table 5.37: Second frame block reservation bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
timeout (vt)	n - 3	vt <sub>6</sub>	vt <sub>5</sub>	vt <sub>4</sub>	vt <sub>3</sub>	vt <sub>2</sub>	vt <sub>1</sub>	SZ <sub>5</sub>	SZ <sub>4</sub>
size (sz)	n - 2	0	0	0	1	1	SZ <sub>3</sub>	SZ <sub>2</sub>	SZ <sub>1</sub>

**Table 5.38: Second frame block reservation field encoding**

Subfield	Range	Definitions
size (sz)	0 to 31	Number of slots to block after the start of each UTC second.
timeout (vt)	1 to 60	Value of TV61.

Requirement reference	
5.2.17.2.2	The information field shall extend up to the last octet prior to the CRC.

### 5.2.17.3 Superframe block reservation parameters

Requirement reference	
5.2.17.3.1	The superframe block reservation protocol shall implement the system parameters defined in table 5.39.

**Table 5.39: Superframe block reservation VSS system parameters**

Symbol	Parameter name	Minimum	Maximum	Default	Increment
V61	Superframe block start offset	2	255	20	1
V62	Superframe block length	1	32	3	1
V63	Superframe block repeat rate	1	60	5	See table 5.28 for allowed values
V64	Superframe block re-broadcast request	No	Yes	No	-
V65	Superframe block re-broadcast offset	2	255	10	1

Requirement reference	
5.2.17.3.2	For each superframe block reservation, the VSS user shall provide one or more sets of parameters consisting of: <ul style="list-style-type: none"> <li>a) the time of the required superframe block ground transmission;</li> <li>b) the parameters V61 and V65 for which the default values are not desired;</li> <li>c) Quality of Service parameters (Q2a to Q2d, Q4 and Q5) for which the default values are not desired.</li> </ul>
5.2.17.3.3	The station shall use the first set of parameters to calculate the position and subfield settings for the first ground station transmission as specified in clauses 5.2.17.7.3 to 5.2.17.7.6 and then use each following set to move the position of the reserved blocks.
5.2.17.3.4	Where possible, the station shall pre-announce that a block is to move using the block offset subfield as defined in clauses 5.2.17.7.9 to 5.2.17.7.12.
	<b>Parameter V61 (superframe block start offset)</b>
5.2.17.3.5	Parameter V61 shall be the offset to the start of the first reserved block from the slot containing the ground transmission.
	<b>Parameter V62 (superframe block length)</b>
5.2.17.3.6	Parameter V62 shall be the length in slots of each reserved block.
	<b>Parameter V63 (superframe block repeat rate)</b>
5.2.17.3.7	Parameter V63 shall be number of reserved slots per M1 slots encoded as defined in table 5.28.
	<b>Parameter V64 (superframe block re-broadcast request)</b>
5.2.17.3.8	Parameter V64 shall determine whether the superframe block reservation request is to be re-broadcast by a mobile using the procedures defined in the present document clauses 5.2.17.7.9 to 5.2.17.7.12.

### 5.2.17.4 Superframe block reservation reception procedures

Requirement reference	
5.2.17.4.1	Void.
5.2.17.4.2	Upon receipt of a burst containing a superframe block reservation, the station shall update its reservation table and carry out the actions as specified in tables 5.39a and 5.39b.
NOTE:	The actions in table 5.39b reserve the slot used by the station to provide a superframe block reservation in subsequent superframes.

**Table 5.39a: Actions on receipt of a superframe block reservation burst**

Block start (bs)	Block offset (bo)	Block timeout (bt)	Action
$bs < 2$	Any	Any	Invalid
$bs \geq 2$	Any except 0	0, 1, 2	<p>Reserve the following slots for the source or a mobile directed by the source to broadcast:</p> <p>if <math>bt = 1</math> or <math>2</math> then for <math>j</math> equal to 0 to <math>bt</math> and <math>k</math> equal to 0 to <math>br - 1</math>, the slots equal to <math>\text{truncate}(bs + (k \times M1 / br) + j \times M1)</math> through <math>(blg + \text{truncate}(bs + (k \times M1 / br) + j \times M1))</math> after the first slot of the received burst</p> <p>AND</p> <p>for <math>j</math> equal to <math>bt + 1</math> to 3 and <math>k</math> equal to 0 to <math>br - 1</math>, the slots equal to <math>\text{truncate}(bs + bo + (k \times M1 / br) + j \times M1)</math> through <math>(blg + \text{truncate}(bs + bo + (k \times M1 / br) + j \times M1))</math> after the first slot of the received burst</p>
$bs \geq 2$	0	0, 1 or 2	<p>Reserve the following slots for the source or a mobile directed by the source to broadcast:</p> <p>for <math>j</math> equal to 0 to <math>bt</math> and <math>k</math> equal to 0 to <math>br - 1</math>, the slots equal to <math>\text{truncate}(bs + (k \times M1 / br) + j \times M1)</math> through <math>(blg + \text{truncate}(bs + (k \times M1 / br) + j \times M1))</math> after the first slot of the received burst</p> <p>Thereafter, terminate the reservations.</p>
$bs \geq 2$	Any	3	<p>Reserve the following slots for the source or a mobile directed by the source to broadcast:</p> <p>for <math>j</math> equal to 0 to <math>bt</math> and <math>k</math> equal to 0 to <math>br - 1</math>, the slots equal to <math>\text{truncate}(bs + (k \times M1 / br) + j \times M1)</math> through <math>(blg + \text{truncate}(bs + (k \times M1 / br) + j \times M1))</math> after the first slot of the received burst</p>

**Table 5.39b: Further actions on receipt of a superframe block reservation burst**

Block offset (bo)	Block timeout (bt)	Action
Any except 0	0, 1, 2	<p>Reserve the following slots for the source to broadcast:</p> <p>if <math>bt = 1</math> or <math>2</math> then for <math>j</math> equal to 1 to <math>bt</math>, the slot equal to <math>(j \times M1)</math> after the first slot of the received burst</p> <p>AND</p> <p>for <math>j</math> equal to <math>bt + 1</math> to 3, the slot equal to <math>(bo + j \times M1)</math> after the first slot of the received burst</p>
0	0, 1 or 2	<p>Reserve the following slots for the source to broadcast:</p> <p>for <math>j</math> equal to 1 to <math>bt</math>, the slot equal to <math>(j \times M1)</math> after the first slot of the received burst</p> <p>Thereafter, terminate the reservations.</p>
Any	3	<p>Reserve the following slots for the destination to broadcast:</p> <p>for <math>j</math> equal to 1 to <math>bt</math>, the slot equal to <math>(j \times M1)</math> after the first slot of the received burst</p>

Requirement reference	
5.2.17.4.3	If the re-broadcast offset (roff) is not equal to the block start (bs), the station shall carry out the actions specified in table 5.39c.
NOTE:	The actions in table 5.39c are carried out if a ground station wishes to re-broadcast the block message via a mobile.

**Table 5.39c: Action on receipt of a superframe block reservation burst if roff is not equal to bs**

Re-broadcast offset (roff)	Block offset (bo)	Block timeout (bt)	Action
roff < 2	Any	Any	Invalid
roff ≥ 2	Any except 0	0, 1, 2	Reserve the following slots for the destination to broadcast:  if bt = 1 or 2 then for j equal to 0 to bt, the slot equal to (roff + j × M1) after the first slot of the received burst  AND  for j equal to bt + 1 to 3, the slot equal to (roff + bo + j × M1) after the first slot of the received burst
roff ≥ 2	0	0, 1 or 2	Reserve the following slots for the destination to broadcast:  for j equal to 0 to bt, the slot equal to (roff + j × M1) after the first slot of the received burst  Thereafter, terminate the reservations.
roff ≥ 2	Any	3	Reserve the following slots for the destination to broadcast:  for j equal to 0 to bt, the slot equal to (roff + j × M1) after the first slot of the received burst

### 5.2.17.5 Second frame block reservation parameters

Requirement reference	
5.2.17.5.1	The VSS user shall provide a value for the parameter TV61, defined in table 5.40, for which the default values are not desired.

**Table 5.40: Second frame block reservation parameters**

Symbol	Parameter Name	Minimum	Maximum	Default	Increment
TV61	Second frame block reservation timeout	1 superframe	60 superframes	4 superframes	1 superframe
V66	Second frame block size	0	31	8	1
V67	Second frame block repeat rate	0	60	3	See table 5.28 for allowed values

Requirement reference	
5.2.17.5.2	Void
<b>Timer TV61 (second frame block reservation timeout)</b>	
5.2.17.5.3	The timer TV61 shall control the time which a second frame block reservation is valid.
5.2.17.5.3a	When timer TV61 times out, the mobile station shall return to the initial state defined in table 5.40
<b>Parameter V66 (second frame block size)</b>	
5.2.17.5.4	Parameter V66 shall be the size of the second frame block.
<b>Parameter V67 (second frame block repeat rate)</b>	
5.2.17.5.5	Parameter V67 shall be number of times per M1 slots that a second frame reservation transmission is repeated encoded as defined in table 5.28.

### 5.2.17.6 Second frame block reservation reception procedures

Requirement reference	
5.2.17.6.1	Upon receipt of a burst containing a second frame block reservation, the station shall update its reservation table by reserving the first sz slots of every UTC second and set the timer TV61.

### 5.2.17.7 Void

### 5.2.17.8 Procedures for responding to a rebroadcast request for superframe block reservation

Requirement reference	
5.2.17.8.1	On receipt of a superframe block reservation directed to itself, station B shall transmit a superframe block reservation in the directed slot.
5.2.17.8.2	The station shall set the block repeat rate (br), block offset (bo) and block timeout (bt) subfields to the values contained in the received burst.
5.2.17.8.3	The station shall set the block start (bs) so as to indicate the same first slot of the first block as was directed in the received superframe block reservation, calculated relative to the first slot of the transmission.
5.2.17.8.4	The station shall set the re-broadcast offset (roff) subfield equal to the block start (bs) subfield and shall not include a destination subfield.

## 5.2.18 Response protocol specification

### 5.2.18.1 Response burst format

Requirement reference	
5.2.18.1.1	A reservation ID (rid) = 0 with extended reservation ID (erid) = 00000binary with reservation fields set in accordance with table 5.41 shall indicate a response burst.

**Table 5.41: Response burst reservation bit encoding**

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
destination address (d)	n - 5	d <sub>24</sub>	d <sub>23</sub>	d <sub>22</sub>	d <sub>21</sub>	d <sub>20</sub>	d <sub>19</sub>	d <sub>18</sub>	d <sub>17</sub>
	n - 4	d <sub>16</sub>	d <sub>15</sub>	d <sub>14</sub>	d <sub>13</sub>	d <sub>12</sub>	d <sub>11</sub>	d <sub>10</sub>	d <sub>9</sub>
	n - 3	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>
reservation ID	n - 2	0	0	0	0	0	d <sub>27</sub>	d <sub>26</sub>	d <sub>25</sub>

Requirement reference	
5.2.18.1.2	In the case that the address type field (see clause 5.3.1.2) is equal to 7, bits 1 through 24 of the destination subfield (d) shall be absent.
5.2.18.1.3	In this case the information field shall extend up to the last one octet prior to the CRC.
5.2.18.1.4	Otherwise, the destination subfield (d) shall be the 27-bit address of the destination station (for which the response is addressed).
5.2.18.1.5	In this case the information field shall extend up to the last four octets prior to the CRC.
5.2.18.1.6	No reservation shall be made as a result of receiving a response burst.
5.2.18.1.7	The VSS user shall provide the destination address.

## 5.2.19 General request protocol specification

### 5.2.19.1 General request burst format

Requirement reference	
5.2.19.1.1	To request a peer station to transmit a particular burst, a station shall send the burst described in table 5.42 to the desired destination station.

**Table 5.42: General request bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
	5	r-mi <sub>5</sub>		.....		r-mi <sub>1</sub>	0	0	1
requested message ID (r-mi)	6	x	r-mi <sub>n</sub>			.....			r-mi <sub>2</sub>
VSS user specific parameter (prm)	7 to n - 3					.....			prm <sub>1</sub>
	n - 2	prm <sub>n</sub>				.....			

	.....		Denotes variable length field
--	-------	--	-------------------------------

Requirement reference	
5.2.19.1.2	VSS user-specific parameters shall be encoded starting in the octet following the most significant (high order) bit of the r-mi field.
5.2.19.1.3	Unused bits (x) shall be filled with 0 on transmit and ignored on receive.
5.2.19.1.4	The values of the subfields shall be computed as defined in table 5.43.

**Table 5.43: General request field encoding**

Subfield	Range	Encoding	Notes
requested message ID (r-mi)		See clause 5.2.2.5	
VSS user specific parameter (prm)			This is an optional field defined by the VSS user.

Requirement reference	
5.2.19.1.5	The requested message ID (r-mi) shall define the VSS user, in accordance with table 5.4, which is responsible for handling the request.

### 5.2.19.2 General request procedures

Requirement reference	
	<b>Requester action</b>
5.2.19.2.1	Void.
5.2.19.2.2	Void.
5.2.19.2.3	Void.
	<b>Responder action</b>
5.2.19.2.4	The addressed responder(s) shall respond in the indicated slots with the requested bursts except for the conditions specified in clause 5.2.6.4.
	<b>Exceptional cases</b>
5.2.19.2.5	If the requested function is not supported, the responder shall send a general failure (see clause 1.3.20) with the ok bit set to zero, the requested ID (r-mi) field set to the requested VSS user, the backoff delay (bd) set to FF hex, and the error type (err) set to 00 hex (if that ground station does not support the requested function but other ground stations in the same system could support it).
5.2.19.2.6	If the requested function is supported, but there has been no response in time for transmission in the reserved slot, then the responder shall transmit a general failure (see clause 1.3.20) with the ok bit set to zero, the requested ID and extended ID fields set to the requested VSS user, the backoff delay set to an estimate of when the data will be available, and the error type set to either 7E hex or FE hex.
5.2.19.2.7	Void.
5.2.19.2.8	Void.

### 5.2.20 General response protocol specification

#### 5.2.20.1 General response burst format

Requirement reference	
5.2.20.1.1	A station shall transmit a general response burst (either a General Failure or General Confirm) as defined in table 5.44 with the parameters defined in table 5.45 in response to certain requests from another station as described below.

**Table 5.44: General response bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
confirm/failure flag (ok)	5	ok	1	1	1	0	1	0	1
requested message ID (r-mi)	6	res	r-mi <sub>k</sub>	...					r-mi <sub>1</sub>
backoff delay (bd)	7	bd <sub>8</sub>	bd <sub>7</sub>	bd <sub>6</sub>	bd <sub>5</sub>	bd <sub>4</sub>	bd <sub>3</sub>	bd <sub>2</sub>	bd <sub>1</sub>
error type (err)	8	err <sub>8</sub>	err <sub>7</sub>	err <sub>6</sub>	err <sub>5</sub>	err <sub>4</sub>	err <sub>3</sub>	err <sub>2</sub>	err <sub>1</sub>
VSS user specific parameter (prm)	9 to n - 3	.....							prm <sub>11</sub>
	n - 2	prm <sub>k8</sub>	.....						

	.....		Denotes variable length field
--	-------	--	-------------------------------

**Table 5.45: General response field encoding**

Subfield	Range	Encoding	Notes
confirm/failure flag (ok)		1 = General confirm 0 = General failure	
requested message ID (r-mi)	See clause 5.2.2.4		Can extend into octet 7 for long extended ids.
backoff delay (bd)	0 to 255	integer seconds, FF hex = forever	In seconds, ignore on confirm.
error type (err)	See table 5.46		
VSS user specific parameter (prm)	Defined by the VSS user		

Requirement reference	
5.2.20.1.2	The requested message ID (r-mi) shall indicate the identity of the peer VSS user to which a response is being generated.
5.2.20.1.3	The general response burst shall include one of the following reservation fields: unicast request reservation, information transfer request or response.
5.2.20.1.4	The destination subfield contained in the reservation field shall indicate which VSS user is being responded to.
5.2.20.1.5	The requested message ID (r-mi) shall define the VSS user, in accordance with table 5.4, which is responsible for handling the response.
5.2.20.1.6	If the ok bit is set to 1 (i.e. a General Confirm), and the response does not utilize the parameter field, the information field shall contain the requested message ID (r-mi) subfield only with the remaining parameters omitted.
5.2.20.1.7	If the ok bit is set to 1 and the parameter field is used, then the bd and err fields shall be included and set to 00 hex.
5.2.20.1.8	If the ok bit is set to zero (i.e. a General Failure), then the remaining parameters shall define the reason why the request failed.
5.2.20.1.9	Error type (err) shall be encoded in accordance with table 5.46:
5.2.20.1.10	Error types 00 hex to 7F hex shall apply to the responding station.
5.2.20.1.11	Error types 80 hex to FF hex shall apply to the responding system.

Table 5.46: Error type definition

Cause	Function	Parameter Encoding (prm bits 1 to 8)							
		8	7	6	5	4	3	2	1
00 hex	Unsupported local function. The parameters (defining the protocol options supported) will be filled in when defined.	0	0	0	0	0	0	0	0
01 hex	Out of local resources.	Reserved.							
02 hex	VSS user-specific local error.	Defined by the VSS user.							
03 hex	Terrestrial network not available.	Reserved. Set to zero on transmit, ignore on receipt.							
04 hex	Terrestrial network congestion.								
05 to 7D hex	Reserved.								
7E hex	No response from VSS user.								
7F hex	Other unspecified local reason.								
80 hex	Unsupported global function. The parameters (defining the protocol options supported) will be filled in when defined.	0	0	0	0	0	0	0	0
81 hex	Out of global resources.	Reserved.							
82 hex	VSS user-specific global error.	Defined by the VSS user.							
83 to FC hex	Reserved.	Reserved.							
FD hex	Rejected for internal policy reasons	Set to zero on transmit, ignore on receipt.							
FE hex	No response from VSS user.								
FF hex	Other unspecified system reason.								

## 5.2.20.2 General response procedures

Requirement reference	
5.2.20.2.1	If a reservation has been placed for a response or acknowledgement but the VSS sublayer has not received the response or acknowledgement from the VSS user in time for the scheduled reservation, the station shall send a General Failure (see clause 5.2.20.1.8) with cause code 7E hex or FE hex.
5.2.20.2.2	If a response is received, the VSS shall inform the VSS user.

## 5.3 DLS sublayer

### 5.3.1 Services

#### 5.3.1.1 General

Requirement reference	
5.3.1.1.1	The DLS shall support broadcast and multicast connectionless communications.

#### 5.3.1.2 Data transfer

Requirement reference	
5.3.1.2.1	LME data shall be transferred in the information fields of UDATA data link protocol data units (DLPDUs).
5.3.1.2.2	LME data shall be contained in UCTRL DLPDUs only.

#### 5.3.1.3 Station address encoding

Requirement reference	
	<b>Address type</b>
5.3.1.3.1	The address type field shall be encoded as defined in table 5.47.

**Table 5.47: Address type field encoding**

Bit encoding			Description type	Bits 1 to 24
27	26	25		
0	0	0	Mobile	Non-unique identity
0	0	1	Aircraft	24-bit ICAO address
0	1	0	Ground vehicles	Nationally administered address space
0	1	1	Reserved	Future use
1	0	0	Ground station	ICAO-administered address space
1	0	1	Ground station	ICAO-delegated address space
1	1	0	Reserved	Future use
1	1	1	All stations broadcast	All stations

Requirement reference	
	<b>Non-unique identity address</b>
5.3.1.3.2	Void.
5.3.1.3.2a	A mobile station using the non-unique identity address shall randomly choose a 24-bit address.
5.3.1.3.2b	The non-unique identity address of all zeros shall not be used.
5.3.1.3.2c	The non-unique identity address of all ones shall be used as a destination address for broadcast applications only.
5.3.1.3.2d	All radio units located at a station shall use the same non-unique identity address.
5.3.1.3.2e	If the station detects that another station is using the same random address, it shall stop transmitting on the current address;
5.3.1.3.2f	it shall then randomly select a new address that is not already present in its PECT.
5.3.1.3.2g	It shall used this new address in subsequent transmissions.
5.3.1.3.3	When using VDL Mode 4 for ATS applications, aircraft shall use the unique 24-bit ICAO address
	<b>Aircraft specific address</b>
5.3.1.3.4	The aircraft specific address field shall be the 24-bit ICAO aircraft address.
	<b>ICAO-administered ground station specific addresses</b>
5.3.1.3.5	Void
5.3.1.3.6	Void
	<b>ICAO-delegated ground station specific addresses</b>
5.3.1.3.7	Void
	<b>Broadcast and multicast addresses</b>
5.3.1.3.8	The broadcast and multicast addresses shall be used only as a destination address for UDATA DLPDUs.
	<b>Broadcast and multicast address encoding</b>
5.3.1.3.9	The broadcast and multicast addresses shall be encoded as in table 5.48.

Table 5.48: Broadcast and multicast address encoding

Broadcast destination	Type field	Specific address field
All mobiles that use non-unique addresses	000	All ones
All mobiles	001	All ones
All ground stations of a particular provider	100 or 101, as necessary	Most significant bits: Variable length Provider code Remaining bits: All ones
All ground stations with ICAO-administered addresses	100	All ones
All ground stations	101	All ones
All stations	111	All ones

#### 5.3.1.4 DLS burst formats

Requirement reference	
	<b>UDATA DLPDU encoding</b>
5.3.1.4.1	A DLS station wishing to send a UDATA shall transmit one of the UDATA bursts defined in tables 5.49 to 5.51 with the VSS user supplied QoS and reservation parameters.
5.3.1.4.2	The DLS station shall select between tables 5.49, 5.50, or 5.51 based on the UDATA ID (udid) of the message as defined by table 5.52.
5.3.1.4.3	A DLS station sending a UCTRL shall set ucd to 0 and encode the appropriate ud field to the value of ucid per table 5.52.
5.3.1.4.4	A DLS station sending a UINFO shall set ucd to 1 and encode the appropriate ud field to the value of uinf per table 5.53.

**Table 5.49: One-byte UDATA burst format**

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
Message ID, UDATA ID (ud1)	5	ud1 <sub>5</sub>	ud1 <sub>4</sub>	ud1 <sub>3</sub>	ud1 <sub>2</sub>	ud1 <sub>1</sub>	ucd	1	1
UDATA DLPDU	6	Information field							
	7								
	8								
	9								
	10								

**Table 5.50: Two byte UDATA burst format**

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
Message ID	5	1	1	1	1	0	ucd	1	1
UDATA ID (ud2)	6	ud2 <sub>8</sub>	ud2 <sub>7</sub>	ud2 <sub>6</sub>	ud2 <sub>5</sub>	ud2 <sub>4</sub>	ud2 <sub>3</sub>	ud2 <sub>2</sub>	ud2 <sub>1</sub>
UDATA DLPDU	7	Information field							
	8								
	9								
	10								
	11								

**Table 5.51: Three-byte UDATA burst format**

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
Message ID	5	1	1	1	1	1	ucd	1	1
UDATA ID (ud3)	6	ud3 <sub>16</sub>	ud3 <sub>15</sub>	ud3 <sub>14</sub>	ud3 <sub>13</sub>	ud3 <sub>12</sub>	ud3 <sub>11</sub>	ud3 <sub>10</sub>	ud3 <sub>9</sub>
	7	ud3 <sub>8</sub>	ud3 <sub>7</sub>	ud3 <sub>6</sub>	ud3 <sub>5</sub>	ud3 <sub>4</sub>	ud3 <sub>3</sub>	ud3 <sub>2</sub>	ud3 <sub>1</sub>
UDATA DLPDU	8	Information field							
	9								
	10								
	11								
	12								

NOTE: The UDATA DLPDU field may be up to ND4 octets long.

**Table 5.52: Encoding of the UDATA ID (udid) value**

UDATA ID (udid)	Encoded by
0 to 29	table 5.49, ud1 = udid
30 to 285	table 5.50, ud2 = udid - 30
286 to 65 821	table 5.51, ud3 = udid - 286
NOTE: The UCTRL ID (ucid) subfield, is defined in clause 5.4.2.6	

**Table 5.53: UINFO ID (uinf) assignments**

UINFO ID (uinf)	Assignment
0 to 60 000	Reserved for future use
60 001 to 65 821	Messages reserved for transmission by ground station only and defined by ground station operator

### 5.3.2 DLS system parameters

Requirement reference	
5.3.2.1	The parameters needed by the DLS sublayer shall be as listed in table 5.54.

**Table 5.54: Data link service system parameters**

Symbol	Parameter name	Minimum	Maximum	Default	Increment
ND4	Maximum length of UDATA burst	23 octets	496 octets	271 octets	1 octet

### 5.3.2.1 Parameter ND4 (maximum length of a UDATA burst)

Requirement reference	
5.3.2.1.1	The parameter ND4 shall define the maximum size in octets of a UDATA burst.

## 5.3.3 DLS procedures

### 5.3.3.1 Broadcast

Requirement reference	
5.3.3.1.1	Only UDATA DLPDUs shall be broadcast.
<b>Action on receipt of UDATA DLPDU</b>	
5.3.3.1.2	A station receiving a UDATA DLPDU shall forward the contents of the information field to the DLS user and take no further action.

### 5.3.3.2 DLS not supported

Requirement reference	
5.3.3.2.1	If the responder to a DLS DLPDU other than a UDATA DLPDU does not support the DLS, then it shall transmit a general failure (see clause 5.2.20) with an error type of 80 hex in the slot reserved by the unicast request reservation field contained in the data DLPDU transmission.

### 5.3.3.3 User data packet reception

Requirement reference	
5.3.3.3.1	When a UDATA DLPDU is received without errors from another station, it shall be passed to the service user as a single incoming user data packet.
5.3.3.3.2	Otherwise it shall be discarded.
<b>Unacknowledged DLPDUs</b>	
5.3.3.3.3	UDATA DLPDUs shall be unacknowledged.

### 5.3.3.4 CTRL DLPDU

Requirement reference	
5.3.3.4.1	The CTRL DLPDU shall be used for the LME to establish and maintain links as defined in clause 5.4.

## 5.4 Link Management Entity sublayer

### 5.4.1 Services

Requirement reference	
5.4.1.1	The LME shall support the provision of broadcast services

### 5.4.2 Synchronization burst format

#### 5.4.2.1 General

Requirement reference	
5.4.2.1.1	All VDL Mode 4 stations shall transmit synchronization bursts to support link management.

#### 5.4.2.2 Fixed and variable data fields

Requirement reference	
5.4.2.2.1	The synchronization burst shall consist of two portions: a fixed data field containing information that is sent with each synchronization burst and a variable data field containing additional system management information that does not need to be included in each synchronization burst.

#### 5.4.2.3 Fixed data field format

Requirement reference	
5.4.2.3.1	Stations shall have fixed data fields as defined in table 5.55.

**Table 5.55: Synchronization burst format**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
TCP/SVQ change flag (tqc) baro/geo altitude (b/g) CPR Format even/odd (cprf) navigation integrity category (nic)	5	nic <sub>4</sub>	nic <sub>3</sub>	nic <sub>2</sub>	nic <sub>1</sub>	cprf	b/g	tqc	0
latitude (lat)	6	lat <sub>8</sub>	lat <sub>7</sub>	lat <sub>6</sub>	lat <sub>5</sub>	lat <sub>4</sub>	lat <sub>3</sub>	lat <sub>2</sub>	lat <sub>1</sub>
base altitude (balt)	7	balt <sub>12</sub>	balt <sub>11</sub>	balt <sub>10</sub>	balt <sub>9</sub>	lat <sub>12</sub>	lat <sub>11</sub>	lat <sub>10</sub>	lat <sub>9</sub>
	8	balt <sub>8</sub>	balt <sub>7</sub>	balt <sub>6</sub>	balt <sub>5</sub>	balt <sub>4</sub>	balt <sub>3</sub>	balt <sub>2</sub>	balt <sub>1</sub>
longitude (lon)	9	lon <sub>8</sub>	lon <sub>7</sub>	lon <sub>6</sub>	lon <sub>5</sub>	lon <sub>4</sub>	lon <sub>3</sub>	lon <sub>2</sub>	lon <sub>1</sub>
time figure of merit (tfom)	10	tfom <sub>2</sub>	tfom <sub>1</sub>	lon <sub>14</sub>	lon <sub>13</sub>	lon <sub>12</sub>	lon <sub>11</sub>	lon <sub>10</sub>	lon <sub>9</sub>
data age (da) information field ID (id)	11	da <sub>4</sub>	da <sub>3</sub>	da <sub>2</sub>	da <sub>1</sub>	id <sub>4</sub>	id <sub>3</sub>	id <sub>2</sub>	id <sub>1</sub>
ID extension 1 (id1) ID extension 2 (id2)	12	id1 <sub>4</sub>	id1 <sub>3</sub>	id1 <sub>2</sub>	id1 <sub>1</sub>	id2 <sub>4</sub>	id2 <sub>3</sub>	id2 <sub>2</sub>	id2 <sub>1</sub>
ID extension 3 (id3)	13	id3 <sub>4</sub>	id3 <sub>3</sub>	id3 <sub>2</sub>	id3 <sub>1</sub>	in <sub>k</sub>			
information field (in)	14								
	15								
	16								
	17	in <sub>14</sub>	in <sub>13</sub>	in <sub>12</sub>	in <sub>11</sub>	in <sub>10</sub>	in <sub>9</sub>	in <sub>8</sub>	in <sub>7</sub>
	18	in <sub>6</sub>	in <sub>5</sub>	in <sub>4</sub>	in <sub>3</sub>	in <sub>2</sub>	in <sub>1</sub>		

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1

NOTE: Mobile and ground stations are identified by the address type field in the 27-bit code (see clause 5.3.1.2).

..... Denotes variable length field

Requirement reference	
5.4.2.3.2	The subfields shall be computed as defined in table 5.56.

**Table 5.56: Synchronization burst field encoding (fixed data field)**

Subfield	Range	Encoding	Notes
TCP/SVQ change flag (tqc)	Boolean	Encoded as described in clause 3.6 of [1] if the message ID (see table 5.4) indicates that the burst is a directed synchronization burst. Otherwise reserved for future definition and set equal to 1.	
time figure of merit (tfom)	0 to 3	0 = primary certified 1 = primary/non-certified 2 = secondary 3 = none of the above	See clause 5.1.4.
navigation integrity category (nic)	0 to 15	See table 5.57 Values 12 to 15 are reserved for future definition	
latitude (lat)	-90 to + 90°	12-bit low-resolution encoding according to the CPR encoding algorithm adapted for VDL Mode 4, as described in clause 5.6	The 12-bit CPR encoding provides position to a resolution of approximately ±140 m, within a segment (patch) of approximately 600 nmi.
longitude (lon)	-180° to + 180°	14-bit low-resolution encoding according to the CPR encoding algorithm adapted for VDL Mode 4, as described in clause 5.6	The 14-bit CPR encoding provides position to a resolution of approximately ±120 m, within a segment (patch) of approximately 600 nmi.
CPR format even/odd	0 to 1	0 = even 1 = odd The CPR flag shall apply to all CPR encoded sub-fields included in the synchronization burst	
base altitude (balt)	0 to 4 095	Base altitude is reported as specified in table 5.58	
baro/geo altitude (b/g)	0 to 1	0 = barometric 1 = geometric	Indicates whether barometric or geometric base altitude is reported.
data age (da)	0 to 15	See table 5.59	
information field ID (id)	0 to 15	As defined by application standards. Some values for the information field ID are pre-reserved and defined in clause 5.4.5	Provides the information field identity contained in the variable data field (see clause 5.4.2.4).
ID extension	0 to 15	See clauses 5.4.2.3.3 to 5.4.2.3.9 below	Provides a means of increasing the number of variable fields that can be accommodated.
information field (in)	-	As defined by application standards	The information field contained in the variable data field (see clause 5.4.2.4).

Requirement reference	
5.4.2.3.3	The information field ID (id) and ID extension (idn) subfields shall provide addresses for information fields (in) as follows:
5.4.2.3.4	1) An information field ID (id) equal to F hex shall indicate that no information field is present.
5.4.2.3.5	2) An information field ID (id) subfield equal to 0 hex to 9 hex or B hex to E hex shall indicate one of 14 information fields of length 54 bits.
5.4.2.3.6	3) ID extension 1 (id1) subfield shall only be present if the information field ID (id) is equal to A hex.
5.4.2.3.7	4) An ID extension 1 (id1) subfield equal to 0 hex to 9 hex or B hex to F hex shall indicate one of 15 information fields of length 50 bits.
5.4.2.3.8	5) ID extension n (idn) subfield shall only be present if the ID extension n - 1 (idn - 1) subfield is equal to A hex.
5.4.2.3.9	An ID extension n (idn) subfield equal to 0 hex to 9 hex or B hex to F hex shall indicate one of 15 information fields of length 54 - 4n bits.
5.4.2.3.10	The station shall encode its navigation integrity (nic) in accordance with table 5.57.

Table 5.57: Encoding of position Navigation Integrity Category (NIC)

NIC	Required Navigation Performance (RNP) class	Horizontal and Vertical containment radius ( $R_c$ )
0	Unknown integrity	$R_c \geq 20$ nmi
1	RNP-10	$R_c < 20$ nmi
2	RNP-4	$R_c < 8$ nmi
3	RNP-2	$R_c < 4$ nmi
4	RNP-1	$R_c < 2$ nmi
5	RNP-0,5	$R_c < 1$ nmi
6	RNP-0,3	$R_c < 0,6$ nmi
7	RNP-0,1	$R_c < 0,2$ nmi
8	RNP-0,05	$R_c < 0,1$ nmi
9	Undefined	$R_c < 75$ m
10	Undefined	$R_c < 25$ m
11	Undefined	$R_c < 7,5$ m
12	Reserved for future definition	
13	Reserved for future definition	
14	Reserved for future definition	
15	Reserved for future definition	

Requirement reference	
5.4.2.3.11	The station shall encode base altitude in accordance with table 5.58.

Table 5.58: Base altitude encoding

Actual base altitude of transmitting station (feet)	Transmitted value of altitude	Decoded base altitude (feet) (geo = WGS84 height except as noted)
Unknown	0	altitude unknown
altitude < -1 305	1	less than -1 300
-1 305 ≤ altitude < -1 295	2	-1 300
-1 295 ≤ altitude < -1 285	3	-1 290
↓	↓	↓
-15 ≤ altitude < -5	131	-10
-5 ≤ altitude < 5	132	0
5 ≤ altitude < 15	133	10
↓	↓	↓
7 995 ≤ altitude < 8 005	932	8 000
8 005 ≤ altitude < 8 015	933	8 010
8 015 ≤ altitude < 8 037,5	934	8 025
8 037,5 ≤ altitude < 8 062,5	935	8 050
8 062,5 ≤ altitude < 8 087,5	936	8 075
↓	↓	↓
71 912,5 ≤ altitude < 71 950	3 490	71 925
71 950 ≤ altitude < 72 050	3 491	72 000
72 050 ≤ altitude < 72 150	3 492	72 100
72 050 ≤ altitude < 72 250	3 493	72 200
72 250 ≤ altitude < 72 350	3 494	72 300
72 350 ≤ altitude < 72 450	3 495	72 400
↓	↓	↓
129 950 ≤ altitude < 130 050	4 072	130 000
130 050 ≤ altitude	4 073	more than or equal to 130 100
	4 074 to 4 094	reserved
station on ground	4 095	station at 0 AGL

Requirement reference	
5.4.2.3.12	The data age (da) subfield shall be encoded based on the report latency which shall be the difference between the time of validity of the horizontal position data (latitude and longitude) and the time of transmission, in accordance with table 5.59.

Table 5.59: Report latency encoding and decoding

Report latency (ms)	Transmitted value of data age (da)	Decoded latency (ms)
difference < 100	0	50
100 ≤ difference < 200	1	150
200 ≤ difference < 300	2	250
↓	↓	↓
900 ≤ difference < 1 000	9	950
1 000 ≤ difference < 1 200	10	1 100
1 200 ≤ difference < 1 500	11	1 350
1 500 ≤ difference < 2 000	12	1 750
2 000 ≤ difference < 3 000	13	2 500
3 000 ≤ difference < 4 000	14	3 500
4 000 ≤ difference or unknown	15	unknown

Requirement reference	
5.4.2.3.13	If the report latency is greater than 4 s, then nic shall be set to 0.

## 5.4.2.4 Variable data field format

Requirement reference	
5.4.2.4.1	The variable data field shall be available to carry additional information as may be required by another VSS user or application.
5.4.2.4.2	The content and format of the variable data field shall be identified by the information field ID (id).
5.4.2.4.3	The format of the variable data field corresponding to a given id shall be as specified in the appropriate application standard.

## 5.4.2.5 Synchronization burst request

Requirement reference	
5.4.2.5.1	To request that a station transmit a synchronization burst with a specific information field, a station shall transmit a general request burst to the appropriate application process (see clause 5.4.5.2).

## 5.4.2.6 Broadcast link management burst

Requirement reference	
5.4.2.6.1	Broadcast link management data shall be contained within the information field of a UCTRL DLPDU as defined in table 5.60.

Table 5.60: UCTRL DLPDU burst format

Description	Octet	Bit Number							
		8	7	6	5	4	3	2	1
UCTRL DLPDU header	n	ucid <sub>5</sub>	ucid <sub>4</sub>	ucid <sub>3</sub>	ucid <sub>2</sub>	ucid <sub>1</sub>	1	0	0
CTRL parameter 1: Parameter ID	n+1	id <sub>8</sub>	id <sub>7</sub>	id <sub>6</sub>	id <sub>5</sub>	id <sub>4</sub>	id <sub>3</sub>	id <sub>2</sub>	id <sub>1</sub>
Parameter length	n+2	lg <sub>8</sub>	lg <sub>7</sub>	lg <sub>6</sub>	lg <sub>5</sub>	lg <sub>4</sub>	lg <sub>3</sub>	lg <sub>2</sub>	lg <sub>1</sub>
Parameter value	n+3	q1 <sub>8</sub>	q1 <sub>7</sub>	q1 <sub>6</sub>	q1 <sub>5</sub>	q1 <sub>4</sub>	q1 <sub>3</sub>	q1 <sub>2</sub>	q1 <sub>1</sub>
	to	to							
	n+2 + lg	qlg <sub>8</sub>	qlg <sub>7</sub>	qlg <sub>6</sub>	qlg <sub>5</sub>	qlg <sub>4</sub>	qlg <sub>3</sub>	qlg <sub>2</sub>	qlg <sub>1</sub>
		more CTRL parameters							

Requirement reference	
5.4.2.6.2	ucid = 0 shall indicate that the UCTRL DLPDU is a GSIF containing any of the CTRL parameters defined in clause 5.4.3.
5.4.2.6.3	ucid = 1 shall indicate that the UCTRL DLPDU is a GSIF containing a CTRL DOS parameter only as defined in clause 5.4.3.
5.4.2.6.4	ucid = 5 to 31 are currently unassigned and available for future definition.

### 5.4.3 Control (CTRL) parameter formats

#### 5.4.3.1 Encoding

Requirement reference	
5.4.3.1.1	The CTRL parameters described in this section shall be included in the user data field of UCTRL DLPDUs.
5.4.3.1.2	Except for parameter ID00 (which must appear last), the parameters in a CTRL DLPDU shall be listed in non-decreasing numeric order.

#### 5.4.3.2 VDL Mode 4 parameter identification

Requirement reference	
5.4.3.2.1	Bits 7 and 8 of the parameter ID field shall allow simple identification of the purpose of the parameter as defined in table 5.61.

**Table 5.61: VDL Mode 4 parameter identifier purpose**

Bit 8	Bit 7	Purpose
0	0	General purpose information parameter
0	1	Ground-initiated modification parameter
1	0	Mobile-initiated information parameter
1	1	Ground-initiated information parameter

#### 5.4.3.3 Ground-initiated modification parameters

Requirement reference	
5.4.3.3.1	A ground LME shall use the ground-initiated modification parameters to change the value of various parameters in one or more mobiles.
5.4.3.3.1a	Mobile LMEs shall not send a CTRL containing these parameters.
	<b>VSS sublayer parameter</b>
5.4.3.3.2	This parameter defines the value of VS1, VS2, VS4 and VS5 that a mobile shall use, encoded as per table 5.62.

**Table 5.62: VSS sublayer parameter encoding**

Field	Bit position								Notes
Parameter ID	0	1	0	0	0	0	0	1	VSS sublayer parameter
Parameter length	0	0	0	0	0	0	1	1	
Parameter value	VS5 4	VS5 3	VS5 2	VS5 1	VS1 4	VS1 3	VS1 2	VS1 1	VS1, VS5 (dB)
	0	0	VS2 6	VS2 5	VS2 4	VS2 3	VS2 2	VS2 1	VS2 (nmi)
	0	VS4 7	VS4 6	VS4 5	VS4 4	VS4 3	VS4 2	VS4 1	VS4

Requirement reference	
	<b>Quality of service parameter</b>
5.4.3.3.3	This parameter defines the quality of service parameters that a mobile shall use for priority levels Q1min to Q1max, encoded as per table 5.63.

**Table 5.63: Quality of service parameter encoding**

Field	Bit position								Notes
Parameter ID	0	1	0	0	0	0	1	0	Quality of Service parameter
Parameter length	lg <sub>8</sub>	lg <sub>7</sub>	lg <sub>6</sub>	lg <sub>5</sub>	lg <sub>4</sub>	lg <sub>3</sub>	lg <sub>2</sub>	lg <sub>1</sub>	
Parameter value	Q1max <sub>4</sub>	Q1max <sub>3</sub>	Q1max <sub>2</sub>	Q1max <sub>1</sub>	Q1min <sub>4</sub>	Q1min <sub>3</sub>	Q1min <sub>2</sub>	Q1min <sub>1</sub>	
	Q2a <sub>8</sub>	Q2a <sub>7</sub>	Q2a <sub>6</sub>	Q2a <sub>5</sub>	Q2a <sub>4</sub>	Q2a <sub>3</sub>	Q2a <sub>2</sub>	Q2a <sub>1</sub>	Q2a (nmi)
	Q2b <sub>8</sub>	Q2b <sub>7</sub>	Q2b <sub>6</sub>	Q2b <sub>5</sub>	Q2b <sub>4</sub>	Q2b <sub>3</sub>	Q2b <sub>2</sub>	Q2b <sub>1</sub>	Q2b (nmi)
	Q2c <sub>8</sub>	Q2c <sub>7</sub>	Q2c <sub>6</sub>	Q2c <sub>5</sub>	Q2c <sub>4</sub>	Q2c <sub>3</sub>	Q2c <sub>2</sub>	Q2c <sub>1</sub>	Q2c (nmi)
	Q2d <sub>8</sub>	Q2d <sub>7</sub>	Q2d <sub>6</sub>	Q2d <sub>5</sub>	Q2d <sub>4</sub>	Q2d <sub>3</sub>	Q2d <sub>2</sub>	Q2d <sub>1</sub>	Q2d (nmi)
	Q2d <sub>10</sub>	Q2d <sub>9</sub>	Q2c <sub>10</sub>	Q2c <sub>9</sub>	Q2b <sub>10</sub>	Q2b <sub>9</sub>	Q2a <sub>10</sub>	Q2a <sub>9</sub>	
	0	0	0	Q4 <sub>5</sub>	Q4 <sub>4</sub>	Q4 <sub>3</sub>	Q4 <sub>2</sub>	Q4 <sub>1</sub>	Q4

Requirement reference	
	<b>m2 filter parameters</b>
5.4.3.3.4	table 5.64 shall define the encoding of parameters for the m2 filter [1] to be used by a mobile.

**Table 5.64: m2 filter parameter encoding**

Field	Bit position								Notes
Parameter ID	0	1	0	0	0	0	1	1	m2 filter parameters
Parameter length	0	0	0	0	0	0	1	1	
M2inc parameter value	i <sub>8</sub>	i <sub>7</sub>	i <sub>6</sub>	i <sub>5</sub>	i <sub>4</sub>	i <sub>3</sub>	i <sub>2</sub>	i <sub>1</sub>	M2inc
M2limit parameter value	l <sub>16</sub>	l <sub>15</sub>	l <sub>14</sub>	l <sub>13</sub>	l <sub>12</sub>	l <sub>11</sub>	l <sub>10</sub>	l <sub>9</sub>	M2limit
	l <sub>8</sub>	l <sub>7</sub>	l <sub>6</sub>	l <sub>5</sub>	l <sub>4</sub>	l <sub>3</sub>	l <sub>2</sub>	l <sub>1</sub>	

Requirement reference	
5.4.3.3.5	M2inc shall be encoded as an 8-bit unsigned integer.
5.4.3.3.6	M2limit shall be encoded as a 16-bit unsigned integer.
	<b>CG1 filter parameters</b>
5.4.3.3.7	The values of parameters used by mobiles for the CG1 [1] filter shall be as defined in table 5.65.
5.4.3.3.8	CG1_plea shall be encoded as an 8-bit unsigned integer.
5.4.3.3.9	CG1_range shall be encoded as an 8-bit unsigned integer.
5.4.3.3.10	TL4 shall be encoded as an 8-bit unsigned integer.
5.4.3.3.11	CG1_inc shall be encoded as an 8-bit unsigned integer.
5.4.3.3.12	1/CG1_decay shall be encoded as an 8-bit unsigned integer.
5.4.3.3.13	CG1_limit shall be encoded as a 16-bit unsigned integer.

**Table 5.65: CG1 filter parameter encoding**

Field	Bit position								Notes
Parameter ID	0	1	0	0	0	1	0	0	CG1 filter parameters
Parameter length	0	0	0	0	0	1	1	1	
CG1_plea parameter value	p <sub>8</sub>	p <sub>7</sub>	p <sub>6</sub>	p <sub>5</sub>	p <sub>4</sub>	p <sub>3</sub>	p <sub>2</sub>	p <sub>1</sub>	CG1_plea
CG1_range parameter value	r <sub>8</sub>	r <sub>7</sub>	r <sub>6</sub>	r <sub>5</sub>	r <sub>4</sub>	r <sub>3</sub>	r <sub>2</sub>	r <sub>1</sub>	CG1_range
TL4 parameter value	t <sub>8</sub>	t <sub>7</sub>	t <sub>6</sub>	t <sub>5</sub>	t <sub>4</sub>	t <sub>3</sub>	t <sub>2</sub>	t <sub>1</sub>	TL4
CG1_limit parameter value	l <sub>16</sub>	l <sub>15</sub>	l <sub>14</sub>	l <sub>13</sub>	l <sub>12</sub>	l <sub>11</sub>	l <sub>10</sub>	l <sub>9</sub>	CG1_limit
	l <sub>8</sub>	l <sub>7</sub>	l <sub>6</sub>	l <sub>5</sub>	l <sub>4</sub>	l <sub>3</sub>	l <sub>2</sub>	l <sub>1</sub>	

Field	Bit position								Notes
CG1_inc parameter value	i <sub>8</sub>	i <sub>7</sub>	i <sub>6</sub>	i <sub>5</sub>	i <sub>4</sub>	i <sub>3</sub>	i <sub>2</sub>	i <sub>1</sub>	CG1_inc
1/CG1_decay parameter value	d <sub>8</sub>	d <sub>7</sub>	d <sub>6</sub>	d <sub>5</sub>	d <sub>4</sub>	d <sub>3</sub>	d <sub>2</sub>	d <sub>1</sub>	1/CG1_decay

Requirement reference	
	<b>Random access parameter</b>
5.4.3.3.14	The random access parameter shall define p, VS3 and TM2 used within the random access protocol, encoded as per table 5.66 NOTE: p is encoded as hexadecimal 00 (= decimal 1 / 256) to hexadecimal FF (= decimal 256 / 256).

Table 5.66: Random access parameter encoding

Field	Bit position								Notes
Parameter ID	0	1	0	0	1	0	0	0	Random access parameter encoding
Parameter length	0	0	0	0	0	1	0	0	
Parameter value	p <sub>8</sub>	p <sub>7</sub>	p <sub>6</sub>	p <sub>5</sub>	p <sub>4</sub>	p <sub>3</sub>	p <sub>2</sub>	p <sub>1</sub>	p
	VS3 <sub>8</sub>	VS3 <sub>7</sub>	VS3 <sub>6</sub>	VS3 <sub>5</sub>	VS3 <sub>4</sub>	VS3 <sub>3</sub>	VS3 <sub>2</sub>	VS3 <sub>1</sub>	
	VS3 <sub>16</sub>	VS3 <sub>15</sub>	VS3 <sub>14</sub>	VS3 <sub>13</sub>	VS3 <sub>12</sub>	VS3 <sub>11</sub>	VS3 <sub>10</sub>	VS3 <sub>9</sub>	
	TM2 <sub>8</sub>	TM2 <sub>7</sub>	TM2 <sub>6</sub>	TM2 <sub>5</sub>	TM2 <sub>4</sub>	TM2 <sub>3</sub>	TM2 <sub>2</sub>	TM2 <sub>1</sub>	

#### 5.4.3.4 Ground-initiated information parameters

Requirement reference	
5.4.3.4.1	A ground LME shall use ground initiated information parameters to inform one or more mobile LMEs about that ground-based system's capabilities.
5.4.3.4.1a	Mobile LMEs shall not send these parameters.
	<b>Directory of Service (DOS) parameter</b>
5.4.3.4.2	The Directory of Service parameter shall be encoded as defined in table 5.67.

Table 5.67: Directory of service message encoding

Field	Bit position								Notes
parameter value	8	7	6	5	4	3	2	1	
	gsc	ai <sub>3</sub>	ai <sub>2</sub>	ai <sub>1</sub>	ent <sub>4</sub>	ent <sub>3</sub>	ent <sub>2</sub>	ent <sub>1</sub>	entry number (ent), <b>current channel subfield</b> additional service info (ai); GSC flag (gsc)
	si <sub>8</sub>	si <sub>7</sub>	si <sub>6</sub>	si <sub>5</sub>	si <sub>4</sub>	si <sub>3</sub>	si <sub>2</sub>	si <sub>1</sub>	service information (si)
	res	res	res	res	anum <sub>4</sub>	anum <sub>3</sub>	anum <sub>2</sub>	anum <sub>1</sub>	application number (anum) res field absent if anum field is absent.
	a <sub>18</sub>	a <sub>17</sub>	a <sub>16</sub>	a <sub>15</sub>	a <sub>14</sub>	a <sub>13</sub>	a <sub>12</sub>	a <sub>11</sub>	application 1 (a <sub>1</sub> )
					to				
	a <sub>k8</sub>	a <sub>k7</sub>	a <sub>k6</sub>	a <sub>k5</sub>	a <sub>k4</sub>	a <sub>k3</sub>	a <sub>k2</sub>	a <sub>k1</sub>	application k (a <sub>k</sub> )
	gsc	ai <sub>3</sub>	ai <sub>2</sub>	ai <sub>1</sub>	f <sub>12</sub>	f <sub>11</sub>	f <sub>10</sub>	f <sub>9</sub>	<b>channel subfield:</b> additional service info (ai); GSC flag (gsc)
	f <sub>8</sub>	f <sub>7</sub>	f <sub>6</sub>	f <sub>5</sub>	f <sub>4</sub>	f <sub>3</sub>	f <sub>2</sub>	f <sub>1</sub>	frequency (f)
	si <sub>8</sub>	si <sub>7</sub>	si <sub>6</sub>	si <sub>5</sub>	si <sub>4</sub>	si <sub>3</sub>	si <sub>2</sub>	si <sub>1</sub>	service information (si)
	res	res	res	res	anum <sub>4</sub>	anum <sub>3</sub>	anum <sub>2</sub>	anum <sub>1</sub>	application number (anum)

Field	Bit position								Notes
	a <sub>18</sub>	a <sub>17</sub>	a <sub>16</sub>	a <sub>15</sub>	a <sub>14</sub>	a <sub>13</sub>	a <sub>12</sub>	a <sub>11</sub>	application 1 (a <sub>1</sub> )
					to				
	a <sub>k8</sub>	a <sub>k7</sub>	a <sub>k6</sub>	a <sub>k5</sub>	a <sub>k4</sub>	a <sub>k3</sub>	a <sub>k2</sub>	a <sub>k1</sub>	application k (a <sub>k</sub> )
	sit <sub>6</sub>	sit <sub>5</sub>	sit <sub>4</sub>	sit <sub>3</sub>	sit <sub>2</sub>	sit <sub>1</sub>	x	x	service information type (sit)

NOTE: Bits denoted "x" may be used within the reservation field.

Requirement reference	
5.4.3.4.3	If the DOS parameter is included within a UCTRL DLPDU with the ucid subfield set to 1, then the DOS parameter ID and parameter length shall be omitted and no other parameter included in the UCTRL.
5.4.3.4.4	The current channel subfield shall always be present.
5.4.3.4.5	One, two, or more other channel subfields (channel 1, channel 2 etc) shall be added as required in a continuous bit sequence.
5.4.3.4.6	The contents of the channel subfields shall be determined by the ai subfield as defined in table 5.68.

**Table 5.68: Directory of service message subfield encoding**

Subfield	Range	Encoding	Notes
entry number (ent)	0 to 15	ent = entry number of Directory of Services message.	up to 16 different DOS messages can be accommodated associated with each ground station transmitting DOS messages.
frequency (f)		See table 5.26  Absent in current channel subfield.	indicates the channel on which the DOS service is provided.
GSC flag (gsc)	0 to 1	set to 1 if channel is a GSC	
additional service information (ai)	0 to 7	bit 1: set to 1 if si field included bit 2: set to 1 if anum field present. bit 3: set to 1 if application (a) subfield(s) present.	
service information type (sit)	0 to 63	Defines services indicated by each bit in the service information field.  As defined by application standards.	
service information (si)	Contains 8 single bit flags	Bits indicate the services provided on the indicated channel.  bit set if service is available.  Meaning of bits defined by application standards.  field absent if ai bit 1 = 0.	
application number (anum)	0 to 15	Indicates the number of application fields present.  field absent if ai bit 2 = 0.	
application (a)	0 to 255	Identifies a single service defined by application standards  field absent if ai bit 3 = 0  if ai bit 1 = 0 and ai bit 2 ≠ 0, only one application subfield shall be present.	

Requirement reference	
5.4.3.4.7	The service information type (sit) subfield shall follow the last channel subfield.
5.4.3.4.8	The subfields within each channel subfield shall be computed as defined in table 5.68.
5.4.3.4.9	Each DOS parameter shall override any previous DOS parameter from the same ground station with the same entry number (ent).
5.4.3.4.10	The upper bit of the application field shall be used as an extension field, so that a 0 indicates a one octet field and a 1 indicates that the ID continues in the next octet.
5.4.3.4.11	Application fields shall be allocated as defined in table 5.69.

Table 5.69: Allocation of application fields

Encoding (decimal equivalent)	Allocation
0 to 3	defined for broadcast services [9]
4 to 31	reserved for future allocation by ICAO
32 to 63	reserved for private allocation by service provider
64 to 127	reserved for future allocation by ICAO delegated authority
128 to 255	reserved for future use (extension of application field)

Requirement reference	
5.4.3.4.12	Service information type (sit) fields shall be allocated as defined in table 5.70.

Table 5.70: Allocation of service information type fields

Encoding (decimal equivalent)	Allocation
0 to 3	defined for broadcast services [9]
4 to 31	reserved for future allocation by ICAO
32 to 47	reserved for private allocation by service provider
48 to 63	reserved for future allocation by ICAO delegated authority

## 5.4.4 LME procedures

### 5.4.4.1 Synchronization burst procedures

Requirement reference	
5.4.4.1.1	All stations shall transmit the appropriate synchronization burst defined in clause 5.4.2 depending on whether it is a mobile station or a ground station.
5.4.4.1.2	If the synchronization burst is transmitted with a periodic broadcast protocol, it shall use default QoS parameters except as defined in table 5.71.
5.4.4.1.3	If the synchronization burst is not transmitted with a periodic broadcast protocol, slot selection shall use the default QoS parameters defined for the selected reservation protocol or user supplied QoS parameters.

Table 5.71: Synchronization burst parameters

Symbol	Parameter name	Default
V11	Nominal periodic rate	6
Q1	Priority	14
Q2a	Slot selection range constraint for level 1	380 nmi
Q2b	Slot selection range constraint for level 2	380 nmi
Q2c	Slot selection range constraint for level 3	0 nmi
Q2d	Slot selection range constraint for level 4	380 nmi
Q3	Replace queued data	TRUE

Requirement reference	
5.4.4.1.4	The values of the subfields shall be the latest available data that can be obtained by the station at the start of the slot that is two slots before the first slot of the intended transmission.
5.4.4.1.5	Where time is used to calculate fields in the transmission, it shall be the time associated with the latitude and longitude data contained in the transmission.
<b>Transmission of synchronization bursts supporting applications</b>	
5.4.4.1.6	A station shall transmit synchronization bursts in accordance with a request from a peer station as described in clause 5.4.2.5, at the specified rate, and containing the information field corresponding to the requested information field ID (r-id).
5.4.4.1.6a	The station shall transmit additional synchronization bursts required to meet the demands of any application.
5.4.4.1.6b	In the event that an application request requiring the transmission of synchronization bursts is delivered by means of a directed request, the required bursts shall be transmitted in the slots reserved by the directed request protocol.
<b>Mobile stations.</b>	
5.4.4.1.6c	Whenever a mobile station is not directed to transmit synchronization bursts on any frequency, it shall transmit mobile synchronization bursts at least once per M1 slots on all GSCs which it can receive.
5.4.4.1.6d	When transmitting autonomously on the GSCs, a mobile station shall use the standard parameters defined in table 5.56.
<b>Ground stations</b>	
<b>Recommendation</b>	
5.4.4.1.7	Void
<b>Procedures for conflict resolution</b>	
5.4.4.1.8	For the purposes of assessing whether another reservation conflicts with a reservation for a synchronization burst, the station shall apply the procedures defined in clause 5.2.6.4.
5.4.4.1.9	In this case, the quality of service parameters defined in table 5.72 or user supplied parameters shall be applied to the synchronization burst reservation.

Table 5.72: Synchronization burst parameters for conflict resolution

Symbol	Parameter name	Value
Q1	Priority	As per information field
Q2a	Slot selection range constraint for level 1	360 nmi
Q2b	Slot selection range constraint for level 2	360 nmi
Q2c	Slot selection range constraint for level 3	360 nmi
Q2d	Slot selection range constraint for level 4	360 nmi

#### 5.4.4.2 Peer entity contact table (PECT)

Requirement reference	
5.4.4.2.1	Every station shall maintain a table of all known stations.
5.4.4.2.2	For each station, the table shall include the type of the station, a copy of the last of each type of broadcast burst, the time of the last transmission and a L1 counter.
5.4.4.2.3	The ability to reach a peer station shall be assumed lost after L1 missed reservations.

#### 5.4.4.3 Network entry protocol specifications

Requirement reference	
<b>Network entry parameters</b>	
5.4.4.3.a	The network entry protocol shall implement the system parameters defined in table 5.7.2a.

Table 5.72a: Plea parameters

Symbol	Parameter name	Minimum	Maximum	Recommended default	Increment
CG1_plea	Minimum pool size of peer stations for plea	1	256	2	1
CG1_range	Range limit used in digital filter for "exposure" determination	0 NM	255 NM	100 NM	1 NM
TG6	Maximum delay for plea response	0,1 s	16 s	2 s	0,1 sec
CG1_limit	Digital filter threshold which triggers network entry due to station being "exposed"	1	65 536	2 000	1
CG1_inc	Digital filter increment when a synchronization burst from a previously unknown station is detected	1	256	max{min[5 × (V11-1), 256], 1}	1
CG1_decay	Decay rate for CG1 filter	1 / 256	1	247 / 256	0
CG1_reach	Maximum unreachability time	1 min	15 min	3 min	1 min
TL6	Minimum time delay for CG1 filter	1 slot	255 slots	75 slots	1 slot

Requirement reference	
	<b>Parameter CG1_plea (minimum pool size of peer stations for plea).</b>
5.4.4.3.b	CG1_plea shall define the minimum number of viable peer stations which must be identified before a plea can be issued.
5.4.4.3.c	The plea target shall be selected uniformly from a set of CG1_plea viable peer stations.
	<b>Parameter CG1_range (maximum range for exposure filter).</b>
5.4.4.3.d	CG1_range shall define the threshold beyond which newly-identified peer stations are disregarded for purposes of determining "exposure".

Requirement reference	
	<b>Parameter TL4 (maximum delay for plea response)</b>
5.4.4.3.1	TL4 shall specify the maximum allowed time interval between receiving a plea and transmitting a plea response.
5.4.4.3.2	A station receiving a plea shall attempt to respond as quickly as possible.
5.4.4.3.3	If a response cannot be generated in TL4 s, the station shall purge the plea and not respond.
	<b>Parameter CG1_limit (exposure filter threshold).</b>
5.4.4.3.3a	When CG1 is greater than or equal to CG1_limit, the station shall consider itself "exposed" (i.e., it has recently detected a large number of users which were not previously in its PECT, indicating that its reservation table may be incomplete).
5.4.4.3.3b	Consistent with the requirements of clause 1.5.6.3 [1], the station shall then reset CG1 = 0, and perform network entry, on the affected channel.
	<b>Parameter CG1_inc (exposure filter unknown station increment).</b>
5.4.4.3.3c	CG1_inc shall be the value by which CG1 is incremented each time a station which has been unreachable for at least CG1_reach minutes or a previously unknown peer station is detected with a station-to-station range less than or equal to CG1_range, or with station-to-station range which is indeterminate.
	<b>Parameter CG1_decay (decay rate for CG1 filter).</b>
5.4.4.3.3d	CG1_decay shall be the per second decay rate for CG1.
	<b>Recommendation.</b>
5.4.4.3.3e	CG1_decay should be selected such that CG1 represents an approximate metric for the uncertainty in reservation information associated with newly detected stations.
	<b>Parameter CG1_reach</b>
5.4.4.3.3f	CG1_reach shall be the maximum allowed time between two successfully received transmissions from a peer station without increasing the CG1 filter in accordance with the procedures defined in table 5.72b.

**Table 5.72b: Asynchronous events affecting value of management filter CG1**

Events	Values of CG1
Station detects a synchronization burst from a station which has been unreachable on the channel for at least CG1_reach minutes or from a previously unknown station at a station-to-station range which can either be calculated as less than CG1_range or is indeterminate.	$CG1_{new} = CG1_{old} + CG1_{inc}$
Station detects a synchronization burst from a station which has been unreachable on the channel for less than CG1_reach minutes or from a previously unknown station at a station-to-station range which can be calculated as greater or equal to CG1_range.	$CG1_{new} = CG1_{old}$
Once per second.	$CG1_{new} = \text{truncate}(CG1_{old} \times CG1_{decay})$

Requirement reference	
	<b>Parameter TL5 ( minimum time delay for plea).</b>
5.4.4.3.3g	TL5 shall be the minimum time delay, measured in slot intervals, between the initiation of network entry procedures and the issuance of the first plea on the channel, and also the retry interval between successive examinations of the pool of viable peer stations for ple1.
5.4.4.3.3h	TL5 shall be set when a station tunes to a new frequency on which it has less than nr reservations for synchronization bursts over the next M1 slots; or, upon expiration, if there are no viable peer stations for the plea.
5.4.4.3.3i	TL5 shall be cleared when the number of reservations for synchronization bursts, over the next M1 slots, equals or exceeds nr; or, when the station has monitored the frequency for M1 slots since the initiation of network entry procedures.
5.4.4.3.3j	Upon expiration of TL5, the station shall transmit a plea if a viable peer station exists.
	<b>Conditions for application of network entry procedures</b>
5.4.4.3.4	Void.
5.4.4.3.4a	When entering the network, a VSS user shall apply at least one of the network entry procedures defined in clauses 5.4.4.3.4e to 5.4.4.3.4o, 5.4.4.3.12b to 5.4.4.3.12i, or 5.4.4.3.13, under any of the conditions identified in table 5.72c, on the indicated channels.

**Table 5.72c: Conditions for network entry**

Condition	Channel(s)
Power ON	Global Signalling Channels (GSCs)
$m2 \geq M2\_limit$	Any channel on which the station intends to transmit synchronization bursts in autonomous mode.
$CG1 \geq CG1\_limit$	Any channel on which the station intends to transmit synchronization bursts in autonomous mode.
NOTE: The m2 test addresses retuning as well as short periods of receiver non-performance for reasons such as receiver deactivation or desensitization in a single-antenna configuration during transmission on another channel.	

Requirement reference	
5.4.4.3.4b	The events affecting the value of the CG1 filter shall be as defined in table 5.72b.
5.4.4.3.4c	If $CG1 \geq CG1\_limit$ , CG1 shall be reset to 0.
5.4.4.3.4d	Following successful application of the network entry procedures of this section on a given channel, yielding (60/nr) reservations, nr = nominal rate, a station shall not re-apply the procedures of this section, on that channel, for a period of M1 slots.
<b>Network entry using plea/response procedures</b>	
<b>Plea transmission procedures.</b>	
5.4.4.3.4e	A station desiring to transmit synchronization bursts on a VDL Mode 4 channel, which has been tuned to the channel for at least TL5 slots but which is prevented from transmission by lack of a valid reservation table, shall identify a set of peer stations S with the highest reported altitudes.
5.4.4.3.4f	The size of S, S_count, shall be defined by $S\_count = \min(\text{number of viable peer stations identified}, CG1\_plea)$
5.4.4.3.4g	A peer station shall be considered viable if it is a mobile station which is known to have transmitted a synchronization burst on the channel on the normal slot boundary with the a/d bit set = 0, or if it is a ground station which is known to have transmitted a synchronization burst on the channel.
5.4.4.3.4h	If S_count is equal to zero, the TL5 timer shall be reset.
5.4.4.3.4i	If S_count is greater than 0, the station shall transmit a plea to a peer station selected randomly from S.
5.4.4.3.4j	The plea shall be transmitted using the response reservation encoding in clause 5.2.18.1 (the destination address bits being set to the address of the selected peer station), with transmission starting on the delayed burst slot boundary of an unoccupied slot.
5.4.4.3.4k	The station shall continue to transmit plea requests, using the Q5 parameters specified in table 5.73, until one of the following conditions is satisfied: a) it receives a plea response directed reservation request; b) it receives an autotune directed reservation request; c) it creates the necessary number of synchronization burst streams for the channel.
5.4.4.3.4l	On each transmission of a plea request, the set S shall be rebuilt and the destination shall be selected randomly from the set.
5.4.4.3.4m	A network entry burst (defined in table 5.3) shall have length $n \leq 11$ octets excluding burst flags and bit stuffing
5.4.4.3.4n	And shall have a priority of 14.
5.4.4.3.4o	The information field, if present, shall be set to 0 on transmit and shall be ignored on receive.
<b>Plea response transmission procedures</b>	
5.4.4.3.5	Upon receiving a network entry burst with a response reservation addressed to itself (i.e. a plea), a station shall take the following actions.
5.4.4.3.6	If the station has observed the given frequency for at least the previous 60 s, and has not initiated a network entry or re-entry procedure within the previous 60 s, it shall transmit a plea response burst as defined in clauses 5.2.16.1.10 to 5.2.16.1.14 containing min (12, number of reservations required to allow one minute of transmissions at the default sync burst rate for this channel) reservations or else if the transmission rate is not known once per 10 s reservations.
5.4.4.3.7	These reservations shall be identified as follows: 1) unexpired reservations from any prior plea response addressed to the requesting station; 2) any periodic reservations for the requesting station, not otherwise contained in a prior plea response and which a) do not conflict with other known reservations, and b) can be appended to a possible list of reservations in accordance with item (1) above (considering the encoding constraints of the plea response); 3) additional reservations as required, using the selection parameters of table 5.73.

Table 5.73: Plea response parameters

Symbol	Parameter name	Default
Q1	Priority	2
Q2a	Slot selection range constraint for level 1	150 nmi
Q2b	Slot selection range constraint for level 2	150 nmi
Q2c	Slot selection range constraint for level 3	0 nmi
Q2d	Slot selection range constraint for level 4	300 nmi
Q3	Replace queued data	TRUE
Q4	Number of available slots	3

Requirement reference	
5.4.4.3.8	Otherwise the station shall ignore the burst.
5.4.4.3.9	If the station cannot transmit the plea response within TL4 s of receiving the plea, the plea response shall be purged and not transmitted.
	<b>Recommendation</b>
5.4.4.3.10	The station should attempt to transmit the plea response as soon as possible following the plea (while still selecting the transmit slot randomly).
5.4.4.3.11	The first reservation contained in the plea response should occur as soon as possible in time following the plea response, but not sooner than V52 slots.
5.4.4.3.12	The station should attempt to reserve slots which are currently unreserved, and which are related to available slots for which the plea recipient can transmit BND reservations
	<b>Plea response reception procedures.</b>
5.4.4.3.12a	A station receiving a plea response shall transmit in the reserved slots.
	<b>Network entry via BND.</b>
5.4.4.3.12b	A station intending to initiate synchronization burst transmissions on a channel, which has insufficient reservations for its intended number of synchronization burst streams, and which cannot make periodic reservations, shall transmit a series of delayed network entry bursts with BND reservations.
5.4.4.3.12c	The number per minute of delayed network entry bursts with BND reservations shall be equal to or less than the intended number of synchronization burst streams per minute.
5.4.4.3.12d	The station shall stop transmitting delayed network entry bursts with a BND reservation if it has set up the required number of streams or it receives a plea response or a directed reservation request.
5.4.4.3.12e	If it receives a plea response or directed reservation request, and thus does not require the reservations created by previous BND transmissions, it shall include a no reservation field in the synchronization bursts transmitted in the unnecessary slots.
5.4.4.3.12f	At most one delayed network entry burst using a BND broadcast reservation shall be made per intended stream.
5.4.4.3.12g	A station which has reservations for synchronization burst transmissions and which intends to continue operations on the channel, but which is unable to make periodic reservations, shall use BND reservations in lieu of periodic reservations.
5.4.4.3.12h	A network entry burst (defined in table 5.3) shall have length $n \leq 11$ octets excluding burst flags and bit stuffing and shall have a priority of 14.
5.4.4.3.12i	The information field, if present, shall be set to 0 on transmit and shall be ignored on receive.
	<b>Network entry by full-slot random transmission</b>
5.4.4.3.13	<p>In the event that a station has listened to a channel for a full minute prior to net entry, a station shall use one of two procedures to begin transmitting synchronization bursts:</p> <ul style="list-style-type: none"> <li>a) use default random transmission protocols with combined periodic/incremental reservation types to place each new periodic reservation and to simultaneously reserve the next selected slot in the same superframe for the transmission containing the next periodic reservation; or</li> <li>b) use default random transmission protocols to transmit a plea response addressed to itself, followed by synchronization bursts with periodic reservations in the reserved slots.</li> </ul> <p>NOTE: these may be affected by other reservations detected after transmission of the plea response).</p>

## 5.4.5 Additional material for ADS-B applications

### 5.4.5.1 Information field formats

Requirement reference	
5.4.5.1.1	The information field formats [defined in the present document] shall be as defined in table 5.74.

**Table 5.74: ADS-B information fields**

Information field ID (id)	ID extension 1 (id1)	ID extension 2 (id2)	Information field name
B to E hex	Not present	not present	Available for future use
F hex	Not present	not present	No information field provided

### 5.4.5.2 ADS-B request format

Requirement reference	
5.4.5.2.1	To request that a station transmit an ADS-B report consisting of a synchronization burst, a station shall transmit a general request burst with $r\text{-}mi_1 = 0$ , and include the information as shown in table 5.75.
5.4.5.2.2	The information subfields shall be encoded according to table 5.76.

**Table 5.75: ADS-B request bit encoding**

Description	Octet	Bit number							
		8	7	6	5	4	3	2	1
requested base altitude ( $r\text{-}b/a$ ), $r\text{-}mi_1$ (bit 8 = 0), burst ID	5	0	0	$r\text{-}b/a_2$	$r\text{-}b/a_1$	0	0	0	1

**Table 5.76: ADS-B request field encoding**

Subfield	Range	Encoding	Out of Scale	Notes
Requested base altitude ( $r\text{-}b/a$ )	0 to 3	0 = report either barometric or geometric 1 = report barometric or, if not available, report geometric 2 = report geometric or, if not available, report barometric 3 = reserved for future use		

## 5.5 Void

## 5.6 Definitions For Compact Position Reporting

### 5.6.1 Introduction

### 5.6.2 Parameter symbols, data types, constants and variables.

#### 5.6.2.1 Parameter symbols

**Table 5.77: Summary of parameter symbols for CPR**

Parameter	Name	clause or table defined in
TR1	Maximum age for use in global decode	clauses 5.6.6.2.2 to 5.6.6.2.4
TR2	Maximum time between global updates	clauses 5.6.6.2.5 to 5.6.6.2.6

#### 5.6.2.2 Data types

Requirement reference	
5.6.2.2.1	All calculations in this section shall use signed integers.
5.6.2.2.2	Results of calculations to perform encoding and decoding shall match the results when performed with 64-bit signed integer operations.

#### 5.6.2.3 Constants

Requirement reference	
5.6.2.3.1	Constants used in the description of CPR shall have the values defined in table 5.78

**Table 5.78: Constants used in CPR calculations**

Type	Name	Value	Description
Integer	$LAT_z$	9	Number of zones from 0° to 90° latitude
Integer	$MAX_c$	$2^{51}$	Maximum value for longitude and latitude
Integer	$MAX_c$	$2^{12}-1$	Maximum transmitted latitude value
Integer	$MAX_T^{lon}$	$2^{14}-1$	Maximum transmitted longitude value

#### 5.6.2.4 Variables

Requirement reference	
5.6.2.4.1	Variables used in CPR calculations shall have the type and range restrictions defined in table 5.79.
5.6.2.4.2	[A,B] shall mean greater than or equal to A and less than or equal to B.
5.6.2.4.3	[A,B) shall mean greater than or equal to A and less than B.

Table 5.79: Variables used in CPR calculations

Type	Name	Range	Description
External representation			
Real	Latitude	[0,90], [270, 360)	The input latitude Note that a latitude of [-90,0] maps to [270,360]
Real	Longitude	[0,360)	The input longitude
Internal representation			
Integer	type, type <sub>last</sub>	0 or 1	The type of CPR (0 = even, 1 = odd)
Integer	clat <sub>in</sub> , clon <sub>in</sub>	[0, Max <sub>C</sub> ]	Latitude and longitude to be encoded
Integer	tmp <sub>n</sub>	[0, Max <sub>C</sub> ]	Temporary variable number n. Only used to make expressions and functions more readable.
Integer	clat <sub>ref</sub> , clon <sub>ref</sub>	[0, Max <sub>C</sub> ]	Reference latitude and longitude for local decoding.
Integer	X		Any integer
Integer	pos <sub>1</sub> , pos <sub>2</sub>	[0, Max <sub>C</sub> ]	A latitude or longitude.
Integer	clat <sub>dec</sub> , clon <sub>dec</sub>	[0, Max <sub>C</sub> ]	Decoded latitude and longitude.
Integer	Bits	3,5 or 7	Number of bits for the magnitude offset
Integer	lat <sub>offs</sub> , lon <sub>offs</sub>	[0, 2 <sup>bits</sup> -1]	Latitude and Longitude offset
Integer	s <sub>lat</sub> , s <sub>lon</sub>	0 or 1	Sign of the latitude and longitude offset
Integer	lat <sub>p</sub>	[0, 18]	The latitude patch
Integer	lon <sub>p</sub>	[0, 35]	The longitude patch
Link representation			
Integer	Cprf	0 or 1	CPR format even/odd
Integer	Lat	[0, MAX <sub>T</sub> <sup>lat</sup> ]	Encoded latitude
Integer	Lon	[0, MAX <sub>T</sub> <sup>lat</sup> ]	Encoded longitude
Integer	lat <sub>ref</sub> , lat <sub>0</sub> , lat <sub>1</sub>	[0, MAX <sub>T</sub> <sup>lat</sup> ]	Encoded latitude
Integer	lon <sub>ref</sub> , lon <sub>0</sub> , lon <sub>1</sub>	[0, MAX <sub>T</sub> <sup>lat</sup> ]	Encoded longitude
Integer	lat4, lat6, lat8	[0, 2 <sup>bits</sup> + 1 - 1]	Encoded latitude offset
Integer	lon4, lon6, lon8	[0, 2 <sup>bits</sup> + 1 - 1]	Encoded longitude offset
Integer	Pid	[0, 179]	Encoded patch ID

### 5.6.2.5 Functions

Requirement reference	
5.6.2.5.1	Functions used in CPR shall have the input parameters and return values defined in table 5.80.

**Table 5.80: Input parameters and return values for functions used in CPR calculations**

Type	Name	Description
Function	returns value in internal representation	
Integer	$nz$ (type)	Number of zones depending on the type (odd/even) of CPR format.
Integer	$dlat$ (type)	Latitude patch size for type.
Integer	$nl$ ( $clat_{dec}$ , type)	Looks up the value in the transition level table 5.81.
Integer	$dlon$ ( $clat_{dec}$ , type)	Longitude patch size at latitude $clat_{dec}$ for type typ5.
Integer	$lat_{offs}$ ( $lat$ , $lat_{ref}$ )	Latitude zone offset
Integer	$lon_{offs}$ ( $lon$ , $lon_{ref}$ )	Longitude zone offset
Integer	$dec_{lat}$ ( $clat_{ref}$ , $lat$ , $lat_{ref}$ , type)	Local latitude decoding.
Integer	$dec_{lon}$ ( $clat_{dec}$ , $clon_{ref}$ , $lon$ , $lon_{ref}$ , type)	Local longitude decoding.
Integer	$lat_{seg}$ ( $lat_0$ , $lat_1$ , type <sub>last</sub> )	Latitude segment for global decoding.
Integer	$lon_{seg}$ ( $lon_0$ , $lon_1$ , $clat_{dec}$ , type <sub>last</sub> )	Longitude segment for global decoding.
Integer	$globalDec_{lat}$ ( $lat_0$ , $lat_1$ , type <sub>last</sub> )	Global latitude global.
Integer	$globalDec_{lon}$ ( $lon_0$ , $lon_1$ , $clat_{dec}$ , type <sub>last</sub> )	Global longitude global.
Integer	$fix$ (x)	Converts negative co-ordinates to positive.
Integer	$lookup$ ( $clat_{in}$ , type)	The value that corresponds to $clat_{in}$ and type in the transition level table.
Integer	$diff$ ( $pos_1$ , $pos_2$ )	The (shortest) distance between $pos_1$ and $pos_2$ .
Integer	$sign$ ( $pos_1$ , $pos_2$ )	The sign of $diff$ ( $pos_1$ , $pos_2$ ).
Integer	$offset_{dec}^{lat}$ ( $lat_{offs}$ , $s_{lat}$ , bits, type)	Calculates the true offset for the latitude offset given in bits.
Integer	$offset_{dec}^{lon}$ ( $clat_{dec}$ , $lon_{offs}$ , $s_{lon}$ , bits, type)	Calculates the true offset for the longitude offset given in bits.
Integer	$fullDec_{lat}$ ( $lat$ , $lat_p$ , type)	Decodes full position latitude.
Integer	$fullDec_{lon}$ ( $clat_{dec}$ , $lon$ , $lon_p$ , type)	Decodes full position longitude.
<b>Function returns value in link representation</b>		
Integer	$enc_{lat}$ ( $clat_{in}$ , type)	Returns the CPR encoded value for $clat_{in}$ using type.
Integer	$enc_{lon}$ ( $clat_{dec}$ , $clon_{in}$ , type)	Returns the CPR encoded value for $clon_{in}$ using type.
Integer	$offset_{enc}^{lat}$ ( $clat_{in}$ , $clat_{dec}$ , bits, type)	The difference between $clat_{in}$ and $clat_{dec}$ expressed using bits.
Integer	$offset_{enc}^{lon}$ ( $clat_{dec}$ , $clon_{in}$ , $clon_{dec}$ , bits, type)	The difference between $lon_{in}$ and $clon_{dec}$ expressed using bits.
Integer	$enc_{patch}$ ( $lat_p$ , $lon_p$ )	Encode the patch id.

#### 5.6.2.6 Patch constants

Requirement reference	Transition table
5.6.2.6.1	The function <i>lookup</i> ( <i>clatin</i> , <i>type</i> ) shall return the value in the number of zones (even or odd, depending on <i>type</i> ) column in table 5.81 for which the <i>clatin</i> value satisfies the restriction in the Range(integer) column.

Table 5.81: Transition table for *lookup* function

Range (degrees)	Range (integer)	Number of zones Even	Number of zones Odd
<13,518674176405572	<84559299976949	35	34
[13.518674176405572,19.162797152134097)	[84559299976949,119863286269066)	34	33
[19.162797152134097,23.5247169626056)	[119863286269066,147147092426093)	33	32
[23.5247169626056,27.228512609375226)	[147147092426093,170314332279771)	32	31

≥ 84.99999999999986	≥ 531674956009016	1	1

Requirement reference	Patch size functions
5.6.2.6.2	<p>The size of a latitude and longitude patch shall be:</p> $nz(type) = 4 \cdot LAT_z - type$ $dlat(type) = \frac{MAX_c}{nz(type)}$ $nl(clat_{in}, type) = \begin{cases} lookup(clat_{in}, type) & \text{if } clat_{in} < MAX_c/2 \\ lookup(MAX_c - clat_{in}, type) & \text{else} \end{cases}$ $dlon(clat_{in}, type) = \frac{MAX_c}{nl(clat_{in}, type)}$

## 5.6.3 Fixed Data Field Position Encoding

### 5.6.3.1 General

Requirement reference	
5.6.3.1.1	Given an arbitrary position <i>latitude</i> and <i>longitude</i> and a desired <i>type</i> (odd or even), the <i>lat</i> , <i>lon</i> and <i>cprf</i> sub-fields in the fixed data field of the synchronization burst shall be set to the value of $enc_{lat}()$ and $enc_{lon}()$ computed as defined in clauses 5.6.3.2.1 to 5.6.3.3.2.

### 5.6.3.2 Input parameters

Requirement reference	
5.6.3.2.1	The input parameters used for fixed data field encoding shall be defined as follows: latitude = latitude to be encoded. longitude = longitude to be encoded. type = type of encoding (odd or even).

### 5.6.3.3 Calculations

Requirement reference	
	<b>Latitude</b>
5.6.3.3.1	The encoded fixed latitude component shall be calculated as follows: $clat_{in} = \frac{(latitude) \cdot (MAX_C + 1)}{360}$ $lat = enc_{lat}(clat_{in}, type) = \frac{\left( nz(type) \cdot \text{mod}(clat_{in}, dlat(type)) + \frac{MAX_C}{2 \cdot MAX_T^{lat}} \right)}{\left( \frac{MAX_C}{MAX_T^{lat}} \right)}$
	<b>Longitude</b>
5.6.3.3.2	The encoded fixed longitude component shall be calculated as follows: $clon_{in} = \frac{(longitude) \cdot (MAX_C + 1)}{360}$ $lon = enc_{lon}(clat_{dec}, clon_{in}, type) = \frac{\left( nl(clat_{dec}, type) \cdot \text{mod}(clon_{in}, dlon(clat_{dec}, type)) + \frac{MAX_C}{2 \cdot MAX_T^{lon}} \right)}{\left( \frac{MAX_C}{MAX_T^{lon}} \right)}$

## 5.6.4 Fixed Data Field Position Local Decoding

### 5.6.4.1 General

Requirement reference	
5.6.4.1.1	When the position report processing state machine (see clause 5.6.6.3.6) indicates that local decoding is to be performed, then the fixed data field position shall be decoded using a single position report and an unambiguous global reference location.
5.6.4.1.2	The calculation shall return the latitude, longitude and type sub-fields.

## 5.6.4.2 Input parameters

Requirement reference	
5.6.4.2.1	<p>The input parameters used for fixed data field decoding shall be defined as follows:</p> <p><math>clat_{ref}</math> = reference latitude.</p> <p><math>clon_{ref}</math> = reference longitude.</p> <p><math>lat</math> = CPR encoded latitude to be decoded.</p> <p><math>lon</math> = CPR encoded longitude to be decoded.</p> <p><math>cprf</math> = CPR format even/odd.</p>

## 5.6.4.3 Calculations

Requirement reference	Supporting Function
5.6.4.3.1	<p>The supporting function for calculating the decoded fixed position field shall be as follows:</p> $fix(x) = \begin{cases} x + 1 + MAX_C & \text{if } x < 0 \\ x & \text{else} \end{cases}$
	<b>Latitude</b>
5.6.4.3.2	<p>The decoded fixed latitude component shall be calculated as follows:</p> <p><math>type = cprf</math></p> <p><math>lat_{ref} = enc_{lat}(clat_{ref}, type)</math></p> $lat_{offs}(lat, lat_{ref}) = \begin{cases} 1 & \text{if } (lat_{ref} - lat) > \frac{MAX_T^{lat}}{2} \\ -1 & \text{if } (lat_{ref} - lat) < -\frac{MAX_T^{lat}}{2} \\ 0 & \text{else} \end{cases}$ $tmp_1 = dlat(type) \cdot \left( \frac{clat_{ref}}{dlat(type)} + lat_{offs}(lat, lat_{ref}) \right)$ $clat_{dec} = dec_{lat}(clat_{ref}, lat, lat_{ref}, type) = fix \left( \frac{\left( \left( \frac{MAX_C}{MAX_T^{lat}} \right) \cdot lat \right)}{nz(type)} + tmp_1 \right)$ $latitude = \frac{(clat_{dec} + offset_{dec}^{lat}(lat_{offs}, s_{lat}, bits, type))}{(MAX_C + 1)} \cdot 360$

Requirement reference	Longitude
5.6.4.3.3	<p>The decoded fixed longitude component shall be calculated as follows:</p> $lon_{ref} = enc_{lon}(clat_{dec}, clon_{ref}, type)$ $lon_{offs}(lon, lon_{ref}) = \begin{cases} 1 & \text{if } (lon_{ref} - lon) > \frac{MAX_T^{lon}}{2} \\ -1 & \text{if } (lon_{ref} - lon) < -\frac{MAX_T^{lon}}{2} \\ 0 & \text{else} \end{cases}$ $tmp_2 = dlon(clat_{dec}, type) \cdot \left( \frac{clon_{ref}}{dlon(clat_{dec}, type)} + lon_{offs}(lon, lon_{ref}) \right)$ $clon_{dec} = dec_{lon}(clat_{dec}, clon_{ref}, lon, lon_{ref}, type) = fix \left( \frac{\left( \left( \frac{MAX_C}{MAX_T^{lon}} \right) \cdot lon \right)}{nl(clat_{dec}, type)} + tmp_2 \right)$ $longitude = \frac{(clon_{dec} + offset_{dec}^{lon}(clat_{dec}, lon_{offs}, s_{lon}, bits, type)) \cdot 360}{(MAX_C + 1)}$

## 5.6.5 Fixed Data Field Position Global Decoding

### 5.6.5.1 General

Requirement reference	
5.6.5.1.1	When the position report processing state machine (see clause 5.6.6.3.6) indicates that global decoding is to be performed, then the fixed data field position shall be decoded using the most recently received odd and even fixed data field positions.
5.6.5.1.2	The calculation shall return the <i>latitude</i> , <i>longitude</i> and <i>type</i> fields.

### 5.6.5.2 Input parameters

Requirement reference	
5.6.5.2.1	<p>The input parameters used for fixed data field global decoding shall be defined as follows:</p> <p><math>lat_0</math> = even CPR encoded latitude to be decoded.</p> <p><math>lon_0</math> = even CPR encoded longitude to be decoded.</p> <p><math>lat_1</math> = odd CPR encoded latitude to be decoded.</p> <p><math>lon_1</math> = odd CPR encoded longitude to be decoded.</p> <p><math>cprf</math> = type of encoding (odd or even) for the most recent of the two CPR reports.</p>

### 5.6.5.3 Transition level straddling

Requirement reference	
5.6.5.3.1	If, $nl(globalDec_{lat}(lat_0, lat_1, 1, 0)) \neq nl(globalDec_{lat}(lat_0, lat_1, 0, 0))$ then decoding as defined in clause 4.10.3.3 shall be computed instead of a global decode.

### 5.6.5.4 Calculations

Requirement reference	
	<b>Latitude</b>
5.6.5.4.1	<p>The globally decoded fixed latitude component shall be calculated as follows:</p> $type_{last} = cprf$ $tmp_3 = \frac{\left( lat_0 \cdot nz(1) + 2 \cdot nz(type_{last}) \cdot MAX_T^{lat} + \frac{MAX_T^{lat}}{2} - lat_1 \cdot nz(0) \right)}{MAX_T^{lat}}$ $lat_{seg}(lat_0, lat_1, type_{last}) = \text{mod}(tmp_3, nz(type_{last}))$ $tmp_4 = lat_{seg}(lat_0, lat_1, type_{last}) \cdot dlat(type_{last})$ $clat_{dec} = globalDec_{lat}(lat_0, lat_1, type_{last}) = tmp_4 + \frac{\left( \left( \frac{MAX_C}{MAX_T^{lat}} \right) \cdot lat_{type_{last}} \right)}{nz(type_{last})}$
	<b>Longitude</b>
5.6.5.4.2	<p>The globally decoded fixed longitude component shall be calculated as follows:</p> $tmp_5 = \frac{\left( lon_0 \cdot nl(clat_{dec}, 1) + 2 \cdot nl(clat_{dec}, type_{last}) \cdot MAX_T^{lon} + \frac{MAX_T^{lon}}{2} - lon_1 \cdot nl(clat_{dec}, 0) \right)}{MAX_T^{lon}}$ $lon_{seg}(lon_0, lon_1, clat_{dec}, type_{last}) = \text{mod}(tmp_5, nl(clat_{dec}, type_{last}))$ $tmp_6 = lon_{seg}(lon_0, lon_1, clat_{dec}, type_{last}) \cdot dlon(clat_{dec}, type_{last})$ $clon_{dec} = globalDec_{lon}(lon_0, lon_1, clat_{dec}, type_{last}) = tmp_6 + \frac{\left( \left( \frac{MAX_C}{MAX_T^{lon}} \right) \cdot lon_{type_{last}} \right)}{nl(clat_{dec}, type_{last})}$

## 5.6.6 Position Report Processing

### 5.6.6.1 Services

Requirement reference	
5.6.6.1.1	The PECT (see clause 5.4.4.2) shall maintain sufficient history of received targets to enable unambiguous global position to be determined.

### 5.6.6.2 Position report parameters

Requirement reference	
5.6.6.2.1	The position report parameters shall be as defined in table 5.82.

**Table 5.82: Position report processing parameters**

Symbol	Parameter name	Minimum	Maximum	Default	Increment
TR1	Maximum age for use in global decode	1 s	60 s	30 s	1 s
TR2	Maximum time between global updates	1 s	240 s	60 s	1 s

Requirement reference	
	<b>Parameter TR1 (maximum age for use in global decode)</b>
5.6.6.2.2	The parameter TR1 shall be the maximum age of a report for its use in a global decode.
5.6.6.2.3	The timer shall be started (or restarted) as defined in table 5.83.
5.6.6.2.4	If it expires the report shall not be valid for use in a global decode.
	<b>Parameter TR2 (maximum time between global updates)</b>
5.6.6.2.5	The parameter TR2 shall be the maximum time between global updates.
5.6.6.2.6	The timer shall be started (or restarted) as defined in table 5.83.

### 5.6.6.3 Position report processing procedures

Requirement reference	
	<b>Position report processing state machine</b>
5.6.6.3.1	For each station maintained in the PECT (see clause 5.4.4.2), the station shall maintain the record of the last received position report and a position report processing state machine with the following states:
5.6.6.3.2	a) State 1 shall indicate that no position report has been received and represents the initial state of the position report processing state machine;
5.6.6.3.3	b) State 2 shall indicate that a position report has been received but that no position has been decoded;
5.6.6.3.4	c) State 3 shall indicate that a position report has been received and that a local position has been decoded;
5.6.6.3.5	d) State 4 shall indicate that a position report has been received and that a global position has been decoded.
	<b>Position report processing state machine transitions</b>
5.6.6.3.6	On receipt of a position report, the station shall update its state machine as defined in table 5.83 and report target position quality to the application.

Table 5.83: State transitions for position report processing

In State				1	2	3		4			
Last report				None	Even	Odd	Even	Odd	Even	Odd	
Target position quality				None	None	None	Local	Local	Global	Global	
Received position report type	Own Position	Timers (exp = expired)									
		TR1	TR2

	Exp								N = 2, C = NO, resTR1		

Requirement reference	
	<b>State machine transitions for transition level straddling</b>
5.6.6.3.7	When a position report is received from a station which fulfils: <ul style="list-style-type: none"> <li>a) the conditions for the initial state, last received report type, received report type, own position and timer states defined in table 5.84;</li> <li>b) the conditions defined in clause 5.6.5.3 are met (because the station has crossed a transition latitude),</li> </ul> the receiving station shall update its state machine as defined in table 5.84 and report the target position quality to the application.
5.6.6.3.8	Otherwise the station shall process the report as defined in clause 5.6.6.3.6

**Table 5.84: State transitions for position report processing (transition level straddling)**

In State				1	2	3		4

## 6 General design requirements

### 6.1 Controls and indicators

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.1.

### 6.2 Warm up

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.3.

### 6.3 Airworthiness

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.4.

### 6.4 Intended function

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.5.

### 6.5 International Telecommunications Union Regulations

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.6.

## 6.6 Fire protection

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.7.

## 6.7 Operation of controls

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.8.

## 6.8 Accessibility of controls

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.9.

## 6.9 Effects of tests

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.10.

## 6.10 System requirements

### 6.10.1 Receiver Operating Range

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.11.1.

### 6.10.2 Transmitter Operating Range

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.11.2.

### 6.10.3 Demodulator Action

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.11.3.

### 6.10.4 Automatic Transmitter Shut-Down

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.11.4.

## 6.11 Software management

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.12.

## 6.12 VDL Mode 4 transceiver configuration

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.13.

## 6.13 Slot map management

The equipment shall meet the requirements of EN 302 842-1 [4], clause 7.14.

## 6.14 Recovery from failure

### 6.14.1 Reservation table stored in non-volatile memory

A VDL Mode 4 transceiver shall always have an up-to-date copy of its reservation table stored in memory that shall be stored for at least 10 s.

NOTE: This is to mitigate in the event of failure, and to allow the equipment to continue operation if the m2 filter permits.

### 6.14.2 Inspection of m2 filter following equipment failure

A VDL Mode 4 transceiver shall ensure that the m2 value is accurate immediately following any failure of the transceiver.

The m2 filter shall be incremented whenever reception is lost on a channel according to clause 5.1.3.3.2.

Following power interrupt or failure affecting a VDL Mode 4 transceiver that exceeds 200 ms in duration, the transceiver shall, on its return to normal operation, inspect the value of the m2 filter. If m2 is greater than or equal to M2limit, m2 shall be set to 0, and the station shall execute a network entry procedure.

### 6.14.3 Provision for multiple redundant VDL4 transceivers

Recommendation

If it is required to meet operational availability requirements, provision should be made for multiple redundant VDL Mode 4 Transceivers (i.e. a "hot" standby unit) with cross-links between them which may provide for:

- a) Exchange of reservation information on all channels monitored by each transceiver, so as to enable either transceiver to continue to operate on a channel previously monitored by the other transceiver in the event of an equipment failure, without a need to perform net-entry.
- b) Co-ordination of the channels monitored and applications supported by each transceiver in normal operation.
- c) Monitoring operation of individual transceivers, to allow timely response to an equipment failure. In the event of such failure, cross-links allow the system to adjust its operation so as to maintain operation of the most critical applications.

### 6.14.4 Failure of the VDL Mode 4 equipment

Failure of the VDL Mode 4 equipment shall not degrade the operation of other mobile equipment.

### 6.14.5 Failure of Associated Equipment

In the event of any failure of associated equipment providing position and/or timing information, the VDL Mode 4 Transceiver shall take the appropriate action as defined by the ICAO Technical Manual [1].

In the event of unavailability of application data, the VDL Mode 4 Transceiver shall provide an indication that the data is not available, in accordance with the applicable application standard. Data derived from equipment under failure conditions shall not be transmitted.

NOTE: Application standards may specify a flag to indicate invalidity of data, or else a reserved value.

## 6.15 Monitoring of proper operation

The VDL Mode 4 Transceiver shall contain Built-in Test Equipment (BITE) which shall be capable of performing the functions specified in clause 6.23.1.

## 6.16 Network Entry

### 6.16.1 Methods of network entry

When required to perform network entry (see clause 6.16.3), a station shall apply at least one of the following network entry procedures:

- Network entry using plea/response procedures;
- Network entry via BND;
- Network entry by listening to the channel for 60 s followed by either:
  - full-slot random transmission with periodic, incremental, or combined periodic/incremental reservation types;
  - plea-to-self (i.e. reserving slots for itself to transmit).

### 6.16.2 Requirements applicable to individual network entry procedures

If a station will use network entry by plea/response procedures then it shall conform to the test NetEntry\_Delayed\_Plea. Otherwise, it shall not be required to conform to this test.

If a station will use network entry by BND then it shall conform to the test NetEntry\_Delayed\_BND. Otherwise, it shall not be required to conform to this test.

If a station will use network entry by listening to the channel for 60 s followed by full-slot random transmission with combined periodic/incremental reservation types, then it shall conform to the test NetEntry\_Periodic. Otherwise, it shall not be required to conform to this test.

### 6.16.3 Conditions for application of network entry procedures

A VDL4 station shall re-enter the network as soon as possible after any of the conditions requiring network entry to be performed have been met.

The conditions for network entry are specified in clause 5.4.4.3.4a, with the following qualification:

Network entry shall be performed if:

- a) The m2 filter is exceeded, due either to:
  - Return to operation following power failure (see clause 6.14.2).
  - Return to operation following hardware or software failure (see clause 6.14.1).
  - Return to operation following receive function that is blocked by own station transmission on another channel (e.g. through a common antenna) (see clause 5.1.3.3.2).
  - Return to operation any other inability to receive (see clause 5.1.3.3.2).
- b) The value of CG1 is greater than or equal to CG1\_limit, which may be due to:
  - Return to operation following complete or partial RF shadowing for a period of time resulting in an inability to receive from other stations.

#### **Recommendation:**

The station should aim to re-enter the network within x seconds after any of the conditions requiring network entry to be performed have been met. The default value of x shall be 10, but different values may be used depending on the applications used with VDL Mode 4.

## 6.17 PECT and CPR decode Requirements

### 6.17.1 Handling transmissions received from other stations

A station shall be capable of handling in the PECT received transmissions from at least 2 100 stations.

If a receiving station cannot store a target in the PECT due to insufficient capacity of the PECT table, a station shall report the target at the application interface as it would for a target for which no report had previously been received.

**Recommendation:**

When there are too many stations to keep them all in the PECT, a station should:

- a) delete stations from the PECT that are marked as unreachable prior to deleting reachable stations;
- b) maintain closer aircraft in the PECT in preference to more distant aircraft, while also weighting approaching aircraft over receding aircraft.

### 6.17.2 Reports from targets with the same non-unique address

A receiving station shall not use stored PECT data on receipt of reports that appear to be from multiple targets with the same non-unique address, which cannot be distinguished by any other means.

NOTE 1: This means only local CPR decode may be used.

**Recommendation:**

A station should record and track the movements of aircraft with non-unique addresses for a time that is sufficient to be able to distinguish them.

NOTE 2: If the tracks of such stations can be followed with certainty, then stored PECT data may be used on receipt of the reports.

A receiving station shall use local decode for 5 minutes after it is able to distinguish multiple targets with the same non-unique address which it had previously been unable to distinguish.

## 6.18 Reception capability

A station shall be capable of processing new transmissions received from previously unknown stations at a rate of at least  $\text{MIN}(\text{number of receivers installed}, [4]) \times 75$  new transmissions per second.

## 6.19 Transmission capability

A station shall be capable of transmitting in 120 slots per minute.

NOTE 1: This takes into account the minimum requirement to operate on two global signalling channels. This also permits additional channels to be monitored with a receive function only.

NOTE 2: The above assumes the minimum for link management. For point-to-point operation, an additional 5 % duty cycle needs to be allowed for.

## 6.20 Conjoining of bursts

A mobile station shall not conjoin bursts (place bursts one after the other, with only the first burst in the sequence starting on a slot boundary).

NOTE: A ground station may conjoin bursts.

## 6.21 Timing obtained from Bursts of other stations

If a station is in receipt of transmissions from another station in which bursts are conjoined, then the station shall not derive time from any burst except the first burst in the sequence.

## 6.22 Equipment installation

### 6.22.1 Accessibility

Where controls or monitors are provided for in-flight operation, they shall be readily accessible from the appropriate operator's normal seated position. The operator/crew member(s) shall have an unobstructed view of the display(s) or controls when in the normal seated position.

### 6.22.2 Aircraft Environment

Equipment shall be compatible with the environmental conditions present in the specific location in the aircraft where the equipment is installed.

### 6.22.3 Inadvertent Turn Off

Where controls for VDL Mode 4 Transceiver operation are provided, they shall be equipped with adequate protection against inadvertent turn off.

### 6.22.4 Failure Protection

Any foreseeable failure of the VDL Mode 4 Transceiver function shall not degrade the normal operation of any other systems connected to it.

### 6.22.5 Interference Effects

The equipment shall not be the source of harmful conducted or radiated interference, nor be adversely affected by conducted or radiated interference from other equipment or systems installed in the aircraft.

NOTE: Interference problems noted upon installation of this equipment may result from such factors as the design characteristics of previously installed systems or equipment and the physical installation itself. It is not intended that the equipment manufacturer designs for all installation environments. The installing facility will be responsible for resolving any incompatibility between this equipment and previously installed equipment in the aircraft.

### 6.22.6 Aircraft Power Source

The voltage and frequency tolerance characteristics of the equipment shall be compatible with the aircraft power source of appropriate category as specified in EUROCAE ED-14D / RTCA DO-160D [12].

### 6.22.7 Antenna location

Consideration should be given to the location of the antenna(e) used by the VDL Mode 4 transceiver installed on an aircraft in order to ensure maximum coverage in all phases of flight.

## 6.23 Installed equipment performance requirements

The installed equipment shall meet the requirements of the clauses 5 and 6.

Additionally, all sources of application data, and the interfaces to them, shall be capable of providing data of the appropriate accuracy, integrity and update rate to meet the requirements of the application.

Further installed equipment requirements are set out in the following clauses.

### 6.23.1 Built-In Test Equipment (BITE)

The VDL Mode 4 transceiver shall contain Built-In Test Equipment (BITE) capable of detecting and annunciating failures of the transceiver system.

Automatic monitoring of correct operation of the VDL Mode 4 equipment shall take place continuously throughout the flight, taking into account any impaired functionality detected in associated equipment (e.g. loss or reported failure of sources of position and time).

The BITE shall display the system condition and indicate any failures upon activation of the Power-Up self test. The BITE shall also operate during the time the transceiver is being powered up and at other times when commanded by the flight crew. Monitoring, performed by the BITE, shall be automatic. No failure occurring within the BITE subsystem shall interfere with the normal operation of the transponder.

The VDL Mode 4 equipment shall be capable of providing an indication to the crew of any detected failure.

The BITE history of malfunction events shall be stored for later retrieval.

NOTE: An acceptable means of compliance would be to provide system status monitor(s) and built-in test functions which would detect and indicate to the flight crew a failure of the VDL Mode 4 system due to any of the following:

- a) loss of system electrical power to the VDL Mode 4 equipment;
- b) failure of digital interfaces;
- c) input data flagged as failed by source equipment, or else fails to pass a credibility check;
- d) failure of the equipment to perform intended functions;
- e) removal of the equipment from the aircraft.

### 6.23.2 Power-Up Self Test

When the VDL Mode 4 transceiver is turned on, either on the ground or in the air, a Power-Up self test shall be initiated automatically. The Power-Up self test shall not be initiated in the event of short duration power interrupts as defined in clause 6.14. The transceiver shall provide a manual self-test capability for trouble shooting and installation verification. Initiation of the manual self-test shall be possible from keys, located on the front panel. A display shall provide the operator with the results of the self-test.

The BITE should also detect when the 24-bit aircraft address represents an illegal address. In this case, a non-unique identity address should be used by the VDL Mode 4 station and an error indication should be made to the operator.

### 6.23.3 Regular Maintenance

The manufacturer should prescribe tests documented in the maintenance manual to ensure continued airworthiness. These tests should be based at minimum on a biannual inspection. The transceiver tests are to be defined by the manufacturer and described in the maintenance manual.

### 6.23.4 Flight Test Procedures

This guidance material offers examples of flight test procedures for demonstrating performance functions as listed below. Flight demonstration of installed performance may be required by the aircraft operator or by airworthiness inspection agencies.

#### 6.23.4.1 Preparation of Flight Tests

Equipment shall be made available for independent verification of the data provided by the VDL Mode 4 equipment under test. A test area should be selected such that line-of-sight signal propagation is ensured so that a test operator can confirm valid returns through normal flight attitudes.

### 6.23.4.2 Flight Tests

When airborne, the tests should be conducted at typical altitude and attitude profiles of the aircraft, using a test ground station.

- a) Before take-off, ensure that the ground tests have been completed successfully.
- b) After take-off, determine whether successful operation at the maximum usable range is achieved when flying towards and away from the ground station. Ideally data from the test ground station only should be displayed.
- c) At a distance not less than 60 % of the maximum usable range, execute orbits and level the aircraft every 10 degrees. Ensure valid transmissions are received by the test ground station.
- d) At a range not less than 60 % of the maximum usable range, establish that valid transmissions can be received by the test ground station when flying towards and away from the station:
  - at usual attitudes in normal climb and decent;
  - at alternating usual bank angles used in cruising flight.

The exact test parameters to be applied during the flight tests shall be determined by the relevant certification authority.

NOTE: Where the aircraft is unable to perform any of the above tests, suitable alternatives should be agreed with the relevant Certification Authority.

## 6.24 Conditions of test

Clauses 6.24.1 to 6.24.5 define conditions under which tests, specified in clause 6.25, shall be conducted.

### 6.24.1 Power Input

Unless otherwise specified, tests shall be conducted with the equipment powered by the aircraft's electrical power generating system.

### 6.24.2 Associated Equipment or Systems

Unless otherwise specified, all aircraft electrically operated equipment and systems shall be turned on, and where possible operating, before conducting interference tests.

### 6.24.3 Environment

During the tests, the equipment shall not be subjected to environmental conditions that exceed those in EUROCAE ED-14D / RTCA DO-160D [12] as specified by the equipment manufacturer.

Where application data, and/or primary timing is provided by means of GNSS, the test shall be conducted under conditions of adequate GNSS reception.

### 6.24.4 Adjustment of Equipment

Circuits of the equipment under test shall be properly aligned and otherwise adjusted in accordance with the manufacturer's recommended practices prior to application of the specified tests.

### 6.24.5 Warm Up Period

Unless otherwise specified, tests shall be conducted after a warm-up (stabilization) period of not less than two minutes.

NOTE: This period of warm-up has been derived in order to allow sufficient time for the establishment of periodic streams.

## 6.25 Test procedures for installed equipment performance

The following test procedures provide one means of determining installed equipment performance.

Although specific test procedures are prescribed, it is recognized that other methods may be preferred by the installer/manufacture. Such alternative procedures may be used if they provide at least equivalent information, in which case, the procedures described in this clause should be used as one criterion in evaluating the acceptability of the alternative procedures.

### 6.25.1 Ground Test Procedures

#### 6.25.1.1 Conformity Inspection

- a) Verify that proper mechanical and electrical connections have been made and that the equipment has been located and installed in accordance with the manufacturer's recommendations.
- b) Ensure that the equipment is fully functional and has met the functional test requirements defined in clause 5.

#### 6.25.1.2 Interference Tests

- a) Establish an operating datalink with a ground VDL Mode 4 simulator.
- b) With all equipment energized, individually operate each of the other electrically operated aircraft equipment and systems to determine that no significant levels of conducted or radiated interference exist.
- c) Evaluate all combinations of control settings and operating modes.
- d) Operate communication and navigation equipment on the lowest, highest and at least one but preferably four mid-band frequencies.
- e) Make note of systems or modes of operation that should also be evaluated during flight.

#### 6.25.1.3 Power Supply Fluctuation Test

- a) Operate any aircraft control and system which may cause power fluctuations. Verify that the equipment continues to operate without re-initialization.

#### 6.25.1.4 Functional Behaviour Tests

NOTE 1: These tests can be performed by using a portable (non-connected) ground VDL Mode 4 simulator.

- a) Verify that following power-up, ADS-B reports are transmitted on both GSCs at the default rate.
- b) Verify that the time figure of merit corresponds to primary or primary certified time synchronization (as required).
- c) Verify that the aircraft source address is correctly encoded.
- d) Direct the station to transmit sync bursts on an alternative channel to the GSC, and verify that the station transmits in accordance with the directed request.
- e) In the case of a dual redundant installation, direct the station to transmit and monitor on further local channels, in addition to the GSCs, so that all receivers in the installation are active. Send simulated application data on all channels, and verify that the intended results are presented to the flight deck crew. Remove power to one redundant unit, and verify that re-configuration of operation occurs in accordance with the applicable application standards.

NOTE 2: In the absence of specific application requirements for re-configuration of operation in the event of failure, it should be verified that when a directed request is sent with the receiver control field (rcvr) indicating that a channel is to be monitored, and the transceiver monitoring the channel is subsequently disabled, the monitoring is transferred to the other unit.

### 6.25.1.5 Interface Conformance Tests

The objective of these tests is to verify that all interfaces to the VDL Mode 4 Transceiver perform their intended functions and the equipment configuration is compatible with the specific installation.

NOTE: These tests can be performed by using a portable (non-connected) ground VDL Mode 4 simulator.

- a) For each fixed field, provide, by simulation if necessary, realistic inputs to all systems contributing data to the field.
- b) Exercise each input, selecting a sufficient number of test points to ensure the correct operation of the installation.
- c) Verify at each test point that the data is being correctly reported.

## 6.25.2 Flight Test Procedures

### 6.25.2.1 Interference Effects

- a) For aircraft equipment and systems that can be checked only in flight, determine that significant indications of conducted or radiated interference do not exist.
- b) Operate communications and navigation equipment on the lowest, highest and at least one but preferably four mid-band frequencies.

### 6.25.2.2 Operational Range Performance

Fly the aircraft in a racetrack pattern at maximum operational range from a ground station, transmitting default sync bursts on the GSCs. Verify that the average rate of message loss observed at the ground station is consistent with operational requirements for the supported applications.

---

## 7 Protocol test procedures

### 7.1 General

#### 7.1.1 Input voltage

The equipment shall meet the requirements of EN 302 842-1 [4], clause 9.1.1.

#### 7.1.2 Power input frequency

The equipment shall meet the requirements of EN 302 842-1 [4], clause 9.1.1.

#### 7.1.3 Adjustment of equipment

The circuits of the equipment under test shall be properly aligned and otherwise adjusted in accordance with the manufacturer's recommended practices prior to application of the specified tests. Unless otherwise specified, no adjustments may be made once the test procedures have started.

#### 7.1.4 Equipment configuration

Replacement or substitution of components or circuit modules within the equipment under test is not permitted once the test procedures have started.

The VDL Mode 4 mobile station shall undergo all testing with its operational software installed in the equipment. The software version number shall reflect the revision that is intended for approval.

The configuration data shall be set up so as to be representative of a real airborne installation. This configuration data set shall be completely documented. The configuration setup shall not be altered during the entire testing procedure.

### 7.1.5 Test equipment precautions

Precautions shall be taken during conduct of the tests to prevent the introduction of errors resulting from the improper connection of test instruments across the input and/or output impedances of the equipment under test.

If used to terminate the input or output of the equipment under test, the test instruments shall present the equivalent impedance to the equipment under test for which it was designed. Otherwise, the equipment under test shall be connected to loads having the impedance values for which it was designed.

### 7.1.6 Ambient conditions

Unless otherwise specified, all tests should be conducted under conditions of ambient room temperature, pressure and humidity, as defined in EN 302 842-1 [4], clause 9.1.1.

### 7.1.7 Connected loads

Unless otherwise specified, all tests shall be performed with the equipment connected to loads having the impedance values for which it is designed.

### 7.1.8 Warm-up period

Unless otherwise specified, all tests shall be conducted after a warm-up period of not less than 2 minutes.

NOTE: This period of warm-up has been derived in order to allow sufficient time for the establishment of periodic streams.

## 7.2 Required test rig

An overview of the PCOs identified as required for the conduct of test cases is illustrated in figure 7.1.

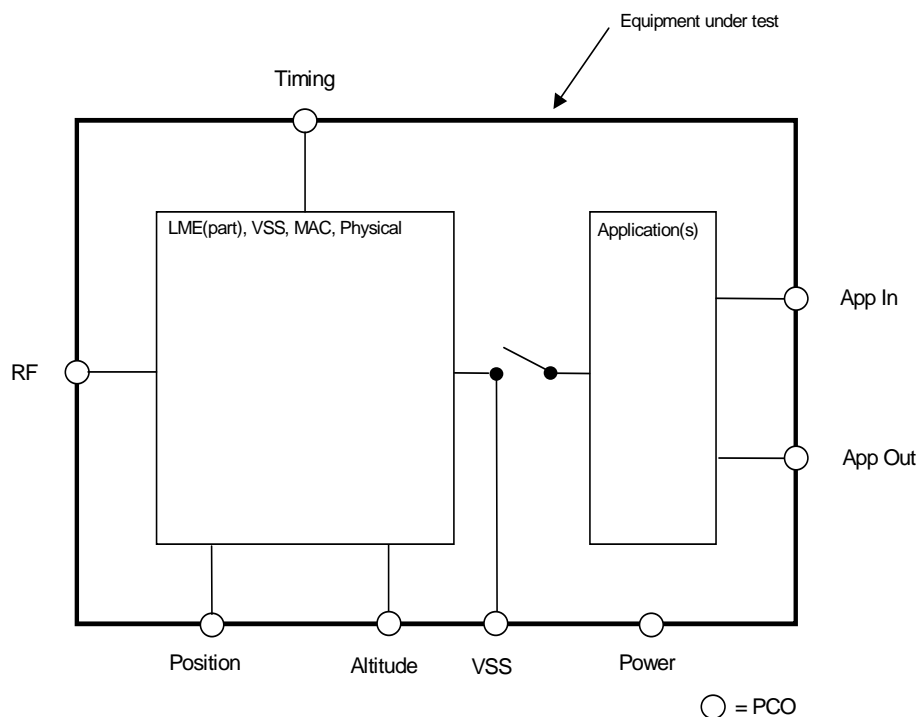

Figure 7.1: location of PCOs

In addition, it shall be possible to verify that the equipment under test has passed the self test procedure.

The PCOs identified in this figure are each associated with a test set which shall support the following:

RF:

- input to the equipment under test of a single burst or sequence of bursts, of specified content, one or more slots in length, commencing in a slot at a specified time, on a specified channel;
- recording of the time at which a burst containing specified content (per field) is output by the equipment under test, on any of three channels;
- simultaneous input to the equipment of bursts of specified content, commencing in a slot at a specified time, on two separate channels.

Timing:

- input of a reference time source compliant with the requirements of the present document;
- disabling of the input of reference time.

NOTE 1: Disabling of the timing source is required to force the equipment under test into secondary timing mode.

NOTE 2: In certain equipment architectures, the reference timing source may be incorporated internally within the equipment under test. Under such conditions, there is no requirement to expose the timing source itself, but a means must be provided to disable it as identified above.

Position:

- input to the equipment under test of a specified geographical position at a specified time;
- input to the equipment under test of position validity/quality to allow determination of position integrity (nic);
- disabling of the position source.

NOTE 3: Disabling of the position source is required to demonstrate that appropriate notification is provided by means of the Navigation Integrity Category (NIC) field.

NOTE 4: In certain equipment architectures, the position source may be incorporated internally into the equipment under test. Under such conditions, manufacturers will be required to perform alternative tests to those specified in the present document to demonstrate correct operation of the position encoding/decoding algorithms. In addition, a means must be provided to disable the position source as stated above.

Altitude:

- input to the equipment under test of a specified altitude at a specified time;
- disabling of the altitude source;
- configuration information identifying whether geometric or barometric altitude is provided.

NOTE 5: Disabling of the altitude source is required to demonstrate that appropriate notification is provided by means of the fixed synchronization burst.

NOTE 6: In certain equipment architectures, the altitude source may be incorporated internally into the equipment under test. Under such conditions, manufacturers will be required to perform alternative tests to those specified in the present document to demonstrate correct operation of the position encoding/decoding algorithms. In addition, a means must be provided to disable the position source as stated above.

**VSS:**

The VSS User PCO is not normally exposed during operational use of the VDL Mode 4 ADS-B system. It is available only during test mode, in which the internal application(s) are disconnected from the VSS and lower layers, as illustrated above.

The VSS User PCO is intended to provide a means to stimulate the VDL Mode 4 system independently of the internal applications, and to offer a mechanism to use test such features of the VSS sub-layer such as slot selection and reservation conflict processing which could not be tested adequately by any other means. At this PCO, functionality shall be provided to allow the User (i.e. test set) to:

- enable/disable autonomous synch bursts, and control of parameters TV11 min, TV11 max and V11 associated with their transmission;
- maintain a queue of random access transmissions, of user specified content, such that at least one burst is always in the transmit queue;
- establish a sequence of streams of periodic broadcasts, of user specified content, defined by parameters TV11 min, TV11 max, V11, V12, together with Quality of Service parameters Q2a to Q2d, Q4 and Q5;
- cancel an existing sequence of periodic streams;
- establish a sequence of incremental broadcasts, of user specified content, defined by parameters V21, V22, together with Quality of Service parameters Q2a to Q2d, Q4 and Q5;
- receive a notification that a non-zero version number has been detected;
- receive a notification in response to a request for transmission that no slot was available for selection.

**AppIn:**

Input to the equipment under test of any additional data required to support any internal applications. Tests for application functionality are outside the scope of the present document, and manufacturers are required to specify tests to demonstrate correct operation of any applications supported, including appropriate inputs via this PCO.

**AppOut:**

Output from the equipment under test of any data associated with internal application(s). Examples include ADS-B, TIS-B, FIS-B data for output to the crew. Tests for application functionality are outside the scope of the present document, and manufacturers are required to specify such tests to demonstrate correct operation of any applications supported, including appropriate outputs via this PCO.

NOTE 7: A display of ADS-B data built into the equipment may represent this PCO.

**Power:**

Power shall be applied at this PCO in accordance with clauses 7.1.1 and 7.1.2. The facility shall be provided to interrupt the power supply for a period between 150 ms and 15 s, upon an event being signalled from the surrounding test harness.

## 7.3 Protocol test-suite description methodology

The precise rules which control the functions of computer based equipment like the VDL Mode 4 mobile station, which involve sequential logic, require a rigorous interpretation which cannot always be readily achieved by plain text description. Therefore, a formal description has been used based on ISO/IEC 9646 [7]. The concepts of ISO/IEC 9646 [7] were, to maximum extent, applied to the VDL Mode 4 test procedures included in the present document. For convenience the underlying basic concepts are described in annex B.

## 7.4 Detailed protocol test procedures

The protocol test procedures set forth below constitute a satisfactory method of determining the required VDL Mode 4 mobile station performance. Although specific test procedures are cited, it is recognized that other methods may be preferred. Such alternate methods may be used if the manufacturer can show that they provide at least equivalent information. Therefore, the procedures cited herein should be used as one criterion in evaluating the acceptability of the alternate procedures.

### 7.4.1 Test-suite overview

The test-suite overview shown in table 7.1 on the following pages lists the test cases by their name. The second column holds a short description of the test case objective. A cross reference between the test case names and the applicable requirements is provided in annex A.

**Table 7.1: Protocol test-suite overview**

Test Case Name	Description
Physical_SysParams	To demonstrate that a station operates correctly at the limits of the physical layer system parameters.
Timing_Primary	To demonstrate that when primary timing is available, a transmission from the station complies with primary timing performance.
Timing_Secondary	To demonstrate that when primary timing is unavailable, a transmission from the station complies with secondary timing performance.
Timing_Secondary_Recover	To demonstrate that when primary timing becomes available to a station which is transmitting on secondary time, it reverts to using primary time.
CRC_Norm	To demonstrate that a station transmitting a burst will insert a valid CRC.
CRC_Rej	To demonstrate that a station receiving a burst with an invalid CRC will reject the burst.
Version_NonZero	To demonstrate that a station receiving a burst containing a non-zero version number will ignore the burst and inform the VSS user.
Queue_Replace	To demonstrate that a burst submitted to the VSS layer with Q3 set to TRUE will replace any queued data of the same type.
Queue_Norm	To demonstrate that a burst submitted to the VSS layer with Q3 set to FALSE will not replace any queued data of the same type.
MessageID_Invalid_A	To demonstrate that a unicast burst received with an invalid message ID will cause a General Failure burst to be transmitted.
MessageID_Invalid_B	To demonstrate that a burst with an invalid message ID not making a reservation for reply, causes no response to be made.
Reservation_Unrecognized	To demonstrate that an unrecognized reservation type will cause the packet to be rejected and an error logged.
Reservation_Invalid	To demonstrate that reception of a known reservation type with an invalid subfield causes the appropriate slots to be reserved, but not to transmit a response, nor pass the burst to a VSS user.
Reservation_Recognition	To demonstrate that a reservation will be recognized prior to the end of the slot following the transmission in which it was carried.
SlotSel_Level0_A	To demonstrate that a station will select a slot at level 0 when no slots are reserved.
SlotSel_Level0_B	To demonstrate that a station will select a slot at level 0, excluding those not meeting the criteria of any other level.
SlotSel_Level0_C	To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 1.
SlotSel_Level0_D	To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 2.
SlotSel_Level0_E	To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 3.
SlotSel_Level0_F	To demonstrate that a station will select a slot at level 0 in preference to those slots available at level 4.
SlotSel_Level1_A	To demonstrate that a station will select a slot at level 1 when the appropriate criteria are satisfied.
SlotSel_Level1_B	To demonstrate that a station will select a slot at level 1, excluding those slots not meeting the criteria of level 1 or any lower priority level.
SlotSel_Level1_C	To demonstrate that a station will select a slot at level 1 in preference to those available at level 2.

Test Case Name	Description
SlotSel_Level1_D	To demonstrate that a station will select a slot at level 1 in preference to those available at level 3.
SlotSel_Level1_E	To demonstrate that a station will select a slot at level 1, in preference to those available at level 4.
SlotSel_Level1_F	To demonstrate that a station will select slots at level 1 from a more distant station in preference to a closer station.
SlotSel_Level2_A	To demonstrate that a station will select a slot at level 2 when the appropriate criteria are satisfied.
SlotSel_Level2_B	To demonstrate that a station will select a slot at level 2, excluding those slots not meeting the criteria of level 2 or any lower priority level.
SlotSel_Level2_C	To demonstrate that a station will select a slot at level 2 in preference to those available at level 3.
SlotSel_Level2_D	To demonstrate that a station will select a slot at level 2 in preference to those available at level 4.
SlotSel_Level2_E	To demonstrate that a station will select slots at level 2 from a more distant station in preference to a closer station.
SlotSel_Level3_A	To demonstrate that a station will select a slot at level 3 when the appropriate criteria are satisfied.
SlotSel_Level3_B	To demonstrate that a station will select a slot at level 3, excluding those slots not meeting the criteria of level 3 or any lower priority level.
SlotSel_Level3_C	To demonstrate that a station will select a slot at level 3 in preference to those available at level 4.
SlotSel_Level3_D	To demonstrate that a station will select slots at level 3 from a more distant station in preference to a closer station.
SlotSel_Level4_A	To demonstrate that a station will select a slot at level 4 when the appropriate criteria are satisfied.
SlotSel_Level4_B	To demonstrate that a station will select a slot at level 4, excluding those slots not meeting the criteria of level 4.
SlotSel_Level4_C	To demonstrate that a station will select a slot at level 4 from a more distant station in preference to a closer station.
SlotSel_Block_Level0_A	To demonstrate that a station will select a block of slots at level 0 when no slots are reserved.
SlotSel_Block_Level0_B	To demonstrate that a station will select a block of slots at level 0, excluding those not meeting the criteria of any other level.
SlotSel_Block_MixedLevel	To demonstrate that a station will select a block of slots from slots available at different levels.
SlotSel_Reselection	To demonstrate that a station after selecting a slot which has been reserved by another station will not select a slot which has been reserved by the same station within the next M1-1 slots.
SlotSel_Unsuccessful	To demonstrate that a station will fail to select a slot when no slots are available which are compatible with the QoS parameters.
SlotSel_QoSGroup	To demonstrate that a station will select a slot using a second group of QoS parameters when no slot has been selected by means of the first group.
Conflict_Periodic_A	To demonstrate that a station will continue to transmit a periodic stream without action in the event of a conflicting non-periodic transmission from another station.
Conflict_Periodic_B	To demonstrate that a station will dither a periodic stream to resolve a conflict with a periodic stream from another station.
Conflict_Periodic_C	To demonstrate that a station will move a periodic stream to a new location in the event of a conflict with a periodic stream from another station that does not allow the original stream to be dithered.
Conflict_NoAction	To demonstrate that a station will continue to transmit a periodic stream without action in the event of receiving a conflicting reservation such that the slot remains available.
Conflict_Incremental	To demonstrate that a station will not transmit in a slot previously reserved by an incremental broadcast reservation in the event of receiving a conflicting reservation, and will make the broadcast in an alternative slot by random access.
Conflict_BND	To demonstrate that a station which has made a BND reservation will not transmit in the reserved slot in the event of a conflicting reservation made by a periodic broadcast.
Conflict_Priority	To demonstrate that a station required to transmit in the same slot by conflicting requests will transmit the response of highest priority.
Conflict_FirstRequest	To demonstrate that a station required to transmit in the same slot by conflicting requests of equal priority will transmit the response to the first request.

Test Case Name	Description
Conflict_Channel_Priority	To demonstrate that a station required to transmit in the same slot on different channels by conflicting requests will transmit the response of highest priority.
Conflict_Channel_Ground_A	To demonstrate that when a station is requested to make a sync burst transmission in the same slot on different channels, the request from the ground station takes precedence.
Conflict_Channel_Ground_B	To demonstrate that when a station is requested to make a sync burst transmission in the same slot on different channels by more than one ground station, the latest request takes precedence.
Conflict_Channel_FirstRequest	To demonstrate that when a station is requested to make a sync burst transmission in the same slot on different channels by more than one ground station, the latest request takes precedence.
Slot_Boundary	To demonstrate that a transmission from the station complies with timing performance requirements at the slot boundary.
Slot_Delayed	To demonstrate that a delayed transmission from the station complies with timing performance requirements.
Rand_Busy	To demonstrate that a station will not make a random access transmission in a slot perceived to be busy at the start of the slot (e.g. a transmission which extends beyond the guard time).
Rand_Congestion	To demonstrate that the VSS User is informed if a request to make a random transmission is not successful within TM2 slots.
Rand_Persistence	To demonstrate that a random transmission is made with probability p.
Rand_MaxAttempts	To demonstrate that the station will authorize a random transmission as soon as the channel is available after VS3 unsuccessful attempts
Rand_Priority	To demonstrate that bursts queued for transmission by random access are transmitted in order of priority.
Rand_TM2Reset	To demonstrate that timer TM2 is reset following a successful random transmission when a further burst is queued for transmission.
Rand_TM2Clear	To demonstrate that timer TM2 is cleared following a successful random transmission when no further bursts are queued for transmission.
Rand_VS3Clear	To demonstrate that if a request to make a random transmission is not successful within TM2 slots then the VS3 counter is cleared and no transmission is made.
Rand_Availability	To demonstrate that a station makes random access attempts in slots available only at levels 0 to 2.
Null_Reservation	To demonstrate that no slot is reserved following the receipt of a null reservation.
Periodic_InitialRes	To demonstrate that in the absence of any conflicting reservation, a station will maintain a periodic reservation in a constant position in the superframe, with $pt = 3$ and $po = 0$ , until announcing a further dither.
Periodic_NonDitherRes	To demonstrate that a station receiving a periodic broadcast reservation specifying no dither will reserve the appropriate slots.
Periodic_DitherRes	To demonstrate that a station receiving a periodic broadcast reservation specifying dither will reserve the appropriate slots.
Periodic_DitherRange	To demonstrate that a station will maintain a periodic stream within the dither range in accordance with the V11 and V12 parameters.
Periodic_DitherOffset_A	To demonstrate that in the absence of a conflicting reservation, a station will announce a dither to a periodic stream three superframes before the dither occurs.
Periodic_DitherOffset_B	To demonstrate that in the absence of a conflicting reservation, following announcement of a dither to a periodic stream, the same dithered slot will be reserved by each of the subsequent two transmissions, containing decrementing values of $pt$ .
Periodic_DitherOffset_C	To demonstrate that a station will always dither away from the current transmission slot.
Periodic_DitherOffset_D	To demonstrate that following announcement of a dither to a periodic stream, the transmission slot will be adjusted to occupy the reserved slot.
Periodic_IndependentStreams	To demonstrate that separate streams of periodic broadcasts dither independently.
Periodic_Replacement	To demonstrate that a station receiving a periodic broadcast reservation in a slot previously by a periodic broadcast will replace the previous reservations by those carried in the new transmission.
Periodic_Quarantine_A	To demonstrate that a periodic reservation issued by a ground station will cause the following slots to be regarded as quarantined by a station receiving the response.
Periodic_Quarantine_B	To demonstrate that a periodic broadcast issued by a ground station greater than VS4 away will not cause slots to be quarantined.

Test Case Name	Description
Periodic_Availability_A	To demonstrate that a station will take account of the availability of the current transmission slot when dithering to a new slot.
Periodic_Availability_B	To demonstrate that when the current transmission slot is occupied at the dither of a periodic broadcast, the slot availability is determined from the first occupancy of the slot by a different station.
Periodic_Rate	To demonstrate that the station will establish a set of periodic streams at a nominal periodic rate according to the V11 parameter.
Periodic_TV11	To demonstrate that in the absence of any conflicting reservation a station will set the value of TV11 uniformly between the minimum and maximum values.
Periodic_Cancel	To demonstrate that a station receiving a periodic broadcast cancellation in a slot previously reserved for a periodic broadcast will cancel the periodic stream
Periodic_CancelIncremental	To demonstrate that upon receipt of an incremental broadcast in a slot expected to contain a periodic broadcast from the same peer station, the periodic stream is cancelled.
Periodic_CancelUnicast	To demonstrate that upon receipt of a unicast request with source/destination flag set to 1 in a slot expected to contain a periodic broadcast from the same peer station, the periodic stream is cancelled.
Periodic_CancelQuarantine	To demonstrate that a cancellation of a periodic reservation will cause quarantine to be preserved for one superframe following the cancellation.
Incremental_Reservation_A	To demonstrate that a station receiving an incremental broadcast reservation will reserve the appropriate slots.
Incremental_Reservation_B	To demonstrate that an incremental broadcast with io = 0 causes no reservation to be made.
Incremental_Request	To demonstrate that a station will select and reserve a series of future transmission slots by means of the incremental broadcast protocol.
Incremental_SlotSel	To demonstrate that a slot is selected for an incremental broadcast reservation from the appropriate candidate range.
Combined_Reservation	To demonstrate that receipt of a combined periodic and incremental broadcast reservation causes the appropriate slots to be reserved.
BND_Reservation	To demonstrate that reception of a BND reservation causes the appropriate slots to be reserved.
Unicast_Reservation_A	To demonstrate that reception of a point-to-point unicast reservation for the destination station to transmit causes the appropriate slots to be reserved.
Unicast_Reservation_B	To demonstrate that a reception of a point-to-point unicast reservation for the source station to transmit causes the appropriate slots to be reserved.
Unicast_Reservation_C	To demonstrate that a reception of a broadcast unicast reservation causes the appropriate slots to be reserved.
Unicast_Reservation_D	To demonstrate that a station applying the slot selection criteria will exclude any slot reserved by another station using the unicast request protocol with sdf = 1.
Info_Reservation	To demonstrate that a station receiving a burst containing an information transfer request reservation addressed to another station will reserve the slots identified for the information transfer and acknowledgement.
Autotune_Autonomous_A	To demonstrate that an autotune request for autonomous broadcasts on the current frequency with trmt = 0 causes a station to send autonomous sync bursts as directed, cancelling the current autonomous transmissions, and also that the default sync burst reporting rate is restored following expiry of the request.
Autotune_Autonomous_B	To demonstrate that an autotune request for autonomous broadcasts on a different frequency with trmt = 0 causes a station to send autonomous sync bursts as directed, cancelling the current autonomous transmissions, and also that the default sync burst reporting rate is restored following expiry of the request.
Autotune_Autonomous_C	To demonstrate that an autotune request for autonomous broadcasts with trmt = 1 causes a station to continue current autonomous transmissions during and after expiry of the request.
Autotune_Autonomous_D	To demonstrate that an autotune request for autonomous broadcasts on a different frequency with rcvr = 00 or 11 causes a station to continue receiving sync bursts on the current frequency.
Autotune_Autonomous_E	To demonstrate that an autotune request for autonomous broadcasts on a different frequency with rcvr = 01 causes a station to receive sync bursts on the indicated frequency.
Autotune_AutonomousCessation	To demonstrate that on cessation of an autotune command directing the reporting rate, normal default behaviour on the GSCs is established.
Autotune_Directed_A	To demonstrate that an autotune request directing transmission in specified slots on the current frequency, causes a station to transmit in the directed slots, cancelling current autonomous transitions, and that the default sync burst reporting rate is restored following expiry of the command.

Test Case Name	Description
Autotune_Directed_B	To demonstrate that an autotune request directing transmission in specified slots on a different frequency, causes a station to transmit in the directed slots, cancelling current autonomous transitions, and that the default sync burst reporting rate is restored following expiry of the command.
Autotune_Unsupported	To demonstrate that when an autotune request cannot be supported due to lack of receiver resources, a general failure is issued with the required error code.
Autotune_Reservation	To demonstrate that a station receiving a directed request from a ground station addressed to another station will reserve the directed slots.
Autotune_CancelResp	To demonstrate that a station making a directed request cancellation will provoke the addressed station to cancel the directed broadcast.
Autotune_CancelAbsent	To demonstrate that a station receiving a directed request addressed to another station will take no action upon receipt of a directed cancellation from the directing station alone.
Autotune_Override	To demonstrate that a station receiving a directed request with the override flag set will cancel previously placed directed request reservations made by the same station.
Autotune_Invalid_A	To demonstrate that an invalid directed rate autotune reservation results in no action.
Autotune_Invalid_B	To demonstrate that an invalid frequency field in an autotune reservation results in no reservation.
Autotune_DirectedCessation	To demonstrate that on cessation of an autotune command directing slots to use, normal default behaviour on the GSCs is established.
Autotune_DirectedCancelAutonomous	To demonstrate that receipt of a directed slot autotune causes autonomous reporting of the same data to be cancelled.
Autotune_DirectedQuarantine	To demonstrate that a response to a directed request issued by a ground station will cause the following slots to be regarded as quarantined by a station receiving the response.
PleaResponse_Reservation_A	To demonstrate that receipt of a plea response with a standard nominal rate causes the appropriate slots to be reserved.
PleaResponse_Reservation_B	To demonstrate that receipt of a plea response with a special nominal rate causes the appropriate slots to be reserved.
PleaResponse_Transmission_A	To demonstrate that receipt of a plea addressed to a station results in transmission of a plea response of the appropriate format.
PleaResponse_Transmission_B	To demonstrate that a second plea addressed to a station results in transmission of a plea response containing the remaining future slots from the previous plea response.
PleaResponse_Retransmission	To demonstrate that a plea response is not re-transmitted.
Block_Superframe_Reserve_A	To demonstrate that the station will not transmit in blocks of slots reserved by a ground station by means of a superframe block message.
Block_Superframe_Reserve_B	To demonstrate that the station will not transmit in blocks of slots reserved by a ground station by means of a superframe block message with block offset (bo) non-zero but block timeout (bt) set to 3.
Block_Superframe_Reserve_C	To demonstrate that the station will not transmit in blocks of slots reserved by a ground station by means of a superframe block message with block offset (bo) non-zero.
Block_Superframe_Invalid	To demonstrate that the station will ignore a superframe block reservation with re-broadcast offset < 2.
Block_Superframe_Rebroadcast	To demonstrate that a station will re-broadcast a superframe blocking message in accordance with a ground station request.
Block_Superframe_Quarantine	To demonstrate that a block reservation message issued by a station greater than distance VS4 away will not cause slots to be reserved.
Block_Secondframe_Reserve	To demonstrate that the station will not transmit in blocks of slots reserved by a ground station by means of a second frame block message.
Response_Reservation	To demonstrate that a response reservation field is recognized and causes no reservation to be made.
Request_Unsupported	To demonstrate that a station will respond to a general request burst that cannot be supported with a general failure burst.
Sync_Format	To demonstrate that a station will broadcast a sync burst with the correct format.
Sync_Format_Rec	To demonstrate that a station will correctly process a received sync burst.
Sync_Latency	To demonstrate that the latency of ADS data reported by the station is within acceptable limits.
Sync_Rate	To demonstrate that the station outputs autonomous sync bursts at a rate of at least one per M1 slots on all Global Signalling Channels (GSCs).
Sync_Interval	To demonstrate that a station outputs autonomous sync bursts with a uniform interval between nominal slots on each GSC.

Test Case Name	Description
Sync_Fixed_NIC	To demonstrate that a station sets the navigation uncertainty category appropriately.
Sync_Fixed_BaseAlt	To demonstrate that a station sets the base altitude in the fixed part of the sync burst in accordance with the input altitude data.
Sync_Fixed_DataAge	To demonstrate that a station sets the data age subfield of a sync burst appropriately.
NetEntry_Periodic	To demonstrate that a station which desires to gain entry to a network using the combined periodic and incremental broadcast protocols is able to set up a series of regularly spaced streams.
NetEntry_Delayed_Plea	To demonstrate that a station which desires to perform network entry using a delayed plea transmission will make such a transmission in an otherwise unoccupied slot.
NetEntry_Delayed_BND	To demonstrate that a station which desires to perform network entry using a delayed BND transmission will make such a transmission in an otherwise unoccupied slot.
NetEntry_Receive	To demonstrate that a station in receipt of a delayed transmission containing a plea will generate a reply to the source station with slots for it to transmit in, if it has some slots which it could make available.
NetEntry_OneMinute	To demonstrate that a station which desires to transmit for the first time without using network entry protocols, will listen to the channel on which it desires to transmit for 1 minute prior to making any transmissions.
UCTRL_param_VS1	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS1.
UCTRL_param_VS2	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS2.
UCTRL_param_VS4	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS4.
UCTRL_param_Q4	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter Q4.
UCTRL_param_CG1_limit	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter CG1_limit.
UCTRL_param_CG1_range	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter CG1_range.
UCTRL_param_CG1_inc	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter CG1_inc.
UCTRL_param_CG1_reach	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter CG1_inc.
UCTRL_param_CG1_decay	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter CG1_decay.
UCTRL_param_M2inc	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter M2inc.
UCTRL_param_M2limit	To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter M2limit.
ADS_Report_Receive	To demonstrate that a station receiving a sequence of ADS reports from a peer station will generate an appropriate output.
ADS_Report_Simultaneous	To demonstrate that a station is capable of receiving ADS reports simultaneously on both GSCs.
CPR_Encode	To demonstrate that a series of latitude and longitude positions may be correctly encoded in the sync burst using the CPR algorithm.
CPR_Decode	To demonstrate that a series of latitude and longitude positions may be correctly decoded from the sync burst using the CPR algorithm.
Power_Interrupt_A	To demonstrate that a station continues to operate the receiver through a power interrupt not exceeding 200 ms.
Power_Interrupt_B	To demonstrate that a station will observe the m2 filter after a power interrupt exceeding 200 ms.
DLS_NotSupported	To demonstrate that a station in receipt of a CTRL_RTS transmits a general failure with an error type of 80 hex when it does not support the DLS.
DLS_UDATA_Receive	To demonstrate that a UDATA DLPDU received from another station will be forwarded to the DLS user.
DLS_UDATA_Invalid	To demonstrate that a station receiving an invalid UDATA DLPDU will detect and discard it.

## 7.4.2 Declarations

For the performance of the tests, stimuli are applied and test results are observed at the Points of Control and Observation (PCO) as defined in clause 7.2.

## 7.4.3 Constraints

### 7.4.3.1 Abbreviations

#### 7.4.3.1.1 Subfield mnemonics

**Table 7.2: Subfield mnemonics**

<b>Mnemonic</b>	<b>Meaning</b>
a	Additional slots
a/d	Autonomous/directed flag
auto	Autonomous information
balt	Base altitude
b/g	Baro/geo altitude
blg	Block length
bo	Block offset
br	Block repeat rate
bs	Block start
bt	Block timeout
c	CRC
cprf	CPR format even/odd
d	Destination address
da	Data age
dos	Directory of services flag
erid	Extended reservation ID
f	Frequency
flag	Flag delimiting burst
id	Information field identity
in	Information field
io	Incremental offset
lat	Latitude
lon	Longitude
mi	Message ID
nd	Negative dither
nr	Nominal update rate
nic	Position navigation integrity category
off	Offset to first reserved slot
ok	Confirm/failure flag
po	Periodic offset
pr	Priority
pr_flag	Plea response flag
pt	Periodic timeout
r-b/a	Requested baro/geo altitude
r-mi	Requested message ID
rcvr	Receiver control
rd	Reservation data
res	Reserved bit
rid	Reservation ID
ro	Response offset
roff	Re-broadcast offset
s	Source address
sdf	Source/destination flag
sleep	Autonomous monitoring
sz	Size
tc	Trajectory Change Point change flag

Mnemonic	Meaning
tfom	Time FOM
ver	Version number
vt	Timeout

#### 7.4.3.1.2 Special characters used in the subfield definitions

**Table 7.3: Special characters used in the subfield definitions**

Character	Meaning
-	Subfield not applicable (0 bit length)
x	The value of this subfield is do not care
	The subfield is defined in an extra table

#### 7.4.3.1.3 Station addresses and positions

Station addresses are referred to in the test cases in the following format:

add\_A = address of the station under test (station A);

add\_B = address of simulated station B (simulated by the test equipment);

add\_C = address of simulated station C;

with the pattern continuing for other stations. A simulated ground station is normally named G, with address "add\_G".

The test station (station A) is assumed to be at 0° latitude and at 0° longitude. The positions of other stations are given in terms of the direction (East, E, is used for all cases) and distance in nautical miles with respect to the position of station A.

The following functions:

lat:= CPR\_LAT(y);

lon:= CPR\_LON(x);

are used to indicate that the given position will need to be encoded using the CPR encoding algorithm, defined in clause 5.6 of ETSI Ground Station.

For example, the encoded position of the test station (station A) is:

lat:= CPR\_LAT(0);

lon:= CPR\_LON(0);

while the encoded position of a simulated station B, that is 325 NM away from A, will be expressed as:

lat:= CPR\_LAT(0);

lon:= CPR\_LON(E 325 NM).

The positions of the simulated stations in the tests have been given on the basis of the following set of values of the Q2 parameters. This set is used as the default in the tests and referred to as Q2 Set 1. The ICAO VDL Mode 4 Technical Manual [1] default values are used for the parameters Q2a, Q2b, and Q2d. A value of Q2c = 120 NM is used in order to allow testing of conditions it would not be possible to test if Q2c = 0.

**Table 7.4: Q2 Parameters: Q2 Set 1 (Default for all tests)**

Symbol	Parameter Name	Value	Notes
Q2a	Slot selection range constraint for level 1	150 NM	
Q2b	Slot selection range constraint for level 2	150 NM	
Q2c	Slot selection range constraint for level 3	120 NM	Not a VDL4 Technical Manual default value
Q2d	Slot selection range constraint for level 4	300 NM	

For some tests, a second less stringent set of values for the Q2 parameters is specified, to be used when slot selection fails using Set 1. This set is defined below and referred to as Q2 Set 2:

**Table 7.5: Q2 Parameters: Q2 Set 2**

Symbol	Parameter Name	Value
Q2a	Slot selection range constraint for level 1	100 NM
Q2b	Slot selection range constraint for level 2	100 NM
Q2c	Slot selection range constraint for level 3	80 NM
Q2d	Slot selection range constraint for level 4	200 NM

For some tests, the following set of values for the Q2 parameters is used:

**Table 7.6: Q2 Parameters: Q2 Set 3**

Symbol	Parameter Name	Value
Q2a	Slot selection range constraint for level 1	150 NM
Q2b	Slot selection range constraint for level 2	150 NM
Q2c	Slot selection range constraint for level 3	120 NM
Q2d	Slot selection range constraint for level 4	120 NM

For assessment of conflict resolution, the following set of values for the Q2 parameters is used, as specified in ICAO VDL Mode 4 Technical Manual [1], clause 1.5.5.1.4:

**Table 7.7: Q2 Parameters: Q2 Set 4**

Symbol	Parameter Name	Value
Q2a	Slot selection range constraint for level 1	360 NM
Q2b	Slot selection range constraint for level 2	360 NM
Q2c	Slot selection range constraint for level 3	360 NM
Q2d	Slot selection range constraint for level 4	360 NM

#### 7.4.3.1.4 Tables of values for use in CPR test cases

The following tables are used in the CPR test cases.

Table 7.8: CPR state machine for position report processing (points not straddling a transition level)

In State				1	2		3		4	
Last report				None	Even	Odd	Even	Odd	Even	Odd
Target position quality				None	None	None	Local	Local	Global	Global

**Table 7.10: Key to CPR encoding table in following section**

Table heading	Description
latitude	latitude to be encoded
longitude	longitude to be encoded
cpr type	CPR type of position report
lat enc	encoded latitude for transmission in fixed part of sync burst
lon enc	encoded longitude for transmission in fixed part of sync burst

Test values for CPR report encoding CPR\_ENC\_TABLE (row, column) (CE(r, c))

(For the key to this table see the section above.)

The CPR test values have been designed assuming an aircraft travelling at constant velocity in a north-easterly direction and transmitting its position with a CPR report every 10 s. The receiving station is assumed to miss many of the transmitted reports, and in a way which allows this test to pass through all the various operations of the state machine during the decoding process (see table in clause 5.2.4.3.2.7). The missed positions, which are not relevant here, are excluded from the encoding table below and from the decoding table in clause 5.2.4.3.2.7 for clarity.

The input latitude and longitude values in the first two columns of the encoding table below (and in the first four columns of the table in clause 5.2.4.3.2.7) vary for the purpose of the test up to the fourth decimal place, but are required to be accurate to 9 decimal places as shown, in order to achieve the given encoded values.

Table 7.11: Test values for CPR report encoding CPR\_ENC\_TABLE (row, column) (CE(r, c))

latitude	longitude	cpr_type	lat_enc	lon_enc
12,855700000	-0,815000000	0	1 169	15 085
12,872000000	-0,798700000	1	1 030	15 147
12,888300000	-0,782400000	0	1 183	15 137
12,904600000	-0,766100000	1	1 043	15 198

#### CPR test value tolerances

The number of decimal places afforded to the decoded latitude and longitude values in the last eight columns of the previous tables varies according to the resolution expected from the decoding algorithm (see table 7.12). When using the tables to test the validity of an installed algorithm, the given decoded latitude and longitude values should be interpreted using the tolerances given in the last column of the table 7.12.

**Table 7.12: CPR test value tolerances**

Decoded Parameter	Total number of bits used to encode	Approximate max decoded error (degrees)	Number of decimal places given to decoded values	Tolerance to be given on decoded values during test of algorithm (degrees)
Decoded lat	12	$\pm 0,0012$	4	$\pm 0,0003$
Decoded lon	14	$\pm 0,0012$ (see note)	5	$\pm 0,0003$
NOTE: These figures take into account that in the case of longitude the maximum error in the decoded value is up to four times greater at high latitudes.				

NOTE: Since the figures given in the previous tables are designed to be used to test the CPR algorithm, the decoded figures in the last eight columns of the table are given to more decimal places than the number of decimal places to which the decoded results may be relied upon for position reporting.

Key to CPR decoding table in following section.

**Table 7.13: Key to CPR decoding table in following section**

Table heading	Description
lat last	input latitude from last position
lat prev	input latitude from previous (last but one) position
lon last	input longitude from last position
lon prev	input longitude from previous (last but one) position
tl	input CPR type from last position
tp	input CPR type from previous (last but one) position
tr	indicates 1 if the two points straddle a transition latitude (and 0 otherwise)
i	initial state in CPR state machine
tim	time in seconds since last report received
o	indicates whether the receiver knows its own position
op	state machine operation used (see Op field in state machine tables above)
cal	calculation determined by state machine operation
f	final state in CPR state machine
decoded lat	decoded latitude without high resolution offset
decoded lon	decoded longitude without high resolution offset

Test values for CPR report decoding CPR\_DEC\_TABLE (row, column) (CD(r, c))

(For the key to this table see the section above.)

The encoding for the latitude and longitude values contained in the first four columns of the decoding table below is given in the encoding table above.

The decoding operation used in the table below is determined by the state machine tables, and referred to in this table using the column with heading "op". The time since a report was last received is indicated by the column headed "tim". When plotted, the decoded positions form a straight line in a north-easterly direction (allowing for the expected decoding errors), with gaps in the line corresponding to the missed reports.

**Table 7.14: Test values for CPR position report decoding CPR\_DEC\_TABLE (row, column) (CD(r, c))**

### 7.4.3.1.6 VDL4 burst formats

In the following definitions, the function  $\text{int}(x)$  shall be taken to mean the largest integer less than or equal to  $x$ .

A subfield value of "x" shall mean that the parameter value may be ignored for the purpose of the particular test.

The following burst formats do not include the effect of bit stuffing. On generation of a burst at the RF PCO by the test harness, a logical 0 shall be inserted following a consecutive sequence of five logical 1s, except when arising in a flag. During recording of a burst by the test harness at the RF PCO, a sequence of five logical 1s followed by a 0 shall cause the 0 to be removed.

On generation of a burst, the test harness shall insert the value of the CRC field in accordance with clause 5.2.1.1.

**Table 7.17: SYNC\_BURST\_a (Sa): Information field all "0"s, occupies one slot, lat and lon specified**

### 7.4.3.2 Test cases

The equipment under test must be brought into the defined idle state before the performance of the individual test cases. Each test case starts in this state and leaves the equipment in that state after completion. The idle state is the state which the equipment enters after successful completion of the power up sequence. To perform several test cases in sequence the power on macro M\_POWER\_UP must only be executed at the beginning.

All protocol test cases shall be performed on a GSC channel (GSC1 or GSC2) unless stated otherwise in the test case itself.

Whenever a burst is specified in a test without values being given for all the parameters in a burst, and where the test does not instantiate the values, then the values of these parameters may be ignored.

If an expected test result mentioned in a test step is not observed during the execution of a test case, then the test case must be terminated and the equipment initialized before a new test case is executed. Further verification in that test case may not provide any valid results.

### 7.4.3.2.1 Test case macros

The following macros are used in several test cases.

DATA\_a(*m*) (Da(*m*)): Definition: Fill *m* bits of data with "0"s followed by "1"s. Bit number 1 is "0".

*m* odd

bit <sub><i>m</i></sub>	bit <sub><i>m</i>-1</sub>	bit <sub><i>m</i>-2</sub>		bit <sub>4</sub>	bit <sub>3</sub>	bit <sub>2</sub>	bit <sub>1</sub>
0	1	0		1	0	1	0

*m* even

bit <sub><i>m</i></sub>	bit <sub><i>m</i>-1</sub>	bit <sub><i>m</i>-2</sub>		bit <sub>4</sub>	bit <sub>3</sub>	bit <sub>2</sub>	bit <sub>1</sub>
1	0	1		1	0	1	0

Macro Name: M_POWER_UP				VDL4 ground station power up.		
Parameters:						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
macro	1	do		Switch on VDL4 ground station		
	2	verify	Self test	Successful VDL4 ground station BITE self test		Verify that the VDL4 ground station has successfully passed BITE power-up test.
	3	wait		3 minutes		Wait for ground station to acquire reservation table and default into idle state.
	4	send	Position	Input test station's ADS position		Inform station under test of its own position.
	5	record		add_A:= address of station under test		
	6	send	VSS	SET PARAMETERS (V66:= 0)		Set the second frame block reservation to 0.
Comments: This macro prepares the VDL4 ground station for testing. It brings the VDL4 ground station into the defined idle state.						

Macro Name: M_RAND_ACC_SU (sf)				Establish a queue of random access transmissions over a number of superframes.		
Parameters: (sf = number of superframes to transmit over)						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
macro	1	repx		$n := 0$ ; $sf :=$ no. of superframes to transmit over		Maintains transmissions over $sf$ superframes.
	2	queue	VSS	DATA_a( $m$ )	Da( $m$ )	Send packets of data (labelled DATA_a) to the station under test for subsequent transmission by the random access protocol. Identify packets with repeating 10101010 bit sequence over $m$ bits.
	3	until		$n = sf \times M1$ ; $n = n + 1$		Send $M1 \times sf$ random access transmissions.
<b>Comments:</b> Establishes a queue of random access transmissions over a defined number of superframes. Each random access is transmitted as a discrete burst, requiring the station under test to verify the state of the channel at the slot boundary prior to transmission. Flow control must be implemented at the VSS User PCO to ensure that the station under test is not flooded. This macro tests which slots the station considers occupied. It is acceptable for implementations to use other means to provide this information (e.g., with a command on the VSS PCO).						

Macro Name: M_RAND_ACC_SL (slots)				Establish a queue of random access transmissions over a number of slots.		
Parameters: (slots = number of slots to transmit over)						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
macro	1	repx		$n := 0$ ; $slots :=$ no. of slots to transmit over		Maintains transmissions over sf superframes.
	2	queue	VSS	DATA_a( $m$ )	Da( $m$ )	Send packets of data (labelled DATA_a) to the station under test for subsequent transmission by the random access protocol. Identify packets with repeating 10101010 bit sequence over $m$ bits.
	3	until		$n = slots$ ; $n := n + 1$		Send $slots$ random access transmissions.
<b>Comments:</b> Establishes a queue of random access transmissions over a defined number of superframes. Each random access is transmitted as a discrete burst, requiring the station under test to verify the state of the channel at the slot boundary prior to transmission. Flow control must be implemented at the VSS User PCO to ensure that the station under test is not flooded. This macro tests which slots the station considers occupied. It is acceptable for implementations to use other means to provide this information (e.g., with a command on the VSS PCO).						

Macro Name: M_ASSIGN_SLOTS (pos1, pos2)				Chooses two random slot positions.		
Parameters: (pos1 = variable to which first slot position is assigned, pos2 = variable to which second slot position is assigned)						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
macro	1	record		pos1:= 64 + 4 x RAND(0, 5)		Slot to reserve within each candidate range, chosen at random from the six possible candidate slots.
	2	repx				
	3			pos2:= 64 + 4 x RAND(0, 5)		Choose another slot position within the candidate range.
	4	until		pos2 ≠ pos1		Ensure random_position_2 differs from random_position_1.
	5	do		IF pos2 < pos1 THEN buffer:= pos1 pos1:= pos2 pos2:= buffer		Swap order of slot positions if necessary.
Comments: Chooses two random slot positions from the incremental broadcast candidate range used in a number of test cases.						

## 7.4.3.2.2 Test case descriptions

Test Case Name:		Physical_SysParams				
Purpose:		To demonstrate that a station operates correctly at the limits of the physical layer system parameters.				
Special test instructions:		<p>This test case tests requirements in EN 302 842-1 [4]. The test description is located in the present document and not in EN 302 842-1 [4] as the present document includes all the necessary additional requirements and information for the completion of protocol tests, of which this is one.</p> <p>This test case is set up to last up to 10 minutes. Whilst the loop is executing, the timing of the test signals relative to UTC time shall be adjusted using a waveform analyser to inspect the timing between a) the end of the final data bit of the sync burst (<math>t_{\text{sync\_burst}}</math>) received in step 19 and the start of the first data bit of the unicast burst (<math>t_{\text{unicast1}}</math>) in step 20, and b) the end of the final bit of the unicast burst (<math>t_{\text{unicast2}}</math>) in step 20 and the start of the first bit of the random access burst in the next slot (<math>t_{\text{random}}</math>).</p> <p>Two tests shall be carried out using this test case:</p> <p>The timing shall be adjusted such that <math>t_{\text{unicast1}} - t_{\text{sync\_burst}}</math> equals 3 083,3 microseconds +/- 1 microseconds. Successful demonstration of the test case step 22 ensures compliance with MOPS and (ICAO VDL SARPS [1] 6.9.5.4.3)</p> <p>The timing shall be adjusted such that <math>t_{\text{random}} - t_{\text{unicast2}}</math> equals 2 099,3 microseconds +/- 1 microseconds. Successful demonstration of the test case step 22 ensures compliance with MOPS and (ICAO VDL SARPS [1] 6.9.5.4.1)</p> <p>Note that the tests are carried out using the start and end of the burst data blocks as reference points. This is because it is otherwise impossible to determine the exact end points of the receive function and the start of the transmitter power stabilization sequence.</p>				
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SET PARAMETERS (p:= 1)		Ensure 100 % chance of transmission on access.
	3	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
test body	4	send	VSS	PERIODIC BROADCAST request to transmit SYNC_BURST_n (Q4:= 3; TV11 <sub>min</sub> := 15; TV11 <sub>max</sub> := 16; V11:= 60; V12:= (2/M1) × 60)	Sn	Set up a series of periodic streams of one-slot messages from the station under test. Q4 set to 3. TV11 reservation hold timer is set to hold stream for 15 superframes. V11 set to 60 bursts within M1 slots. V12 set to give dither range of ±1. Length of sync burst is extended by 2 octets greater than normal 1 slot length.
	5	rep 60		n:= 1		Repeat 60 times to record the times of the sync bursts within the first minute.
	6	await	RF	SYNC_BURST_n (pt:= 0; s:= add_A)	Sn	
	7	record	RF	sync_time(n):= time at beginning of slot of n <sup>th</sup> SYNC_BURST_n  diff_time:= sync_time(n) - sync_time(1) - (n - 1)  slot_diff(n):= diff_time × M1/60	Sn	Record the time of the n <sup>th</sup> sync burst. sync_time(1) defines a reference time to measure relative times from during the test.  Calculate the relative time differences between each ct_slot and the ct_slot of the first burst and transpose to a common time reference.  Convert time differences to slot differences.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	8	endrep		$n := n + 1$		
	9	rep 10		$m := 1$		Repeat test enough times to allow test station timing to be adjusted. 10 minutes is provided.
	10	rep 30		$n := 1$		Repeat 30 times per minute.
	11	send	RF	UNI_BURST_a (sdf:= 1; ro:= slot_diff(n + 1) - 1; lg:= 0; pr:= 0; s:= add_B; d:= add_A) in slot beginning at time = sync_time(n) + 60 × m + 60/(M1)	Ua	Send a unicast burst from a simulated station B, in the slot following the sync burst from station under test, reserving a slot (r_slot) 1 slot after the next sync burst for the source to transmit in (r_slot = t_slot + ro + 1).
	12	macro		M_RAND_ACC_SL (slots:= 100)		Queue random access transmissions over 100 slots.
	13	await	RF	RAND_ACC_DATA_a (s= add_A)	Ra	First random access transmission should occur before the slot reserved by the unicast reservation.
	14	record	RF	start_time:= time at beginning of slot containing RAND_ACC_DATA_a (s= add_A)	Ra	Define a reference time to measure relative times from during the test.
	15	repx		$q := 1$		
	16	verify	RF	RAND_ACC_DATA_a (s= add_A) in slot beginning at time = start_time + q × 60/M1	Ra	Verify that random access transmissions are made by the station under test in the slots preceding the reserved slot.
	17	until		time = sync_time(n + 1) + 60 × m - 60/M1; $q := q + 1$		End the loop when the slot immediately preceding the next sync burst from station under test.
	18	await		time = sync_time(n + 1) + 60 × m		
	19	verify	RF	SYNC_BURST_b (s= add_A) in slot beginning at time = sync_time(n + 1) + 60 × m		
	20	send	RF	UNI_BURST_a (sdf:= 1; ro:= 1; lg:= 0; pr:= 0; s:= add_B; d:= add_A) in slot beginning at time = sync_time(n + 1) + 60 × m + 60/M1	Ua	Send a unicast burst from a simulated station B, reserving a slot 2 slots in the future.
	21	repx		$q := 1$		
	22	verify  verify	RF  RF	IF $q = 2$ THEN no transmission present in slot beginning at time = sync_time(n + 1) + 60 × m + (q + 1) × 60/M1 ELSE RAND_ACC_DATA_a (s=add_A) in slot beginning at time = sync_time(n + 1) + 60 × m + (q + 1) × 60/M1	Ra	Verify that random access transmissions are made by the station under test in all slots except the reserved slot.
	23	until		time = start_time + 100 × 60/M1; $q := q + 1$		End the loop 100 slots after the first random access transmission was sent.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	24	endrep		$n := n + 2$		
	25	endrep		$m := m + 1$		
postamble	26	send	VSS	SET PARAMETERS ( $p := 64/256$ )		Reset to default value.
	27	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
<b>Comments:</b>						

Test Case Name:		Timing_Primary				
Purpose:		To demonstrate that when primary timing is available, a transmission from the station complies with primary timing performance.				
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the ground station for testing.
	2	do	TIME	ESTABLISH PRIMARY TIME INPUT		Establish source of primary time information.
test body	3	rep 10		$n := 1$		
	4	await	RF	SYNC_BURST_c ( $s = add\_A$ )	Sc	Wait for an autonomous sync burst.
	5	verify	RF	For SYNC_BURST_c ( $s = add\_A$ ) $tfom = 0$ or $1$	Sc	Verify that the time figure of merit of the autonomous sync burst indicates either certified or non-certified primary time.
	6	record	RF	$t =$ time at which first data is transmitted in the slot containing the sync burst, measured from the test equipment's UTC slot start time		
	7	verify	RF	$t = 2\,083,3 \pm 1,1\ \mu s$		Verify that the time at which data is first transmitted in the slot is compliant with the requirements of primary timing.
	8	endrep		$n := n + 1$		
postamble	9					
<b>Comments:</b> The first bit of data is required to be transmitted within $\pm 0,6\ \mu s$ from the start of the slot. The primary time source is required to be synchronized to UTC time with a precision of $0,4\ \mu s$ two sigma, and can thus be expected to be within $0,5\ \mu s$ on 99 % of occasions. Thus, the worst case timing error at the RF PCO is expected to be within $0,6 + 0,5 = 1,1\ \mu s$ .						
Note that the test equipment's UTC time needs to be certified to be accurate by some means.						

Test Case Name:		Timing_Secondary				
Purpose:		To demonstrate that when primary timing is unavailable, a transmission from the station complies with secondary timing performance.				
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the ground station for testing.
	2	do	TIME	DISCONNECT PRIMARY TIME INPUT		Disconnect source of primary time.
test body	3	rep 10		$n := 1$		
	4	send	RF	SYNC_BURST_a ( $tfom = 0$ ; $s = add\_B$ ; $CPR\_LAT(0)$ ; $lon := CPR\_LON(E\ 10\ NM)$ )	Sa	Send a sync burst from a simulated station B declaring certified primary time. The start of the burst shall be delayed from the slot start time to simulate the delay caused by the time-of-flight from station B.
	5	await	RF	SYNC_BURST_c ( $s = add\_A$ )	Sc	Wait for an autonomous sync burst.
	6	record	RF	$tfom\_A =$ tfom contained in SYNC_BURST_c ( $s = add\_A$ )	Sc	Time figure of merit of the autonomous sync burst.
	7	record	RF	$t =$ time at which first data is transmitted in the slot containing the sync burst, measured from the test equipment's UTC slot start time		
	8	verify	RF	<b>IF</b> $tfom\_A = 0$ or $1$ <b>THEN</b> $t = 2\ 083,3 \pm 1,1\ \mu s$ <b>ELSE</b> $tfom\_A = 2$ <b>AND</b> $t = 2\ 083,3 \pm 20\ \mu s$		Verify that the time at which data is first transmitted in the slot is compliant with the requirements of either primary or secondary timing.
	9	endrep		$n := n + 1$		
postamble	10	do	TIME	ESTABLISH PRIMARY TIME INPUT		Re-establish source of primary time information.
<b>Comments:</b> The first bit of data is required to be transmitted within $\pm 0,6\ \mu s$ from the start of the slot. The secondary time source is required to be synchronized to UTC time with a precision of $15\ \mu s$ two sigma, and can thus be expected to be within $19,3\ \mu s$ on 99 % of occasions. Thus, the worst case timing error at the RF PCO is expected to be within $0,6 + 19,3 \approx 20\ \mu s$						

Test Case Name: Timing_Secondary_Recover						
Purpose: To demonstrate that when primary timing becomes available to a station which is transmitting on secondary time, it reverts to using primary time.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the ground station for testing.
test body	2	rep 10		$n := 1$		
	3	do	TIME	DISCONNECT PRIMARY TIME INPUT		Disconnect source of primary time.
	4	send	RF	SYNC_BURST_a (tfom = 0; s = add_B; CPR_LAT(0); lon := CPR_LON(E 10 NM))	Sa	Send a sync burst from a simulated station B declaring certified primary time. The start of the burst shall be delayed from the slot start time to simulate the delay caused by the time-of-flight from station B.
	5	await	RF	SYNC_BURST_c (s = add_A)	Sc	Wait for an autonomous sync burst.
	6	verify	RF	For SYNC_BURST_c (s = add_A) tfom = 0, 1 or 2	Sc	Verify that the time figure of merit of the autonomous sync burst indicates primary or secondary time.
	7	do	TIME	ESTABLISH PRIMARY TIME INPUT		Establish source of primary time.
	8	verify	RF	For SYNC_BURST_c (s = add_A) tfom = 0 or 1	Sc	Verify that the time figure of merit of the autonomous sync burst indicates primary time.
	9	record	RF	$t =$ time at which first data is transmitted in the slot containing the sync burst, measured from the test equipment's UTC slot start time		
	10	verify	RF	$t = 2\,083,3 \pm 1,1 \mu\text{s}$		Verify that the time at which data is first transmitted in the slot is compliant with the requirements of primary timing.

	18	send	VSS	SET PARAMETERS (V11:= 1)		Reset to default value.
<b>Comments:</b> This test requires waiting for one minute to perform net entry. If this is not supported by a station, then this test does not apply.						

Test Case Name: UCTRL_param_VS1						
Purpose: To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS1.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
test body	3	send	RF	UCTRL_VS (VS1:= 6; VS2, VS4, VS5:= default values; s:= add_G)	Cv	Send a broadcast UCTRL from a simulated ground station G addressed to the station under test. The transmission sets the VS1 parameter to 6.
	4	send	RF	SYNC_BURST_b (pt:= 3; po:= 0; a/d:= 1; s:= add_G, address indicating source is a ground station)	Sb	Send a sync burst (burst length 1) from ground station G reserving the same transmission slot, and the following VS1=6 ground quarantined slots, in the next 4 superframes.
	5	record	RF	periodic_start:= time at beginning of slot containing SYNC_BURST_b	Sb	Provides a reference time for the reserved slots of the ground station G.
	6	macro		M_RAND_ACC_SU (sf:= 5)		Queue random access transmissions over 2 superframes.
	7	await	RF	RAND_ACC_DATA_a (s= add_A)	Ra	Wait for the start of the random access transmissions.
	8	await		time = periodic_start + 60		
	9	rep M1		n:= 0		Verify over 1 superframe.
	10	verify	RF	IF n = {1, 2, 3, 4, 5, 6} THEN no transmission present in slot beginning at time = periodic_start + (n + M1) × 60/M1 ELSE RAND_ACC_DATA_a (s= add_A) in slot beginning at time = periodic_start + (n + M1) × 60/M1	Ra	Verify that random access transmissions are made by the station under test in all slots except the reserved slots and the following ground quarantined slots.
	11	endrep		n:= n + 1		
	12	send	VSS	SET PARAMETERS (p:= 64/256)		Reset to default value.
postamble	13	send	RF	UCTRL_VS (VS1, VS2, VS4, VS5:= default values; s:= add_G)	Cv	Send a broadcast UCTRL from ground station G addressed to the station under test, setting the VS1 parameter back to its default value.
	14	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
<b>Comments:</b>						

Test Case Name: UCTRL_param_VS2						
Purpose: To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS2.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts.
	3	send	VSS	SET PARAMETERS (Q4:= 6; V22:= 720/(V21×M1))		Q4 set to 6; equals the number of slots in the incremental broadcast dither range available for selection. V21 (nominal reserved slot position) equals default value of 1,0 s. V22 (max incremental dither range) set to minimum; gives maximum dither range of $75 \pm 12$ after the incremental broadcast transmission slot (allowed slots of 64, 68, 72, 76, 80, 84).
test body	4	send	RF	UCTRL_VS (VS2:= 14; VS1, VS4, VS5:= default values; s:= add_G)	Cv	Send a broadcast UCTRL from a simulated ground station G addressed to the station under test. The transmission sets the VS2 parameter to 14, representing a CCI ratio of 5 instead of the default value of 4.
	5	send	VSS	INCREMENTAL BROADCAST request to transmit INCREM_BURST_a followed by successive INCREM_BURST_a in reserved slots	Ia	Request to send incremental broadcast reservation and to place another incremental broadcast reservation in each reserved slot, thus creating an automatic succession of incremental broadcast reservations.
	6	await	RF	INCREM_BURST_a (s= add_A)	Ia	Wait for the incremental broadcast reservation.
	7	record	RF	current_inc_time:= time at beginning of slot containing INCREM_BURST_a (s= add_A)	Ia	Record the time of the incremental reservation transmission slot as current_inc_time.
	8	record	RF	IO(0):= io contained in INCREM_BURST_a (s= add_A)	Ia	Record value of io given in the incremental broadcast reservation.
	9	record		random_position:= 64 + 4 × RAND(0, 5)		Slot to reserve within each candidate range, chosen at random from the six possible candidate slots.
	10	record		no_IO(m):= 0 for m:= {64, 68, 72, 76, 80, 84}		Initialize the number of slots in each candidate slot position to zero.
	11	rep 60		n:= 1		Repeat 60 times.
	12	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_B; lat:= CPR_LAT(0); lon:= CPR_LON(E 160 NM)) (position of station B is > Q2a away from station under test) in slot beginning at time = current_inc_time + 5 × 60/M1	Sa	Send a sync burst from a simulated station B > Q2a away from the station under test, reporting B's position.
	13	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_D; lat:= CPR_LAT(0); lon:= CPR_LON(E 195 NM)) (position of station D is such that a transmission from B to D is not CCI protected with a CCI ratio of 5 but would be with a CCI ratio of 4) in slot beginning at time = current_inc_time + 10 × 60/M1	Sa	Send a sync burst from a simulated station D, reporting D's position, which is such that a transmission from B to D is not CCI protected with a CCI ratio of 5 (but would be with a CCI ratio of 4).
	14	record		reserve_slot:= 4 × IO(n - 1) + random_position		Slot position to reserve within the next-but-one incremental broadcast candidate range.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	15	send	RF	UNI_BURST_a (sdf:= 1; ro:= reserve_slot - 15 - 1; lg:= 0; pr:= 0; s:= add_B; d:= add_D) in slot beginning at time = current_inc_time + 15 × 60/M1	Ua	Send a unicast burst from station B > Q2a away from A, reserving a slot for transmission to station D. The distance from the station under test (station A) to station D is such that a transmission from B to D is not CCI protected with a CCI ratio of 5 (but would be with a CCI ratio of 4).  The burst reserves a slot in the candidate range of the next-but-one incremental broadcast reservation.
	16	await	RF	INCREM_BURST_a (s= add_A)	la	Wait for the next incremental broadcast reservation.
	17	record	RF	current_inc_time:= time at beginning of slot containing INCREM_BURST_a (s= add_A)	la	Record the time of the incremental reservation transmission slot as current_inc_time.
	18	record	RF	IO(n):= io contained in INCREM_BURST_a (s= add_A)  no_IO(IO(n)):= no_IO(IO(n)) + 1	la	Record value of io given in the incremental broadcast reservation. Record the frequency of occurrence of slots in each candidate slot position.
	19	endrep		n:= n + 1		
	20	verify		no_IO(random_position) = 0		Verify that no transmission is made in the slot reserved by station B.
	21	rep 6		m:= 64; chi_squared:= 0		Set value of m to the minimum value of the candidate range. Initialize chi_squared.
	22	record		IF m ≠ random_position THEN chi_squared:= chi_squared + (no_IO(m) - 10) <sup>2</sup> /10		For all the other slots the distribution is tested for uniformity by calculating the value of chi_squared.
	23	endrep		m:= m + 4		
	24	verify		chi_squared < 11,7		Value of chi_squared shall be less than 11,7 for confidence that the distribution is uniform (4 degrees of freedom). The test should be repeated if the value of chi_squared exceeds this value (this will normally happen with a uniform distribution on only 2 % of occasions).
postamble	25	send	VSS	SET PARAMETERS (Q4:= 3; V22:= MIN(0.75, maximum allowed value of V22); VS2:= 12)		Reset to default values.
	26	send	RF	UCTRL_VS (VS1, VS2, VS4, VS5:= default values; s:= add_G)	Cv	Send a broadcast UCTRL from ground station G addressed to the station under test, setting the VS2 parameter back to its default value.
	27	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
<b>Comments:</b>						

Test Case Name: UCTRL_param_VS4						
Purpose: To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter VS4.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
test body	3	send	RF	UCTRL_VS (VS4:= 25; VS1, VS2, VS5:= default values; s:= add_G)	Cv	Send a broadcast UCTRL from a simulated ground station G addressed to the station under test. The transmission sets the VS4 parameter to 250 NM.
	4	send	RF	SYNC_BURST_k(3) (pt:= 3; po:= 0; a/d:= 1; s:= add_G, address indicating source is a ground station; lat:= CPR_LAT(0); lon:= CPR_LON(E 270 NM)) (position of ground station G is > VS4 away from station under test)	Sk(3)	Send a sync burst 3 slots in length from ground station G > VS4 away from the station under test, reporting the ground station's position.
	5	macro		M_RANDOM_ACCESS_SU (sf:= 4)		Queue random access transmissions over 4 superframes.
	6	await	RF	RAND_ACCESS_DATA_a (s= add_A)	Ra	Wait for the start of the random access transmissions.
	7	record	RF	start_time:= time at beginning of slot containing RAND_ACCESS_DATA_a (s= add_A)	Ra	
	8	rep 4xM1		p:= 0

	10	endrep		p:= p + 1		
postamble	11	send	RF	UCTRL_VS (VS1, VS2, VS4, VS5:= default values; s:= add_G)	CXe	Send a broadcast UCTRL from ground station G addressed to the station under test, setting the VS4 parameter to its default value.
	12	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
Comments:						

Test Case Name: UCTRL_param_Q4						
Purpose: To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of private parameter Q4.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
	3	send	VSS	SET PARAMETERS (Q4:= 6; V22:= 720/(V21×M1))		Q4 set to 6; equals the number of slots in the incremental broadcast dither range available for selection. V21 (nominal incremental reserved slot position) equals default value of 1,0 sec. V22 (max incremental dither range) set to minimum; gives maximum dither range of $75 \pm 12$ after the incremental broadcast transmission slot (allowed slots of 64, 68, 72, 76, 80, 84).
test body	4	send	VSS	INCREMENTAL BROADCAST request to transmit INCREM_BURST_a followed by successive INCREM_BURST_a in reserved slots	la	Request to send incremental broadcast reservation and to place another incremental broadcast reservation in each reserved slot, thus creating an automatic succession of incremental broadcast reservations.
	5	await	RF	INCREM_BURST_a (s= add_A)	la	Wait for the first incremental broadcast reservation from the station under test (incremental burst 1).
	6	record	RF	inc_time:= time at beginning of slot containing INCREM_BURST_a (s= add_A)	la	Record the time of the incremental reservation transmission slot as current_inc_time.
	7	record	RF	IO:= io contained in INCREM_BURST_a (s= add_A)	la	Record value of io given in the incremental broadcast reservation.
	8	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_B; lat:= CPR_LAT(0); lon:= CPR_LON(E 110 NM)) (position of station B is < Q2a, b, c, d away from station under test) in slot beginning at time = inc_time + 5 × 60/M1	Sa	Send a sync burst from a simulated station B < Q2a, b, c, d away from the station under test, reporting B's position.
	9	send	RF	INCREM_BURST_b(16) (io:= 24; s= add_B) in slot beginning at time = inc_time + (4 × IO + 70 - 96) × 60/M1	lb(16)	Send an incremental burst from station B < Q2a, b, c, d away reserving a series of 16 slots that conflict with all but two slots of the candidate range of the next incremental burst from the station under test.
	10	send	RF	UCTRL_Q (Q4:= 2; Q1min, Q1max, Q2a, Q2b, Q2c, Q2d: default values; s:= add_G; d:= add_A)	Cq	Send a broadcast UCTRL from a simulated ground station G addressed to the station under test. The transmission sets the Q4 parameter to 2.
	11	verify	RF	INCREM_BURST_a (s= add_A) in slot beginning at time = inc_time + (4 × IO) × 60/M1	la	Verify that the station under test uses the fact that Q4 has been reduced to 2 by being able to select a slot from the two available slots not reserved by station B, when it would not be able to do so with Q4 set to 3. This slot therefore contains an incremental broadcast reservation (incremental burst 2) pointing to the selected slot.
	12	record	RF	inc_time:= time at beginning of slot containing INCREM_BURST_a (s= add_A)	la	Record the time of the incremental reservation transmission slot as current_inc_time.
	13	record	RF	IO2:= io contained in INCREM_BURST_a (s= add_A)	la	Record value of io given in the incremental broadcast reservation.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	14	verify	RF	INCREM_BURST_a (s= add_A) in slot beginning at time = inc_time_2 + (4 × IO2) × 60/M1	Ia	Verify that the selected slot is used by the station under test to transmit a further incremental broadcast (incremental burst 3).
postamble	15	send	VSS	SET PARAMETERS (Q4:= 3; V22:= MIN(0.75, maximum allowed value of V22))		Reset to default value.
	16	send	RF	UCTRL_q (Q4, Q1min, Q1max, Q2a, Q2b, Q2c, Q2d: default values; s:= add_G)	Cq	Send a broadcast UCTRL from ground station G addressed to the station under test, setting the Q4 parameter to its default value.
	17	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
<b>Comments:</b>

test body	4	await	RF	SYNC_BURST_c (s= add_A)	Sc	Verify an autonomous sync burst is transmitted, indicating that the station is already on the network.
	5	send	RF (GSC1)	UCTRL_M2 (i:= 1; l:= 200; s:= add_G)	Cm	Send a broadcast UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2limit to 200, and M2inc to 1.
	6	send	VSS (GSC2)	PERIODIC BROADCAST request to transmit SYNC_BURST_b (V11:= 60)	Sb	Establish sync burst transmissions on GSC2 at a rate of 1 per second.
	7	send	VSS (GSC1)	PERIODIC BROADCAST request to transmit SYNC_BURST_b (V11:= 60) with bursts midway between those on GSC2	Sb	Establish sync burst transmissions on GSC1 at a rate of 1 per second and midway between the bursts on GSC2.
	8	send	RF (GSC1)	UCTRL_M2 (i:= 120; l:= 200; s:= add_G)	Cm	Send a UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2limit to 200, and M2inc to 120.
	9	record	RF (GSC1)	ctrl_time:= time at beginning of slot occupied by UCTRL_M2	Cm	
	10	verify	RF (GSC2)	Four SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 4	Sb	Wait for four sync bursts to be transmitted on GSC2 following the UCTRL.
	11	verify	RF (GSC1)	SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 5	Sb	Verify that a sync burst is transmitted on GSC1 following the four transmitted on GSC2 since the UCTRL. This verifies that network entry was not triggered on GSC1 after the first four sync bursts on GSC2.
	12	verify	RF (GSC1)	No transmissions from the station under test before time:= ctrl_time + 65		Verify that there are no transmissions on GSC1 for a period of one minute, in which time the station shall be listening to the channel to build up a complete slot map.
	13	await	RF (GSC1)	SYNC_BURST_c (s= add_A) transmitted at or after time:= ctrl_time + 65	Sc	Verify an autonomous sync burst is then transmitted.
	14	verify	RF (GSC1)	SYNC_BURST_c (s= add_A) contains pt = 3 AND io ≠ 0 (or po ≠ 0)	Sc	Verify that the first sync burst transmitted contains pt and io (or po) values compatible with a combined periodic and incremental broadcast reservation.
	15	wait		1 minute		
	16	send	RF (GSC1)	UCTRL_M2 (i:= 90; l:= 200; s:= add_G)	Cm	Send a broadcast UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2limit to 200, and M2inc to 90.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	17	record	RF (GSC1)	ctrl_time:= time at beginning of slot occupied by UCTRL_M2	Cm	
	18	verify	RF (GSC2)	Twelve SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 12	Sb	Wait for 12 sync bursts to be transmitted on GSC2 following the UCTRL.
	19	verify	RF (GSC1)	SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 13	Sb	Verify that a sync burst is transmitted on GSC1 following the 12 transmitted on GSC2 since the UCTRL. This verifies that network entry was not triggered on GSC1 after the first four sync bursts on GSC2.
	20	verify	RF (GSC1)	No transmissions from the station under test before time:= ctrl_time + 73		Verify that there are no transmissions on GSC1 for a period of one minute, in which time the station shall be listening to the channel to build up a complete slot map.
	21	await	RF (GSC1)	SYNC_BURST_c (s= add_A) transmitted at or after time:= ctrl_time + 65	Sc	Verify an autonomous sync burst is then transmitted.
	22	verify	RF (GSC1)	SYNC_BURST_c (s= add_A) contains pt = 3 AND io ≠ 0 (or po ≠ 0)	Sc	Verify that the first sync burst transmitted contains pt and io (or po) values compatible with a combined periodic and incremental broadcast reservation.
postamble	23	send	RF (GSC1)	UCTRL_M2 (i:= 2; l:= 160; s:= add_G)	Cm	Send a broadcast UCTRL from ground station G to the station under test, setting the parameters to their default values.
	24	send	VSS	CANCEL PERIODIC RESERVATION requests on GSC1 AND GSC2		Cancel established periodic streams.
	25	send	VSS	SET PARAMETERS (V11:= 1) on GSC1 AND GSC2		Reset to default value.
<b>Comments:</b> Net entry by waiting for one minute is not mandated by the VDL4 Technical Manual [1], and nor by these MOPS. In the event that a station does not support this, then a modified form of this test shall be performed						

Test Case Name: UCTRL_param_M2limit						
Purpose: To demonstrate that a station will act upon receipt of a UCTRL commanding ground modification of parameter M2limit.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	do		NETWORK ENTRY BY PERIODIC AND INCREMENTAL		Ensure transceiver is set to perform network entry by a combination of periodic and incremental broadcasts as opposed to other means.
	3	do		Antenna coupling such that receiver on GSC1 blocked by transmission on GSC2		Arrange the antenna coupling such that the receiver on GSC1 is blocked by any transmission on GSC2.
test body	4	await	RF	SYNC_BURST_c (s= add_A)	Sc	Verify an autonomous sync burst is transmitted, indicating that the station is already on the network.
	5	send	RF (GSC1)	UCTRL_M2 (i:= 1; l:= 280; s:= add_G)	Cm	Send a broadcast UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2inc to 1, and M2limit to 360.
	6	send	VSS (GSC2)	PERIODIC BROADCAST request to transmit SYNC_BURST_b (V11:= 60) in the first slot of the UTC second	Sb	Establish sync burst transmissions on GSC2 at a rate of 1 per second in the first slot of the UTC second.
	7	send	VSS (GSC1)	PERIODIC BROADCAST request to transmit SYNC_BURST_b (V11:= 60) in the second slot of the UTC second	Sb	Establish sync burst transmissions on GSC1 at a rate of 1 per second in the second slot of the UTC second.
	8	send	RF (GSC1)	UCTRL_M2 (i:= 100; l:= 360; s:= add_G)	Cm	Send a broadcast UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2inc to 100, and M2limit to 360.
	9	record	RF (GSC1)	ctrl_time:= time at beginning of slot occupied by UCTRL_M2	Cm	
	10	verify	RF (GSC2)	Ten SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 9 + 1/M1	Sb	Wait for 10 sync bursts to be transmitted on GSC2 following the UCTRL.
	11	verify	RF (GSC1)	SYNC_BURST_b (s= add_A) transmitted in slot beginning at time:= ctrl_time + 9 + 1/M1	Sb	Verify that a sync burst is transmitted on GSC1 following the 10 transmitted on GSC2 since the UCTRL. This verifies that network entry was not triggered on GSC1 after the first ten sync bursts on GSC2.
	12	verify	RF (GSC2)	SYNC_BURST_b (s= add_A) transmitted in slot beginning at time:= ctrl_time + 10	Sb	Verify that the 11th sync burst is transmitted on GSC2. This causes network entry
	13	verify	RF (GSC1)	No transmissions from the station under test before time:= ctrl_time + 70 + 1/M1		Verify that there are no transmissions on GSC1 for a period of one minute, in which time the station shall be listening to the channel to build up a complete slot map.
	14	await	RF (GSC1)	SYNC_BURST_c (s= add_A) transmitted at or after time:= ctrl_time + 70 + 1/M1	Sc	Verify an autonomous sync burst is then transmitted.
	15	verify	RF (GSC1)	SYNC_BURST_c (s= add_A) contains pt = 3 AND io ≠ 0 (or po ≠ 0)	Sc	Verify that the first sync burst transmitted contains pt and io (or po) values compatible with a combined periodic and incremental broadcast reservation.
	16	wait		1 minute		

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	17	send	RF (GSC1)	UCTRL_M2 (i:= 490; l:= 90; s:= add_G)	Cm	Send a broadcast UCTRL on GSC1 from a simulated ground station G to the station under test. The transmission sets M2limit to 490, and M2inc to 90.
	18	record	RF (GSC1)	ctrl_time:= time at beginning of slot occupied by UCTRL_M2	Cm	
	19	verify	RF (GSC2)	Twenty-five SYNC_BURST_b (s= add_A) transmitted before time:= ctrl_time + 24 + 1/M1	Sb	Wait for 25 sync bursts to be transmitted on GSC2 following the UCTRL.
	20	verify	RF (GSC1)	SYNC_BURST_b (s= add_A) transmitted in slot beginning at time:= ctrl_time + 24 + 1/M1	Sb	Verify that a sync burst is transmitted on GSC1 following the 25 transmitted on GSC2 since the UCTRL. This verifies that network entry was not triggered on GSC1 after the first 25 sync bursts on GSC2.
	21	verify	RF (GSC2)	SYNC_BURST_b (s= add_A) transmitted in slot beginning at time:= ctrl_time + 25	Sb	Verify that the 25th sync burst is transmitted on GSC2. This causes network entry
	22	verify	RF (GSC1)	No transmissions from the station under test before time:= ctrl_time + 85		Verify that there are no transmissions on GSC1 for a period of one minute, in which time the station shall be listening to the channel to build up a complete slot map.
	23	await	RF (GSC1)	SYNC_BURST_c (s= add_A) transmitted in the second beginning at time:= ctrl_time + 85	Sc	Verify an autonomous sync burst is then transmitted in the following second.
	24	verify	RF (GSC1)	SYNC_BURST_c (s= add_A) contains pt = 3 AND io ≠ 0 (or po ≠ 0)	Sc	Verify that the first sync burst transmitted contains pt and io (or po) values compatible with a combined periodic and incremental broadcast reservation.
postamble	25	send	RF (GSC1)	UCTRL_M2 (i:= 2; l:= 160; s:= add_G)	Cm	Send a broadcast UCTRL from ground station G to the station under test, setting the parameters to their default values.
	26	send	VSS	CANCEL PERIODIC RESERVATION requests on GSC1 AND GSC2		Cancel established periodic streams.
	27	send	VSS	SET PARAMETERS (V11:= 1) on GSC1 AND GSC2		Reset to default value.
<b>Comments:</b> Net entry by waiting for one minute is not mandated by the VDL4 Technical Manual [1], and nor by these MOPS. In the event that a station does not support this, then a modified form of this test shall be performed						

Test Case Name:		ADS_Report_Receive				
Purpose:		To demonstrate that a station receiving a sequence of ADS reports from a peer station will generate an appropriate output.				
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
test body	3	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_B; lat:= CPR_LAT(S 25 NM); lon:= CPR_LON(E 35 NM))	Sa	Send a sync burst from a simulated station B containing position information in the fixed data field.
	4	record	RF	sync_time:= time at start of slot containing sync burst		Define a reference time to measure relative times from during the test.
	5	rep 5		n:= 1; lat_data(n):= {CPR_LAT(S 30 NM), CPR_LAT(S 35 NM), CPR_LAT(S 40 NM), CPR_LAT(S 45 NM), CPR_LAT(S 50 NM)}; lon_data(n):= {CPR_LON(E 40 NM), CPR_LON(E 45 NM), CPR_LON(E 50 NM), CPR_LON(E 55 NM), CPR_LON(E 60 NM)}		Set up an array containing the sequence of positional data to be used in the test.
	6	await		time = sync_time + n x 30		
	7	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_B; lat:= lat_data(n); lon:= lon_data(n))	Sa	Send a sync burst containing the next position report in the sequence every 30 s for 5 minutes.
	8	record	AppOut	LAT DATA OUT, LON DATA OUT		Wait for the next received packet of data to be processed by the station and sent to the position output.
	9	endrep		n:= n + 1		Repeat for each report.
	10	verify	AppOut	LAT DATA OUT = {S 30 NM, S 35 NM, S 40 NM, S 45 NM, S 50 NM} AND LON DATA OUT = {E 40 NM, E 45 NM, E 50 NM, E 55 NM, E 60 NM}		Verify that the station under test generates the appropriate output.
postamble	11	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
Comments:						

Test Case Name:		ADS_Report_Simultaneous				
Purpose:		To demonstrate that a station is capable of receiving ADS reports simultaneously on both GSCs.				
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
test body	3	send	RF	SYNC_BURST_a (pt:= 3; po:= 0; s:= add_B; lat:= CPR_LAT(0); lon:= CPR_LON(0)) on GSC 1 AND SYNC_BURST_a (pt:= 3; po:= 0; s:= add_C; lat:= CPR_LAT(N 10 NM); lon:= CPR_LON(E 10 NM)) on GSC 2	Sa	Send a sync burst from a simulated station B on GSC 1 and from simulated station C in the same slot on GSC 2, both containing position information in the fixed data fields.
	4	await	AppOut	LAT DATA OUT B, LON DATA OUT B AND LAT DATA OUT C, LON DATA OUT C		Wait for the received reports from stations B and C to be processed by the station and sent to the position output.
	5	verify	AppOut	LAT DATA OUT B = 0 AND LON DATA OUT B = 0 AND LAT DATA OUT C = N 10 NM AND LON DATA OUT C = E 10 NM		Verify that the station under test processes the data and generates the appropriate output.
postamble	6	send	VSS	REINSTATE AUTONOMOUS SYNC BURSTS		Reinstate the autonomous sync bursts.
Comments:						

Test Case Name:			CPR_Encode			
Purpose: To demonstrate that a series of latitude and longitude positions may be correctly encoded in the sync burst using the CPR algorithm.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	send	VSS	SUPPRESS AUTONOMOUS SYNC BURSTS		Suppress the autonomous sync bursts to avoid possible confliction.
	3	send	VSS	SET PARAMETERS (p:= 1)		Ensure 100 % chance of transmission on access to hasten sync burst responses following a general request.
	4	send	VSS	REQUEST TO TRANSMIT SYNC_BURST (V11:= 60)		Set the station under test to transmit sync bursts at the rate of 1 per second.
test body	5	rep 2166		n:= 1; initialize p		
	6	send	Position	Input to station under test: LAT(n):= 12.8557 + n × 0.163 LON(n):= -0.8150 + n × 0.163	CE(r, c)	Send test values of latitude and longitude from CPR_ENC_TABLE to the station under test.
	7	rep 135		k:= 1		
	8	do		IF  LAT(n) = CPR_ENC_TABLE (k, latitude) for row k of table AND LON(n) = CPR_ENC_TABLE (k, longitude) for row k of table THEN p:= k continue with following test steps within loop using current p value ELSE go to next n bypassing all the steps before the end of the loop

	15	wait		1 minute		
	16	send	VSS	PERIODIC BROADCAST request to transmit SYNC_BURST_b (V11:= 60) in the first slot of the UTC second	Sb	Establish sync burst transmissions from the station under test at a rate of 1 per second in the first slot of the UTC second.
	17	do		Remove power from VDL4 transceiver for 3,2 seconds.		Remove electrical power from the transceiver.
	18	do		Restore power to VDL4 transceiver		Restore electrical power.
	19	record		on_time:= time at restoration of power		Record the time that power was restored.
	20	verify	RF	No transmissions from the station under test before time:= on_time + 60		Verify that there are no transmissions by the station under test for a period of one minute, in which time the station shall be listening to the channel to build up a complete slot map.
	21	await	RF (GSC1)	SYNC_BURST_c (s:= add_A) transmitted at or after time:= on_time + 60	Sc	Verify an autonomous sync burst is then transmitted.

Context	Step	Action	PCO	Action Qualifier	Ref	Comment
	22	verify	RF (GSC1)	SYNC_BURST_c (s= add_A) contains pt = 3 AND io ≠ 0 (or po ≠ 0)	Sc	Verify that the first sync burst transmitted contains pt and io (or po) values compatible with a combined periodic and incremental broadcast reservation.
postamble	23					
<b>Comments:</b>						

Test Case Name: DLS_NotSupported						
Purpose: To demonstrate that a station in receipt of a CTRL_RTS transmits a general failure with an error type of 80 hex when it does not support the DLS.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
	2	do		CONFIGURE TO NOT SUPPORT DLS		Configure the equipment under test so that it does not support the DLS.
test body	3	send	RF	CTRL_RTS_a (s:= add_B; d:= add_A; IB:= 1; T:= 0; pr:= 3; lg:= 7)	CRA	Send an RTS using the long transmission procedures from a simulated station B, with IB = 1 and T = 0, indicating this is the first transmission from station B to station A. The RTS contains a unicast reservation for a response.
	4	await		BURST transmitted by station A		Wait for a burst transmitted by station A.
	5	verify	RF	GEN_RESP_a (s = add_A; d = add_B; r-mi = 0110001; ok = 0; err = 01 hex) in the slot reserved by the RTS	GRa	Verify that a general failure, with error type set to 80 hex, is transmitted by station A in the slot reserved by the RTS.
postamble	6					
<b>Comments:</b> This test is optional. A station that implements the DLS should not perform this test.						

Test Case Name: DLS_UDATA_Receive						
Purpose: To demonstrate that a UDATA DLPDU received from another station will be forwarded to the DLS user.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
test body	2	send	RF	UCTRL_a (s:= add_B)	UCa	Send a UDATA DLPDU to the station under test.
	3	verify	DLS	data in UCTRL_a (s:= add_B) passed to DLS user	UCa	Verify that the data in the UDATA DLPDU is passed to the DLS user.
	4	verify	RF	No ACK transmitted by station A		Verify that the station under test does not generate an ACK in response to the UDATA DLPDU.
	5	send	RF	UINFO_a (s:= add_B)	U1a	Send a UDATA DLPDU to the station under test.
	6	verify	DLS	data in UINFO_a (s:= add_B) passed to DLS user	U1a	Verify that the data in the UDATA DLPDU is passed to the DLS user.
	7	verify	RF	No ACK transmitted by station A		Verify that the station under test does not generate an ACK in response to the UDATA DLPDU.
postamble	8					
Comments:						

Test Case Name: DLS_UDATA_Invalid						
Purpose: To demonstrate that a station receiving an invalid UDATA DLPDU will detect and discard it.						
Context	Step	Action	PCO	Action Qualifier	Ref	Comment
preamble	1	do		M_POWER_UP		Prepare the transceiver for testing.
test body	2	send	RF	UINFO_b (s:= add_B)	U1b	Send a UDATA DLPDU by the short transmission procedure to the station under test. The UDATA burst has no information field and bit 8 of octet 5 is not present. The burst contains a response reservation.
	3	verify	DLS	UINFO_b has been discarded by the station under test	U1b	Verify at the DLS that the incorrectly coded message has been discarded by the station under test. It is assumed the MAC layer would not detect and discard an error of this kind.
postamble	4

## Annex A (informative): Cross reference matrix

Table A.1 outlines the mapping between the VDL Mode 4 Ground station requirements and the related test procedures. The table also provides a cross reference to the ICAO reference material from which many of the requirements within the present document are derived. The cross reference applies to the version of [1] applicable at 25<sup>th</sup> November 2003. In these tables:

- column 1 is a reference to the requirement in the present document;
- column 2 is a reference to the equivalent requirements in [1];
- column 3 identifies individual requirements within [1];
- column 4 identifies clause titles taken from the present document;
- column 5 is a reference to testing requirements specified elsewhere in the present document. Several tests verify a whole group of requirements. They are only mentioned in the first row of such a group, usually a headline. The applicability of these tests to the subordinated requirements is indicated by ditto marks ( " ) in the rows following the first instance of a test case name. Amplification of individual entries is provided by the following notes:

NOTE 1: The clause number in column 1 is a headline or an introduction to requirements that are detailed in subsequent clauses. No test can be applied.

NOTE 1a: The clause number in column 1 is a definition. No test can be applied.

NOTE 2: The requirement listed in column 1 does not allow definition of a satisfactory go/no go test, for example, because it would be technically infeasible, or economically unreasonable. There are circumstances where the implementor can provide reasoned argument or test evidence that the implementation under test does conform to the requirements in Column 1. For each of these circumstances the implementor may be required to satisfy the authorities by separate technical evidence.

NOTE 3: The requirement listed in column 1 is applicable only to VDL Mode 4 ground equipment. No ground equipment test is required.

NOTE 4: This topic is heavily dependent on the implementation or results from a recommendation. No particular test is therefore provided in the present document.

NOTE 5: The ICAO requirement listed in Column 1 is reflected in a more specific MOPS requirement specified and tested elsewhere in the present document.

NOTE 6: The ICAO requirement listed in Column 1 is outside the scope of a unit supporting only the minimum core functionality as defined here.

NOTE 7: Only part of the ICAO requirement listed in Column 1 has been listed here, as the other part is outside the scope of a unit supporting only the minimum core functionality as defined here.

NOTE 8: The ICAO requirement listed in Column 1 has been modified from its original form in order to define a specific MOPS requirement.

Table A.1: VDL Mode 4 requirements according to ICAO TM

Requirement reference	Reference in [1]	Req	Title	Test Case
5.1	1.2		MAC sublayer.	See note 1
5.1.1			Services	See note 1
5.1.1.1	1.2	a		See note 2
5.1.2	1.2.1		MAC sublayer services.	See note 1
5.1.2.1	1.2.1	a		See note 2
5.1.2.2	1.2.1	b		See note 2
5.1.2.3	1.2.1	c		See note 2
5.1.3	1.2.2		MAC sublayer parameters.	See note 1
5.1.3.1			General	See note 1
5.1.3.1.1	1.2.2	a		See note 1a
5.1.3.2	1.2.2.1		Parameter M1 (number of slots per superframe).	See note 1
5.1.3.2.1	1.2.2.1	a		See note 1a
5.1.3.2.2	1.2.2.1	b		See note 1a
5.1.3.3	1.2.2.2		Parameter M2inc and M2limit (MAC layer control parameters for network entry)	See note 1
5.1.3.3.1	1.2.2.2	a		See note 2
5.1.3.3.2	1.2.2.2	b		See note 8 UCTRL_param_M2inc UCTRL_param_M2limit
5.1.3.3.3	1.2.2.2	c		UCTRL_param_M2limit
5.1.4	1.2.3		Time synchronization.	See note 1
5.1.4.1	1.2.3.1		Primary.	See note 1
5.1.4.1.1	1.2.3.1	a		Timing_Primary
5.1.4.2	1.2.3.2		Secondary.	See note 1
5.1.4.2.1	1.2.3.2	a		Timing_Secondary
5.1.4.2.2	1.2.3.2	b		Timing_Secondary
5.1.4.2.3	1.2.3.2	c		Timing_Secondary_Recover
5.1.4.2.4				See note 2
5.1.4.3	1.2.3.3		Alignment to UTC second.	See note 1
5.1.4.3.1	1.2.3.3	a		See note 1a
5.1.4.4	1.2.3.5		Data quality level.	See note 1
5.1.4.4.1	1.2.3.5	a		See note 1a
5.1.4.4.1a	1.2.3.5	b		See note 2
5.1.4.4.2	1.2.3.5	c		See note 1a
5.1.5	1.2.4		Slot idle/busy notification.	See note 1
5.1.5.1	1.2.4.1		Slot idle detection.	See note 1
5.1.5.1.1	1.2.4.1	a		See note 1a
5.1.5.2	1.2.4.2		Slot busy detection.	See note 1
5.1.5.2.1	1.2.4.2	a		See note 1a
5.1.5.3	1.2.4.3		Slot occupied detection.	See note 1
5.1.5.3.1	1.2.4.3	a		See note 1a
5.1.5.4	1.2.4.4		Signal level indication.	See note 1
5.1.5.4.1	1.2.4.4	a		See note 2
5.1.6	1.2.5		Transmission processing.	See note 1
5.1.6.1	1.2.5	a		See note 2
5.1.6.2	1.2.5	b		Slot_Boundary
5.1.6.3	1.2.5	c		Slot_Delayed
5.1.7	1.2.6		Received transmission processing.	See note 1
5.1.7.1	1.2.6	a		CRC_Rej
5.1.7.2	1.2.6	b		Periodic_NonDitherRes ADS_Report_Receive
5.2	1.3		VSS sublayer.	See note 1
5.2.1	1.3.1		Services.	See note 1
5.2.1.a	1.3.1.1		Multiple access	See note 1
5.2.1.a.1		a		See note 1a
5.2.1.1	1.3.1.2		Error detection.	See note 1
5.2.1.1.1	1.3.1.2	a		CRC_Norm
5.2.1.2	1.3.1.3		Channel congestion.	See note 1
5.2.1.2.1	1.3.1.3	a		See note 2
5.2.2	1.3.2		Burst format.	See note 1
5.2.2.1			VSS burst structure	See note 1

## Annex B (informative): Description of ISO/IEC 9646 Test Methodology

### B.1 Overview of the Structure of the ISO/IEC 9646 Test-Suites

A test-suite covers all tests required to test a piece of equipment. In the ISO/IEC 9646 [7] sense it should consist of the following elements:

- Test-Suite Overview:

The Test-Suite Overview presents the general structure of the test-suite. This part primarily contains an index in which the reference between the requirements and the related test cases is outlined.

- Declarations Part:

The Declarations Part outlines the test environment. Here the test equipment is defined. It also introduces the Points of Control and Observation (PCOs). These points are defined in the test setup where stimuli are injected and where the test results are observed.

- Constraints Part:

The Constraints Part contains the definitions of the packets and parameters which are used in the test steps. The individual fields of the packets are defined there.

- Detailed Test Cases (Dynamic Part):

The Detailed Test Cases Part provides the actual test cases. Each test case is designed for the verification of a distinct function of the test object. In order to allow the performance of individual test cases in any sequence, the test cases are designed to be independent from the history of the test campaign (i.e. they contain all necessary steps required to reach the test objective). Each test case therefore starts at a well defined idle state of the test object. In order to avoid effects on successive test cases each test case must leave the test object in the defined idle state after the execution of the test case.

A test case consists of a sequence of test steps. Some steps in the beginning of the test case are required to prepare the test object for the actual verification. These steps form the preamble of the test case. The successive steps which perform the actual verification belong to the test body. The steps which bring the equipment under test back to the defined idle state make up the postamble.

---

### B.2 The Test Case Description

ISO/IEC 9646 [7] provides a formal syntax to describe test-suites for communication equipment. This syntax is called the Tree and Tabular Combined Notation (TTCN). The use of TTCN is recommended by ISO/IEC 9646 [7] but not mandated. TTCN is a powerful semi-formal language defined to facilitate computerized test tools for any kind of communication equipment. However, TTCN is, due to its abstractness, not so human friendly as plain text. In order to keep the test cases readable to a maximum extent while making them as formal as necessary, it has been decided to use a simpler formal notation in the description of the test cases.

A more comprehensive description of the syntax follows on the next pages. It is important for the understanding of the test cases to be familiar with the syntax. The following table defines the meaning of entries in individual test cases.

Meaning of entries in the test case table:

**Table B.1: Test case format**

Field name	Description	
Test Case Name	the name of the test case. This name is used to reference a specific test case in the test-suite.	
Long Designator	the long designator directly following the test case name provides the test case scope.	
Purpose	describes the intention of the test case	
Reference	provides the reference to the clauses of the requirements which are addressed by the tests.	
Context	indicates which part of the test case is executed. The following entries are foreseen:	
	preamble:	in this part of the test case the equipment under test is brought into an appropriate state to begin the actual verification
	test body:	in this part of the test case the actual test steps required for the verification objective are executed
	postamble:	in this part of the test case the equipment under test is brought into the defined idle state
Step	numbers the individual test steps	
Action	holds the action to be performed during the test.	
	send:	send a the specified entity
	queue:	maintain a queue for input at the specified PCO, respecting any local flow control procedures, so that at least one of the specified entity is always available
	verify:	verify that a result matches a given outcome (if an outcome is not observed, then the test has failed and the test case must be abandoned !)
	record:	record a value
	await:	wait until a certain event takes place (the test step has failed if more than 30 s expire before the event is observed !)
	wait:	wait a specified time
	macro:	execute a named macro
	do:	do something special which is described in the Action Qualifier column
	repx:	repeat the following steps x times in a loop
	endrep:	indicates the end of the loop statements
	repx:	repeat the following steps in a loop until a condition is true
	until:	indicates the end of the loop statements and holds the termination condition
PCO	Point of Control and Observation, which indicates where in the test setup the action shall be performed. The following entries are used:	
	RF	RF antenna connection
	Timing	Timing source input
	Position	Position source input
	Altitude	Altitude source input
	VSS	VSS user
	App in	Application data input
	App out	Application data output
	Self test	Self test passed indication

Field name	Description
Action Qualifier	further qualifies the action. It either holds one or more of the entries shown below:
	the transaction type to be used together with specific field values. Principally the field values are those presented in the constraints clause. Different field values are stated explicitly like (LCI:= 316 or UD:= [5]{1...5}). The content of data fields which normally consist of several bytes is written like:  [n]{val} (e.g. [20]{85}): n bytes with byte value val (decimal values only) [n]{n1...n2} (e.g. [128]{0...127}): n bytes in ascending order from n1 to n2 (decimal values only) [n]{k1,k2,k3,k4,...,kn} (e.g. [5]{4,6,8,10,12}): n bytes according to explicit list (decimal values only)
	the name of a macro plus one or more parameter values required by the macro like: M-NAME (LCI:= 316,CH:= 15)
	a time to wait
	none, timeout = x s no event to be expected, do not wait longer than x s
	an event to await
	parameters of a rep construct in the row with action repx or endrep
	any free text which further qualifies the action
	if alternative events are expected in one test step, then they are presented in individual lines but in one row of the table (i.e. only one step number is allocated). Two different cases need to be distinguished: 1) Several events stated in one row without an additional keyword must all appear. Any sequence of the results is valid. 2) Several events combined with an OR may appear alternatively either one or more. Any sequence of the results is valid.
Ref	A reference to the definition of a basic version of a packet as described in the constraints clause
Comment	a comment which adds information for understanding of the actual step
Comments	Overall Comments on the test case, if necessary

## B.3 The Queue Action

The action "queue" is applied to the VSS User PCO to maintain a constant stream of random access requests. Each request represents a discrete request and results in a single burst with a transmitter ramp up and down at the start and end of the burst. It is not expected that the item under test should be capable of buffering all the random access transmissions demanded by this procedure. The test set should provide a suitable mechanism (e.g. buffer) to maintain a stream of inputs through the VSS User PCO, subject only to the flow control imposed by the item under test.

## B.4 The Repeat Construct

To express test steps which need to be executed repetitively in a loop, the repeat construct is used. A repeat construct consists of the two delimiting keywords:

- **repx;** and
- **endrep.**

In this the parameter "x" stands for the number of loops to be performed. "x" may either be an integer constant or an integer expression. In order to provide the test steps of the loop with possibly required variables, an arbitrary number of variables may be initialized in the Action Qualifier column in the row of the **rep**x keyword like:

```
n:= 1;

p( ):=
{
    CALL REQUEST;
    RECEIVE NOT READY;
    CLEAR REQUEST
}
```

In the above statements n is initialized to 1. In the second line a vector p( ), holding packets to be used during the loop, is Initialized. Each element of the vector may be addressed by an integer index. The first element is addressed by the index 1.

A **rep** statement is used to prepare for a loop of successive statements. There is no test step executed in the rep statement line itself. The loop defined by rep and endrep actually begins in the line following the rep statement line (i.e. the initialization in the rep statement line is only performed once !).

In most loops certain variables need to be modified while the loop is performed several times. The modification is stated by one ore more equation(s) in the **endrep** line, like:

```
n:= n + 1; i:= i -1
```

Nested loops are allowed.

An alternative to the repeat construct which ends after a certain number of loops have been performed is the **repeat until** construct, which consists of the two delimiting keywords:

- **rep**x; and
- **until**.

In the line with the keyword until the condition is mentioned which terminates the loop. This condition is enclosed by brackets ( ). The parameter x may still be used to indicate a maximum number of loops to be performed. This allows to terminate possible endless loops if the termination condition is not reached due to an error. In such a case the test has failed and must be abandoned!

---

## B.5 Macro Definitions

Macros are used to express sequences of steps which are used frequently. A macro may not include verification statements. A macro name is preceded by "M-" for distinction from normal test cases. Macros may be called with parameters. The parameters are mentioned in ( ) behind the macro name the macro is called.

---

## B.6 Test Case Naming

The individual test cases are named for reference. In order to obtain a systematic name, the name is composed in a hierarchical manner, with subsidiary naming levels separated by the underscore character.

---

## Annex C (informative): Bibliography

EUROCAE ED-108: "Interim MOPS for VDL Mode 4 Ground station for ADS-B".

## List of tables

Table 5.1: MAC service system parameters .....	29
Table 5.2: Burst format .....	32
Table 5.3: Message ID assignment .....	33
Table 5.4: Extended reservation ID field (erid) .....	34
Table 5.5: Autonomous/directed flag encoding .....	34
Table 5.6: VSS sublayer parameters .....	35
Table 5.7: VSS quality of service system parameters .....	36
Table 5.8: Priority levels .....	37
Table 5.9: Slot selection criteria .....	37
Table 5.10: Action in the event of reservation conflict .....	42
Table 5.11: Random access VSS system parameters .....	42
Table 5.12: Null reservation bit encoding .....	45
Table 5.13: Periodic broadcast reservation bit encoding .....	45
Table 5.14: Periodic broadcast reservation field encoding .....	45
Table 5.15: Periodic broadcast VSS system parameters .....	46
Table 5.16: Action on receipt of periodic broadcast reservation burst .....	47
Table 5.17: Incremental broadcast reservation bit encoding .....	50
Table 5.18: Incremental broadcast reservation field encoding .....	50
Table 5.19: Incremental broadcast VSS system parameters .....	50
Table 5.20: Combined periodic/incremental broadcast reservation bit encoding .....	52
Table 5.21: BND broadcast reservation bit encoding .....	52
Table 5.22: BND broadcast reservation parameters .....	52
Table 5.23: Unicast request reservation bit encoding .....	53
Table 5.24: Unicast request reservation field encoding .....	53
Table 5.25: Information transfer request reservation bit encoding .....	54
Table 5.26: Information transfer reservation field encoding .....	55
Table 5.27: Directed request reservation bit encoding .....	56
Table 5.28: Nominal update rate encoding .....	56
Table 5.29: Encoding of additional data in autotune reservation burst .....	57
Table 5.30: Directed request reservation field encoding .....	57
Table 5.31: Encoding of additional data with $nr \neq \text{"special"}$ .....	58
Table 5.32: Encoding of additional data for $nr = \text{"special"}$ .....	58
Table 5.33: Directed request VSS system parameters .....	59
Table 5.34: Action on receipt of an autotune reservation burst .....	59
Table 5.35: Superframe block reservation bit encoding .....	61

Table 5.36: Superframe reservation field encoding .....	62
Table 5.37: Second frame block reservation bit encoding.....	62
Table 5.38: Second frame block reservation field encoding .....	62
Table 5.39: Superframe block reservation VSS system parameters .....	63
Table 5.39a: Actions on receipt of a superframe block reservation burst .....	64
Table 5.39b: Further actions on receipt of a superframe block reservation burst.....	64
Table 5.39c: Action on receipt of a superframe block reservation burst if roff is not equal to bs.....	65
Table 5.40: Second frame block reservation parameters.....	65
Table 5.41: Response burst reservation bit encoding .....	66
Table 5.42: General request bit encoding .....	67
Table 5.43: General request field encoding.....	67
Table 5.44: General response bit encoding.....	68
Table 5.45: General response field encoding .....	68
Table 5.46: Error type definition .....	69
Table 5.47: Address type field encoding .....	70
Table 5.48: Broadcast and multicast address encoding .....	71
Table 5.49: One-byte UDATA burst format.....	72
Table 5.50: Two byte UDATA burst format .....	72
Table 5.51: Three-byte UDATA burst format .....	72
Table 5.52: Encoding of the UDATA ID (udid) value .....	72
Table 5.53: UINFO ID (uinf) assignments .....	72
Table 5.54: Data link service system parameters .....	73
Table 5.55: Synchronization burst format .....	74
Table 5.56: Synchronization burst field encoding (fixed data field) .....	75
Table 5.57: Encoding of position Navigation Integrity Category (NIC).....	76
Table 5.58: Base altitude encoding.....	77
Table 5.59: Report latency encoding and decoding.....	77
Table 5.60: UCTRL DLPDU burst format .....	78
Table 5.61: VDL Mode 4 parameter identifier purpose .....	79
Table 5.62: VSS sublayer parameter encoding.....	79
Table 5.63: Quality of service parameter encoding.....	80
Table 5.64: m2 filter parameter encoding.....	80
Table 5.65: CG1 filter parameter encoding .....	80
Table 5.66: Random access parameter encoding.....	81
Table 5.67: Directory of service message encoding.....	81
Table 5.68: Directory of service message subfield encoding .....	82
Table 5.69: Allocation of application fields .....	83
Table 5.70: Allocation of service information type fields .....	83

Table 5.71: Synchronization burst parameters .....	83
Table 5.72: Synchronization burst parameters for conflict resolution.....	84
Table 5.72a: Plea parameters.....	85
Table 5.72b: Asynchronous events affecting value of management filter CG1 .....	86
Table 5.72c: Conditions for network entry.....	86
Table 5.73: Plea response parameters.....	88
Table 5.74: ADS-B information fields .....	89
Table 5.75: ADS-B request bit encoding.....	89
Table 5.76: ADS-B request field encoding.....	89
Table 5.77: Summary of parameter symbols for CPR.....	90
Table 5.78: Constants used in CPR calculations .....	90
Table 5.79: Variables used in CPR calculations.....	91
Table 5.80: Input parameters and return values for functions used in CPR calculations .....	92
Table 5.81: Transition table for <i>lookup</i> function .....	93
Table 5.82: Position report processing parameters.....	98
Table 5.83: State transitions for position report processing .....	99
Table 5.84: State transitions for position report processing (transition level straddling).....	100
Table 7.1: Protocol test-suite overview .....	113
Table 7.2: Subfield mnemonics .....	119
Table 7.3: Special characters used in the subfield definitions .....	120
Table 7.4: Q2 Parameters: Q2 Set 1 (Default for all tests).....	121
Table 7.5: Q2 Parameters: Q2 Set 2 .....	121
Table 7.6: Q2 Parameters: Q2 Set 3 .....	121
Table 7.7: Q2 Parameters: Q2 Set 4 .....	121
Table 7.8: CPR state machine for position report processing (points not straddling a transition level).....	122
Table 7.9: CPR state machine for position report processing (transition level straddling) .....	124
Table 7.10: Key to CPR encoding table in following section .....	124
Table 7.11: Test values for CPR report encoding CPR_ENC_TABLE (row, column) (CE(r, c)).....	125
Table 7.12: CPR test value tolerances .....	127
Table 7.13: Key to CPR decoding table in following section .....	128
Table 7.14: Test values for CPR position report decoding CPR_DEC_TABLE (row, column) (CD(r, c))...129	
Table 7.15: Values for use in the test "Sync_Format".....	133
Table 7.16: Values for use in the test "Sync_Format_Rec".....	134
Table 7.17: SYNC_BURST_a (Sa): Information field all "0"s, occupies one slot, lat and lon specified .....	136
Table 7.18: SYNC_BURST_b (Sb): Information field contains "0"s, occupies one slot.....	137
Table 7.19: SYNC_BURST_c (Sc): Occupies one slot, autonomous burst .....	137
Table 7.20: SYNC_BURST_d(k) (Sd(k)): Information field contains "0"s, occupies exactly k slots.....	138
Table 7.21: SYNC_BURST_e (Se): Information field all "0"s, exceeds slot boundary by 5 octets .....	139

Table 7.22: SYNC_BURST_f(k) (Sf(k)): Non-zero ver. Information field all "0"s, occupies k slots.....	140
Table 7.23: SYNC_BURST_k(k) (Sd(k)): Information field all "0"s, occupies k slots, lat and lon specified .....	141
Table 7.24: SYNC_BURST_l (Sl): Occupies one slot.....	142
Table 7.25: SYNC_BURST_m (Sm): Directed sync burst with response reservation, directed burst.....	142
Table 7.26: SYNC_BURST_n (Sn): Information field contains "0"s, extends past one slot boundary by 2 octets.....	143
Table 7.27: RAND_ACC_DATA_a (Ra): Information field contains "0"s, occupies one slot.....	143
Table 7.28: BURST_UNREC_a (Ba): Information field contains "0"s, occupies one slot.....	144
Table 7.29: UNI_BURST_a (Ua): Information field all "0"s, occupies one slot .....	144
Table 7.30: UNI_BURST_b (Ub): Invalid message ID, Information field all "0"s, occupies one slot.....	145
Table 7.31: UNI_BURST_c (Uc): For source to broadcast, Information field all "0"s, occupies one slot ....	145
Table 7.32: UNI_BURST_d (Ud): With general request, Information field all "0"s, occupies one slot.....	146
Table 7.33: INCREM_BURST_a (Ia): Information field contains "0"s, occupies one slot .....	146
Table 7.34: INCREM_BURST_b(k) (Ib(k)): Information field contains "0"s, occupies exactly k slots .....	147
Table 7.35: INCREM_BURST_c (Ic): Invalid message ID. Information field all "0"s, occupies one slot ...	147
Table 7.36: NULL_RES_a (Na): Information field contains "0"s, occupies one slot.....	148
Table 7.37: INF_TRANS_a (ITa): Information field contains "0"s, occupies one slot.....	148
Table 7.38: DIR_REQ_a (Da): Contains general request, Information field contains "0"s, occupies one slot .....	149
Table 7.39: DIR_SYNC_BURST_a (DSa): Directed sync burst, occupies one slot.....	149
Table 7.40: GEN_RESP_a (GRa): General response burst with response reservation .....	150
Table 7.41: PLEA_a (Pa): Information field contains destination address, fits within delayed burst.....	150
Table 7.42: PLEA_RESP_a (PRa): Directed request with pr_flag = 1, nr ≠ "special" .....	151
Table 7.43: PLEA_RESP_b (PRb): Directed request with pr_flag = 1, nr = "special" .....	152
Table 7.44: SUPER_BLOCK_a (SUa): Superframe block reservation .....	152
Table 7.45: RE_BROADCAST_a (RBa): Superframe block re-broadcast reservation .....	153
Table 7.46: SECOND_BLOCK_a (SCa): Second frame block reservation.....	153
Table 7.47: UCTRL_VS (Cv): UCTRL burst for VS1, VS2, VS4, and VS5 parameters. ....	154
Table 7.48: UCTRL_CG (Cg): UCTRL burst for CG1 parameters .....	154
Table 7.49: UCTRL_M2 (Cm): UCTRL burst for M2 parameters .....	155
Table 7.50: UCTRL_Q (Cq): UCTRL burst for QoS parameters .....	155
Table 7.51: BND_DELAYED_a (BDa): Contains BND reservation, fits within delayed burst .....	156
Table 7.52: BND_LONG_b (BDb): Contains BND reservation, fits within one slot .....	156
Table 7.53: CTRL_RTS_a (CRa): CTRL_RTS DLPDU with unicast reservation.....	157
Table 7.54: UINFO_a (UIa): UINFO DLPDU with response reservation with address type field 7.....	157
Table 7.55: UINFO_b (UIb): Invalid UINFO DLPDU with response reservation with address type field equal to 7 (bit 8 of octet 5 is not present) .....	157
Table 7.56: UCTRL_a (UCa): UCTRL DLPDU with response reservation with address type to 7 .....	158

Table A.1: VDL Mode 4 requirements according to ICAO TM .....	381
Table B.1: Test case format .....	397
