Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This draft Harmonised European Standard (EN) has been produced by ETSI Technical Committee Environmental Engineering (EE), and is now submitted for the combined Public Enquiry and Vote phase of the ETSI standards EN Approval Procedure.

The present document has been prepared under the Commission's standardisation M/544, C(2015) 9468 final of 5 January 2016, as regards ecodesign requirements for networked standby in support of Regulation (EC) No 1275/2008 [i.1] and Regulation (EC) No 642/2009 [i.10], to provide one voluntary means of conforming to the ecodesign requirements on networked standby of the following:

- Commission Regulation (EC) No 1275/2008 [i.1] of 17 December 2008 implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to ecodesign requirements for standby and off mode, and networked standby, electric power consumption of electrical and electronic household and office equipment; and
- Commission Regulation (EC) No 642/2009 [i.10] of 22 July 2009, implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to ecodesign requirements for televisions.

NOTE 1: Regulation (EC) No 1275/2008 [i.1] and Regulation (EC) No 642/2009 [i.10] were amended by Commission Regulation (EU) No 801/2013 [i.2] of 22 August 2013.

NOTE 2: Commission Regulation (EC) No 642/2009 [i.10] of 22 July 2009, implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to ecodesign requirements for televisions is quoted in the introduction of this annex but no relationship with this standard and the requirements of Commission Regulation (EC) No 642/2009 [i.10] are provided because televisions are out of scope of this standard.

Once the present document is cited in the Official Journal of the European Union under that Regulation, compliance with the normative clauses of the present document given in table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding ecodesign requirements of that Regulation and associated EFTA Regulations.

National transposition dates	
Date of latest announcement of this EN (doa):	3 months after ETSI publication
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	6 months after doa
Date of withdrawal of any conflicting National Standard (dow):	18 months after doa

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Introduction

The methods defined in the present document are intended to define requirements for the measurement of the power consumed by the interconnecting equipment having one or more wired or wireless networked port(s) able to resume a function by way of a remotely initiated trigger or reactivation trigger from a network connection. The present document also provides a method to test power management and whether it is possible to deactivate wireless network connection(s).

For the measurement of low power modes, reference is made to CENELEC EN 50564 [1].

1 Scope

1.1 Equipment in the scope of the present document

The present document specifies methods of measurement of electrical power consumption in networked standby and the reporting of the results for network interconnecting equipment.

Example of interconnecting equipment are in Annex B.

Power consumption in standby (other than networked standby) is covered by CENELEC EN 50564 [1], including the input voltage range.

The present document also provides a method to test power management and whether it is possible to deactivate wireless network connection(s).

The present document applies to electrical products with a rated input voltage of 230 V a.c. for single phase products and 400 V a.c. for three phase products.

The present document is produced under the mandate M/544 and can be used to demonstrate compliance to the EU Regulation (EC) No 1275/2008 [i.1] amended by Regulation 801/2013 [i.2].

The present document does not apply to televisions as defined in Regulation (EC) No 642/2009 [i.10].

NOTE 1: The EU regulation 801/2013 [i.2] applies to equipment designed for use with a nominal voltage rating of 250 V and below.

NOTE 2: EU regulation 801/2013 [i.2] does not apply to electrical and electronic household and office equipment placed on the market with a low voltage external power supply to work as intended.

NOTE 3: "*Low voltage external power supply*" is the definition provided in EU regulation 278/2009 [i.3].

NOTE 4: The measurement of energy consumption and performance of equipment during intended use are generally specified in product standards and are not covered by the present document.

NOTE 5: Where the present document is referenced by more specific standards or procedures, these should define and name the relevant conditions to which this test procedure is applied.

1.2 Equipment not in the scope of the present document

The present document does not apply to the measurement of electrical power consumption in networked standby for edge equipment. The edge equipment is a networked equipment that can be connected to a network and interact with that network or other devices and that does not have, as its primary function, the passing of network traffic to provide a network. Edge equipment are covered in CENELEC EN 50643 [i.8].

2 References

2.1 Normative references

References are specific, identified by date of publication and/or edition number or version number. Only the cited version applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <https://docbox.etsi.org/Reference/>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

- [1] CENELEC EN 50564:2011: "Electrical and electronic household and office equipment - measurement of low power consumption".

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

- [i.1] Commission Regulation (EC) No 1275/2008 of 17 December 2008 implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to ecodesign requirements for standby and off mode electric power consumption of electrical and electronic household and office equipment.
- [i.2] Commission Regulation (EU) No 801/2013 of 22 August 2013 amending Regulation (EC) No 1275/2008 with regard to ecodesign requirements for standby, off mode electric power consumption of electrical and electronic household and office equipment, and amending Regulation (EC) No 642/2009 with regard to ecodesign requirements for televisions.
- [i.3] Commission Regulation (EC) No 278/2009 of 6 April 2009 implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to ecodesign requirements for no-load condition electric power consumption and average active efficiency of external power supplies.

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the terms given in CENELEC EN 50564 [1] and the following apply:

NOTE: When the present document is used to provide presumption of conformity to a European Directive or Regulation, definitions given in the Directive or Regulation prevail.

edge equipment: networked equipment that can be connected to a network and interact with that network or other equipment and that does not have, as its primary function, the passing of network traffic to provide a network

NOTE: Examples of edge equipment are given in Annex B.

interconnecting equipment: networked equipment that has, as its primary function, the passing of network traffic to provide a network

NOTE: Examples of interconnecting equipment are given in Annex B.

logical network port: network technology running over a physical network port

NOTE 1: EU Commission Regulation No 801/2013 [i.2] definition.

NOTE 2: Different communication protocols result in different network technologies.

low voltage external power supply: external power supply with a nameplate output voltage of less than 6 volts and a nameplate output current greater than or equal to 550 milliamperes

NOTE: EC Commission Regulation No 278/2009 [i.3] definition.

network: communication infrastructure with a topology of links, an architecture, including the physical components, organizational principles, communication procedures and formats (protocols)

NOTE: EU Commission Regulation No 801/2013 [i.2] definition.

network availability: capability of the equipment to resume functions after a remotely initiated trigger has been detected by a network port

NOTE: EU Commission Regulation No 801/2013 [i.2] definition.

network port: wired or wireless physical interface of the network connection located on the equipment through which the equipment can be remotely activated

NOTE 1: EU Commission Regulation No 801/2013 [i.2] definition.

NOTE 2: The International Electrotechnical Vocabulary (IEC 60050 [i.9]) defines "port (of a network)" as: "*a termination through which signals can enter or leave a network*".

networked equipment: equipment that can connect to a network and has one or more network ports

NOTE: EU Commission Regulation No 801/2013 [i.2] definition.

networked standby: condition in which the equipment is able to resume a function by way of a remotely initiated trigger from a network connection

NOTE: EU Commission Regulation No 801/2013 [i.2] definition.

physical network port: physical (hardware) medium of a network port. A physical network port can host two or more network technologies

NOTE 1: EU Commission Regulation No 801/2013 [i.2] definition.

NOTE 2: A "physical network port" can consist of multiple "logical network ports".

power management: automatic control mechanism that achieves the smallest input power consistent with a pre-determined level of functionality

NOTE: Source: IEV 904-03-01 [i.11], modified by omission of the note to entry.

reactivation trigger: signal that brings the equipment back to active mode

NOTE: The reactivation may be remotely initiated.

remotely initiated trigger: signal that comes from outside the equipment via a network

NOTE: EU Commission Regulation No 801/2013 [i.2] definition.

3.2 Symbols

Void.

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

ADSL	Asymmetric Digital Subscriber Line
ADSL2plus	Second generation ADSL with extended bandwidth
AP	Access Point
CRC	Cyclic Redundancy Check
DOCSIS®	Data Over Cable Service Interface Specification
DSL	Digital Subscriber Line
EFTA	European Free Trade Association
EPON	Ethernet Passive Optical Network
EUT	Equipment Under Test
FXS	Foreign eXchange Station
GPON	Gigabyte Passive Optical Network
HiNA	High Network Availability
HPNA	Home Phoneline Networking Alliance
LAN	Local Area Network
POF	Plastic Optical Fibber
PSD	Power Spectral Density
QAM	Quadrature Amplitude Modulation
RF	Radio Frequency
USB	Universal Serial Bus
VDSL	Very high speed Digital Subscriber Line
VDSL2	Second generation VDSL
WAN	Wide Area Network
WiMAX	Worldwide interoperability for Microwave Access
XG-PON	10-Gigabit-capable Passive Optical Network

4 Information required for testing purposes

4.1 Information about networked port(s)

For each type of physical and associated logical networked port, the following information shall be provided by the manufacturer:

- a) the default time after which the power management function, or a similar function, automatically switches the equipment into networked standby, and if available, the procedure for:
 - 1) setting a time shorter than the default time; and/or
 - 2) manually switching the equipment into networked standby.

- b) the characteristics of the reactivation trigger (message, signal, etc.) that is used to reactivate the equipment when in networked standby and how to remotely initiate it;
- c) the maximum performance specifications, e.g. the maximum speed or data rate supported by that networked port;
- d) the (maximum) power consumption of the equipment in a condition providing networked standby into which power management function, or a similar function, will switch the equipment, if only this port is used for remote activation, e.g. the declared power consumption of the equipment under defined conditions for a type of port;
- e) the communication protocol used by equipment;
- f) the radio frequency range at which each radio wireless logical network port operates;
- g) the characteristics of wireless logical network ports other than radio wireless logical network ports.

NOTE: Annex D describes examples of product information for network equipment.

4.2 Power management function - periods & conditions

The manufacturer shall provide information on:

- whether the equipment under test provides a power management or a similar function. If the EUT does not provide power management or a similar function, the manufacturer shall indicate why such a function would be inappropriate for the intended use;
- the default period of time after which the power management function, or a similar function, switches the equipment automatically into a condition providing networked standby.

NOTE: According to European Regulation No 1275/2008 [i.1] (as amended by EU Regulation No 801/2013 [i.2]), the maximum default period is given as 20 minutes during which the equipment has not been providing its main function.

4.3 Activation and deactivation of wireless network connections

The manufacturer shall provide information on the procedure the user needs to follow in order to activate and deactivate each wireless network connection, if any.

The above requirement does not apply to equipment which relies on a single wireless network connection for intended use and does not have a wired network connection.

5 Measurement conditions

5.1 Common requirements

The general conditions for measurements specified in clause 4.1 of CENELEC EN 50564 [1] shall apply.

The tests described in clause 6 of the present document shall be repeated, if applicable, for each type of network port.

Each type of logical network port (as declared by the manufacturer) using the same physical network port shall be tested.

Where the manufacturer declares that multiple physical network ports have the same technical and logical specification(s), tests shall be executed with any one of these physical network ports being connected (the other ones being deactivated for wireless network ports and disconnected for wired network ports).

When a logical network port, as declared by the manufacturer, supports multiple editions of a communication technology standard (e.g. for backward compatibility), the logical network port is tested only according to the specifications of the latest standard edition used by the EUT for retrieving a reactivation message. Examples are shown in Annex C.

NOTE: Some devices can be designed to switch to a lower data rate during networked standby in order to further reduce energy consumption.

In order to restrict influence of external factors, the reactivation trigger shall be initiated within a local test network without external network connections. In the case that a network connection external to the local test network is necessary for remote activation, this external network connection shall be established and maintained during testing so that the reactivation trigger can be received; where identified in the information provided by the manufacturer (see clause 4), the stability of this external network connection may be checked or monitored.

EXAMPLE 1: External factors can be maintenance, information/software update or a denial of service attack.

EXAMPLE 2: External network connections can be WAN, cable network, satellite link, etc.

5.2 Test room

The requirements specified in clause 4.2 of CENELEC EN 50564 [1] shall apply.

5.3 Power supply

The requirements specified in clause 4.3 of CENELEC EN 50564 [1] shall apply.

5.4 Power measuring instruments

The requirements specified in clause 4.4 of CENELEC EN 50564 [1] shall apply.

5.5 Configuration of network ports

When testing only one type of network port, the procedure given in clause 6 shall apply. The network ports of the equipment under test, other than the network port under test shall be deactivated for wireless network ports and disconnected for wired network ports, if possible. Logical network ports which can only be activated and deactivated together shall be tested together following the same procedures used for individual network ports.

NOTE: If a product relies on active wired connection(s) to one or more network port(s) for the intended use, manual deactivation of these network port(s) is allowed instead of physical wire disconnection. The manual deactivation demands manual activation of network port(s) to resume the operational state of the device. As an example some of the technologies that are always relayed on downstream reception like DOCSIS, DSL starts continuous carrier scanning in respective frequency bands to recover its lost connection and consequently the measured power consumption is not representative of the real power consumption of the device; when it is in networked standby.

The network port under test shall have networked standby functionality enabled and shall be connected to the appropriate test equipment which will form the network configuration for the test. In case more than one type of reactivation trigger is available per type of network port to reactivate the equipment under test when in networked standby, the configuration resulting in the highest power consumption in networked standby shall be determined, as given below:

- a) At least once, all configurations shall be set-up with the information provided according clause 4.1 and tested following the procedure given in clause 6 to determine the related power consumption to determine the configuration with the highest power consumption.
- b) When the configuration with the reactivation trigger resulting in the highest power consumption in networked standby is known, this configuration shall be selected to conduct the measurement. The source of this information shall be additionally given in the test report.

- c) When the power consumption does not depend on the configuration and its reactivation trigger used, the configuration with the default reactivation trigger setting shall be selected.

The test equipment shall be able to test the EUT at the maximum performance level of the network port's protocol supported by hardware and software of the EUT.

The configuration of the network ports shall be according to the following setups (see also ETSI EN 301 575 [i.4] and Code Of Conduct on Energy Consumption of Broadband Communication Equipment [i.5]):

- WAN: link established and synchronized to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- ADSL2plus: select a valid ADSL2plus specific test profile, configured in rate adaptive mode. Use a test loop of 1,250 m to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- VDSL2: Select a valid VDSL2 profile line combination, for the governing profile bandwidth (namely 8 MHz, 12 MHz or 17 MHz), configured in rate adaptive mode. Use a test loop of 300 m for the 8 MHz profile and 150 m for each of the 12 MHz and 17 MHz profiles to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- VDSL2 (30a): VDSL2 Band Profile shall be: Profile 30a, using a valid PSD mask, configured in rate adaptive mode. Use a test loop of 100 m to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- Fast Ethernet WAN: Link established at 100 Mbit/s and passing user traffic: concurrent 1 Mbit/s downstream and 1 Mbit/s upstream sent in bursts of 25 back-to-back 500 bytes Ethernet Frames (CRC included) to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- Gigabit Ethernet WAN: Link established at 1 000 Mbit/s and passing user traffic: concurrent 50 Mbit/s downstream and 10 Mbit/s upstream sent in bursts of 250 back-to-back 500 bytes Ethernet Frames (CRC included) to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- Fibre Point-to-Point Fast Ethernet WAN: Link established at 100 Mbit/s and passing user traffic: 20 Mbit/s downstream, 5 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- Fibre Point-to-Point Gigabit Ethernet WAN: Link established at 1 000 Mbit/s and passing user traffic: 50 Mbit/s downstream, 10 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- GPON: passing user traffic: 10 Mbit/s downstream, 10 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- 1G-EPON: passing user traffic: 10 Mbit/s downstream, 10 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- 10/1G-EPON: passing user traffic: 50 Mbit/s downstream, 5 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- 10/10G-EPON: passing user traffic: 50 Mbit/s downstream, 10 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established and up, the interface is ready to transmit traffic but no user traffic is present.
- XG-PON1: passing user traffic: 50 Mbit/s downstream, 10 Mbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.

- DOCSIS® 2.0 [i.6]: Active with a downstream channel with a modulation type of 256 QAM and an upstream channel with a modulation type of 64 QAM and a symbol rate of 5,12 Ms/s to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- DOCSIS® 3.0 [i.7]: Active with an NxM configuration with N downstream channels with a modulation type of 256 QAM and M upstream channels with a modulation type of 64 QAM and a symbol rate of 5,12 Ms/s to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- WiMAX, 3G, LTE Passing user traffic: 1 Mbit/s downstream, 200 kbit/s upstream to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.
- LAN Fast Ethernet ports: all ports active, link established at 100 Mbit/s, cable length is 10 m and passing user traffic: concurrent 1 Mbit/s downstream and 1 Mbit/s upstream per port sent in bursts of 25 back-to-back 500 bytes Ethernet Frames (CRC included). For the verification of power management functions, the link shall be established but no user traffic transmission.
- LAN Gigabit Ethernet ports: all ports active, link established at 1 000 Mbit/s, cable length is 10 m and passing user traffic: concurrent 10 Mbit/s downstream and 10 Mbit/s upstream per port sent in bursts of 250 back-to-back 500 bytes Ethernet Frames (CRC included). For the verification of power management functions, the link shall be established but no user traffic transmission.
- Wi-Fi 802.11g or 11a [i.12]: beacon on, 1 Wi-Fi client associated and 1 - 5 m away from AP in the same room, avoid interference in the same band, with user traffic: concurrent 5 Mbit/s downstream and 5 Mbit/s upstream (where simultaneous dual-band operation is supported, this traffic is used). For the verification of power management functions, beacon is on, but no user traffic transmitted, no client associated.
- Wi-Fi 802.11n or 11ac [i.12]: beacon on, 1 Wi-Fi 802.11n client associated and 1 - 5 m away from AP in the same room, avoid interference in the same band, with user traffic: concurrent 10 Mbit/s downstream and 10 Mbit/s upstream (where simultaneous dual-band operation is supported, this traffic is used). For the verification of power management functions, beacon is on, but no user traffic transmitted, no client associated.
- Alternative LAN technologies (e.g. HPNA, MoCA, Powerline, POF): MoCA, Powerline, HPNA, or POF capability is activated, with user traffic: concurrent 10 Mbit/s downstream and 10 Mbit/s upstream per interface. For the verification of power management functions, MoCA, Powerline, HPNA, or POF capability is activated, but no user traffic transmitted.
- FXS: 1 phone connected (200 Ohm/loop current of 20 mA/5 m max cable length), off hook, 1 active call. For the verification of power management functions, 1 FXS port with phone connected, phone on-hook, off hook detection active. Remaining FXS ports: no phone or other load connected, but able to detect a connection.
- Femtocell (Home use, RF power < 10 mW, RF power 10 mW - 50 mW): active, client 5 m away in the same room, with user traffic: 2 Mbit/s to verify the on-mode conditions. For the verification of power management functions, the link shall be established but no user traffic is present.

For types of network connections not described above, the manufacturer of the EUT shall specify the test conditions.

5.6 Measurement uncertainty

Uncertainty introduced by the instrument that measures the input power shall be determined according to clause 4.4.1. of CENELEC EN 50564 [1]. Annex D of CENELEC EN 50564 [1] also describes the determination of measurement uncertainty, taking other parameters into account.

In order to avoid uncertainty associated to the communication link of the equipment under test, the cable lengths and measurement distances specified in clause 5.5 shall be respected where applicable. The test network should be restricted to the necessary test and ancillary equipment, directly related connected devices and the EUT.

6 Measurement procedures

6.1 General

The requirements specified in clause 5.1 of CENELEC EN 50564 [1] shall apply.

6.2 Wireless network port management

6.2.0 General

Activation and deactivation of wireless network port is verified according to the following procedure.

6.2.1 Test sequence

Wireless network port management shall be tested using the following steps or, where applicable, information supplied by the manufacturer:

- 1) Identify all logical network ports provided by the EUT which utilize a wireless network technologies; make sure the EUT is provided with, or connected to, a suitable antenna.
- 2) Deactivate all logical network ports provided by the EUT which utilize one or more wireless network technologies.
- 3) Verify that all wireless transmitters corresponding to the logical network ports identified in step 1 are off, according to clause 6.2.2.
- 4) In sequence, for each logical network port identified in step 1:
 - Activate the logical network port under test.
 - Verify that the logical network port under test is active according to clause 6.2.3.
 - Deactivate the logical network port under test.
 - Verify that wireless transmitters of the logical network port under test are off, according to clause 6.2.2.

6.2.2 Verifying that wireless connections are deactivated

To verify that wireless transmitters are in off mode, a suitable detection device shall be used to determine that wireless signals are not transmitted by the EUT in the normal operating frequencies or wavelengths provided by the manufacturer for each wireless logical network port.

NOTE: For determining whether an RF transmitter has been deactivated, an antenna connected to a suitable measurement instrument (including an RF Spectrum Analyser, RF Fast Fourier Transform analyser, or an RF Receiver) is used.

6.2.3 Verifying that wireless logical network port is active

A wireless logical network port is deemed to be active when it allows the EUT to identify other devices or to be identified by them.

6.3 Preparation of the EUT and general testing aspects

The requirements specified in clause 5.2 of CENELEC EN 50564 [1] shall apply.

6.4 Power management, reactivation and networked standby power consumption

This clause describes the procedure to test the power management function, measure the network standby power consumption, and test the reactivation function. This procedure shall be applied to each type of logical network port on an individual basis. Where network ports cannot be managed separately, the procedure shall be applied to groups of network ports managed simultaneously.

The EUT shall be tested using the following steps or, where applicable, using information supplied by the manufacturer (see clause 4):

- 1) Setup the EUT network ports according to the configurations given in clause 5.5 of the present document or according to the manufacturer specifications if the EUT has network ports not defined in clause 5.5 of the present document. If the EUT is equipment with HiNA functionality, the HiNA function shall be enabled if available when HiNA port is measured.
- 2) Configure the EUT and dependent devices so that the power management function automatically initiates the transition of the EUT into a condition having networked standby and the logical network port through which the EUT will be reactivated is enabled. Deactivate all other wireless ports not under test and deactivate or disconnect all wired network ports not under test; see note 1.

NOTE 1: According to EU Regulation No 801/2013 [i.2], "*networked equipment that has one or more standby mode(s) shall comply with the requirements for these standby mode(s) when all wired network ports are disconnected and when all wireless network ports are deactivated*".

NOTE 2: If a product relies on active wired connection(s) to one or more network port(s) for the intended use, manual deactivation of these wired network port(s) is allowed instead of disconnection.

- 3) Measure, with an accuracy of 10 seconds, the time after which the power management function automatically initiates the transition of the EUT into a condition providing networked standby by the following steps:
 - leave the EUT in a mode where it is not providing a main function (as determined in step 1) and no other devices are dependent on its functions. Start the timer used for measurement;
 - measure the time taken until the power management function initiates an automatic power mode change instigating network standby.

NOTE 3: For electronic household and office equipment other than televisions and computers, Regulation (EU) No 801/2013 [i.2] says "*The default period of time after which the power management function, or a similar function, switches the equipment automatically into a condition providing networked standby shall not exceed 20 minutes*".

- 4) When the EUT has entered a condition providing networked standby, measure the power consumption according to clause 5.3 of CENELEC EN 50564 [1]. For an EUT requiring connection to an external network, if stability of networked standby power consumption is not attained, then the network connection shall be checked to detect influence of external factors (see clause 5.1).

NOTE 4: Instability of power consumption due to external influences could be compared with periodic or cyclic patterns being present. See note 2 of clause 5.3.2 in CENELEC EN 50564 [1].

- 5) Considering the specific network port configuration under test, verify that the EUT can be reactivated through the network port configuration being tested. The EUT shall be reactivated using a network trigger appropriate for the logical network port being tested. The required reactivation trigger shall be declared by the manufacturer. If this reactivation trigger uses proprietary technology it shall be specified in detail or supplied by the manufacturer. If the reactivation trigger does not initiate reactivation of the EUT, the EUT is not considered to be in networked standby.

Steps 2 to 5 shall be repeated for each type of logical network port. If the EUT can be manually set to networked standby, perform steps 4 and 5 after manually setting the EUT to networked standby. This shall also be repeated for each type of logical network port. The EUT may need to be reset before the next measurement starts.

6.5 Measurement of standby power consumption with all network ports disconnected

The EUT shall be tested using the following steps, utilizing information (including whether it has HiNA functionality) supplied by the manufacturer (see clause 4):

- 1) Configure the EUT and dependent devices so that all wired network ports are disconnected and all wireless network ports are deactivated (according to clause 5.5).
- 2) Configure the EUT with the power management function that automatically initiates the transition of the EUT into a condition having standby (or a similar low power mode). If applicable the EUT may be manually set to standby.

NOTE 1: Equipment with HiNA functionality does not normally go automatically into standby or similar low power mode.

- 3) Measure the power consumption according to clause 5.3 of CENELEC EN 50564 [1], when the EUT has entered a stable condition providing standby or similar low power modes.

NOTE 2: If the EUT has not a stable power condition, the method defined in clause 5.3.2 of CENELEC EN 50564 [1] applies.

6.6 Measurement of networked standby power consumption with all network ports connected

The EUT shall be tested using the following steps, utilizing information (including whether it has HiNA functionality) supplied by the manufacturer (see clause 4):

- 1) Configure the EUT and dependent devices so that all wired network ports are connected and all wireless network ports are activated (according to clause 5.5).
- 2) Configure the EUT with the power management function that automatically initiates the transition of the EUT into a condition having networked standby for all logical network ports. If applicable the EUT may be manually set to networked standby.
- 3) When the EUT has entered a condition providing networked standby, measure the power consumption according to clause 5.3 of CENELEC EN 50564 [1]. For an EUT requiring connection to an external network, if stability of networked standby power consumption is not attained, then the network connection shall be checked to detect influence of external factors (see clause 5.1 and note 4 of clause 6.4).

7 Test report

7.1 Test and laboratory details

The requirements specified in clause 6.4 of CENELEC EN 50564 [1] shall apply.

7.2 Details of product under test

The requirements specified in clause 6.1 of CENELEC EN 50564 [1] shall apply.

In addition, following information shall be provided:

- a) The number and type of network ports and, with the exception of wireless network ports, where these ports are located on the equipment; in particular it shall be declared if the same physical network port accommodates two or more types of network ports.
- b) Whether all network ports are deactivated before delivery.

- c) The normal range of frequencies or wavelengths for each wireless network port.
- d) Whether the equipment qualifies as HiNA equipment or equipment with HiNA functionality.

When no information is provided according to point (d), equipment shall be considered to be neither HiNA equipment nor equipment with HiNA functionality.

7.3 Test parameters and network configuration

The requirements specified in clause 6.2 of CENELEC EN 50564 [1] shall apply.

The configuration of the test network in accordance to clauses 5.5, 6.2, 6.4 and 6.5 shall be documented for each measurement conducted in respect to interconnecting equipment and access point used (name of manufacturer, model name and serial number, relevant settings), the cabling (type & length), layout and distances for wireless connections and network connection speeds.

Where manufacturer instructions have been used, this shall be documented.

7.4 Measured and documented data

The requirements specified in clause 6.3 of CENELEC EN 50564 [1] shall apply. In addition, the following information shall be provided in the test report:

- a) Network configuration used for each type of network port (for example where applicable: cable length & type, distance from the EUT, network equipment utilized and network connection speeds).
- b) Time taken for the EUT to automatically power down into a condition providing networked standby mode for each type of network port.
- c) Power measurements for the EUT in networked standby mode, for each type of network port (following automatic or manual power down).
- d) Confirmation of successful remote reactivation for each type of network port.
- e) Wireless measurement for EUT after each wireless logical network port has been deactivated.
- f) Power measurement in networked standby mode, with all wired network port connected and all wireless network ports activated.

NOTE: Annex E provides an example of a test report template.

Annex A (informative): Relationship between the present document and the ecodesign requirements of Commission Regulation (EC) No 1275/2008, as amended by Commission Regulation (EU) No 801/2013

The present document has been prepared under the Commission's standardisation request to the European standardisation organizations as regards eco-design requirements for networked standby in support of Regulation (EC) No 1275/2008 [i.1] and Regulation (EC) No 642/2009 [i.10], M/544 / C(2015) 9468 final of 5 January 2016, to provide one voluntary means of conforming to the eco-design requirements on networked standby of the following:

- Commission Regulation (EC) No 1275/2008 [i.1] of 17 December 2008 implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to eco-design requirements for standby and off mode, and networked standby, electric power consumption of electrical and electronic household and office equipment; and
- Commission Regulation (EC) No 642/2009 [i.10] of 22 July 2009, implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to eco-design requirements for televisions.

NOTE 1: Regulation (EC) No 1275/2008 [i.1] and Regulation (EC) No 642/2009 [i.10] were amended by Commission Regulation (EU) No 801/2013 [i.2] of 22 August 2013.

NOTE 2: Commission Regulation (EC) No 642/2009 [i.10] of 22 July 2009, implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to eco-design requirements for televisions is quoted in the introduction of this annex but no relationship with this standard and the requirements of Commission Regulation (EC) No 642/2009 [i.10] are provided because televisions are out of scope of this standard

Once the present document is cited in the Official Journal of the European Union under Regulation (EC) No 1275/2008, compliance with the normative clauses of the present document given in table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding eco-design requirements of that Regulation, and associated EFTA Regulations.

Table A.1: Relationship between the present document and the eco-design requirements of Commission Regulation (EU) No 1275/2008 [i.1] implementing Directive 2005/32/EC of the European Parliament and of the Council with regard to eco-design requirements for standby and off mode, and networked standby, electric power consumption of electrical and electronic household and office equipment (as amended by Commission Regulation (EU) No 801/2013 [i.2] of 22 August 2013)

Key to columns:**Requirement:**

No A unique identifier for one row of the table which may be used to identify a requirement.

Description A textual reference to the requirement.

Requirements of Regulation

Identification of article(s) defining the requirement in the Regulation.

Clause(s) of the present document Identification of clause(s) defining the requirement in the present document unless another document is referenced explicitly.

Requirement Conditionality:

U/C Indicates whether the requirement is unconditionally applicable (U) or is conditional upon the manufacturer's claimed functionality of the equipment (C).

Condition Explains the conditions when the requirement is or is not applicable for a requirement which is classified "conditional".

Presumption of conformity stays valid only as long as a reference to the present document is maintained in the list published in the Official Journal of the European Union. Users of the present document should consult frequently the latest list published in the Official Journal of the European Union.

Other Union legislation may be applicable to the product(s) falling within the scope of the present document.

Annex B (informative): Equipment classification

B.1 General

Networked equipment can be classified as edge equipment or interconnecting equipment. Depending on the application, the same equipment may sometimes fall into either or both of those classifications. The relation between regulatory definitions and the classifications applied for the measurement standards are explained further in table B.1. Examples of equipment and their classification can be found in table B.2.

Table B.1: Classification of networked equipment

Definition from Commission Regulation (EU) 801/2013 [i.2]		Equipment classification	
		Edge equipment	Interconnecting equipment
		Measurement procedures described in CENELEC EN 50643 [i.8]	Measurement procedures described in ETSI EN 303 423 (the present document)
Networked equipment (see note) with high network availability (HiNA equipment)	Equipment with one or more of the following functionalities, but no other, as the main function(s): router, network switch, wireless network access point, hub, modem, VoIP telephone, video phone.	No	Yes
Networked equipment (see note) with high network availability functionality (equipment with HiNA functionality)	Equipment with the functionality of a router, network switch, wireless network access point or combination thereof included, but not being HiNA equipment.	Yes	No
Other networked equipment (see note) which is neither HiNA equipment nor equipment with HiNA functionality		Yes	No

NOTE: Networked equipment means equipment that can connect to a network and has one or more network ports.

Table B.2: Example of equipment definition and classifications

Defined term in Commission Regulation (EU) 801/2013 [i.2]	Definition from EU Regulation	Edge device	interconnecting
Router	Network device whose primary function is to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another, based on network layer information (L3).	No	yes
Network switch	Network device whose primary function is to filter, forward and distribute frames based on the destination address of each frame. All switches operate at least at the data link layer (L2).	No	Yes
Wireless network access point	Device whose primary function is to provide IEEE 802.11™ (Wi-Fi) [i.12] connectivity to multiple clients.	No	Yes

Defined term in Commission Regulation (EU) 801/2013 [i.2]	Definition from EU Regulation	Edge device	interconnecting
Hub	Network device that contains multiple ports and is used to connect segments of a Local Area Network.	No	Yes
Modem	Device whose primary function is to transmit and receive digitally modulated analogue signals over a wired network.	No	Yes
Printing equipment	Equipment that generates paper output from electronic input. Printing equipment may have additional functions and may be marketed as a multifunctional device or multifunctional product.	Yes	no
Large format printing equipment	Printing equipment designed for printing on A2 media and larger, including equipment designed to accommodate continuous-form media of at least 406 mm width.	Yes	no
Tele-presence system	Dedicated system for high-definition video conferencing and collaboration which includes a user interface, a high-definition camera, a display, a sound system and processing capabilities for encoding and decoding video and audio.	Yes	no

Annex C (informative): General information on network technologies and network configurations with respect to power consumption

C.1 Examples of network port configuration

Examples are provided below on how different types of network port configurations would be assessed with respect to the present document.

Table C.1: Examples of technologies considered for Networked standby

Hardware network port type	Network port 1: Protocol	Network port 1: additional protocol or variant	Network port 2: protocol	Comment:
USB	USB 2.0	-	USB 3.0	Two separate network ports
USB	USB 3.0	USB 2.0	-	One USB 3.0 network port
Ethernet	10 Base-T	100 Base-T	1000 Base-T	Two separate network ports. One 100 Base-T and one 1000 Base-T
Ethernet	100 Base-T	1000 Base-T	-	One 1000 Base-T network port
Coax	DOCSIS		MoCA	Two separate network ports
Coax	DOCSIS	MoCA		Two separate logical network ports connected to the same physical network port
Wi-Fi (802.11)	IEEE 802.11™b	802.11g	802.11n	Two separate network ports. One 802.11g and one 802.11n
Wi-Fi (802.11)	802.11b/g	802.11n		One 802.11n network port

Annex D (informative): Information to be provided to the user and other interested parties

D.1 Information to be provided to the user and other interested parties

D.1.1 Information available on-line

According to the regulation No 801/2013 [i.2], the following information for networked equipment should be visibly displayed on one or more freely accessible website(s):

- a) for each standby and/or off mode and the condition providing networked standby into which the equipment is switched by the power management function or similar function:
 - the power consumption data in Watt rounded to the first decimal place;
 - the period of time after which the power management function, or a similar function, switches the equipment automatically into standby and/or off mode and/or the condition providing networked standby.
- b) the power consumption of the product in networked standby if all wired network ports are connected and all wireless network ports are activated;
- c) guidance on how to activate and deactivate wireless network ports.

NOTE: Power consumption in Watt is rounded to the first decimal.

D.1.2 Information available in the user manual

According to the regulation No 801/2013 [i.2], the following information for networked equipment should be included in the user manual:

- a) the power consumption of the product in networked standby if all wired network ports are connected and all wireless network ports are activated;
- b) guidance on how to activate and deactivate wireless network ports.

Annex E (informative): Example of a test report template

Product under test			
Brand name as identified on product			
Model identification			
Version or serial number			
Product description			
Regulatory reference			
Name of applicant
