Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, PLUGTESTS™, UMTS™ and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. 3GPP™ and LTE™ are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. oneM2M™ logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. GSM® and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

The present document is part 8 of a multi-part deliverable. Full details of the entire series can be found in part 1 [1].

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.
1 Scope

The present document defines the mapping rules for CORBA IDL (as defined in clause 3 in [4]) to TTCN-3 (as defined in ETSI ES 201 873-1 [1]) to enable testing of CORBA-based systems. The principles of mapping CORBA IDL to TTCN-3 can be also used for the mapping of interface specification languages of other object-/component-based technologies.

The specification of other mappings is outside the scope of the present document.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

[2] Recommendation ITU-T T.50: "International Reference Alphabet (IRA) (Formerly International Alphabet No. 5 or IA5) - Information technology - 7-bit coded character set for information interchange".

NOTE: Available at http://www.omg.org/spec/CORBA/.

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

4 General considerations

4.1 Introduction

Object-based technologies (such as CORBA, DCOM, DCE) and component-based technologies (such as CCM, EJB, Microsoft® .NET) use interface specifications to describe the structure of an object-/component-based system and its operations and capabilities to interact with the environment. These interface specifications support interoperability and reusability of objects/components.

The techniques used for interface specifications are often called Interface Definition Language (IDL), for example CORBA IDL, Microsoft® IDL or DCE IDL. These languages are comparable in their abilities to define system interfaces, operations at system interfaces and system structures to various extends. They differ in details of the object/component model.

When considering the testing of object-/component-based systems with TTCN-3, one is faced with the problem of accessing the systems to be tested via the system interfaces as described in an IDL specification. In particular, for TTCN-3 based test systems a direct import of IDL specifications into the test specifications for the use of e.g. system’s interface, operation and exception definitions is prevalent to any manual transformation into TTCN-3.

The present document discusses the mapping of CORBA IDL specifications into TTCN-3. This mapping rules out the principles not only for CORBA IDL, but also for other interface specification languages. The mapping can be adapted to the details of other interface specification languages.

The Interface Definition Language (IDL) (clause 3 in [4]) is a base of the whole Common Object Request Broker Architecture (CORBA) [4] and an important point in developing distributed systems with CORBA. It allows the reuse and interoperability of objects in a system. A mapping between IDL and a programming language is defined in the CORBA standard. IDL is very similar to C++ containing pre-processor directives (include, comments, etc.), grammar as well as constant, type and operation declarations. There are no programming language features like, e.g. if-statement statements.

The core language of TTCN-3 is defined in ETSI ES 201 873-1 [1] and provides a full text-based syntax, static semantics and operational semantics. The IDL mapping provides a definition for the use of the core language with IDL (figure 1).

**Figure 1: User’s view of the core language and its packages**

It makes no difference for the mapping if requested or provided interfaces are required by the test system and SUT. Hence, TTCN can be used on client and server side without modifications to the mapping rules.
The present document is structured similar to the IDL specification document to provide easy access to the mapping of each IDL element.

4.2 Approach

Two different approaches can be identified: the use of either implicit or explicit mapping. The implicit mapping makes use of the import mechanism of TTCN-3, denoted by the keywords language and import. It facilitates the immediate use of data specified in other languages. Therefore, the definition of a specific data interface for each of these languages is required. Currently, ASN.1 data can be used besides the native TTCN-3 types (see ETSI ES 201 873-7 [i.1]).

The present document follows the approach of explicit mapping, i.e. IDL data are translated into appropriate TTCN-3 data. And only those TTCN-3 data are further used in the test specification.

4.3 Conformance and compatibility

For an implementation claiming to support the IDL to TTCN-3 mapping, all features specified in the present document shall be implemented consistently with the requirements given in the present document and in ETSI ES 201 873-1 [1].

5 Lexical Conventions

5.0 General

The lexical conventions of IDL define the comments, identifiers, keywords and literals conventions which are described in the following clauses.

5.1 Comments

Comment definitions in TTCN-3 and IDL are the same and therefore, no conversion of comments is necessary.

5.2 Identifiers

IDL identifier rules define a subset of the TTCN-3 rules in which no conversion is necessary.

5.3 Keywords

When IDL is used with TTCN-3 the keywords of TTCN-3 shall not be used as identifiers in an IDL module.

5.4 Literals

The definition of literals differs slightly between IDL and TTCN-3 why some modifications have to be made. Table B.1 gives the mapping for each literal type.
Table 1: Literal mapping

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

6 Pre-processing

Pre-processor statements are not matched to TTCN-3 because the IDL specification shall be used after pre-processing it.

7 Importing from IDL specifications

7.0 General

The import of module, interface, value and constant declaration are described in this clause. The type and exception declaration as well as the bodies of interfaces are described later.

All imported IDL declarations are in TTCN-3 public by default (see clause 8.2.5 of ETSI ES 201 873-1 [1]).

7.1 Importing module declaration

IDL modules are mapped to TTCN-3 modules. Nested IDL modules shall be flattened accordingly to TTCN-3 modules.

As one IDL module can contain many nested IDL modules where several nested modules can have equal names in different scopes, these names can clash. Hence, module names identifiers are to be used which are composed of the identifiers of the upper level IDL modules (from hierarchical point of view) and the nested IDL module name, separated one from each other by two underscores.

According to the IDL scoping rules nested modules have access to the scope of upper level modules. As there are no nested modules in TTCN-3, TTCN-3 modules have to import upper level modules. For avoiding name clashes, a prefix for the imported definitions composed of the identifier of the module from which it is imported shall be used. The prefix and the identifier are separated by a dot (.) as defined in TTCN-3.

IDL EXAMPLE:

```idl
module identifier1 {
    typedef long mylong1;
    module identifier2 {
        typedef string mystring2;
        typedef mylong1 mylong2;
        module identifier3 {
            typedef mylong1 long_from_module_1;
            typedef mystring2 string_from_module_2;
            typedef mylong2 long_from_module_1_2;
        }
    }
};
```
TTCN EXAMPLE:

```tcl
module identifier1 {
  type long mylong1;
}

module identifier1__identifier2 {
  import from identifier1 all;
  type iso8859string mystring2;
  type identifier1.mylong1 mylong2;
}

module identifier1__identifier2__identifier3 {
  import from identifier1 all;
  import from identifier1__identifier2 all;
  type identifier1.mylong1 long_from_module_1;
  type identifier1__identifier2.mystring2 string_from_module_2;
  type identifier1__identifier2.mylong2 long_from_module_1_2;
};
```

7.2 Importing interface declaration

Interfaces are flattened and all interface definitions are stored in one group. In contrast to interfaces in IDL, groups in TTCN-3 do not create a scope. Therefore, prefixes for all identifiers of type definitions inside of the interface shall be used, which are a combination of the interface name and two underscores as the prefix.

Import of single interface definitions from other modules via the importing group statement is possible. This can be used if inheritance is used in the IDL specification.

For each interface, a procedure-based port type is defined for the test specification. It is associated with signatures translated from attributes and operations of the interface.

An IDL attribute is mapped to two signatures: one for the setting of a value and one for getting it. These signatures have names composed of the prefix (interface name and two underscores), attribute name and the word "Set" (except for "readonly") or "Get" correspondingly.

Since an interface can be used in operation parameters to pass object references, an address type is also declared in the data part - the concrete implementation is left to the user. Components are used as collection of interfaces or objects.

IDL EXAMPLE:

```idl
interface identifier {
  attribute long attributeId;
  void operationname ( in string param_value ) raises ( ExceptionType ) ;
  ... other body definitions ...
};
```

TTCN EXAMPLE:

```tcl
group identifierInterface {
  signature identifier__attributeIdGet () return long
  exception ( ... /* and all system exceptions defined in clause 9 */ );
  signature identifier__attributeIdSet ( in long identifier__attributeId)
  exception { ... /* and all system exceptions defined in clause 9 */ };
  signature identifier__operationname ( in iso8859string identifier__param_value )
  exception ( ExceptionType, ... /* and all system exceptions defined in clause 9 */ ) ;
  ...other body definitions ...
  type port identifier procedure { ... }
  type charstring identifierObject;  /* a possible definition for the address type */
  type identifierObject address;
};
```

Interface inheritance is executed by rolling out all inherited elements. Thus, they have to be handled as defined in the interface itself. Multiple inheritance elements have to be inherited only once! As normally an inherited IDL interface uses types defined in the module, usually it is essential to import the complete mapped TTCN-3 module. All inherited elements have to be rolled out directly in the TTCN-3 group for the interface, even if the inheritance is multiple.
Forward references of interfaces are provided by forward referencing the according port of the interface. Local interfaces are treated as normal interfaces. However it is recommend not to use forward references and to move a TTCN-3 definition of the interface (group) to a place where a forward definition is used first time.

7.3 Importing value declaration

In contrast to type interface, the IDL type value has local operations that are not used outside the object, and are therefore not relevant from the functional testing point of view. However, since the public attributes of value instances are used to communicate object states, the IDL value type is mapped to the record type in TTCN-3.

The example below shows how to map valuertype and was used from clause 5.2.5 in [4].

IDL EXAMPLE:

```idl
valuetype EmployeeRecord {
   // note this is not a CORBA::Object
   // state definition
   private string name;
   private string email;
   private string SSN;
   // initializer
   factory init(
      in string name, in string SSN );
}
```

TTCN EXAMPLE:

```tTCN
type record EmployeeRecord {
   iso8859string name,
   iso8859string email,
   iso8859string SSN
}
```

7.4 Importing constant declaration

Constant declarations can be transformed by use of literal (see table B.1) and operator mapping for floating-point and integer values (see table 2).

<table>
<thead>
<tr>

</tbody>
</table>
8 Importing type declaration

8.0 General
Type declaration mapping will be shown in the following clauses.

A construct for naming data types and defining new types by using the keyword typedef is provided by IDL. This can be done under TTCN-3 via the keyword type, too.

To enhance readability and to provide a clear distinction, mapped IDL data types get the prefix IDL and the extension attribute "variant" as done in TTCN-3 for type IDLfixed (see clause E.2.3.0 in ETSI ES 201 873-1 [1]).

8.1 IDL basic types

8.1.0 General approach
IDL basic data types are mapped to predefined or useful types in TTCN-3.

8.1.1 Integer and floating-point types
Integer and floating-point types are mapped onto the corresponding useful types short, unsignedshort, long, unsignedlong, longlong, unsignedlonglong, IEEE754float, IEEE754double, and IEEE754extdouble.

IDL EXAMPLE:
```idl
const long size = ( ( number << 3 ) % 0x1F ) & 0123;
const float decimal = 15.7;
```

TTCN EXAMPLE:
```tccn
const long size := ( ( number << 3 ) mod '1F'H ) and4b '0123'O;
const IEEE754float decimal := 15.7;
```

8.1.2 Char and wide char type
The IDL char and wide char type represent a single and wide character. They are mapped to the self defined type iso8859char and type uchar.

IDL EXAMPLE:
```idl
const char letter = 'ABCD';
const wchar wideLetter = L'ABCD';
```

TTCN EXAMPLE:
```tccn
type universal charstring uchar length(1);
type uchar iso8859char (char ( 0,0,0,0 ) .. char ( 0,0,0,255)) with { variant "8 bit" };
const iso8859char letter := char ( 65, 66, 67, 68 );
const uchar wideLetter := char ( 65, 66, 67, 68 );
```
8.1.3 Boolean type

The IDL boolean type is equivalent to the TTCN-3 boolean type.

IDL EXAMPLE:
const boolean isValid = TRUE;

TTCN EXAMPLE:
const boolean isValid = true;

8.1.4 Octet type

Octet cannot be mapped onto an integer type because it has the special feature that it will not change its internal ordering if transferred between different system architectures. To represent it octet is mapped to octetstring.

IDL EXAMPLE:
const octet data = 0x55;

TTCN EXAMPLE:
const octetstring data = '55'H

8.1.5 Any type

The IDL any type is mapped onto anytype in TTCN-3 which was especially introduced for this mapping.

IDL EXAMPLE:
typedef any AllTypes;

TTCN EXAMPLE:
type anytype AllTypes;

8.2 Constructed types

8.2.0 General approach

IDL provides the three constructed types struct, union, and enum. Recursive construction of types is only permitted with the sequence template.

8.2.1 Struct

struct is used to collect ordered data in one place where it is mapped onto record in TTCN-3.

IDL EXAMPLE:
typedef struct NC {
   string id;
   string kind;
} NameComponent;

TTCN EXAMPLE:
type record NameComponent {
   iso8859string id,
   iso8859string kind
}
8.2.2 Discriminated unions

In IDL, unions are discriminated to determine the actual type. Therefore, a record type is used, which contains two members. The first one stores the discriminator information using an enumeration type. The second member is a TTCN-3 union type which members are defined according to the specified IDL union members.

In addition, two types are defined to express the link between discriminator's type and union's type: a type to reflect the discriminating type of a union and an enumeration to distinguish the discriminated cases. Using the information provided by these type definitions, the marshalling/unmarshalling for discriminated unions is possible in an unambiguous manner: to encode or decode a union value, the value of the kind field to resolve the corresponding chosen option and calculate then the real value for the discriminator by resolving this value in the discriminator enumeration shall be used.

IDL EXAMPLE 1:

```idl
union MyUnion switch ( long ) {
    case 0 : boolean b;
    case 1 : char c;
    case 2 : octet o;
    case 3 : short s;
}
```

TTCN EXAMPLE 1:

```ttcn
type long MyUnion__Switch;

type union MyUnionType {
    boolean b,
    iso8859string c,
    octetstring o,
    short s }

type enumerated MyUnionEnumType {
    boolean_b, iso8859string_c, octetstring_o, short_s }

type record MyUnion {
    MyUnionEnumType kind,
    MyUnionType value
}
```

IDL EXAMPLE 2:

```idl
Enum MyDiscr {
    BOOLEAN_DISCR,
    CHAR_DISCR,
    OCTET_DISCR,
    SEQ_DISCR,
    SHORT_DISCR
};

union MyUnion switch ( MyDiscr ) {
    case BOOLEAN_DISCR : boolean b;
    case SHORT_DISCR : short s;
}
```

TTCN EXAMPLE 2:

```ttcn
type enumerated MyDiscr {
    BOOLEAN_DISCR, CHAR_DISCR, OCTET_DISCR, SEQ_DISCR, SHORT_DISCR }

type MyDiscr MyUnion__Switch;

type enumerated MyUnion__CasesType {
    case_BOOLEAN_DISCR,
    case SHORT_DISCR
}

type union MyUnionType {
    boolean b,
    short s
}

type enumerated MyUnionEnumType {
```
8.2.3 Enumerations

Enumerations are equally defined in IDL and TTCN-3.

IDL EXAMPLE:

```idl
type enum NotFoundReason {
    missing_node,
    not_context,
    not_object
}
```

TTCN EXAMPLE:

```tccn
type enumerated NotFoundReason {
    missing_node,
    not_context,
    not_object
}
```

8.3 Template types

8.3.0 General approach

IDL supports the template types sequence, string, wide string and fixed type.

8.3.1 Sequence

IDL sequence is mapped to record of in TTCN-3 to maintain order and to allow unbounded sequences.

IDL EXAMPLE 1:

```idl
typedef sequence<NameComponent> Name;
```

TTCN EXAMPLE 1:

```tccn
type record of NameComponent Name;
```

IDL sequences with a specified maximum size are mapped to record of with limited number of elements to maintain order and restrict the maximum number of elements.

IDL EXAMPLE 2:

```idl
typedef sequence<NameComponent, maximum_size> Name;
```

TTCN EXAMPLE 2:

```tccn
type record length (0, maximum_size-1) of NameComponent Name;
```

8.3.2 String and wstring

string and wstring types are sequences of char and wchar. Therefore, string and wstring are mapped to the useful type iso8859string and universal charstring.

IDL EXAMPLE:

```idl
const string name = "My String";
const wstring wideName = L"My String";
```
TTCN EXAMPLE:

```tcl
const iso8859string name := "My String";
const universal charstring wideName := "My String";
```

### 8.3.3 Fixed types

The **fixed** type represents a fixed-point decimal number. It is mapped to the corresponding useful type **IDLfixed** in TTCN-3 (see clause E.2.3.0 in ETSI ES 201 873-1 [1]).

**IDL EXAMPLE:**

```idl
typedef fixed<12,7> myFix;
```

**TTCN EXAMPLE:**

```tcl
template IDLfixed myFixTemplate := { 12, 7, ? }; // e.g. in module definition part
var IDLfixed myFix := { 12, 7, "12345.1234567" }; // e.g. in module control part
```

### 8.4 Complex declarator

#### 8.4.0 General approach

The last kind of type declarators are the complex array and native types.

#### 8.4.1 Arrays

**IDL array** is equal to the TTCN-3 array type.

**IDL EXAMPLE:**

```idl
typedef long NumberList[100];
```

**TTCN EXAMPLE:**

```tcl
type long NumberList[100];
```

#### 8.4.2 Native types

Native types are used to allow implementation of dependent types. TTCN-3 provides the type **address** to address entities inside a SUT. Hence, **address** can be used for mapping of type **native** and concrete implementation is left to the user.

**IDL EXAMPLE:**

```idl
typedef native MyNativeVariable;
```

**TTCN EXAMPLE:**

```tcl
type MyNativeVariable address;
```

### 9 Importing exception declaration

In IDL, exceptions are used in conjunction with operations to handle exceptional conditions during an operation call. Thus, a special struct-like **exception** type is provided which has to be associated with each operation that can trigger this exception. TTCN-3 also supports the use of exceptions with procedure calls by binding it to signature definitions. However, it provides no special **exception** type. Hence, exceptions are defined by using type **record**.

A definition of an **exception** is shown in the following example. The use of exception binding in signature definitions and exception catching is shown in the context of operation declaration.
IDL EXAMPLE:

```
exception NotFoundException {
    NotFoundReason why;
    Name rest_of_name; }
```

TTCN EXAMPLE:

```
// definition of an exception type
type record NotFoundException {
    NotFoundReason why,
    Name rest_of_name }
```

// definition of a template for the
// defined exception type
template NotFoundException ( NotFoundReason reason, Name name ) := {
    why := reason,
    rest_of_name := name }

In addition to user defined exceptions, there are CORBA system exceptions defined in chapter 4 in [4]. In order to make them available for use in TTCN-3, the following definitions are to be used:

```
// CORBA system exceptions
type record UNKNOWN()  // the unknown type record
type record BAD_PARAM()  // an invalid parameter was passed
type record NO_MEMORY()  // dynamic memory allocation failure
type record IMP_LIMIT()  // violated implementation limit
type record COMM_FAILURE()  // communication failure
type record INV_OBJREF()  // invalid object reference
type record NO_PERMISSION()  // no permission for attempted op.
type record INTERNAL()  // ORB internal error
type record MARSHAL()  // error marshaling param/result
type record INITIALIZE()  // ORB initialization failure
type record NO_IMPLEMENT()  // operation implementation unavailable
type record BAD_TYPECODE()  // bad typecode
type record BAD_OPERATION()  // invalid operation
type record NO_RESOURCES()  // insufficient resources for req.
type record NO_RESPONSE()  // response to req. not yet available
type record PERSIST_STORE()  // persistent storage failure
type record BAD_INV_ORDER()  // routine invocations out of order
type record TRANSIENT()  // transient failure - reissue request
type record FREE_MEM()  // cannot free memory
type record INV_IDENT()  // invalid identifier syntax
type record INV_FLAG()  // invalid flag was specified
type record INTF_REPOS()  // error accessing interface repository
type record BAD_CONTEXT()  // error processing context object
type record OBJ_ADAPTER()  // failure detected by object adapter
type record DATA_CONVERSION()  // data conversion error
type record OBJECT_NOT_EXIST()  // non-existent object, delete reference
type record TRANSACTION_REQUIRED()  // transaction required
type record TRANSACTION_ROLLEDBACK()  // transaction rolled back
type record INVALID_TRANSACTION()  // invalid transaction
type record INV_POLICY()  // invalid policy
type record CODESET_INCOMPATIBLE()  // incompatible code set
type record REBIND()  // rebind needed
type record TIMEOUT()  // operation timed out
type record TRANSACTION_UNAVAILABLE()  // no transaction
```

```
type record TRANSACTION_MODE()  // invalid transaction mode
type record BAD_QOS()  // bad quality of service
```

```
type record INVALID_ACTIVITY()  // bad quality of service
type record ACTIVITY_COMPLETED()  // bad quality of service
```

```
type record ACTIVITY_REQUIRED()  // bad quality of service
```

```
type union SYSTEM_EXCEPTION {
    UNKNOWN unknown,
    BAD_PARAM bad_Param,
    NO_MEMORY no_MEMORY,
    IMP_LIMIT IMP_LIMIT,
    COMM_FAILURE COMM_FAILURE,
    INV_OBJREF INV_OBJREF,
    NO_PERMISSION no_PERMISSION,
    INTERNAL INTERNAL,
    MARSHAL MARSHAL,
    INITIALIZE INITIALIZE,
    NO_IMPLEMENT no_IMPLEMENT,
    BAD_TYPECODE bad_TYPECODE
```
10 Importing operation declaration

Apart from attributes, operations are the main part of interface definitions in IDL and are used, for instance, in the CORBA scheme as procedures which can be called by clients. Procedure calls in general are supported by TTCN-3 by means of synchronous communication operations which are used in combination with ports.

IDL supports an optional oneway attribute for operations which implies best-effort invocation semantics without a guarantee of delivery but with a most-once invocation semantics. Message or procedure-based ports can be used for oneway procedures because both would be a valid mapping based upon IDL. However, the use of procedure-based ports for oneway procedures is recommended because the IDL specification does not guarantee that oneway calls are non-blocking or asynchronous. Furthermore, CORBA implements oneway procedures by synchronous communication, too. Use of non-blocking or blocking procedures for oneway operations is left to the user. Mapped oneway operations acquire an additional variant attribute (see example).

The parameter attributes in, inout and out describe the transmission direction of parameters and can be mapped directly to the communication parameter attributes in TTCN-3 because they have the exact same semantics.

A raise expression specifies all user-defined exceptions which can be thrown by an operation. In addition, all CORBA system exceptions as defined in clause 9 can be raised. The raise expression can be mapped directly to TTCN-3 because it can be indicated by the procedure signature definition by specifying the list of exceptions.

A context expression provides access to local properties of the called operation. These properties consist of a name and a string value. The context expression can be matched by redefining the operation with the context parameters included in the operation parameters (see clause 4.6 in [4]). The additional parameter shall be of type array containing a type record for each context parameter. The record itself contains two variables of type string for the context name and value.

IDL EXAMPLE:

```idl
// NotFoundException is defined clause "Exception declaration"
string remoteProc1( in long Par11, out long Par12, inout string name1 )
raises( NotFoundException )
context { "MyContext1" };

// oneway procedure: no return value and no inout or out allowed!!!
oneway void remoteProc2( in long Par21, in long Par22, in string name2 );
```
TTCN EXAMPLE:

```tcl
// only operation definition

type record IDLContextElement {
    iso8859string name,
    iso8859string value_
}

type record of IDLContextElement IDLContext;

signature RemoteProcSignature1{
    in long Par11, out long Par12,
    inout charstring name1, in IDLContext context
    return iso8859string
    exception( // user-defined exception
        NotFoundException,
        SYSTEM_EXCEPTION
    )
};

signature RemoteProcSignature2{
    in long Par21, in long Par22,
    in iso8859string name2
    exception( SYSTEM_EXCEPTION )
    with { variant "IDL:oneway FORMAL/01-12-01 v.2.6" }
}

type port RemoteProcPort procedure {
    out RemoteProcSignature1;
    out RemoteProcSignature2
}

type component CorbaSystem {
    port RemoteProcPort PCO
}
```

11 Importing attribute declaration

An attribute is like a set- and get-operation pair to access a value. If an attribute is marked as `readonly`, only the get-operation is used. Therefore, attribute mapping can be done by the operation mapping.

12 Names and scoping

The name definition scheme of IDL does not collide with the name definition in TTCN-3. Scoping is more restrictive in IDL than in TTCN-3, where the IDL scoping rules have to be mapped appropriately to allow seamless mapping. IDL uses nested scopes for modules, interfaces, structures, unions, operations and exceptions and identifiers are scoped in types, constants, enumeration values, exceptions, interfaces, attributes and operations. The hierarchical scopes in TTCN-3 are `module`, control part of module, `function`, `testcase` and statement blocks within control part of `module`, `function` and `testcase`.

Furthermore, TTCN-3 supports no overloading of identifiers so that no identifier name can be used more than once in a scope hierarchy. However, IDL allows redefinition of self defined types if defined inside a `module`, `interface` or `valuetype`. Hence, identifiers have to be mapped by using their path name including all `interface` and `valuetype` names as designated in IDL and TTCN-3. The use of module names is not necessary because they are reflected by the TTCN-3 module structure. An underscore is used as a separator and existing underscores are doubled.

Several new identifiers are generated during transformation of IDL types by adding to the original IDL type identifier suffixes like: "Type", "Enum", "Object", "Interface", etc. This approach and the use of TTCN-3 keywords in IDL modules can cause a name clashes, which are to be resolved by a suffix "_;"

NOTE: ETSI ES 201 873-1 [1] clause A.1.5 table A.2 defines the keywords of the core language. However, TTCN-3 language extensions (see [i.5] to [i.9], but other extensions may also be published after the publication of the present document) may define additional keywords and rules for handling those keywords in TTCN-3 modules requiring the given extension.
IDL EXAMPLE:

```idl```
interface identifier {
  ... body definitions ...
};

// an example of the identifier, which can cause a name clash
typedef long identifierObject;
```idl```

TTCN EXAMPLE:

```ttcn3```
group identifierInterface {
  ... body definitions ...

  type port identifier procedure { ... }

  // the suffix '_' is used only where necessary
  // to resolve the name clash
  type charstring identifierObject_;
  type identifierObject_ address;
}
```ttcn3```

type long identifierObject;

To indicate the special treatment of TTCN-3 statements derived from IDL, TTCN-3 provides a new mechanism to attach attributes to language elements. The use of attributes makes code more readable and requires no special naming scheme. Therefore, the `variant` attribute can be used to indicate the derivation of types from IDL and the special treatment for encoding by the test system. This is used in TTCN-3 for the `IDLfixed` useful type:

```ttcn3```
type record IDLfixed {
    unsigned short digits,
    short scale,
    charstring value_
} with { variant "IDL:fixed FORMAL/01-12-01 v.2.6" };
```ttcn3```

Names of new types which are specially defined for the IDL mapping and their use in conjunction with IDL shall always begin with the word IDL to provide better distinction.
Annex A (informative):
Examples

A.1 The example

The following example shows how a mapping would look like if a complete IDL and TTCN-3 specification, including a test case, is used. It is only intended to give an impression of how the different elements have to be mapped and used in TTCN-3.

Some parts are used from the CORBA standard like the Naming Service with slight modifications to cover more IDL elements.

A.2 IDL specification

```idl
module ttcnExample {
    // ***********
    // Basic Types
    // ***********
    const long number     = 017; // 017 == 0xF == 15
    const long size       = ( number << 3 ) % 0x1F ) & 0123;
    const float decimal    = 15.7;
    const char letter     = 'A';
    const wchar wideLetter = L'A';
    const boolean isValid    = TRUE;
    const octet anOctet    = 0x55; // limited to 8 bit
    const string myName     = "my name";
    const wstring wideMyName = L"my name";

typedef string MyString;

    // *****************
    // Constructed Types
    // *****************

typedef struct NC {
    MyString id;
    MyString kind;
} NameComponent;

union MyUnion switch{ long } {
    case 0 : boolean b;
    case 1 : char c;
    case 2 : octet o;
    case 3 : short s;
};

typedef sequence <NameComponent> Name;

typedef sequence <NameComponent> Key;

typedef fixed<12,7> Fix;

    // ******************
    // Template Types
    // ******************

typedef sequence <NameComponent> Name;

    // *****************
    // Complex Declarator
    // *****************

typedef long NumberList[100];
```
native MyNativeVariable;

// **********************
// Valuetype Definition
// **********************
valuetype StringValue string;

valuetype EmployeeRecord {
  // note this is not a CORBA::Object
  // state definition
  private string name;
  private string email;
  private string SSN;

  // initializer
  factory init(in string name, in string SSN);
};

// **********************
// Interface Definition
// **********************
interface NamingContext {
  attribute string object_type;
  readonly attribute Key external_form_id;

  exception NotFoundException {
    NotFoundReason why;
    Name rest_of_name;
  }

  MyString bind(in Name n, inout Object obj, out Object myObj )
    raises( NotFoundException )
    context( "Hostname" );

  oneway void rebind(in Name n, in Object obj );
}; // end of interface NamingContext

}; // end of module ttcnExample

A.3 Derived TTCN-3 specification
