Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

1 Scope

The present document specifies the syntax and use of a notation for the definition of Test Purposes, TPLan. This notation provides a structure and a common set of English keywords for the specification of Test Purposes. The basic notation is oriented towards testing of reactive, black-box communication systems and uses terminology derived from ISO/IEC 9646-1 [3]. However, facilities are also included to allow users to extend the notation with application-specific keywords of their own.

6

The use of TPLan as the means of specifying Test Purposes is optional but, if it is used, the requirements specified in the present document shall be met.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:
 - if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document;
 - for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at http://docbox.etsi.org/Reference.

For online referenced documents, information sufficient to identify and locate the source shall be provided. Preferably, the primary source of the referenced document should be cited, in order to ensure traceability. Furthermore, the reference should, as far as possible, remain valid for the expected life of the document. The reference shall include the method of access to the referenced document and the full network address, with the same punctuation and use of upper case and lower case letters.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

2.1 Normative references

The following referenced documents are indispensable for the application of the present document. For dated references, only the edition cited applies. For non-specific references, the latest edition of the referenced document (including any amendments) applies.

- [1] ETSI ES 201 873-1: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 1: TTCN-3 Core Language".
- [2] ETSI EG 202 568 (V1.1.3): "Methods for Testing and Specification (MTS); Internet Protocol Testing (IPT); Testing: Methodology and Framework".
- [3] ISO/IEC 9646-1: "Information Technology Open Systems Interconnection Conformance Testing Methodology and Framework - Part 1: General concepts".
- [4] ISO/IEC 9646-2: "Information Technology Open Systems Interconnection Conformance Testing Methodology and Framework - Part 2: Abstract Test Suite specification".

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

event: something observable (measurable) at a given place and time

NOTE: The cause of a stimulus or the result of a response.

notation: textual means of representing ideas

programming language: artificial language that can be used to control the behaviour of a machine

test case: specification of the actions required to achieve a specific test purpose, starting in a stable testing state, ending in a stable testing state and defined in either natural language for manual operation or in a machine-readable language (such as TTCN-3) for automatic execution

7

test description: systematic specification of the test steps (generally in tabulated text) that must be taken to reach a specific test verdict

test purpose: description of a well-defined objective of testing, focussing on a single interoperability requirement or a set of related interoperability requirements

test suite structure: logical grouping of test purposes or test cases which should be both relevant and convenient

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

EBNF	Extended Backus-Nauer Form
EUT	Equipment Under Test
ICS	Implementation Conformance Statement
IP	Internet Protocol
IPT	Internet Protocol Testing
IUT	Implementation Under Test
PICS	Protocol Implementation Conformance Statement
QE	Qualified Equipment
RFC	Request For Comments (IETF terminology for a draft standard)
RQ	ReQuirement
TC	Test Case
TD	Test Description
TP	Test Purpose
TSS	Test Suite Structure
TTCN-3	Testing and Test Control Notation edition 3

4 Introduction

4.1 TPLan: A formal notation for expressing test purposes

ISO/IEC 9646 [3] and [4] recommends that test specifications include a concise and unambiguous description of each test which focuses on its purpose. These Test Purposes, or TPs, define *what* is to be tested rather than *how* the testing is performed. The TPs are based on the *requirements* identified in the relevant standard (or standards) from which the test specification is derived. The detailed coding of each Test Purpose is specified in a Test Case. Often Test Cases, or TCs, are written in a test specification language such as TTCN-3 [1]. The specification of Test Cases is outside the scope of the present document.

Generally, Test Purposes are written in prose (possibly displayed in a tabular format). There is considerable benefit to be gained by having all TPs written in a similar and consistent way. With this in mind, a simple, structured notation called TPLan has been developed for the expression of TPs. TPLan is defined with a minimal set of test-oriented keywords but with the capability that permits users to define extensions to the notation. is an example of how TPLan can be extended into a specific application area; in this case, telecommunications.

8

The benefits of using TPLan are:

- consistency in test purpose descriptions less room for misinterpretation;
- clear identification of the TP pre-conditions, test body, and verdict criteria;
- automatic syntax checking and syntax highlighting in text editors;
- a basis for a TP transfer format and representation in tools.

4.2 Extensibility of TPLan

TPLan provides a framework for a consistent representation (format, layout, structure and logical ordering) and a consistent use of words and patterns of words for expressing TPs. This is achieved without unnecessarily restricting the expressive power of pure prose.

TPLan allows the use of keywords in combination with free-text strings (enclosed by single quotes). Thus, the TP writer has considerable freedom of expression in the use of unstructured text between the keywords.

The basic set of pre-defined TPLan keywords has been kept to a minimum. These keywords are mainly concerned with providing structure to the TPs. The intention is that this set of keywords is extended by the user for specific testing applications through the use of user-defined keywords (see clause 8) which can be checked by automatic tools for consistency and, to some extent, correctness.

4.3 The Test Suite Structure

Test Purposes should be grouped in a tree-like structure. This structure is known as the Test Suite Structure, or TSS. The combination of structure and Test Purposes is known as the TSS&TP [3].

The general composition of a TPLan TSS&TP is as follows:

TSS Header	title, author, version etc.		
Cross References	references to base standards, configuration descriptions etc.		
Definitions	user-defined words, events, test entities, conditions, headers etc.		
TSS Groups if any and possibly nested			
Test Purposes	contained in the groups (if any)		

4.4 Areas of application

TPLan is not specific to a particular type or area of testing. The fundamental set of predefined TPLan keywords is oriented towards conformance and interoperability testing (keywords such as **IUT**, **TESTER** and **TD**) but the extensibility of the language means that the user can adapt TPLan to a wide range of testing contexts.

4.5 Limitations of TPLan

The TPLan grammar provides limited syntax checking and an enhanced visual representation of the TP in, for example, a syntax sensitive text editor. However, in order to retain expressive power, TPLan is only loosely defined in that no strict relation between certain words (especially the user-defined words) is specified. Thus, it is possible to write nonsensical constructions if care is not taken. Of course, appropriate tools may be able to identify such constructions but there are no constructs for doing this explicitly in the notation.

5 TPLan keywords, comments and identifiers

5.1 TPLan keywords

Only those words listed in table 1 shall be considered to be valid TPLan keywords.

Table 1: TPLan keywords

TSS header keywords			
author	Author		
date	Date		
title	Title		
TSS	tss		
version	Version		
Cross-referen	ces keywords		
xref	Xref		
Definitions	kevwords		
condition	Condition		
context	Context		
def	Def		
entity	Entity		
event	Event		
value	Value		
unit	Unit		
word	Word		
TP grouping	a keywords		
end	End		
group	Group		
objective	Objective

TP body I			
ensure	Ensure		
that	That		
with	With		
when	When		
then	Then		
Test entity	iut		
IUT TESTER	tester		
TPLan gl			
a	A		
an	An		
as	As		
in ia	In		
is	Is		
no	No		
of the	Of The		
Logical			
and	And		
not	Not		
or Ctimulus and D	Or		
Stimulus and R			
receives	Receives		
sends	Sends		
Data-related words			
containing	Containing		
indicating	Indicating		

Direction-related words			
from	From		
to	То		
Time- and order-related words			
after	After		
before	Before		
unordered	Unordered		
within	Within		

5.2 Comments

Comments shall be introduced by the string "--" and terminated at the end of the same line.

5.3 TPLan identifiers

Letters, numbers and special characters may be used in a TPLan identifier, as follows:

- alphabetic
 - a..z;
 - A..Z;
- numeric
 - 0..9;
- special characters
 - |._-&%\$*@?!></\#.

Typical TPlan identifiers are TP identifier, event names, cross reference identifiers and requirements identifiers. For example:

```
MyTSS&TP
TP_UMTS_0789_01
RQ_001_789
REQ3952.Arev2
CONF/HOST/INVALID/#75
CF_MOB_02
PICS c.2
```

A TPLan identifier shall not contain any white space (e.g. tabs or spaces).

NOTE: In certain contexts it can be desirable to overlay TPLan with an additional level of checking related to a particular methodology or naming convention. Generally, such overlays are outside the scope of this present document. However, the ETSI IPT Testing Framework [2] includes naming rules for TPs and other identifiers. These conventions are summarized in Annex B.

5.4 Uniqueness of identifiers

All user-defined words, headers, entities, conditions and events shall be unique in the scope of one TSS&TP. Parameter names of events shall be unique in the scope of the list in which they are declared.

No user-defined name shall be the same as any pre-defined TPLan keyword.

5.5 Including files

TPLan supports a limited form of file inclusion. This shall be indicated by the pre-processing directive, **#include**, followed by the location of the included file enclosed in quotes. TPLan does not define the form of this location reference. Typical locations may be a file path, reference to an ETSI standard, an object identifier or a URL. For example:

11

```
#include 'root/MyTPLan/MyDefs.txt'
#include 'root/MyTPLan/MyTPs.txt'
```

The include statement shall only be used to include definitions (see clause 8) or complete test purposes comprising the test purpose header and body (see clauses 10 and 11). Thus, the included file shall follow the syntax for definitions and test purposes as defined in annex A.

6 TSS Header

6.1 Standard TSS header entries

A TPLan specification (i.e. a TSS&TP) shall begin with the following headers (though not all entries are mandatory, see Annex A):

- TSS identifier (mandatory)
 - the keyword **TSS** followed by the formal identifier of the TSS&TP;
- Title (optional)
 - the keyword title followed by the name of the TSS&TP as quoted free text;
- Version (optional)
 - the keyword **version** followed by the version number as any number of numeric values separated by dots (".");
- Date (optional)
 - the keyword **date** followed by three numeric values separated by dots ("."), forward slash ("/") or dash ("-"). The following examples are all valid date entries:
 - 01-12-2007;
 - 1.12.07;
 - 31/5/2007;
 - 05-31-07.
- Author (optional)
 - the keyword **author** followed by the document author(s) as quoted free text.

Each TSS header keyword shall be followed by a colon (":").

A complete TSS&TP header:

```
TSS : UMTS_TSS

title : 'My TSS&TP as an example'

version : 1.0 -- other examples may be 1.0.0 or 11.01

date : 29.11.2004 -- could also be written as 29/11/2004 or 29-11-2004

author : 'ETSI PTCC'
```

6.2 User defined TSS Header entries

Additional user-defined TSS&TP headers may be included with the standard headers. A user-defined TSS header may comprise one or more defined header words, followed by a list of one or more identifiers separated by commas, or a quoted string separated by a colon (see clause 8.2). For example:

12

```
TSS : UMTS_TSS

title : 'My TSS&TP as an example'

version : 1.0

date : 29.11.2004

author : 'ETSI PTCC'

status : 'Public' -- user-defined TSS header
```

A user-defined header may also use the predefined keyword **ref**. For example:

```
PICS ref : 'Release 7'
```

A header (either predefined or user-defined) shall not appear more than once in a TSS.

7 External references

References to external sources of information shall be made using the **xref** keyword followed by an identifier and a list of the external sources. Examples of the use of the **xref** keyword are as follows:

• References to base standards or other sources from which the TPs have been derived. For example:

xref BaseStandards {TS123456-1, TS789345}

In the case where a PICS [3] is used the reference might be:

xref PICS {TS123456-1, TS123456-2}

The TPLan syntax allows reference to be made in any appropriate form such as Object identifiers or URLs. For example:

xref MyWebDocs {www.tplan.info}

• References to explicit test configurations. For example:

```
xref TestConfig1 {3GPPSpecXYZ_AnnexA_page10_fig1}
```

• The list of configuration sources may include references to file names as well as or instead of document information, thus:

```
xref TestConfig2 {OurProjectConfigs.pdf}
```

NOTE: The identifiers associated with **xref** statements could be used by software tools to check for consistency within the specifications of test purposes. For example, a tool could check that TPs refer only to configurations that have been previously declared in **xref** statements.

8 User definitions

8.1 User defined words

TPLan may be extended by the user with the **def word** keywords followed by one or more identifiers separated by commas:

```
def word tunnels, forwards
```

For information to the reader, each word definition may be followed by a description of that word as a quoted string. For example:

def word forwards ' receive a packet on one interface and transmit that packet unchanged on another interface'

These words may be used in the with, when and then statements of the TP body (see clause 11).

Although the addition of new keywords can make a TPLan specification considerably easier to understand, care should be taken to avoid adding multiple words with almost identical meaning. Also, the **def context** construct (see clause 8.8) should be used wherever possible to limit the use of newly-defined keywords.

8.2 User-defined headers

The TSS and TP headers may be extended using the **def header** keywords followed by one or more identifiers separated by commas.

def header status

For information to the reader, each header definition may be followed by a description of the meaning of that header as a quoted string.

8.3 User-defined test entities

Explicit test entity names may be defined using the **def entity** keywords followed by one or more identifiers separated by commas.

def entity EUT, QE

For information to the reader, each entity definition may be followed by a description of the meaning of that entity as a quoted string.

These test entity names may be used in the with, when and then statements of the TP body (see clause 11).

8.4 User-defined events and parameters

Explicit event names may be defined using the **def event** keywords followed by one or more identifiers separated by commas. There is no strong definition of what an event is in TPLan, but, typically, these would be messages, timers or something else that is observable or, at least, measurable. In the present document the term "message" is generally used as an example of an event and, for clarity, event parameters are referred to as message fields, or fields for short. For example:

def event ICMP_Packet, SETUP

Optionally, the event name may be followed by a list of one or more parameter identifiers or user-defined values separated by commas. For example:

```
def event SETUP {f1, f2}
-- or
def event T1 {30sec}
```

For information to the reader, each event definition may be followed by a description of the meaning of that event as a quoted string.

These event and parameter names may be used in the **when** and **then** statements of the TP body (see clause 11).

NOTE: These are abstract definitions of events and are not intended to be, for example, records or similar constructs found in common programming languages.

8.5 User defined values

Values may be defined using the **def value** keywords followed by one or more identifiers or literal values separated by commas.

```
def value T1, 3sec, FFFF, A76.4FF.321.255, ERRCODE, 2000K
```

For information to the reader, each value definition may be followed by a description of the meaning of that value as a quoted string. For example, it can be useful to define an error code as a literal value and identify its actual value in the quoted string, thus:

```
def value AUTHENTICATION_FAILED '24'
```

These values may be used in the with, when and then statements of the TP body (see clause 11).

Integer values (e.g. 1, -653, 001, 0), real values of the form *number dot number* (e.g. 37.12, -1.5, 0.002) and exponentiated values of the form *real value e integer value* (e.g. 3.2e5, 0.65e3, 2.0e-3) are built-in and need not be explicitly defined.

Optionally, a value name may be followed by a list of one or more additional value names separated by commas. For example:

```
def value package1 {a, b, c}
-- or
def value area {length, width}
```

- NOTE: The optional additional value names are used only to identify elements that should be included in the substructure of the defined value. They should not be interpreted as a specification of array parameters or possible enumerated values. As an example, in the definition of area above:
 - area can be considered to be comprised of the values length and width;
 - area *cannot* be considered to be:
 - a 2-dimensional array of size length \times width;
 - an enumerated type which can only take the values length and width.

8.6 User defined units

Units may be defined using the **def unit** keywords followed by one or more identifiers or literal values separated by commas.

def unit seconds, metres, volts, newtons, henrys

For information to the reader, each unit definition may be followed by a description of the units as a quoted string.

Care should be taken to ensure that, if required, both the singular and the plural version of each unit is defined. For example, using only the definition above, the expression 1 second would be considered to be syntactically incorrect. If singular units are required within a TPLan specification, it is necessary that they be defined explicitly. The above example would then be extended as follows:

def unit second, seconds, meter, metres, volt, volts, newton, newtons, henry, henrys

Alternatively, units can be defined using their generally accepted abbreviations which are normally considered to be both singular and plural. To make such definitions clearer to the reader, the optional descriptive string should be used to provide the expanded unit description, thus:

15

def unit	S	'seconds'
def unit	m	'metres'
def unit	V	'volts'
def unit	Ν	'newtons'
def unit	Н	'henrys'

However, the TPLan syntax does not permit the use of symbolic unit abbreviations such as "ohm" (Ω) and "degree" (°) or prefixes such as "micro" (μ) or indices such as "squared" (²). These abbreviations should be defined using plain textual constructs, such as:

def	unit	ohm	
def	unit	degC	'degrees Celsius'
def	unit	micro_s	'micro-seconds'
def	unit	m2	'square meters'

8.7 User defined conditions

Conditions or states may be defined using the **def condition** keywords followed by one or more identifiers or literal values separated by commas:

def condition Idle, Ready, SESSION_ESTABLISHED

For information to the reader each condition definition may be followed by a description of the meaning of that condition as a quoted string.

These conditions may be used in the with, when and then statements of the TP body (see clause 11).

8.8 Constraining keywords to specific contexts

If required, the use of certain keywords may be constrained to appear only in combination with other keywords. For example, a user may wish to define the word **requested** and restrict its use so that it can appear only in the context of **is requested to**.

Such restrictions shall be expressed by using the **def context** keywords followed by one or more predefined or user-defined keywords.

```
def context {is ~requested to}
```

The tilde(~) character shall be used to indicate that a particular user-defined word shall only be used in that context (constrained). Words not preceded by tilde may appear in any context (unconstrained). In a single TPLan specification, a TPLan word shall not be constrained by one **def** context statement and unconstrained by another **def** context statement. A tilde character shall not be considered to constrain the use of any predefined keyword immediately following it.

Keywords that are optional within the defined context shall be expressed by enclosing them in square brackets, for example:

```
def context {is [not] ~requested to}
-- which means that the word requested can only be used in the following contexts:
-- is requested to
-- is not requested to
```

NOTE: Although the **def context** construct is of benefit to human readers, it can also be used by tools to automatically include additional checking.

A **def context** construct may include predefined TPLan keywords and user-defined notation extensions (e.g. words and entities) but should only be used to define the syntactical context associated with particular user-defined words. It should not be used to construct entity, event, condition or value identifiers which contain white space; i.e. in the following example, the definition of the away_from_home condition is semantically different from the result of the context definition which permits the use of the construct, **away from home**:

```
def condition away_from_home
def context {~away from ~home }
```

The inclusion of a user-defined TPLan word in more than one **def context** construct shall be interpreted as the specification of alternative constraints on the use of a word rather than combined constraints. The following example shows how two different contexts could be specified for the word "established":

```
def word established
def word having
def context {having ~established}
def context {~established as}
```

With the above context definitions, it is possible to use the word "established" either immediately after the word "having" or immediately before the word "as", for example:

```
IUT having established a connection
IUT established as default router).
```

In this example, the word "established" cannot be used in any other immediate arrangement of predefined or user-defined words.

9 Groups

The TSS (Test Suite Structure) shall be expressed using the **group** keyword. Groups may be nested to provide sub-grouping. The contents of a group may be other groups (sub-groups) or TPs or both sub-groups and TPs. A TSS&TP does not have to be structured but, if it is, each group in that structure shall have the following group header:

- Begin group
 - The keyword **group** denotes the start of a new group. This keyword shall be followed by at least one of the following:
 - the group number;
 - a string of free text.
 - The group number is any number of digits separated appropriately by dots ('.') e.g. 1 or 1.9 or 1.12.3.
- Group objective
 - The keyword **objective** followed by a quoted free text description of the objective of the test group. This entry is optional.
- End group
 - The keywords **end group** denote the end of a group. These keywords shall be followed by at least one of the following:
 - the group number which should be the same as the group number used at the start of the group;
 - a string of free text.

An example of one group and a sub group:

10 TP Header

10.1 Standard TP Header entries

Each TP shall begin with a header construct as follows:

- TP id (mandatory)
 - the keywords **TP** id followed by the TP Identifier;
- TP summary (optional)
 - the keyword **summary** followed by a free text high-level description (overview) of the TP in quotes;
- Requirements reference (optional)
 - the keywords **RQ ref** followed by the reference identifier;
- Role (optional)
 - the keyword **role** followed by a list of one or more identifiers indication the role or roles of the object being tested by the TP (e.g. router or host);
- Configuration reference (optional)
 - the keyword **config** followed by a reference to the relevant testing configuration;
- The Test Case or Test Description reference (optional)
 - the keywords **TC ref** or **TD ref** followed by a reference to the corresponding Test Case or Test Description.

Header keywords may be followed by a colon (":").

For example:

```
TP id : TP_COR_0001
summary : 'Test for determining the correct use of the Padl option'
RQ ref : RQ_COR_0001
role : host
config : CF_001_C
TC Ref : TC_COR_0001
```

10.2 User defined TP Header entries

Additional user-defined TP headers may follow the standard headers (see clause 8.2). A user-defined TP header may comprise one or more defined header words and the predefined keyword **ref** followed by a list of one or more identifiers separated by commas, or a quoted string (optionally separated by a colon). For example:

11 TP body

11.1 TP body structure

The body of the TP follows the header and it is here that the Test Purpose is described in detail. The TP is generally written from the viewpoint of the Implementation Under Test (IUT).

The general structure of a TP is:

```
Pre-conditions -- optional initial conditions
TP behaviour description -- comprising sequences of:
Stimuli and Responses
```

Each TP behaviour description shall begin with the keywords **ensure that** followed by the remainder of the description enclosed in curly braces ('{ and '}).

For example:

ensure that {
 -- TP behaviour description goes here
}

The **when** and **then** statements describe stimuli and responses (interactions) as seen from the point of view of the IUT. Generally these are of the form:

```
ensure that {
    when { ... } -- stimuli described from the viewpoint of the IUT.
    then { ... } -- IUT responses and other behaviour
```

This pair of statements may be repeated any number of times to define a sequence of stimulus/response pairs, for example:

```
ensure that {
  when { ... }
  then { ... }
  when { ... }
  then { ... }
```

11.2 TP pre-conditions

The with statement may be used to express the initial state or condition of the **IUT** from which the TP description begins. If used, the with statement shall precede the **ensure that** statement. The with statement does not define the steps or actions needed to reach the starting condition, only the condition itself. The conditions shall be expressed as free text. Multiple conditions shall be logically concatenated using the Boolean operators **and**, **or**, **not**. The general format of the **with** statement is:

with { IUT 'condition 1' and 'condition 2' and not ...etc...}

19

For example:

```
with { IUT 'in idle state' and 'port80 open' }
ensure that {
  when { ... }
  then { ... }
```

Conditions may be defined as described in clause 8.7. In which case the condition above might be:

with { IUT in Idle_state and 'port80 open' }

11.3 TP stimuli

The **when** statement shall express some form of stimulus. In most cases such stimuli are caused by the tester and experienced by the IUT. Typically this will be a **receives** statement (i.e. the IUT has received a stimulus) with the name or description of the received event.

IUT receives 'a message'

In cases where there is more than one possible source of event (e.g. an incoming message) in the test configuration the keyword **from** may be added to the **receives** in order to identify that source.

IUT receives 'a message' from 'some interface'

A receive statement may include the keyword **containing** which shall be followed by either a valid event parameter name or a free text quoted string. This may, itself, be followed by the keyword **indicating** which shall be followed by a numeric value, a defined value name or a free text quoted string.

Using defined message names rather than strings allows for consistency checking of message names throughout the TSS&TP. For example:

Further consistency checking can be achieved by defining the source of an event as an entity, thus:

```
def entity Router1
. . .
. . .
when { IUT receives MyMessage from Router1 }
```

The keywords **and**, **or** and **not** may be used to concatenate and qualify actions and conditions within the **when** statement. For example:

11.4 TP responses

The **then** statement shall express the expected response to the previous **when** statement. In most cases the response is performed by the IUT and observed by the tester. Typically this will be a **sends** statement followed by the name or description (expressed as free text) of the sent message.

IUT sends 'a message'

In cases where there is more than one possible message destination in the test configuration the keyword **to** may be added to the **sends** in order to identify that destination. For example:

IUT sends 'a message' to 'some interface'

The syntax of the contents of sent messages is the same as that for the received messages. For example:

IUT sends 'a message' containing 'description of a field' indicating 'expected value of a field'

The keywords **and**, **or** and **not** may be used to concatenate and qualify responses and conditions within the **then** statement. For example:

```
then {    IUT sends 'another message' to 'node 1'
    containing 'field 3' indicating 'any valid value'
    and containing 'field 4' indicating 'any valid value'
    and IUT sends 'yet another message'
}
```

As with the **receives** statement, user-defined messages and field names may be used in place of quoted strings.

11.5 Precedence of TPLan statements

In cases where successive logical operations are used in the TP body, it may not be clear what the intended order of evaluation may be. Parentheses shall be used to resolve such ambiguities. For example:

with { IUT ('condition 1' and 'condition 2') or 'condition 3'} -- is not the same as: with { IUT 'condition 1' and ('condition 2' or 'condition 3')}

The assumed order of precedence is governed by the following rules:

- the basic order of precedence is from left to right;
- logical words within brackets before those that are not;
- where nested brackets are used, logical words within the innermost brackets are evaluated before those in outer brackets,

11.6 Temporal ordering of TPLan statements

If the strict sequence of TPLan behavioural statements is important, this shall be expressed using the pre-defined words **before** and **after**. For example,

```
when {IUT receives message1
            before IUT receives message2 }
then { ....}
```

Statements may also be enclosed by parentheses to make the intended sub-ordering clear. For example,

By default, sequential TPLan statements shall be evaluated in the order that they appear. For example, the following TPLan:

```
when { IUT receives A
and IUT receives B }
```

means that the IUT shall respond to the receipt of message A followed by message B.

The keyword **unordered** shall be used if it is required to express that a set of events may not evaluate in a sequential manner.

means that the IUT shall respond to the receipt of either message A followed by message B or message B followed by message A. Again, parentheses may be used to clearly show what the scope of the ordering should be.

The keywords **before**, within and after may also be used to express ordering, especially in the context of timers.

For example:

```
before 'timer T1 expires'
-- or
within 'two minutes'
-- or
after '15 seconds'
```

In the following example, note also the use of the defined value 15s in place of the string "15 seconds"):

```
then { IUT sends 'a message' to 'Node 1' within 15s
}
```

11.7 Using user defined test entities, conditions and words

In some cases the pre-defined TPLan keywords may not be adequate. In such cases users may define additional keywords suited to particular needs (see clause 8.3). For example, it would be beneficial to define the *entities* **EUT** (Equipment Under test) and **QE** (Qualified Equipment) and the *word* **forwards** in order to make an interoperability TP clearer, thus:

A timer may be defined as a test entity (see clause 8.3), for example:

when { T1 expires ... } -- this example assumes the defined word 'expires'

Defined conditions (see clause 8.7) may be used to express states instead of quoted strings, for example:

```
IUT changes from IDLE to ACTIVE -- assumes the defined word 'changes' as
-- well as the definition of the ACTIVE
-- and IDLE conditions
```

11.8 Glue words and readability

To aid readability, TPLan allows the use of "glue" words such as **a**, **an** and **the**. For example

Syntax highlighting (i.e. use of multiple colours) can also aid readability:

```
then { the EUT accepts an IPv6_Packet
    and the EUT forwards an ICMP_Packet to RouterA within '15 seconds'
}
```

Annex A (normative): The TPLan Grammar

A.1 Syntactic Rules

This annex defines the TPLan grammar in Extended Backus-Nauer Form (EBNF). This can be used either as a reference or as input to parser generator tools. Table A.1 defines the syntactic conventions that should be used when reading the TPLan EBNF.

::=	is defined to be		
abc	the non-terminal symbol abc		
abc xyz	abc followed by xyz		
abc xyz	alternative (abc or xyz)		
[abc]	0 or 1 instances of abc		
{abc}	1 or more instances of abc		
[{abc}]	0 or more instances of abc		
a - z	all characters from a to z		
''	denotes a regular expression		
()	denotes a textual grouping		
"abc"	the terminal symbol abc		
;	production terminator		
\	the escape character		

Table A.1: The syntactic metanotation

A.2 TPLan EBNF Productions

Annex B (informative): Use of the IPT Testing Framework

B.1 IPT naming conventions

B.1.1 IPT identifiers

The IP Testing Framework [2] naming conventions provide traceability to other components of a complete test specification. For example, to the base standards, requirements catalogue or PICS, configuration descriptions or Test Cases. These conventions are defined in EG 202 568 [2] but are repeated here for convenience.

If the TPLan user wishes to follow these conventions then the syntax defined in [2] shall be used.

B.1.2 The Requirements Identifier

The Requirements Identifier is of the form **RQ_nnn_mmm** where "nnn" is a 3-digit number and "mmmm" is a 4-digit number. The Requirements Identifier uniquely identifies a requirement in the corresponding Requirements Catalogue, derived from the relevant base standards. For example:

```
RQ_201_1001
```

In cases where a PICS (or profile PICS) is used rather than a Requirements Catalogue then the reference to the relevant PICS entry will depend on the naming conventions followed by the relevant PICS. A typical example might be:

PICS_101_Table1.item3

B.1.3 The Configuration Identifier

The Configuration Identifier is of the form **CF_aa..a**_**nn** where "aa..a" is an alphanumeric string of length 1 to 8 and "nn" is a 2-digit number (see also clause 7.2). The alphanumeric string may be the same as the TSS identifier in the TSS header (often it will be the same, but not necessarily). The Configuration Identifier uniquely identifies a specific test configuration (if any). For example:

CF_MOBILITY_03

B.1.4 The Test Purpose Identifier

The Test Purpose Identifier is of the form **TP_aa..a_nnnn_mm** where "aa..a" is an alphanumeric string of length 1 to 8, "nnnn" is a 4-digit number and "mm" is a 2-digit number. The alphanumeric string shall be the same as the TSS identifier in the TSS header. The Test Purpose Identifier uniquely identifies the TP.

```
TP_MOBILITY_0001_99
```

B.1.5 The Test Case Identifier

The Test Case Identifier is of the form **TC_aa..a**_nnnn_mm where "aa..a" is an alphanumeric string of length 1 to 8, "nnnn" is a 4-digit number and "mm" is a 2-digit number. The alphanumeric string shall be the same as the TSS identifier in the TSS header. The Test Case Identifier uniquely identifies a corresponding (TTCN-3) test case (if any).

```
TC_MOBILITY_0001_99
```

B.1.6 The Test Description Identifier

The Test description Identifier is of the form **TC_aa..a**_nnnn_mm where "aa..a" is an alphanumeric string of length 1 to 8, "nnnn" is a 4-digit number and "mm" is a 2-digit number. The alphanumeric string shall be the same as the TSS identifier in the TSS header. The Test Description Identifier uniquely identifies a test description (if any).

TD_MOBILITY_0001_99

B.2 IPT cross references

B.2.1 References to the Requirements Catalogue

When the IPT Testing Framework [2] is used each TP shall refer to one or more requirements defined in the relevant Requirements Catalogue. Each requirement is uniquely identified as described in clause B.1. The first three digits in the requirement reference identify the source documents from which a particular set of requirements are derived. This is specified using the **xref** keyword, followed by a list of one or more references to base standards and/or profiles and relevant requirements catalogue.

```
xref RQ_001 {TS123456-1, RFC1234}
.
.
.
RQ ref: RQ_001_0728
--In this example the requirement RQ_001_0728 identifies requirement 0728
-- extracted from the base standards TS123 456-1 and RFC 1234.
```

B.2.2 References to test configurations

References to explicit IPT test configurations are made using the keyword **xref** followed by a configuration identifier as defined in clause B.1 followed by a list of one or more references to where the description (e.g. prose and/or drawing) can be found. For example:

```
xref CF_UMTS_007 {3GPPSpecXYZ_AnnexA_page10_fig1}
```

Annex C (informative): A guide to using TPLan in a communications testing environment

C.1 General considerations

C.1.1 Introduction

TPLan is specified in the present document as a generic notation which has only a limited semantic model and has a number of powerful capabilities which make it adaptable to most testing environments. However, this power and its flexibility, if misused, can result in unreadable and meaningless TP specifications. Consequently, it is important to follow some practical guidelines when writing TPLan. This annex offers some guidelines on using TPLan in the production of communications test specifications.

C.1.2 Structure of a TPLan specification

A complete TPLan specification comprises a Header section followed by the Test Purposes (TPs) themselves.

The TPLan Header section contains the following items:

- the TSS Header
 - TSS Identifier;
 - TSS Title;
 - version number;
 - date;
 - author.
- cross-references:
 - to requirements sources;
 - to configuration (abstract architectures) information.
- user-defined extensions to TPLan:
 - header fields;
 - entities;
 - events;
 - values;
 - units;
 - keywords;
 - conditions
 - syntactical context.

Test Purposes can be grouped together to reflect the Test Suite Structure (TSS) and each TP is specified using the following elements:

- TP Header:
 - TP identifier;
 - a summary of the test;
 - references to the requirements covered by the TP;
 - the role of test subject (IUT or EUT);
 - an identification of the abstract architecture upon which the TP is based;
 - a reference to the Test Case (TC) or Test Description (TD) derived from the TP.
- TP Body:
 - test preconditions;
 - stimulus;
 - response

C.1.3 Choosing a suitable text editor

TPLan depends quite heavily on the use of colour to distinguish between different types of keyword. Consequently, if TPs are being developed outside a specific TPLan tool, it is important to choose a text editor that can support user-defined context-sensitive highlighting. Many such editors exist and the one that is best suited to the particular project should be selected. Apart from the ability to use colour highlighting, other selection criteria may include current availability as an installed product, price, support and additional functionality.

Whichever text editor is chosen, it should be configured to provide the colour scheme shown in Table C.1 for TPLan specifications, if possible:

TPLan element	Font colour	Font weight	Example
TSS Header keywords	purple	bold	Date
Definition keywords	purple	bold	def entity
Grouping keywords	purple	bold	Group End Group
TP Header keywords	blue	bold	RQ ref
TP Body keywords	blue	bold	when
Entities	dark red	normal	IUT
Events	dark red	normal	Call_Proceeding
Event parameters	dark red	normal	source_address
Values	dark red	normal	prefix_lifetime
Units	dark red	normal	300 msec
Conditions	dark red	normal	away_from_home
Numbers	dark red	normal	1234
Strings	dark grey	normal	'this is a string'
Comments	dark green	normal	this is a comment
All other text	black	normal	TP_SEC_2345_04

C.2 The TPLan header

C.2.1 TSS Header

Most of the information specified in the TSS Header is included for the management and control of the TPLan specification and should be maintained conscientiously. This means that:

31

- a) the title field should accurately reflect the contents of the specification;
- b) the date and version fields should, together, identify the revision status of the specification; and
- c) the author field should identify the group or individual responsible for writing the specification.

However, the purpose of the TSS field is to declare the short string (3 to 8 characters) that should be used in the construction of each TP identifier. For example, if the TSS field is declared as "ABCDE" then all TP identifiers should be of the form "TP_ABCDE_nnnn_mm".

The following example shows a valid TSS Header:

```
TSS : SEC
Title : 'IPv6 Security TSS and TP'
Version : 1.1.6
Date : 25.10.2006
Author : 'STF276-II'
```

C.2.2 Cross-references

C.2.2.1 Requirement sources

Cross references to requirements sources are included in a TPLan specification purely for information and have no semantic meaning within the notation. They provide an opportunity to identify the sources of specific groups of requirements referenced within the TPs. Thus, in the following example, all requirements with identifiers of the form RQ_040_nnnn are derived from the source documents, RFC 1234 and RFC 4567:

xref RQ 040 { RFC1234, RFC4567 }

The list of sources should be as complete as possible and should not be limited to publicly-available documents. Any that are relevant and from which requirements have been extracted should be included.

C.2.2.2 Configurations

As with the cross-references to requirements sources, the configuration cross-references are for information only. They provide convenient pointers to files or documents that specify the various abstract architectures upon which the TPs are based. The following example identifies that the configurations CF_SEC_01, CF_SEC_02 and CF_SEC_03 can all be found in the document, Config_IOP_SEC.pdf:

```
xref CF_MOB_02 {Configs_IOP_SEC.pdf}
xref CF_MOB_03 {Configs_IOP_SEC.pdf}
xref CF_MOB_04 {Configs_IOP_SEC.pdf}
```

Again, the list of configurations should be as complete as possible, particularly for interoperability TPs where the abstract architectures are an integral part of the specification.

C.2.3 User-defined extensions to TPLan

C.2.3.1 General layout of user definitions

The TPLan notation requires that all user-defined extensions are specified as part of the TPLan Header, i.e. before any TPs are specified, but, within this part of the Header, there is no strict order specified. However, the use of TPLan comments to group similar types of definition together can make the specification easier to read. The structure of the user-defined extension is likely to be dependent upon the project to which the TPLan is related but, as an example, the following list shows how the extensions could be organized:

- 1. Cross references:
 - Requirements.
 - Configurations.
- 2. Entities:
 - Test entities (e.g. EUT, QE).
 - Network entities (e.g. destination_node, connection).
 - Addressing entities (e.g. multicast_group, port_21).
- 3. Events:
 - Messages (e.g. SETUP, IPv6Packet).
 - Timeouts (e.g. max_response_time).
 - User-interface stimuli (e.g. escape_key, Go_command).
 - Procedural events (e.g. transport_mode, connection_establishment).
 - Generic events (e.g. request, response).
- 4. Conditions:
 - Pre-conditions (e.g. powered-up).
 - States (e.g. idle, away_from_home).
- 5. Values:
 - Event-related values (e.g. packet headers, payload contents).
 - Literal constants (e.g. status codes, error codes, message types).
 - Counters and timers.
- 6. Units
 - Simple measurement (e.g. metres, mille-seconds).
 - Quantitative (e.g. octets, errors).

- 7. Keywords:
 - Comparators (e.g. equal, more).
 - Qualifiers (e.g. acceptable, modified).
 - Functions (e.g. plus, times).
 - General "glue" words (e.g. at, this).
 - Keywords related to the "with" statement (e.g. having, established).
 - Keywords related to the "when" statement (e.g. requested, expires).
 - Keywords related to the "then" statement (e.g. accepts, resends).

C.2.3.2 Header fields

TPlan permits the definition of new fields to be used in the TSS Header and the TP Headers. This facility should be used sparingly to add fields that are of particular relevance to a project. In the TSS Header it could be used to add, for example, a *status* field or a *Work Item* reference as shown below:

```
TSS : SEC

Title : 'IPv6 Security TSS and TP'

WI ref : 'DTS/MTS-IPT-010-IPv6-SecTCSS'

Version : 1.1.6

Status : 'Draft'

Date : 25.10.2006

Author : 'STF276-II'

....

def header WI

def header Status
```

In those projects that use an Implementation Conformance Statement (ICS) as a reference document for the requirements rather than or as well as a requirements catalogue, it is convenient to define a new field for the TP Header, *PICS*, for example. This can then be used in place of the *RQ ref* field, thus:

C.2.3.3 Entities

Although the primary purpose of the **def entity** construct is enable the identification of test entities such as the EUT and QEs, it is also useful for defining other architectural and addressing items. Examples of possible entities of this type are shown in the following list:

- 1. Architectural:
 - destination_node
 - B Channel
- 2. Addressing:
 - multicast_group
 - UDP_port_500

C.2.3.4 Events

The concept of an event within TPLan is not restricted. It could, for example, be a protocol message, a timeout or a procedure invocation. Generally, they can be considered to be associated with stimuli and responses and usually require the presence of additional keywords to describe a complete action. For example, tests often involve message events which need to be associated with a **send** or **receive** keyword. The following examples show the different ways in which events can be used:

```
when { IUT receives SETUP . . . . }
then { IUT sends CALL_PROCEEDING . . . . }
when { sanity_timer expires in the IUT. . . }
when { EUT is requested to establish a call to QE1 . . . }
```

TPLan events may have parameters associated with them. The purpose of this is to make it possible to identify fields within messages and other events. The use of such parameters can improve the readability of a TPLan specification quite considerably, as the following example shows:

```
def event SETUP
        { source_address,
            destination_address,
            A_flag }
        ...
        when { IUT receives SETUP
            containing source_address indicating an external_user
            and containing A_flag set to 1 }
        then { .... }
```

In those cases where a parameter, itself, contains additional fields (for example, a packet header), these fields should be identified in a **def value** statement (see clause C.2.3.6), as follows:

```
def event IPv6Packet
    { IPv6_Header,
    Routing_header,
    payload }

def value IPv6_header
    { Version,
    Traffic_Class,
    Payload_Length,
    source_address,
    destination_address }
....
when { IUT receives an IPv6Packet
    containing an IPv6_header
    containing source_address indicating a link_local_address
    then { .... }
```

The parameter field can also be useful in identifying the length of a timeout event, as follows:

def event response_time {100mSec}

C.2.3.5 Conditions

The **def** condition statement in TPLan makes it possible to identify the various states that a test entity can reach. A condition identifier can either be used within the TP Body in conjunction with a user-defined **state** keyword or in the preconditions (**with** statement) without the **state** keyword, as follows:

```
def condition away_from_home
def condition idle
def word state
....
with { EUT away_from_home }
ensure that
{ when { .... }
then { EUT ....
and EUT enters the idle state }
}
```

C.2.3.6 Values

Within TPLan, a value can be a literal, a constant (e.g. Invalid_Format, Avogadros_Number), a value identifier (e.g. repeat count, message ID) or any other value-related item.

When defining the literal constants which are often associated with protocol status or error codes, for example, it is useful to include the numerical value of the constant as a comment, thus:

```
--** Configuration Types
def value CFG_REQUEST
                                         -- 1
                                        -- 2
def value CFG_REPLY
 -** Notify Message Types
def value UNSUPPORTED_CRITICAL_PAYLOAD -- 1
def value INVALID_IKE_SPI
                                        -- 4
                                        -- 5
def value INVALID MAJOR VERSION
def value INVALID SYNTAX
                                        -- 7
def value INVALID MESSAGE ID
                                        -- 9
def value ADDITIONAL_TS_POSSIBLE
                                        -- 16386
def value IPCOMP_SUPPORTED
                                        -- 16387
def value generic_payload_header
          { next payload,
            Critical_flag,
            payload_length }
```

C.2.3.7 Units

Although TPLan allows specific combinations of numbers and units to be defined as **values** (e.g. 30sec) this approach is not convenient in all cases. In those instances where a TPLan specification includes many different numeric values associated with the same units then these units should be defined using the **def unit** construct as follows:

```
def unit msec 'mille-seconds'
. . . .
then { IUT sends CALL PROCEEDING after 100 msec }
```

C.2.3.8 Keywords

Although the TPLan notation standard includes a base set of useful keywords, it is quite likely that each TP specification will require the definition extra keywords. There are generally two reasons for adding new TPLan keywords:

- 1. to extend the functional capabilities of TPLan, for example:
 - starts;
 - established;
 - registered.
- 2. to add words that improve readability, for example:
 - at;
 - for;
 - this.

Although the addition of new keywords can make the TPLan specification considerably easier to understand, care should be taken to avoid adding multiple words with almost identical meaning. Also, the **def context** construct (see clause 8.8) should be used wherever possible to limit the use of newly-defined keywords.

C.2.3.9 Syntactical context

In order to avoid the use of newly-defined keywords in meaningless combinations, TPLan has a facility for defining the specific syntactical context(s) in which a keyword may be used. This capability should be used extensively to avoid the misuse of user-defined extensions. Within a **def context** statement, square brackets around a word indicates that it is optional within the defined context, a preceding tilde (~) character indicates that the word may only be used in this context (it is, however, possible to include the same word in more than one context). The following example shows how **def context** statements can be constructed:

```
def word established
    . . .
def context {~established as }
def context { [not] ~having ~established }
```

The result of these statements is that the keyword established can only be used in the following constructs:

```
. . . . established as
. . . . not having established
. . . . having established
```

NOTE: The def context construct should only be used to define the syntactical context associated with particular user-defined words. It should not be used to construct entity, event, condition or value identifiers which contain white space; i.e. in the following example, the definition of the away_from_home condition is semantically different from the result of the context definition which permits the use of the construct, away from home:

```
def condition away_from_home
def context {~away from ~home }
```

C.3 Test Purposes

C.3.1 Grouping TPs

Each TP in a test specification is usually allocated to one or other of the groups in the Test Suite Structure (TSS). TPLan allows this grouping to be expressed using its group and end group statements.

Each group of TPs should be given a unique number and a title which accurately reflects the nature of the grouping. group numbers should be in the "legal" form (i.e. 1, 1.1, 1.1.1 etc.) as shown in the following example:

```
Group 2 'Basic communications functions'
....
Group 2.1 'Sending SETUP'
....
End Group 2.1
Group 2.2 'Receiving SETUP'
....
Group 2.2.1 'Sending CALL_PROCEEDING'
....
End Group 2.2.1
End Group 2.2
End Group 2.2
```

If the more traditional approach to naming TSS groups is taken (i.e. the group title is based upon the test path) [2] where there is less functional information in the group title, the optional objective statement should be used to add a more meaningful title, as follows:

```
Group 2 'Basic Call (BC)
Objective 'Basic communications functions'
....
Group 2.1 'Basic Call (BC) / Originating Exchange (OE)
Objective 'Sending SETUP'
....
End Group 2.1
Group 2.2 'Basic Call (BC) / Terminating Exchange (TC)
Objective 'Receiving SETUP'
....
Group 2.2.1 'Basic Call (BC) / Terminating Exchange (TC) / Response to SETUP (RS)
```

```
Objective 'Sending CALL_PROCEEDING'
. . .
End Group 2.2.1
End Group 2.2
End Group 2
```

C.3.1.1 TP header

Each TPLan Test Purpose begins with a header which should contain all of the following information:

• TP Identifier:

The TP identifier should conform to the guidelines specified in EG 202 568 [2] and should include the TSS identifier as shown in the following example:

• Summary of the TP:

The TP summary is a string which should briefly describe the basis for the test. The summary in each TP should be unique within the TSS so that even in those cases where a number of TPs are derived from a single set of requirements, the summaries help to highlight the differences between each TP. For example:

• Identification of the requirement source:

It is important to know which base requirements each TP aims to test so it is essential that all relevant requirements are listed, as shown in the following example:

• The role of the IUT or EUT:

As TPs are generally expressed in terms of the IUT or EUT, this field is necessary in order to identify what functional role the IUT or EUT is expected to play in the test. If the test applies to more than one role, then all applicable roles should be listed, as shown in the following example:

The role should not be confused with the physical entity playing the role. In the example above, a personal computer (physical entity) could be configured to operate as either a Host or a Router (functional role).

• The abstract architecture associated with the TP:

The relevant configuration from those specified in the cross-reference statements in the TPLan Header (clause C.2.2.2) should be identified here, as follows:

• The identifier of the Test Case or Test Description which implements the TP:

Each TP is likely to have a Test Case and/or a Test Description derived from it. The TC or TD identifier, if it exists, should be identified here. If both a TD and a TC exist for a particular TP then only the TD reference should be included:

C.3.1.2 TP Body

C.3.1.2.1 Preconditions

In most TPs there will be conditions that need to be defined before the test itself is specified. These preconditions are specified in the TPLan with statement and should, in general, be status-related rather than dynamic, as shown in the following examples:

```
with { EUT away_from_home }
with { IUT having sent SETUP }
with { EUT configured 'to perform route optimization' }
```

It is possible to express multiple and complex conditions by using the logical **and**, **not** and **or** functions, thus:

```
with { EUT away_from_home
    and EUT registered to QE4 }
with { IUT having sent SETUP
    and IUT not having received CALL_PROCEEDING }
```

User-defined keywords and text within string-quotes should be chosen to fit grammatically in the with statement so that it is easy to read as a correct English phrase. As an example, the following statement is not acceptable:

with { IUT establishes a Security_Association }

However, the following similar statement is acceptable:

with { IUT established in a Security_Association }

C.3.1.2.2 Stimulus and response

C.3.1.2.2.1 The with and then construct

Tests are usually specified as a combination of a stimulus followed by an expected response. In a TPLan specification, these are represented by the **when** and the **then** statements, respectively. Consequently, although it is possible to have more than one **when** and/or **then**, it is not possible to have a **when** statement without a corresponding **then** statement.

TPLan specifications can be written with only a few user-defined extensions (see clause C.2.3) by making extensive use of quoted strings. Such specifications are generally not difficult to read but the opportunities for automatically checking the specification and, possibly, for transposing it into a test case specification language such as TTCN-3, are limited. It is, therefore, beneficial to define sufficient notation extensions to make the use of quoted strings the exception rather than the rule.

All TPs should be written in terms of the IUT or EUT and the other test entities (i.e. the TESTER or the QEs). The following example shows the specification of a simple stimulus and response:

```
ensure that {
    when { IUT receives SETUP }
    then { IUT sends CALL_PROCEEDING }
}
```

C.3.1.2.2.2 Identifying the contents of message events

In most instance, test stimuli (and, to a lesser extent, responses) are based on the status of the parameters of an event rather than the event alone. The **containing** and **indicating** keywords are used for this purpose, as follows:

If it is necessary to be more specific about the contents of an event parameter, the readability of the specification can be improved by substituting the **indicating** keyword with a **set** to construct which is defined and used thus:

A similar approach can be used in a response:

Logical operators can be used to build stimuli and responses from multiple parameters values as the following example shows:

It is possible that message event parameters may, themselves, contain parameters (see clause C.2.3.4). This is particularly true in packet-based protocols such IPv6 where, in addition to a number of simple parameters, a packet may contain:

- headers;
- payloads; and/or
- encapsulated (tunnelled) packets.

In these instances, round braces and suitable indentation should be used to improve the clarity of the TPLan specification. For example:

C.3.1.2.2.3 Interactions with the user

It is not unusual for an event to be stimulated by the notional user of the IUT or EUT or for a response to involve a report to the user. These are highlighted in the following examples which both require the addition of some user-defined extensions to TPLan:

• User-initiated stimulus:

```
def word requested
def word send
def context { is ~requested to ~send }
. . . . . . . .
when { the EUT is requested to send Echo_Request }
. . . . . . .
```

• Report-to-user response:

```
def word indicates
def word receipt
def context { ~indicates ~receipt of }
. . . . . . .
then { the EUT indicates receipt of the packet }
. . . . . . .
```

C.3.1.2.2.4 Establishing the order of a sequence of events

Although logically associated multiple events are treated by TPLan as ordered by default, it is possible to emphasize a strict sequence of events within a stimulus or response by using **before** and **after**, **particularly** if the sequence comprises only a small number of message events (no more than 3), as follows:

when { IUT receives message_1
 before IUT receives message_2 }

Using the **after** keyword to link a number of message events together in a sequence can be confusing (because the messages appear in reverse order) but it is very useful for associating a message event with a timer event, thus:

```
then {      IUT sends message_1
      after timer_3 expires }
```

When there are a larger number of events in a sequence, these should be specified as a list of events which are, by default, ordered. Although this results in poorer English phrasing, it is considerably less complex than a long series of events linked together with either **before** or **after**:

```
when {    IUT receives message_1
    and IUT receives message_2
    and IUT receives message_3
    and IUT receives message_4
    and IUT receives message_5
}
```

Round braces should always be used to indicate the extent of the ordered sequence. For example, the **when** statement above specifies a stimulus which is not the same as the stimulus specified in the following TPLan:

C.3.1.2.2.5 The "do nothing" response

When the expected response to a particular stimulus is to do nothing, user-defined extensions should be specified so that a clear statement can be made, thus:
