Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: “Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards”, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server ([https://ipr.etsi.org/](https://ipr.etsi.org/)).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

The present document relates to the multi-part standard ETSI ES 201 873 covering the Testing and Test Control Notation version 3, as identified in ETSI ES 201 873-1 [1].

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are **NOT** allowed in ETSI deliverables except when used in direct citation.
1 Scope

The present document defines the support for object-oriented features in TTCN-3. TTCN-3 can be used for the specification of all types of reactive system tests over a variety of communication ports. Typical areas of application are protocol testing (including mobile and Internet protocols), service testing (including supplementary services), module testing, testing of OMG CORBA based platforms, APIs, etc. TTCN-3 is not restricted to conformance testing and can be used for many other kinds of testing including interoperability, robustness, regression, system and integration testing. The specification of test suites for physical layer protocols is outside the scope of the present document.

TTCN-3 packages are intended to define additional TTCN-3 concepts, which are not mandatory as concepts in the TTCN-3 core language, but which are optional as part of a package which is suited for dedicated applications and/or usages of TTCN-3.

While the design of TTCN-3 package has taken into account the consistency of a combined usage of the core language with a number of packages, the concrete usages of and guidelines for this package in combination with other packages is outside the scope of the present document.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference/.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

[i.1] ETSI ES 201 873-7: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 7: Using ASN.1 with TTCN-3".
3 Definition of terms and abbreviations

3.1 Terms

For the purposes of the present document, the terms given in ETSI ES 201 873-1 [1], ETSI ES 201 873-4 [2], ETSI ES 201 873-5 [3] and ETSI ES 201 873-6 [4] apply.

3.2 Abbreviations

4 Package conformance and compatibility

The package presented in the present document is identified by the package tag:

"TTCN-3:2018 Object-Oriented features" - to be used with modules complying with the present document.

For an implementation claiming to conform to this package version, all features specified in the present document shall be implemented consistently with the requirements given in the present document and in ETSI ES 201 873-1 [1] and ETSI ES 201 873-4 [2].

The package presented in the present document is compatible to:

- ETSI ES 201 873-1 [1], version 4.10.1;
- ETSI ES 201 873-4 [2], version 4.6.1;
- ETSI ES 201 873-5 [3], version 4.8.1;
- ETSI ES 201 873-6 [4], version 4.9.1;
- ETSI ES 201 873-7 [i.1];
- ETSI ES 201 873-8 [i.2];
- ETSI ES 201 873-9 [i.3];
- ETSI ES 201 873-10 [i.4].

If later versions of those parts are available and should be used instead, the compatibility to the package presented in the present document has to be checked individually.
5 Package Concepts for the Core Language

5.0 General

This package defines objec-oriented features for TTCN-3, i.e. it extends the TTCN-3 core language (ETSI ES 201 873-1 [1]) with well-known concepts from object-oriented programming and modelling languages. This package realizes the following concepts:

- classes (i.e. class definition, scope rules, abstract and external classes, refinement, constructors, destructors, methods, visibility, and built-in classes);
- objects (i.e. ownership, object references, select class-statement, dynamic class discrimination, and casting);
- exception handling (i.e. ability to define exception handling for functions, external functions, altsteps, and test cases).

5.1 Classes and Objects

5.1.0 General

This clause introduces the concepts of class types and their values, called objects as well as the operations allowed to be applied to these objects.

5.1.1 Classes

5.1.1.0 General

Syntactical Structure

```
(public | private) type [external] class [@final | @abstract] Identifier [extends Identifier] [runsOnSpec] [systemSpec] [mtcSpec] "(" ([ClassMember] ")" [finally StatementBlock]
```

Semantic Description

A class is a type where the values are called objects. A class can declare fields (variables, constants, templates, ports, timers) and methods as its members. Each member name inside the class shall be unique, there is no overloading. The private and protected fields and methods are only accessible by the methods of the class, while the public members of the class can be accessed also from behaviour not defined in the class. The private members of the class can be accessed directly only by members of the class itself. All members which are neither private nor public are protected and can also be accessed by members of subclasses.

A class can extend another class. The extended class is called the superclass, while the extending class is called the subclass. The resulting type of a class definition is the set of object instances of the class itself and all instances of its direct or indirect subclasses. A subclass is a subtype of its direct and indirect superclasses and its object instances are type compatible with them. If a class does not explicitly extend another class type, it implicitly extends the root class type object. Thus, all classes are directly or indirectly extensions of the object class.

A class can have optional runs on, mtc and system clauses. This restricts the type of component context that can create objects of that class and all methods of this class. If a class does not have one of these clauses, it inherits it from its superclass, if the superclass has one. If the superclass has or inherits a runs on, mtc or system clause, the subclass may declare each of these clauses with a more specific component type than the one inherited. The function members of classes shall not have runs on, system or mtc classes but inherit them from their surrounding class or its superclasses.
Restrictions

a) Templates are not allowed for class types.

b) Passing of object references to the create operation of a component type or a function started on another
component is not allowed.

c) No subtyping definition is allowed for class types via the normal subtype definition.

d) No local/global constants or module parameters of class type or containing class type fields or elements are
allowed.

e) Class type cannot be the contained value of an anytype value.

f) The functions of a class shall not have a runs on, mtc or system clause.

g) The runs on type of a class shall be runs on compatible with the runs on type of the behaviour creating a class.

h) The runs on type of a class shall be runs on compatible with the runs on type of the superclass.

i) The mtc and system type of a class shall be mtc and system compatible with the mtc and system types of the
superclass, respectively.

5.1.1.1 Scope rules

Class constitutes a scope unit. For the uniqueness of identifiers, the rules specified in the clause 5.2.2 of ETSI
ES 201 873-1 [1] apply with the following exceptions:

a) Identifiers from the higher scope can be reused for member declarations. A reference to a reused identifier
without a prefix occurring inside a class scope shall be resolved as a reference to the class member. In order to
refer to the declaration on the higher scope, the identifier shall be preceded with a module name and a dot (".").

b) Identifiers of member declarations can be reused inside methods for formal parameter and local declarations.
A reference to a reused identifier without a prefix occurring inside a class method shall be resolved as a
reference to the formal parameter or local declaration. In order to refer to the member declaration, the
identifier shall be preceded with the this keyword and a dot.

c) Reusing identifiers of members of the component type specified in the runs on clause of the class for members
and inside methods for formal parameters and local declarations is not allowed.

EXAMPLE:

module ClassModule {
    const integer a := 1;

type class MyClass() {
    const integer a := 2;
    function doSomething (integer a := 3) {
        log(a); // logs 3 (for the default value)
        log(this.a); // logs 2
        log(ClassModule.a); // logs 1
    }
    function doSomethingElse () {
        log(a); // logs 2
        log(this.a); // also logs 2
        log(ClassModule.a); // logs 1
    }
}
}
5.1.1.2 Abstract classes

A class can be declared as `@abstract`. In that case, it is allowed that it also declares abstract member functions who shall be defined by all non-abstract subclasses. An abstract method function has no function body but can be called in all concrete instances of subclasses of the abstract class declaring it. Other members of the abstract class or its subclasses may use the abstract functions as if it was concrete where at runtime the concrete overriding definition will be used.

**NOTE 1:** Abstract classes are only useful as superclasses of concrete classes.

**Restrictions**

a) Abstract classes cannot be explicitly instantiated.

b) If a class that is not declared abstract extends an abstract class, all methods that have no implementation in the superclass shall be implemented in this class.

**NOTE 2:** Variables of an abstract class type can only contain references to instances of non-abstract subclasses.

5.1.1.3 External classes

A class may also be declared as external. In that case, all members shall be external functions without a function body. It is allowed to omit the external keyword from these function declarations. When instantiating an external class, the object being created is provided by the platform adapter and the method calls to the object are delegated via the platform adapter to the corresponding method of the external object.

**NOTE 1:** External classes are a way to use object-oriented library functionality to TTCN-3 while still remaining abstract and independent of actual implementation. Libraries for common constructs like stacks, collections, tables can be defined or automatic import mechanisms could be provided.

If an object of an external class is instantiated, it implicitly creates an external object and the internal object has a handle to the external one. The reference to the external object is called a handle. When an external method is invoked on the internal object, the call is delegated to the handle.

**NOTE 2:** External objects are possibly shared between different parts of the test system. Therefore, racing conditions and deadlocks have to be avoided by the external implementation.

An internal class can extend an external class and add internal behaviour, but also additional external functions, which have to be declared external explicitly. Such a class is conceptually still an external class and each instance has a handle to an external object.

**Restrictions**

a) External classes shall not contain fields or functions with a body.

b) External classes shall not be derived from non-external classes other than object.

c) If an internal class defines an external function, it shall be derived from an external class either directly or indirectly.

**EXAMPLE:**

```plaintext
external type class Stack {
  function push(integer v);
  function pop() return integer;
  function isEmpty() return boolean;
}
```

5.1.1.4 Final Classes

If a class shall not be subclassed, it may be declared as `@final`. Final classes cannot be abstract.
5.1.1.5 Constructors

Syntactic Structure

create "(" { FormalParameter , }* ")"
[":" SuperClass "(" { ActualParameter , }+ ")" ]
StatementBlock

Semantic Description

A class can define a constructor called create. If no constructor is defined, a default constructor is implicitly provided where the formal parameters of the constructor are the parameters of the (implicit or explicit) constructor of the direct superclass and one formal in parameter for each declared member field of the class itself in their order of declaration with equivalent type. The constructor is invoked on a type reference to the class and the result of this invocation is a new instance object of the constructor's specific class. If a class is extending another class with an explicit constructor, that constructor shall be invoked by adding a super-constructor clause with an actual parameter list to the constructor declaration. An implicit constructor will automatically pass the required actual parameters to the constructor of its superclass.

In the constructor, it is allowed to refer to the object being constructed as this to reference the fields of the object to be created in case that the names of the formal parameters clash with the names of those fields. They are explicitly allowed to have the same names as class members.

EXAMPLE:

type class MyClass {  
  var integer a;  
  const float b;  
  // implicit constructor:  
  // create(integer a, float b) {  
  // this.a := a;  
  // this.b := b  
  // }  
}  
type class MyClass2 extends MyClass {  
  template integer t;  
  // explicit constructor  
  create(template integer t) : MyClass(2, 0.5) {  
    this.t := t;  
  }  
}

5.1.1.6 Destructors

Syntactic Structure

finally StatementBlock

Semantic Description

A destructor may be provided using a finally declaration following the class body. This destructor will be invoked automatically at the latest before the system deallocates an object instance (which is tool specific and out of the scope of the present document) or when the owning component terminates. The StatementBlock has access to all members accessible to the class. The StatementBlock is semantically a function body of a function without return clause.

When deallocating the object instance, the destructor of the associated class is invoked first, followed by the destructor of all parent classes in the reverse order of superclass hierarchy.

5.1.1.7 Methods

A method is a function defined inside the class body. It has the same properties and restrictions as any normal function, but it is invoked in an object which can be referred to by the this object reference. A method invocation can access the class's own fields and also the inherited protected fields and methods of its superclasses.
A method inherited from a superclass can be overridden by the subclass by redefining a function of the same name and with the same formal parameter list. When a method is called in an object, the version of the most specific class of the super class hierarchy of the concrete class that defines the method in its body will be invoked. The overridden method can be invoked from the overriding class by using the keyword `super` as the object reference of the invocation. If a method shall not be overridden by any subclass, it can be declared as `@final`.

Public methods, if not overridden by the subclass, are inherited from the superclasses. If a public method is declared in a class, it can be invoked also in all objects of its direct or indirect subclasses.

If a public method is overridden, the overriding method shall have the same formal parameters in the same order as the overridden method. Public methods shall be overridden only by public methods. Protected methods may be overridden by public or protected methods.

The return type of an overriding function shall be the same as the return type of the overridden function with the same template restrictions and modifiers.

Methods shall have no `runs on`, `system` or `mtc` clause directly attached to them. However, they inherit these clauses from their surrounding class.

### 5.1.1.8 Method invocation

**Syntactical Structure**

```
[ObjectInstance "."] Identifier "(" FunctionActualParList ")"*
```

A method invocation is a function call associated with a certain object defined in the class of that object.

Methods are invoked using the dotted notation on an object reference. Inside the scope of a class, methods of the same class or any visible inherited methods can be invoked without the `ObjectInstance` prefix if the object the method shall be invoked in is the same object as the one invoking it. The usual restrictions on actual parameters, as well as `runs on`, `mtc` and `system` types apply also on method invocations. All other restrictions that apply to called functions also apply to method invocation.

### 5.1.1.9 Visibility

Fields can be declared as private or protected. Methods can be declared as private, public or protected. If no visibility is given then the default modifier protected is assumed.

Private member functions are not visible and can be present in multiple classes of the same hierarchy with different parameter lists and return values.

Public member functions can be called from any behaviour running on the object's owner component.

**Restrictions**

- a) A field of any visibility cannot be overridden by a subclass.
- b) A public member function can only be overridden by another public member function.
- c) Private members can only be accessed directly from inside their surrounding class's scope.

### 5.1.1.10 Built-in classes

The abstract special built-in class called `object` is the superclass for all classes that do not explicitly extend another class.

The pseudo definition of that class is:

```tcl
type class @abstract @builtin object {
    // This function will return a tool-specific descriptive string by default
    // but can be overridden by subclasses
    public function toString() return universal charstring;
}
```

**NOTE:** The `@builtin` is only added for illustrative purposes and not part of the TTCN-3 language.
5.1.2 Objects

5.1.2.0 General

Objects are the instances of classes. Each instance comprises an instance of the data of the fields of the class (including all superclasses) and allows invocation of its public methods by other behaviour and protected or private methods by behaviour defined by the object's class itself.

5.1.2.1 Ownership

Each object is owned by the component on which it was created. The owning component of an object can be referenced via the self component reference. Methods of objects can only be invoked by behaviour that also runs on the owning component. An object is created on a component if its constructor was invoked by a behaviour running on that component.

5.1.2.2 Object References

Objects are always passed by reference (even though their formal parameters can still be in, inout or out, dependent on the usage of that parameter). A variable of a class type contains only a reference to the object instance and the object is not copied when used as an actual parameter or assigned to a variable, but only the reference to the object. Therefore, multiple variables can contain a reference to the same object simultaneously.

Restrictions

a) Object References shall not be passed as actual parameter or part of an actual parameter to either the create operation of a component type or a function started on a component. If a structured type contains a field of a class type, this type is not seen as a data type and its values cannot be used for sending and receiving or as an argument to any expression other than the equality/inequality operator.

NOTE: Since objects cannot be shared by different component contexts and for each component at most one behaviour is running, no parallel conflicting access to any of the objects fields or methods is possible.

5.1.2.3 Null reference

An object variable that is not initialized with an object instance contains the special value null. An object variable or parameter may be compared with the special value null with the equality and inequality operators or can be assigned the special value null explicitly.

5.1.2.4 Select class-statement

Syntactical Structure

```
select class "(" Object ")"
宁波市 ClassReference ")" StatementBlock ]+ [ElseCase] "]"
```

Semantic Description

The class of an object can be discriminated for via the 'select class' statement that is similar to a select union statement insofar that it allows only superclasses and known subclasses of the object reference's class in the context. If more than one case contains a superclass of the actual class of the given object instance, the first of these cases will be chosen by the select class statement.

EXAMPLE:

```java
type class A {}
type class B extends A {}
...
var A v_a := B.create();
select class (v_a) {
    case (B) { ... } // will be chosen
    case (A) { ... } // will not be chosen
}
```
Restrictions

a) If a class from one case is a superclass of a class from another case, then the case of the subclass shall be precede the case of the superclass.

5.1.2.5 Of-operator (Dynamic Class Discrimination)

Syntactical Structure

Object of ClassReference

Semantic Description

To check whether an object is an instance is of a certain class, the of operator may be used.

It yields a Boolean value which is true if and only if the most specific class of the object referenced on the left-hand side is either equal to or a subclass derived from the class type reference on the right-hand side.

5.1.2.6 Casting

Syntactical Structure

ObjectReference => ( ClassIdentifier | " ( ClassReference ")"

Semantic Description

An object reference can be cast to another class of the object's known class's set of direct or indirect superclasses and direct or indirect subclasses. This operation yields an object reference to the same object but can be used as being of the type being cast to. If the referenced class to be cast to is an expression that is not a simple identifier, the expression shall be written in parenthesis.

Restrictions

a) If the class the object is being cast to is not in the set of superclasses or the concrete class of the object, the cast operation shall result in an error.

5.2 Exception handling

5.2.0 General

This clause introduces exception handling into TTCN-3. It provides means to define exception handling for functions, external functions, altsteps, and test cases.

5.2.1 Extension to ETSI ES 201 873-1, clause 16.1.0 (Functions)

Clause 16.1.0 General

The syntax of functions is extended with an optional exception clause.

Syntactical Structure

function [ @deterministic | FunctionIdentifier
"(" { FormalValuePar | FormalTimerPar | FormalTemplatePar | FormalPortPar } ["","] )"
[ runs on ComponentType ]
[ mtc ComponentType ]
[ system ComponentType ]
[ return [ template ] Type ]
[ exception "(" (Type ["","]+ ")" ]
StatementBlock
Clause 16.1.0 General
The semantic description part is extended.

Functions may have an exception list. The exception list declares, what exception types may be raised during the execution of the function either directly or indirectly.

NOTE 1: The exception list can be used to communicate to the callers of the function what exceptions to prepare for and by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 2: The exception list might not be exhaustive. With activated altsteps it might not be possible to precisely know what exceptions might be raised within a function directly or indirectly.

If the statement block of a function has a **finally** block, the finally block is always executed before control returns to the location of the call of the function.

5.2.2 Extension to ETSI ES 201 873-1, clause 16.1.3 (External Functions)

Clause 16.1.3 General
The syntax of external functions is extended with the optional *exception* clause.

**Syntactical Structure**

```
external function [ @deterministic ] ExtFunctionIdentifier
    "(" { ( FormalValuePar | FormalTimerPar | FormalTemplatePar | FormalPortPar ) [","] } ")"
    [ return [ template [ Restriction ] ] Type ] [ exception "(" {Type [","]}+ ")" ]
```

Clause 16.1.3 General
The semantic description part is extended.

External functions may have an exception list. The exception list declares, what exception types may be raised during the execution of the external function.

NOTE 0: The exception list can be used by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 1: The exception list might not be exhaustive. It might not be possible to precisely know what exceptions might be raised within an external function directly or indirectly.

5.2.3 Extension to ETSI ES 201 873-1, clause 16.1.4 (Invoking functions from specific places)

Clause 16.1.4 General
The list of restrictions is extended to avoid side effects.

m) Raising an exception with the raise exception statement.

5.2.4 Extension to ETSI ES 201 873-1, clause 16.2 (Altsteps)

Clause 16.2.0 General
The syntax of altstep is extended with the optional *exception*, *catch* and *finally* clauses.

**Syntactical Structure**

```
altstep AltstepIdentifier
    "(" { ( FormalValuePar | FormalTimerPar | FormalTemplatePar | FormalPortPar ) [","] } ")"
    [ runs on ComponentType ]
    [ mtc ComponentType ]
    [ system ComponentType ]
    [ exception "(" {Type [","]}+ ")" ]
    ""
```
Clause 16.2.0 General

The semantic description part is extended.

Altsteps may have an exception list. The exception list declares, what exception types may be raised during the execution of the altstep either directly or indirectly.

NOTE 0: The exception list can be used to communicate to the callers of the altstep what exceptions to prepare for and by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 1: The exception list might not be exhaustive. With activated altsteps it might not be possible to precisely know what exceptions might be raised within an altstep directly or indirectly.

Altsteps may have a finally block. If present the finally block is always executed before control returns to the location of the call of the altstep every time the altstep is invoked, regardless of whether implicitly as an activated default or explicitly from another alt statement.

5.2.5 Extension to ETSI ES 201 873-1, clause 16.3 (Test cases)

Clause 16.3 Test cases

The semantic description part is extended.

The StatementBlock of Test cases may have a finally block. If present the finally block is always executed before the test case terminates.

Exceptions raised directly or indirectly within the test case and not handled latest by the catch clauses of the StatementBlock of the testcase results in the testcase finishing with a dynamic error. In this situation the dynamic error has to reference not handling the exception as the reason of error.

NOTE 0: The reason for the dynamic error is not the raising of the exception, but the lack of handling within the testcase.

5.2.6 Extension to ETSI ES 201 873-1, clause 18 (Overview of program statements and operations)

The list of statements in table 15 of ETSI ES 201 873-1 needs to be extended with a raise exception statement as shown below.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Associated keyword or symbol</th>
<th>Can be directly or indirectly invoked by module control, but not by test components</th>
<th>Can be invoked by functions, test cases and altsteps running on test components</th>

<td>Yes (see note 3)</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE 1:** Specific places are defined in clause 16.1.4. Only operations that do not have any potential side effects on snapshot evaluation are allowed.

**NOTE 2:** Can be used to control timer operations only.

**NOTE 3:** Can only be used in functions and altsteps that are used in module control.

**NOTE 4:** Changing of component variables is disallowed.

**NOTE 5:** Can be used in functions and altsteps but not in test cases.

### 5.2.7 Extension to ETSI ES 201 873-1, clause 19 (Basic program statements)

**Clause 19.0 General**

The list of statements in table 17 needs to be extended with the raise exception statement as described below.

<table>
<thead>
<tr>
<th>Basic program statements</th>
<th>Associated keyword or symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignments</td>
<td>:=</td>
</tr>
<tr>
<td>If-else</td>
<td>if (...) (...) else (...)</td>
</tr>
<tr>
<td>Select case</td>

</tr>
<tr>
<td>For loop</td>
<td>for (...) {...}</td>
</tr>
<tr>
<td>While loop</td>
<td>while (...) {...}</td>
</tr>
<tr>
<td>Do while loop</td>
<td>do (...) while (...)</td>
</tr>
<tr>
<td>Label and Goto</td>
<td>label / goto</td>
</tr>
<tr>
<td>Stop execution</td>
<td>stop</td>
</tr>
<tr>
<td>Returning control</td>
<td>return</td>
</tr>
<tr>
<td>Leaving a loop, altstep or interleave</td>
<td>break</td>
</tr>
<tr>
<td>Next iteration of a loop</td>
<td>continue</td>
</tr>
<tr>
<td>Raise exception</td>
<td>raise</td>
</tr>
<tr>
<td>Logging</td>
<td>log</td>
</tr>
</tbody>
</table>
Clause 19.14 Statement Block

The syntax of statement block is changed as shown below.

```
BasicStatementBlock: 
    "{" (LocalDefinition | Statement) "}"
StatementBlock: BasicStatementBlock {catch "(" Type Identifier ")" BasicStatementBlock }
 {finally BasicStatementBlock}
```

Clause 19.14 Statement Block

The semantic description part is extended.

A basic statement block is a sequence of declarations and statements.

Statement blocks can be used like basic program statements to introduce a local scope in the flow of control of TTCN-3 behaviour. The declarations and statements in a basic statement block are executed in the order of their appearance, i.e. sequentially.

A statement block consists of a basic statement block with optional additional catch clauses, that can be used to handle exceptions raised directly or indirectly within the basic statement block and an optional finally clause which is executed after the basic statement block execution. When an exception is raised by a statement in the basic statement block the catch clauses are tried in order of appearance to find one of the same type for data types or one the exception can be cast to if it is a type class kind exception. Execution continues with the basic statement block of the first catch clause whose type matches the type of the raised exception.

The catch clause declares a variable of an exception, with the type and identifier provided, to hold the value of the exception within the catch clause. The scope of this variable is limited to the basic statement block of the catch clause, i.e. it is only visible inside the body of the catch clause.

**NOTE:** The scope of the catch and finally blocks is on the same level with the scope of the basic statement block. Local variables declared within the basic statement block are not visible in the catch and finally clauses.

Clause 19.14 Statement Block

The list of restrictions is extended

a) The control transfer statements return, and raise shall not be used in the finally clause. Functions that can raise exceptions shall not be called in the finally clause.

b) The basic statement block of a catch clause shall obey the same semantic restrictions as the basic statement block it follows.

Clause 19 is extended with a new clause.

NEW: Clause 19.15 The Raise exception statement

The raise exception statement raises an exception, causing the execution to continue at the catch block closest in the procedure call hierarchy, also executing all finally blocks it encounters while traversing the procedure call hierarchy.

**Syntactical Structure**

```
raise TemplateInstance
```

**Semantic Description**

The raise statement is used to raise an exception. On executing a raise exception statement the statement blocks, loops, alt statements or interleave statement within the encompassing function/altstep/testcase are left. If the encompassing function, altstep or testcase has a catch block with the exact same type as that of the raised exception value for data types or one the exception can be cast to if it is a class type exception, execution continues in that catch block. If the encompassing function or altstep does not have catch blocks or none of the catch blocks can handle the raised exception, execution leaves the function or altstep to handle the exception in the calling function, altstep or testcase. An exception not handled via catch clause of the StatementBlock of a testcase shall cause a dynamic error.
If the StatementBlock of a function, altstep or testcase has a finally block, this finally block is always executed before the function, altstep, testcase terminates. If an exception was raised and handled in a catch block, the finally block is executed after the catch block. If there was no exception raised, or an exception was raised but not handled in any catch blocks the finally block is executed before the function, altstep or testcase terminates.

The parameter of the \texttt{raise} operation shall evaluate to a value, that the exception will have.

Exceptions are specified as types. Therefore the exception value may either be derived from a template conforming to the template(value) restriction or be the value resulting from an expression (which of course can be an explicit value). The type of the value specification to the \texttt{raise} operation shall be determinable as it is necessary to avoid any ambiguity of the type of the value being raised.

\textit{NOTE 0:} The type of the raised exception should be provided explicitly for literal values. Catch clauses with synonym types or restricted types will only catch exceptions of the same type.

\textbf{Restrictions}

In addition to the general static rules of TTCN-3 given in clause 5 and shown in table 15, the following restrictions apply:

\begin{itemize}
  \item[a)] An exception shall only be raised inside a function, altstep or testcase.
  \item[b)] The \texttt{TemplateInstance} shall conform to the template(value) restriction (see clause 15.8).
  \item[c)] Exceptions shall not be raised directly or indirectly inside finally blocks of functions, altsteps or testcases.
\end{itemize}

\textbf{Examples}

\textbf{EXAMPLE 1:}

\begin{verbatim}
raise ( v_myVariable + v_yourVariable - 2);  // Raises an exception with a value which is the result of the arithmetic expression
raise integer:5;       // Raises an exception with the integer value 5
raise charstring:"Olala!"; // Raises an exception with the charstring value "Olala!"
\end{verbatim}

\textbf{EXAMPLE 2:} Catching an exception raised in a called function.

\begin{verbatim}
type record of charstring t_registeredNames;
type component myComponent {
  var t_registeredNames v_registeredNames;
}
function f_init(in charstring name) exception (charstring, integer) runs on myComponent {
  ...
  if (name_was_not_registered) {
    raise ("Could not initialize " & name); // when the exception is raised f_init terminates
  }
  ...
}

function f_operation(in charstring user1, in charstring user2) exception (integer) runs on myComponent {
  f_init(user1);
  f_init(user2);
  ...
  catch (charstring e) {
    // the exception is available for processing in the e variable
    // release resources and terminate function
  }
  catch (integer e) {
    // there was some other issue
    // release resources
    raise e; // the exception is raised again to be handled in the calling function
  }
}
\end{verbatim}

\textbf{EXAMPLE 3:} Finally is always executed.

\begin{verbatim}
function f_operation2(in charstring user1, in charstring user2) exception (charstring) runs on myComponent {
  f_init(user1);
  f_init(user2);
\end{verbatim}
EXAMPLE 4: The exception can travel through several functions in the call hierarchy until handled.

```c
function f_operation3(charstring user1, charstring user2) exception (charstring)
runs on myComponent {
  f_operation2(user1, user2); // an exception is raised in f_init
  ...
} finally {
  // after the finally block in f_operation2 this finally block is also executed
  // the exception is not caught.
}
```

EXAMPLE 5: Exception not caught latest in a testcase is reported as dynamic error.

```c
testcase t_myTest1() runs on myComponent {
  f_init("user1");
  f_init("unknown user"); // bad argument will raise an exception in f_init
  ...
} finally {
  // via the runs on component resources can be freed
  // as the exception is not caught dynamic error is reported
}
```

EXAMPLE 6: The type of the exception has to match the type of the catch clause exactly.

```c
function f_example() exception (integer) {
  raise integer:5;
}

type integer MyIntegerSynonim;
type integer MyIntegerRange (0 .. 255);

function f_example2() {
  f_example();
  catch (MyIntegerRange e) {
    // The exception is not caught here.
    // The type of the raised exception and the type of the catch type has to be the same
  }
  catch (MyIntegerSynonim e) {
    // The exception is not caught here.
    // The type of the raised exception and the type of the catch type has to be the same
  }
  catch (integer e) {
    // As the exception raised in f_example was raise with the integer type it is handled here
  }
```

6 TRI Extensions for the Package

6.1 Extensions to clause 5.3 of ETSI ES 201 873-5 Data interface

Clause 5.3.2 Communication

The clause is to be modified:

**TriExceptionType**

A value of type TriExceptionType is an encoded type and value of an exception that either is to be sent to the SUT or has been received from the SUT. This abstract type is used in procedure based TRI communication operations and raising exception during execution of external functions, constructors, destructors and methods.
Clause 5.3.4 Miscellaneous

The clause is to be extended:

**TriClassIdType**  
A value of type TriClassIdType is the name of a class as specified in the TTCN-3 ATS.

**TriObjHandleType**  
A value of type TriObjHandle contains platform-specific data allowing access to external objects.

6.2 Extensions to clause 5.6.3 of ETSI ES 201 873-5

Miscellaneous operations

Clause 5.6.3.4 triExternalCreate (TE → PA)

This clause is to be added:

| Signature | TriStatusType triExternalCreate(  
|           | in TriClassIdType classId,  
|           | inout TriParameterListType parameterList,  
|           | out TriObjHandleType createdObject) |
| In Parameters | classId | identifier of the external class |
| Out Parameters | returnValue | handle to the created object |
| InOutParameters | parameterList | a list of encoded parameters for the indicated constructor. The parameters in parameterList are ordered as they appear in the TTCN-3 constructor declaration. |
| Return Value | The return status of the triExternalCreate operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation. |
| Constraints | This operation is called by the TE when it invokes a constructor specified in a class which is defined as external in TTCN-3. In the invocation of a triExternalCreate operation by the TE all in and inout constructor parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null. |
| Effect | The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS. On invocation of this operation, the PA shall invoke the constructor of a class indicated by the identifier classId. It shall access the specified in and inout constructor parameters in parameterList, create a new external object instance using the values of these parameters, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out constructor parameters and a handle to the created external object. The triExternalCreate operation returns TRI_OK if the PA completes the constructor of the external class successfully, TRI_Error otherwise. In the latter case, the distinct value null shall be returned as the object handle. Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalCreate operation is considered to be blocking. That means that the operation shall not return before the construction of the external object has been finished. External constructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation. |
Clause 5.6.3.5  triExternalFinally (TE → PA)

This clause is to be added:

| Signature | TriStatusType triExternalFinally(
| In Parameters | in TriObjHandleType handle) |
| Return Value | The return status of the triExternalFinally operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation. |
| Constraints | This operation is called by the TE when it invokes a destructor specified in a class which is defined as external in TTCN-3. |
| Effect | The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS which contains a destructor definition. On invocation of this operation, the PA shall invoke the destructor of the object whose handle is in the handle parameter. |
| | The triExternalFinally operation returns TRI_OK if the PA completes destruction of the external object successfully, TRI_Error otherwise. |
| | Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalFinally operation is considered to be blocking. That means that the operation shall not return before the destruction of the external object has been finished. External destructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation. |

Clause 5.6.3.6  triExternalMethod (TE → PA)

This clause is to be added:

| Signature | TriStatusType triExternalMethod(
| In Parameters | in TriObjHandleType handle, in String methodName, inout TriParameterListType parameterList, out TriParameterType returnValue) |
| Out Parameters | returnValue (optional) encoded return value |
| InOutParameters | parameterList a list of encoded parameters for the indicated method. The parameters in parameterList are ordered as they appear in the TTCN-3 method declaration. |
| Return Value | The return status of the triExternalMethod operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation. |
| Constraints | This operation is called by the TE when it invokes a method specified in a class which is defined as external in TTCN-3. |
| | In the invocation of a triExternalMethod operation by the TE all in and inout parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null. |
| Effect | The PA shall implement the behaviour for each method of all external classes specified in the TTCN-3 ATS. On invocation of this operation, the PA shall call a method methodName of an external object whose handle is in the handle parameter. It shall access the specified in and inout method parameters in parameterList, pass the values of these parameters to the called method, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out method parameters and the encoded return value. If no return type has been defined for this method in the TTCN-3 ATS, the distinct value null shall be used for the latter. |
| | The triExternalMethod operation returns TRI_OK if the PA completes the method of the external object successfully, TRI_Error otherwise. |
| | Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalMethod operation is considered to be blocking. That means that the operation shall not return before the method call has been finished. Methods of external classes have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation. |
Clause 5.6.3.7 triRaiseException (PA → TE)

This clause is to be added:

<table>
<thead>
<tr>
<th>Signature</th>
<th>void triExternalRaise(in TriExceptionType exc)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>exc</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation can be called by the PA only during execution of triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod.</td>
</tr>
<tr>
<td>Effect</td>
<td>The operation raises an exception that can be later processed by the TE in the catch statement. The exception is provided in an encoded form. The TE performs decoding when the triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod where the exception was raised returns. Decoding is performed in the catch statement.</td>
</tr>
</tbody>
</table>

6.3 Extensions to clause 6 of ETSI ES 201 873-5 Java™ language mapping

Clause 6.3.3.20 TriObjHandleType

This clause is to be added.

TriClassIdType is mapped to the following interface:

```
// TRI IDL TriClassIdType
package org.etsi.ttcn.tri;
public interface TriClassId {
    public String toString();
    public String getClassName();
    public boolean equals(TriClassId id);
}
```

Methods:

- `toString`
  Returns the string representation of the class as defined in TTCN-3 specification.

- `getClassName`
  Returns the class identifier as defined in the TTCN-3 specification.

- `equals`
  Compares `id` with this `TriClassId` for equality. Returns `true` if and only if both classes have the same class identifier, `false` otherwise.

Clause 6.3.3.20 TriObjHandleType

This clause is to be added.

TriObjHandleType is mapped to the `java.lang.Object` class.

Clause 6.3.3.21 TriObjHandleWrapper

This clause is to be added.

TriObjHandleWrapper is used in the `triExternalCreate` operation as a placeholder for the created object handle.

```
public interface TriObjHandleWrapper {
    public void setHandle(Object handle);
    public Object getHandle();
}
```
Methods:

- **setHandle**
  Sets the contained object.

- **getHandle**
  Gets the contained object.

Clause 6.5.3.1 TriPlatformPA

This clause is to be extended.

```java
package org.etsi.ttcn.tri;
public interface TriPlatformPA {
    // Ref: TRI-Definition 5.6.3.4
    public TriStatus triExternalCreate(TriClassIdType classId,
                                        TriParameterList parameterList,
                                        TriObjHandleWrapper handle);

    // Ref: TRI-Definition 5.6.3.5
    public TriStatus triExternalFinally(Object handle);

    // Ref: TRI-Definition 5.6.3.6
    public TriStatus triExternalMethod(Object handle, String methodName,
                                        TriParameterList parameterList,
                                        TriParameter returnValue);
}
```

Clause 6.5.3.2 TriPlatformTE

This clause is to be extended.

```java
package org.etsi.ttcn.tri;
public interface TriPlatformTE {
    // Ref: TRI-Definition 5.6.3.7
    public void triRaiseException(TriException exc);
}
```

### 6.4 Extensions to clause 7 of ETSI ES 201 873-5 ANSI C language mapping

#### Clause 7.2.1 Abstract type mapping

This clause is to be extended.

<table>
<thead>
<tr>
<th>TRI ADT</th>
<th>ANSI C Representation</th>
<th>Notes and comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TriClassIdType</td>
<td>QualifiedName</td>
<td></td>
</tr>
<tr>
<td>TriObjectHandleType</td>
<td>typedef void *</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TriObjectHandle;</td>
<td></td>
</tr>
</tbody>
</table>
Clause 7.2.4 TRI operation mapping

This clause is to be extended.

<table>
<thead>
<tr>
<th>IDL Representation</th>
<th>ANSI C Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TriStatusType triExternalCreate (in TriClassIdType classId, inout TriParameterListType parameterList, out TriObjHandleType createdObject)</td>
<td>TriStatus triExternalCreate (const TriClassId* classId, TriParameterList* parameterList, TriObjectHandle* handle)</td>
</tr>
<tr>
<td>TriStatusType triExternalFinally (in TriObjHandleType handle)</td>
<td>TriStatus triExternalFinally (TriObjectHandle handle)</td>
</tr>
<tr>
<td>TriStatusType triExternalMethod(in TriObjHandleType handle, in String methodName, inout TriParameterListType parameterList, out TriParameterType returnValue)</td>
<td>TriStatus triExternalFunction (TriClassId handle, char* methodName, TriParameterList* parameterList, TriParameter* returnValue)</td>
</tr>
<tr>
<td>Void triRaiseException (in TriExceptionType exc)</td>
<td>void triRaiseException (const TriException* exc)</td>
</tr>
</tbody>
</table>

6.5 Extensions to clause 8 of ETSI ES 201 873-5 C++ language mapping

Clause 8.5.19 TriClassId

This clause is to be added.

A value of type TriClassIdType represents the name of a class as specified in the TTCN-3 ATS. It is a derived class from QualifiedName, mapped to the following pure virtual class:

class TriClassId : public QualifiedName {
   public:
      virtual ~TriClassId () = 0;
      virtual Tboolean operator== (const TriClassId &sid) const =0;
      virtual TriClassId * cloneClassId () const =0;
      virtual Tboolean operator< (const TriClassId &sid) const =0;
   }

Methods:

- ~TriClassId
  Destructor.
- operator==
  Returns true if both TriClassId objects are equal.
- cloneClassId
  Returns a copy of the TriClassId.
- operator<
  Operator < overload.

Clause 8.5.20 TriObjectHandle

This clause is to be added.

A value of type TriObjectHandle type is mapped to a void pointer:

typedef void * TriObjectHandle;
Clause 8.6.3 TriPlatformPA

This clause is to be extended.

class TriPlatformPA {
    public:
        
        //For each constructor on an external class specified in the TTCN-3 ATS implement the behaviour.
        virtual TriStatus triExternalCreate (const TriClassId *classId, TriParameterList *parameterList, TriObjectHandle * handle)=0;

        //For each destructor on an external class specified in the TTCN-3 ATS implement the behaviour.
        virtual TriStatus triExternalCreate (TriObjectHandle handle)=0;

        //For each method on an external class specified in the TTCN-3 ATS implement the behaviour.
        virtual TriStatus triExternalMethod (TriObjectHandle handle, const Tstring & methodName, TriParameterList *parameterList, TriParameter *returnValue)=0;
    }

Clause 8.6.4 TriPlatformTE

This clause is to be extended.

class TriPlatformTE {
    public:
        
        //Raises an exception during execution of external code in PA
        virtual void triRaiseException (const TriException *exc)=0;
    }

6.6 Extensions to clause 9 of ETSI ES 201 873-5 C# language mapping

Clause 9.4.2.19 TriClassId

This clause is to be added.

TriClassIdType C# mapping is derived from the IQualifiedName interface:

public interface ITriClassId : IQualifiedName {}

Clause 9.4.2.20 TriObjectHandleType mapping

This clause is to be added.

TriObjectHandleIdType is mapped to the C# object class.

Clause 9.5.2.3 TriPlatformPA

This clause is to be extended.

public interface ITriPlatformPA {
    
    // Miscellaneous operations
    // Ref: TRI-Definition clause 5.6.3.4
    TriStatus triExternalCreate(ITriClassId classId, ITriParameterList parameterList, out object handle);

    // Ref: TRI-Definition clause 5.6.3.5
    TriStatus triExternalFinally(object handle);

    // Ref: TRI-Definition clause 5.6.3.6
    TriStatus triExternalMethod(object handle, string methodName, ITriParameterList parameterList, ITriParameter returnValue);
}
Clause 9.5.2.4 TriPlatformTE

This clause is to be extended.

```java
public interface ITriPlatformTE {
  // Ref: TRI Definition clause 5.6.3.7
  void TriRaiseException(ITriException exc);
}
```

7 TCI Extensions for the Package

7.1 Extensions to clause 7.2.2.1 of ETSI ES 201 873-6 Abstract TTCN-3 data types and values

The definition of the getTypeClass operation shall be modified of the following way:

```java
TciTypeClassType getTypeClass()  // Returns the type class of the respective type. A value of
TciTypeClassType can have one of the following constants:
ADDRESS, ANYTYPE, ARRAY, BITSTRING, BOOLEAN,
CHARSTRING, COMPONENT, ENUMERATED, FLOAT,
HEXSTRING, INTEGER, OCTETSTRING, RECORD,
RECORD_OF, SET, SET_OF, UNION,
UNIVERSAL_CHARSTRING, VERDICT, DEFAULT, PORT,
TIMER, CLASS.
```

7.2 Extensions to clause 7.2.2 of ETSI ES 201 873-6 Abstract TTCN-3 data types and values

Clause 7.2.2.5 Abstract TTCN-3 classes

This clause is to be added.

According to the present document, TTCN-3 user-defined classes will be represented at the TCI interfaces using the abstract data type `Class`. The abstract data type `Class` is based on the abstract data type `Type`.

The following operations defined for abstract data type `Type` work differently in the abstract data type `Class`:

```java
Value newInstance()  // The method creates an ObjectInstance containing a reference to a null
                    // object of the class.
```

The following operations are defined for abstract data type `Class`:

```java
ObjectInstance create(TriComponentIdType c, TciParameterListType tciPars)  // Calls the constructor to create a new instance of this class using
                                                                        // the supplied parameters for the specified component. Created objects
                                                                        // are always considered to be initialized.
ClassSeq getSuperclasses ()  // Returns the superclasses of the current class.
TStringSeq getFieldNames ()  // Returns the names of all public fields defined in the class.
TStringSeq getMethodNames ()  // Returns the names of all public methods of the class.
```
TciParameterTypeListType getConstructorParameters ()
Returns formal parameters of the class constructor.

TciParameterTypeListType getMethodParameters (TString methodName)
Returns formal parameters of the specified public method. The distinct value null is returned if the method does not exist or is not public.

Type getFieldType (TString name)
Returns the type of the specified public field. The distinct value null is returned if the member variable does not exist or is not public.

Type getMethodReturnType (TString name)
Returns the return type of specified public method or the distinct value null if no return value is defined, the method does not exist or it is not public.

Clause 7.2.2.6 ClassSeq
This clause is to be added.

The abstract data type ClassSeq is used to represent a list of classes.
7.3 Extensions to clause 7.2.2.2.0 of ETSI ES 201 873-6 Basic rules

The figure 4 is to be extended:

![Diagram of abstract values hierarchy]

Figure 1: Hierarchy of abstract values

7.4 Extensions to clause 7.2.2.2 of ETSI ES 201 873-6 Abstract TTCN-3 values

Clause 7.2.2.16 The abstract data type ObjectInstance

This clause is to be added.

The abstract data type ObjectInstance is based on the abstract data type Value. It is used to modify the referenced object and to access public object fields and methods.
The following operations are defined on the abstract data type ObjectInstance:

- **TriComponentIdType getOwner ()**
  Returns the component that owns the object instance.

- **TString getId ()**
  Returns an identifier of the object which is unique within the owner component context.

- **void setObject (ObjectInstance source)**
  The operation sets the referenced object to be the same one as the one referenced by the `source` parameter. In case the source object does not contain a null reference, the object instance and the source object shall be owned by the same component.

- **Value getField (TString fieldName)**
  Returns the value of the referenced public member field. The distinct value `null` is returned if the object does not contain the referenced field or the field is not accessible.

- **Value callMethod(TString methodName, TciParameterListType tciPars)**
  Calls the method of the object instance. The distinct value `null` is returned if the method does not return any value. A runtime error is generated if the method does not exist or if the given parameters do not conform to the formal parameters of the declared method.

### 7.5 Extensions to clause 7.3.4.1 of ETSI ES 201 873-6 Abstract TCI-TL provided

**Clause 7.3.4.1.122 tliObjCreateEnter**

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjCreateEnter(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, in ObjectInstance obj, in TciParameterListType tciPars)</th>
</tr>
</thead>
</table>
| **In Parameters** | An additional message.  
| | The time when the event is produced.  
| | The source file of the test specification.  
| | The line number where the request is performed.  
| | The component which produces this event.  
| | The object being created.  
| | The parameters of the constructor. |
| **Return Value** | Void |
| **Constraint** | Shall be called by TE to log the entering of a constructor of an object. This event occurs after the constructor has been entered. |
| **Effect** | The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document. |

**Clause 7.3.4.1.123 tliObjCreateLeave**

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjCreateLeave(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, in ObjectInstance obj, in TciParameterListType tciPars)</th>
</tr>
</thead>
</table>
| **In Parameters** | An additional message.  
| | The time when the event is produced.  
| | The source file of the test specification.  
| | The line number where the request is performed.  
| | The component which produces this event.  
| | The created object instance.  
| | The parameters of the constructor. |
| **Return Value** | Void |
| **Constraint** | Shall be called by TE to log the leaving of an object constructor. This event occurs after the constructor has been left. |
Effect
The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.

Clause 7.3.4.1.124  tliObjFinallyEnter
This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjFinallyEnter(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, in ObjectInstance obj)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td><strong>am</strong></td>
</tr>
<tr>
<td></td>
<td><strong>ts</strong></td>
</tr>
<tr>
<td></td>
<td><strong>src</strong></td>
</tr>
<tr>
<td></td>
<td><strong>line</strong></td>
</tr>
<tr>
<td></td>
<td><strong>c</strong></td>
</tr>
<tr>
<td></td>
<td><strong>obj</strong></td>
</tr>
<tr>
<td>Return Value</td>
<td>Void</td>
</tr>
<tr>
<td>Constraint</td>
<td>Shall be called by TE to log the entering of a destructor of an object. This event occurs after the destructor has been entered.</td>
</tr>
<tr>
<td>Effect</td>
<td>The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.</td>
</tr>
</tbody>
</table>

Clause 7.3.4.1.125  tliObjFinallyLeave
This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjCreateLeave(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, in ObjectInstance obj, in TciParameterListType tciPars)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td><strong>am</strong></td>
</tr>
<tr>
<td></td>
<td><strong>ts</strong></td>

<td><strong>line</strong></td>
</tr>
<tr>
<td></td>
<td><strong>c</strong></td>
</tr>
<tr>
<td></td>
<td><strong>obj</strong></td>
</tr>
<tr>
<td>Return Value</td>
<td>Void</td>
</tr>
<tr>
<td>Constraint</td>
<td>Shall be called by TE to log the leaving of an object destructor. This event occurs after the destructor has been left. Accessing any members, properties and methods of a destroyed object with exception of methods used for comparison shall cause an error.</td>
</tr>
<tr>
<td>Effect</td>
<td>The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.</td>
</tr>
</tbody>
</table>

Clause 7.3.4.1.126  tliObjMethodEnter
This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjMethodEnter(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, in ObjectInstance obj, in TString methodName, in TciParameterListType tciPars)</th>

<tr>
<td>Constraint</td>
<td>Shall be called by TE to log the modification of the value of a field of an object. This event occurs after the field value has been changed. In case of @lazy fields, it is called also after performing evaluation as the evaluation result is automatically assigned to the field.</td>
</tr>
<tr>
<td>Effect</td>
<td>The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.</td>
</tr>
</tbody>
</table>

7.6 Extensions to clause 8 of ETSI ES 201 873-6 Java™ language mapping

Clause 8.3.2.4  TciTypeClassType

This clause is to be extended.

TciTypeClassType is mapped to the following interface:

```java
// TCI IDL TciTypeClassType
goTtcn.tcii;
public interface TciTypeClass {
    public final static int ADDRESS = 0;
    public final static int ANYTYPE = 1;
    public final static int BITSTRING = 2;
    public final static int BOOLEAN = 3;
    public final static int CHARSTRING = 5;
    public final static int COMPONENT = 6;
    public final static int ENUMERATED = 7;
    public final static int FLOAT = 8;
}```
Clause 8.3.6.7  Abstract class mapping

This clause is to be added.

Class  is mapped to the following interface:

```java
// TCI IDL Type
package org.etsi.ttcn.tci;
public interface Class extends Type {
    public ObjectInstance create (TriComponentId c, TciParameterList tciPars);
    public Class[]  getSuperclasses ();
    public String[]  getFieldNames ();
    public String[]  getMethodNames ();
    public TciParameterTypeList getConstructorParmeters ();
    public TciParameterTypeList getMethodParameters (String methodName);
    public Type   getFieldType (String name);
    public Type   getMethodReturnType (String methodName);
}
```

Methods:

- **create**  
  Calls the constructor to create a new instance of this class using the supplied parameters for the specified component.

- **getSuperclasses**  
  Returns the list of superclasses of this class.

- **getFieldNames**  
  Returns the names of all public fields defined in the class.

- **getMethodNames**  
  Returns the names of all public methods of the class.

- **getConstructorParmeters**  
  Returns the formal parameters of the class constructor.

- **getMethodParameters**  
  Returns the formal parameters of the specified public method.

- **getFieldType**  
  Returns the type of the specified public field.

- **getMethodReturnType**  
  Returns the return type of specified public method or the distinct value null if no return type is declared.

Clause 8.3.6.8  ClassSeq

This clause is to be added.

ClassSeq  abstract data type mapped to an array of TciClass.

Clause 8.3.4.16  ObjectInstance

This clause is to be added.

ObjectInstance  is mapped to the following interface:

```java
// TCI IDL DynamicMatch
package org.etsi.ttcn.tci;
public interface ObjectInstance extends Value {
    public TriComponentId getOwner ();
}
public TString getId ();
public void setObject (ObjectInstance source);
public Value callMethod (String methodName, TciParameterList tciPars);
}

Methods:
- getOwner
  Returns the component that owns the object instance.
- getId
  Returns the unique identifier of the object instance.
- setObject
  The operation sets the referenced object to the same reference as the given object.
- getField
  Gets the value of the referenced public field.
- callMethod
  Calls a method of the object instance.

Clause 8.5.4.1 TCI-TL provided

The TciTLProvided interface is to be extended:

```java
package org.etsi.ttcn.tci;
public interface TciTLProvided {
    ...
    public void tliObjCreateEnter(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj, TciParameterList tciPars);
    public void tliObjCreateLeave(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj, TciParameterList tciPars);
    public void tliObjFinallyEnter(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj);
    public void tliObjFinallyLeave(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj);
    public void tliObjMethodEnter(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj, String methodName, TciParameterList tciPars);
    public void tliObjMethodLeave(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj, String methodName, TciParameterList tciPars, Value returnValue);
    public void tliObjVar(String am, int ts, String src, int line, TriComponentId c, ObjectInstance obj, String name, Value value);
}
```

7.7 Extensions to clause 9 of ETSI ES 201 873-6 ANSI C language mapping

Clause 9.2 Data

The table 5 is to be extended.

#### Clause 9.4.4.1  TCI-TL provided

The clause is to be extended.

```c
void tliObjCreateEnter
    (String am, int ts, String src, int line, TriComponentId c, Value obj,
     TciParameterListType tciPars);
void tliObjCreateLeave
    (String am, int ts, String src, int line, TriComponentId c, Value obj,
     TciParameterListType tciPars);
void tliObjFinallyEnter
    (String am, int ts, String src, int line, TriComponentId c, Value obj);
void tliObjFinallyLeave
    (String am, int ts, String src, int line, TriComponentId c, Value obj);
void tliObjMethodEnter
    (String am, int ts, String src, int line, TriComponentId c, Value obj, String methodName,
     TciParameterListType tciPars);
void tliObjMethodLeave
    (String am, int ts, String src, int line, TriComponentId c, Value obj, String methodName,
     TciParameterListType tciPars, Value returnValue);
void tliObjVar
    (String am, int ts, String src, int line, TriComponentId c, Value obj, String name,
     Value value);
```

#### Clause 9.5  Data

The definition of the TciTypeClassType in the table 7 is to be modified.

```c
typedef enum {
    TCI_ADDRESS_TYPE = 0,
    TCI_ANYTYPE_TYPE = 1,
    TCI_BITSTRING_TYPE = 2,
    TCI_BOOLEAN_TYPE = 3,
    TCI_CHARSTRING_TYPE = 5,
    TCI_COMPONENT_TYPE = 6,
    TCI_ENUMERATED_TYPE = 7,
    TCI_FLOAT_TYPE = 8,
    TCI_HEXSTRING_TYPE = 9,
    TCI_INTEGER_TYPE = 10,
    TCI_OCTETSTRING_TYPE = 12,
    TCI_RECORD_TYPE = 13,
    TCI_RECORD_OF_TYPE = 14,
    TCI_ARRAY_TYPE = 15,
    TCI_SET_TYPE = 16,
    TCI_SET_OF_TYPE = 17,
    TCI_UNION_TYPE = 18,
    TCI_UNIVERSAL_CHARSTRING_TYPE = 20,
    TCI_VERDICT_TYPE = 21
} TciTypeClassType;
```
7.8 Extensions to clause 10 of ETSI ES 201 873-6 C++ language mapping

Clause 10.5.2.14 TciTypeClass

This clause is to be extended.

typedef enum
{
    TCI_ADDRESS = 0,
    TCI_ANYTYPE = 1,
    TCI_BITSTRING = 2,
    TCI_BOOLEAN = 3,
    TCI_CHARSTRING = 5,
    TCI_COMPONENT = 6,
    TCI_ENUMERATED = 7,
    TCI_FLOAT = 8,
    TCI_HEXSTRING = 9,
    TCI_INTEGER = 10,
    TCI_OCTETSTRING = 12,
    TCI_RECORD = 13,
    TCI_RECORD_OF = 14,
    TCI_ARRAY = 15,
    TCI_SET = 16,
    TCI_SET_OF = 17,
    TCI_UNION = 18,
    TCI_UNIVERSAL_CHARSTRING = 20,
    TCI_VERDICT = 21,
    TCI_DEFAULT = 22,
    TCI_PORT = 23,
    TCI_TIMER = 24,
    TCI_CLASS = 25
} TciTypeClass;

Clause 10.5.3.23 Class

This clause is to be added.

TTCN-3 class support. It is mapped to the following pure virtual class:

class TciClass : public virtual TciType {
public:
    virtual ~TciClass () =0;
    virtual ObjectInstance * create(const TriComponentId & c, TciParameterList & tciPars) =0;
    virtual const std::vector<TciClass*> & getSuperclasses () const =0;
    virtual const std::vector<Tstring*> & getFieldNames () const =0;
    virtual const std::vector<Tstring*> & getMethodNames () const =0;
    virtual const TciParameterTypeList & getConstructorParmeters () const =0;
    virtual const TciParameterTypeList & getMethodParameters (Tstring methodName) const =0;
    virtual const TciType & getMemberType (const Tstring & name) const =0;
    virtual const TciType & getMethodReturnValue (const Tstring & name) const =0;
    virtual Tboolean operator== (const TciClass &p_class) const =0;
    virtual TciClass * clone () const =0;
    virtual Tboolean operator< (const TciClass &p_content) const =0;
};

Methods:

~TciClass
   Destructor
create
   Calls the constructor to create a new instance of this class using the supplied parameters for the specified component
getSuperclasses
   Returns the superclasses of the current class
getFieldNames
   Returns the names of all public fields defined in the class
getConstructorParameters
   Returns the names of all public methods of the class
getConstructorParameters
getMethodParameters
   Returns formal parameters of the specified public method
getFieldType
   Returns the type of the specified public field
getMethodReturnValue
   Returns the return type of specified public method or the distinct value null if no return value is defined
operator==
   Returns true if both objects are equal
clone
   Return a copy of the matching mechanism
operator<
   Operator < overload

Clause 10.5.3.24 ObjectInstance

This clause is to be added.

TTCN-3 implication and exclusion matching mechanism support. It is mapped to the following pure virtual class:

class ObjectInstance : public virtual TciValue {
   public:
      virtual ~ObjectInstance () =0;
      virtual const TriComponentId & getOwner () const =0;
      virtual const TString getID () const =0;
      virtual void setObject (ObjectInstance & val) =0;
      virtual TciValue * getField (const TString & fieldName) =0;
      virtual Value callMethod(const TString & methodName, TciParameterList & tciPars) =0;
      virtual Tboolean operator== (const ObjectInstance &p_obj) const =0;
      virtual ObjectInstance * clone () const =0;
      virtual Tboolean operator< (const ObjectInstance &p_content) const =0;
   }

Methods:
~ObjectInstance
   Destructor
getOwner
   Returns the component that owns the object instance
getId
   Returns the unique identifier of the object instance
setObject
   The operation sets the referenced object
getField
   Returns the value of the referenced public field
callMethod
   Calls a method of the object instance
operator==
   Returns true if both objects are equal
clone
   Return a copy of the matching mechanism
operator<
   Operator < overload

Clause 10.5.3.25 ClassSeq

This clause is to be added.

The ClassSeq abstract data type is mapped to std::vector<TciClass*>.

Clause 10.6.4.1 TciTLProvided

This clause is to be extended.

//Called by TE to log the entering of a constructor
virtual void tliObjCreateEnter (const TString &am, const timeval ts, const TString &src, const
Tinteger line, const TriComponentId *c, const ObjectInstance *obj, const TciParameterList
*tciPars)=0;

//Called by TE to log the leaving of a constructor
virtual void tliObjCreateLeave (const TString &am, const timeval ts, const TString &src, const
Tinteger line, const TriComponentId *c, const ObjectInstance *obj, const TciParameterList
*tciPars)=0;
7.9 Extensions to clause 11 of ETSI ES 201 873-6 W3C XML mapping

Clause 11.3.3.30 ObjectInstance

ObjectInstance type is mapped to the complex type specified below. The content of the XML elements based on the ObjectInstance type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1 of ETSI ES 201 873-6):

```xml
<xsd:complexType name="ObjectInstance">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

Items:

- **BaseValue**
  Object instance content described in clause 11.3.3.1 of ETSI ES 2001-873-6

- **ValueAtts**
  Value attributes described in clause 11.3.3.1 of ETSI ES 2001-873-6

Clause 11.4.2.1 TCI-TL provided

This clause is to be extended.
7.10 Extensions to clause 12 of ETSI ES 201 873-6 C# language mapping

Clause 12.4.2.4 TciTypeClassType

This clause is to be extended.

TciTypeClassType is mapped to the following enumeration:

```csharp
public enum TciTypeClass {
    Address = 0,
    Anytype = 1,
    Bitstring = 2,
    BooleanType = 3,
    Charstring = 5,
    Component = 6,
    Enumerated = 7,
    Float = 8,
    Hexstring = 9,
}
IntegerType = 10, Octetstring = 12, Record = 13, RecordOf = 14, Array = 15, Set = 16, SetOf = 17, Union = 18, UniversalCharstring = 20, Verdict = 21, Default = 22, Port = 23, Timer = 24, Class = 25

Clause 12.4.7 Abstract class mapping

This clause is to be added.

The IDL type Class is mapped to the following interface:

```java
// TCI IDL Type
package org.etsi.ttcn.tci;
public interface ITciClass : ITciType {
    ITciObjectInstance Create (ITriComponentId c, ITciParameterList tciPars);
    ITciClass[] Superclasses { get; }
    String[] FieldNames { get; }
    String[] MethodNames { get; }
    ITciParameterTypeList ConstructorParmeters { get; }
    ITciParameterTypeList GetMethodParameters (String methodName);
    ITciType GetFieldType (String name);
    ITciType GetMethodReturnType (String methodName);
}
```

Methods:

- **Create**
  Calls the constructor to create a new instance of this class using the supplied parameters for the specified component.

- **Superclasses**
  Returns the list of superclass of the current.

- **FieldNames**
  Returns the names of all public fields defined in the class.

- **MethodNames**
  Returns the names of all public methods of the class.

- **ConstructorParmeters**
  Returns formal parameters of the class constructor.

- **GetMethodParameters**
  Returns formal parameters of the specified public method.

- **GetField**
  Returns the type of the specified public field.

- **GetMethodReturnType**
  Returns the return type of specified public method or the distinct value null if no return value is defined.

Clause 12.4.8 ClassSeq mapping

This clause is to be added.

The ClassSeq abstract data type is mapped to ITciClass[].

Clause 12.4.4.16 ObjectInstance

This clause is to be added.

The IDL type ObjectInstance is mapped to the following interface:

```java
public interface ITciObjectInstance : ITciValue {
    ITciComponentId Owner { get; }
    String Id { get; }
    void SetObject (ITciObjectInstance source);
    ITciValue GetField (String fieldName);
```
ITciValue CallMethod (String methodName, ITciParameterList tciPars);
}

Methods:

• Owner Returns the component that owns the object instance.
• Id Returns the unique identifier of the object instance.
• SetObject The operation sets the referenced object.
• GetField Returns the value of the referenced public field.
• CallMethod Calls a method of the object instance.

Clause 12.5.4.1 TCI-TL provided

The ITciTLProvided interface is to be extended:

public interface ITciTLProvided {
    ...
    void TliObjCreateEnter(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj, ITciParameterList tciPars);
    void TliObjCreateLeave(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj, ITciParameterList tciPars);
    void TliObjFinallyEnter(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj);
    void TliObjFinallyLeave(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj);
    void TliObjMethodEnter(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj, string methodName, ITciParameterList tciPars);
    void TliObjMethodLeave(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj, string methodName, ITciParameterList tciPars,
        ITciValue returnValue);
    void TliObjVar (string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciObjectInstance obj, string name, ITciValue value);
}

8 XTRI Extensions for the Package (optional)

8.1 Changes to clause 5.6.3 of ETSI ES 201 873-5

Miscellaneous operations

Clause 5.6.3.4 triExternalCreate → xtriExternalCreate

<table>
<thead>
<tr>
<th>Signature</th>
<th>TriStatusType xtriExternalCreate(</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>in TriClassIdType classId,</td>
</tr>
<tr>
<td></td>
<td>inout TciParameterListType parameterList,</td>
</tr>
<tr>
<td></td>
<td>out TriObjHandleType createdObject)</td>
</tr>
<tr>
<td>In Parameters</td>
<td>classId identifier of the external class</td>
</tr>
<tr>
<td>Out Parameters</td>
<td>createdObject handle to the created object</td>
</tr>
<tr>
<td>InOutParameters</td>
<td>parameterList a list of encoded parameters for the indicated constructor. The parameters in parameterList are ordered as they appear in the TTCN-3 constructor declaration.</td>
</tr>
<tr>
<td>Return Value</td>
<td>The return status of the xtriExternalCreate operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation.</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation is called by the TE when it invokes a constructor specified in a class which is defined as external in TTCN-3. In the invocation of a triExternalCreate operation by the TE all in and inout constructor parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null.</td>
</tr>
</tbody>
</table>
Effect

The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS. On invocation of this operation, the PA shall invoke the constructor of a class indicated by the identifier classId. It shall access the specified in and inout constructor parameters in parameterList, create a new external object instance using the values of these parameters, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out constructor parameters and a handle to the created external object.

The xtriExternalCreate operation returns TRI_OK if the PA completes the constructor of the external class successfully, TRI_Error otherwise. In the latter case, the distinct value null shall be returned as the object handle.

Note that whereas most of other TRI operations are considered to be non-blocking, the xtriExternalCreate operation is considered to be blocking. That means that the operation shall not return before the construction of the external object has been finished. External constructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.

Clause 5.6.3.6 triExternalMethod → xtriExternalMethod

<table>
<thead>
<tr>
<th>Signature</th>
<th>TriStatusType xtriExternalMethod(in TriObjHandleType handle, in String methodName, inout TciParameterListType parameterList, out TciParameterType returnValue)</th>
</tr>
</thead>
</table>
| In Parameters      | handle | handle of the affected object; null for static methods  
methodName | name of the called method   
| Out Parameters     | returnValue | (optional) encoded return value   
| InOutParameters    | parameterList | a list of encoded parameters for the indicated method. The parameters in parameterList are ordered as they appear in the TTCN-3 method declaration.   
| Return Value       | The return status of the xtriExternalMethod operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation.   
| Constraints        | This operation is called by the TE when it invokes a method specified in a class which is defined as external in TTCN-3. In the invocation of a xtriExternalMethod operation by the TE all in and inout parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null. |

Effect

The PA shall implement the behaviour for each method of all external classes specified in the TTCN-3 ATS. On invocation of this operation, the PA shall call a method methodName of an external object whose handle is in the handle parameter. It shall access the specified in and inout method parameters in parameterList, pass the values of these parameters to the called method, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out method parameters and the encoded return value. If no return type has been defined for this method in the TTCN-3 ATS, the distinct value null shall be used for the latter.

The xtriExternalMethod operation returns TRI_OK if the PA completes the method of the external object successfully, TRI_Error otherwise.

Note that whereas most of other TRI operations are considered to be non-blocking, the xtriExternalMethod operation is considered to be blocking. That means that the operation shall not return before the method call has been finished. Methods of external classes have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.

Clause 5.6.3.7 triRaiseException → xtriRaiseException

<table>
<thead>
<tr>
<th>Signature</th>
<th>void xtriRaiseException(in Value exc)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>exc</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation can be called by the PA during execution of triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod.</td>
</tr>
</tbody>
</table>

Effect

The operation raises an exception that can be later processed by the TE in the catch statement. The exception is provided in an encoded form. Decoding is performed in the catch statement.
8.2 Extensions to clause 6 of ETSI ES 201 873-5 Java™ language mapping

Clause 6.5.3.1 Changes to TriPlatformPA

This clause is to be extended.

```java
// TriPlatform
// TE -> PA
package org.etsi.ttcn.tri;
public interface xTriPlatformPA {

    // Ref: TRI-Definition 5.6.3.4
    public TriStatus triExternalCreate(TriClassIdType classId,
                                       TciParameterList parameterList,
                                       TriObjHandleWrapper handle);

    // Ref: TRI-Definition 5.6.3.6
    public TriStatus xtriExternalMethod(Object handle, String methodName,
                                         TciParameterList parameterList,
                                         TciParameter returnValue);
}
```

Clause 6.5.3.1 Changes to TriPlatformPA

This clause is to be extended.

```java
// TriPlatform
// PA -> TE
package org.etsi.ttcn.tri;
public interface xTriPlatformTE {

    // Ref: TRI-Definition 5.6.3.7
    public void triRaiseException(Value exc);
}
```

8.3 Extensions to clause 7 of ETSI ES 201 873-5 ANSI C language mapping

Clause 7.2.4 TRI operation mapping

This clause is to be extended.

<table>
<thead>
<tr>
<th>IDL Representation</th>
<th>ANSI C Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TriStatusType xtriExternalCreate (in TriClassIdType classId, inout TciParameterListType parameterList, out TriObjHandleType createdObject)</td>
<td>TriStatus xtriExternalCreate (const TriClassId* classId, TciParameterList* parameterList, TriObjectHandle* handle)</td>
</tr>
<tr>
<td>TriStatusType xtriExternalMethod(in TriObjHandleType handle, in String methodName, inout TciParameterListType parameterList, out TciParameterType returnValue)</td>
<td>TriStatus xtriExternalFunction (TriClassId handle, char* methodName, TciParameterList* parameterList, TciParameter* returnValue)</td>
</tr>
<tr>
<td>void xtriRaiseException(in Value exc)</td>
<td>void xtriRaiseException(const Value* exc)</td>
</tr>
</tbody>
</table>
8.4 Extensions to clause 8 of ETSI ES 201 873-5 C++ language mapping

Clause 8.6.3 TriPlatformPA

This clause is to be extended.

```cpp
class xTriPlatformPA {
public:
    ...
    // For each constructor on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus xtriExternalCreate (const TriClassId *classId, TciParameterList *parameterList, TriObjectHandle * handle)=0;
    // For each method on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus xtriExternalMethod (TriObjectHandle handle, const Tstring & methodName, TciParameterList *parameterList, TciParameter *returnValue)=0;
};
```

Clause 8.6.4 TriPlatformTE

This clause is to be extended.

```cpp
class xTriPlatformTE {
public:
    ...
    // Raises an exception during execution of external code in PA.
    virtual void xtriRaiseException (const TciValue *exc)=0;
};
```

8.5 Extensions to clause 9 of ETSI ES 201 873-5 C# language mapping

Clause 9.5.2.3 TriPlatformPA

This clause is to be extended.

```csharp
public interface IXTriPlatformPA {
    ...
    // Miscellaneous operations
    // Ref: TRI-Definition clause 5.6.3.4
    TriStatus XTriExternalCreate(ITriClassId classId, IITciParameterList parameterList, out object handle);
    // Ref: TRI-Definition clause 5.6.3.6
    TriStatus XTriExternalMethod(object handle, string methodName, IITciParameterList parameterList, IITciParameter returnValue);
};
```

Clause 9.5.2.4 TriPlatformTE

This clause is to be extended.

```csharp
public interface IXTriPlatformTE {
    ...
    // Ref: TRI Definition clause 5.6.3.7
    void XTriRaiseException(ITciValue exc);
};
```
Annex A (normative):  
BNF and static semantics

### A.1 Extensions to TTCN-3 terminals

The list of reserved terminals which are keywords in table A.3 in ETSI ES 201 873-1 [1] needs to be extended with `class`, `finally`, `object`, and `this`. The extension of table A.3 in ETSI ES 201 873-1, clause A.1.5.0 is shown below.

| action  | activate | address | alive | all   | alt   | altstep | and   | and4b  | any   | anytype | bitstring | boolean | break | case | catch | char   | charstring | check | class | clear | complement | component | connect | const | continue | control | create | deactivate | decmatch | default | disconnect | display | do | done | else | encode | enumerated | error | except | exception | execute | extends | extension | external |
|---------|----------|---------|-------|-------|-------|---------|-------|--------|-------|---------|-----------|---------|-------|------|-------|-------|---------|--------|-------|-------|----------|---------|--------|--------|-------|--------|----------|-------|--------|-----------|---------|--------|----------|---------|
A.2 Modified TTCN-3 syntax BNF productions

This clause includes all BNF productions that are modifications of BNF rules defined in the TTCN-3 core language document ETSI ES 201 873-1 [1]. When using this package the BNF rules below replace the corresponding BNF rules in the TTCN-3 core language document. The rule numbers define the correspondence of BNF rules.

BNF changes in clause A.1.6.1.1 Type definitions

12. StructuredTypeDef ::= RecordDef | UnionDef | SetDef | RecordOfDef | SetOfDef | EnumDef | PortDef | ComponentDef | ClassDef

BNF changes in clause A.1.6.1.4 Function definitions

158. FunctionDef ::= FunctionKeyword [ DeterministicModifier ] Identifier "(" [ FunctionFormalParList ] ")" [ RunsOnSpec ] [ MtcSpec ] [ SystemSpec ] [ ReturnType ] [ ExceptionSpec ] StatementBlock

169. StatementBlock ::= BasicStatementBlock [ CatchBlocks ] [ FinallyBlock ]

176. FunctionRef ::= ( Identifier | ObjectInstance ) Dot ( Identifier | PreDefFunctionIdentifier )

BNF changes in clause A.1.6.1.6 Testcase definitions

185. TestcaseDef ::= TestcaseKeyword Identifier "(" [ TemplateOrValueFormalParList ] ")" ConfigSpec StatementBlock

BNF changes in clause A.1.6.1.7 Altstep definitions

192. AltstepDef ::= AltstepKeyword Identifier "(" [ FunctionFormalParList ] ")" [ RunsOnSpec ] [ MtcSpec ] [ SystemSpec ] [ ExceptionSpec ] "{" AltstepLocalDefList AltGuardList "}" [ CatchBlocks ] [ FinallyBlock ]

BNF changes in clause A.1.6.1.10 External function definitions

235. ExtFunctionDef ::= ExtKeyword FunctionKeyword [ DeterministicModifier ] Identifier "(" [ FunctionFormalParList ] ")" [ ReturnType ] [ ExceptionSpec ]

BNF changes in clause A.1.6.4.1 Component Operations

BNF changes in clause A.1.6.8.2 Behaviour statements

BNF changes in A.1.6.8.3 Basic statements

548. RelOp ::= "<" | ">" | ">=" | "<=" | OfKeyword

A.3 Additional TTCN-3 syntax BNF productions

This clause includes all additional BNF productions that needed to define the syntax introduced by this package. All rules start with the digits '0330'.

Additional BNF rules related to clause A.1.6.1.1 Type definitions

033001. ClassDef ::= [ ExtKeyword ] ClassKeyword [ FinalModifier | AbstractModifier ] Identifier [ ExtendsKeyword Type ] [ RunsOnSpec ] [ MtcSpec ] [ SystemSpec ] 
"{" ClassMemberList "}"

033002. ClassKeyword ::= "class"
033003. ThisOp ::= "this"
033004. SuperOp ::= "super"
033005. FinalModifier ::= "@final"
033006. AbstractModifier ::= "@abstract"
033007. FinallyKeyword ::= "finally"
033008. ObjectType ::= "object"
033009. ClassMemberList ::= [ ClassMember [ WithStatement ] [ SemiColon ] ]
033010. ClassMember ::= [ MemberVisibility ] 
  ( VarInstance | TimerInstance | ConstDef | TemplateDef | ClassFunctionDef | ConstructorDef )
033011. MemberVisibility ::= "public" | "private"
033012. ClassFunctionDef ::= [ ExtKeyword ] FunctionKeyword [ FinalModifier | AbstractModifier | DeterministicModifier ] Identifier 
"(" [ FunctionFormalParList ] ")" [ ReturnType ] 
  [ StatementBlock ]
033013. ConstructorDef ::= CreateKeyword 
"(" [ FunctionFormalParList ] ")" [ ":=" FunctionInstance ] 
  [ StatementBlock ]

Additional BNF rules related to clause A.1.6.1.4 Function definitions

033014. BasicStatementBlock ::= "{" [ FunctionDefList ] [ FunctionStatementList ] "}"
033015. CatchBlocks ::= CatchBlock { CatchBlock }
033016. CatchBlock ::= CatchOpKeyword "(" Type Identifier ")" BasicStatementBlock
033017. FinallyBlock ::= FinallyKeyword BasicStatementBlock
033018. ObjectInstance ::= ( ExtendedIdentifier | FunctionInstance ) [ ExtendedFieldReference ]

Additional BNF rules related to clause A.1.6.8.2 Behaviour statements

033019. RaiseExceptionStatement ::= RaiseKeyword TemplateInstance
/* STATIC SEMANTICS - The TemplateInstance shall evaluate to an explicit value. */
