Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

**DECT™**, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™** and **LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

The use of underline (additional text) and strike through (deleted text) highlights the differences between base document and extended documents.

The present document relates to the multi-part standard ETSI ES 201 873 covering the Testing and Test Control Notation version 3, as identified in ETSI ES 201 873-1 [1].

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the **ETSI Drafting Rules** (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.
1 Scope

The present document defines the support for object-oriented features in TTCN-3. TTCN-3 can be used for the specification of all types of reactive system tests over a variety of communication ports. Typical areas of application are protocol testing (including mobile and Internet protocols), service testing (including supplementary services), module testing, testing of OMG CORBA based platforms, APIs, etc. TTCN-3 is not restricted to conformance testing and can be used for many other kinds of testing including interoperability, robustness, regression, system and integration testing. The specification of test suites for physical layer protocols is outside the scope of the present document.

TTCN-3 packages are intended to define additional TTCN-3 concepts, which are not mandatory as concepts in the TTCN-3 core language, but which are optional as part of a package which is suited for dedicated applications and/or usages of TTCN-3.

While the design of TTCN-3 package has taken into account the consistency of a combined usage of the core language with a number of packages, the concrete usages of and guidelines for this package in combination with other packages is outside the scope of the present document.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference/.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

[i.1] ETSI ES 201 873-7: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 7: Using ASN.1 with TTCN-3".
3 Definition of terms, symbols and abbreviations

3.1 Terms
For the purposes of the present document, the terms given in ETSI ES 201 873-1 [1], ETSI ES 201 873-4 [2], ETSI ES 201 873-5 [3] and ETSI ES 201 873-6 [4] apply.

3.2 Symbols
Void.

3.3 Abbreviations

4 Package conformance and compatibility
The package presented in the present document is identified by the package tag:

*TTCN-3:2018 Object-Oriented features* - to be used with modules complying with the present document.

For an implementation claiming to conform to this package version, all features specified in the present document shall be implemented consistently with the requirements given in the present document and in ETSI ES 201 873-1 [1] and ETSI ES 201 873-4 [2].

The package presented in the present document is compatible to:

- ETSI ES 201 873-1 [1], version 4.10.1;
- ETSI ES 201 873-4 [2], version 4.6.1;
- ETSI ES 201 873-5 [3], version 4.8.1;
- ETSI ES 201 873-6 [4], version 4.9.1;
- ETSI ES 201 873-7 [i.1];
- ETSI ES 201 873-8 [i.2];
- ETSI ES 201 873-9 [i.3];
- ETSI ES 201 873-10 [i.4].

If later versions of those parts are available and should be used instead, the compatibility to the package presented in the present document has to be checked individually.
5 Package Concepts for the Core Language

5.0 General

This package defines object-oriented features for TTCN-3, i.e. it extends the TTCN-3 core language (ETSI ES 201 873-1 [1]) with well-known concepts from object-oriented programming and modelling languages. This package realizes the following concepts:

- classes (i.e. class definition, scope rules, abstract and external classes, refinement, constructors, destructors, methods, visibility, and built-in classes);
- objects (i.e. ownership, object references, select class-statement, dynamic class discrimination and casting); and
- exception handling (i.e. ability to define exception handling for functions, external functions, altsteps and test cases).

5.1 Classes and Objects

5.1.0 General

This clause introduces the concepts of class types and their values, called objects as well as the operations allowed to be applied to these objects.

5.1.1 Classes

5.1.1.0 General

Syntactical Structure

```
[public | private] type [external] class [ @final | @abstract | @trait ]
Identifier [ extends ClassType [ "", Identifier ]]
[ runsOnSpec ] [ systemSpec ] [ mtcSpec ]
"[" [ ClassMember ] "]"
[ finally StatementBlock ]
```

Semantic Description

A class is a type where the values are called objects. A class can declare fields (variables, constants, templates, timers, classes), methods and properties as its members. Each member name inside the class shall be unique, there is no overloading. The private and protected fields and methods are only accessible by the methods of the class, while the public members of the class can be accessed also from behaviour not defined in the class. The private members of the class can be accessed directly only by members of the class itself. All members which are neither private nor public are protected and can also be accessed by members of subclasses.

All fields may be declared without initializer, even const and template fields.

A class can be declared with the @trait modifier. Such a class is called a trait class. Other classes are called normal classes. A trait class is an abstract class and can not be instantiated. It also shall only declare methods without function bodies as members and no constructor.

A normal class can extend at most one other normal class and also any number of trait classes. The extended normal class is called the superclass, the extended trait classes are called the supertraits, while the extending class is called the subclass of all the classes it extends. Trait classes can only extend trait classes but not normal classes. The resulting type of a class definition is the set of object instances of the class itself and all instances of its direct or indirect subclasses. A subclass is a subtype of its direct and indirect superclasses and supertraits and its object instances are type compatible with them. If a class does not explicitly extend another class type, it implicitly extends the root class type object. Thus, all classes are directly or indirectly extensions of the object class.
A class inherits all members of its superclass and its supertraits that it does not override in its own class body. A non-private non-abstract member from the superclass can always be accessed inside the class body by using the dotted notation on the keyword `super`. Non overridden non-private members can be accessed without any dotted notation before the member name.

A class can have optional runs on, mtc and system clauses. This restricts the type of component context that can create objects of that class and all methods of this class. If a class does not have one of these clauses, it inherits it from its superclass, if the superclass has one. If the superclass has or inherits a runs on, mtc or system clause, the subclass may declare each of these clauses with a more specific component type than the one inherited. The function members of classes shall not have runs on, system or mtc classes but inherit them from their surrounding class or its superclasses.

Classes can be used as field or element types of structured types.

**Restrictions**

a) Void.

b) Passing of object references and structured types containing fields or elements of class type to the create operation of a component type or a function started on another component is not allowed.

c) No subtyping definition is allowed for class types via the normal subtype definition.

d) No local/global constants or module parameters of class type or structured types containing fields or elements of class type are allowed.

e) Class type cannot be the contained value of an any type value.

f) The functions of a class shall not have a runs on, mtc or system clause.

g) The runs on type of a class shall be runs on compatible with the runs on type of the behaviour creating a class.

h) The runs on type of a class shall be runs on compatible with the runs on type of the superclass and the supertraits.

i) The mtc and system type of a class shall be mtc and system compatible with the mtc and system types of the superclass and the supertraits, respectively.

j) Class extension shall not contain cycles such that a class directly or indirectly extends itself.

k) Reference to a class shall not occur more than once in the list of classes being extended.

l) Neither fields nor non-abstract methods shall be declared in trait classes.

m) Trait classes shall not define a constructor and shall not define a finally block.

n) A class shall extend at most one normal class.

o) If a structured type contains a field of a class type, this type is not seen as a data type and its values cannot be used for encoding or decoding, sending or receiving and neither used as an actual parameter (or part thereof) to a function started on another component.

**Examples**

**EXAMPLE 1:**

```kotlin
external function newGlobalId() return charstring;

type @trait Identifiable {  
  public function @abstract setId(charstring id);  
  public function @abstract getId() return charstring;  
}

type class MyIdentifiableClass extends Identifiable {  
  create() {  
    setId(newGlobalId());  
  }  
  var charstring id;
```
public function setId(charstring id) { this.id := id }
public function getId() return charstring { return id }

var Identifiable v_idObj := MyIdentifiableClass.create();
var charstring v_id := v_idObj.getId();

EXAMPLE 2: parallel inheritance

type class @trait A {
  function @abstract f();
}

type class @trait B {
  function @abstract f();
}

type class C extends A, B {
  // legal, as it inherits A.f() and B.f() and they have the same parameters and return clause
}

type class @trait B2 extends A {
  function @abstract f(); // overrides A.f()
}

type class C2 extends A, B2 { // legal, as B2 does not clash with A
  function f() { ... } // implements A.f() and B2.f()
}

type class C3 extends A {
  function f() { ... } // implements A.f()
}

type class D extends C2, C3 {
  // illegal, as it only one non-trait class can be inherited
}

type class E extends A, C2 {
  // legal, but inheriting A is redundant
}

5.1.1.1 Scope rules

Class constitutes a scope unit. For the uniqueness of identifiers, the rules specified in clause 5.2.2 of ETSI ES 201 873-1 [1] apply with the following exceptions:

a) Identifiers from the higher scope can be reused for member declarations. A reference to a reused identifier without a prefix occurring inside a class scope shall be resolved as a reference to the class member. In order to refer to the declaration on the higher scope, the identifier shall be preceded with a module name and a dot (".").

b) Identifiers of member declarations can be reused inside methods for formal parameter and local declarations. A reference to a reused identifier without a prefix occurring inside a class method shall be resolved as a reference to the formal parameter or local declaration. In order to refer to the member declaration, the identifier shall be preceded with the this keyword and a dot.

c) Reusing identifiers of members of the component type specified in the runs on clause of the class for members and inside methods for formal parameters and local declarations is not allowed.

EXAMPLE:

module ClassModule {
  const integer a := 1;

type class MyClass() {
  const integer a := 2;
  function doSomething (integer a := 3) {
    log(a); // logs 3 (for the default value)
    log(this.a); // logs 2
    log(ClassModule.a); // logs 1
  }
  function doSomethingElse () {
    log(a); // logs 2
    log(this.a); // also logs 2
  }
}
5.1.1.2 Abstract classes

A class can be declared as @abstract. In that case, it is allowed that it also declares abstract member functions, abstract properties or properties with abstract getters or setters who shall be defined by all non-abstract subclasses. An abstract method function has no function body but can be called in all concrete instances of subclasses of the abstract class declaring it. Other members of the abstract class or its subclasses may use the abstract functions as if it was concrete where at runtime the concrete overiding definition will be used.

Abstract getters and setters have no body but the properties containing them can be referenced in all concrete instance of subclasses of the abstract class declaring them. Other members of the abstract class or its subclasses may reference abstract properties as if they were concrete. At runtime the concrete overriding definition will always be used.

NOTE 1: Abstract classes are only useful as superclasses of concrete classes.

Restrictions

a) Abstract classes cannot be explicitly instantiated.

b) If a class that is not declared abstract extends an abstract class, all methods, property getters and setters that have no implementation in the superclass shall be implemented in this class.

NOTE 2: Variables of an abstract class type can only contain references to instances of non-abstract subclasses.

5.1.1.3 External classes

A class may also be declared as external. In that case, it may declare external member functions without a function body. It is allowed to omit the external keyword from these function declarations. External classes can extend non-external classes but classes not declared as external shall not extend from external classes. External classes may also define other members like normal classes. When instantiating an external class, the external object being created is provided by the platform adapter and the external method calls to the external object are delegated via the platform adapter to the corresponding method of the external object.

NOTE 1: External classes are a way to use object-oriented library functionality in TTCN-3 while still remaining abstract and independent of actual implementation. Libraries for common constructs like stacks, collections, tables can be defined or automatic import mechanisms could be provided.

If an object of an external class is instantiated, it implicitly creates an external object and the internal object has a handle to the external one. The reference to the external object is called a handle. When an external method is invoked on the internal object, the call is delegated to the handle.

NOTE 2: External objects are possibly shared between different parts of the test system. Therefore, racing conditions and deadlocks have to be avoided by the external implementation.

Restrictions

a) Void

b) Void

c) Void

d) An internal class shall not extend an external class

EXAMPLE:

type class @abstract Collection {
  function @abstract size() return integer;
  // internal default implementation
  function isEmpty() return boolean {
    return size() == 0
  }
}
Type external class Stack extends Collection{
    function push(integer v);
    function pop() return integer;
    function isEmpty() return boolean; // external implementation overrides internal
    function size() return integer; // external implementation of abstract function
}

5.1.1.4 Final Classes
If a class shall not be subclassed, it may be declared as @final. Final classes cannot be abstract.

5.1.1.5 Constructors

Syntactic Structure

create "(" { FormalParameter , }* ")"
[ external "(" { FormalParameter , }* ")" ]
[ ":" ClassType "(" { ActualParameter , }+ ")" ]
[ StatementBlock ]

Semantic Description

A class may define a constructor called create.

If no constructor is defined inside a class body, an implicit default constructor is provided where the formal parameters of the constructor are the parameters of the (implicit or explicit) constructor of the direct superclass and one additional formal in parameter for each declared var and var template field or automatic property of the class itself unless they are declared with the @internal modifier and also all const or template fields with no initializer in their order of declaration with the same type as in the declaration. If a var or var template field has an initializer, the additional formal in parameter created for it, for the implicit constructor, shall have the initializer value as the default value of the formal parameter.

NOTE 1: Having a default value in the implicit constructor for the var and var template fields with initializer, makes it possible to skip that parameter when invoking the implicit constructor, or to override it with another value if explicitly provided.

The constructor is invoked on a type reference to the class and the result of this invocation is a new instance object of the constructor's specific class. If a class is extending another class with a constructor with at least one parameter without default, that constructor shall be invoked by adding a super-constructor clause to the constructor declaration. The super-constructor clause consist of a reference to the class being extended and an actual parameter list. An implicit constructor will automatically pass the required actual parameters to the constructor of its superclass.

In the constructor, it is allowed to refer to the object being constructed as this to reference the fields of the object to be created in case that the names of the formal parameters clash with the names of those fields. They are explicitly allowed to have the same names as class members.

When an object is created via the invocation of a constructor, the fields of each class body in the class hierarchy that have initializers are initialized before the execution of that class body's constructor body. The fields of a superclass that have initializers are initialized before the fields of the subclass. Also, the constructor of the superclass is executed before the constructor body of the subclass. Thus, it is ensured that all initialization of the superclass hierarchy as well as local fields with initializers is finished before the execution of a constructor body.

Since the members of a class body can appear in any order and forward references are allowed between them, a field with an initializer which is referenced by the initializer of another field, is initialized first.

As the underlying external constructor of external classes might need additional parameters, these can be provided via the additional external formal parameter list. If no internal constructor needs to be defined, the constructor may be defined without external formal parameter list and no body. In that case, the formal parameter list defines the formal parameters passed to the external constructor.

Restrictions

a) All formal parameters of the constructor shall be in parameters.
b) The constructor body shall not assign anything to variables that are not local to the constructor body or accessible fields of the class the constructor belongs to.

c) The constructor body shall not use blocking operations.

d) The initialization of a member field shall not invoke any member function in the object being initialized.

e) The constructor body shall not invoke any member function in the object being initialized.

f) A member constant or template shall be initialized exactly once, either by its initialization part or by at most one constructor body.

g) Direct or indirect cyclic initialization is not allowed. That is the initializer of a field shall not use the same field directly or indirectly.

h) The initializer of a field shall not use a field that does not have an initializer.

EXAMPLE 1:

type class MyClass {
  var integer a;
  const float b;
  const float c := 7;  // implicit constructor:
  template float myTemplate := ?; // only using variable fields and non-variable fields with no initializer
  //create(integer a, float b) { // no parameter for c and myTemplate
  // this.a := a;
  // this.b := b
  //}
}

type class MyClass2 extends MyClass {
  template integer t;
  // explicit constructor
  create(template integer t) : MyClass(2, 0.5) {
    this.t := t;
  }
}

type class MyClass3 extends MyClass {
  var float f;
  // implicit constructor:
  //create(integer a, float b, float f) : MyClass(a, b) {
  // this.f := f;
  // }
}

EXAMPLE 2:

For each initialization statement it is marked with its initialization order in the comment.

type class MySuperClass {
  var integer a := 5;  // 1
  var float b;
  create(integer a, float b) {
    this.a := a; // 3
    this.b := b; // 4
  }
}

type class MySubClass extends MySuperClass {
  var template integer t := ?; // 2
  create(template integer t) : MySuperClass(2, 0.5) {
    this.t := t; // 5
  }
}

EXAMPLE 3:

type class MySuperClass {
  var integer a := 1;
  var float b;
  // implicit constructor:
  // only using variable fields with and without initializer
//create(integer a := 1, float b) {
    // this.a := a;
    // this.b := b
    //}

type class MySubClassWithDefault extends MySuperClass {
    var float f := 1.0;
    // implicit constructor:
    // create(integer a := 1, float b, float f := 1.0) : MySuperClass(a, b) {
    //    this.f := f;
    // }
}

5.1.1.6 Constructor invocation

Syntactic Structure

```
ClassReference "." create [ ActualParList ] [ external ActualParList ]
```

Semantic Description

To instantiate on object, the constructor of the class is invoked. The result of that operation is a reference to a newly constructed of the given concrete class.

If the constructor is a constructor of an external class that has an external formal parameter list, an additional external actual parameter list is given following the external keyword. If the constructor is to be invoked with a parameter list with no actual parameters, then the whole actual parameter list may be omitted.

If the constructor of an external class is invoked, first the external object is created using the given external formal parameters, then the internal constructor is evaluated to initialize the internal part of the object.

EXAMPLE:

type class Named {
    var charstring name;
}

type external class Address extends Named {
    create(charstring name)
    external (charstring host, int portNr)
        : Named(name){}
}

type external class UnnamedAddress {
    create (charstring host, int portNr);
}

var Address v_addr := Address.create("Connection 1") external ("127.0.0.1", 555);
var UnnamedAddress := UnnamedAddress.create("127.0.0.1", 555);
var Stack v_stack := Stack.create; // only implicit external constructor without parameters

// calling implicit constructor with default values
var MySubClassWithDefault v_mysub1 := MySubClassWithDefault.create(1, 1.0, 1.0);
var MySubClassWithDefault v_mysub2 := MySubClassWithDefault.create(1, 1.0);
var MySubClassWithDefault v_mysub3 := MySubClassWithDefault.create(b := 1.0);

5.1.1.7 Destructors

Syntactic Structure

```
finally StatementBlock
```

Semantic Description

A destructor may be provided using a finally declaration following the class body. This destructor will be invoked automatically at the latest before the system deallocates an object instance (which is tool specific and out of the scope of the present document) or when the owning component is terminates. The `StatementBlock` has access to all members accessible to the class. The `StatementBlock` is semantically a function body of a function without return clause.
When deallocating the object instance, the destructor of the associated class is invoked first, followed by the destructor of all parent classes in the reverse order of superclass hierarchy.

5.1.1.8 Methods

A method is a function defined inside the class body. It has the same properties and restrictions as any normal function, but it is invoked in an object which can be referred to by the `this` object reference. A method invocation can access the class's own fields and also the inherited protected fields and methods of its superclasses.

A method inherited from a superclass can be overridden by the subclass by redefining a function of the same name and with the same formal parameter list. When a method is called in an object, the version of the most specific class of the super class hierarchy of the concrete class that defines the method in its body will be invoked. The overridden method can be invoked from the overriding class by using the keyword `super` as the object reference of the invocation. If a method shall not be overridden by any subclass, it can be declared as `@final`.

Public methods, if not overridden by the subclass, are inherited from the superclasses. If a public method is declared in a class, it can be invoked also in all objects of its direct or indirect subclasses.

If a public method is overridden, the overriding method shall have the same formal parameters in the same order as the overridden method. Public methods shall be overridden only by public methods. Protected methods may be overridden by public or protected methods.

The return type of an overriding function shall be the same as the return type of the overridden function with the same template restrictions and modifiers.

Methods shall have no runs on, system or mtc clause directly attached to them. However, they inherit these clauses from their surrounding class.

5.1.1.9 Method invocation

Syntactical Structure

```
[(ObjectInstance | "super") "."] Identifier "(" FunctionActualParList ")"
```

A method invocation is a function call associated with a certain object defined in the class of that object.

Methods are invoked using the dotted notation on an object reference. Inside the scope of a class, methods of the same class or any visible inherited methods can be invoked without the `ObjectInstance` prefix if the object the method shall be invoked in is the same object as the one invoking it. The usual restrictions on actual parameters, as well as runs on, mtc and system types apply also on method invocations. All other restrictions that apply to called functions also apply to method invocation.

The super keyword shall only be used from inside a class member definition to access one of the accessible methods inherited from the super class of the member's containing class.

5.1.1.10 Visibility

Fields can be declared as private or protected. Methods can be declared as private, public or protected. If no visibility is given then the default modifier protected is assumed.

Private member functions are not visible and can be present in multiple classes of the same hierarchy with different parameter lists and return values.

Public member functions can be called from any behaviour running on the object's owner component.

Restrictions

a) A field of any visibility cannot be overridden by a subclass.

b) A public member function can only be overridden by another public member function.

c) Private members can only be accessed directly from inside their surrounding class's scope.
5.1.1.11 Built-in classes

The abstract special built-in class called `object` is the superclass for all classes that do not explicitly extend another class.

The pseudo definition of that class is:

```lttng
5.1.1.11 Built-in classes

The abstract special built-in class called `object` is the superclass for all classes that do not explicitly extend another class.

The pseudo definition of that class is:

```lttng
type class @abstract @builtin object {
  // This function will return a tool-specific descriptive string by default
  // but can be overridden by subclasses
  public function toString() return universal charstring;
  // Indicates whether some object is semantically equivalent to this one,
  // according to some equivalence relation.
  // The default implementation returns true if and only if both this and obj
  // are the same object instance, otherwise returns false.
  public function equals(object obj) return boolean {
    return this == obj;
  }
}
```

```
NOTE: The @builtin is only added for illustrative purposes and not part of the TTCN-3 language.
```

**EXAMPLE:** The `@builtin` is only added for illustrative purposes and not part of the TTCN-3 language.

**EXAMPLE:**

```lttng
type class Square {
  public function getSideLength() return integer { ... }
  public function equals(object obj) return boolean {
    if (this == obj) {
      return true;
    }
    else if (obj of Rectangle) {
      // a rectangle is a square its width and height are of equal lengths
      var Rectangle rectangle := obj => Rectangle;
      return rectangle.getWidth() == getSideLength() and
             rectangle.getHeight() == getSideLength();
    }
    else if (obj of Square) {
      return getSideLength() == obj=>Square.getSideLength();
    }
    return false;
  }
}
```

```lttng
type class Rectangle {
  public function getWidth() return integer { ... }
  public function getHeight() return integer { ... }
  public function equals(object obj) return boolean {
    if (this == obj) {
      return true;
    }
    else if (obj of Square) {
      return obj.equals(this);
    }
    else if (obj of Rectangle) {
      var Rectangle r2 := obj => Rectangle;
      return getWidth() == r2.getWidth() and
             getHeight() == r2.getHeight();
    }
    return false;
  }
}
```

5.1.1.12 Properties

**Syntactic Structure**

```lttng
5.1.1.12 Properties

**Syntactic Structure**

```lttng
var [ TemplateModifier ] [ @abstract | @final | @deterministic | @internal ]
```

**EXAMPLE:**

```lttng
var [ TemplateModifier ] [ @abstract | @final | @deterministic | @internal ]
```

**EXAMPLE:**
A class property is a class var member which is referenced like a record field for reading and writing with the dotted notation, but implemented via getter and setter functions that are provided in the definition of the property (allowing value checking/normalization/conversion when setting a value and on-the-fly computation when getting the value). It can be syntactically mixed in a compound var declaration with other variables.

Properties are in many regards similar to member functions, they can be declared with modifiers and visibility and it is allowed to override them in subclasses. When overriding a property, it is allowed to add a getter or setter even if it was not present in the parent class. Such a getter or setter is available only in the overriding class and its subclasses. When overriding a property, if a getter or setter is present in the parent class but not in the overriding class, then the getter or setter from the parent class is inherited by the overriding class.

Modifiers can occur either on the property level or in a getter and setter declaration. Modifiers declared on a property level are valid for both the getter and setter.

Visibility can be declared on the property declaration level or before the getter and setter declarations inside the property body separately. If no visibility is declared before a getter or setter directly, the visibility of the property declaration is used for it.

While most properties are declared with a property body containing either a getter or setter function, it is allowed to declare a property without a body. Such a property is called an automatic property. Automatic properties are similar to member variables, they are always generated with an associated anonymous member variable and a getter that returns this variable and a setter that assigns a value to this variable. While they are similar to member variables, there are two important differences: automatic properties can be public and it is possible to override them in subclasses. If a class contains an implicit default constructor, this constructor contains a formal parameter for each anonymous member variable associated with an automatic property with the name of the automatic property as the name of the formal parameter.

All getters and setters shall have a body unless they are declared abstract. A body of a getter can be specified in two distinct forms: either in a simple form that contains a single TemplateBody or in an extended form that consist of a statement block. In case of the simple form, referencing the property on the right hand side of an assignment will return the TemplateBody referenced in the getter declaration. When the extended form is referenced on the right hand side of an assignment, the statement block of the getter function will be executed and the value from the return clause of this block will be returned.

A body of a setter can be specified in two distinct forms: either in a simple form that contains a single assignment or in an extended form that consist of a statement block. The setter is executed when the property is referenced on the left hand side of an assignment. Both forms of the setter may reference a special variable value. This variable works as an in formal parameter of the setter function. It is of the same type as the property itself and when the setter is invoked, the value from the left hand side of the assignment where the property was referenced is passed into it as an actual parameter according to the rules specified in clause 5.4.2 of [1]. The value variable of the setter function has the same template modifiers as the property itself.

Properties that contain a setter (including automatic properties that have an implicit setter) may be optionally declared with an initial value. The initial value follows the identifier of the property and is preceded by an assign symbol. The initial value is automatically passed to the setter when an instance of the defining class is created. This automatic invocation takes place after execution of a constructor of the parent class and before execution of the constructor of the defining class. Properties are automatically initialized in the declaration order.

Restrictions

a) With the exception of a special case of automatic properties, a property shall always have a getter or a setter or both of them. An empty property body is not allowed.
b) The TemplateBody in the simplified form of the getter function and in the return clause of the common form of the getter function shall be compatible with the property type according to the rules specified in clause 6.3 of [1]. If the property has no TemplateModifier, the TemplateBody shall contain a value. Otherwise, it might contain a template that fulfills the restrictions set by the TemplateModifier that are specified in clause 15.8 of [1].

c) When passing a value to the value variable of the setter function, the rules specified in clause 5.4.2 of [1] shall apply.

d) If a property or its getter or setter contain the @deterministic modifier, rules for deterministic functions specified in clause 16.1.0 of [1] shall apply to the body of the concerned getter or setter.

e) An error shall be produced when a property that has no getter is referenced on the right hand side of an assignment.

f) An error shall be produced when a property that has no setter is referenced on the left hand side of an assignment.

g) An error shall be produced if execution of the extended form of a getter is terminated by reaching the end of the statement block without executing a return statement or a statement that terminates component execution (such as stop or testcase.stop).

h) The initial value of a property shall be compatible with the property type. If the property has no TemplateModifier, the initial value shall resolve into a value. Otherwise, it might resolve into a template that fulfills the restrictions set by the TemplateModifier of the property. These restrictions are specified in clause 15.8 of [1].

i) Abstract properties shall always contain a property body. Getters and setters declared inside an abstract property shall have no body. If the @abstract modifier is attached to a getter or setter, the getter or setter shall have no body.

j) An error shall be produced if an index or dot notation is applied to a property referenced on the left hand side of an assignment.

EXAMPLE:

type class Rectangle {
  private var integer heightVal;
  public @property integer width; // automatic property width
  public @property integer height { // property with a getter and setter
    @get => heightVal; // simple form of a getter
    @set { // extended form of a setter
      if (value > 0) { // simple data integrity check
        heightVal := value;
      }
    }
  }
  public @property integer perimeter {
    @get { // extended form of a getter
      return 2 * (width + height);
    }
  }
}

var Rectangle v_rect := Rectangle.create(heightVal := 10, width := 9); // instantiation using an
// implicit constructor
v_rect.width := 16; // change the width to 16
log [v_rect.perimeter]; // prints 144 to the log
v_rect.perimeter := 100; // causes an error as the referenced property has no setter
v_rect.height := -100; // does not change the heightVal variable

5.1.2 Objects

5.1.2.0 General

Objects are the instances of classes. Each instance comprises an instance of the data of the fields of the class (including all superclasses) and allows invocation of its public methods by other behaviour and protected or private methods by behaviour defined by the object’s class itself.
5.1.2.1 Ownership

Each object is owned by the component on which it was created. The owning component of an object can be referenced via the `self` component reference. Methods of objects can only be invoked by behaviour that also runs on the owning component. An object is created on a component if its constructor was invoked by a behaviour running on that component.

5.1.2.2 Object References

Objects are always passed by reference (even though their formal parameters can still be in, inout or out, dependent on the usage of that parameter). A variable of a class type contains only a reference to the object instance and the object is not copied when used as an actual parameter or assigned to a variable, but only the reference to the object. Therefore, multiple variables can contain a reference to the same object simultaneously.

**Restrictions**

a) Object References shall not be passed as actual parameter or part of an actual parameter to either the create operation of a component type or a function started on a component.

**NOTE:** Since objects cannot be shared by different component contexts and for each component at most one behaviour is running, no parallel conflicting access to any of the objects fields or methods is possible.

**EXAMPLE:**

```plaintext
type class MyClass() {
    var integer a := 0;
    function increment () {
        a := a + 1;
    }
    function getter() return integer {
        return a;
    }
}
type record of MyClass ROC;
...
var MyClass v_a := MyClass.create();
var ROC my_roc := [v_a];
var ROC my_roc2 := my_roc; //create a copy
v_a.increment();
my_roc[0].increment();
my_roc2[0].increment();
var integer v_temp1 := my_roc[0].getter(); // returns 3
var integer v_temp2 := my_roc2[0].getter(); // returns 3
```

5.1.2.3 Null reference

An object variable that is not initialized with an object instance contains the special value `null`. An object variable or parameter may be compared with the special value `null` with the equality and inequality operators or can be assigned the special value `null` explicitly.

5.1.2.4 Select class-statement

**Syntactical Structure**

```plaintext
select class "(" Object ")" 
"(" ( case "(" ClassReference ")" StatementBlock )+ [ElseCase] ")"
```

**Semantic Description**

The class of an object can be discriminated for via the 'select class' statement that is similar to a select union statement insofar that it allows only superclasses and known subclasses of the object reference's class in the context. If more than one case contains a superclass of the actual class of the given object instance, the first of these cases will be chosen by the select class statement.
In case that the Object is not an instance of any of the ClassReferences in the different cases, the statement block in the ElseCase, if present, will be executed.

**EXAMPLE:**

```plaintext
type class A {}
type class B extends A {}
...
var A v_a := B.create();
select class (v_a) {
  case (B) { ... } // will be chosen
  case (A) { ... } // will not be chosen
}
```

**Restrictions**

a) If a class from one case is a superclass of a class from another case, then the case of the subclass shall be precede the case of the superclass.

### 5.1.2.5 Of-operator (Dynamic Class Discrimination)

**Syntactical Structure**

Object of ClassReference

**Semantic Description**

To check whether an object is an instance is of a certain class, the `of` operator may be used.

It yields a Boolean value which is true if and only if the most specific class of the object referenced on the left-hand side is either equal to or a subclass derived from the class type reference on the right-hand side.

### 5.1.2.6 Casting

**Syntactical Structure**

ObjectReference `=>` (ClassIdentifier | "(" ClassReference ")")

**Semantic Description**

An object reference can be cast to another class of the object's known class's set of direct or indirect superclasses and direct or indirect subclasses. This operation yields an object reference to the same object but can be used as being of the type being cast to. If the referenced class to be cast to is an expression that is not a simple identifier, the expression shall be written in parenthesis.

**Restrictions**

a) If the class the object is being cast to is not in the set of superclasses or the concrete class of the object, the cast operation shall result in an error.

### 5.1.2.7 Comparison

**Syntactical Structure**

ObjectReference `"=="` ObjectReference | `"!="` ObjectReference

**Semantic Description**

Two object references can be compared for equality or inequality. Two object references are equal if and only if they reference the same object instance. An object reference is equal to the special null object reference if it does not reference an object instance.
Restrictions

a) Object references can only be compared if they are type compatible, i.e. if they both have the same declared class type or if the declared type of one of the references is a direct or indirect superclass of the declared type of the other reference.

Examples

type class Shape {}
type class Circle extends Shape {}
type class Rectangle extends Shape {}

var Circle v_circle := Circle.create();
var Rectangle v_rectangle := Rectangle.create();
var Shape v_shape := v_circle;

v_shape == v_circle // allowed => true
v_circle != v_rectangle // not allowed
v_shape == null // allowed => false
v_shape == Circle.create() // allowed => false

5.1.2.8 Object Templates

Syntactical Structure

"{{ FieldName | FunctionInstance }":=" TemplateBody ["," ]}""

Semantic Description

An object template is a matching mechanism to be used for objects similar to those used for record values. It can be used as a TemplateBody in template declarations for templates of class type and everywhere else where a TemplateBody is acceptable except in sending and receiving operations as objects can neither be sent nor received.

If an object template is used in a matching operation to match against an object reference, it matches if and only if for all assignments in the compound assignment notation the matching mechanism on the right hand side of the assignment matches the value yielded by the evaluation of applying the left hand side of the assignment as dotted notation to the object.

NOTE 1: It is not necessary to add an assignment in the template for all public properties that exist in the class. For all public properties that are not assigned any matching mechanism in the template, a "don't care" semantics is assumed. This is especially useful for using templates for objects of subclasses that might have additional properties.

Object templates declared for a class can also be used to match against objects of all subclasses.

The modifies operation is allowed also for Object templates with the same procedure as for record templates, but only FieldName assignments are modified while FunctionInstance assignments are not modified, though additional FunctionInstance assignments may be added.

It is allowed to have multiple FunctionInstance assignments of the same method in the same object template, possibly with different actual parameters.

NOTE 2: Usage of FunctionInstance assignments can lead to contradictory assignments that would lead to the object template not matching any object of the class.

Restrictions

a) The FieldName in an assignment in the template shall be the name of a public value property of the template's class. The type of the property shall be compatible with the corresponding TemplateBody on the right hand side.

b) The name of the function in the FunctionInstance in an assignment in the template shall be the name of a public method of the template's class. The actual parameter lists given in the FunctionInstance shall be compatible with the formal parameter lists of that method and the return type of the function shall be a value type compatible with the corresponding TemplateBody on the right hand side.
c) The getter of a public property or the function used on the left hand side of an assignment in an object template shall be deterministic and shall fulfill the restrictions imposed on content of functions used in special places given in clause 16.1.4.

d) The names in FieldName assignments in an object template shall be unique, i.e. no FieldName shall appear more than once on the left hand side.

e) Object templates shall not be used in sending or receiving operations.

f) Object template shall not be used as values and can not be converted to a value with the \texttt{valueof} operation.

\textbf{Examples}

\textbf{EXAMPLE 1:}

\begin{verbatim}
  type class Pair { public var integer @property a, @property b }
  template Pair t := { a := (1 .. 20) }
  type class Triple extends Pair { public var integer @property c }
  match (Triple.create(1,2,3), t) // returns true
\end{verbatim}

\textbf{EXAMPLE 2:}

\begin{verbatim}
  type class @abstract Shape { public function @abstract area() return float; }
  // smallShape would match for all objects whose class is derived from Shape
  // and where the result of the method call to area() fulfills the constraint.
  template Shape smallShape := { area() := (0.0 .. 20.0) }

  // contradictory template:
  template Shape empty := {
    area() := (0.0 .. infinity),
    area() := (-infinity .. 10.0)
  }
\end{verbatim}

\section{Extension to ETSI ES 201 873-1, clause 7.1.8 (Presence checking operators)}

\subsection{Clause 7.1.8.0 General}

The presence checking operators (\texttt{ispresent}, \texttt{ischosen}, \texttt{isvalue} and \texttt{isbound}) shall also apply to object references and invocations of methods of objects.

If resolving a dot notation on an object would produce an error (the object referenced or returned by the invoked method having the null value) the following happens:

- No error is produced.
- Evaluation of all remaining unresolved fields in the \texttt{ExtendedFieldReference} is stopped. All remaining parts of the \texttt{ExtendedFieldReference} that are located right from the operation that would normally produce an error up to the end of the presence checking operator are not evaluated.
- The presence checking operator yields the value \texttt{false}.

The rule on special handling of dot notation, index notation, object method invocation and decoded field references is not applied recursively. Errors occurring during the invocation of an object's method are not affected by this rule.

\subsection{Clause 7.1.8.1 The ispresent operator}

The \texttt{ispresent} operator can also be used to check if an object instance is present.

For an object instance argument the \texttt{ispresent} operator returns:

- The value \texttt{false} if the object is set to the null value.
- The value \texttt{true} otherwise.
Examples

EXAMPLE:

// Given
type class A {}  
var A v_a1;  
var A v_a2 := A.create();

var boolean v_checkResult := ispresent(v_a1) // yields false
v_checkResult := ispresent(v_a2) // yields true

Clause 7.1.8.3 The isvalue operator

The isvalue operator always returns the value true for an object instance.

Examples

EXAMPLE:

// Given
type class A {}  
var A v_a1;  
var A v_a2 := A.create();

var boolean v_checkResult := isvalue(v_a1) // yields true
v_checkResult := isvalue(v_a2) // yields true

Clause 7.1.8.4 The isbound operator

The isbound operator always returns the value true for an object instance.

Examples

EXAMPLE:

// Given
type class A {}  
var A v_a1;  
var A v_a2 := A.create();

var boolean v_checkResult := isbound(v_a1) // yields true
v_checkResult := isbound(v_a2) // yields true

5.2 Exception handling

5.2.0 General

This clause introduces exception handling into TTCN-3. It provides means to define exception handling for functions, external functions, altsteps and test cases.

5.2.1 Extension to ETSI ES 201 873-1, clause 16.1.0 (Functions)

Clause 16.1.0 General

The syntax of functions is extended with an optional exception clause.

Syntactical Structure

function [ @deterministic | @control ] FunctionIdentifier
  "(" { ( FormalValuePar | FormalTemplatePar ) [","] } ")"  
  [ runs on ComponentType ]
  [ mtc ComponentType ]
  [ system ComponentType ]
  [ return | template ] Type
  [ exception "(" Type [","]+ ")" ]
Clause 16.1.0  General

The semantic description part is extended.

Functions may have an exception list. The exception list declares, what exception types may be raised during the execution of the function either directly or indirectly.

NOTE 1: The exception list can be used to communicate to the callers of the function what exceptions to prepare for and by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 2: The exception list might not be exhaustive. With activated altsteps it might not be possible to precisely know what exceptions might be raised within a function directly or indirectly.

If the statement block of a function has a finally block, the finally block is always executed before control returns to the location of the call of the function.

5.2.2  Extension to ETSI ES 201 873-1, clause 16.1.3 (External Functions)

Clause 16.1.3  General

The syntax of external functions is extended with the optional exception clause.

Syntactical Structure

```
external function [ @deterministic | @control ] ExtFunctionIdentifier
 "(" { ( FormalValuePar | FormalTemplatePar ) [","] } ")"
 [ return [ template [ Restriction ] ] Type ] [ exception "(" {Type [","] }+ ")" ]
```

Clause 16.1.3  General

The semantic description part is extended.

External functions may have an exception list. The exception list declares, what exception types may be raised during the execution of the external function.

NOTE 0: The exception list can be used by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 1: The exception list might not be exhaustive. It might not be possible to precisely know what exceptions might be raised within an external function directly or indirectly.

5.2.3  Extension to ETSI ES 201 873-1, clause 16.1.4 (Invoking functions from specific places)

Clause 16.1.4  General

The list of restrictions is extended to avoid side effects.

n) Raising an exception with the raise exception statement.

5.2.4  Extension to ETSI ES 201 873-1, clause 16.2 (Altsteps)

Clause 16.2.0  General

The syntax of altstep is extended with the optional exception, catch and finally clauses.

Syntactical Structure

```
altstep [ @control ] [ interleave ] AltstepIdentifier
 "(" { ( FormalValuePar | FormalTemplatePar ) [","] } ")"
 [ runs on ComponentType ]
 [ mtc ComponentType ]
 [ system ComponentType ]
```

StatementBlock
Clause 16.2.0  General

The semantic description part is extended.

Altsteps may have an exception list. The exception list declares, what exception types may be raised during the execution of the altstep either directly or indirectly.

NOTE 0: The exception list can be used to communicate to the callers of the altstep what exceptions to prepare for and by tools to perform stronger static checks. For backward compatibility reasons the exception list is optional.

NOTE 1: The exception list might not be exhaustive. With activated altsteps it might not be possible to precisely know what exceptions might be raised within an altstep directly or indirectly.

Altsteps may have a finally block. If present the finally block is always executed before control returns to the location of the call of the altstep every time the altstep is invoked, regardless of whether implicitly as an activated default or explicitly from another alt statement.

5.2.5  Extension to ETSI ES 201 873-1, clause 16.3 (Test cases)

Clause 16.3  Test cases

The semantic description part is extended.

The StatementBlock of Test cases may have a finally block. If present the finally block is always executed before the test case terminates.

Exceptions raised directly or indirectly within the test case and not handled latest by the catch clauses of the StatementBlock of the testcase results in the testcase finishing with a dynamic error. In this situation the dynamic error has to reference not handling the exception as the reason of error.

NOTE 0: The reason for the dynamic error is not the raising of the exception, but the lack of handling within the testcase.

5.2.6  Extension to ETSI ES 201 873-1, clause 18 (Overview of program statements and operations)

The list of statements in table 15 of ETSI ES 201 873-1 needs to be extended with a raise exception statement as shown below.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Associated keyword or symbol</th>
<th>Can be directly or indirectly invoked by module control, but not by test components</th>

**NOTE 1:** Specific places are defined in clause 16.1.4. Only operations that do not have any potential side effects on snapshot evaluation are allowed.

**NOTE 2:** Can be used to control timer operations only.

**NOTE 3:** Can only be used in functions and allsteps that are used in module control.

**NOTE 4:** Changing of component variables is disallowed.

**NOTE 5:** Can be used in functions and allsteps but not in test cases.

### 5.2.7 Extension to ETSI ES 201 873-1, clause 19 (Basic program statements)

#### Clause 19.0 General

The list of statements in table 17 needs to be extended with the raise exception statement as described below.

<table>
<thead>
<tr>
<th>Basic program statements</th>
<th>Associated keyword or symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignments</td>

<tr>
<td>Leaving a loop, alt, altstep or interleave</td>
<td>break</td>
</tr>
<tr>
<td>Next iteration of a loop</td>
<td>continue</td>
</tr>
<tr>
<td>Raise exception</td>
<td>raise</td>
</tr>
<tr>
<td>Logging</td>
<td>log</td>
</tr>
</tbody>
</table>
Clause 19.14  Statement Block

The syntax of statement block is changed as shown below.

```
BasicStatementBlock: "{" LocalDefinition | Statement } "}"
StatementBlock: BasicStatementBlock {catch "{" Type Identifier "}" BasicStatementBlock } [finally BasicStatementBlock]
```

Clause 19.14  Statement Block

The semantic description part is extended.

A basic statement block is a sequence of declarations and statements.

Statement blocks can be used like basic program statements to introduce a local scope in the flow of control of TTCN-3 behaviour. The declarations and statements in a basic statement block are executed in the order of their appearance, i.e. sequentially.

A statement block consists of a basic statement block with optional additional catch clauses, that can be used to handle exceptions raised directly or indirectly within the basic statement block and an optional finally clause which is executed after the basic statement block execution. When an exception is raised by a statement in the basic statement block the catch clauses are tried in order of appearance to find one of the same type for data types or one the exception can be cast to if it is a type class kind exception. Execution continues with the basic statement block of the first catch clause whose type matches the type of the raised exception.

The catch clause declares a variable of an exception, with the type and identifier provided, to hold the value of the exception within the catch clause. The scope of this variable is limited to the basic statement block of the catch clause, i.e. it is only visible inside the body of the catch clause.

NOTE: The scope of the catch and finally blocks is on the same level with the scope of the basic statement block. Local variables declared within the basic statement block are not visible in the catch and finally clauses.

Clause 19.14  Statement Block

The list of restrictions is extended:

a) The control transfer statements return, and raise shall not be used in the finally clause. Functions that can raise exceptions shall not be called in the finally clause.

b) The basic statement block of a catch clause shall obey the same semantic restrictions as the basic statement block it follows.

Clause 19 is extended with a new clause.

NEW: Clause 19.15  The Raise exception statement

The raise exception statement raises an exception, causing the execution to continue at the catch block closest in the procedure call hierarchy, also executing all finally blocks it encounters while traversing the procedure call hierarchy.

**Syntactical Structure**

`raise TemplateInstance`

**Semantic Description**

The raise statement is used to raise an exception. On executing a raise exception statement the statement blocks, loops, alt statements or interleave statement within the encompassing function/altstep/testcase are left. If the encompassing function, altstep or testcase has a catch block with the exact same type as that of the raised exception value for data types or one the exception can be cast to if it is a class type exception, execution continues in that catch block. If the encompassing function or altstep does not have catch blocks or none of the catch blocks can handle the raised exception, execution leaves the function or altstep to handle the exception in the calling function, altstep or testcase. An exception not handled via catch clause of the StatementBlock of a testcase shall cause a dynamic error.
If the StatementBlock of a function, altstep or testcase has a finally block, this finally block is always executed before the function, altstep, testcase terminates. If an exception was raised and handled in a catch block, the finally block is executed after the catch block. If there was no exception raised, or an exception was raised but not handled in any catch blocks the finally block is executed before the function, altstep or testcase terminates.

The parameter of the `raise` operation shall evaluate to a value, that the exception will have.

Exceptions are specified as types. Therefore the exception value may either be derived from a template conforming to the template(value) restriction or be the value resulting from an expression (which of course can be an explicit value). The type of the value specification to the `raise` operation shall be determinable as it is necessary to avoid any ambiguity of the type of the value being raised.

**NOTE 0:** The type of the raised exception should be provided explicitly for literal values. Catch clauses with synonym types or restricted types will only catch exceptions of the same type.

**Restrictions**

In addition to the general static rules of TTCN-3 given in clause 5 and shown in table 15, the following restrictions apply:

a) An exception shall only be raised inside a function, altstep or testcase.

b) The TemplateInstance shall conform to the template(value) restriction (see clause 15.8).

c) Exceptions shall not be raised directly or indirectly inside finally blocks of functions, altsteps or testcases.

**Examples**

**EXAMPLE 1:**

```plaintext
raise ( v_myVariable + v_yourVariable - 2); // Raises an exception with a value which is the result of the arithmetic expression
raise integer:5; // Raises an exception with the integer value 5
raise charstring:"Olala!"; // Raises an exception with the charstring value "Olala!"
```

**EXAMPLE 2:** Catching an exception raised in a called function.

```plaintext
type record of charstring t_registeredNames;
type component myComponent {  
  var t_registeredNames v_registeredNames;
}
function f_init(in charstring name) exception (charstring, integer) runs on myComponent {
  ...
  if (name_was_not_registered) {
    raise ("Could not initialize " & name); // when the exception is raised f_init terminates
  }
  ...
}
function f_operation(in charstring user1, in charstring user2) exception (integer) runs on myComponent {
  f_init(user1);
  f_init(user2);
  ...
} catch (charstring e) {  
  // the exception is available for processing in the e variable
  // release resources and terminate function
} catch (integer e) {  
  // there was some other issue
  // release resources
  raise e; // the exception is raised again to be handled in the calling function
}
```

**EXAMPLE 3:** Finally is always executed.

```plaintext
function f_operation2(in charstring user1, in charstring user2) exception (charstring) runs on myComponent {
  f_init(user1);
  f_init(user2);
...}
```
EXAMPLE 4: The exception can travel through several functions in the call hierarchy until handled.

```plaintext
function f_operation3(in charstring user1, in charstring user2) exception (charstring)
  runs on myComponent {
    f_operation2(user1, user2); // an exception is raised in f_init
    ...
  } finally {
    // after the finally block in f_operation2 this finally block is also executed
    // the exception is not caught.
  }
```

EXAMPLE 5: Exception not caught latest in a testcase is reported as dynamic error.

```plaintext
testcase t_myTest1() runs on myComponent {
  f_init("user1");
  f_init("unknown user"); // bad argument will raise an exception in f_init
  ...
  finally {
    // via the runs on component resources can be freed
    // as the exception is not caught dynamic error is reported
  }
}
```

EXAMPLE 6: The type of the exception has to match the type of the catch clause exactly.

```plaintext
function f_example() exception (integer) {
  raise integer:5;
}

type integer MyIntegerSynonim;
type integer MyIntegerRange (0 .. 255);

function f_example2() {
  f_example();
  }
}

catch (MyIntegerRange e) {
  // The exception is not caught here.
  // The type of the raised exception and the type of the catch type has to be the same
}
catch (MyIntegerSynonim e) {
  // The exception is not caught here.
  // The type of the raised exception and the type of the catch type has to be the same
}
catch (integer e) {
  // As the exception raised in f_example was raise with the integer type it is handled here
}
```

6 TRI Extensions for the Package

6.1 Extensions to clause 5.3 of ETSI ES 201 873-5 Data interface

Clause 5.3.2 Communication

The clause is to be modified:

TriExceptionType

A value of type TriExceptionType is an encoded type and value of an exception that either is to be sent to the SUT or has been received from the SUT. This abstract type is used in procedure based TRI communication operations and raising exception during execution of external functions, constructors, destructors and methods.
Clause 5.3.4 Miscellaneous

The clause is to be extended:

**TriClassIdType**

A value of type TriClassIdType is the name of a class as specified in the TTCN-3 ATS.

**TriObjHandleType**

A value of type TriObjHandle contains platform-specific data allowing access to external objects.

6.2 Extensions to clause 5.6.3 of ETSI ES 201 873-5

Miscellaneous operations

Clause 5.6.3.4 triExternalCreate (TE → PA)

This clause is to be added.

| Signature | TriStatusType triExternalCreate( |
|           | in TriClassIdType classId, |
| In Parameters | in TriParameterListType parameterList, |
| Out Parameters | out TriObjHandleType createdObject) |
| InOutParameters | classId identifier of the external class |
|               | parameterList a list of encoded parameters for the indicated constructor. The parameters in parameterList are ordered as they appear in the TTCN-3 constructor declaration. |
| Return Value | The return status of the triExternalCreate operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation. |
| Constraints | This operation is called by the TE when it invokes a constructor specified in a class which is defined as external in TTCN-3. In the invocation of a triExternalCreate operation by the TE all in and inout constructor parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null. |
| Effect | The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS. On invocation of this operation, the PA shall invoke the constructor of a class indicated by the identifier classId. It shall access the specified in and inout constructor parameters in parameterList, create a new external object instance using the values of these parameters, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out constructor parameters and a handle to the created external object. The triExternalCreate operation returns TRI_OK if the PA completes the constructor of the external class successfully, TRI_Error otherwise. In the latter case, the distinct value null shall be returned as the object handle. Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalCreate operation is considered to be blocking. That means that the operation shall not return before the construction of the external object has been finished. External constructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation. |

Clause 5.6.3.5 triExternalFinally (TE → PA)

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>TriStatusType triExternalFinally( in TriObjHandleType handle)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>handle handle to the object being destroyed</td>
</tr>
<tr>
<td>Return Value</td>
<td>The return status of the triExternalFinally operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation.</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation is called by the TE when it invokes a destructor specified in a class which is defined as external in TTCN-3.</td>
</tr>
<tr>
<td>Effect</td>
<td>The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS which contains a destructor definition. On invocation of this operation, the PA shall invoke the destructor of the object whose handle is in the handle parameter. The triExternalFinally operation returns TRI_OK if the PA completes destruction of the external object successfully, TRI_Error otherwise. Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalFinally operation is considered to be blocking. That means that the operation shall not return before the destruction of the external object has been finished. External destructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.</td>
</tr>
</tbody>
</table>

Clause 5.6.3.6 triExternalMethod (TE → PA)

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>TriStatusType triExternalMethod( in TriObjHandleType handle, in String methodName, inout TriParameterListType parameterList, out TriParameterType returnValue)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>handle handle of the affected object; null for static methods</td>
</tr>
<tr>
<td>Out Parameters</td>
<td>methodName name of the called method</td>
</tr>
<tr>
<td>InOutParameters</td>
<td>returnValue (optional) encoded return value</td>
</tr>
<tr>
<td>parameterList</td>
<td>a list of encoded parameters for the indicated method. The parameters in parameterList are ordered as they appear in the TTCN-3 method declaration.</td>
</tr>
<tr>
<td>Return Value</td>
<td>The return status of the triExternalMethod operation. The return status indicates the local success (TRI_OK) or failure (TRI_Error) of the operation.</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation is called by the TE when it invokes a method specified in a class which is defined as external in TTCN-3. In the invocation of a triExternalMethod operation by the TE all in and inout parameters contain encoded values. No error shall be indicated by the PA in case the value of any out parameter is non-null.</td>
</tr>
<tr>
<td>Effect</td>
<td>The PA shall implement the behaviour for each method of all external classes specified in the TTCN-3 ATS. On invocation of this operation, the PA shall call a method methodName of an external object whose handle is in the handle parameter. It shall access the specified in and inout method parameters in parameterList, pass the values of these parameters to the called method, and compute values for inout and out parameters in parameterList. The operation shall then return encoded values for all inout and out method parameters and the encoded return value. If no return type has been defined for this method in the TTCN-3 ATS, the distinct value null shall be used for the latter. The triExternalMethod operation returns TRI_OK if the PA completes the method of the external object successfully, TRI_Error otherwise. Note that whereas most of other TRI operations are considered to be non-blocking, the triExternalMethod operation is considered to be blocking. That means that the operation shall not return before the method call has been finished. Methods of external classes have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.</td>
</tr>
</tbody>
</table>
Clause 5.6.3.7  triRaiseException (PA → TE)

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void triExternalRaise(in TriExceptionType exc)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>exc</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation can be called by the PA only during execution of triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod.</td>
</tr>
<tr>
<td>Effect</td>
<td>The operation raises an exception that can be later processed by the TE in the catch statement. The exception is provided in an encoded form. The TE performs decoding when the triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod where the exception was raised returns. Decoding is performed in the catch statement.</td>
</tr>
</tbody>
</table>

6.3 Extensions to clause 6 of ETSI ES 201 873-5 Java™ language mapping

Clause 6.3.3.20 TriObjHandleType

This clause is to be added.

TriClassIdType is mapped to the following interface:

```java
// TRI IDL TriClassIdType
package org.etsi.ttcn.tri;
public interface TriClassId {
    public String toString();
    public String getClassName();
    public boolean equals(TriClassId id);  
}
```

Methods:

- `toString`
  Returns the string representation of the class as defined in TTCN-3 specification.

- `getClassName`
  Returns the class identifier as defined in the TTCN-3 specification.

- `equals`
  Compares id with this TriClassId for equality. Returns `true` if and only if both classes have the same class identifier, `false` otherwise.

Clause 6.3.3.20 TriObjHandleType

This clause is to be added.

TriObjHandleType is mapped to the `java.lang.Object` class.

Clause 6.3.3.21 TriObjHandleWrapper

This clause is to be added.

TriObjHandleWrapper is used in the triExternalCreate operation as a placeholder for the created object handle.

```java
public interface TriObjHandleWrapper {
    public void setHandle(Object handle);
    public Object getHandle();
}
```
Methods:

- **setHandle**
  Sets the contained object.

- **getHandle**
  Gets the contained object.

Clause 6.5.3.1  TriPlatformPA

This clause is to be extended.

```java
// TriPlatform
// TE -> PA
package org.etsi.ttcn.tri;
public interface TriPlatformPA {
  ...
  // Ref: TRI-Definition 5.6.3.4
  public TriStatus triExternalCreate(TriClassIdType classId,
      TriParameterList parameterList, TriObjHandleWrapper handle);
  // Ref: TRI-Definition 5.6.3.5
  public TriStatus triExternalFinally(Object handle);
  // Ref: TRI-Definition 5.6.3.6
  public TriStatus triExternalMethod(Object handle, String methodName,
      TriParameterList parameterList, TriParameter returnValue);
}
```

Clause 6.5.3.2  TriPlatformTE

This clause is to be extended.

```java
// TriPlatform
// PA -> TE
package org.etsi.ttcn.tri;
public interface TriPlatformTE {
  ...
  // Ref: TRI-Definition 5.6.3.7
  public void triRaiseException(TriException exc);
}
```

6.4  Extensions to clause 7 of ETSI ES 201 873-5 ANSI C language mapping

Clause 7.2.1  Abstract type mapping

This clause is to be extended.

<table>
<thead>
<tr>
<th>TRI ADT</th>
<th>ANSI C Representation</th>
<th>Notes and comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TriClassIdType</td>
<td>QualifiedName</td>
<td></td>
</tr>
<tr>
<td>TriObjectHandleType</td>
<td>typedef void *</td>
<td>TriObjectHandle;</td>
</tr>
</tbody>
</table>
Clause 7.2.4 TRI operation mapping

This clause is to be extended.

<table>
<thead>
<tr>
<th>IDL Representation</th>
<th>ANSI C Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TriStatusType triExternalCreate (in TriClassIdType classId, inout TriParameterListType parameterList, out TriObjHandleType createdObject)</td>
<td>TriStatus triExternalCreate (const TriClassId* classId, TriParameterList* parameterList, TriObjectHandle* handle)</td>
</tr>
<tr>
<td>TriStatusType triExternalFinally (in TriObjHandleType handle)</td>
<td>TriStatus triExternalFinally (TriObjectHandle handle)</td>
</tr>
<tr>
<td>TriStatusType triExternalMethod (in TriObjHandleType handle, in String methodName, inout TriParameterListType parameterList, out TriParameterType returnValue)</td>
<td>TriStatus triExternalFunction (TriClassId handle, char* methodName, TriParameterList* parameterList, TriParameter* returnValue)</td>
</tr>
<tr>
<td>void triRaiseException (in TriExceptionType exc)</td>
<td>void triRaiseException (const TriException* exc)</td>
</tr>
</tbody>
</table>

6.5 Extensions to clause 8 of ETSI ES 201 873-5 C++ language mapping

Clause 8.5.19 TriClassId

This clause is to be added.

A value of type TriClassIdType represents the name of a class as specified in the TTCN-3 ATS. It is a derived class from QualifiedName, mapped to the following pure virtual class:

```cpp
class TriClassId : public QualifiedName {
    public:
        virtual ~TriClassId (){
        virtual Tboolean operator== (const TriClassId &sid) const =0;
        virtual TriClassId * cloneClassId () const =0;
        virtual Tboolean operator< (const TriClassId &sid) const =0;
    }

    Methods:
    • ~TriClassId
        Destructor.
    • operator==
        Returns true if both TriClassId objects are equal.
    • cloneClassId
        Returns a copy of the TriClassId.
    • operator<
        Operator < overload.
```

Clause 8.5.20 TriObjectHandle

This clause is to be added.

A value of type TriObjectHandle type is mapped to a void pointer:

```cpp
typedef void * TriObjectHandle;
```
Clause 8.6.3 TriPlatformPA

This clause is to be extended.

class TriPlatformPA {
public:

    // For each constructor on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus triExternalCreate (const TriClassId *classId, TriParameterList *parameterList, TriObjectHandle * handle)=0;

    // For each destructor on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus triExternalCreate (TriObjectHandle handle)=0;

    // For each method on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus triExternalMethod (TriObjectHandle handle, const Tstring & methodName, TriParameterList *parameterList, TriParameter *returnValue)=0;
};

Clause 8.6.4 TriPlatformTE

This clause is to be extended.

class TriPlatformTE {
public:

    // Raises an exception during execution of external code in PA
    virtual void triRaiseException (const TriException *exc)=0;
};

6.6 Extensions to clause 9 of ETSI ES 201 873-5 C# language mapping

Clause 9.4.2.19 TriClassId

This clause is to be added.

TriClassIdType C# mapping is derived from the IQualifiedName interface:

class interface ITriClassId : IQualifiedName {
}

Clause 9.4.2.20 TriObjectHandleType mapping

This clause is to be added.

TriObjectHandleIdType is mapped to the C# object class.

Clause 9.5.2.3 TriPlatformPA

This clause is to be extended.

public interface ITriPlatformPA {

    // Miscellaneous operations
    // Ref: TRI-Definition clause 5.6.3.4
    TriStatus TriExternalCreate(ITriClassId classId, ITriParameterList parameterList, out object handle);

    // Ref: TRI-Definition clause 5.6.3.5
    TriStatus TriExternalFinally(object handle);

    // Ref: TRI-Definition clause 5.6.3.6
    TriStatus TriExternalMethod(object handle, string methodName, ITriParameterList parameterList, ITriParameter returnValue);
};
Clause 9.5.2.4 TriPlatformTE

This clause is to be extended.

```java
public interface ITriPlatformTE {
    // Ref: TRI Definition clause 5.6.3.7
    void TriRaiseException(ITriException exc);
}
```

7 TCI Extensions for the Package

7.1 Extensions to clause 7.2.2.1 of ETSI ES 201 873-6 Abstract TTCN-3 data types and values

The definition of the getTypeClass operation shall be modified of the following way:

```java
TciTypeClassType getTypeClass() Returns the type class of the respective type. A value of
TciTypeClassType can have one of the following constants:
ADDRESS, ANYTYPE, ARRAY, BITSTRING, BOOLEAN,
CHARSTRING, COMPONENT, ENUMERATED, FLOAT,
HEXSTRING, INTEGER, OCTETSTRING, RECORD,
RECORD_OF, SET, SET_OF, UNION,
UNIVERSAL_CHARSTRING, VERDICT, DEFAULT, PORT,
TIMER, CLASS.
```

7.2 Extensions to clause 7.2.2 of ETSI ES 201 873-6 Abstract TTCN-3 data types and values

Clause 7.2.2.5 Abstract TTCN-3 classes

This clause is to be added.

According to the present document, TTCN-3 user-defined classes will be represented at the TCI interfaces using the abstract data type Class. The abstract data type Class is based on the abstract data type Type.

The following operations defined for abstract data type Type work differently in the abstract data type Class:

- `Value newInstance()` The method creates an ObjectInstance containing a reference to a null object of the class.

The following operations are defined for abstract data type Class:

- `ObjectInstance create(TriComponentIdType c, TciParameterListType tciPars)` Calls the constructor to create a new instance of this class using the supplied parameters for the specified component. Created objects are always considered to be initialized.

- `ClassSeq getSuperclasses()` Returns the superclasses of the current class.

- `TStringSeq getFieldNames()` Returns the names of all public fields defined in the class.

- `TStringSeq getMethodNames()` Returns the names of all public methods of the class.
TciParameterTypeListType getConstructorParameters ()

Returns formal parameters of the class constructor.

TciParameterTypeListType getMethodParameters (TString methodName)

Returns formal parameters of the specified public method. The distinct value null is returned if the method does not exist or is not public.

Type getFieldType (TString name)

Returns the type of the specified public field. The distinct value null is returned if the member variable does not exist or is not public.

Type getMethodReturnType (TString name)

Returns the return type of specified public method or the distinct value null if no return value is defined, the method does not exist or it is not public.

Clause 7.2.2.6 ClassSeq

This clause is to be added.

The abstract data type ClassSeq is used to represent a list of classes.

7.3 Extensions to clause 7.2.2.0 of ETSI ES 201 873-6 Basic rules

Figure 4 is to be extended.
7.4 Extensions to clause 7.2.2.2 of ETSI ES 201 873-6 Abstract TTCN-3 values

Clause 7.2.16 The abstract data type ObjectInstance

This clause is to be added.

The abstract data type ObjectInstance is based on the abstract data type Value. It is used to modify the referenced object and to access public object fields and methods.

The following operations are defined on the abstract data type ObjectInstance:

TriComponentIdType getOwner ()          Returns the component that owns the object instance.
TString getId ()                        Returns an identifier of the object which is unique within the owner component context.
void setObject (ObjectInstance source)

The operation sets the referenced object to be the same one as the one referenced by the source parameter. In case the source object does not contain a null reference, the object instance and the source object shall be owned by the same component.

Value getField (TString fieldName)

Returns the value of the referenced public member field. The distinct value null is returned if the object does not contain the referenced field or the field is not accessible.

Value callMethod(TString methodName, TciParameterListType tciPars)

Calls the method of the object instance. The distinct value null is returned if the method does not return any value. A runtime error is generated if the method does not exist or if the given parameters do not conform to the formal parameters of the declared method.

7.5 Extensions to clause 7.3.4.1 of ETSI ES 201 873-6 Abstract TCI-TL provided

Clause 7.3.4.1.122 tliObjCreateEnter

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjCreateEnter(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, QualifiedName className, in ObjectInstance obj, in TciParameterListType tciPars)</th>
</tr>
</thead>
</table>
| In Parameters | am | An additional message.  
ts | The time when the event is produced.  
src | The source file of the test specification.  
line | The line number where the request is performed.  
className | The component which produces this event.  
obj | The class of the constructor being called.  
tciPars | The created object instance. |
| Return Value | Void |
| Constraint | Shall be called by TE to log the entering of a constructor of an object. This event occurs after the constructor has been entered. |
| Effect | The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document. |

Clause 7.3.4.1.123 tliObjCreateLeave

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjCreateLeave(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, QualifiedName className, in ObjectInstance obj, in TciParameterListType tciPars)</th>
</tr>
</thead>
</table>
| In Parameters | am | An additional message.  
ts | The time when the event is produced.  
src | The source file of the test specification.  
line | The line number where the request is performed.  
className | The component which produces this event.  
obj | The class of the constructor being called.  
tciPars | The created object instance. |
| Return Value | Void |
| Constraint | Shall be called by TE to log the leaving of an object constructor. This event occurs after the constructor has been left. |
| Effect | The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document. |
Clause 7.3.4.1.124  tliObjFinallyEnter

This clause is to be added.

**Signature**
void tliObjFinallyEnter(in TString am, in TInteger ts, in TString src, 
in TInteger line, in TriComponentIdType c, QualifiedName className,  
in ObjectInstance obj)

**In Parameters**
am  An additional message.
ts  The time when the event is produced.
src  The source file of the test specification.
line The line number where the request is performed.
c   The component which produces this event.
className The class of the finally block being executed.
obj  The object instance being destroyed.

**Return Value**
Void

**Constraint**
Shall be called by TE to log the entering of a destructor of an object. This event occurs after the destructor has been entered.

**Effect**
The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.

Clause 7.3.4.1.125  tliObjFinallyLeave

This clause is to be added.

**Signature**
void tliObjCreateLeave(in TString am, in TInteger ts, in TString src,  
in TInteger line, in TriComponentIdType c, QualifiedName className,  
in ObjectInstance obj, in TciParameterListType tciPars)

**In Parameters**
am  An additional message.
ts  The time when the event is produced.
src  The source file of the test specification.
line The line number where the request is performed.
c   The component which produces this event.
className The class of the finally block being executed.
obj  The object being destroyed.

**Return Value**
Void

**Constraint**
Shall be called by TE to log the leaving of an object destructor. This event occurs after the destructor has been left. Accessing any members, properties and methods of a destroyed object with exception of methods used for comparison shall cause an error.

**Effect**
The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.

Clause 7.3.4.1.126  tliObjMethodEnter

This clause is to be added.

**Signature**
void tliObjMethodEnter(in TString am, in TInteger ts, in TString src,  
in TInteger line, in TriComponentIdType c, QualifiedName className,  
in ObjectInstance obj, in TString methodName,  
in TciParameterListType tciPars)

**In Parameters**
am  An additional message.
ts  The time when the event is produced.
src  The source file of the test specification.
line The line number where the request is performed.
c   The component which produces this event.
className The class of the method being called.
obj  The affected object instance.
methodName The name of the called method.
tciPars The parameters of the called method.

**Return Value**
Void

**Constraint**
Shall be called by TE to log the entering of an object method. This event occurs after the method has been entered.

**Effect**
The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.
Clause 7.3.4.1.127  tliObjMethodLeave

This clause is to be added.

<table>
<thead>
<tr>
<th>Signature</th>
<th>void tliObjMethodLeave(in TString am, in TInteger ts, in TString src, in TInteger line, in TriComponentIdType c, QualifiedName className, in ObjectInstance obj, in TString methodName, in TciParameterListType tciPars, in Value returnValue)</th>

</tr>
<tr>
<td>Effect</td>
<td>The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.</td>
</tr>
</tbody>
</table>
### Clause 7.3.4.1.134  tlObjGetLeave

This clause is to be added.

**Signature**

```c
void tlObjGetLeave(in TString am, in TInteger ts, in TString src,
                   in TInteger line, in TriComponentIdType c,
                   in ObjectInstance obj, in TString propertyName,
                   in Value value)
```

**In Parameters**

- **Am**: An additional message.
- **Ts**: The time when the event is produced.
- **Src**: The source file of the test specification.
- **Line**: The line number where the request is performed.
- **C**: The component which produces this event.
- **Obj**: The affected object instance.
- **propertyName**: The name of the referenced property.
- **ReturnValue**: The value returned by the getter.

**Return Value**

**Void**

**Constraint**

Shall be called by TE to log the leaving of an object getter. This event occurs after the getter has been left.

**Effect**

The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.

### Clause 7.3.4.1.135  tlObjSetEnter

This clause is to be added.

**Signature**

```c
void tlObjSetEnter(in TString am, in TInteger ts, in TString src,
                   in TInteger line, in TriComponentIdType c,
                   in ObjectInstance obj, in TString propertyName,
                   in Value value)
```

**In Parameters**

- **Am**: An additional message.
- **Ts**: The time when the event is produced.
- **Src**: The source file of the test specification.
- **Line**: The line number where the request is performed.
- **C**: The component which produces this event.
- **Obj**: The affected object instance.
- **propertyName**: The name of the referenced property.
- **value**: The value passed to the setter.

**Return Value**

**Void**

**Constraint**

Shall be called by TE to log the entering of an object setter. This event occurs after the setter has been entered.

**Effect**

The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.
Clause 7.3.4.1.136  tliObjSetLeave

This clause is to be added.

**Signature**

```java
void tliObjGetLeave(in TString am, in TInteger ts, in TString src,
in TInteger line, in TriComponentIdType c,
in ObjectInstance obj, in TString propertyName)
```

In Parameters

- **Am**  
  An additional message
- **Ts**  
  The time when the event is produced.
- **src**  
  The source file of the test specification.
- **line**  
  The line number where the request is performed.
- **C**  
  The component which produces this event.
- **obj**  
  The affected object instance.
- **propertyName**  
  The name of the referenced property.

Return Value

```java
void
```

Constraint

Shall be called by TE to log the leaving of an object setter. This event occurs after the setter has been left.

Effect

The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.

7.6  Extensions to clause 8 of ETSI ES 201 873-6 Java™ language mapping

Clause 8.3.2.4  TciTypeClassType

This clause is to be extended.

**TciTypeClassType** is mapped to the following interface:

```java
// TCI IDL TciTypeClassType
package org.etsi.ttcn.tci;
public interface TciTypeClass {
    public final static int ADDRESS     = 0 ;
    public final static int ANYTYPE     = 1 ;
    public final static int BITSTRING    = 2 ;
    public final static int BOOLEAN     = 3 ;
    public final static int CHARSTRING    = 5 ;
    public final static int COMPONENT    = 6 ;
    public final static int ENUMERATED    = 7 ;
    public final static int FLOAT     = 8 ;
    public final static int HEXSTRING    = 9 ;
    public final static int INTEGER     = 10 ;
    public final static int OCTETSTRING    = 12 ;
    public final static int RECORD     = 13 ;
    public final static int RECORD_OF     = 14 ;
    public final static int ARRAY     = 15 ;
    public final static int SET      = 16 ;
    public final static int SET_OF     = 17 ;
    public final static int UNION     = 18 ;
    public final static int UNIVERSAL_CHARSTRING = 20 ;
    public final static int VERDICT     = 21 ;
    public final static int DEFAULT     = 22 ;
    public final static int PORT     = 23 ;
    public final static int TIMER     = 24 ;
    public final static int CLASS     = 25 ;
}
```

Clause 8.3.6.7  Abstract class mapping

This clause is to be added.

**Class** is mapped to the following interface:

```java
// TCI IDL Type
package org.etsi.ttcn.tci;
public interface Class extends Type {
    public ObjectInstance create (TriComponentId c, TciParameterList tciPars);
    public Class[]  getSuperclasses ();
    public String[]  getFieldNames ();
```
public String[] getMethodNames ();
public TciParameterTypeList getConstructorParameters ();
public TciParameterTypeList getMethodParameters (String methodName);
public Type getFieldType (String name);
public Type getMethodReturnType (String methodName);
}

Methods:

• create
  Calls the constructor to create a new instance of this class using the supplied
  parameters for the specified component.

• getSuperclasses
  Returns the list of superclasses of this class.

• getFieldName
  Returns the names of all public fields defined in the class.

• getMethodName
  Returns the names of all public methods of the class.

• getConstructorParameters
  Returns the formal parameters of the class constructor.

• getMethodParameters
  Returns the formal parameters of the specified public method.

• getFieldType
  Returns the type of the specified public field.

• getMethodReturnType
  Returns the return type of specified public method or the distinct value null
  if no return type is declared.

Clause 8.3.6.8 ClassSeq

This clause is to be added.

ClassSeq abstract data type mapped to an array of TciClass.

Clause 8.3.4.16 ObjectInstance

This clause is to be added.

ObjectInstance is mapped to the following interface:

// TCI IDL DynamicMatch
package org.etsi.ttcn.tci;
public interface ObjectInstance extends Value {
  public TriComponentId getOwner ()
  public TString getId ()
  public void setObject (ObjectInstance source)
  public Value callMethod (String methodName, TciParameterList tciPars);
}

Methods:

• getOwner
  Returns the component that owns the object instance.

• getId
  Returns the unique identifier of the object instance.

• setObject
  The operation sets the referenced object to the same reference as the given
  object.

• getField
  Gets the value of the referenced public field.

• callMethod
  Calls a method of the object instance.

Clause 8.5.4.1 TCI-TL provided

The TcITLProvided interface is to be extended:

package org.etsi.ttcn.tci;
public interface TcITLProvided {
  public void tliObjCreateEnter(String am, int ts, String src, int line, TriComponentId c,
  QualifiedName className, ObjectInstance obj, TciParameterList tciPars);
}
7.7 Extensions to clause 9 of ETSI ES 201 873-6 ANSI C language mapping

Clause 9.2 Data

Table 5 is to be extended.

7.8 Extensions to clause 10 of ETSI ES 201 873-6 C++ language mapping

Clause 10.5.2.14 TciTypeClass

This clause is to be extended.

typedef enum {
   TCI_ADDRESS = 0,
   TCI_ANYTYPE = 1,
   TCI_BITSTRING = 2,
   TCI_BOOLEAN = 3,
   TCI_CHARSTRING = 5,
   TCI_COMPONENT = 6,
   TCI_ENUMERATED = 7,
   TCI_FLOAT = 8,
   TCI_HEXSTRING = 9,
   TCI_INTEGER = 10,
   TCI_OCTETSTRING = 12,
   TCI_RECORD = 13,
   TCI_RECORD_OF = 14,
   TCI_ARRAY = 15,
   TCI_SET = 16,
   TCI_SET_OF = 17,
   TCI_UNION = 18,
   TCI_IGNORED = 19,
   TCI_RECORD_OF = 14,
   TCI_ANYTYPE = 1,
   TCI_UNSPECIFIED = 255
} TciTypeClass;

Clause 10.5.3.23 Class

This clause is to be added.

TTCN-3 class support. It is mapped to the following pure virtual class:

class TciClass : public virtual TciType {
public:
   virtual ~TciClass (){
   virtual ObjectInstance * create(const TriComponentId & c, TciParameterList & tciPars) =0;
   virtual const std::vector<TciClass*> & getSuperclasses () const =0;
   virtual const std::vector<Tcstring*> & getFieldNames () const =0;
   virtual const std::vector<Tcstring*> & getMethodNames () const =0;
   virtual const TciParameterTypeList & getConstructorParmeters () const =0;
   virtual const TciType & getMemberType (const Tstring & name) const =0;
   virtual E TciClass * clone () const =0;
   virtual E operator< (const TciClass &p_content) const =0;
}

Methods:

~TciClass
   Destructor
create
   Calls the constructor to create a new instance of this class using the supplied parameters for the specified component
getSuperclasses
   Returns the superclasses of the current class
getFieldNames
   Returns the names of all public fields defined in the class
getMethodNames
   Returns the names of all public methods of the class
getConstructorParmeters
   Returns formal parameters of the class constructor
getMethodParameters
  Returns formal parameters of the specified public method
getFieldType
  Returns the type of the specified public field
getMethodReturnValue
  Returns the return type of specified public method or the distinct value null if no return value is defined
operator==
  Returns true if both objects are equal
clone
  Return a copy of the matching mechanism
operator<
  Operator < overload

**Clause 10.5.3.24  ObjectInstance**

This clause is to be added.

TTCN-3 implication and exclusion matching mechanism support. It is mapped to the following pure virtual class:

```cpp
class ObjectInstance : public virtual TciValue {
public:
  virtual ~ObjectInstance () ;
  virtual const TriComponentId & getOwner () const =0;
  virtual const TString & getId () const =0;
  virtual void setObject (ObjectInstance & val) =0;
  virtual TciValue * getField (const TString & fieldName) =0;
  virtual Value callMethod(const TString & methodName, TciParameterList & tciPars) =0;
  virtual Tboolean operator== (const ObjectInstance &p_obj) const =0;
  virtual ObjectInstance * clone () const =0;
  virtual Tboolean operator< (const ObjectInstance &p_content) const =0;
};
```

**Methods:**

- ~ObjectInstance
  Destructor
- getOwner
  Returns the component that owns the object instance
- getId
  Returns the unique identifier of the object instance
- setObject
  The operation sets the referenced object
- getField
  Returns the value of the referenced public field
- callMethod
  Calls a method of the object instance
- operator==
  Returns true if both objects are equal
- clone
  Return a copy of the matching mechanism
- operator<
  Operator < overload

**Clause 10.5.3.25  ClassSeq**

This clause is to be added.

The ClassSeq abstract data type is mapped to `std::vector<TciClass*>`.

**Clause 10.6.4.1  TciTIProvided**

This clause is to be extended.

//Called by TE to log the entering of a constructor
virtual void tliObjCreateEnter (const TString &am, const timeval ts, const TString &src, const Tinteger line, const TriComponentId *c, const QualifiedName *className, const ObjectInstance *obj, const TciParameterList *tciPars)=0;

//Called by TE to log the leaving of a constructor
virtual void tliObjCreateLeave (const TString &am, const timeval ts, const TString &src, const Tinteger line, const TriComponentId *c, const QualifiedName *className, const ObjectInstance *obj, const TciParameterList *tciPars)=0;
7.9 Extensions to clause 11 of ETSI ES 201 873-6 W3C XML mapping

Clause 11.3.3.30 ObjectInstance

Object Instance type is mapped to the complex type specified below. The content of the XML elements based on the ObjectInstance type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1 of ETSI ES 201 873-6 [4]):

```
<xsd:complexType name="ObjectInstance">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

Items:

- **BaseValue**
  Object instance content described in clause 11.3.3.1 of ETSI ES 201-873-6

- **ValueAtts**
  Value attributes described in clause 11.3.3.1 of ETSI ES 201-873-6

Clause 11.4.2.1 TCI-TL provided

This clause is to be extended.

```
<xsd:complexType name="tliObjCreateEnter">
  <xsd:complexContent mixed="true">
  </xsd:complexContent>
</xsd:complexType>
```
<xsd:extension base="Events:Event">
  <xsd:sequence>

        <xsd:element name="className" type="Types:QualifiedName" />
        <xsd:element name="obj" type="Values:ObjectInstance" />
        <xsd:element name="methodName" type="SimpleTypes:TString" />
        <xsd:element name="tciPars" type="Types:TciParameterListType" minOccurs="0"/>
        <xsd:element name="returnValue" type="Values:Value" minOccurs="0"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>

<xsd:complexType name="tliObjVar">
  <xsd:complexContent mixed="true">
    <xsd:extension base="Events:Event">
      <xsd:sequence>
        <xsd:element name="className" type="Types:QualifiedName" />
        <xsd:element name="obj" type="Values:ObjectInstance" />
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
7.10 Extensions to clause 12 of ETSI ES 201 873-6 C# language mapping

Clause 12.4.2.4 TciTypeClassType

This clause is to be extended.

TciTypeClassType is mapped to the following enumeration:

```csharp
public enum TciTypeClass {
    Address = 0,
    Anytype = 1,
    Bitstring = 2,
    BooleanType = 3,
    Charstring = 5,
    Component = 6,
    Enumerated = 7,
    ...}
```
Clause 12.4.7  Abstract class mapping

This clause is to be added.

The IDL type **Class** is mapped to the following interface:

```java
// TCI IDL Type
package org.etsi.ttcn.tci;
public interface ITciClass : ITciType {
    ITciObjectInstance Create (ITriComponentId c, ITciParameterList tciPars);
    ITciClass[] Superclasses { get; }
    String[] FieldNames { get; }
    String[] MethodNames { get; }
    ITciParameterTypeList ConstructorParameters { get; }
    ITciParameterTypeList GetMethodParameters (String methodName);
    ITciType GetFieldType (String name);
    ITciType GetMethodReturnType (String methodName);
}
```

**Methods:**
- **Create**
  Calls the constructor to create a new instance of this class using the supplied parameters for the specified component.

- **Superclasses**
  Returns the list of superclass of the current.

- **FieldNames**
  Returns the names of all public fields defined in the class.

- **MethodNames**
  Returns the names of all public methods of the class.

- **ConstructorParameters**
  Returns formal parameters of the class constructor.

- **GetMethodParameters**
  Returns formal parameters of the specified public method.

- **GetFieldType**
  Returns the type of the specified public field.

- **GetMethodReturnType**
  Returns the return type of specified public method or the distinct value `null` if no return value is defined.

Clause 12.4.8  ClassSeq mapping

This clause is to be added.

The **ClassSeq** abstract data type is mapped to **ITciClass[]**.

Clause 12.4.4.16  ObjectInstance

This clause is to be added.

The IDL type **ObjectInstance** is mapped to the following interface:

```java
public interface ITciObjectInstance : ITciValue {
    ITciComponentId Owner { get; }
    String    Id { get; }
```
Methods:

- **Owner**
  Returns the component that owns the object instance.

- **Id**
  Returns the unique identifier of the object instance.

- **SetObject**
  The operation sets the referenced object.

- **GetField**
  Returns the value of the referenced public field.

- **CallMethod**
  Calls a method of the object instance.

**Clause 12.5.4.1 TCI-TL provided**

The ITciTLProvided interface is to be extended:

```java
public interface ITciTLProvided {
    ...
    void TliObjCreateEnter(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj,
                            ITciParameterList tciPars);
    void TliObjCreateLeave(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj,
                            ITciParameterList tciPars);
    void TliObjFinallyEnter(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj);
    void TliObjFinallyLeave(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj);
    void TliObjMethodEnter(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string methodName,
                            ITciParameterList tciPars);
    void TliObjMethodLeave(string am, System.DateTime ts, string src, int line,
                            ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string methodName,
                            ITciParameterList tciPars, ITciValue returnValue);
    void TliObjVar (string am, System.DateTime ts, string src, int line,
                    ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string name,
                    ITciValue value);
    void TliObjGetEnter(string am, System.DateTime ts, string src, int line,
                        ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string propertyName);
    void TliObjGetLeave(string am, System.DateTime ts, string src, int line,
                        ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string propertyName,
                        ITciValue returnValue);
    void TliObjSetEnter(string am, System.DateTime ts, string src, int line,
                        ITriComponentId c, IQualifiedName className, ITciObjectInstance obj, string propertyName,
                        ITciValue value);
    void TliObjSetLeave(string am, System.DateTime ts, string src, int line,
                        ITriComponentId c, IQualifiedName className, ITciObjectInstance obj);
    ...
}
```

8 XTRI Extensions for the Package (optional)

8.1 Changes to clause 5.6.3 of ETSI ES 201 873-5

Miscellaneous operations

**Clause 5.6.3.4 triExternalCreate → xtriExternalCreate**

| Signature | TriStatusType xtriExternalCreate(
|           | TriClassIdType classId,
|           | inout TciParameterListType parameterList,
|           | out TriObjHandleType createdObject) |
### In Parameters
- **classId**: identifier of the external class

### Out Parameters
- **createdObject**: handle to the created object

### InOutParameters
- **parameterList**: a list of **encoded** parameters for the indicated constructor. The parameters in `parameterList` are ordered as they appear in the TTCN-3 constructor declaration.

### Return Value
- The return status of the `xtriExternalCreate` operation. The return status indicates the local success (**TRI_OK**) or failure (**TRI_Error**) of the operation.

### Constraints
- This operation is called by the TE when it invokes a constructor specified in a class which is defined as external in TTCN-3.
- In the invocation of a `xtriExternalCreate` operation by the TE all **in** and **inout** constructor parameters contain **encoded** values. No error shall be indicated by the PA in case the value of any **out** parameter is non-null.

### Effect
- The PA shall implement the behaviour for each external class specified in the TTCN-3 ATS. On invocation of this operation, the PA shall invoke the constructor of a class indicated by the identifier `classId`. It shall access the specified **in** and **inout** constructor parameters in `parameterList`, create a new external object instance using the values of these parameters, and compute values for **inout** and **out** parameters in `parameterList`. The operation shall then return **encoded** values for all **inout** and **out** constructor parameters and a handle to the created external object.
- The `xtriExternalCreate` operation returns **TRI_OK** if the PA completes the constructor of the external class successfully, **TRI_Error** otherwise. In the latter case, the distinct value `null` shall be returned as the object handle.
- Note that whereas most of other TRI operations are considered to be non-blocking, the `xtriExternalCreate` operation is considered to be **blocking**. That means that the operation shall not return before the construction of the external object has been finished. External constructors have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.

### Clause 5.6.3.6 \( \text{triExternalMethod} \rightarrow \text{xtriExternalMethod} \)

| Signature | TriStatusType xtriExternalMethod(  
|-----------|----------------------------------------------------------  
| In Parameters |   in TriObjHandleType handle,  
|             |   in String methodName,  
|             |   inout TciParameterListType parameterList,  
|             |   out TciParameterType returnValue)  
| Out Parameters | returnValue (optional) **encoded** return value  
| InOutParameters | parameterList a list of **encoded** parameters for the indicated method. The parameters in `parameterList` are ordered as they appear in the TTCN-3 method declaration.  
| Return Value | The return status of the `xtriExternalMethod` operation. The return status indicates the local success (**TRI_OK**) or failure (**TRI_Error**) of the operation.  
| Constraints | This operation is called by the TE when it invokes a method specified in a class which is defined as external in TTCN-3.  
|             | In the invocation of a `xtriExternalMethod` operation by the TE all **in** and **inout** parameters contain **encoded** values. No error shall be indicated by the PA in case the value of any **out** parameter is non-null.  
| Effect | The PA shall implement the behaviour for each method of all external classes specified in the TTCN-3 ATS. On invocation of this operation, the PA shall call a method `methodName` of an external object whose handle is in the `handle` parameter. It shall access the specified **in** and **inout** method parameters in `parameterList`, pass the values of these parameters to the called method, and compute values for **inout** and **out** parameters in `parameterList`. The operation shall then return **encoded** values for all **inout** and **out** method parameters and the **encoded** return value.  
|             | If no return type has been defined for this method in the TTCN-3 ATS, the distinct value `null` shall be used for the latter.  
|             | The `xtriExternalMethod` operation returns **TRI_OK** if the PA completes the method of the external object successfully, **TRI_Error** otherwise.  
|             | Note that whereas most of other TRI operations are considered to be non-blocking, the `xtriExternalMethod` operation is considered to be **blocking**. That means that the operation shall not return before the method call has been finished. Methods of external classes have to be implemented carefully as they could cause deadlock of test component execution or even the entire test system implementation.  

---

**ETSI**
Clause 5.6.3.7  triRaiseException → xtriRaiseException

<table>
<thead>
<tr>
<th>Signature</th>
<th>void xtriRaiseException(in Value exc)</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Parameters</td>
<td>exc</td>
</tr>
<tr>
<td>Constraints</td>
<td>This operation can be called by the PA during execution of triExternalFunction, triExternalCreate, triExternalFinally or triExternalMethod.</td>

8.2 Extensions to clause 6 of ETSI ES 201 873-5 Java™ language mapping

Clause 6.5.3.1 Changes to TriPlatformPA

This clause is to be extended.

```java
// TriPlatform
// PA -> TE
package org.etsi.ttcn.tri;
public interface xTriPlatformPA {
    // Ref: TRI-Definition 5.6.3.4
    public TriStatus triExternalCreate(TriClassIdType classId,
                                        TciParameterList parameterList,
                                        TriObjHandleWrapper handle);
    // Ref: TRI-Definition 5.6.3.6
    public TriStatus xtriExternalMethod(TriClassIdType handle,
                                         String methodName,
                                         TciParameterList parameterList,
                                         TciParameterType returnValue);
}
```

Clause 6.5.3.1 Changes to TriPlatformPA

This clause is to be extended.

```java
// TriPlatform
// TE -> PA
package org.etsi.ttcn.tri;
public interface xTriPlatformTE {
    // Ref: TRI-Definition 5.6.3.7
    public void triRaiseException(Value exc);
}
```

8.3 Extensions to clause 7 of ETSI ES 201 873-5 ANSI C language mapping

Clause 7.2.4 TRI operation mapping

This clause is to be extended.

8.4 Extensions to clause 8 of ETSI ES 201 873-5 C++ language mapping

Clause 8.6.3 TriPlatformPA

This clause is to be extended.

```cpp
class xTriPlatformPA {
public:
    //For each constructor on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus xtriExternalCreate (const TriClassId *classId, TciParameterList *parameterList, TriObjectHandle * handle)=0;
    //For each method on an external class specified in the TTCN-3 ATS implement the behaviour.
    virtual TriStatus xtriExternalMethod (TriObjectHandle handle, const Tstring & methodName, TciParameterList *parameterList, TciParameter *returnValue)=0;
};
```

Clause 8.6.4 TriPlatformTE

This clause is to be extended.

```cpp
class xTriPlatformTE {
public:
    //Raises an exception during execution of external code in PA
    virtual void xtriRaiseException (const TciValue *exc)=0;
};
```

8.5 Extensions to clause 9 of ETSI ES 201 873-5 C# language mapping

Clause 9.5.2.3 TriPlatformPA

This clause is to be extended.

```csharp
public interface IXTriPlatformPA {
    // Miscellaneous operations
    // Ref: TRI-Definition clause 5.6.3.4
    TriStatus XTriExternalCreate(ITriClassId classId, ITCiParameterList parameterList, out object handle);
    // Ref: TRI-Definition clause 5.6.3.6
    TriStatus XTriExternalMethod(object handle, string methodName, ITCiParameterList parameterList, ITCiParameter returnValue);
}
```

Clause 9.5.2.4 TriPlatformTE

This clause is to be extended.

```csharp
public interface IXTriPlatformTE {
    // Ref: TRI Definition clause 5.6.3.7
    void XTriRaiseException(ITciValue exc);
}
```
Annex A (normative):
BNF and static semantics

### A.1 Extensions to TTCN-3 terminals

The list of reserved terminals which are keywords in table A.3 in ETSI ES 201 873-1 [1] needs to be extended with `class, finally, object` and `this`. The extension of table A.3 in ETSI ES 201 873-1 [1], clause A.1.5.0 is shown below.

<table>
<thead>
<tr>
<th>action</th>
<th>fail</th>
<th>noblock</th>
<th>select</th>

A.2 Modified TTCN-3 syntax BNF productions

This clause includes all BNF productions that are modifications of BNF rules defined in the TTCN-3 core language document ETSI ES 201 873-1 [1]. When using this package the BNF rules below replace the corresponding BNF rules in the TTCN-3 core language document. The rule numbers define the correspondence of BNF rules.

**BNF changes in clause A.1.6.1.1 Type definitions**

12. StructuredTypeDef ::= RecordDef | UnionDef | SetDef | RecordOfDef | SetOfDef | EnumDef | PortDef | ComponentDef | ClassDef

**BNF Changes in clause A.1.6.1.3 Template Definitions**

100. FieldSpec ::= ( FieldReference | FunctionInstance ) AssignmentChar (TemplateBody | Minus)

**BNF changes in clause A.1.6.1.4 Function definitions**

158. FunctionDef ::= FunctionKeyword [ DeterministicModifier | ControlModifier ] IdentifierOrControl "(" [ FunctionFormalParList ] ")" [ RunsOnSpec ] [ MtcSpec ] [ SystemSpec ] [ ReturnType ] [ ExceptionSpec ] StatementBlock

169. StatementBlock ::= BasicStatementBlock [ CatchBlocks ] [ FinallyBlock ]

176. FunctionRef ::= [ ( Identifier | ObjectInstance ) Dot ] ( Identifier | PreDefFunctionIdentifier )

**BNF changes in clause A.1.6.1.6 Testcase definitions**

185. TestcaseDef ::= TestcaseKeyword Identifier "(" [ TemplateOrValueFormalParList ] ")" ConfigSpec StatementBlock

**BNF changes in clause A.1.6.1.7 Altstep definitions**

192. AltstepDef ::= AltstepKeyword [ ControlModifier ] [ InterleaveKeyword ] Identifier "(" [ FunctionFormalParList ] ")" [ RunsOnSpec ] [ MtcSpec ] [ SystemSpec ] [ ExceptionSpec ] "(" AltstepLocalDefList AltGuardList ")" [ CatchBlocks ] [ FinallyBlock ]

**BNF changes in clause A.1.6.1.10 External function definitions**

235. ExtFunctionDef ::= ExtKeyword FunctionKeyword [ DeterministicModifier | ControlModifier ] Identifier "(" [ FunctionFormalParList ] ")" [ ReturnType ] [ ExceptionSpec ]

**BNF changes in clause A.1.6.3.1 Variable instantiation**

257. SingleVarInstance ::= [ PropertyModifier ] Identifier [ ArrayDef ] [ AssignmentChar Expression ] [ PropertyBody ]

/* STATIC PropertyBody shall only be present if PropertyModifier is also present */

260. SingleTempVarInstance ::= [ PropertyModifier ] Identifier [ ArrayDef ] [ AssignmentChar TemplateBody ] [ PropertyBody ]

/* STATIC PropertyBody shall only be present if PropertyModifier is also present */

261. ValueRef ::= [ ThisOp Dot ] Identifier [ ExtendedFieldReference ]

**BNF changes in clause A.1.6.4.1 Component Operations**

267. CreateOp ::= Type Dot CreateKeyword [ ActualParList ] [ AliveKeyword ] [ ExternalKeyword ActualParList ]
BNF changes in clause A.1.6.5 Type

400. PredefinedType ::= BitStringKeyword | BooleanKeyword | CharStringKeyword | UniversalCharString | IntegerKeyword | OctetStringKeyword | HexStringKeyword | VerdictTypeKeyword | FloatKeyword | AddressKeyword | DefaultKeyword | AnyTypeKeyword | TimerKeyword | ObjectKeyword

/* STATIC SEMANTICS – The TemplateInstance shall evaluate to an explicit value. */
Annex B (normative):
Standard Collections

B.1 The TTCN3_standard_collections module

B.1.0 General

The classes and external functions defined in this module provide users with the following commonly used data structures.

```java
module TTCN3_standard_collections {

  function instanceEqual(object element1, object element2) return boolean {
    return element1 == element2
  }

  public external function createLinkedList(in equalsFunctionType equalsFunction := instanceEqual) return LinkedList;
  public external function createQueue(in equalsFunctionType equalsFunction := instanceEqual) return Queue;
  public external function createPriorityQueue(in comparatorFunctionType comparatorFunction) return PriorityQueue;
  public external function createStack(in equalsFunctionType equalsFunction := instanceEqual) return Stack;
  public external function createRingBuffer(in integer maxSize) return RingBuffer;
  public external function createHashMap(in hashFunctionType hashFunction, in equalsFunctionType equalsFunction) return HashMap;
  public external function createSet(in equalsFunctionType equalsFunction := instanceEqual) return Set;

  public type class @abstract Exception {
  }

  type class @abstract Iterator {
    function @abstract hasNext() return boolean;
    function @abstract next() return object;
  }

  type class @abstract Collection {
    function size() return integer;
    function contains(object element) exception Exception return boolean;
    function @abstract iterator() return Iterator;
  }

  type class @abstract List extends Collection {
    public function @abstract add(object element) exception Exception;
    public function @abstract remove(object element) exception Exception return boolean;
    public function @abstract get(integer index) exception Exception return object;
  }

  public type class @abstract LinkedList extends List {
    public function @abstract getFirst() exception Exception return object;
    public function @abstract getLast() exception Exception return object;
    public function @abstract removeFirst() exception Exception return object;
    public function @abstract removeLast() exception Exception return object;
    public function @abstract addFirst(object element) exception Exception;
    public function @abstract addLast(object element) exception Exception;
  }

  public type class @abstract Queue extends Collection {
    public function @abstract add(object element) exception Exception;
    public function @abstract remove() exception Exception return object;
  }

  public function @abstract comparatorFunctionType(in object element1, in object element2) exception Exception return integer;

  public type class @abstract PriorityQueue extends List {
    public function @abstract push(object element) exception Exception;
    public function @abstract pop() exception Exception return object;
  }

  public type class @abstract RingBuffer extends Collection {
    public function @abstract put(object element) exception Exception;
    public function @abstract get() exception Exception return object;
    public function @abstract capacity() return integer;
  }
}
```
public type function hashFunctionType(in object element) exception Exception return integer;
public type function equalsFunctionType(in object element1, in object element2) exception Exception return boolean;

public type class @abstract HashMap {
    public function @abstract put(object keyElement, object valueElement) exception Exception;
    public function @abstract get(object keyElement) exception Exception return object;
    public function @abstract containsKey(object keyElement) return boolean;
    public function @abstract remove(object keyElement) exception Exception return object;

    public function @abstract keySet() return Set;
    public function @abstract values() return List;
    public function @abstract size() return integer;
}

public type class @abstract Set extends Collection {
    public function @abstract add(object element) exception Exception return boolean;
    public function @abstract remove(object element) exception Exception;
}

B.1.1 The Collection class

The abstract Collection class represents a data structure that is a collection of elements. It is used as a base class of more specific collection data structures like lists and sets.

External function and class methods:
- size
  Returns the number of elements stored in the LinkedList.
- contains
  Returns the value true if the given element is contained at least once in the collection.
- iterator
  Returns an Iterator object for iterating over the elements of the collection.

B.1.2 The List class

The abstract List class represents a list of elements where each contained element has an index (starting from 0).

External function and class methods:
- add
  Adds the given element to the list.
- remove
  Tries to remove one instance of the provided element from the List.
  Returns true if an element was removed, false if no elements were removed.
  Please note, that a List might contain the same element several times, in which case only one instance will be removed.
- get
  Gets the element at the given index from the list, if the index in in the range (0 .. size()-1).

B.1.3 The LinkedList class

The abstract LinkedList class represents a double linked data structure for storing objects.
A new Instance can be created via the external function createLinkedList. It is derived from the abstract List class.

External function and class methods:
- createLinkedList
  Factory function for creating a new LinkedList instance.
• **getFirst**
  Returns the first element of the LinkedList if it is not empty.
  Raises an exception if the LinkedList is empty.

• **getLast**
  Returns the last element of the LinkedList if it is not empty.
  Raises an exception if the LinkedList is empty.

• **removeLast**
  Removes and returns the last element of the LinkedList if it is not empty.
  Raises an exception if the LinkedList is empty.

• **addFirst**
  Adds a new element as the first element of the LinkedList if this is possible.
  Raises an exception in case of error, for example: running out of memory.

• **addLast**
  Adds a new element as the last element of the LinkedList if this is possible.
  Raises an exception in case of error, for example: running out of memory.

• **iterator**
  Returns an iterator over the elements of this LinkedList.
  The elements are iterated from first to last.

• **size**
  Returns the number of elements stored in the LinkedList.

### B.1.4 The Queue class

The abstract **Queue** class represents a queue data structure for storing objects. This data structure uses a First In First Out semantics, meaning that the element added first will also be the element removed first. It is derived from the abstract class Collection.

A new Instance can be created via the external function **createQueue**.

External function and class methods:

• **createQueue**
  Factory function for creating a new Queue instance.

• **add**
  Adds an element to the end of the Queue if this is possible.
  Raises an exception in case of error, for example: running out of memory.

• **remove**
  Removes and returns the first element of the Queue if it is not empty.
  Raises an exception if the Queue is empty.

• **size**
  Returns the number of elements stored in the Queue.

### B.1.5 The PriorityQueue class

The abstract **PriorityQueue** class represents a priority queue data structure for storing objects. This data structure stores its elements ordered according to the comparator function. This data structure does not allow null elements.

A new Instance can be created via the external function **createPriorityQueue**. It is derived from the class Queue.

External function and class methods:

• **createPriorityQueue**
  Factory function for creating a new.PriorityQueue instance.

• **comparatorFunctionType**
  Used to compare the 2 provided elements for their ordering.
  Returns a negative integer if the element1 is less than element2.
Returns 0 if the element1 is equivalent to element2.

Return a positive integer if element1 is greater than element2.

Functions of this type can also raise an exception, for example if the object received as one of their actual parameters is not of the expected class.

- **add**
  Adds an element to the PriorityQueue if this is possible. The element will be added before all elements that are greater than the element and after all elements that are smaller than or equal to the element. Thereby it is ensured that always the smallest element first added to the queue is at the head of the queue.

  Raises an exception in case of error, for example: running out of memory or adding a null object.

- **remove**
  Removes and returns the head element of the PriorityQueue if it is not empty. The head element has the lowest priority among the elements of the PriorityQueue.

  Raises an exception if the PriorityQueue is empty.

- **size**
  Returns the number of elements stored in the PriorityQueue.

### B.1.6 The Stack class

The abstract **Stack** class represents a stack data structure for storing objects. This data structure uses a Last In First Out semantics, meaning that the element added last will also be the element removed first.

A new Instance can be created via the external function **createStack**.

External function and class methods:

- **createStack**
  Factory function for creating a new Stack instance.

- **push**
  Pushes an element onto the Stack if this is possible.

  Raises an exception in case of error, for example: running out of memory.

- **pop**
  Removes and returns the element inserted last from the Stack if it is not empty.

  Raises an exception if the Stack is empty.

- **size**
  Returns the number of elements stored in the Stack.

### B.1.7 The RingBuffer class

The abstract **RingBuffer** class represents a ringbuffer data structure for storing objects. This data structure uses a First In First Out semantics, with a fixed size limit. This means that the element added first will also be the element removed first. An instance of this collection can only accept elements to the maximum amount it is created for.

A new Instance can be created via the external function **createRingBuffer**.

External function and class methods:

- **createRingBuffer**
  Factory function for creating a new RingBuffer instance, with the provided maximum size.

- **put**
  Adds an element to the end of the RingBuffer if this is possible.

  Raises an exception in case of error, for example: reaching the maximum allowed size of the buffer.

- **get**
  Removes and returns the first element of the RingBuffer if it is not empty.

  Raises an exception if the RingBuffer is empty.

- **size**
  Returns the number of elements stored in the RingBuffer.
• capacity
  Returns the maximum capacity of the RingBuffer.

B.1.8 The HashMap class

The abstract HashMap class represents a hashmap data structure for storing key-value pairs of objects. This collection can be indexed with the keyElement part of the pair, to receive the valueElement of the pair. Please note that each key has to be unique according to the given equalsFunction.

A new Instance can be created via the external function createHashMap. The hash value of the keyElement object can be calculated using the provided hashFunctionType function and the equality of two given keyElements can be determined using the provided equalsFunctionType function.

External function and class methods:

• createHashMap
  Factory function for creating a new HashMap instance, that will use the provided hashFunction for calculating the hash values of the key element objects and an equalsFunction for determining the equality of keys. The two functions need to fulfil the property that for all pairs of objects o1, o2, if equalsFunction(o1,o2) is true then also hashFunction(o1)==hashFunction(o2) is true.

• hashFunctionType
  A behaviour type allowing the user of the collection to provide their implementation for calculating the hash value of their key element objects. Functions of this type will be called with a key element object as their only parameter and shall return an integer value that represents the hash value of the object. Functions of this type can also raise an exception, for example if the object received as their actual parameter is not of the expected class.

• equalsFunctionType
  A behaviour type allowing the user of the collection to provide their implementation with an equality relation between key objects insofar that different object instances of the same content can be seen as equal which allows to ensure the uniqueness property for the keys as there can be no two different key instances k1, k2 where equalsFunction(k1,k2) is true.

• put
  Adds a new keyElement - valueElement pair to the HashMap. If the HashMap already contains a pair with the same keyElement, the old pair is removed before inserting the new pair. Raises an exception in case of error, for example: running out of memory.

• get
  Returns the valueElement part of a keyElement - valueElement pair in the HashMap, if such a pair with the provided keyElement object exists in the HashMap. Raises an exception if the HashMap has no keyElement - valueElement pair with the provided keyElement.

• containsKey
  Returns true if the HashMap contains a keyElement - valueElement pair with the provided keyElement, false otherwise. Raises an exception in case of error, for example the hashFunction raised an exception.

• remove
  Removes a keyElement - valueElement and returns the valueElement part of a keyElement - valueElement pair in the HashMap, if such a pair with the provided keyElement object exists in the HashMap. Raises an exception in case of error, for example the hashFunction raised an exception.

• keyset
  Returns a Set object containing a set of the keyElements of all the keyElement - valueElement pairs in the HashMap.

• values
  Returns a List object containing the valueElement objects of all the keyElement - valueElement pairs in the HashMap.
• \textit{size}
  Returns the number of pairs stored in the HashMap.

\subsection*{B.1.9 The Set class}

The abstract \textit{Set} class represents a set data structure for storing objects. This data structure is unordered and contains unique elements.

A new Instance can be created via the external function \textit{createSet}.

External function and class methods:

\begin{itemize}
  \item \textit{createSet}
    Factory function for creating a new Set instance. It may be passed an equalsFunction to determine equality and ensure uniqueness of the contained set elements. Per default, instance equality is used.
  
  \item \textit{add}
    Adds an element to the Set if this is possible.
    Returns true if the element could be added, returns false if the element was already present in the set and so was not added (to ensure uniqueness).
    Raises an exception in case of error, for example: running out of memory.
  
  \item \textit{remove}
    Removes the provided element from the Set if it is present in the set.
    Returns true if the element was located in the Set, false otherwise.
    Subclasses might raise an exception.
  
  \item \textit{contains}
    Returns true if the Set contains the element, \texttt{false} otherwise.
    Subclasses might raise an exception.
  
  \item \textit{iterator}
    Returns an iterator over the elements of this Set.
    The elements are not iterated in any particular order.
  
  \item \textit{size}
    Returns the number of elements stored in the Set.
\end{itemize}

\subsection*{B.1.10 The Exception class}

The abstract \textit{Exception} class represents a generic exception that can be raised by standard collections.

Please note, that later the list of raised exception can be updated with more specific exceptions.

\subsection*{B.1.11 The Iterator class}

The abstract \textit{Iterator} class represents an iterator over a collection. An instance of the Iterator class allows to iterate over the elements of a collection.

Class methods:

\begin{itemize}
  \item \textit{hasNext}
    Returns true if the iterated collection still has elements not yet visited by the iterator.
  
  \item \textit{next}
    Returns the next element in the collection and steps the iterator for the upcoming collection.
    Raises an exception if the collection has no more elements not yet visited.
\end{itemize}
