1 Scope

The purpose of this document is to provide a basic guide to the standards for the European ISDN. ETSI has published or will publish both European Telecommunication Standards (ETSS) or ETSI Technical Reports (ETRs) to specify or provide guidance on the services and standards for the European ISDN. This document therefore identifies the services and standards required and provides an overview of the structure, inter-relationship of the ETSS/ETRs. It does not indicate the status of the various ETSS/ETRs.

This basic guide has been produced by the ISDN Standards Management Group (ISM).

2 Background to the ISDN - CCITT Recommendations

An ISDN is a network providing end-to-end digital connectivity to support a wide range of telecommunication services. These services include voice and non-voice services to which customers have access by a small set of standard user-network interfaces.

The CCITT has prepared, in the I-Series, Recommendations which provide principles and guidelines on the ISDN concept, as well as detailed specifications. Information about the ISDN concept can be found in the following CCITT Recommendations:

- I.112 defines those terms that are considered essential to the understanding and application of the principles of an ISDN.
- I.120 describes the concept, principles and structure of an ISDN.
- I.130 provides a method for describing telecommunication services (3 stage methodology).
- I.210.2 includes the description of the principles for defining telecommunication services supported by an ISDN including the concept of bearer services, teleservices and supplementary services.
- I.310 describes the ISDN network functional principles.
- I.410 describes general aspects and principles relating to the user-network interface.

Based on these principles the European Commission has embarked on a European ISDN.

3 The Memorandum of Understanding (MOU) and the ETSI work programme

In 1989 a MOU was agreed and signed between European Network Operators to enable European ISDN services to be offered across Europe in 1992. This includes a minimum set of services which all signatories will provide (indicated with a * in table 1). This MOU requires:

- standards for a common range of services which all signatories will follow;
- standards for user-network interfaces and protocols having the objective of enabling any customer equipment implemented to the required standards to be connected to and operated with the ISDN provided by each party (terminal interchangeability);
- standards for interconnecting national systems in order to provide international services.

Recognizing the needs of the MOU, thereby taking into account the requirements of private networks, but also bearing in mind the limited resources available, ETSI/SRC proposed a set of services and standards that would need to be established for the launching of the European ISDN in 1992 (see table 1).

Table 1: Services and standards

<p>End-to-end protocols for the services mentioned above</p>
<p>Network capabilities for the services mentioned above</p>

4 Commonality between public and private ISDN standardisation

As a basic objective, the ISDN standards, in particular those covering service descriptions, have been designed to be common to both public and private ISDNs.

The principle of terminal interchangeability is to ensure that a terminal shall be (as far as possible) capable of participating in services independent of the actual network to which it is attached, i.e. different national ISDNs, private ISDNs, etc.

However, the ETSs describing a European ISDN include options which:

- cover historical variants of services and their usage in individual countries;
- allow for innovation.

Interworking between networks is assured.

The ETSs also cover interworking of the European ISDN with private ISDNs which support identical or similar services to those of the public ISDN.

Again, whenever terminal interchangeability between public and private ISDNs might be affected, appropriate listings can be found in annexes to the public and private ISDN standards.

For the definition of terminal interchangeability and for the guidance on achieving terminal interchangeability see Annex B.

For the principles of alignment of standardisation between public and private ISDNs see Annex C.

Annex D gives the list of abbreviations used in this document.

5 Attachment testing

An EC Council Directive (83/189/EEC) specified that in EEC countries, until 6th November 1992, a harmonised attachment testing regime would exist. This was also accepted by the EFTA countries. The basis for this testing would be Normes Européennes de Télécommunications (NETs), which would be produced by ETSI as ETSs.

From 6th November 1992, a new EC Council Directive (91/263/EEC) comes into force; a harmonised attachment testing regime will still exist throughout Europe, but the basis for testing will be Common Technical Regulations (CTRs). The technical content of the CTRs will be developed by ETSI as Technical Basis for Regulations (TBRs); a TBR will contain all the technical aspects of the CTR but the CTR will also contain regulatory aspects.

The requirements for ISDN TBRs are very slightly different from those for the NETs. Relevant work items on TBRs have been identified as NOTES to Clause 7 and to the tables that form Annex A of this ETR.

Until these TBRs are agreed, an interim approval regime may be adopted by National Standards Organisations based upon the ETSs developed by ETSI as Candidate NETs.

6 General organisation of ETSs/ETRs and numbering scheme for ETSs

6.1 Numbering

Numbers for ISDN ETSs (and all other ETSs) will commence from 300 001 and will be allocated on a consecutive basis, ETSs with such numbers can be purchased from the appropriate national standards body. ETSI has decided that no gaps should be left in any ETS numbering scheme, therefore numbers will not relate to any organisational structure. Until such numbers have been allocated by ETSI a temporary code has been given which uniquely identifies the draft ETS. ETRs are also identified by a unique code.

6.2 Titles

The title of each ISDN ETS consists of three elements:

- an introductory element indicating the general field to which the standard belongs (e.g. "Integrated Services Digital Network (ISDN)");
- a main element indicating the principle subject treated within that general field (e.g. name of telecommunication service such as "Explicit Call Transfer (ECT) supplementary service"; name of interface type such as "Basic user-network interface");
- a complementary element indicating the particular aspect of the principle subject or giving details which distinguish the standard from other standards, or one part from other parts of the same standard (e.g. if a telecommunication service the type of description according to CCITT Recommendation I.130 such as "Service description"; if an interface type the name of the protocol layer such as "data link layer protocol specification for the control plane").

6.3 Structure

This section provides a structure and framework for understanding the inter-relationships between the ISDN ETSs/ETRs.

The ETSs are grouped according to the field of their application. The Stage 1 and 2 descriptions are grouped by service (i.e. they differ from other similar standards because they define a different aspect of a service; changing the interface has no effect on these). Other ETSs including the Stage 3 descriptions are grouped by interface (i.e. they differ from other similar standards because they define a different aspect of an interface; changing the service supported has no effect on these).

In addition there are ETSs and ETRs that relate to network capabilities and others to the end-to-end protocols between terminal equipments.

The overview of the ISDN ETSs/ETRs is the following:

- 1 General
 - Includes this guideline document.
- 2 Service aspects
 - a) Stage 1 descriptions. Provide an overall description from the user's viewpoint.
 - b) Stage 2 descriptions. Identifies the functional capabilities and the information flows needed to support the service described in stage 1.

- c) Stage 3 descriptions. The user-network interface protocol standards in this group provide the specification of the signalling protocol at the user-network access to the public ISDN, as well as to private ISDNs for interworking with an attached private ISDN. The network control protocol standards in this group provide the specification of the signalling protocol at the international gateway between two public networks.

3 User-network interface aspects

Includes the specification of the user-network interface for service independent aspects e.g., safety, protection, electro-magnetic compatibility and maintenance.

4 ISDN interconnection interface

Includes the specification of the inter-exchange signalling system for service independent aspects of international gateways - CCITT Signalling System No. 7.

5 User equipment end-to-end protocols

Includes the specification of the end-to-end protocols for the bearer and teleservices.

6 Network aspects

Includes the ETSs/ETRs on:

- routing, numbering and addressing, and service interworking aspects;
- interworking aspects between terminals and networks.

7 Attachment requirements

For a description of attachment testing see Clause 5 of this ETR. Item 7 contains references to those ETSs which have been prepared as Candidate NETs.

NOTE: Conformance testing specifications are appropriate to all standards except Stage 1 and 2 descriptions; conformance to Stage 1 and Stage 2 is met by conformance to the Stage 3 standard and the end-to-end protocol standard if appropriate. Standards for the groups numbered 2 to 6 above may contain conformance testing specifications either as an integral part or a separate ETS. Where separate standards for conformance testing have been produced these are listed in the same group of standards as the requirements standard.

7 List of ETSs/ETRs according to structure

This section provides a list of ETSs/ETRs according to the structure given in section 5.3, Annex A compliments this section by providing the information contained in matrix form and also identifies relevant CCITT Recommendations.

The list below gives an ETS or ETR reference for each document. This reference does not indicate the status of the document. Information on the status can be obtained from ETSI Secretariat.

1 General

- 1.1 The ETSI basic guide on the European Integrated Services Digital Network ETR 010

2 Services

- 2.1 General aspects of interworking between public and private ISDNs for the provision of telecommunications services DE/NA-12243

2.2 Stage 1 descriptions

2.2.1 Basic services

2.2.1.1 Bearer services

- 2.2.1.1.1 Circuit-mode 64 kbit/s unrestricted ETS 300 108
- 2.2.1.1.2 Circuit-mode 3,1 kHz audio ETS 300 110
- 2.2.1.1.3 Packet-mode (X.31, case B)
 - 2.2.1.1.3.1 B-channel ETS 300 048
 - 2.2.1.1.3.2 D-channel ETS 300 049
 - 2.2.1.1.3.3 Packet Handler Interface (PHI) ETS 300 099
- 2.2.1.1.4 Circuit-mode speech ETS 300 109

2.2.1.2 Teleservices

- 2.2.1.2.1 Telephony 3,1 kHz ETS 300 111
- 2.2.1.2.2 Telefax G4 ETS 300 120
- 2.2.1.2.3 Teletex ETS DE/NA-12201
- 2.2.1.2.4 Telephony 7 kHz ETS DE/NA-12232
- 2.2.1.2.5 Syntax-based videotex ETS DE/NA-12239
- 2.2.1.2.6 Videotelephony ETS DE/NA-12231

2.2.2 Supplementary services

2.2.2.1 Number identification services

- 2.2.2.1.1 DDI ETS 300 062
- 2.2.2.1.2 MSN ETS 300 050
- 2.2.2.1.3 CLIP ETS 300 089
- 2.2.2.1.4 CLIR ETS 300 090
- 2.2.2.1.5 COLP ETS 300 094
- 2.2.2.1.6 COLR ETS 300 095

- 6 Network aspects
 - 6.1 Network capabilities
 - 6.1.1 Numbering addressing and routing
 - 6.1.1.1 Numbering and addressing in ISDN ETR 006
 - 6.1.1.2 Routing
 - 6.1.1.2.1 Routing for priority I and II services of the ISDN MOU for ISUP version 1 ETS 300 100
 - 6.1.1.2.2 Routing for MOU ISDN services covering Priority 1 & 2 services for ISUP Version 2 ETS DE/NA-22108
 - 6.1.1.3 Numbering and addressing for X.31 services ETR 020
 - 6.2 Terminal and network interworking aspects
 - 6.2.1 Terminal selection and compatibility checking principles for priority I and II services of the ISDN MOU ETR 026
 - 6.2.2 Interworking aspects of ISDN MOU services (Priority I and II services) ~~ETR 030~~ (withdrawn)
 - 7 Attachment requirements
 - 7.1 Basic rate
 - 7.1.1 Attachment requirements for Layer 1 and 2 basic access ETS 300 153 (NOTE 4)
 - 7.1.2 Attachment requirements for Layer 3 basic access ETS 300 104 (NOTE 4)
 - 7.2 Primary rate
 - 7.2.1 Attachment requirements for Layer 1, 2 and 3 primary rate access ETS 300 156 (NOTE 5)
 - 7.3 Terminal adaptors
 - 7.3.1 Attachment requirements for terminal adaptors to connect to an ISDN at the S/T reference point ETS 300 077

NOTE 4: This ETS will be replaced for the purposes of attachment testing by DTBR/TE-05003.

NOTE 5: This ETS will be replaced for the purposes of attachment testing by DTBR/BT-2035.

Annex A: ISDN services and specifications - matrix

A.1 Introduction

The tables contained in this annex list all the ETSs required for defining basic services (i.e. bearer and teleservices), supplementary services and network capabilities as required by the ETSI work programme for the European ISDN.

Each service is described in an entry matrix. The vertical entries are all specific parts where a given service can be defined. These are:

- Stage 1: This part is an overall description from the user's standpoint.
- Stage 2: This part is an overall description of the organization of the network functions to map service requirements into network capabilities.
- Stage 3a: This part is the definition of switching and signalling capabilities needed to support services at the access protocol ("a" stands for access).
- Stage 3n: This part is the definition of switching and signalling capabilities needed to support services in the network ("n" stands for network).
- Protocol: Under this item only user-plane protocol specifications are listed.

For each of these vertical entries there is a column where the relevant ETS specifying the requirements, conformance testing (Conf.) and attachment testing (Attach.) is entered. ETRs are also included where relevant, and there is a column for CCITT Recommendations (Rel.Rec.) related to the requirement's ETS.

The following key applies to entries in the matrices:

N/A Not applicable.

-- None.

NOTE 1: Generic procedures for supplementary services (stage 3a) are included in ETS 300 122 and ETS 300 196. Interactions between supplementary services are included in ETS 300 195.

NOTE 2: There are no additional requirements over and above the basic call control procedures specified in ETS 300 102-1. Therefore no additional ETS is required.

NOTE 3: Outside the scope of the ISM work programme.

NOTE 4: For equipment with ISDN interface.

NOTE 5: This ETS will be replaced for the purposes of attachment testing by DTBR/TE-05003.

NOTE 6: This ETS will be replaced for the purposes of attachment testing by DTBR/BT-2035.

NOTE 7: For identification of appropriate PICS and PIXIT proformas see Clause A.4.

NOTE 8: This ETS will be replaced for the purposes of attachment testing by DTBR/TE-04121.

A.2 Basic services

A.2.1 Circuit-mode 64 kbit/s unrestricted

Type: Bearer

Items	ETS/ETR	Conf.	Attach.	Rel. Rec
Stage 1	300 108	N/A	N/A	I.231.1
Stage 2	T/S 23-01	N/A	N/A	Q.71
Stage 3a	300 102-1 300 102-1/A1 300 102-2 ETR 018 (NOTE 7)	DI/SPS-5002 DE/SPS-5038 (NOTE 7)	300 104 300 156 (NOTE 5) (NOTE 6)	Q.931
Stage 3n	300 121	DE/SPS-6004	N/A	Q.767

A.2.2 Circuit-mode 3,1 kHz audio

Type: Bearer

Items	ETS/ETR	Conf.	Attach.	Rel.Rec.
Stage 1	300 110	N/A	N/A	I.231.3
Stage 2	T/S 23-01	N/A	N/A	Q.71
Stage 3a	300 102-1 300 102-1/A1 300 102-2 ETR 018 (NOTE 7)	DI/SPS-5002 DE/SPS-5038 (NOTE 7)	300 104 300 156 (NOTE 5) (NOTE 6)	Q.931
Stage 3n	300 121	DE/SPS-6004	N/A	Q.767
Protocol	300 084	300 084	--	G.711

A.2.3 Packet-mode (X.31 case B) B- and D- channel

Type: Bearer

Items	ETS/ETR	Conf.	Attach.	Rel.Rec.
Stage 1	300 048 300 049	N/A	N/A	I.232.1
Stage 2	T/S 23-03	N/A	N/A	--
Stage 3a	300 007	DE/SPS-5003	300 077	Q.931/ X.31
Protocol	300 007	DE/SPS-5003	300 077	X.31

NOTE: ETS 300 007 goes somewhat beyond stage 3 specification of the packet-mode switched bearer service in that it also includes specification of the X.25 Terminal Adaptor which is usually outside the scope of a stage 3 specification. In addition, some aspects of the stage 1 ETS (e.g. Packet Level Layer (PLL) access method on the D-channel) is not explicitly specified in ETS 300 007.

A.2.4 Circuit-mode speech

Type: Bearer

Annex B: Terminal interchangeability

B.1 Definition

The ability of a Terminal Equipment (TE) to be attached to any two network(s) accesses, A and B, if at least one interface of the terminal equipment, and all interface and network access related functions, can satisfy the functional requirements, or a subset of, applicable to network access A and the functional requirements, or a subset of, applicable to network access B, with minimal modification or re-configuration.

A functional subset of a standard provides a particular set of functions (e.g. call answering capabilities on terminal equipment). It shall be sufficient for a terminal equipment or network access to conform to functional subsets only.

Minimal modification or re-configuration is that amount of modification or re-configuration that could be expected to be performed by an unskilled user of that piece of terminal equipment. It therefore includes the possibility of software and hardware modifications simply implementable by unskilled users, but excludes re-configurations or modifications that would normally be performed by the terminal equipment supplier.

NOTE: The definition given above does not consider administrative and regulatory aspects pertinent to individual networks. In addition, the actual connection of a terminal to a network may require the action of the network operator, e.g. allocation of terminal identification, subscription to the relevant service, etc.

Further to the definition, in the ISDN environment, the network accesses are the terminal-to-public-ISDN accesses at the S/T reference point and the terminal-to-private-ISDN accesses at the S reference point.

Terminal interchangeability can be achieved, even if constrained to certain bearer services and/or teleservices and/or supplementary services. This depends upon the ability of the terminals and networks to provide the functions necessary to support those services. It therefore requires both the terminal and the network to provide, and to conform to, the functions standardised for the support of these services.

Terminals are expected to be interchanged between network(s) accesses that do not support particular bearer services, teleservices or supplementary services in a standardized manner. The user shall be able to determine which services are or are not supported when the terminal equipment is used on a particular network access.

B.2 Purpose

The ISDN provides a standard set of interfaces and services. The ISDN MOU defines a basic kernel set of ISDN service which all public ISDNs are expected to provide. It also allows for additional services to be provided as options. However, when these optional services are provided, they shall be provided in the standardised manner¹⁾. Thus when a terminal equipment is connected to an ISDN network access any service which is:

- a) provided by the network; and
- b) provided by the terminal equipment

it will operate correctly.

¹⁾ Any network operator/terminal provider may provide non-standardised services (and this is expected to be the norm in the early stages of ISDN implementation). However, terminal interchangeability cannot provide the user with a guaranteed operation of these non-standardised services.

The only reason why a service will not operate is if either:

- a) the service is not provided by the network; or
- b) the service is not provided by the terminal equipment.

A terminal equipment which supports standardised services may therefore be connected to any ISDN (public or private) at the access points X1, X2, X3 or X4 of figure 1.

Terminal interchangeability includes interchanging terminal equipments between two accesses:

- 1. on one public network;
- 2. on two different public networks;
- 3. on one private network;
- 4. on two different private networks;
- 5. one on a public network and one on a private network.

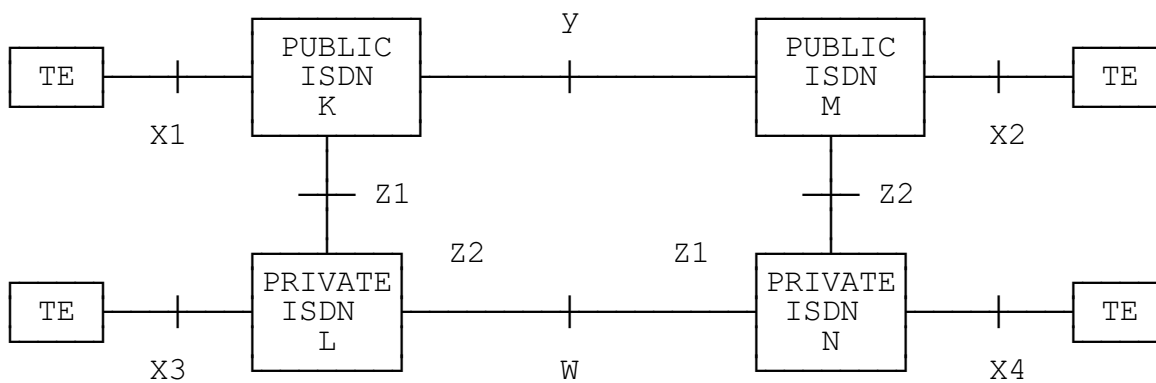

Figure 1¹⁾ : Access and interconnection points in ISDN concept

B.3 Achieving terminal interchangeability in the standardisation process

Practical terminal interchangeability requires that the standards defining the services of the ISDN are written in a manner which prevents deliberate (or accidental) selection of options within a standard which will prevent two implementations of a service, each of which conform to the standard, failing to interwork.

However, the definition should not prevent terminal equipment or network suppliers from choosing to support only a limited set of the options of a service.

Terminal interchangeability is prevented by ambiguity within Standards.

¹⁾ The interconnections W, Y and Z of figure 1 are not relevant to the subject of terminal interchangeability.

Standardisation of the services and interfaces at point W of figure 1 is the subject of work currently being undertaken by ECMA.

Standardisation of the interface at point Y in figure 1 is the subject of work currently being undertaken by ETSI.

The public ISDN access points (Z1 and Z2) in figure 1 may be different to the access points X1 and X2. Standardisation of the interfaces and services at the access points Z1 and Z2 would allow for ISPBX interchangeability.

It is assumed that an unskilled user would not perform the reconfigurations or modifications necessary to achieve ISPBX interchangeability.

In order to create apparatus that will allow terminal interchangeability, it is necessary for terminal and network equipment suppliers that:

- 1) all parts of standards related to network accesses and services be written in a manner that prevents misinterpretation and unintentional equipment differences;
- 2) all optional parts of standards related to network accesses and services be clearly identified as options, when they will affect the ability of terminals to be interchangeable or the network to support interchangeable terminal equipment;
- 3) on the basis of the options identified within the standard, the network operators explicitly define which options they support at which time and, when more than one option supported, how the options are defined. This will provide a "profile" of the network accesses and services;
- 4) on the basis of the options identified within the standards, terminal manufacturers explicitly define which options they support and, when more than one option is supported, how the options are to be used. This will provide a "profile of the terminal equipment in respect of all standards supported.

The users/purchasers of terminal equipment can then use the "profiles" of the terminal equipment and of the network(s) accesses to determine whether a satisfactory level of terminal interchangeability can be achieved.

When creating Protocol Implementation Conformance Specifications (PICS) for an existing standard, the revised standard shall identify the obvious and hidden options.

Annex C: Principles for standardisation alignment between public and private ISDNs

Joint ITAEGT (Information Technology Expert Group for private Telecommunications) and ISM (ISDN Standards Management) statement

ITAEGT and ISM have considered, in particular, the need for common service descriptions for public and private ISDN. Already ISM has produced stage 1 service descriptions, taking into account requirements from private ISDNs (presented by ECMA and ETSI TC-BT). As a general aim, a single service description document covering both public and private ISDNs is desirable.

To enhance the aim of producing a single service description document, there should be a single base standard and with conformance statements for both the public and private ISDNs.

It is further considered that this aim should be applied to all the standards being produced for public and private ISDNs. However, the time constraints of both the ISM and ITAEGT programmes of work made this difficult in the short term, but this should not constrain the long term aims.

Therefore, ITAEGT and ISM recommend that the following principles should be adopted for future standardization activities in the areas of public and private ISDNs:

- 1 Where European Standards for corresponding services are being developed concurrently in the public and private ISDN domain, the standardization bodies concerned declare:
 - that, while recognizing that some differences in the standards may be essential, unnecessary differences shall be avoided;
 - a common format and layout should be used for both public and private network standards;
 - there shall be, following ITAEGT procedures, a timely exchange of information;
 - European ISDN Standards should indicate the differences between public and private applications.

- 2 Where a European Standard exists for a service for the public ISDN but not for the private ISDN, and it is decided to develop a standard for the private ISDN, the public ISDN standard shall form the core for a common ISDN standard, so that the user's perception of the service shall be kept the same as far as possible.

Necessary differences between the requirements of public and private networks shall be explicitly indicated by conformance statements.

- 3 Where a European Standard exists for a service for the private ISDN but not for the public ISDN, and it is decided to develop a standard for the public ISDN, the private ISDN standard shall form the core for a common ISDN standard, so that the user's perception of the service shall be kept the same as far as possible.

Necessary differences between the requirements of public and private networks shall be explicitly indicated by conformance statements.

- 4 Coordination is required to prevent unnecessary duplication of the development of standards.

- 5 It should be noted that it is possible that some standards and services may only be applicable to either public ISDNs or private ISDNs. When separate, stand-alone documents are necessary, then those parts of the two specifications which are the same should be identical; i.e. rewriting of a section using different words or a different format for whatever reason should be avoided.
