Foreword

This European Telecommunication Standard (ETS) has been produced by the Signalling Protocols and Switching (SPS) Technical Committee of the European Telecommunications Standards Institute (ETSI).

Transposition dates	
Date of adoption of this ETS:	6 September 1996
Date of latest announcement of this ETS (doa):	31 December 1996
Date of latest publication of new National Standard or endorsement of this ETS (dop/e):	30 June 1997
Date of withdrawal of any conflicting National Standard (dow):	30 June 1997

Endorsement notice

The text of ITU-T Recommendations Q.781 (1993) and Q.782 (1993) was approved by ETSI as an ETS with agreed modifications as given below.

NOTE: New or modified text is indicated using sidebars. In addition, underlining and/or strike-out are used to highlight detailed modifications where necessary. For the tests, bold font is used in addition to increase legibility.

Global modifications to ITU-T Recommendations Q.781 and Q.782

Insert the following two clauses (scope and normative references):

Scope

This European Telecommunication Standard (ETS) defines a set of detailed tests of the Signalling System No.7 Message Transfer Part (MTP) level 2 and level 3 protocol. These tests intend to validate the protocol specified in ETS 300 008-1 [1].

This ETS conforms to ITU-T Recommendation Q.780 [2] which describes the basic rules of the test specifications, however, it contains additional general principles specific to level 2 and level 3 tests, respectively.

Normative references

This ETS incorporates by dated and undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this ETS only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

TEST DESCRIPTION			
1.	Start normal alignment procedure.		
2.	Check link aligns and enters “In service” state.		
3.	Check that “In service” state is maintained.		
4.	In VAT only check it is possible to perform a normal alignment procedure in the following cases:		
	– use LSSU in point B with a status field of 8 bits;		
	– use LSSU in point B with a status field of 16 bits.

Test number 4.1

Modify the test as follows:

TEST NUMBER: 4.1		PAGE: 1 OF 1	
REFERENCE: Q.703 Clause 8 STD: Fig. 10			
TITLE: Processor outage control			
SUB TITLE: Set and clear LPO while link in service			
PURPOSE: To check the ability to perform correctly when LPO is set and recovered			
PRE-TEST CONDITIONS: Link in service			
CONFIGURATION: 1		TYPE OF TEST: VAT	
EXPECTED SIGNAL UNIT SEQUENCE:			
	SP B		SP A
Link		Link	
		1 - 0	FISU (FSN = 7F, BSN = 7F)

<u>1 - 0</u>	<u>FISU</u> <u>(FSN = 0, BSN = 0)</u>		
			: clear LPO
		1 - 0	MSU (3) (FSN = 1, BSN = 5)
TEST DESCRIPTION			
1.	Set LPO at A while link in service.		
2.	Check that MSU from B is discarded.		
3.	Clear LPO at A after at least 1,2 s.		
4.	Check that "old" messages are flushed from level 2 buffers and not transmitted on the link. Check that new MSUs are sent correctly.		

Test number 5.3

Modify the test as follows:

TEST NUMBER: 5.3		PAGE: 1 OF 1	
REFERENCE: Q.703 subclause 4.1 STD: Fig. 11			
TITLE: SU delimitation, alignment, error detection and correction			
SUB TITLE: Below minimum signal unit length			
PURPOSE: To test the signal unit delimitation, alignment and error detection action on receipt of signal unit less than the minimum length			
PRE-TEST CONDITIONS: Link in service			
CONFIGURATION: 1		TYPE OF TEST: VAT	
EXPECTED SIGNAL UNIT SEQUENCE:

		<-----	1 - 0
			FISU (BSN unchanged)
1 - 0	FISU	----->	
TEST DESCRIPTION			
1.	Generate a corrupt MSU at B of less than 6 octet (i.e. less than 5 octets between flags).		
2.	Check A discards the signal unit, and <u>may go goes</u> into octet counting mode.		
3.	On reception of a correct FISU, check that A leaves the octet counting mode <u>if it was entered</u> and remains in the "in service" state.		

Test number 9.7

TEST DESCRIPTION			
1.	Generate an MSU at A.		
2.	Instead of sending positive acknowledgement, set and keep PO at B for at least 1.2 s .		
3.	Check A stops a retransmission of the MSU and sends FISUs, and does not detect link failure by the expiration of T7.		
4.	Cease PO after at least 1.2 s and send an MSU with no positive acknowledgement at B.		
5.	Check A flushed its buffer and no old MSU is sent.		
6.	Generate an MSU at B.		
7.	Check A receives the MSU and responds correctly.

TEST DESCRIPTION			
1.	Start traffic to B and C on all the links.		
2.	Send a COO from B to A for 1 - 1 on link 1 - 2 and check that the COA is received.		
3.	Check that the link 1 - 1 becomes unavailable.		
4.	Stop traffic and check that the changeover procedure has been performed.		
5.	Check that there was no loss of messages, no duplication and no missequencing.		
6.	Repeat the test but send an ECO (instead of a COO) and check that <u>a COA</u> an ECA is received (instead of a COA). Some messages may be lost.

TEST DESCRIPTION			
1.	Start traffic to E (and D in VAT) on linkset 3.		
2.	Activate link 2 – 1.		
3.	Check that T21 is started in A, and is stopped on reception of TRA from SP B (see Notes).		
4.	Check that traffic on linkset 3 ceased in A and that after expiration T3 traffic diverts to link 2 – 1 in accordance with the load sharing rules in A.		
5.	Stop traffic and check that there were no lost messages, no duplication and no missequencing.		
6.	Check that the duration of T3 is inside the specified range.		
7.	Repeat the test (in VAT) without sending TRA from B to A and check that the time controlled diversion is performed when T21 expires.

NOTE - n is the maximum load capacity of linkset 2. The traffic model used in this test is described in Table 2/Q.706.																																																																																																																	
TEST DESCRIPTION																																																																																																																	
1.	Start traffic to C with a load exceeding n/2 erlang on links 1 - 1 and 1 - 2 (n is the maximum load that the link 2 may carry without congestion).																																																																																																																
2.	Check that the signalling traffic flow control procedure is started in A. Check that a TFC message concerning C is received for each 8 messages received or each 256 octets received in B during the congestion.																																																																																																																
3.	Reduce the load to <u>n/2</u> 0.4 erlang or less on links 1 - 1 and 1 - 2.																																																																																																																
4.	Check that the congestion disappears and that no TFC is received.																																																																																																																
5.	Stop traffic.																																																																																																																
6.	Check that the traffic from C to B has not been disturbed.

	:Wait			
	:Stop traffic			
NOTE – A changeover procedure is performed after deactivation of link 1 – 1 but is not described in this transfer prohibited test.				
TEST DESCRIPTION				
1.	Start traffic to D and E on linkset 1 and 2			
2.	Deactivate link 1 – 1 and check that TFPs concerning B and D are sent from A to C (alternative route to reach B and D). Check that no TFP concerning E is sent from A to C (load sharing between linksets 1 and 2 in A to reach E). Check that TFPs concerning B and D are sent from A to B (via C).			
3.	Check that time out T8 is started for each TFP sent.			
4.	Check that traffic to D and E is diverted to C.			
5.	Stop traffic and check that it was not disturbed.

NOTE – A forced rerouting is performed after the reception of TFP for D in A but it is not described in this transfer prohibited test.			
TEST DESCRIPTION			
1.	Start traffic to D and E.		
2.	Deactivate link 5 – 1 and check that a TFP concerning D is sent to A.		
3.	Check that a TFP concerning D is received from A and that traffic to D is diverted via C. Check that a TFP concerning D is sent from A to B.		
4.	Check that a time out T8 is started.		
5.	Stop traffic and check that traffic to E has not been disturbed. Some messages to D may have been lost.

TEST DESCRIPTION		
1.	Start traffic to B and C.	
2.	Send TFPs and TFAs with <u>unusual</u> invalid values to A (as described above). Check that these messages are discarded without impact on the traffic (<u>except for spare bits \neq 0</u>).	
3.	Deactivate linkset 2 and check that <u>C B</u> becomes inaccessible.	
4.	Send TFAs concerning C with <u>unusual</u> invalid values to A (as described above) and check that these messages are discarded without impact on the traffic.	
5.	Check the indications are given by the system (except for SLC and spare bits 0).	
6.	Stop traffic.
