Annex D (informative):	Definition of the ISI ROSE operation	212
History		215

Foreword

This European Telecommunication Standard (ETS) has been produced by the Terrestrial Trunked Radio (TETRA) Project of the European Telecommunications Standards Institute (ETSI), and is now submitted for the Public Enquiry phase of the ETSI standards approval procedure.

This ETS is a multi-part standard and will consist of the following parts:

- Part 1: "General network design";
- Part 2: "Air Interface (AI)";
- Part 3: "Interworking at the Inter-System Interface (ISI)";**
- Part 4: "Gateways basic operation";
- Part 5: "Peripheral Equipment Interface (PEI)";
- Part 6: "Line connected Stations (LS)";
- Part 7: "Security";
- Part 8: "Network management services";
- Part 9: "General requirements for supplementary services";
- Part 10: "Supplementary services stage 1";
- Part 11: "Supplementary services stage 2";
- Part 12: "Supplementary services stage 3".

Proposed transposition dates	
Date of latest announcement of this ETS (doa):	3 months after ETSI publication
Date of latest publication of new National Standard or endorsement of this ETS (dop/e):	6 months after doa
Date of withdrawal of any conflicting National Standard (dow):	6 months after doa

Blank page

1 Scope

This ETS defines the Terrestrial Trunked Radio system (TETRA) supporting Voice plus Data (V+D). It specifies:

- general design aspects (e.g. reference points, numbering and addressing, or protocol architecture);
- the interworking between TETRA networks;
- the interworking of TETRA networks with other networks, via gateways;
- the supplementary services applicable to the basic TETRA tele- or bearer services.

The TETRA V+D interworking - basic operation part defines the interworking between TETRA networks over the corresponding interface: the Inter-System Interface (ISI). It comprises the following subparts:

- ISI general design;
- Additional Network Feature - ISI Individual Call (ANF-ISIIC);
- Additional Network Feature - ISI Group Call (ANF-ISIGC);
- Additional Network Feature - ISI Short Data service (ANF-ISISD);
- Additional Network Feature - ISI Mobility Management (ANF-ISIMM);
- 8 kbit/s encoding of user information at the ISI.

This ETS is the ANF-ISIGC subpart.

In analogy with CCITT Recommendations I.130, the stage one, stage two and stage three of the three level structure is used to describe the TETRA Inter-System Interface services as provided by European Private or Public Trunked Radio System operators:

- Stage 1, is an overall service description, from the service subscriber's and user's standpoint;
- Stage 2, identifies the functional capabilities and information flows needed to support the services described in stage 1, and;

NOTE: The information flows in stage 2 have been drawn as Message Sequence Charts (MSC). Therefore PISN basic call information flows are also shown together with the ANF-ISIGC information flows.

- Stage 3, defines the signalling system protocols and switching functions needed to implement the services described in stage 1.

This ETS details the Interworking Basic Operation of the Terrestrial Trunked Radio system (TETRA). Specifically this subpart details the stage 1 aspects (overall service description) of the ANF-ISIGC as seen from the TETRA Switching and Maintenance Infrastructure point of view at the Inter-System Interface (ISI). It details the stage 2 aspects (functional partitioning) of ANF-ISIGC which includes the identification of the functional entities and the flows between them, and finally it details the stage 3 signalling protocols for the ANF-ISIGC services, i.e. the protocols at the relevant reference points between the functional entities defined in stage 2.

The ANF-ISIGC service specifies:

- TETRA Group Call Clear Speech over the ISI, acknowledged and unacknowledged;
- TETRA Group Call End-to-End Encrypted Speech over the ISI;
- TETRA Group Call Circuit Mode one slot data over the ISI;
- TETRA Group Call Circuit Mode one slot End-to-End Encrypted data over the ISI;
- TETRA Group Call Circuit Mode N x 2,4 kbit/s, N x 4,8 kbit/s or N x 7,2 kbit/s data, with N = 2, 3 or 4;
- TETRA Group Call Circuit Mode N x 2,4 kbit/s N x 4,8 kbit/s or N x 7,2 kbit/s End-to-End Encrypted data, with N = 2, 3 or 4.

2 Normative references

This European Telecommunication Standard (ETS) incorporates, by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to, or revisions of, any of these publications apply to this European Telecommunications Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of this ETS the following definitions apply:

controlling SwMI: the Switching and Management Infrastructure(SwMI) which sets up and maintains a call between two or more SwMIs.

foreign user: a user who is not a member of the called group.

group home: the home of the GTSI, i.e. the SwMI where the network code (MNC) is equal to that of the group (GTSI).

individual home: the home of the MS's ITSI, i.e. the SwMI where the network code (MNC) is equal to that of the individual subscriber (ITSI).

linking controlling SwMI: the SwMI that controls the linking of one of its own groups to one or more groups from other SwMIs. The group linking controlling SwMI is the home SwMI of the linked groups.

linking home SwMI: see linking controlling SwMI.

linking participating SwMI: SwMI that participates in the group linking by linking (joining) one group to the group linking.

linked group: linking of one or more group identities from different TETRA SwMIs which forms a multigroup across several TETRA SwMIs and where one of these is designated to be the home of the linked group.

originating SwMI: SwMI from where the call originates, i.e. where the initial call set-up is detected. Once the calling user has been connected, the originating SwMI becomes a participating SwMI.

participating SwMI: SwMI only participates in the call without controlling it and will always be the end point of the call, i.e. where the call is terminated.

served SwMI: SwMI that is involved in a group call either as the originating SwMI, the controlling SwMI or as the participating SwMI, hence utilizing the ANF-ISIGC service.

transit SwMI: within the context of a call, any SwMI through which the call passes, excluding the originating SwMI, controlling SwMI or participating SwMI(s), is known as a transit SwMI. No members of the active call shall terminate at a transit SwMI.

visited SwMI: the TETRA network which MNI is not equal to the user's MNI.

3.2 Abbreviations

For the purposes of this ETS the following abbreviations apply:

AL	Ambience Listening
ANF	Additional Network Features
AoC	Advice of Charge
AP	Access Priority
AS	Area Selection
BIC	Barring of Incoming Calls
BOC	Barring of Outgoing Calls
CAD	Call Authorized by Dispatcher
CC	Call Control
CCBS	Call Completion to Busy Subscriber
CCNR	Call Completion on No Reply
CFB	Call Forwarding on Busy
CFNRc	Call Forwarding on Not Reachable
CFNRy	Call Forwarding on No Reply
CFU	Call Forwarding Unconditional
CLIP	Calling Line Identification Presentation
CLIR	Calling/connected Line Identification Presentation
COLP	Connected Line Identification Presentation
CR	Call Report
CRT	Call Retention
CW	Call Waiting
DGNA	Dynamic Group Number Assignment
DL	Discreet Listening
FE	Functional Entity
FEA	Functional Entity Actions
GTSI	Group TETRA Subscriber Identity
IC	Include Call
ISDN	Integrated Services Digital Network
ISI	Inter-System Interface
ISIIC	Inter-System Interface Individual Call
ISIMM	ISI Mobility Management
ISISD	ISI Short Data
ITSI	Individual TETRA Subscriber Identity
LE	Late Entry
LSC	List Search Call
MM	Mobility Management
MNI	Mobile Network Identity
MS	Mobile Station
PC	Priority Call
PINX	Private Integrated Services Network Exchange
PISN	Private Integrated Services Network
PPC	Pre-emptive Priority Call
PSS1	Private Integrated Signalling System Number 1
PSTN	Public Switched Telephone Network

SDL	Specification and Description Language
SAP	Service Access Points
SNA	Short Number Addressing
SwMI	Switching and Management Infrastructure
ToC	Transfer of Control
TPI	Talking Party Identification

4 ANF-ISIGC stage 1 specification

4.1 Description

4.1.1 General description

ANF-ISIGC enables point to multipoint calls to be set-up between TETRA users located in more than one TETRA Switching and Management Infrastructure (SwMI), over the Inter-System Interface (ISI). In support of this, the ANF-ISIGC which operates at the ISI, shall detect a request from the originating SwMI for establishing one point to multipoint TETRA group call service between two or more TETRA SwMIs.

For originating requests the ANF-ISIGC provides access to the user profiles for both the calling individual TETRA user as well as it provides access to the user profile of the called TETRA group. The information is used for routing purposes and call contention checking. ANF-ISIGC also forwards the group call indication to the participating TETRA SwMIs.

For the duration of the call, the ANF-ISIGC shall handle transmission control signalling from all participating TETRA SwMIs. This is to ensure that transmission granting is only given to one of the individual TETRA users participating in the group call according to the point to multipoint TETRA call procedures defined in ETS 300 392-2 [3]. Additionally, ANF-ISIGC shall participate in call restoration when a TETRA user in the group call migrates to another TETRA SwMI.

ANF-ISIGC may also be used to transport group related supplementary services between TETRA SwMIs.

4.1.2 Qualifications on applicability to TETRA basic services

ANF-ISIGC is applicable to the following point to multipoint basic services as defined in ETS 300 392-2 [3]:

- point to multipoint one slot TETRA clear mode speech;
- point to multipoint one slot TETRA end-to-end encrypted speech;
- point to multipoint one slot 2,4 kbit/s, 4,8 kbit/s, or 7,2 kbit/s TETRA circuit mode data;
- point to multipoint end-to-end encrypted one slot 2,4 kbit/s, 4,8 kbit/s, or 7,2 kbit/s TETRA circuit mode data;
- point to multipoint N x 2,4 kbit/s, N x 4,8 kbit/s, or N x 7,2 kbit/s TETRA circuit mode data, with N = 2, 3 or 4;
- point to multipoint end-to-end encrypted N x 2,4 kbit/s, N x 4,8 kbit/s, or N x 7,2 kbit/s TETRA circuit mode data, with N = 2, 3 or 4.

4.2 Procedures

4.2.1 Provision/withdrawal

ANF-ISIGC shall be permanently available or controlled by provision/withdrawal.

4.2.2 Normal procedures

4.2.2.1 Activation/deactivation/registration/interrogation

ANF-ISIGC shall be permanently activated on provision and permanently deactivated on withdrawal.

Registration and interrogation are not applicable to this ANF.

4.2.2.2 Invocation and operation

ANF-ISIGC is an extension of TETRA SwMI call control and PSS1 basic call control over an Inter-System Interface, as documented by ETS 300 392-2 [3] and ISO/IEC 11572 [12], which replaces and adds certain procedures that PSS1 basic call control is unable to perform satisfactory for TETRA users. ANF-ISIGC is compatible with PISN inter-exchange signalling protocol as defined by ISO/IEC 11582 [14].

4.2.2.3 ANF-ISIGC - the service provider

ANF-ISIGC shall be a SwMI V+D layer 3 (network layer) service provider. ANF-ISIGC shall offer services to SwMI CC applications.

The generic stage 1 service model is illustrated in figure 1. The control aspects of the services are defined in terms of primitives. The primitives are sent across the ISIGC Service Access Points (SAP) (ISIGC-SAPs) between the service provider and the service users. The ANF-ISIGC services use the following four generic service primitives: request (req), indication (ind), response (resp) and confirm (conf). The service-specific primitives are defined for each service as part of the stage 1 service description in the following clauses. In the stage 1 descriptions, the ANF-ISIGC shall be seen as one entity.

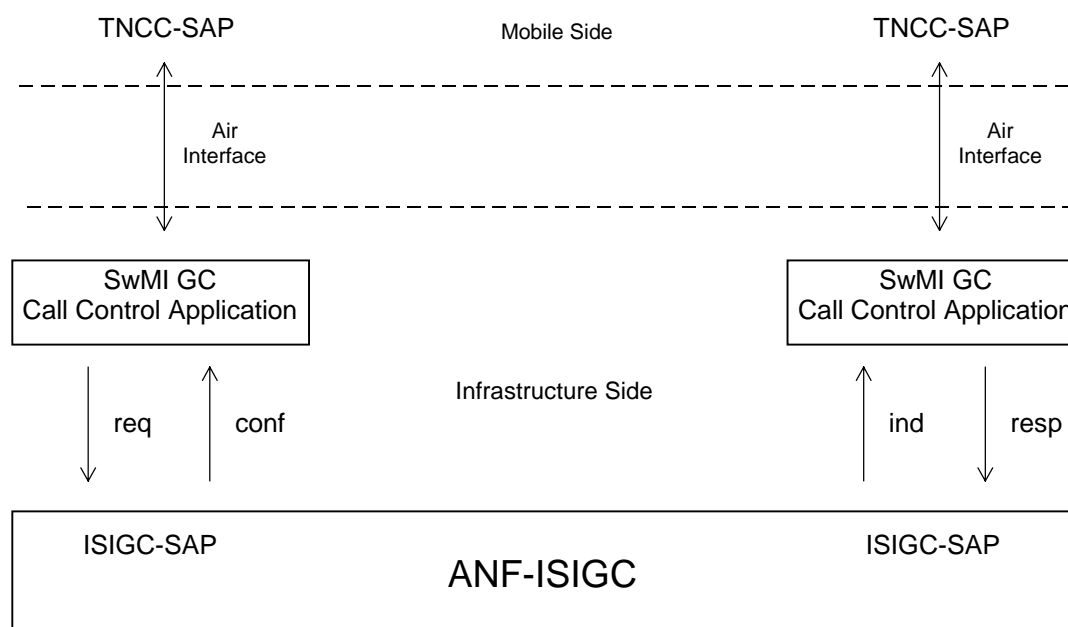

Figure 1: ANF-ISIGC stage 1 service model

4.2.2.3.1 Establishing the group call at the originating and controlling TETRA SwMI

ANF-ISIGC shall be invoked when a group call request has been received by the originating SwMI and analysis of the originating MS's migration profile and destination group identity (GTSI) has shown that the request is allowed and routing path to the group home SwMI exist.

The ANF-ISIGC entity shall analyse the originating MS identity and the destination group identity which shall give a result that points to one of the following three cases:

- (1) the home SwMI of the called user group is the originating SwMI and at least one of the members of the called group has migrated to a another TETRA SwMI. The details of the migrated member(s) may be known in the database of the visited SwMI. Only one instance of the ANF-ISIGC shall be invoked, independent of the number of participating SwMI, i.e. more than one MS has migrated to a different TETRA SwMI;
- (2) the calling MS and the called user group has the same home SwMI, but the calling MS has migrated to another system. The details of the calling MS may be known in the database of the visited SwMI and shall be known in the database of the group home SwMI. The calling MS is a member of the called user group;
- (3) the home SwMI of the calling MS is the originating SwMI and the called user group belongs to a different TETRA SwMI than the originating SwMI. The calling user is located in the originating SwMI. The details of the called user group are known from the called group identity, i.e. the GTSI.

In cases (2) and (3), the ANF-ISIGC shall forward the call over the ISI to the group home SwMI CC application using the result of the analysis found in the originating SwMI. The group home is in case (2) determined by the VGSSI/GTSI association and in case (3) determined by the Mobile Network Identity (MNI) of the GTSI.

In case (1) the originating SwMI, i.e. the SwMI in which the calling MS is located, is the group home SwMI.

The request for group call establishment transferred across the SAP from the originating SwMI CC application to the ANF-ISIGC entity shall include the following information used in the analysis for routing and call set-up purposes in the controlling SwMI:

- basic service information qualifying the bearer capability;
- called party identity specified by the GTSI;
- transmission control information, e.g. request to transmit or request that other MS may transmit;

NOTE 1: The controlling SwMI CC application normally gives the first permission to transmit to the calling MS/LS when a new call has been set-up. However, the controlling SwMI CC application may also set-up the call without granting transmission to a specific user, e.g. the calling user application has indicated that it does not wish to transmit.

- priority of the call, e.g. emergency call priority.

After analysis of the called group profiles, the group home SwMI CC application shall inform the ANF-ISIGC entity of the analysis result. If the group call is accepted, the ANF-ISIGC entity shall analyse the called group identity. If the called group identity indicates that the group is linked to at least one other group identity where the home for the linked group is in a different TETRA SwMI, then the group call request shall be re-routed back to the originating SwMI with information indicating the linking home SwMI. The originating SwMI shall then once again forward the call request over the ISI. However this time, to the linking home SwMI CC application indicated by the group home SwMI. The details of the linked group are known in the database of the linking home SwMI. The linking home SwMI shall become the controlling SwMI for the group call. If the called group is not linked, the group home SwMI shall become the controlling SwMI for the call.

NOTE 2: The group home for the linked group is determined by the time of linkage.

NOTE 3: No group linking profile is generated when two or more groups are linked together. Each group has their own group profiles and the group home SwMI shall always evaluate these profiles when requested to set-up a call.

4.2.2.3.2 Establishing the group call at a participating TETRA SwMI

Once the controlling SwMI has been determined, the ANF-ISIGC entity shall analyse the call set-up information received in the forwarded set-up request and the location information for all group members.

NOTE 1: The controlling SwMI may change the priority and basic service information of the group call, e.g. if the controlling SwMI cannot support the call priority received from the originating SwMI.

The ANF-ISIGC entity shall convey the group call as an incoming group call indication across the SAP to the participating SwMI(s) CC application as well as to the originating SwMI CC application and the indication shall include the following information:

- basic service information qualifying the bearer capability;
- called party identity specified by the GTSI;
- transmission control information, e.g. allow request to transmit;
- priority of the call, e.g. emergency call priority.

The invoked SwMI(s) CC application (both the originating SwMI and the participating SwMI) shall evaluate if resources necessary (air interface, mobile and infrastructure resources) for the group call are available and that group members exist in the SwMI. If a group call can be performed in the invoked SwMI(s), the necessary resources shall be reserved. The invoked SwMI(s) shall then indicate in a set-up response back to the controlling SwMI the mode of operation used to allocate resources, used for transmission over the ISI, during the group call. There are two modes of operation for a participating SwMI to allocating resources during the call maintenance phase:

- permanently allocated resources;
- temporary allocated resources.

For permanently allocated resources, all resources (air interface, mobile and infrastructure resources) reserved during call set-up shall be available for the duration of the active group call. For temporary allocation resources, the controlling SwMI shall for each new transmission ask each SwMI with temporary resources if they can participate in the transmission.

NOTE 2: The two modes of operation (permanently allocated resources/ temporary allocated resources) when transmitting over ISI shall not directly be connected to the air-interface trunking method. However, message trunking shall be needed in order to ensure "permanently allocated resource " mode.

The set-up response shall also indicating whether the group call is valid and whether the SwMI can support the communication type (normal, acknowledge or broadcast calls) indicated in the set-up indication.

NOTE 3: Negotiation of the service at set-up cannot be done for a group call (refer to ETS 300 392-2 [3]). The only "negotiation" allowed is whether the invoked SwMI(s) accept the incoming call request, i.e. the service presented matches the service that can be provided. However, in case of non-acceptance of the communication type, the invoked SwMI may indicate which type of group call it can support (normal, acknowledge or broadcast). It is then up to the controlling SwMI to decide if the call is to be set-up to the specific SwMI. Otherwise, the invoked SwMI has no other alternative than to reject the call request if it cannot accept the indicated service at set-up.

The ANF-ISIGC entity shall collect all set-up responses, both acceptances and rejects, from the invoked SwMI(s) and convey them back to the controlling SwMI. The controlling SwMI CC application shall then determine whether the call can be set-up as either a complete or partial group call, if the group call shall be delayed or if the group call shall be released. If the group call is accepted, the originating SwMI and participating SwMI(s), shall be informed to connect the members of the group call. At this point in the call, the originating SwMI shall connect the calling user. The originating SwMI shall then change status to a participating SwMI and the called user shall be connected. The originating SwMI shall cease to exist.

4.2.2.3.3 Delaying the group call

The controlling SwMI CC application can determine to delay set-up of the group call if an invoked SwMI (both the originating SwMI and the participating SwMI) has responded to the group call set-up request with an indication that the call set-up should be delayed. The group call shall only be delayed if no reject cause has been received from another SwMI participating in the call that can result in group call release.

NOTE 1: A partial group call may be set-up even though a invoked SwMI wishes to delay the group call set-up.

When the controlling SwMI CC application determines to delay the group call, the ANF-ISIGC entity shall be informed. The ANF-ISIGC entity shall then inform all available SwMI(s) of the delay. Resources reserved by the originating SwMI and participating SwMI(s) during call set-up should be released. Only ISI channel resources shall be preserved. An ISI delay timer shall be initiated in the controlling SwMI when a group call is delay. This timer is used to release ISI channel resources and delaying SwMI(s), if no response is received from the delaying SwMI(s) within a certain period of time.

A response that the call is allowed to proceed in the delaying TETRA SwMI shall be provided back to the ANF-ISIGC entity when this SwMI becomes available. The ANF-ISIGC entity shall convey the response back to the controlling SwMI. The controlling SwMI CC application shall then again determine whether the call can be set-up as either a complete or partial group call, if the group call shall continue to be delayed or if the group call shall be released. If the group call is accepted, the originating SwMI and participating SwMI(s), shall be informed to connect the members of the group call.

NOTE 2: The controlling SwMI may at any time decide to continue a delayed call set-up. When a delaying SwMI is ready to proceed with call set-up, it should be included in the call with the late entry service.

4.2.2.3.4 Control of call time-out timers

Call time-out for the call set-up phase should be defined by the controlling SwMI. The controlling SwMI CC application should indicate its time-out value to the originating SwMI. The originating SwMI CC application should then either use the indicated time-out value or define a larger value for its corresponding timer. The call time-out value for the call set-up phase shall be conveyed to the originating SwMI(s) following a forward set-up request.

The call time-out timer used during the maintenance phase of the call shall also be defined by the controlling SwMI CC application. The controlling SwMI CC application shall indicate this time-out value to the participating SwMI(s) (once the call is established the originating SwMI is also considered a participating SwMI). The participating SwMI(s) CC application should then either use the indicated time-out value or define a larger value for its corresponding timer. The call time out value shall be conveyed to the invoked SwMI(s) during call set-up.

NOTE: While the exchange of time-out values has been specified in the protocol, the use of the time-out values is optional. However, if the originating/participating SwMI(s) do not use the given timer values, the risk of call attempt failure (due to premature call establishment time-out) or call disconnection (due to premature call duration time-out) can be increased.

4.2.2.3.5 Acknowledged group call procedures

For acknowledged group calls, the controlling SwMI shall request participating SwMI(s) to poll group members within a called group. The controlling SwMI CC application shall send a poll request to the ANF-ISIGC entity indicating whether the number or percentage of poll responses is wanted from each participating SwMI. The poll request shall be forwarded to all participating SwMI(s) supporting acknowledge group call.

NOTE: Polling of group members can only occur after the call has been established. However, it is implementation independent how many times a group may be polled during the call maintenance phase.

When polling group members, the controlling SwMI can decide either to let the call proceed immediately by giving the calling user permission to transmit before, during or after the participating SwMI(s) have responded to the polling request.

The ANF-ISIGC entity shall convey all received polling responses from the participating SwMI(s) back to the controlling SwMI CC application. After a certain period of time, all received responses shall be evaluated. The controlling SwMI may disconnect the call if an insufficient number of responses have been received.

It is an option of the controlling SwMI as how and when to inform the calling user or any other user of the polling result.

4.2.2.3.6 Colliding calls

Call collisions can occur when two SwMIs simultaneously send a forward call set-up request to the same group. The two calls are then colliding:

- within the controlling SwMI when a forward group call set-up request is received within the window where the controlling SwMI is waiting for a call set-up responses to the same group from SwMIs that are to participate in the group call.
- within the originating SwMI when a group call set-up request is received within the window where the originating SwMI is waiting for a group call set-up request to the same group however with a different originating call identity than the one received.

NOTE: Collision occurring when two SwMIs try to seize the same resources may be solved by letting SwMIs own their own resources.

If the requested basic services are compatible for the colliding calls, then the controlling SwMI should amalgamate the calls and inform all participating SwMI(s) of call amalgamation in the group call connect request. Otherwise, the controlling SwMI call control application shall discard call set-up request received while waiting for call set-up responses from the participating SwMI(s).

Upon reception of a colliding group call set-up request, the originating SwMI shall accept the incoming call set-up request and discard it's own outgoing call set-up request.

4.2.2.3.7 Maintenance of the group call

Transmission control:

The ANF-ISIGC entity shall remain operational for the duration of the call, controlling the TETRA group call across the ISI using TETRA signalling messages defined as:

- transmission cease information, which requests the transmission to be ceased and informs all participating SwMIs about the transmission cease;
- transmission request information, where a participating SwMI requests the right to transmit and where all participating SwMIs operating in 'temporary allocated resource' mode are acquired to reserve the relevant resources for the transmission;
- transmission grant information which informs a participating SwMI that it has been granted transmission and informs all other participating SwMIs that transmission has been granted;

- transmission withdraw information, where a participating SwMI requests to withdraw from the call when resources are required to another call or a temporary pause is needed. The controlling SwMI shall determine whether the call can continue as a partial group call or if the complete group call must be present to continue;
- transmission continue information, where a participating SwMI requests to continue with the withdrawn call;
- transmission interrupt information, where a participating SwMI requests current transmission to be interrupted due to higher priority and where all other participating SwMIs are informed about an interruption of the transmission in progress.

The ANF-ISIGC entity may contain a queuing mechanism for transmission request. When a TETRA user wishes to transmit, a transmission request shall be sent to the participating SwMI. The participating SwMI CC application shall then convey the transmission request to the ANF-ISIGC entity.

Upon reception of a request to transmit, the ANF-ISIGC entity shall evaluate if any conflicting transmission requests are received, e.g. only one participating SwMI shall be awarded the right to transmit while other transmission requests may be queued or rejected. If the transmission request is not queued or rejected, then all participating SwMI(s) without permanent allocated resources shall be requested by the ANF-ISIGC entity, to evaluate if necessary air interface, mobile and infrastructure resources are available for transmission.

If resources are available for transmission at the inquired participating SwMI(s), the necessary resources shall be reserved. The inquired SwMI(s) shall respond back to the ANF-ISIGC entity whether resources are available or not.

The ANF-ISIGC entity shall collect all responses, both acceptances and rejects, from the inquired SwMI(s) and evaluate if transmission can be performed as either a complete grant of transmission, partial grant of transmission or if the transmission request shall be rejected. The transmission request shall be rejected by ANF-ISIGC if important or critical SwMI(s) cannot participate in the transmission grant.

Each time a request to transmit is received in the controlling SwMI, the ANF-ISIGC entity should fetch group location information, so as to evaluate if new group members have registered to a SwMI not already participating in the group call. If new SwMI(s) are to be joined to the active call, a set-up request shall be sent to the new participating SwMI. The new participating SwMI will join the call according to normal call set-up procedures. However, the connect or release response sent from the controlling SwMI during call set-up shall be used together with the collected resource responses to evaluate if transmission can be granted to the requesting user.

Service modification:

For the duration of a group call, modification to the services can be provided by the ANF-ISIGC entity. The service modification can only take place for services within the scope of this ANF. The service may be changed between any combination of one or more of the following:

- a point to multipoint one slot TETRA clear call (circuit mode data or speech) may be modified to a point to multipoint one slot TETRA end-to-end encrypted call;
- a point to multipoint one slot TETRA end-to-end encrypted call (circuit mode data or speech) may be modified to a point to multipoint one slot TETRA clear call;
- a 4-slots-per-frame circuit mode data call may be changed to a 1-slot, 2-slot or 3-slot call;
- a 3-slot circuit mode data call may be changed to a 1-slot or 2-slot;
- a 2-slot circuit mode data call may be changed to a 1-slot;

- a TETRA circuit mode data call (either clear or encrypted) with a data rate of 2,4 kbit/s, 4,8 kbit/s, or 7,2 kbit/s may be changed to a different data rate, i.e:
 - 2,4 kbit/s may be modified to 4,8 kbit/s or 7,2 kbit/s;
 - 4,8 kbit/s may be modified to 2,4 kbit/s or 7,2 kbit/s;
 - 7,2 kbit/s may be modified to 2,4 kbit/s or 4,8 kbit/s.
- or to a circuit mode speech call.
- a TETRA circuit mode speech call (either clear or encrypted) may be changed to a circuit mode data call with a data rate of 2,4 kbit/s, 4,8 kbit/s, or 7,2 kbit/s.

Call restoration:

When a TETRA user, active in a group call, migrates to a new SwMI from a participating SwMI (denoted in the following as the old SwMI) the group call shall be restored to the TETRA user following the call restoration procedures for group calls in ETS 300 392-2 [3] and ETS 300 392-3-5 [6].

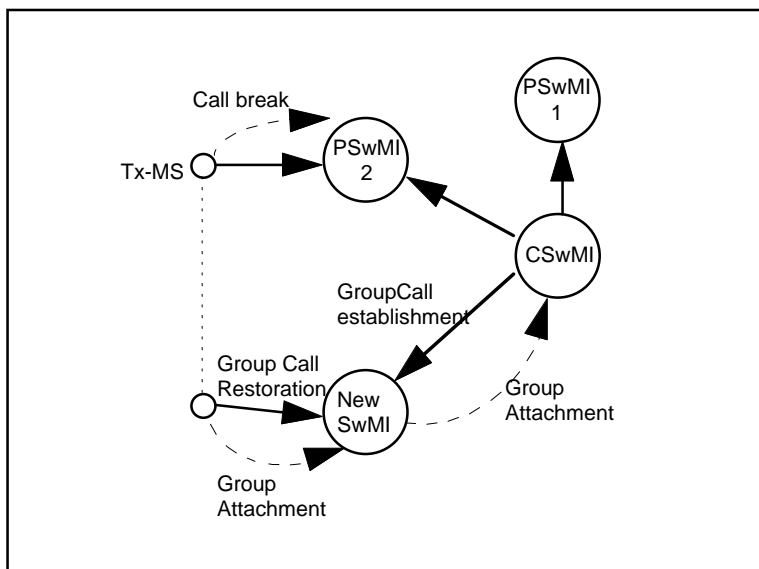

Figure 2: Group call restoration

As shown in figure 2 the support of these air interface procedures demands the TETRA user to attach to the group on which it is active, thus invoking an ANF-ISIMM entity. The ANF-ISIMM entity then informs the group home SwMI call control application that a TETRA user belonging to an active group call has moved to a new SwMI. The following three cases exist for the ANF-ISIGC:

- (1) in the case where the group call did not exist at the new SwMI, i.e. no ISI path is set-up to the new SwMI, the active ANF-ISIGC entity shall be instructed to extend the group call to the new SwMI and await call restoration from the migrating TETRA user;
- (2) in the case where the group call already exists at the new SwMI, then the migrated user's call information shall be transferred over the existing ANF-ISIGC;
- (3) in the case where the migrating TETRA user was the last member of the group at the old SwMI, the ANF-ISIGC entity shall clear the ISI group call path to the old SwMI.

When the called group is linked to another group and the group home SwMI is not the linking controlling SwMI, then the call restoration request received by the ANF-ISIMM entity shall be forwarded to the linking controlling SwMI.

In the case where the migrated users home SwMI differs from the controlling SwMI call restoration information shall be forwarded to the controlling SwMI. When the migrated users home SwMI is not participating in the group call, the call restoration request shall be forwarded via the old participating SwMI to the controlling SwMI. In this situation the migrated users home SwMI has no knowledge of the active group call.

4.2.2.3.8 Termination of the group call

Only the controlling TETRA SwMI shall be in control of the termination of the call. When a participating SwMI request for call disconnection, ANF-ISIGC shall route this request over the ISI to the controlling TETRA SwMI CC application. The controlling TETRA SwMI CC application shall validate the call disconnection request and if found valid the controlling TETRA SwMI CC application may choose to either disconnect the entire group call or disconnect the group call partially by only releasing the requesting TETRA SwMI. The reasons to disconnect the call may either be:

- if a participating TETRA SwMI cannot support the call anymore, e.g. because of pre-emption of the resources is necessary or the call length timer of this particular SwMI has expired. The call may then be released partially, i.e. the call continues without the requesting TETRA SwMI;
- if the controlling SwMI fails to support the call anymore. The entire group call across all SwMIs shall be terminated.

NOTE 1: When a participating TETRA SwMI wants to release a call for e.g. pre-emption purposes and to free ISI resources, it cannot acquire access to ISI links which are owned by the controlling TETRA SwMI.

NOTE 2: However, if a TETRA SwMI is used as a transit SwMI, it should be possible for this SwMI to terminate the call if it cannot support the transit function anymore. The capability to do this is linked to the fact that the transit call utilizes switching capacity in the transit SwMI.

When a request to release the group call is received by the controlling SwMI, sent from the call owning user, the controlling SwMI CC application shall always release the entire group call even though the call owning user is located in a participating SwMI. The controlling SwMI shall however still have the possibility of releasing the call even though the call ownership is transferred to a served user in another SwMI.

4.2.3 Exceptional procedures

4.2.3.1 Activation/deactivation/registration/interrogation

Not applicable.

4.2.3.2 Invocation and operation

The ANF-ISIGC entity may reject the group call service request from the originating TETRA SwMI with an appropriate failure indication for any of the following reasons:

- if ISI connections are permanently not available;
- if ISI connections are temporary not available;
- if the maximum number of available ISI links have exceeded.

The controlling SwMI may reject the group call service request from the originating TETRA SwMI with an appropriate failure indication for any of the following reasons:

- called group does not support calls from foreign users;
- if the important or critical subscribers of the called group are not available at call set-up time because of unavailability or for other reasons given by the group service profile;
- if a participating TETRA SwMI refuses to participate in the group call due to the call priority which cannot be supported or due to call contention or congestion in the TETRA SwMI.

During the maintenance phase of the call the ANF-ISIGC may reject any signalling request with an appropriate failure indication for any of the following reasons:

- if the ANF-ISIGC cannot grant a higher priority transmission request because it either temporary cannot support interruption or because interruption permanently is not supported;
- if critical ISI connections become either temporary or permanently unavailable due to pre-emption of the resources.

During the maintenance phase of the call the controlling SwMI may reject any signalling request with an appropriate failure indication for any of the following reasons:

- if the important or critical subscribers of the called group have not responded to polling request because of unavailability or for other reasons given by the group service profile;
- if an insufficient number of polling responses have been received;
- if a important or critical SwMI wishes to withdraw from the group call;
- group call can not be re-established to a migrated user in a SwMI that has not previously been involved in the group call;
- if the important or critical subscribers of the called group suddenly become unavailable.

In addition, all restrictions and exceptional procedures for PSS1 basic call establishment shall apply (see ISO/IEC 11574 [13]), e.g. non-valid destination number in the event that the controlling SwMI could send such a number.

4.3 Interaction with other PISN supplementary services and PISN ANFs

There shall be no interactions with other supplementary services and ANFs for which PISN International Standards were available at the time of publication.

4.4 Interaction with TETRA supplementary services and other TETRA ANFs

Interactions with other TETRA supplementary services and ANFs for which TETRA Standards or TETRA draft standards were available at the time of publication of the present document are specified below.

4.4.1 Calling Line Identification Presentation (SS-CLIP)

No interaction.

4.4.2 Connected Line Identification Presentation (SS-COLP)

No interaction.

4.4.3 Calling/Connected Line Identification Restriction (SS-CLIR)

No interaction.

4.4.4 Call Report (SS-CR)

No interaction.

NOTE: The originating SwMI will use ANF-ISISS for this service.

4.4.5 Talking Party Identification (SS-TPI)

No interaction.

NOTE: When TPI is invoked for a call, i.e. for a group, the SS-TPI signalling is transported transparently between the controlling SwMI and the participating SwMI(s) and is not considered to be an interaction.

4.4.6 Call Forwarding Unconditional (SS-CFU)

SS-CFU is applicable for group calls if the call is forwarded unconditionally from one group call to another.

ANF-ISIGC shall interact with SS-CFU when a group call is forwarded to a group located in a SwMI other than the called group home SwMI. The call shall be re-routed to the new group home SwMI.

NOTE: SS-CFU can change the service of the call from a group call to an individual call and vice versa.

4.4.7 Call Forwarding on Busy (SS-CFB)

Not applicable.

4.4.8 Call Forwarding on No Reply (SS-CFNRY)

Not applicable.

4.4.9 Call Forwarding on Not Reachable (SS-CFNRC)

Not applicable.

4.4.10 List Search Call (SS-LSC)

No interaction.

4.4.11 Call Authorized by Dispatcher (SS-CAD)

SS-CAD shall interact with ANF-ISIGC when SS-CAD is invoked towards the called group number and the calling user is located in a SwMI other than the restricted groups home SwMI.

4.4.12 Short Number Addressing (SS-SNA)

No interaction.

4.4.13 Area Selection (SS-AS)

SS-AS information shall be forwarded to the group/linking home SwMI. The SwMI shall use this information to set-up the group call and may also be used during call restoration.

NOTE: When Area Selection is invoked for a call, i.e. for a group, the SS-AS signalling is transported transparently between the originating SwMI and the controlling SwMI and is not considered to be an interaction.

4.4.14 Access Priority (SS-AP)

No interaction. SS-AP only applies locally at the radio access.

4.4.15 Priority Call (SS-PC)

If SS-PC has been activated and call set-up operates by queuing, then each call shall be established according to the queuing mechanism implemented in the SwMI(s) for priority calls.

4.4.16 Call Waiting (SS-CW)

No interaction.

4.4.17 Call Hold (SS-HOLD)

No interaction. The ISI-connection shall be maintained during HOLD of an active group call.

NOTE 1: Not applicable when the controlling SwMI has call ownership.

NOTE 2: Group calls that are on HOLD, shall have no call owner.

4.4.18 Call Completion to Busy Subscriber (SS-CCBS)

No interaction.

NOTE: SS-CCBS is only activated when the called group is busy. This can occur when the group call request is made from a user who is not a member of the called group.

4.4.19 Late Entry (SS-LE)

No interaction.

NOTE: When Late Entry is invoked for a call, i.e. for a group, the SS-LE signalling is transported transparently between the controlling SwMI and the participating SwMI(s) and is not considered to be an interaction.

4.4.20 Transfer of Control (SS-ToC)

No interaction.

NOTE 1: When Transfer of Control is invoked for a call, i.e. for a group, the SS-ToC signalling is transported transparently between the participating SwMI(s) and the controlling SwMI and is not considered to be an interaction.

NOTE 2: When a request to release the group call is received by the controlling SwMI, sent from the call owning user i.e. the call owning user is located in the participating SwMI, the controlling SwMI must always release the entire group call and not allow a partial release. The controlling SwMI however still has the right to releasing the call even though the call ownership is transferred to a served user in another SwMI.

4.4.21 Pre-emptive Priority Call (SS-PPC)

SS-PPC shall interact with ANF-ISIGC to pre-empt an inter-TETRA connection with the lowest Call Retention Value (CRV) among those which may be used to route the priority call. SS-PPC shall invoke pre-emption by forcing the clearing of the chosen inter-TETRA connection and then invoking a new ANF-ISIGC at the corresponding ISI.

NOTE 1: The correct time to tear down the inter-TETRA connections and allocate new inter-TETRA connections, should be when the controlling SwMI has received positive indication back from the participating SwMI that it can and will support the group call (see stage 2).

NOTE 2: If the clearing of an inter-TETRA connection results in the call owning user being released, then the controlling SwMI must release the complete call.

4.4.22 Include Call (SS-IC)

SS-IC and ANF-ISIGC shall interact whenever the SS-IC served user active in a group call wants to include a user or group of users who are not members of the active group call and who are registered in a SwMI other than the controlling SwMI. The SS-IC shall request the ANF-ISIGC to include the affected user or group of users (user to be included) into the group call.

NOTE: Only the group call owner is allowed to invoke SS-IC for an active group call.

The group call request to each affected user may or may not involve setting up a new inter-TETRA connection to a new participating SwMI previously not part of the group call. In cases where the participating SwMI already contains participating group call members, a set-up message shall be sent using the existing inter-TETRA connection. In cases where the participating SwMI is not already part of the group call a set-up messages shall be sent using a new inter-TETRA connection.

4.4.23 Advice of Charge (SS-AoC)

No information available.

4.4.24 Barring of Outgoing Calls (SS-BOC)

No interaction. SS-BOC is operated before ANF-ISIGC invocation.

4.4.25 Barring of Incoming Calls (SS-BIC)

No interaction.

NOTE: SS-BIC is operated in the called group's home SwMI CC application and supplementary service control application.

4.4.26 Discreet Listening (SS-DL)

No interaction.

4.4.27 Ambience Listening (SS-AL)

No interaction.

NOTE: The invocation of the supplementary service SS-AL constitutes a call set-up similar to an individual call.

4.4.28 Dynamic Group Number Assignment (SS-DGNA)

No interaction.

NOTE: When Dynamic Group Number Assignment is invoked for an existing group call, the SS-DGNA signalling is transported transparently between the controlling SwMI and the participating SwMI(s) and is not considered to be an interaction.

4.4.29 Call Completion on No Reply (SS-CCNR)

Not applicable.

4.4.30 Call Retention (SS-CRT)

SS-CRT shall interact with the ANF-ISIGC by having the Call Retention Value (CRV) for the group call assigned to the inter-TETRA connection(s) used to route the call.

4.4.31 Additional Network Features - Inter-System Interface Individual Call (ANF-ISIIC)

The only interactions between ANF-ISIIC and ANF-ISIGC shall be through SS-Include Call and SS Call Forwarding Unconditional (see subclauses 4.4.22 and 4.4.6).

NOTE 1: For SS-Include Call, even when all but two group call participants have left a group call, i.e. only the group call owner and the last group call participant are remaining in the call active state, the call remains a group call. This enables easy introduction of new participants into the group call.

NOTE 2: When a group call request is forwarded unconditionally to an individual, ANF-ISIGC shall invoke ANF-ISIIC and hereafter become IDLE.

4.4.32 ISI Short Data (ANF-ISISD)

No interaction.

4.4.33 ISI Mobility Management (ANF-ISIMM)

No interaction.

NOTE 1: In the case of call restoration, ANF-ISIMM does not interact with ANF-ISIGC; ANF-ISIMM only interacts with the call control application of the SwMI concerned and it is this call control application which interacts with ANF-ISIGC.

NOTE 2: All updating of the SwMI databases used for the operation of ANF-ISIGC are not to be considered as interactions between ANF-ISIMM and ANF-ISIGC.

4.5 Interworking considerations

ANF-ISIGC and Public Switched Telephone Network (PSTN) shall interwork in the case of a PSTN call through a TETRA gateway located in a SwMI different from that where the TETRA called group has its home SwMI.

For an incoming telephony call to a TETRA group, the PSTN calling user shall have to send the number of the called group to the TETRA PSTN gateway. If the call is a group call and the SwMI where the gateway is located is not the called group's home SwMI, an ANF-ISIGC entity shall be invoked to extend the group call requested to the called group's home SwMI. This ANF-ISIGC entity shall use the GTSI number, converted from the received PSTN number, as the called number.

NOTE 1: A PSTN telephone call may result in a TETRA speech (tele-) service call.

NOTE 2: Only the calling user can participate in a group call to a group which it is not a member of. Therefore, a group call made by a TETRA user cannot involve an individual from an external network.

A similar procedure shall apply for an incoming data call, with the difference that this call would first be connected by the gateway to some modem belonging to its modem pool.

NOTE 3: For data calls from PSTN, TETRA bearer service negotiation may be possible with the called SwMI or the group home SwMI. However, this is only possible if the called SwMI can inform the gateway modem which bearer service it supports sufficiently fast. Otherwise, the negotiation phase between the two modems involved in the call establishment, one on the calling party side and the other from the PSTN gateway modem pool, may be over.

ANF-ISIGC and Integrated Services Digital Network (ISDN) shall interwork in the case of an ISDN call through a TETRA gateway located in a SwMI different from that where the TETRA called group has its home SwMI.

For an incoming call to a TETRA group, contrary to the case of a PSTN calling user, the ISDN calling user can send the identity of the called group to the TETRA ISDN gateway. It shall do this by using one of the various means available (e.g. using the ISDN supplementary services subaddressing or user to user signalling) for ISDN. The calling user can also indicate the type of call, telephony or data call, through the bearer service requested.

NOTE 4: An ISDN telephony teleservice may result in a TETRA speech (tele-) service call. And an incoming ISDN call requesting a bearer capability defined by an information transfer capability value equal to unrestricted digital information, and a layer 1 access protocol value corresponding to the rate adaptation in accordance with ITU-T Recommendation V.110, may result in a TETRA data call.

The data rate for the call might then be negotiated using the (optional) in-band parameter exchange (IPE) procedure described in appendix I of this ITU-T Recommendation V.110.

ANF-ISIGC and PISN shall interwork in the case of a PISN call through a TETRA gateway located in a SwMI different from that where the TETRA called group has its home SwMI. This interworking shall be exactly the same as that described above between ANF-ISIGC and ISDN, in replacing ISDN number by PISN number.

NOTE 5: The fact that ANF-ISIGC allows the use of PISN to interconnect the SwMIs involved in inter-TETRA group calls is not to be considered as interworking at stage 1 level.

4.6 Static description of ANF-ISIIC using attributes

In accordance with ITU-T Recommendation I.210 [17], the static description of ANF-ISIGC is given below using the relevant attributes with the corresponding values as defined in ITU-T Recommendation I.140 [16].

ANF-ISIGC is extending over the ISI the TETRA bearer or tele- service invoked by a group calling user, by creating the necessary connection between the originating, the controlling and the participating SwMIs. The corresponding bearer service attributes are given in annex C, which is informative (since it is simply reformulating the corresponding information defined in ETS 300 392-2 [3]).

Using the terminology defined in ITU-T Recommendation I.140 [16], the connection to be created by ANF-ISIGC as a result of its invocation and operation is a connection element.

Table 1 defines the static description of this connection element in terms of the values of its attributes as listed in ITU-T Recommendation I.140 [16].

As an option, another set of values is defined in table 2 for networks which can handle multirate 8 kbit/s calls. That is, networks which can handle 8 kbit/s -instead of or in addition to the standard 64 kbit/s channels-, and secondly can establish calls involving more than one such channel.

NOTE 1: The attributes in the two tables below have been grouped into categories in a similar manner as in ITU-T Recommendation I.210 [17] for the bearer service attributes.

As already stated in subclause 4.2.2.3, call modification shall have no impact on the connection(s) established by the invoked ANF-ISIGC, but it shall result in a change of the 8 kbit/s encoding of the user information when the data rate of this information changes. Thus, the access attribute Information transfer coding/protocol in the static descriptions of the ISI connection elements in tables 1 and 2 may change when a call modification occurs. No other attribute in these tables shall change.

NOTE 2: This means that even if the ISI connection has been established as an $n \times 8$ kbit/s connection (see table 2), the number N of 8 kbit/s ISI channels used for the call may not change. The reason for this, is that the various cases of call modification defined in subclause 14.5.2.2 of ETS 300 392-2 [3] never result in an increased number of ISI 8 kbit/s channels. Secondly, the definition of PISN multirate calls does not cater for the possibility of reducing the number of channels used for the call at set-up time.

As to the case of 64 kbit/s connection elements, addressed in table 1, obviously there is no possibility to change the information transfer rate of these connection elements.

Table 1: Basic definition of ANF-ISIGC connection element attributes

Attribute category	Attribute name	Attribute value
Information transfer attributes	1. Information transfer mode: 2. Information transfer rate: 3. Information transfer capability: 4. Structure: 5. Establishment of connection: 6. Symmetry: 7. Connection configuration:	circuit 64 kbit/s no restriction (see note) 8 kHz integrity demand bi-directional symmetric point-to-multipoint
Access attributes	8. Channel: 9. Connection control protocol: 10. Information transfer coding/ protocol	B _Q for user information, D _Q for signalling PSS1 for D _Q -channel Encoding of each TETRA slot into an 8 kbit/s stream. In case of a (TETRA) multi-slot bearer service, the resulting 8 kbit/s streams shall be multiplexed as defined in CCITT Recommendation I.460 [18].
General attributes	11. Network performance 12. Network interworking 13. Operations and management aspects	for further study for further study for further study
NOTE: According to the definition of the attribute information transfer capability of a connection element in ITU-T Recommendation I.140 [16], the value of this attribute for the ANF-ISIGC connection element should be "null". Since this value means that there is no restriction to the types of information which may pass through the connection element, the term "no restriction" has been preferred.		

Table 2: optional definition of ANF-ISIGC connection element attributes

Attribute category	Attribute name	Attribute value
Information transfer attributes	1. Information transfer mode: 2. Information transfer rate: 3. Information transfer capability: 4. Structure: 5. Establishment of connection: 6. Symmetry: 7. Connection configuration:	circuit n x 8 kbit/s (with n = 1, 2, 3 or 4) no restriction (see note) time slot sequence integrity (TSSI) demand bi-directional symmetric point-to-multipoint
Access attributes	8. Channel: 9. Connection control protocol: 10. Information transfer coding/ protocol	8 kbit/s channels for user information, D ₀ for signalling PSS1 for D ₀ -channel Encoding of each TETRA slot into an 8 kbit/s stream
General attributes	11. Network performance 12. Network interworking 13. Operations and management aspects	for further study for further study for further study
NOTE:	According to the definition of the attribute information transfer capability of a connection element in ITU-T Recommendation I.140 [16], the value of this attribute for the ANF-ISIGC connection element should be "null". Since this value means that there is no restriction to the types of information which may pass through the connection element, the term "no restriction" has been preferred.	

4.7 Overall SDL

Figures 3 to 17 contain the dynamic description of ANF-ISIGC using the Specification and Description Language (SDL) defined in ITU-T Recommendation Z.100 [19]. The SDL process represents the behaviour of the set of SwMI entities involved, interconnected by the intervening network, possibly by a PISN, in providing ANF-ISIGC.

The following conventions are used:

- the input signals from the left and output signals to the left represent primitives from and to the initiating or controlling SwMI CC application;
- the input signals from the right and output signals to the right represent primitives from and to the served SwMI CC application.

5 ANF-ISIGC stage 2 specification

5.1 Functional model

5.1.1 Functional model description

The functional model shall comprise the following functional entities:

FE1 ISI group call originating entity

FE1' Originating SwMI call control application functional entity

FE2 ISI group home controlling entity/group call controlling entity

FE2' Group home SwMI/Controlling SwMI call control application functional entity

FE3 ISI group call participating entity

FE3' Participating SwMI call control application functional entity

FE4 ISI Database entity of the calling party (ITSI)

FE5 ISI Database entity of the called group (GTSI)

The following functional relationships shall exist between these FEs:

ra between FE1' and FE1.

rb between FE1 and FE4.

rc between FE1 and FE2.

rd between FE2 and FE2'.

re between FE2 and FE5.

rf between FE2 and FE3.

rg between FE3 and FE3'.

Figure 18 shows the FEs and there relationships.

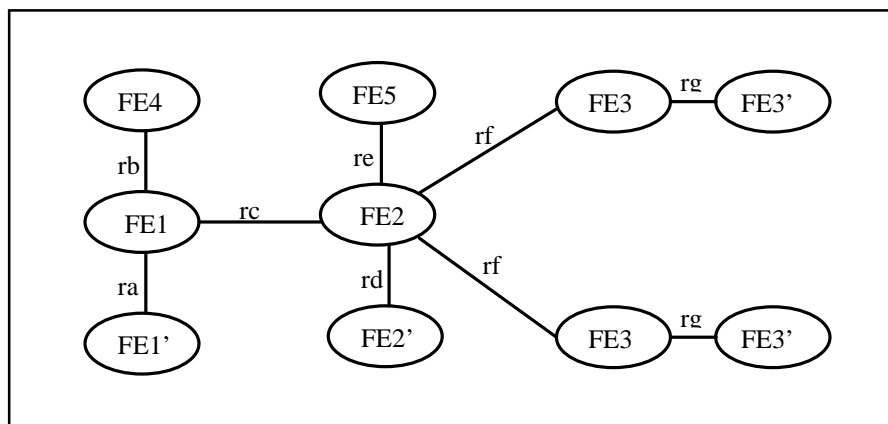

Figure 18: Functional model for the ANF-ISIGC

5.1.2 Description of functional entities

5.1.2.1 ISI group call originating entity, FE1

FE1 represents the originating entity of the group call. The purpose of this FE shall be to receive an outgoing group call request from the originating SwMI CC and forward the call request and call control to FE2.

This functional entity shall:

- detect an outgoing group call;
- request and receive information on the individual identity (ITSI) from FE4;
- determine routing to FE2;
- forward the call set-up request to FE2;
- re-route the call set-up request to a linking controlling SwMI or a new group home SwMI (when SS-CFU has been invoked);
- receive a set-up indication from FE2 for the initiated group call;
- receive the response on the delivered group call request from FE1' and forward the response to FE2;
- connect the calling user and invoke FE3 upon reception of a group call connect request;
- release the group call on request from FE2;
- receive request for group call release from FE1' and forward the request to FE2;
- function as an intermediary between TETRA and PSS1 call control.

5.1.2.2 Originating SwMI CC application functional entity, FE1'

FE1' represents the CC application entity of the originating SwMI. This FE represents the existing call control functionality for a single SwMI. The purpose of this FE is to initiate the establishment of a group call when a set-up information flow is received from a calling user (at the air interface). FE1' should invoke FE1 when establishment of the call is to a group which, to FE1's knowledge, is registered in another TETRA network.

This functional entity may:

- detect an ISI outgoing group call at the air interface;
- analyse the calling MS's profiles;
- analyse the called group number;
- invoke FE1 and forward the call set-up request;
- analyse set-up indication received by FE1 for the initiated group call;
- analyse resource availability and reserve resources;
- co-ordinate call identity with FE3';
- release the group call when requested by FE1;
- request to disconnect group call.

NOTE: FE1' is not part of the ISI standard.

5.1.2.3 ISI group call controlling entity, FE2

FE2 can represent either the group home entity or the controlling entity of the group call. After call set-up, FE2 shall always represent the controlling entity. The group home entity will only differ from the controlling entity when the called group is linked to a group located in another SwMI, and this other SwMI is the linking controlling SwMI.

FE2 shall be the central distribution and reception point for all group call signalling between FE3s, FE1 and FE2'. During the maintenance phase of the call, FE2 shall control all transmission granting.

This functional entity shall:

- receive forwarded group call request from FE1;
- receive and request information on the group identity (GTSI) from FE5;
- perform additional analyse of the called group number;
- re-route the call when this SwMI is not the controlling SwMI or when the group call has been forwarded unconditionally;
- determine routing over ISI trunks to participating SwMIs;
- send call set-up to all FE3s and FE1 participating in the group call;
- perform transmission control during call maintenance phase;
- releases the ISI group call path when the last migrated user in a participating SwMI migrates to a new participating SwMI;
- forward disconnect call request received from FE3 to FE2';
- clear the call to participating SwMI (FE3) when requested by FE2';
- function as an intermediary between TETRA and PSS1 call control.

5.1.2.4 Controlling SwMI CC application functional entity, FE2'

FE2' represents the CC application entity of the group home SwMI or controlling SwMI. After call set-up, FE2' shall always represent the controlling SwMI CC application entity. The group home CC application entity will only differ from the controlling SwMI CC application entity when the called group is linked to a group located in another SwMI, and this other SwMI is the linking controlling SwMI.

FE2' represents the existing call control functionality for a single SwMI. This FE shall be the central point for all group call arbitration between FE3s, during call set-up and release.

This functional entity may:

- analyse incoming group call request from FE2;
- perform analyse of the called group profiles;
- analyse the call set-up response from all participating FE3s and FE1;
- initialize polling of all participating FE3s in the case of acknowledged group call;
- initialize call set-up delays in the case of delay request;
- forward call restoration information to FE2;
- analyse withdraw and continue request from FE3;
- analyse call disconnection request from FE2.

NOTE: FE2' is not part of the ISI standard.

5.1.2.5 ISI group call participating entity, FE3

FE3 represents the participating entity of the group call. This FE shall be an intermediary between FE2 and the participating SwMI CC application, FE3'. The participating SwMI may have one or more members of the group call registered either as resident or as visitor. If the called group is linked to a group or groups and the linking controlling SwMI is different from the called group's home SwMI, then residents (members of the linked group) can exist in a participating SwMI.

This functional entity shall:

- receive an incoming ISI group call from FE2;
- receive the response on the delivered group call request from the FE3' and forward the response to FE2;
- receive a polling request from FE2 and inform FE3' to poll group members;
- receive call information from FE2 and forward to FE3' or from FE3' and forward to FE2;
- receive continuation and withdrawal information from FE3';
- receive transmission control information from FE2 and deliver it to FE3';
- receive request for transmission from FE3' and forward the request to FE2;
- release the group call on request from FE2;
- receive request for group call release from FE3' and forward the request to FE2;
- function as an intermediary between TETRA and PSS1 call control.

5.1.2.6 Participating SwMI CC application functional entity, FE3'

FE3' represents the CC application entity of the participating SwMI. This FE represents the existing call control functionality for a single SwMI. The purpose of this FE is to analyse group call set-up request from FE3 and forward these request to the called users (over the air interface).

This functional entity may:

- analyse group call set-up request received by FE3;
- perform analyse on the called group number;
- analyse resource availability and reserve resources;
- poll group members over the air interface;
- request to withdraw from group call;
- request to continue with group call;
- forward transmission request and ceases from users;
- release the group call when requested by FE1;
- request to disconnect group call.

NOTE: FE3' is not part of the ISI standard.

5.1.2.7 ISI Calling MS Database entity (ITSI), FE4

FE4 represents the Database entity of the calling MS for a group call request. This FE shall provide the basic and supplementary user profiles of the calling MS to the requesting entity. The user profiles contain information about the available services for the individual MS, e.g. whether the MS may initiate a group call or not, or whether there may exist interactions to other services for the MS. The interrogation with the Database may either be with the VDB or it may be with the IHDB depending on which SwMI the calling MS is located in.

This functional entity shall:

- provide individual user profile information to the functional entity were FE4 is located;
- check whether any interrogation exist between the invoked service and other services, e.g. supplementary services, for the calling MS and provide the information to the functional entity were FE4 is located.

5.1.2.8 ISI Called Group Database entity (GTSI), FE5

FE5 represents the Database entity of the called group for a group call request. The purpose of this FE shall be to provide the basic and supplementary group profiles of the called group to the requesting entity. The group profiles contain information about the properties for the called group, e.g. who are the important users of the group, or what is the priority of the group, or whether there may exist interactions to other services for the group. The interrogation with the Database shall be with the GHDB. The interrogation shall also include any relationships between the calling MS and the called group.

This functional entity shall:

- provide group (GTSI) profile information to the functional entity were FE5 is located;
- check whether any interrogation exist between the invoked service and other services, e.g. supplementary services, for the called group and provide the information to the functional entity were FE5 is located.

5.1.3 Relationship of functional model to PSS1 basic call functional model

By definition, an invoked ANF-ISIGC establishes a PISN basic call. As a result its functional model matches closely that of PISN basic call (as defined in ISO/IEC 11572 [12]). For established group calls:

- FE2 shall be collocated with the originating PISN CC;
- FE3(s) shall be collocated with a terminating PISN CC.

Figures 19 shows an example of the relationship between the two models:

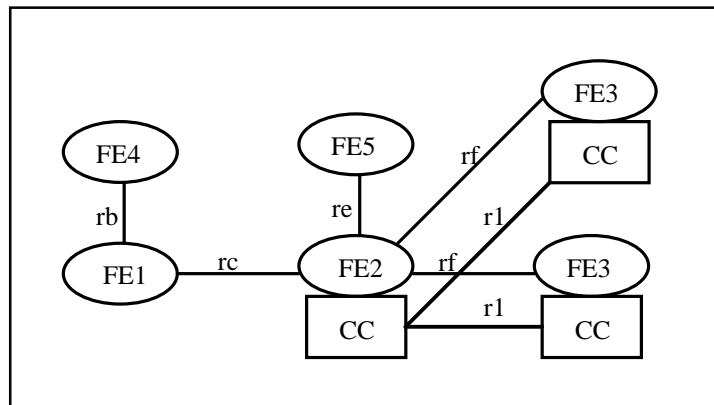

Figure 19: Example relationship between models for ANF-ISIGC and PSS1 basic call

5.2 Information flow

5.2.1 Information flow diagrams

This subclause specifies the information flow scenarios for the ANF-ISIGC basic operation services. The information flow scenarios shall provide sequences arising from error situations, interactions with PSS1 basic call, interactions with other PSS1 supplementary services, interactions with other TETRA ANFs and TETRA supplementary services, different topologies, etc.

NOTE 1: The information flow scenarios in stage 2 do not cover all possible signalling scenarios.

The stage 3 description of ANF-ISIGC shall provide signalling procedures in support of the information flow sequences specified below.

In the information flow scenarios, ANF-ISIGC information flows are represented by solid arrows where the flow is given by the name above the flow, and PSS1 basic call information flows are represented by flow names in square brackets below the flow. Whenever the PSS1 flow name is given, the two information flows occur simultaneously. Within a column representing an ANF-ISIGC functional entity, the numbers refer to functional entity actions listed in subclause 5.3.

NOTE 2: The names used for the PISN basic call information flows are those defined in ISO/IEC 11572 [12] and ISO/IEC 11582 [14], description of PISN basic call. Whenever possible (i.e. when such primitives exist), the names given to the ANF-ISIGC information flows are those of the corresponding CMCE uplink and downlink PDUs, as defined in clause 14 of ETS 300 392-2 [3].

The following abbreviations are used:

req	request
ind	indication
resp	response
conf	confirmation

5.2.1.1 Successful group call set-up over ISI using ANF-ISIGC

Figures 20 through 30 shows the information flow sequence for a successful group call set-up using ANF-ISIGC. The figures cover all three cases described in subclause 4.2.2.3.1 plus the case where the called group is linked to another group in a SwMI other than it's own home SwMI, this shall be case 4.

For the **case 1 scenario** the originating FE1 and the controlling FE2 are collocated. Figure 20 to 22 shows how group members located in visited SwMIs (FE3s) are called using the group identity (GTSI). The group identity belongs to the group home SwMI.

For the **case 2 scenario** the originating FE1 is located in a visited SwMI where a visited MS is calling its home group ID (GTSI). Figure 23 to 26 shows the information flow sequence when the group call request is forwarded to the controlling FE2 in the group home using ANF-ISIGC.

For the **case 3 scenario** the originating FE1 can be located in either the visited or in the home SwMI of the calling MS. The controlling FE2 is located in the called group home SwMI. Figure 23 to 26 shows the information flow sequence when an MS initiates a group call to a foreign group over the ISI using ANF-ISIGC.

For the **case 4 scenario** the originating FE1 and the controlling FE2 are collocated. Figure 27 to 30 shows the information flow sequence for a group call to an linked group over the ISI using ANF-ISIGC. The MS is calling a group ID in its own network. The called group ID is linked to a group ID in another SwMI, where the other SwMI is the group home SwMI of the linked group. There may be other case 4 scenarios which however also are subsets of case 2 scenarios and case 3 scenarios. These are:

- 1) The MS is not in its home and calls a group ID which the MS is not member of. The group ID is associated to a group ID in another network.
- 2) The MS is in its home and calls a group ID which the MS is not member of. The group ID is associated to a group ID in another network.
- 3) The MS is not in its home and calls a group ID which has been given to the MS as a VGSSI. There also exists an association between the VGSSI and the original group ID in the home SwMI of the MS. The VGSSI may or may not have ordinary group members in the migrated network.

MSC Successful_group_call_set-up

/* Case 1 scenario
 - FE1 and FE2 are collocated
 - MS has roamed from SwMI1 to SwMI2 */

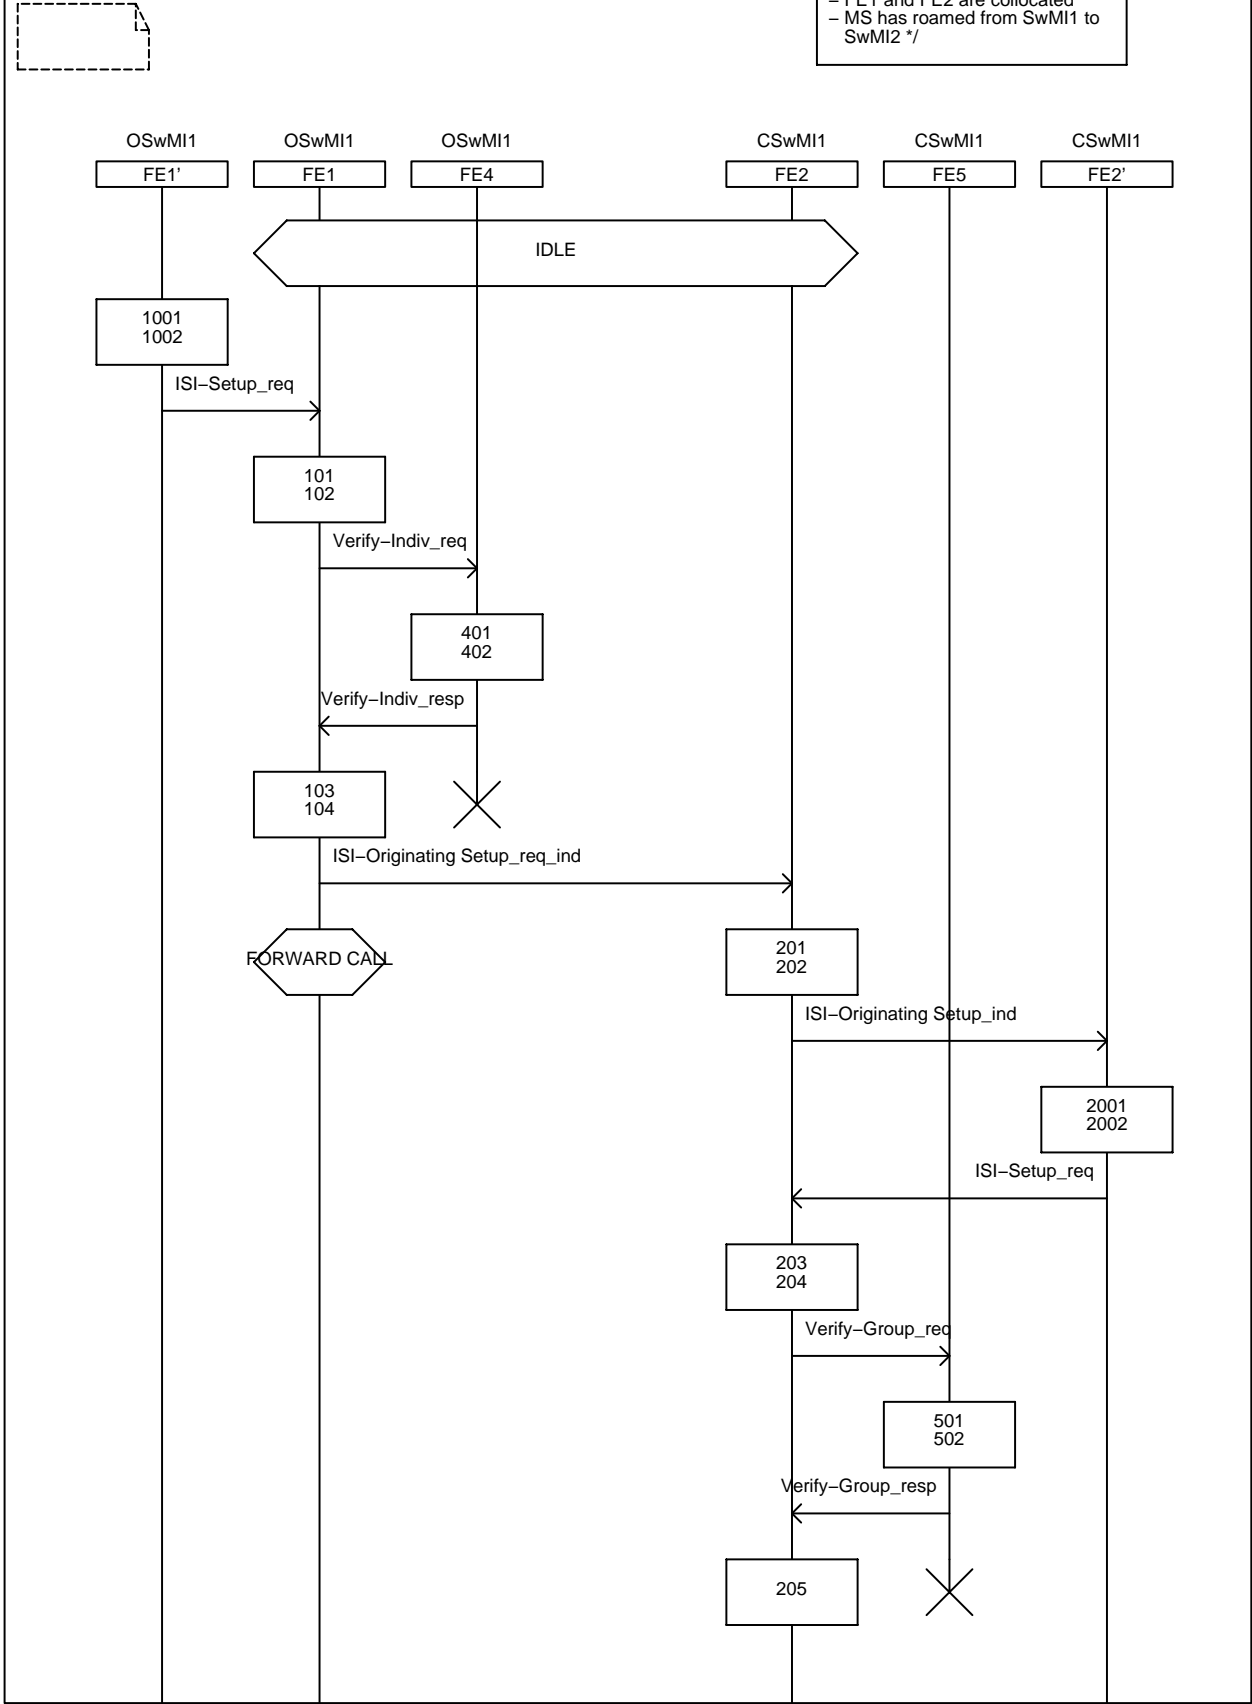

Figure 20: Information flow sequence - successful group call set-up, case 1 - sheet 1 of 3

MSC Successful_group_call_set-up

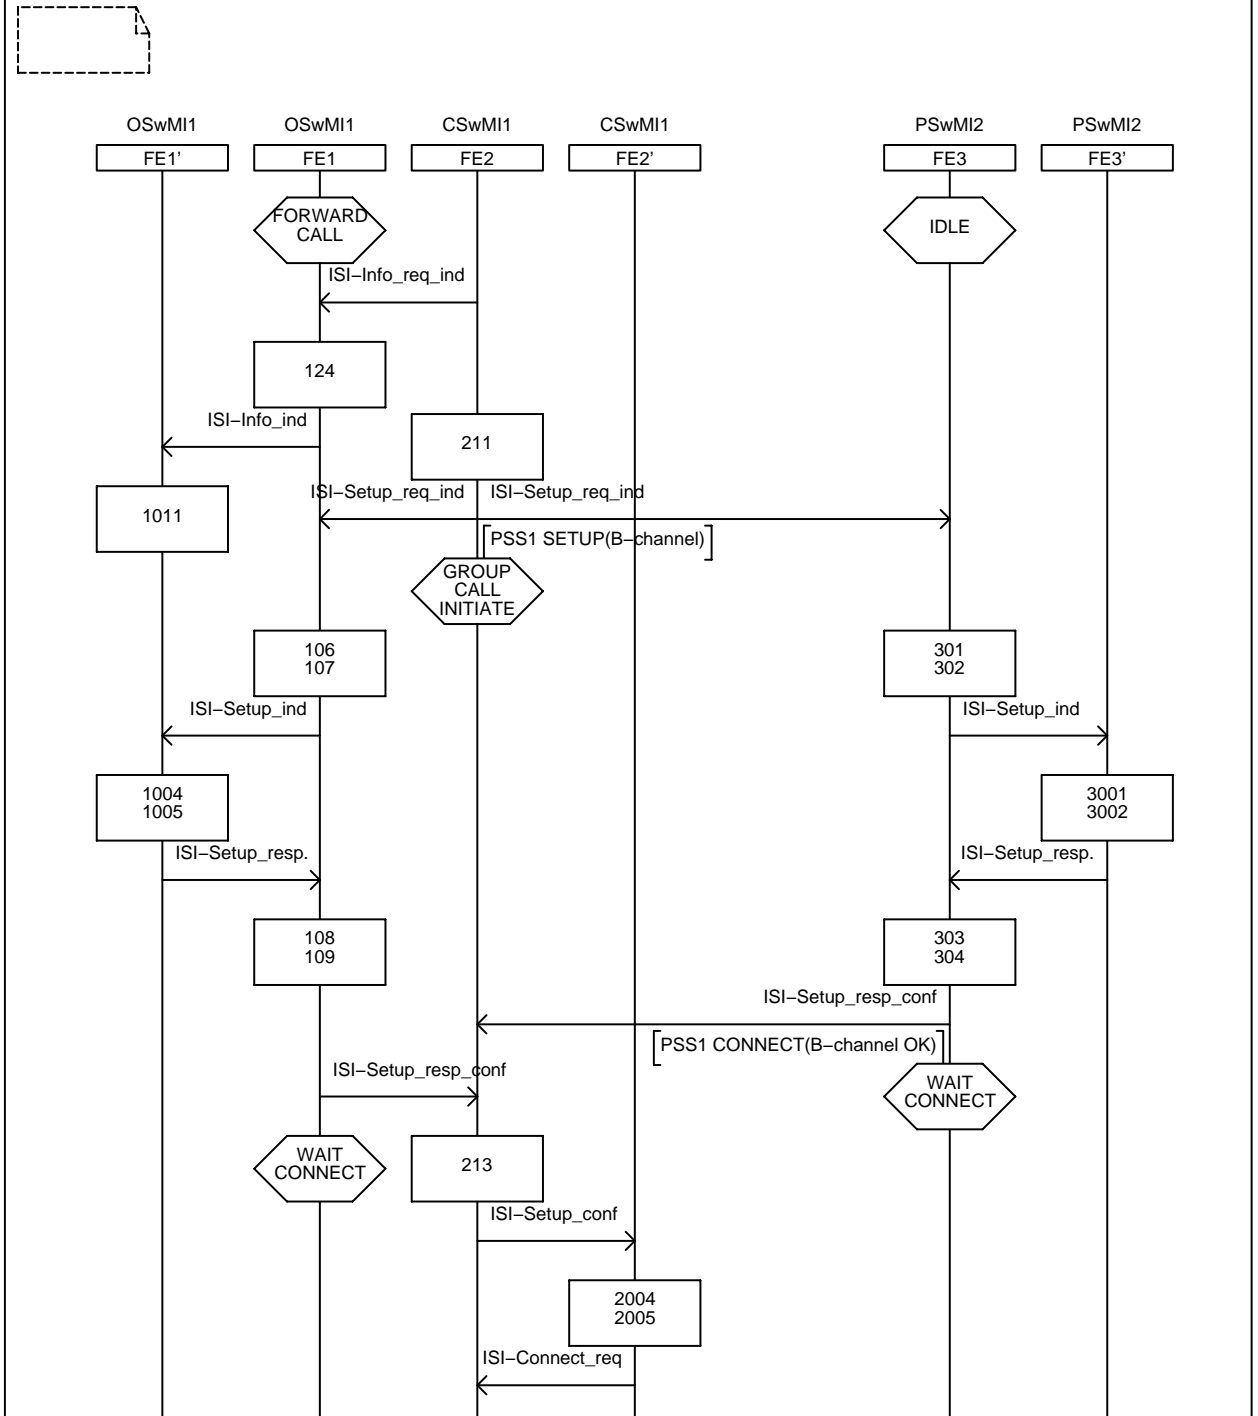

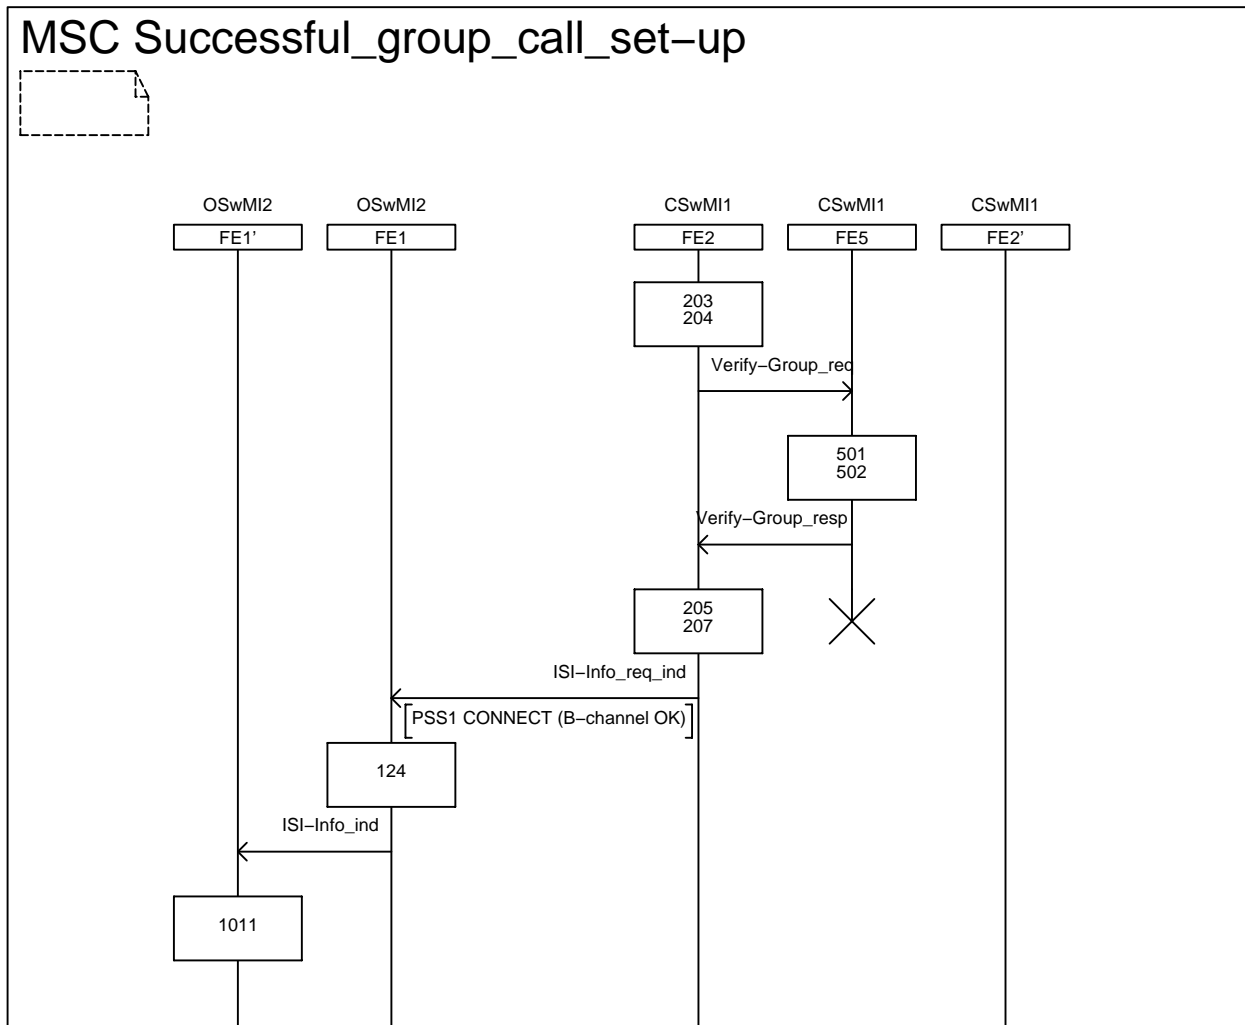

Figure 21: Information flow sequence - successful group call set-up, case 1 - sheet 2 of 3

A PSS1 facility information element shall not be sent to the controlling SwMI before a response has been sent from the participating SwMI to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent from the participating SwMI before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

NOTE: According to ISO/IEC 11582 [14] clause 10, the only PSS1 messages allowed to be used for the transport of APDUs and notification information during the call establishment phase are ALERTING, CONNECT and SETUP.

Figure 24: Information flow sequence - successful group call set-up, case 2 and 3- sheet 2 of 4

A PSS1 facility information element shall not be sent by the controlling SwMI before a response has been sent to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

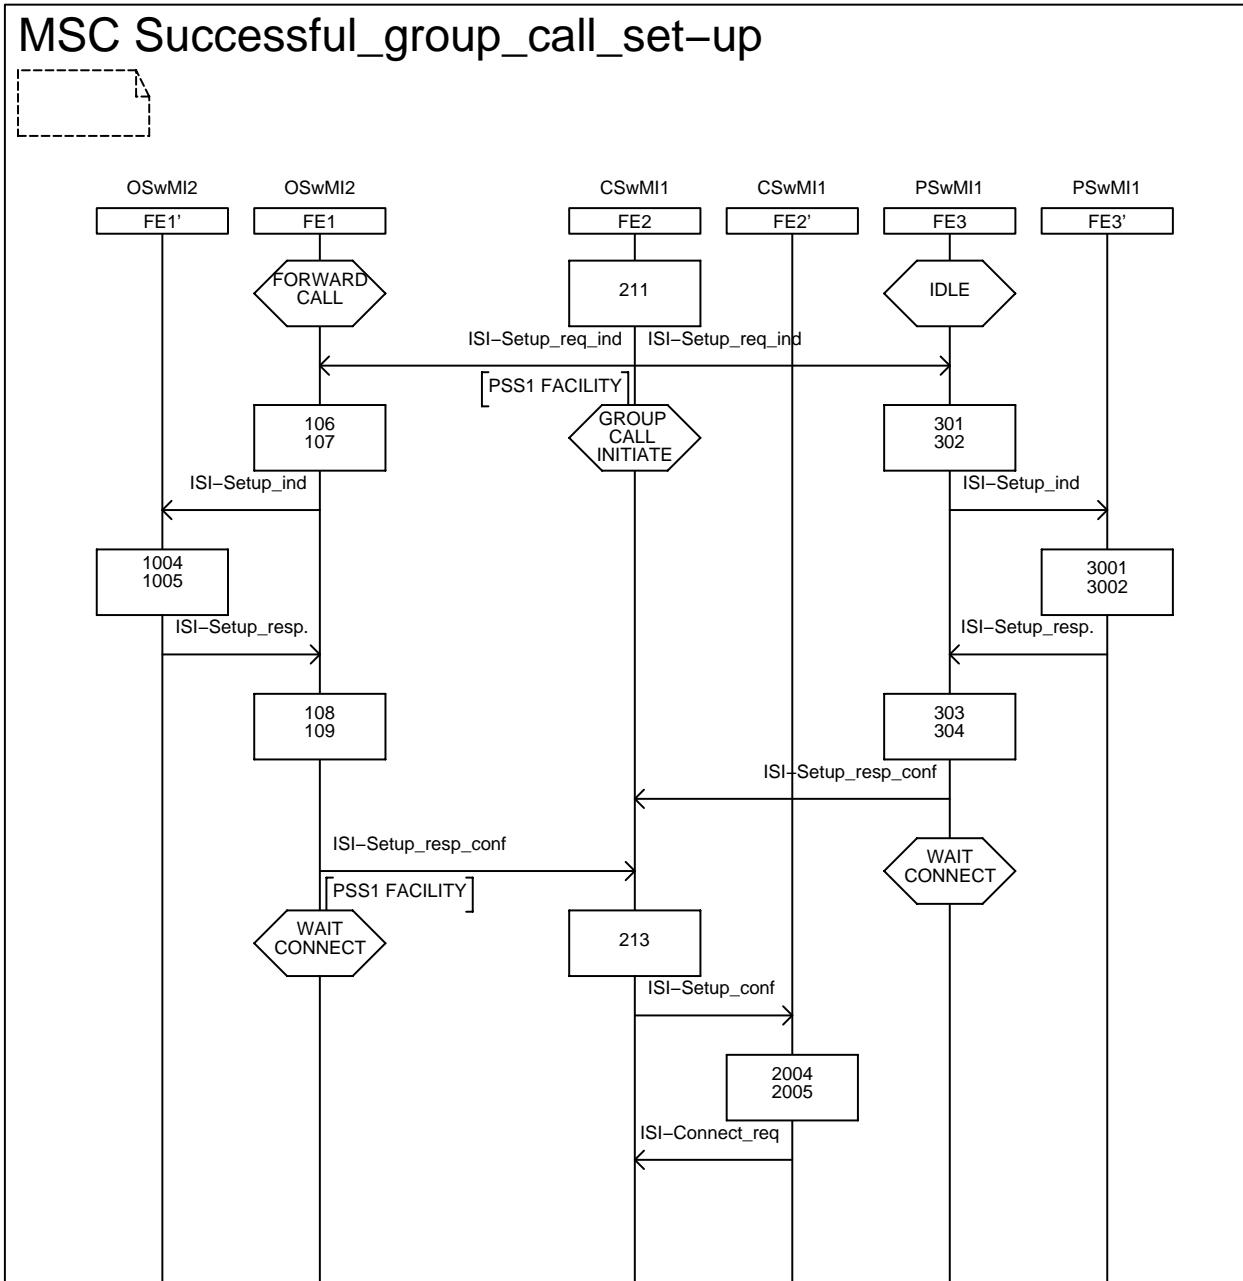

Figure 25: Information flow sequence - successful group call set-up, case 2 and 3- sheet 3 of 4

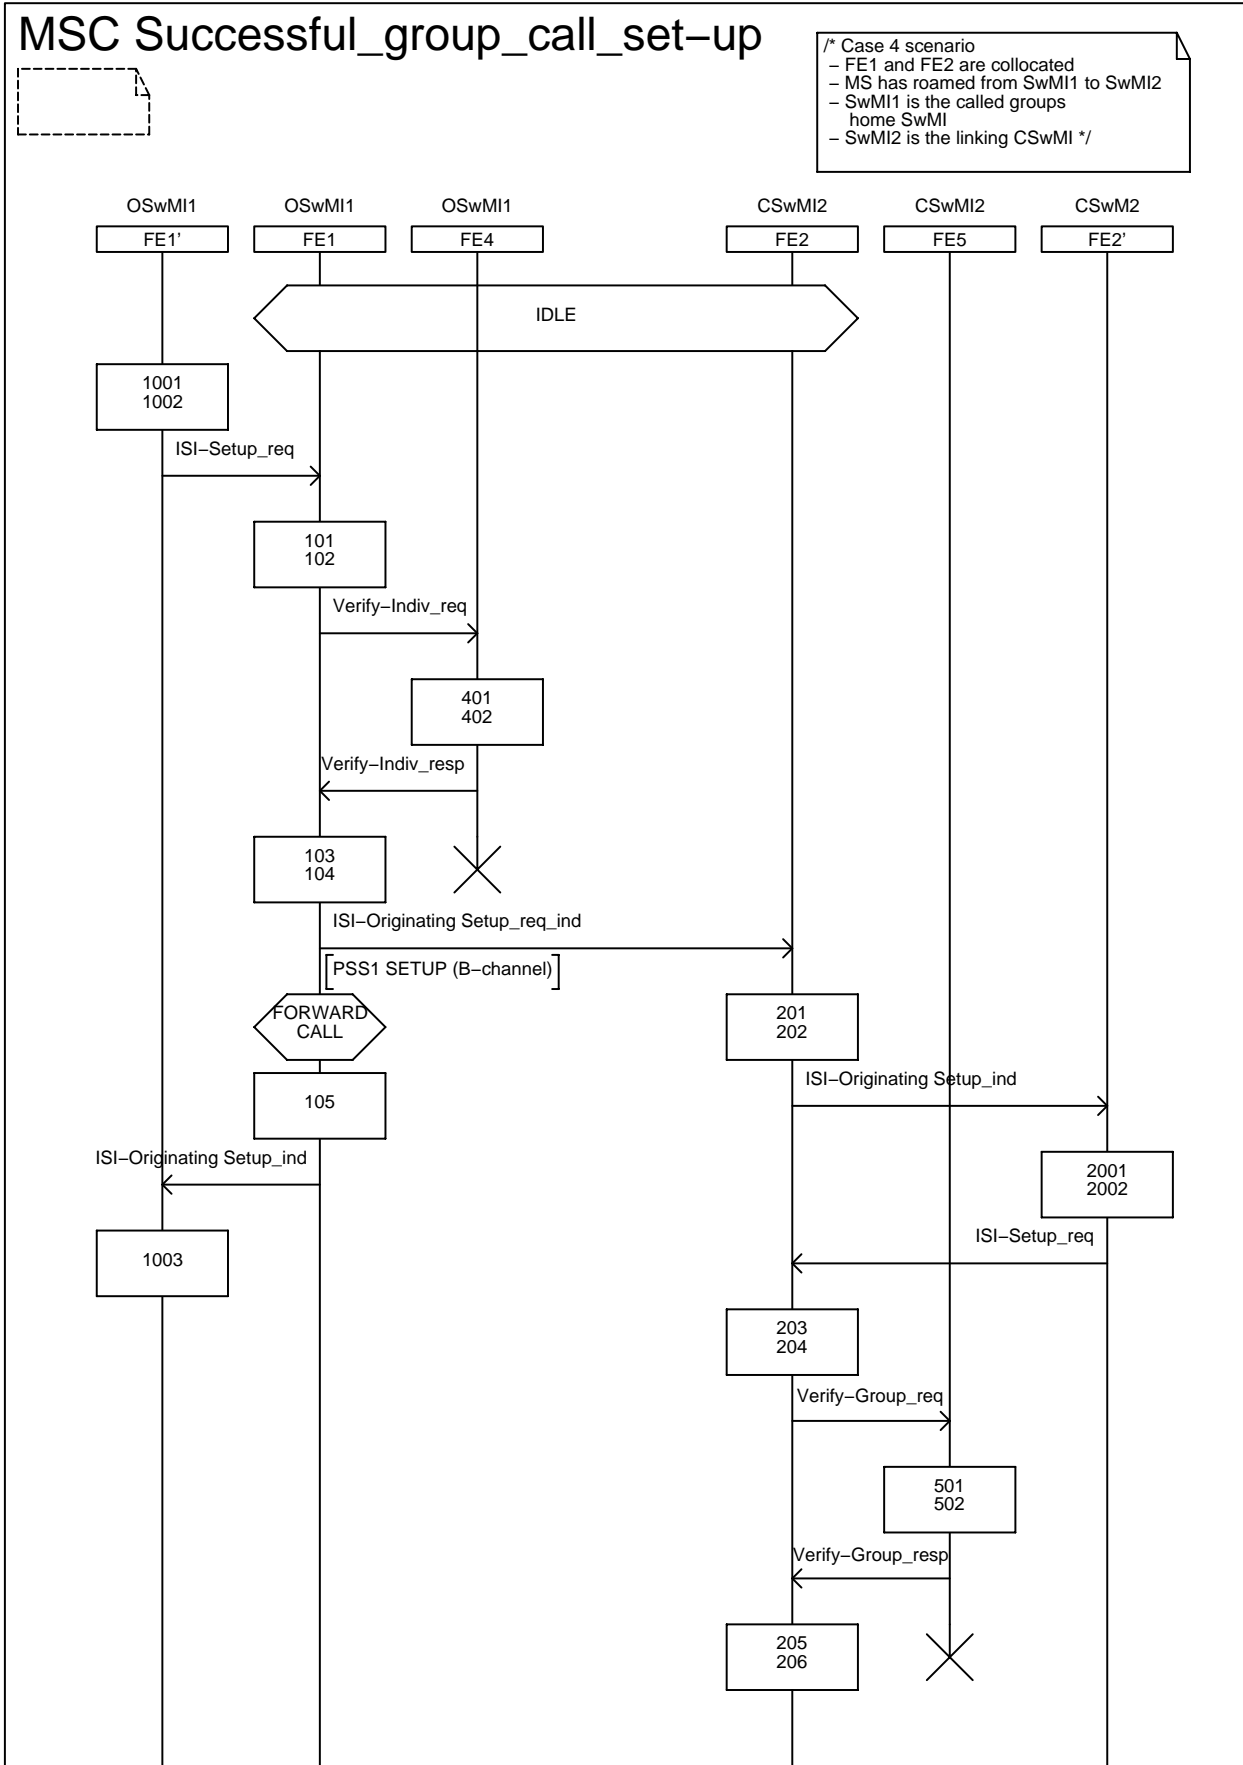

Figure 27: Information flow sequence - successful group call set-up, case 4 - sheet 1 of 4

MSC Successful_group_call_set-up

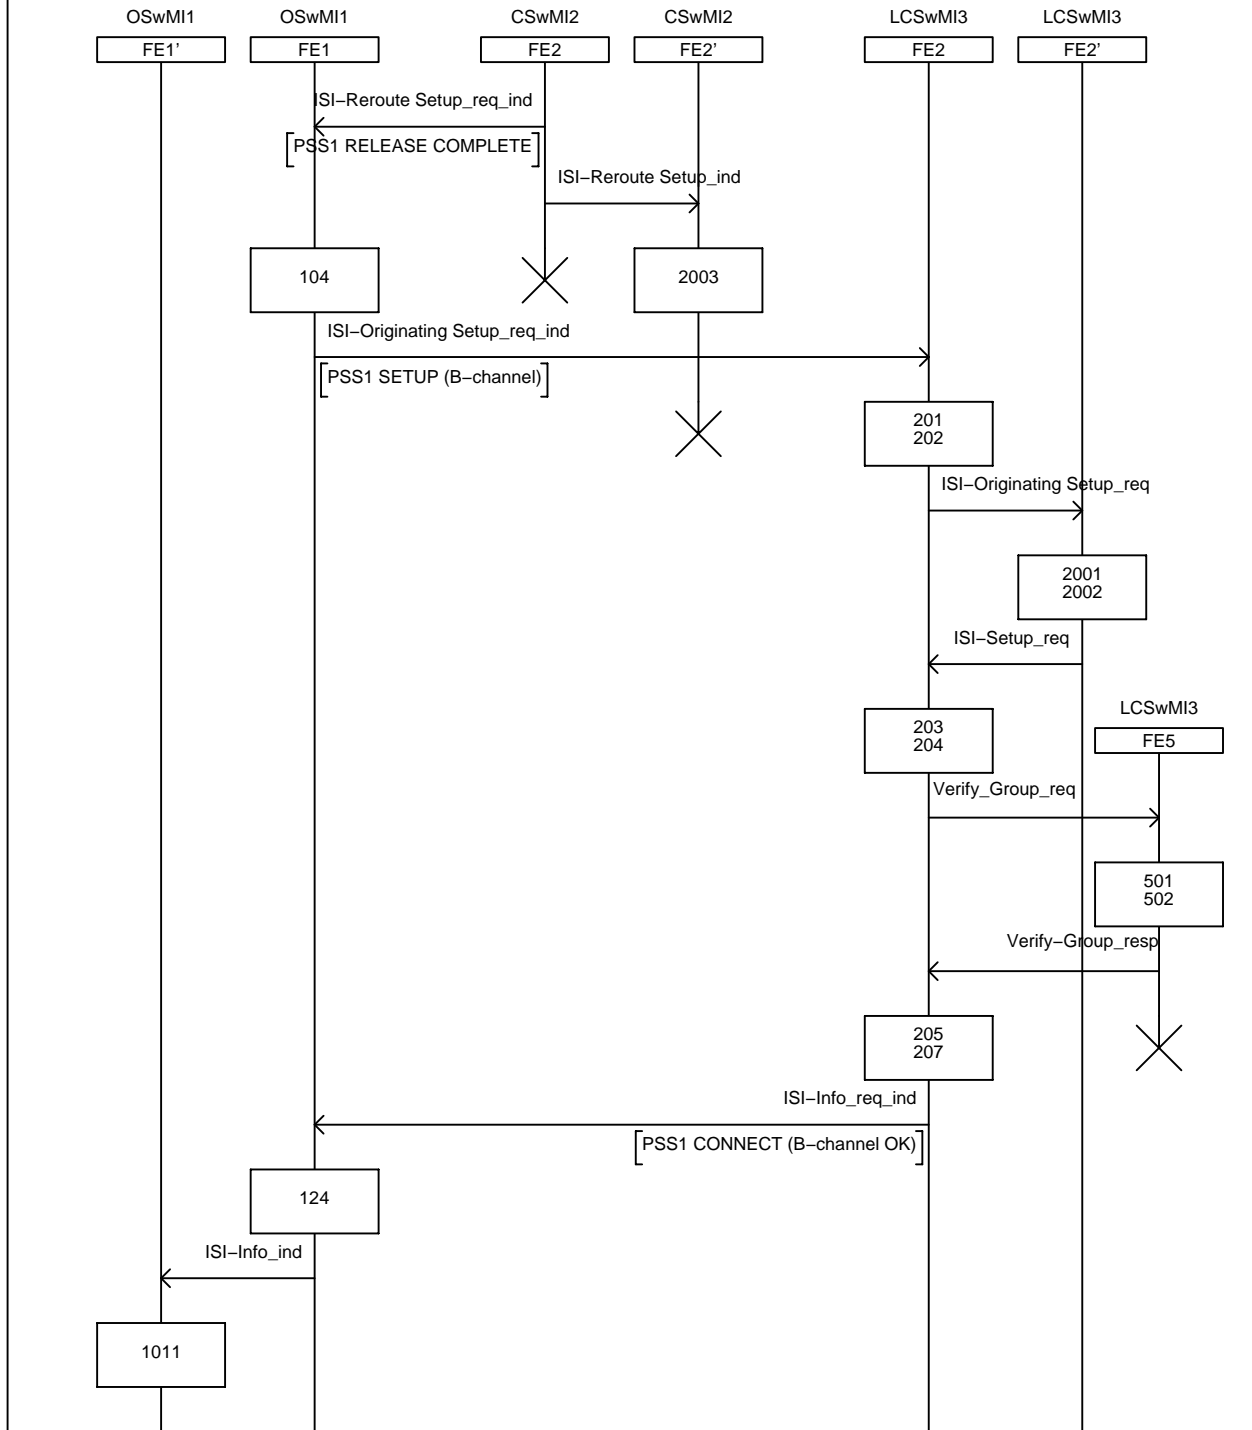

Figure 28: Information flow sequence - successful group call set-up, case 4 - sheet 2 of 4

A PSS1 facility information element shall not be sent by the controlling SwMI before a response has been sent to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

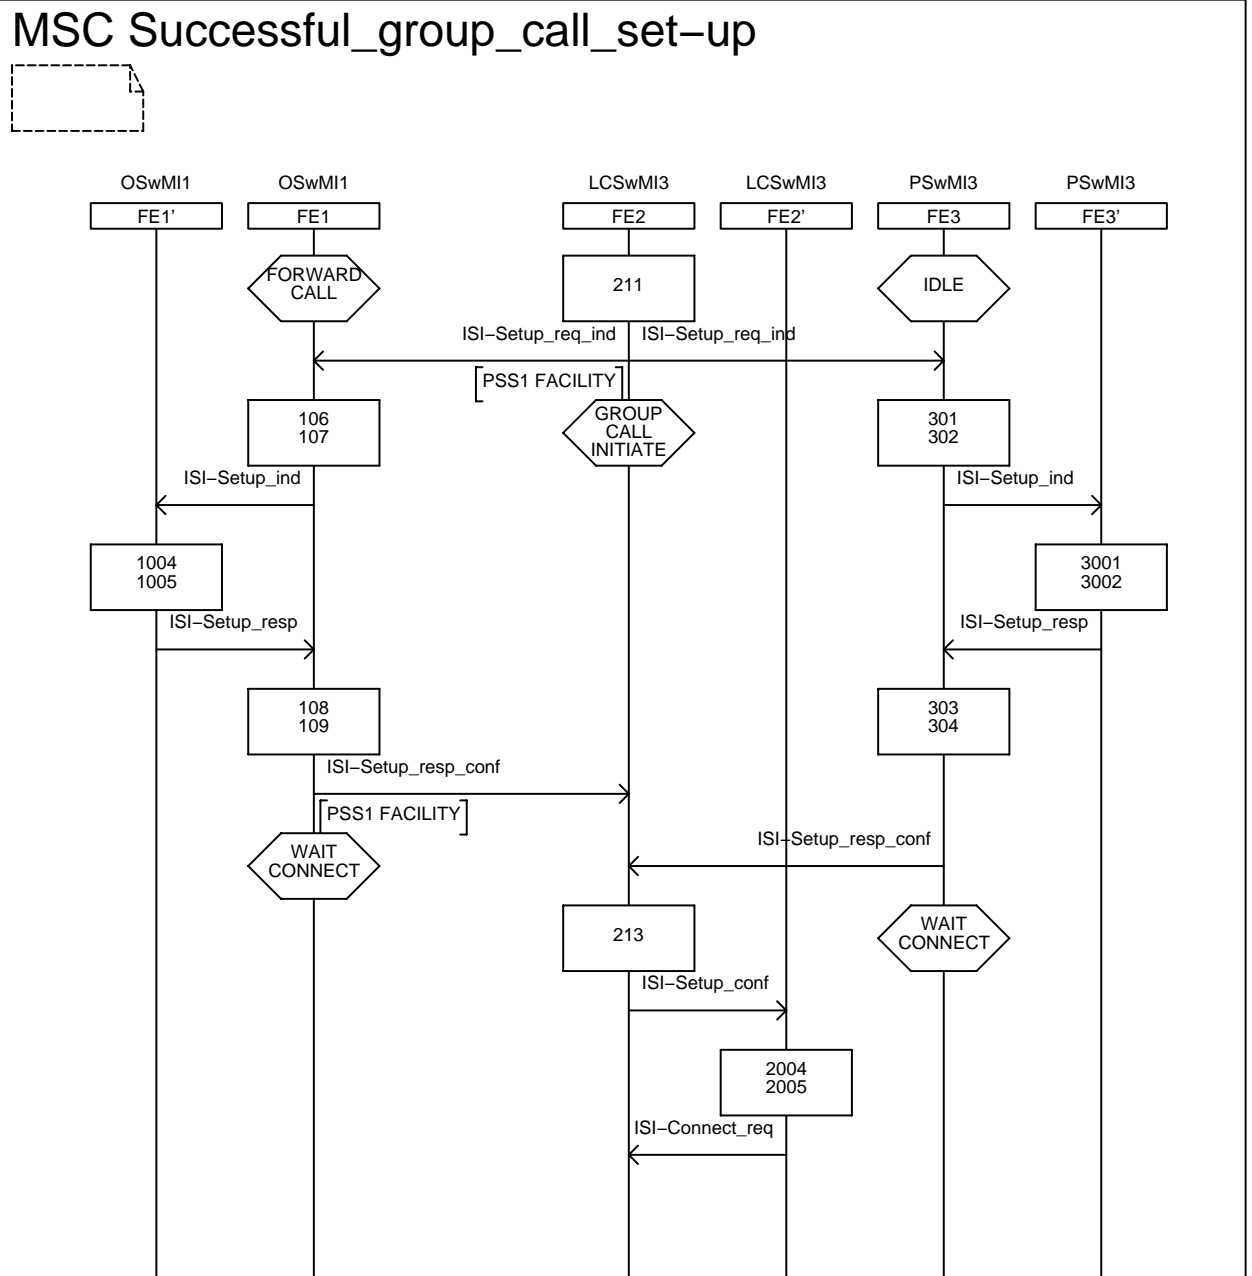

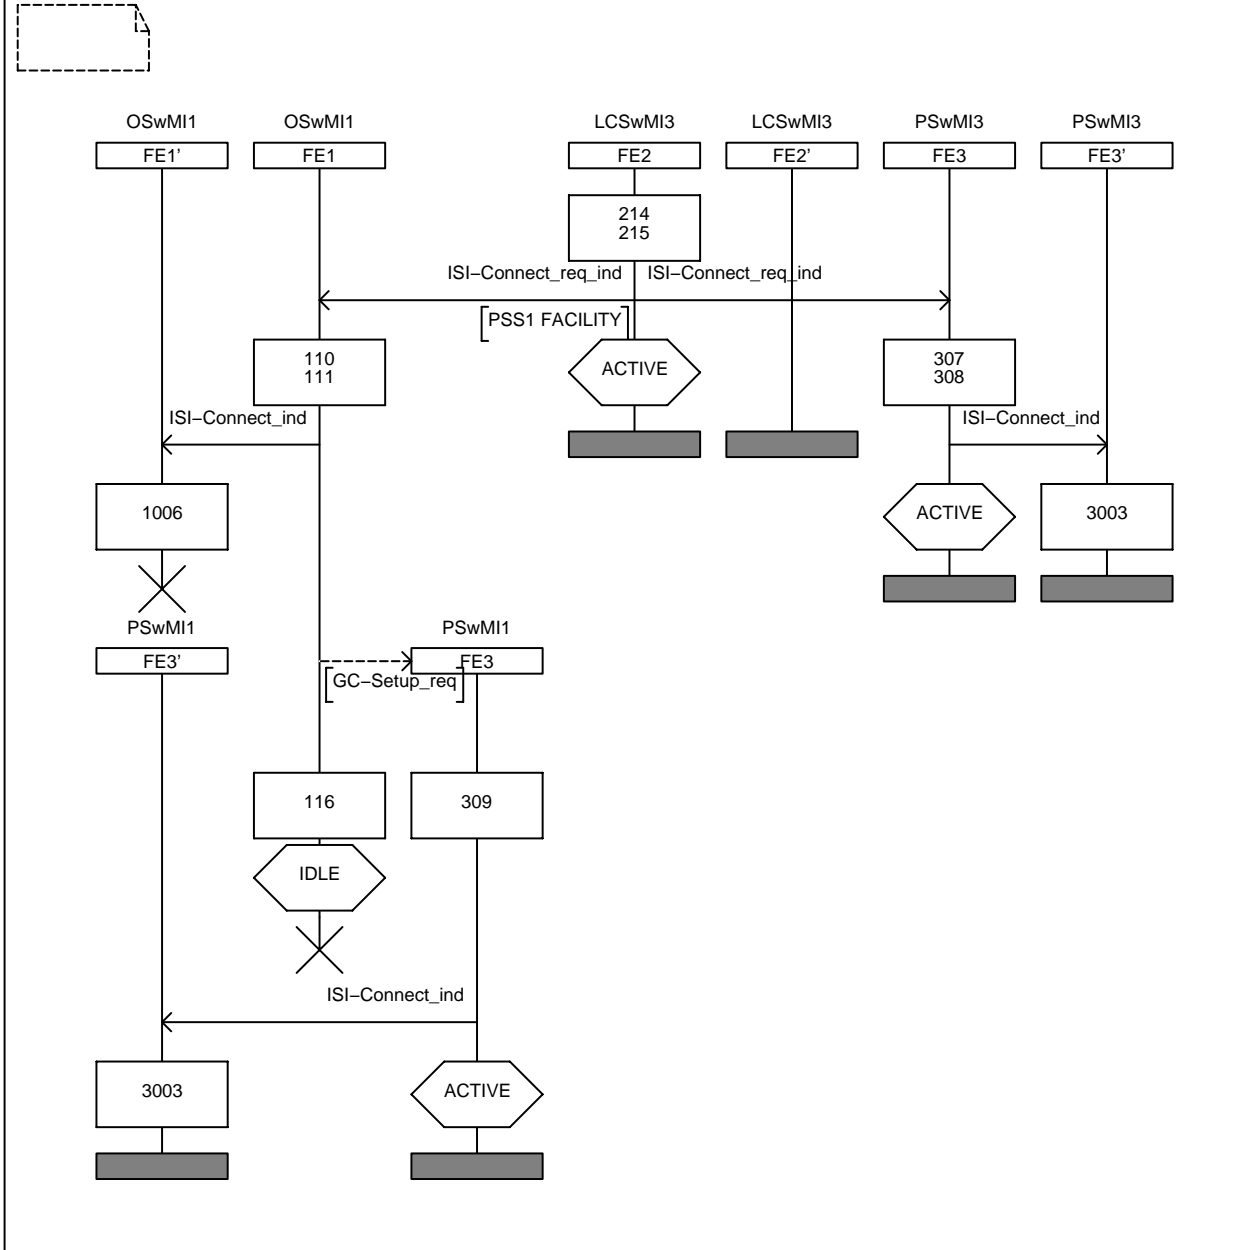

Figure 29: Information flow sequence - successful group call set-up, case 4 - sheet 3 of 4

MSC Successful_group_call_set-up

NOTE: The QSIG timer T313 (started by the originating/participating SwMI upon sending PSS1 CONNECT) is not to be implemented. The sending of PSS1 CONNECT ACKNOWLEDGE is therefore optional (ISO/IEC 11572 [12], subclause 10.1.6).

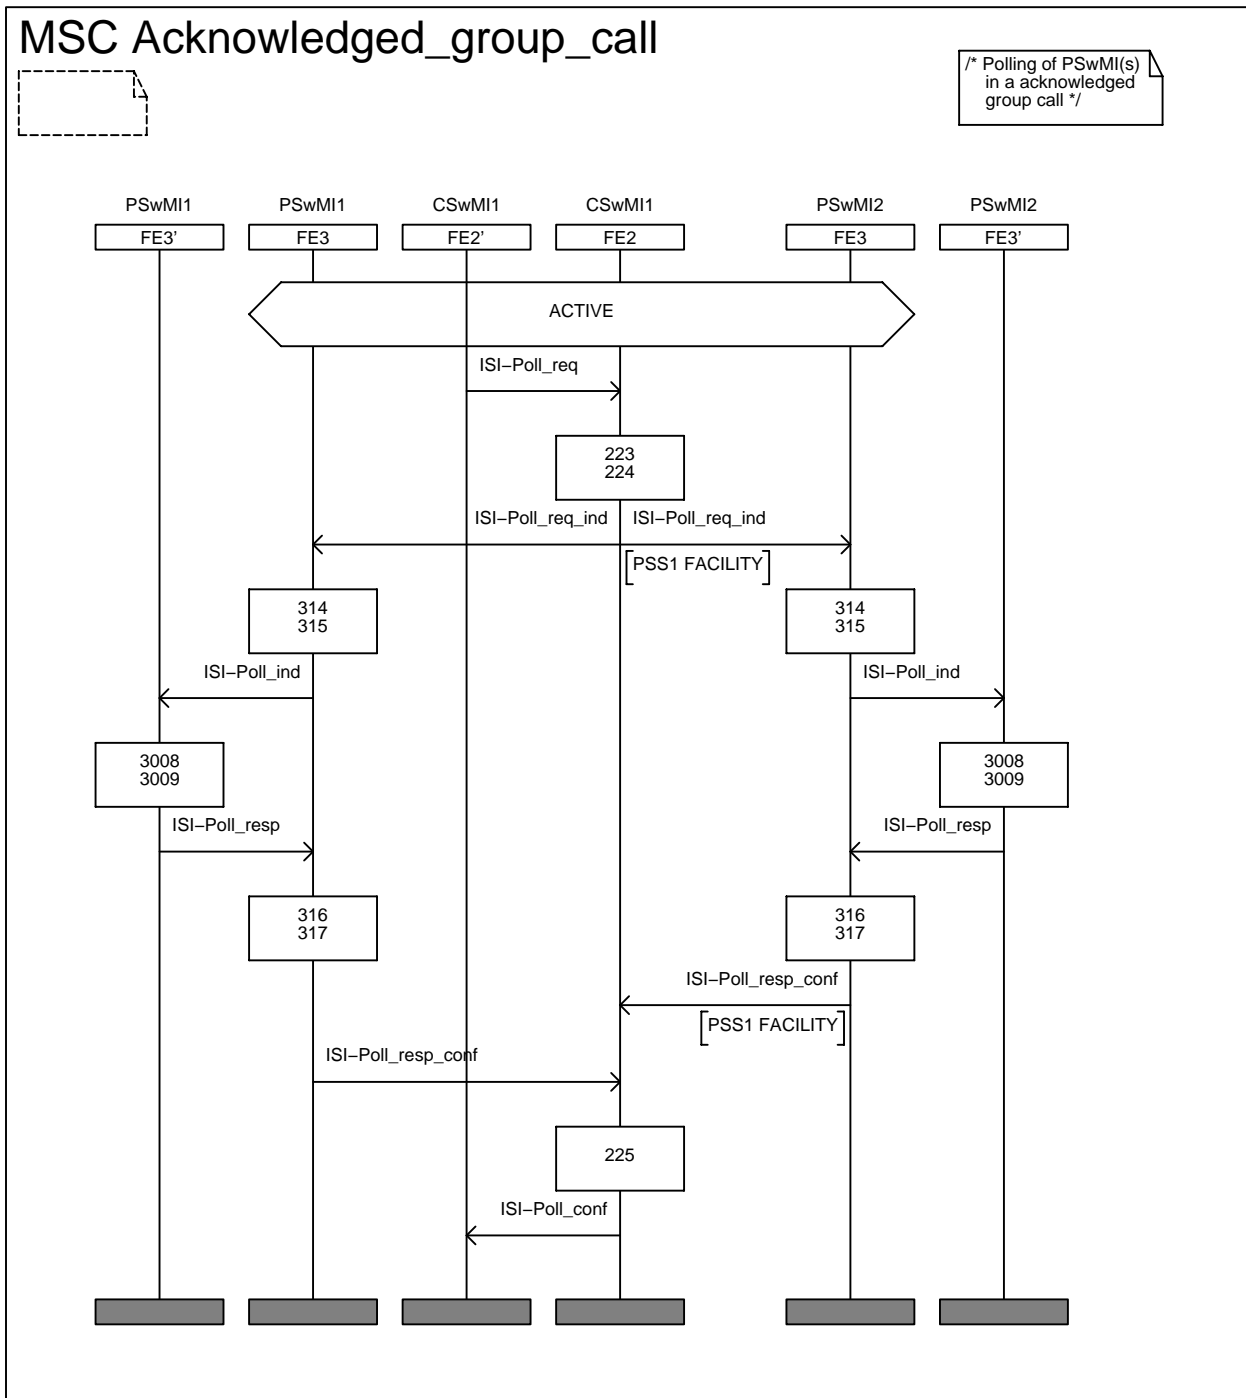

Figure 30: Information flow sequence - successful group call set-up, case 4 - sheet 4 of 4

FE2 should inform FE1 of 'call time-out, set-up phase' after reception of an ISI_ORIGINATING SETUP req.ind. 'Call time-out, set-up phase' should be used to inform the originating SwMI of the call set-up time used by the controlling SwMI. The 'call time-out, set-up phase' shall be contained within the information flow ISI_INFO req.ind. and carried by the PSS1 CONNECT message.

FE2 may inform FE1 of the 'call status' after reception of an ISI_ORIGINATING SETUP req.ind. The 'call status' should be used to inform FE1 of a possible queuing of the ISI_ORIGINATING SETUP req.ind. within the controlling SwMI. The 'call status' shall be contained within the information flow ISI_INFO req.ind. and carried by the PSS1 CONNECT message.

5.2.1.2 Acknowledged group call set-up over ISI using ANF-ISIGC

For acknowledged group calls, participating SwMIs shall first be polled after the group call has been successfully set-up. The group call set-up sequence for acknowledged group calls shall comply to the set-up sequences shown in figures 20 to 30.

NOTE: FE2 may at any time send FE3 the polling result contained within the information flow ISI_INFO req.ind.

Figure 31: Information flow sequence - successful acknowledged group call set-up

5.2.1.3 Partial group call set-up over ISI using ANF-ISIGC

The group call has been initiated as shown for case scenarios 1 through 4, figure 20 to 30.

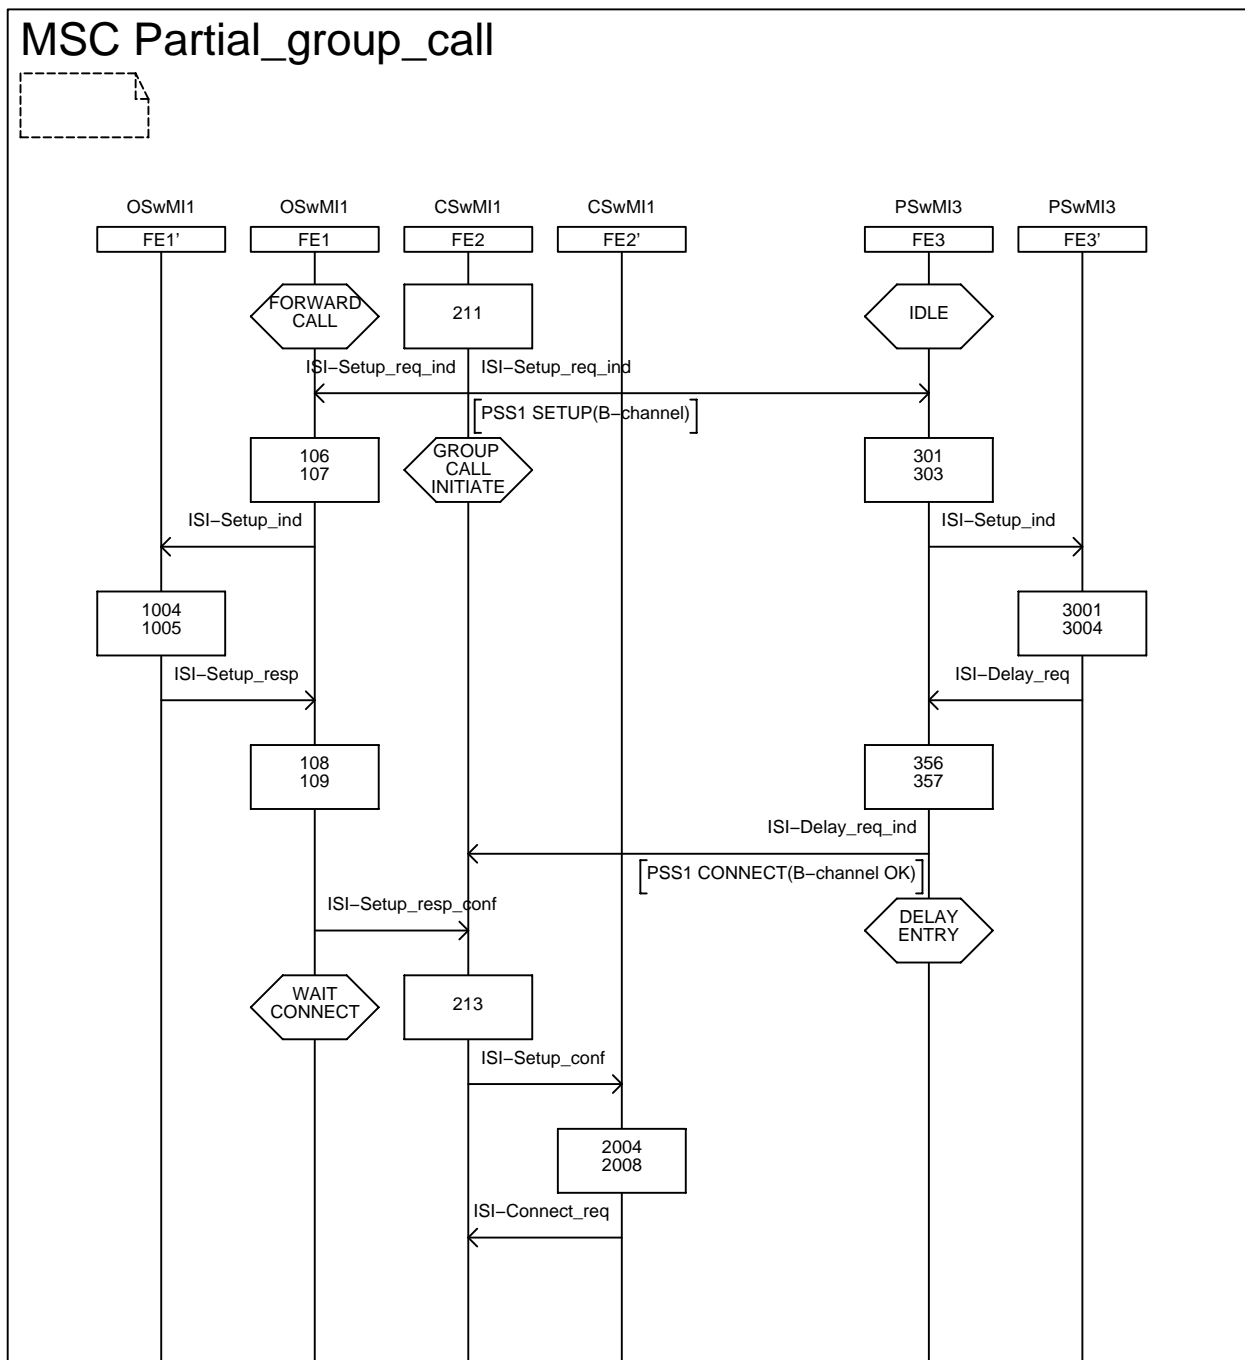

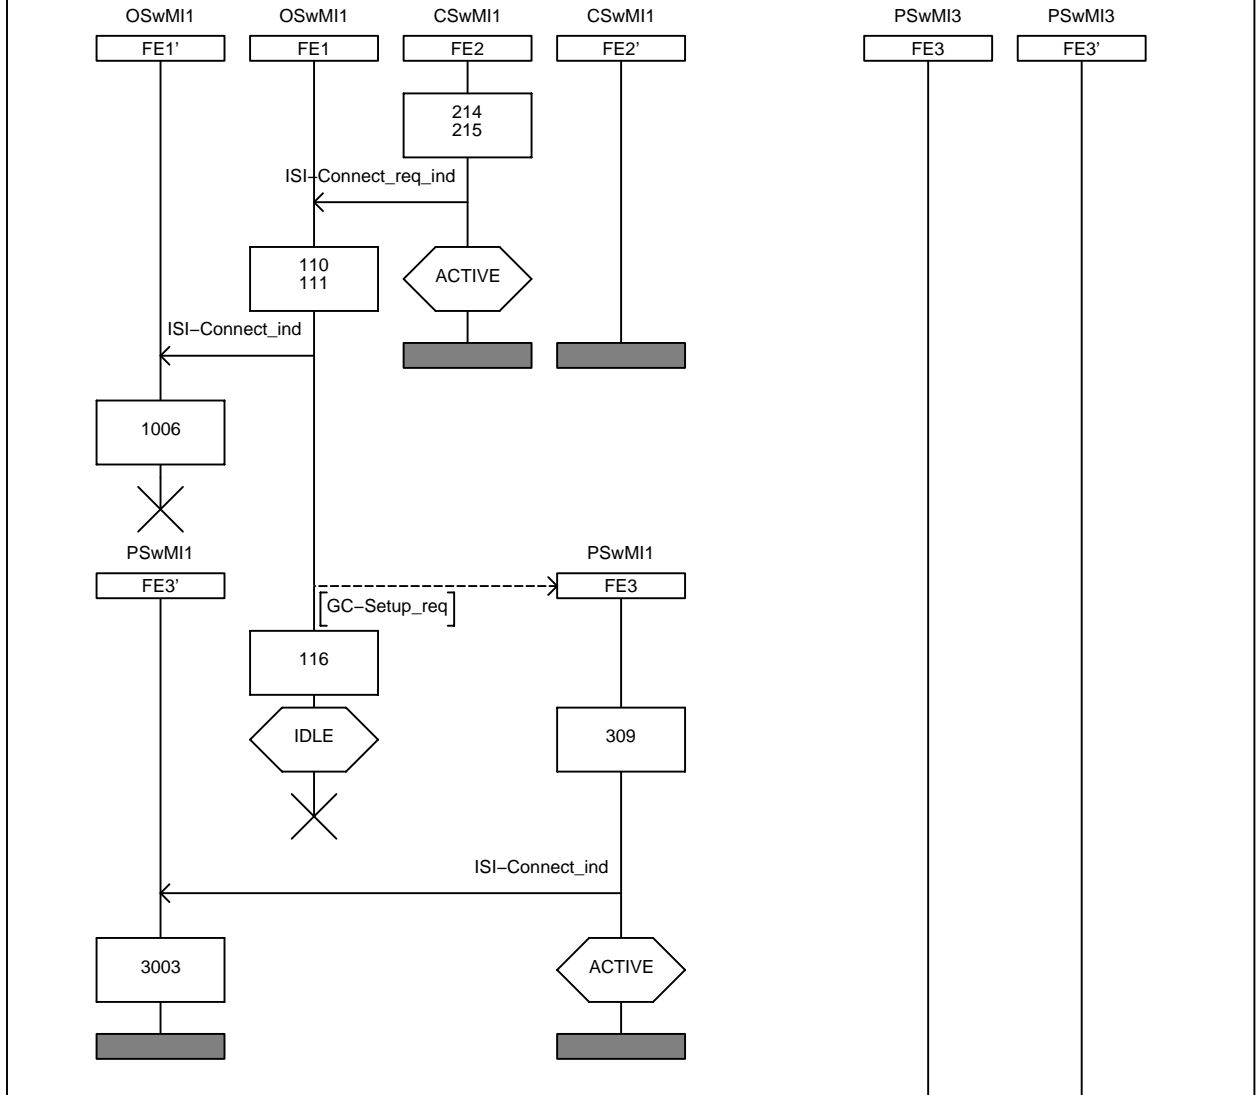

Figure 32: Information flow sequence - partial group call set-up - sheet 1 of 3

A PSS1 facility information element shall not be sent by the controlling SwMI before a response has been sent to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

MSC Partial_group_call

NOTE: The QSIG timer T313 (started by the originating/participating SwMI upon sending PSS1 CONNECT) is not to be implemented. The sending of PSS1 CONNECT ACKNOWLEDGE is therefore optional (ISO/IEC 11572 [12], subclause 10.1.6).

Figure 33: Information flow sequence - partial group call set-up - sheet 2 of 3

MSC Partial_group_call

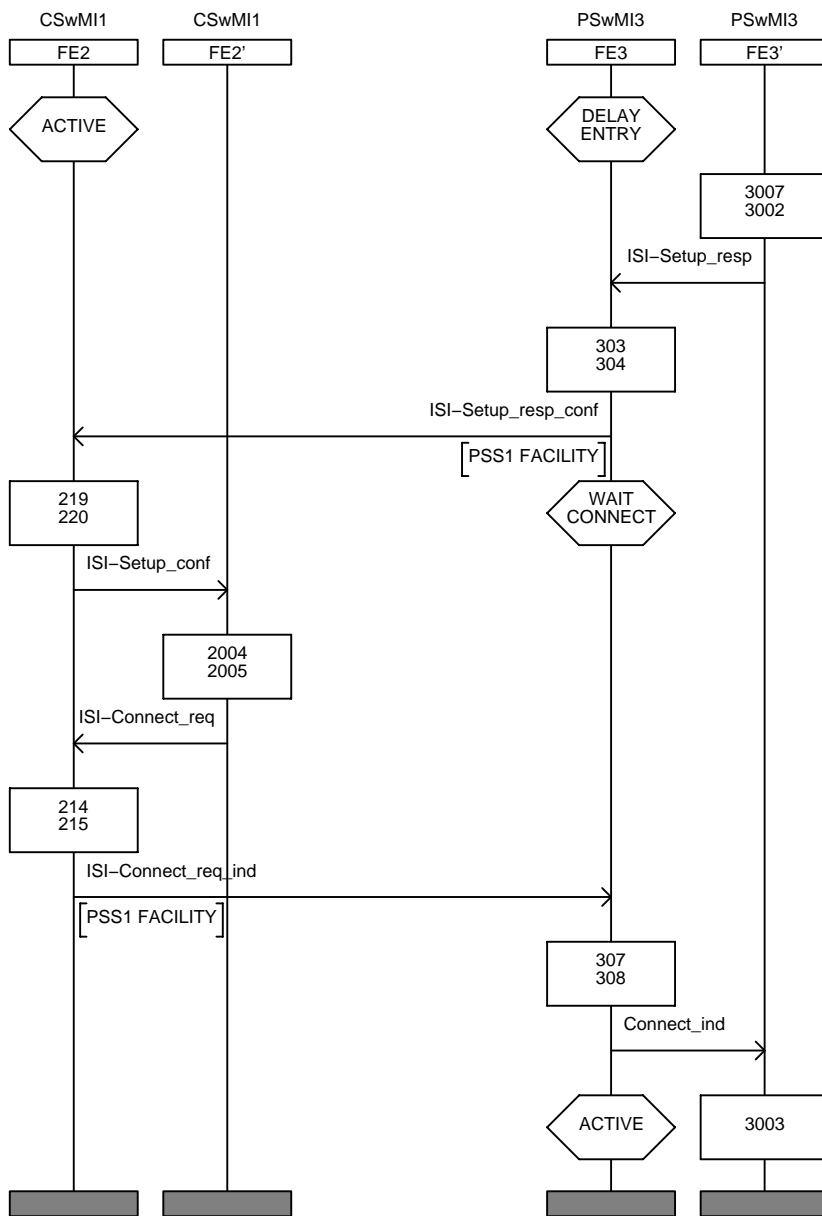

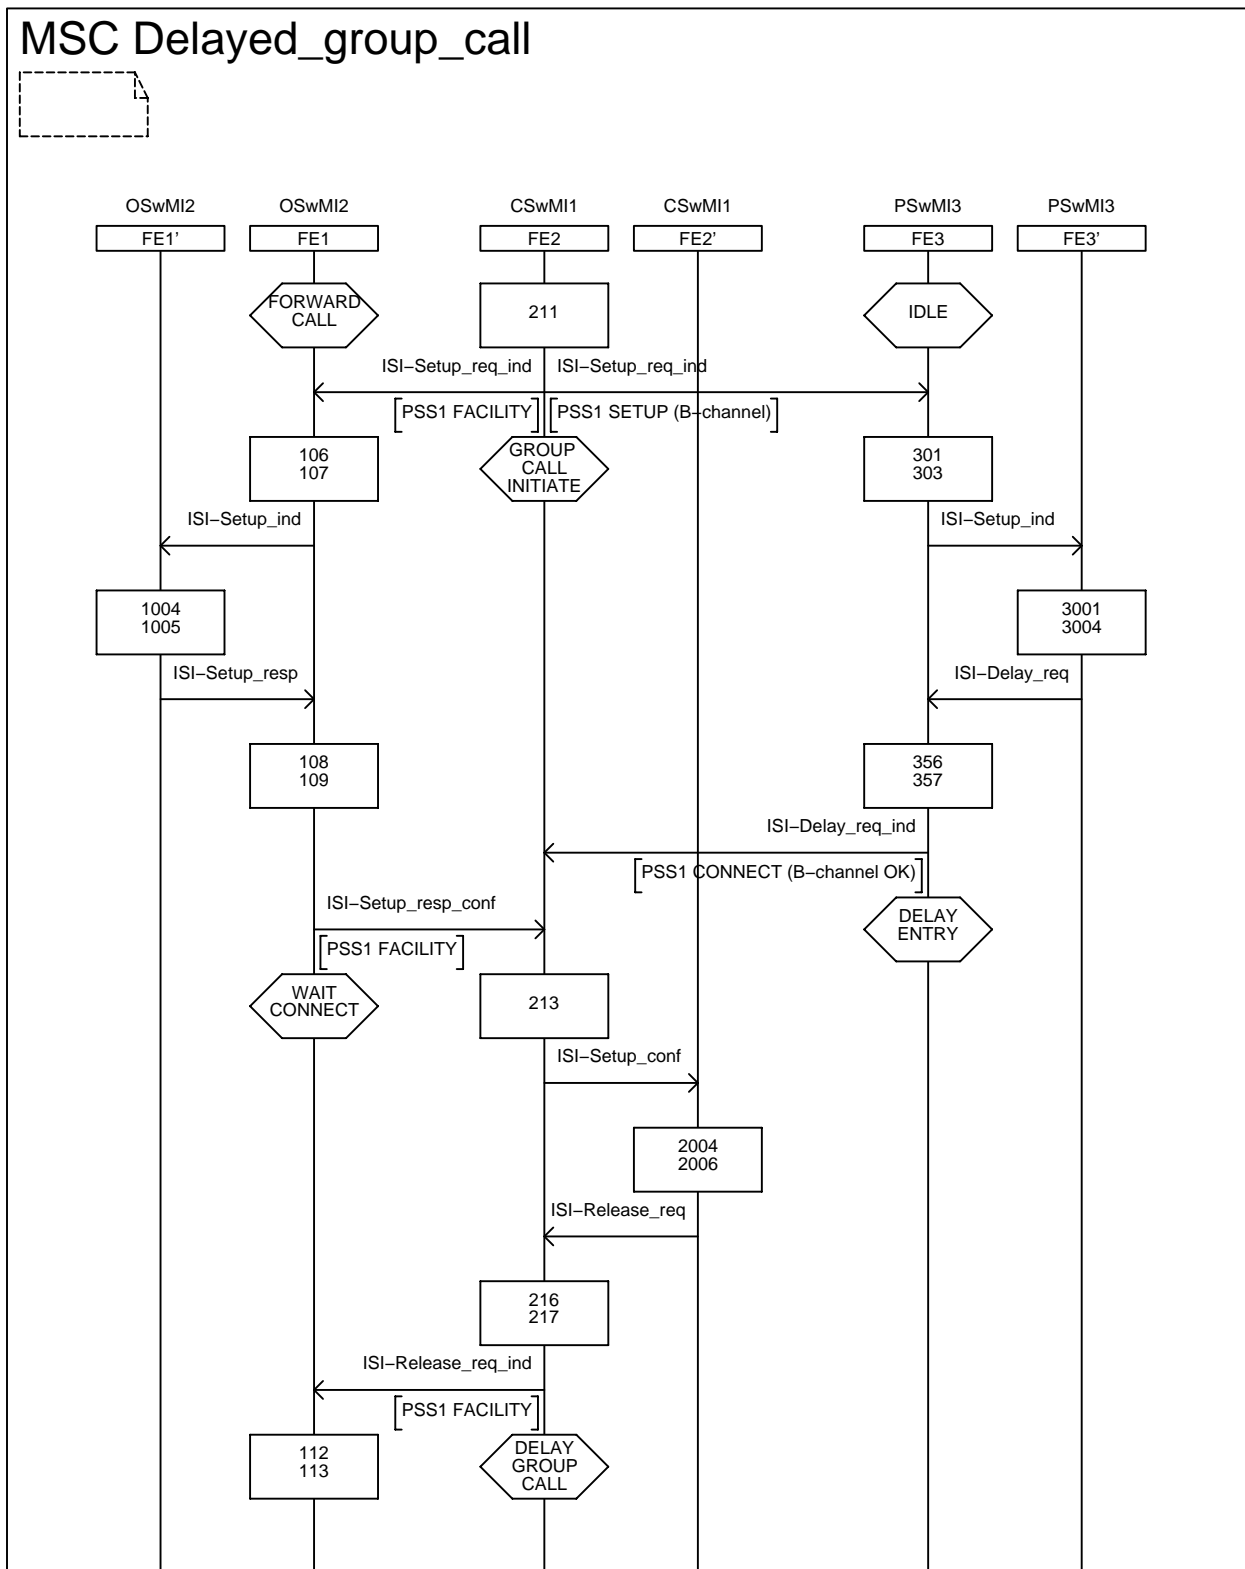

Figure 34: Information flow sequence - partial group call set-up - sheet 3 of 3

5.2.1.4 Delay of group call set-up over ISI using ANF-ISIGC

The group call has been initiated as shown for case scenarios 1 through 4, figure 20 to 30.

NOTE: The QSIG timer T313 (started by the originating/participating SwMI upon sending PSS1 CONNECT) is not to be implemented. The sending of PSS1 CONNECT ACKNOWLEDGE is therefore optional (ISO/IEC 11572 [12], subclause 10.1.6).

Figure 35: Information flow sequence - delayed group call set-up, sheet 1 of 4

A PSS1 facility information element shall not be sent by the controlling SwMI before a response has been sent to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

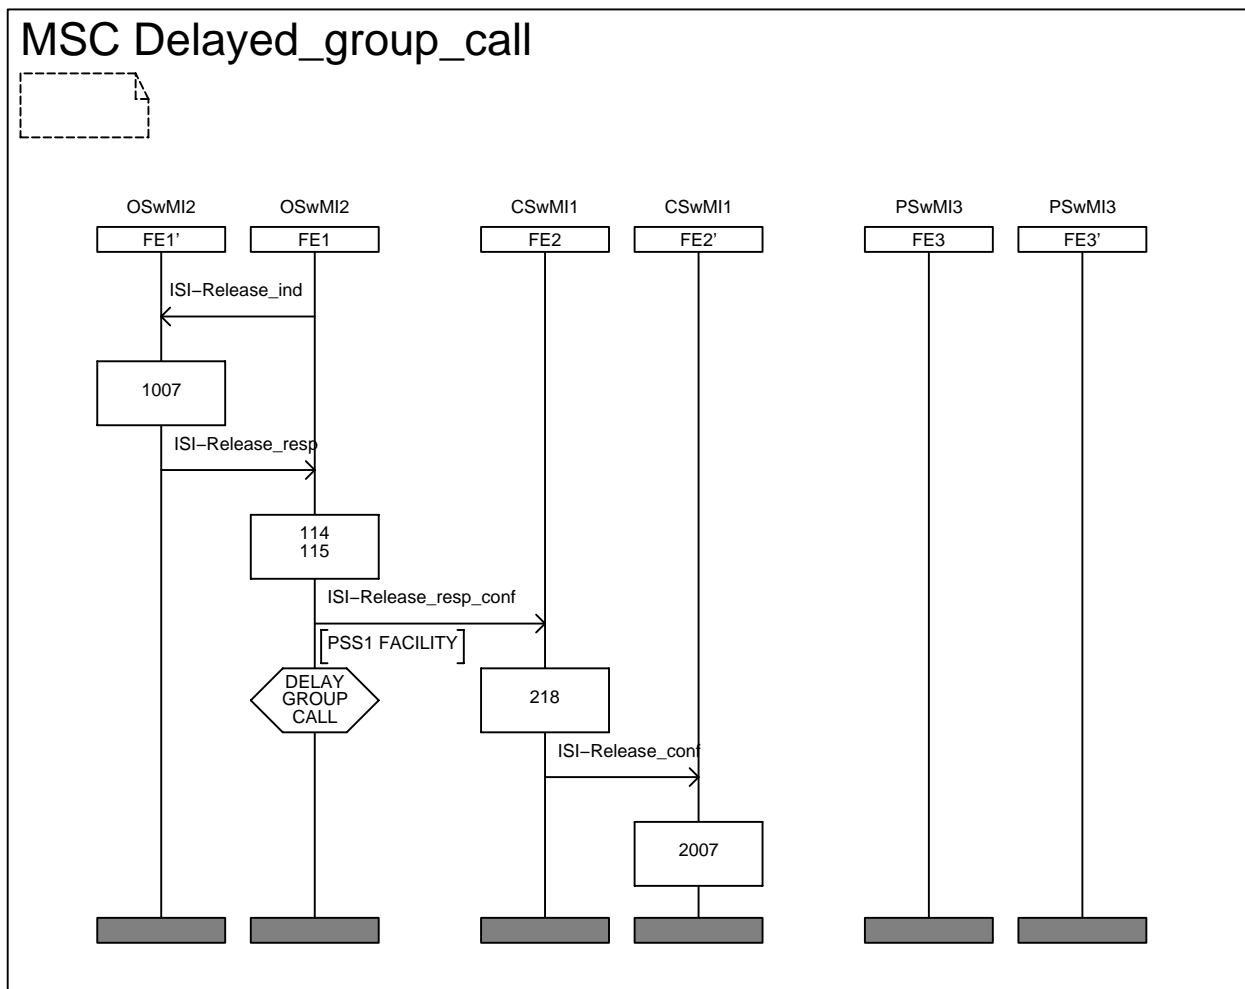

Figure 36: Information flow sequence - delayed group call set-up, sheet 2 of 4

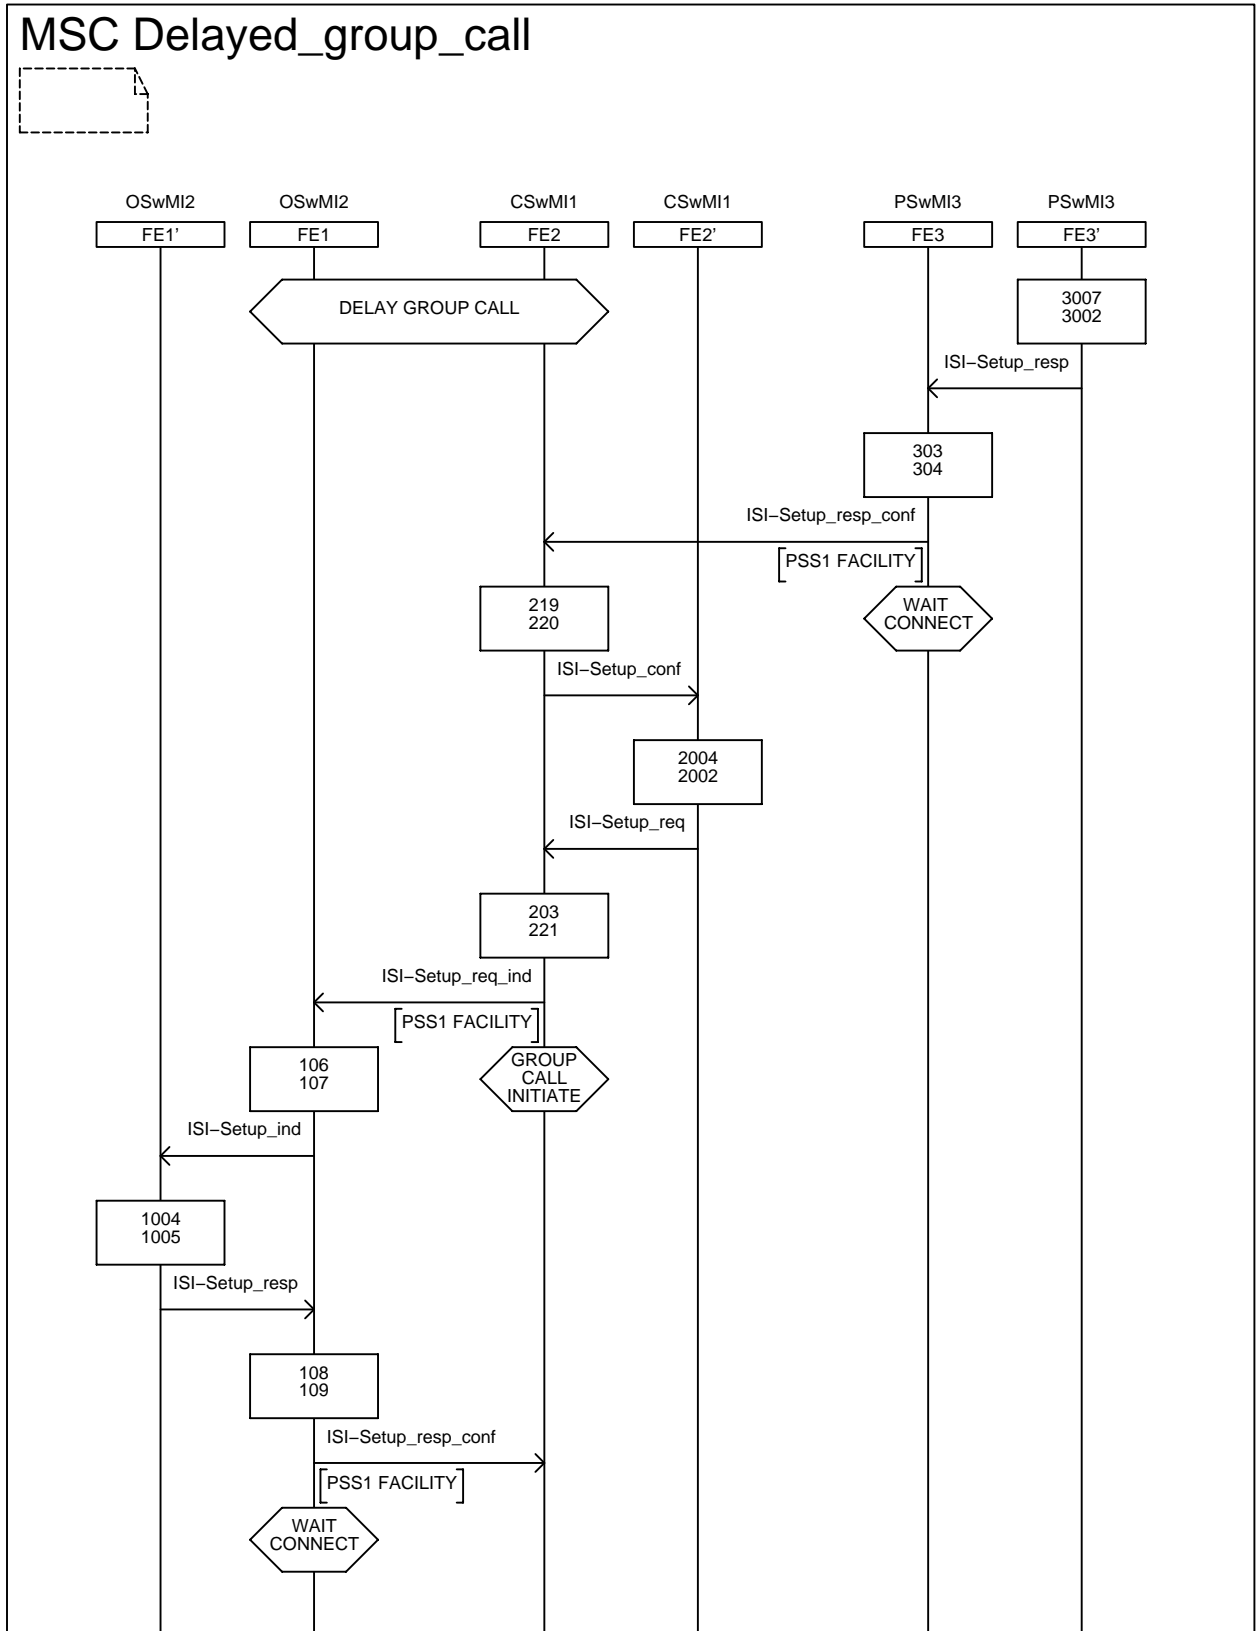

Figure 37: Information flow sequence - delayed group call set-up, sheet 3 of 4

MSC Delayed_group_call

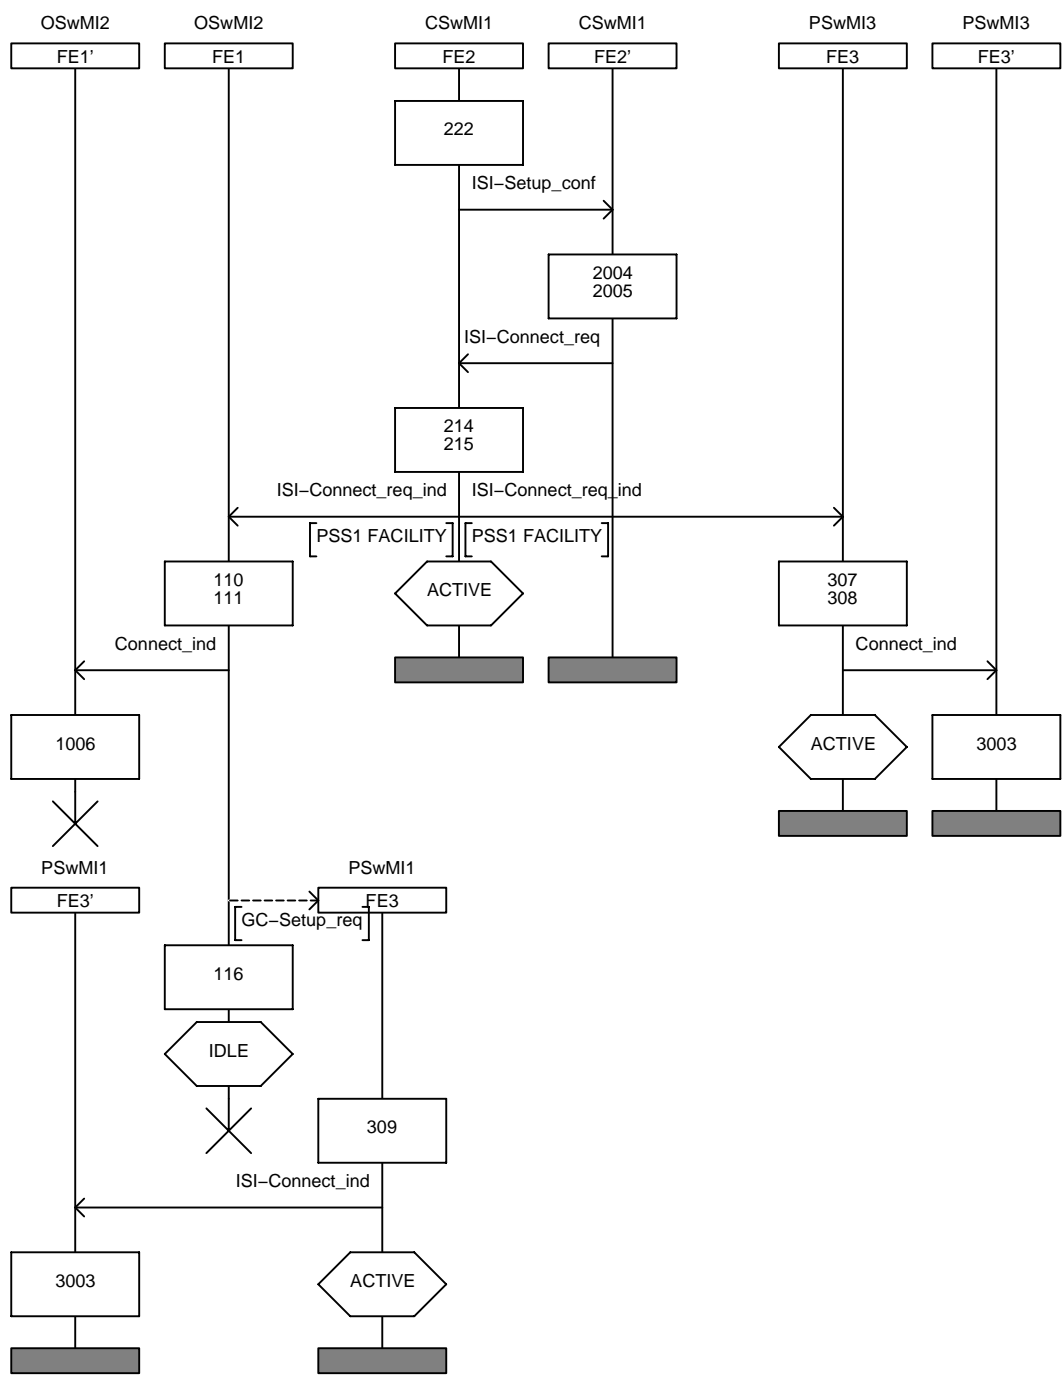

Figure 38: Information flow sequence - delayed group call set-up, sheet 4 of 4

5.2.1.5 Interaction with an active group call

Figure 39 and 40 shows the information flow when an individual TETRA user makes a call to a group already active in a call. Upon acceptance from the controlling SwMI call control application, the invoked ANF-ISIGC entity shall be merged into the call. If the active call is an intra-TETRA call, then an ISI connection shall be set-up to the new SwMI by the ANF-ISIGC entity in the controlling SwMI.

If the active call is an inter-TETRA call then the invoked ANF-ISIGC entity shall be merged with the ANF-ISIGC entity for the active call.

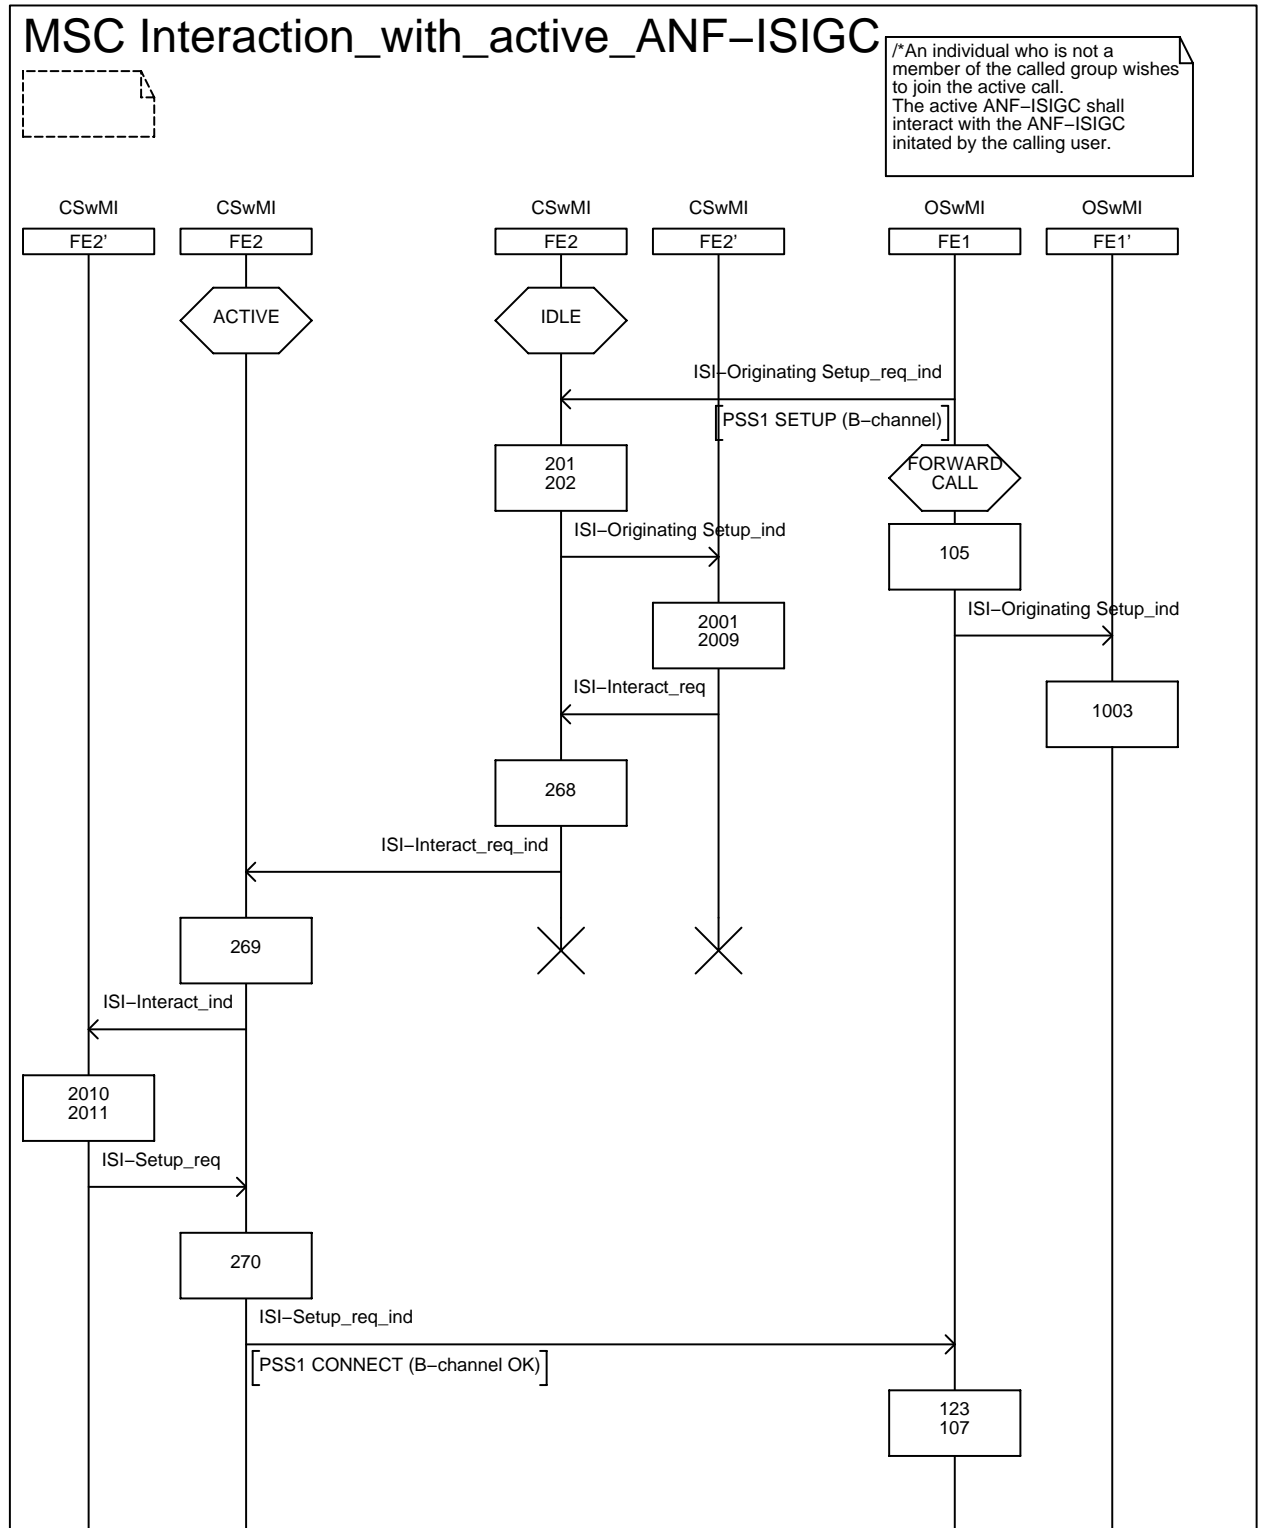

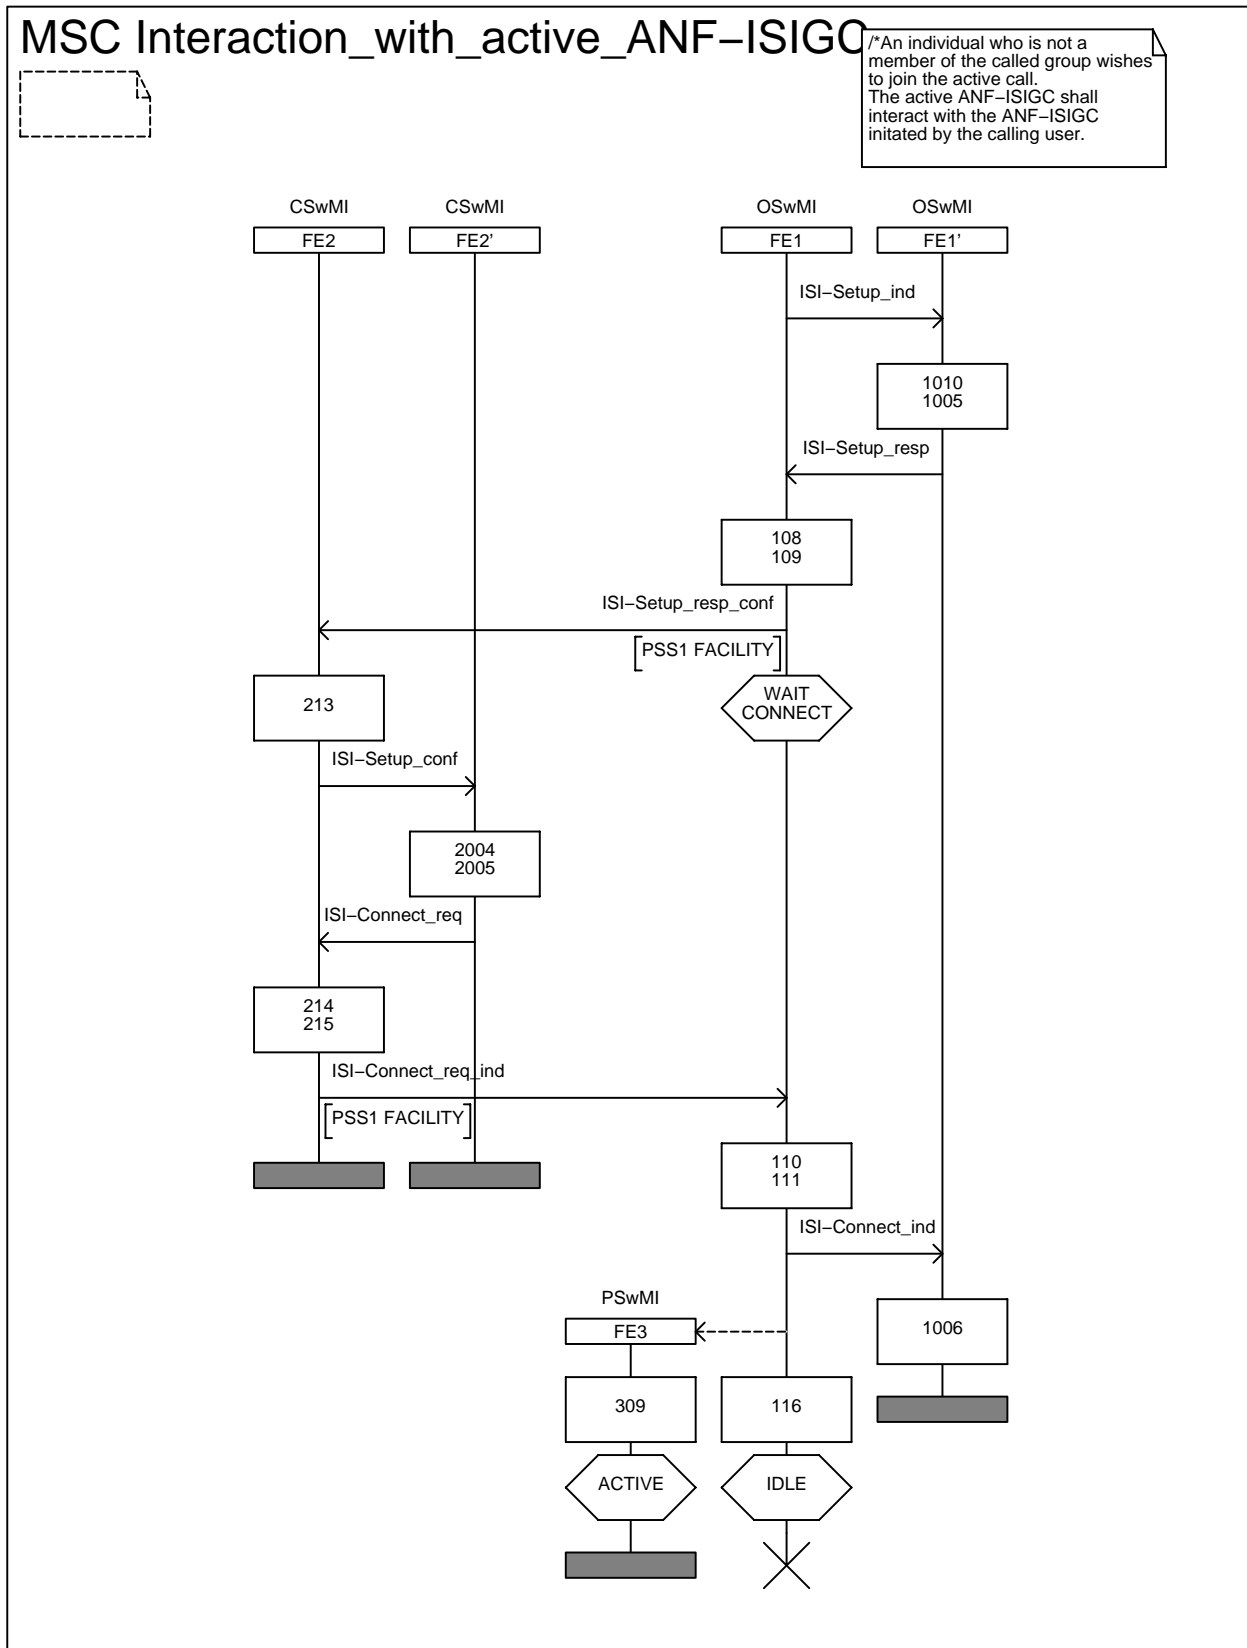

Figure 39: Information flow sequence – Interaction with active ANF-ISIGC, sheet 1 of 2

A PSS1 facility information element shall not be sent by the controlling SwMI before a response has been sent to the previously received PSS1 SETUP message. The PSS1 CALL PROCEEDING message shall therefore be sent before the PSS1 CONNECT message may be sent carrying TETRA PDUs.

NOTE: The QSIG timer T313 (started by the originating/participating SwMI upon sending PSS1 CONNECT) is not to be implemented. The sending of PSS1 CONNECT ACKNOWLEDGE is therefore optional (ISO/IEC 11572 [12], subclause 10.1.6).

Figure 40: Information flow sequence – Interaction with active ANF-ISIGC, sheet 2 of 2

5.2.1.6 Unsuccessful group call set-up over ISI using ANF-ISIGC

Figure 41 to 45 shows the information flow sequence for an unsuccessful group call set-up using ANF-ISIGC. The unsuccessful scenarios cover all four cases from subclause 4.2.2.3.1 and is a result of call rejection by the controlling SwMI, group home SwMI or participating SwMI.

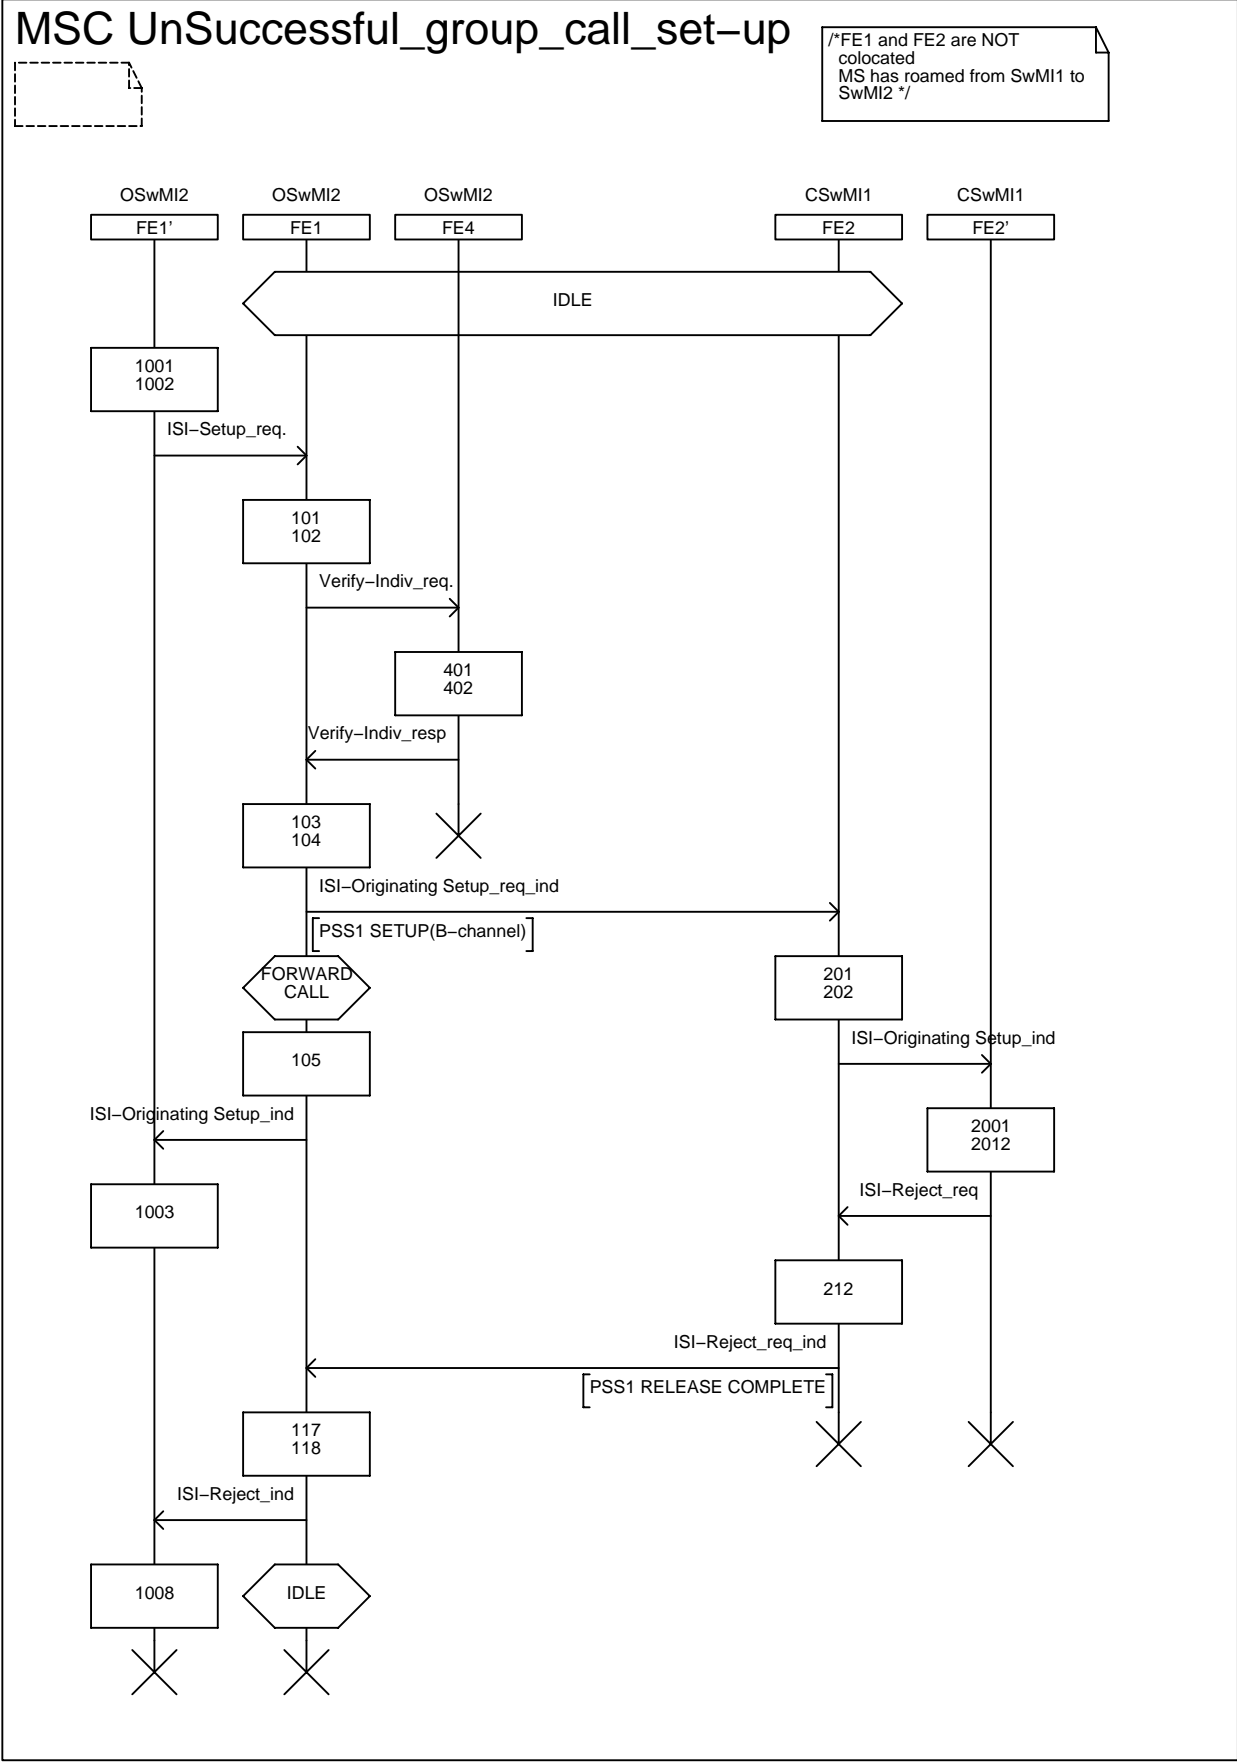

Figure 41: Information flow sequence - group home SwMI rejects the call

MSC Unsuccessful_group_call_set-up

/* PSwMI wishes to delay call
FE1 and FE2 are collocated
MS has roamed from
SwMI1 to SwMI3 */

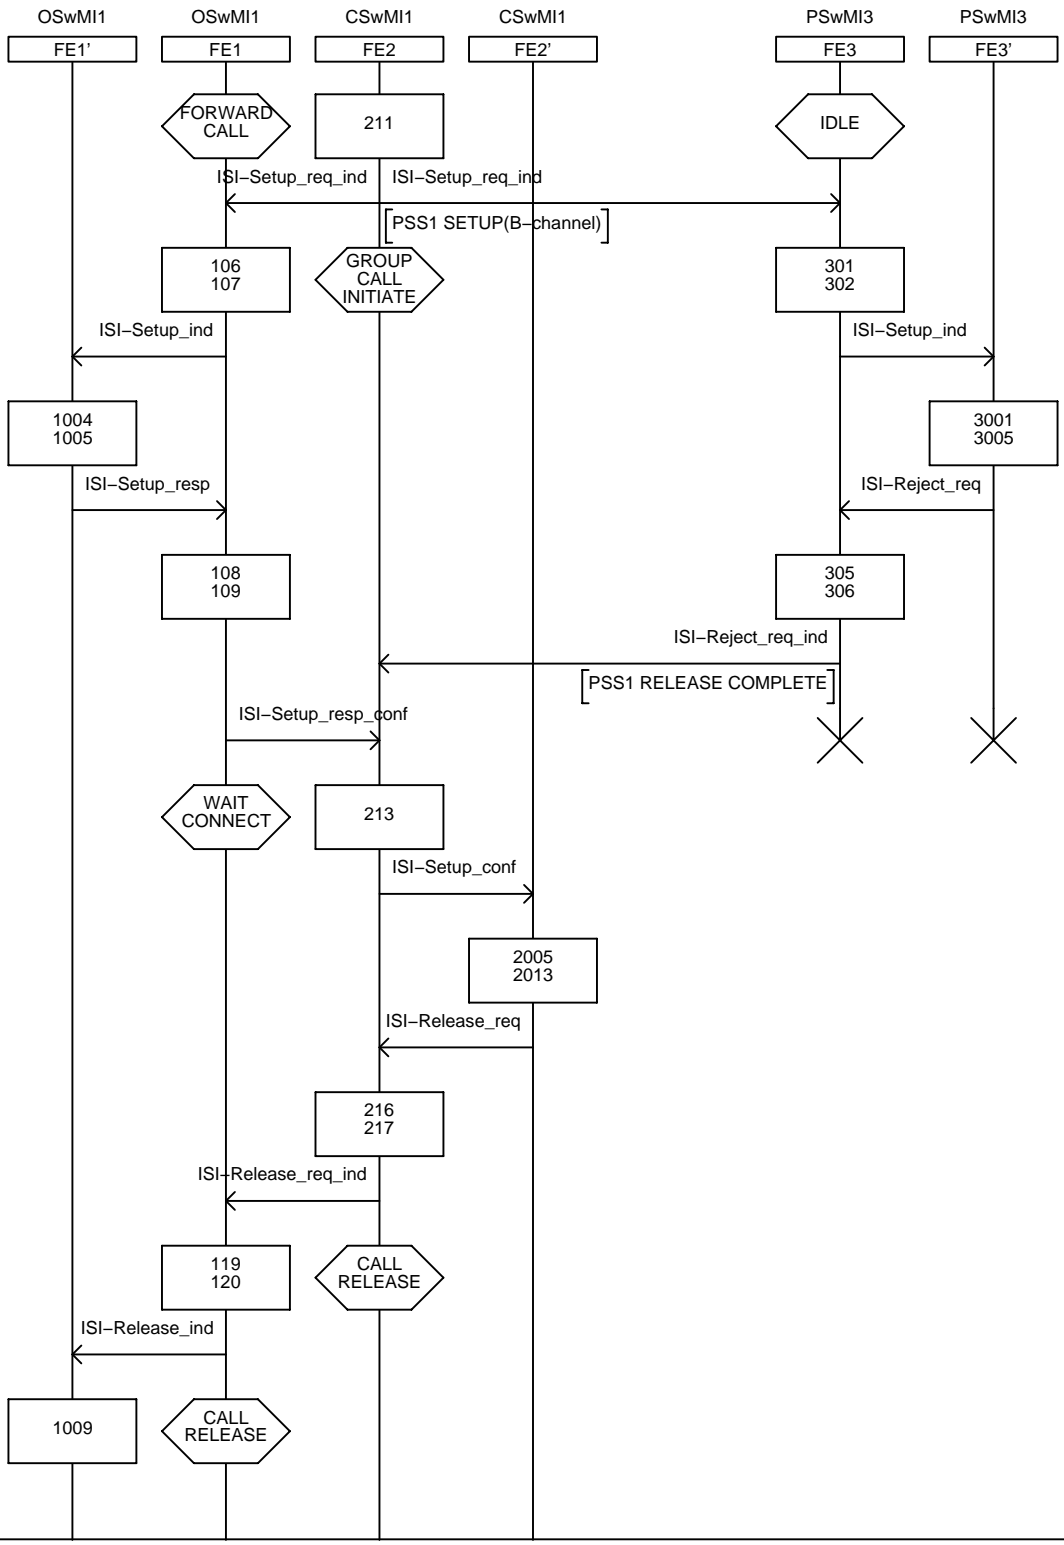

Figure 42: Information flow sequence - controlling SwMI rejects the call, sheet 1 of 2

MSC Unsuccessful_group_call_set-up

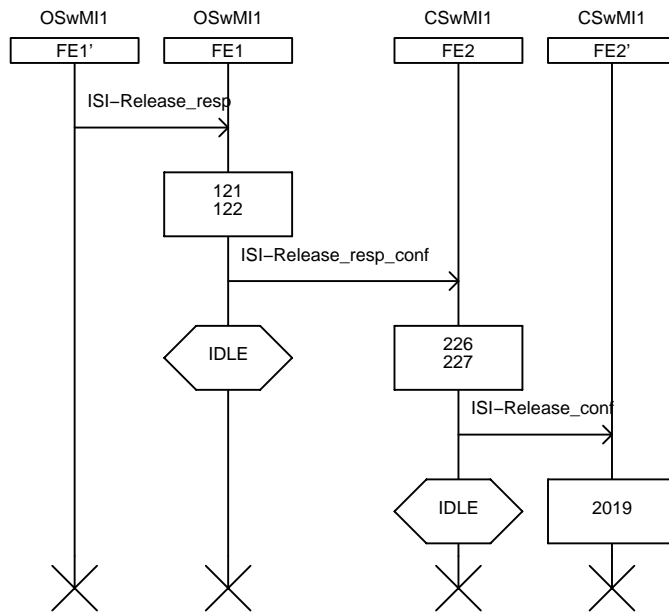

Figure 43: Information flow sequence - controlling SwMI rejects the call, sheet 2 of 2

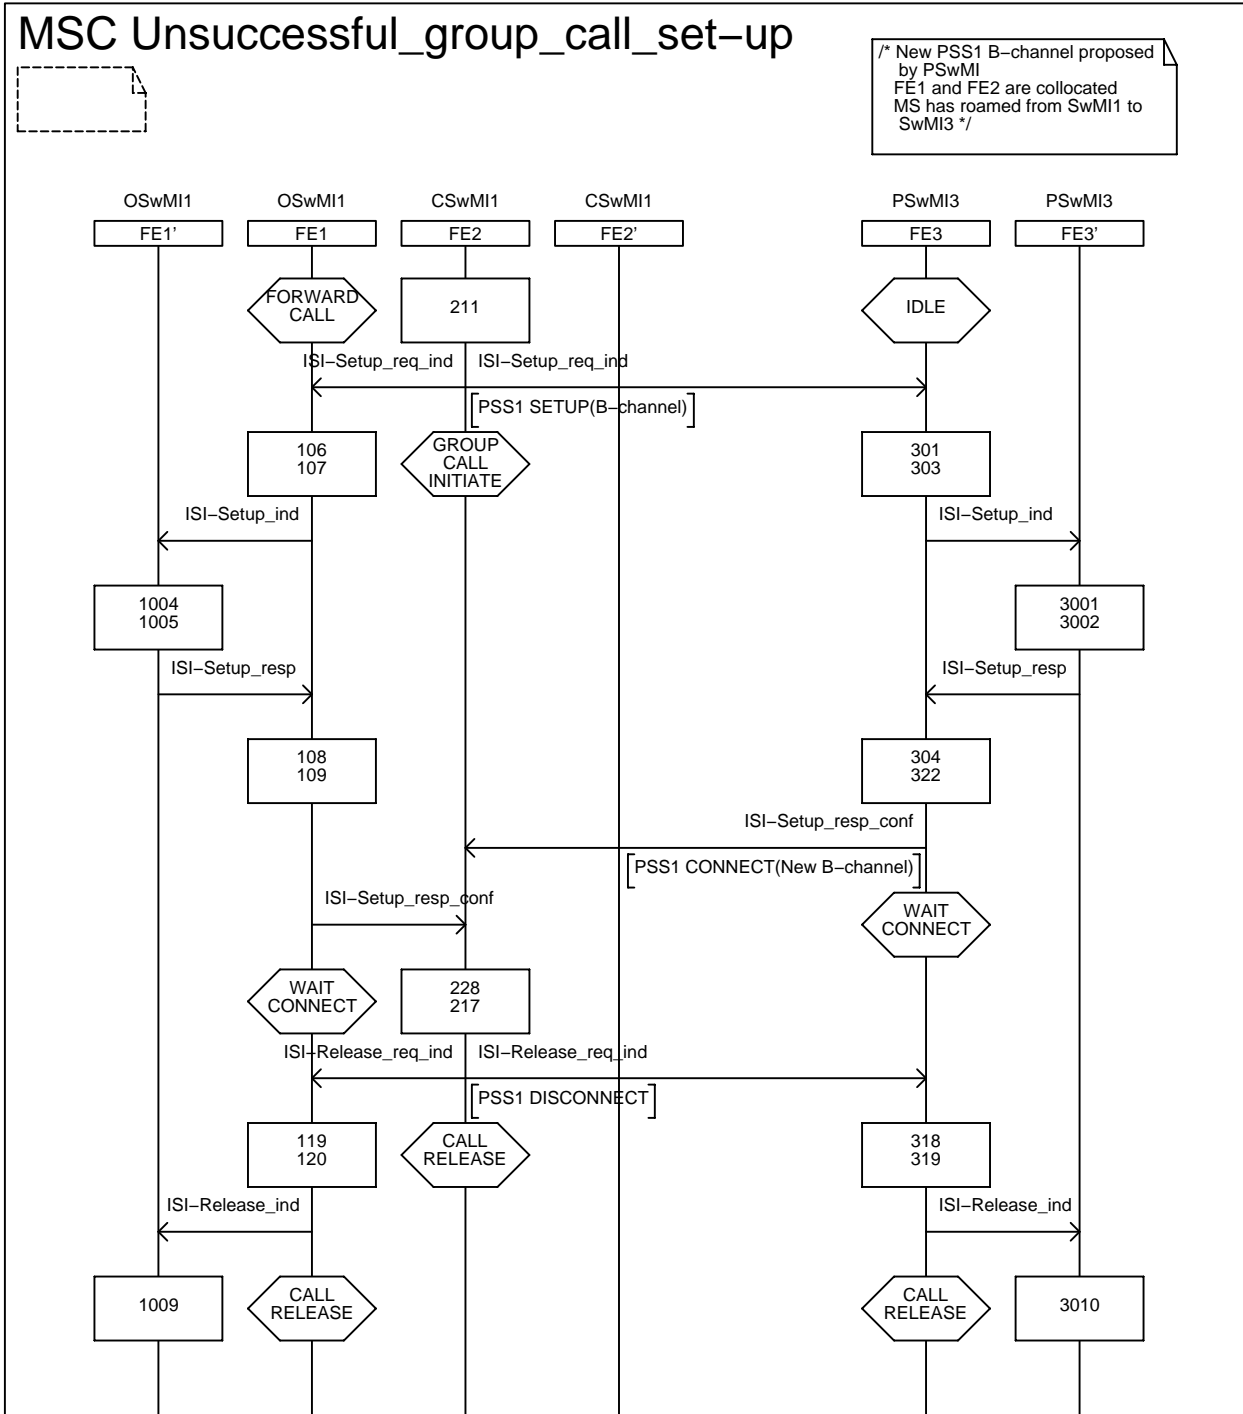

Figure 44: Information flow sequence - new B-channel not accepted, sheet 1 of 2

MSC Unsuccessful_group_call_set-up

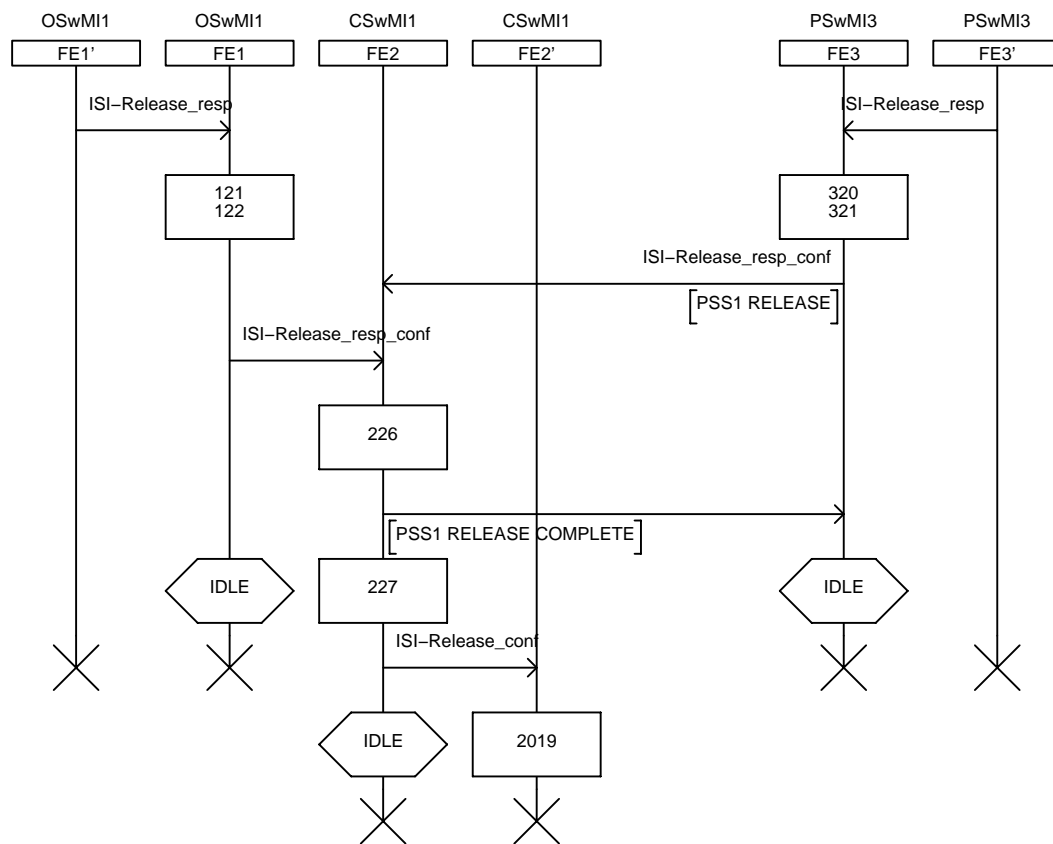

Figure 45: Information flow sequence - new B-channel not accepted, sheet 2 of 2

5.2.1.7 Call Maintenance procedures - Request to transmit

Figures 46 to 51 show the information flow sequence for a request to transmit from a TETRA user in a participating SwMI and the possible request and granting responses from the controlling SwMI. All participating SwMIs involved in the call shall receive a group addressed ISI_TX_GRANTED PDU when transmission has been granted to a user.

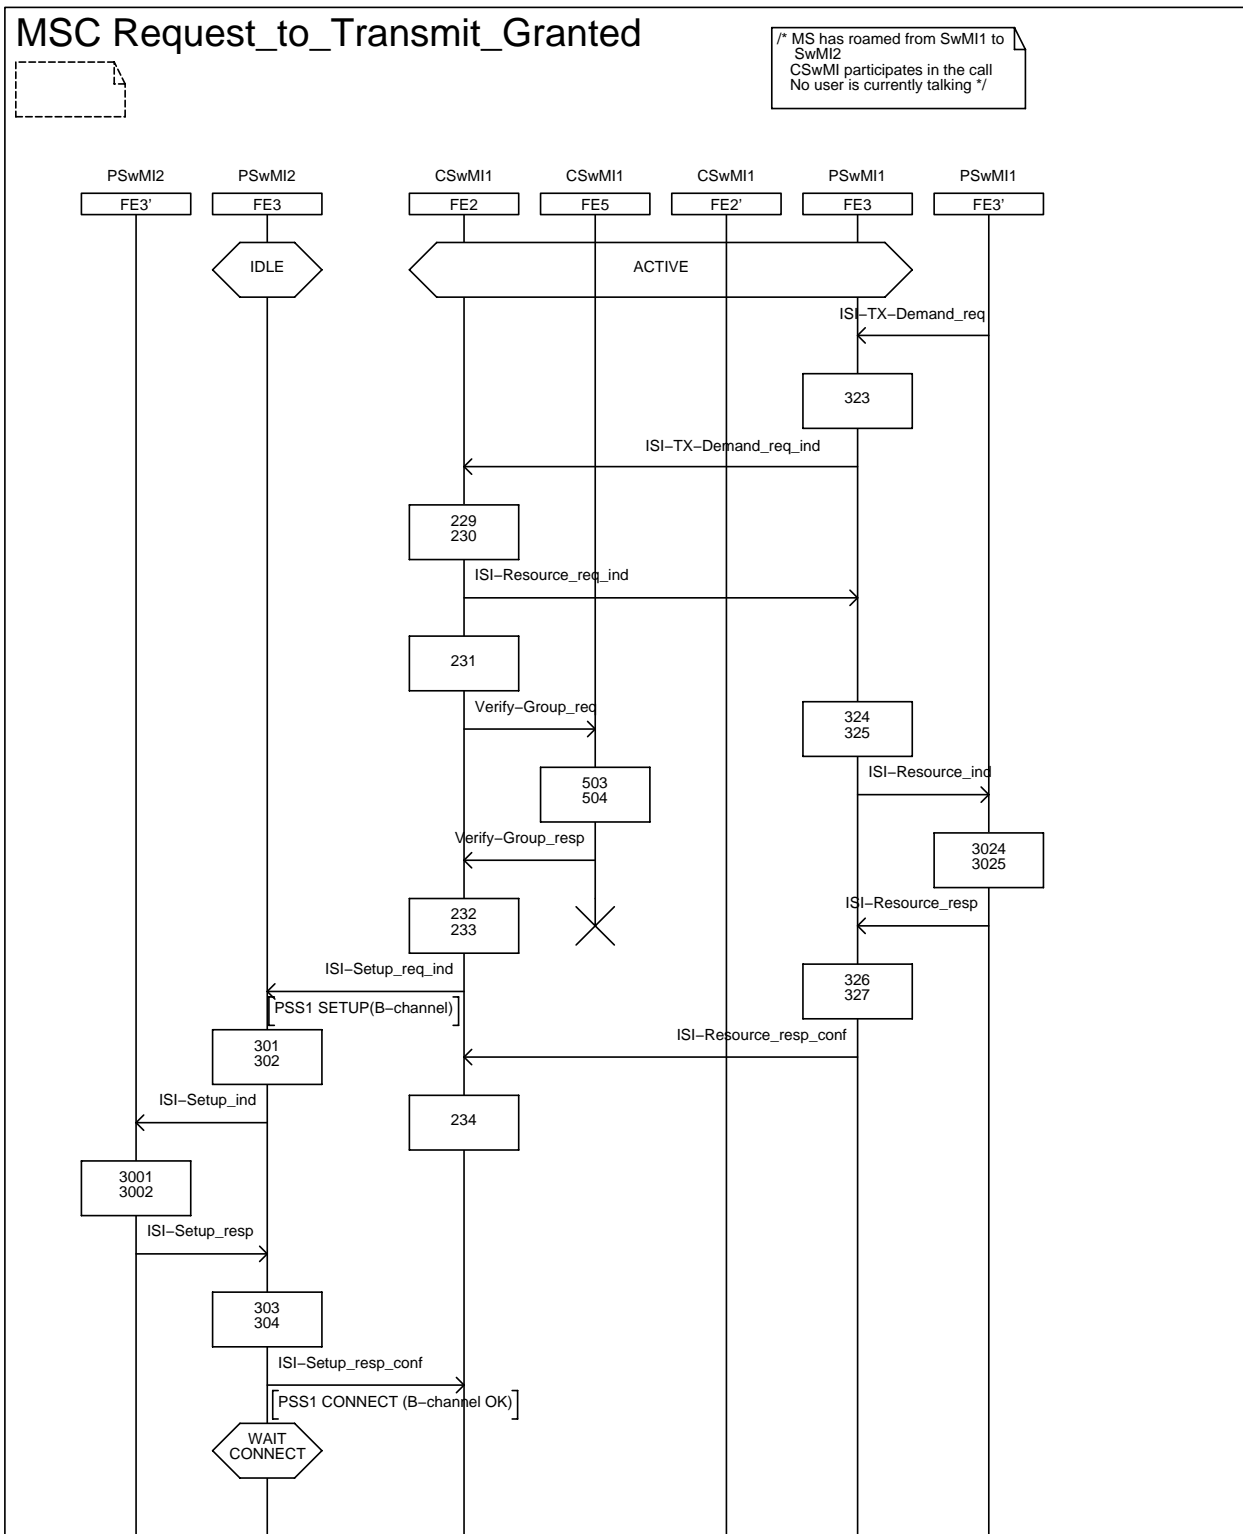

Figure 46: Information flow sequence - Request to transmit from participating SwMI, sheet 1 of 2

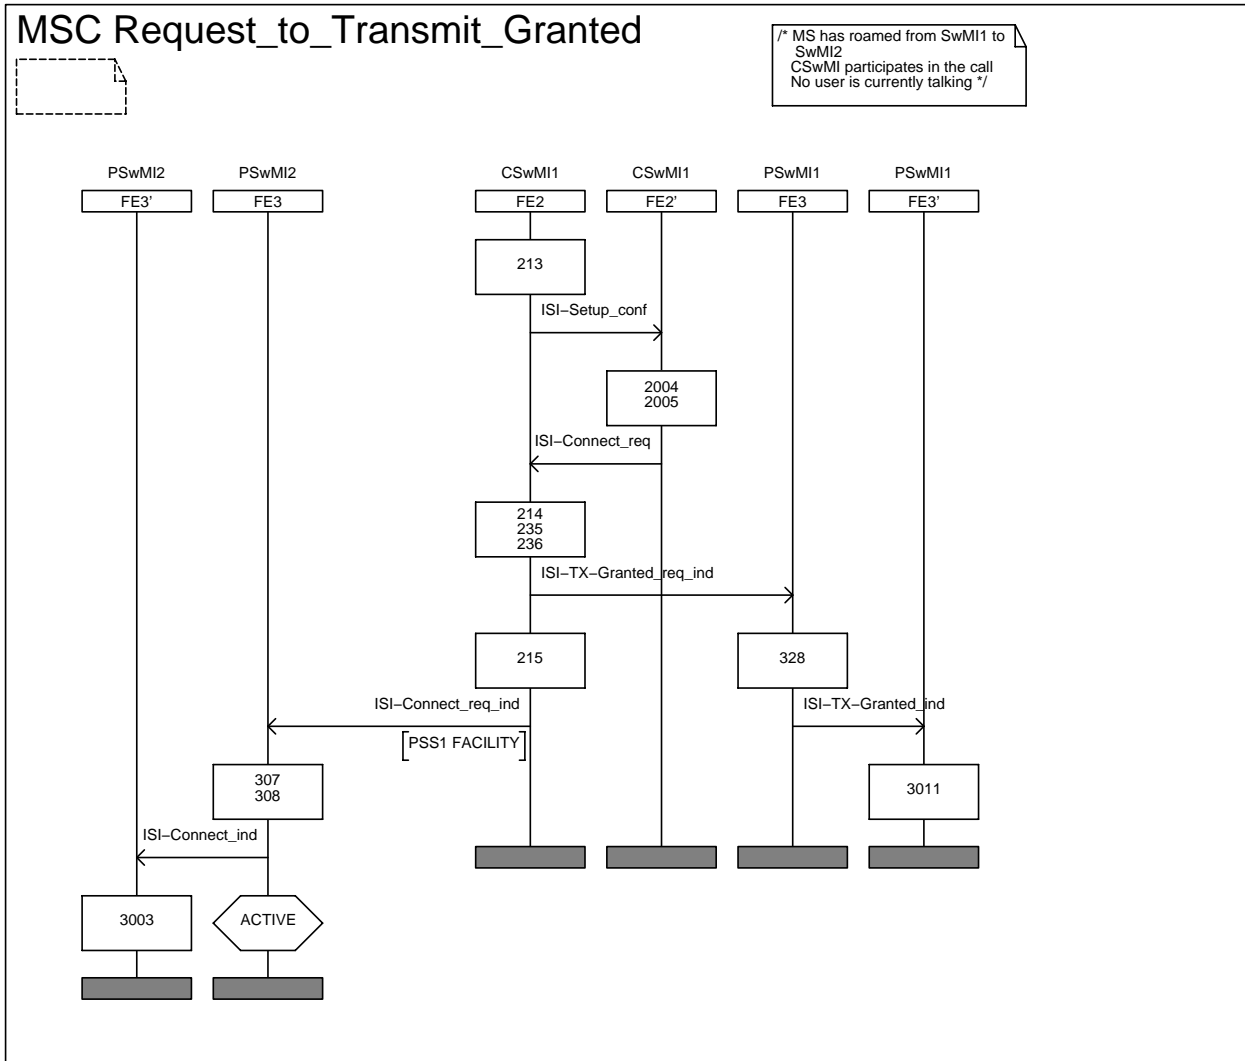

Figure 47: Information flow sequence - Request to transmit from participating SwMI, sheet 2 of 2

Figure 48 shows the information flow sequence for a request to transmit from a TETRA user in a participating SwMI. The transmission request is queued by the controlling SwMI.

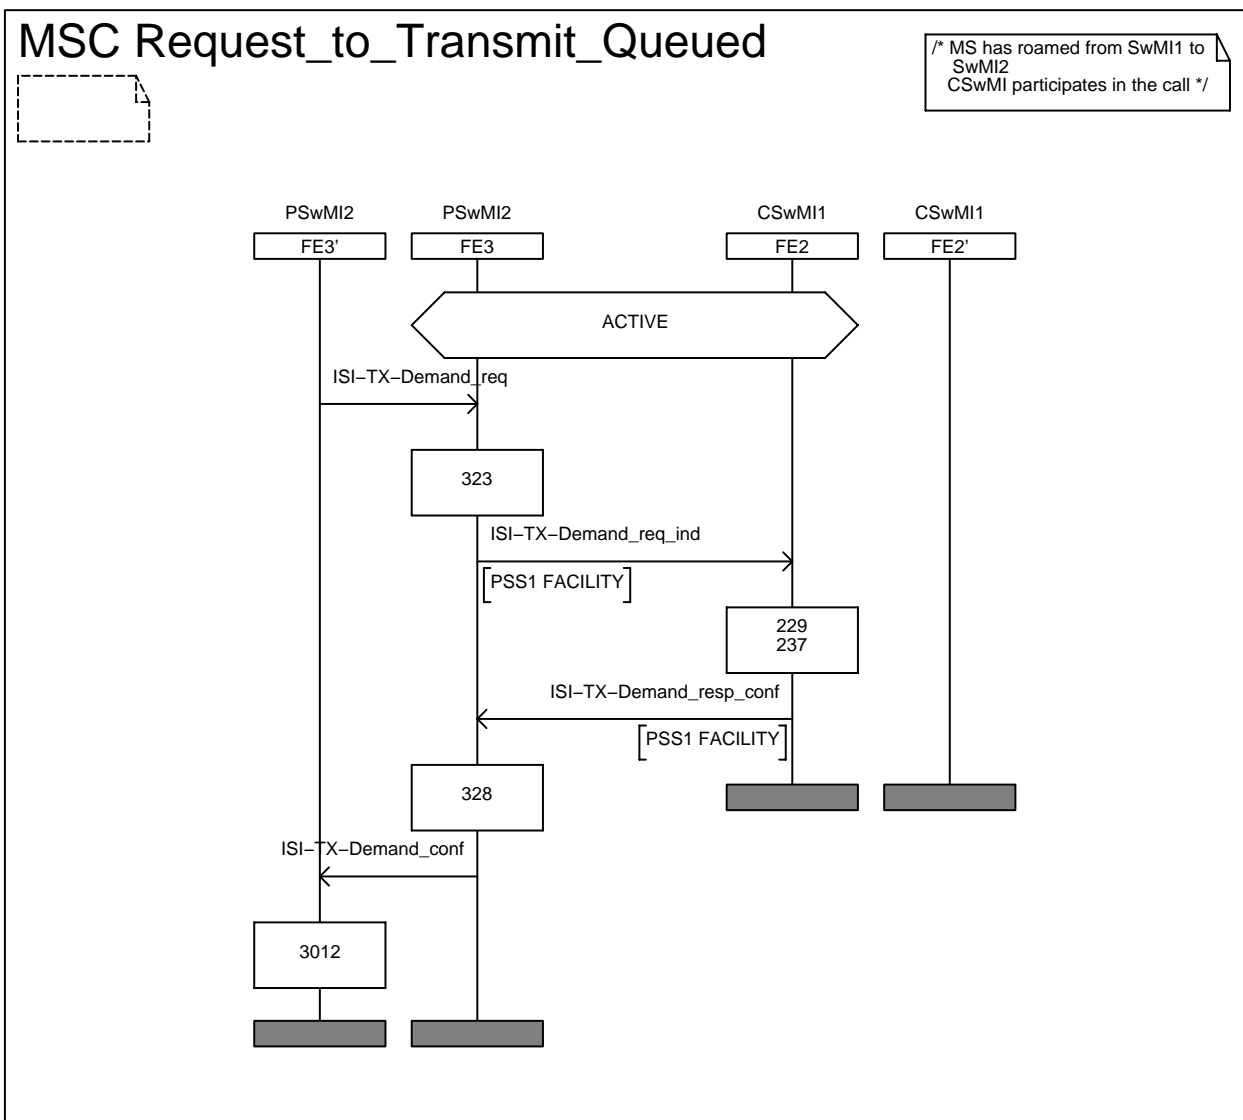

Figure 48: Information flow sequence - Request to transmit queued

Figure 49 shows the information flow sequence for a request to transmit from a TETRA user in a participating SwMI. The transmission request is rejected by the controlling SwMI. No queuing mechanism exist in controlling SwMI.

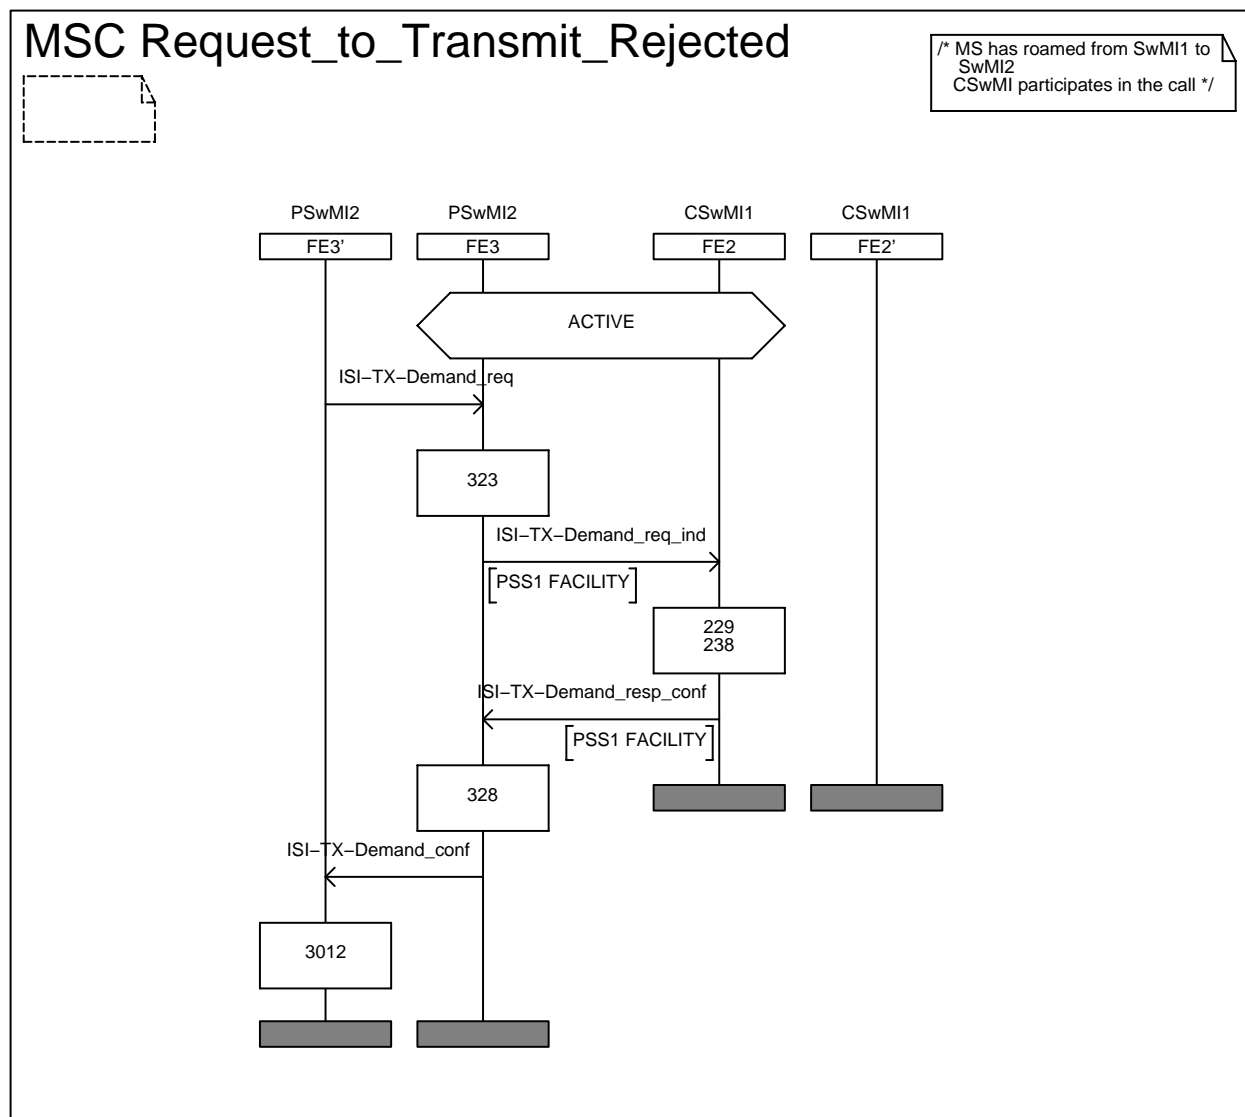

Figure 49: Information flow sequence - Request to transmit rejected

Figure 50 and 51 shows the information flow sequence for a pre-emptive request to transmit from a TETRA user in a participating SwMI. Transmission is already granted to another user. The transmitting user is interrupt by a ISI_TX_INTERRUPT PDU sent from the controlling SwMI. The ISI_TX_INTERRUPT PDU shall be group addressed. The participating SwMI call control application shall upon reception of an ISI_TX_INTERRUPT ind. inform the transmitting user of interruption and inform the requesting user of granted transmission.

NOTE: All participating SwMIs who are listening to the call should receive information about the new granted user in a group addressed ISI_TX_INTERRUPT PDU as shown in figure 50 and 51.

MSC Interrupt_Transmission

/* MS has roamed from SwMI1 to SwMI2
 CSwMI participates in the call */

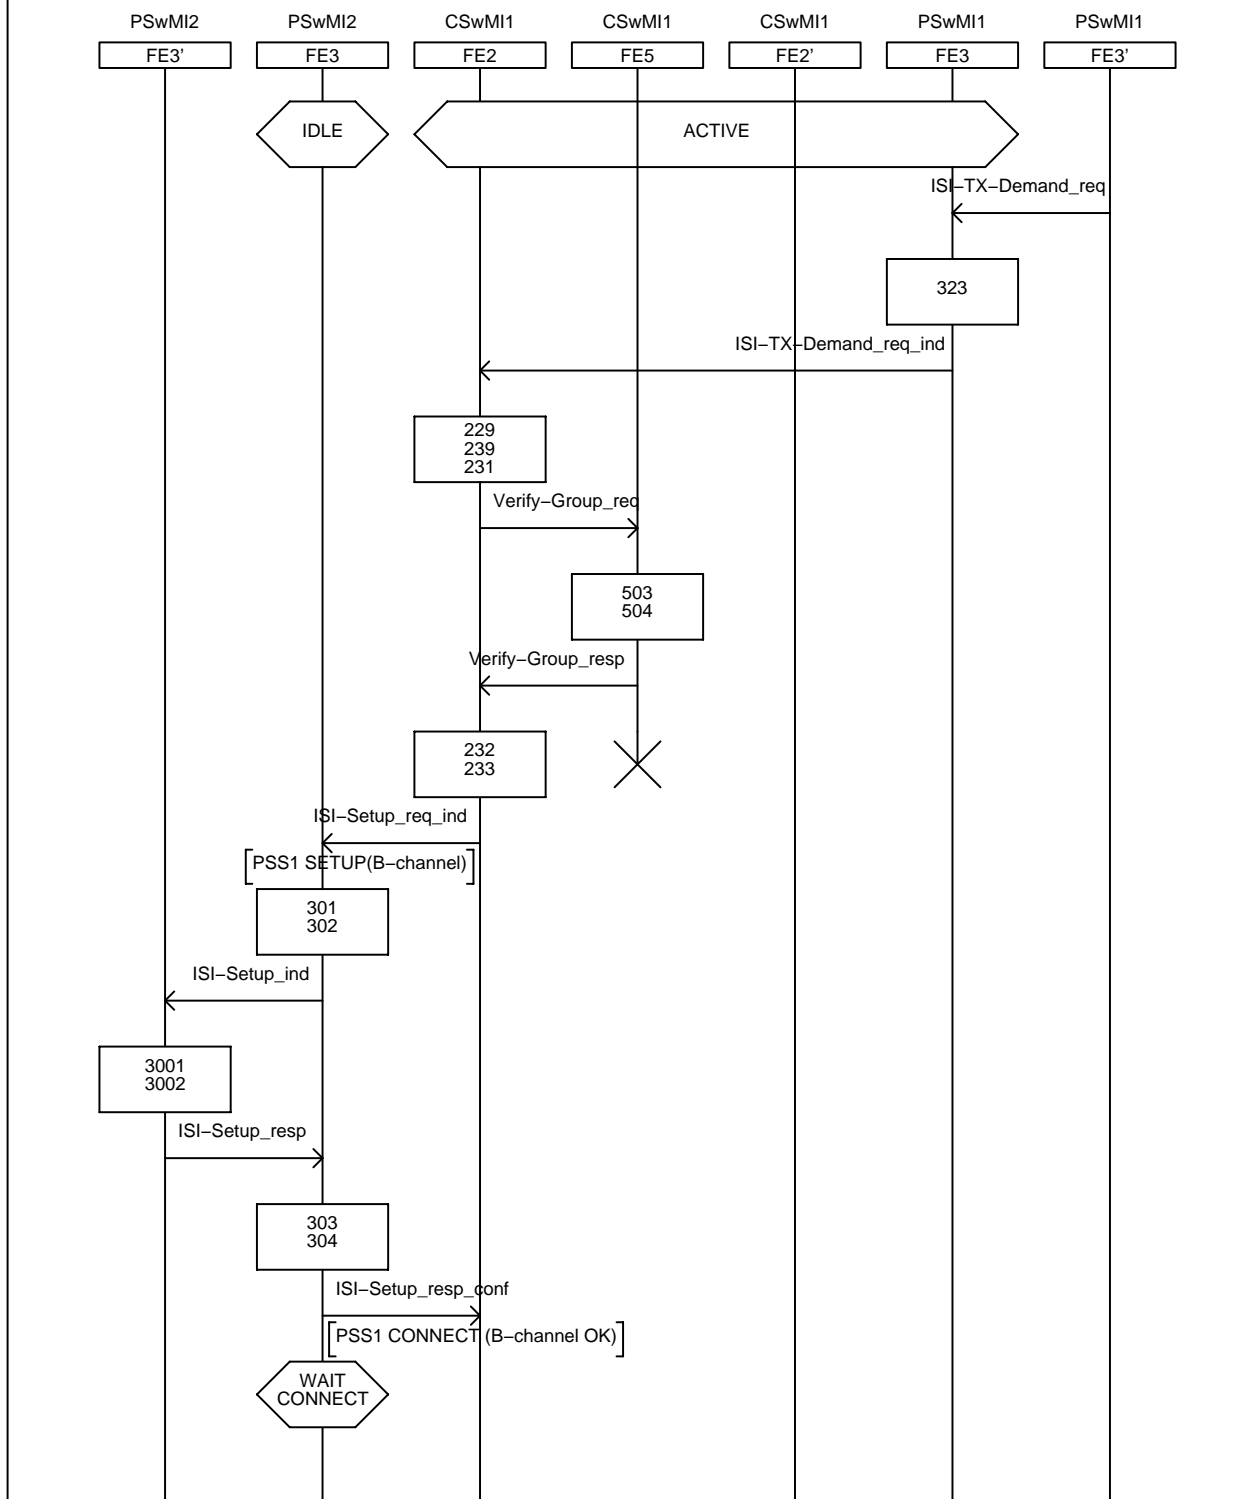

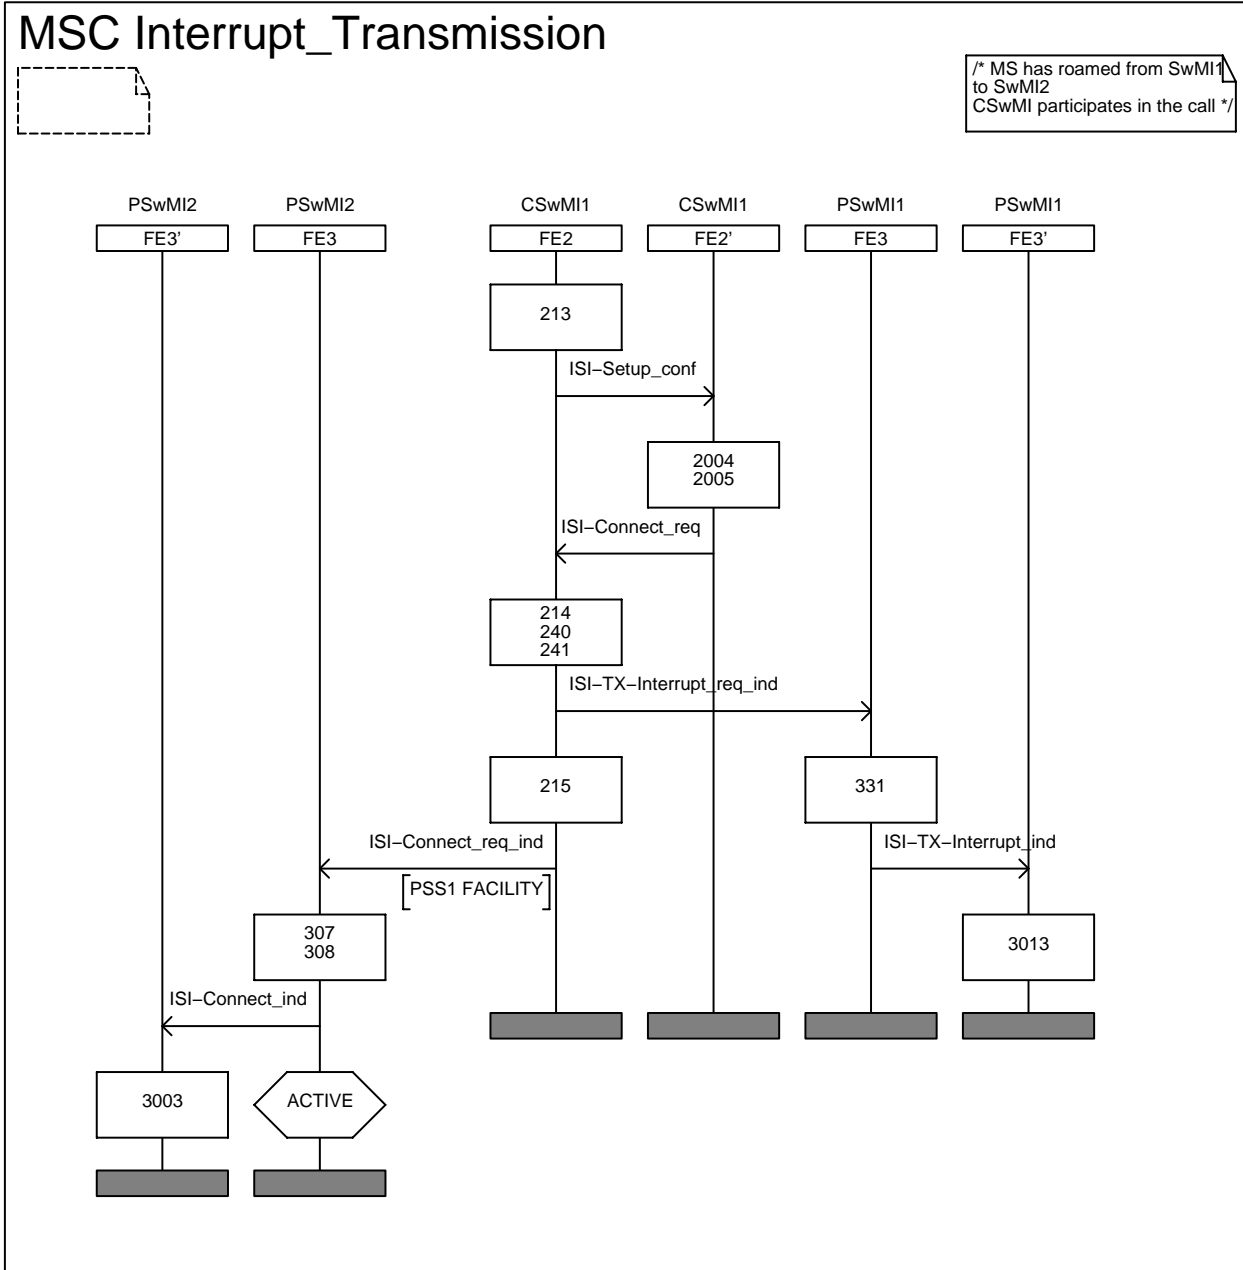

Figure 50: Information flow sequence -
 Request to transmit interrupting current transmission, sheet 1 of 2

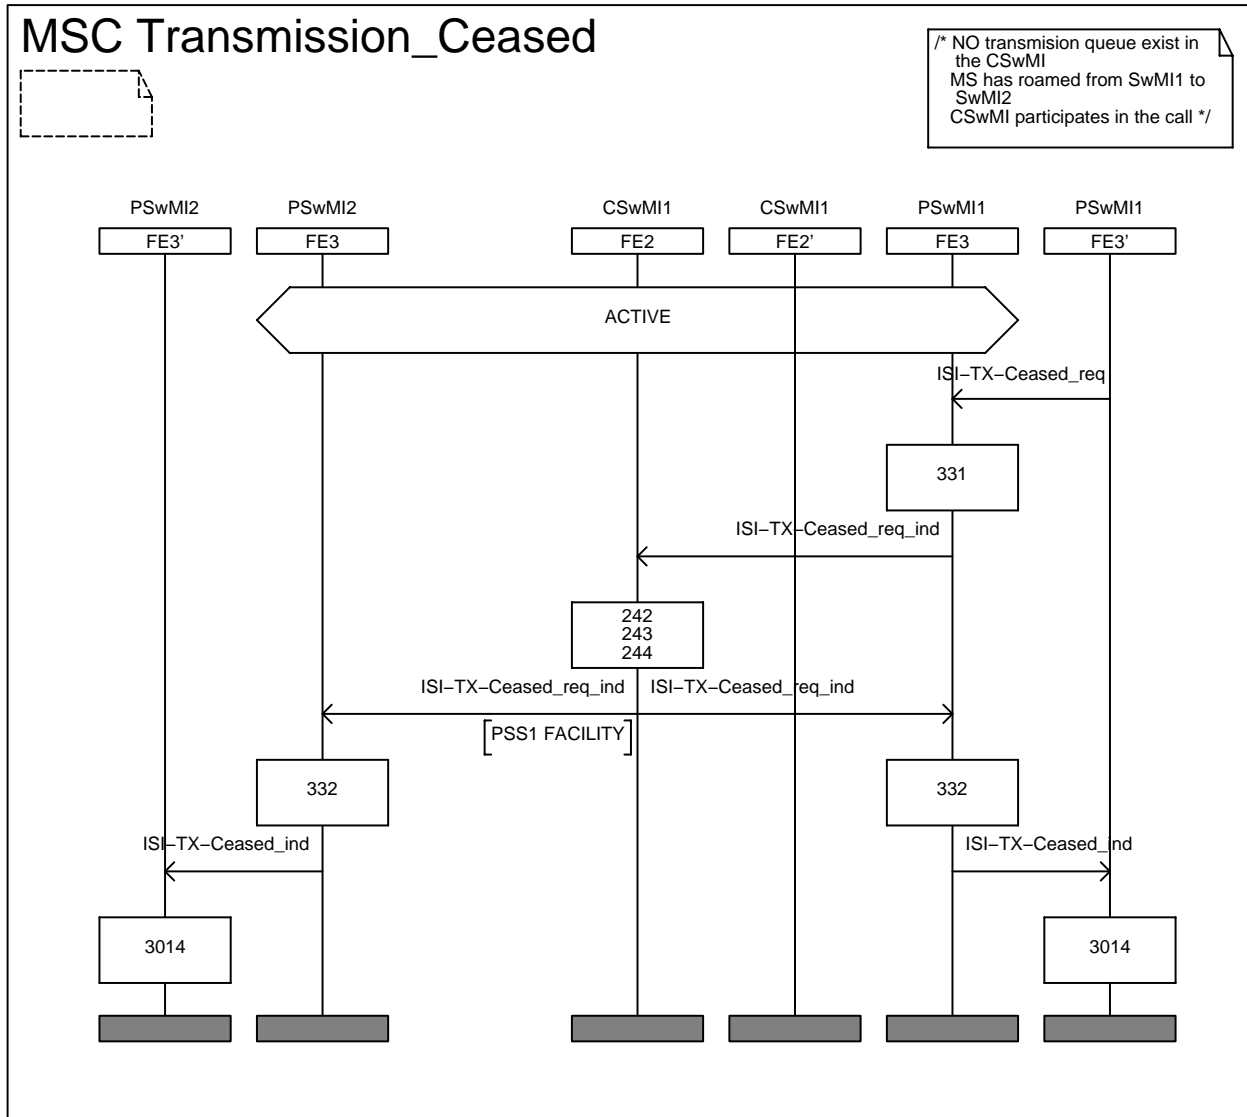

NOTE: If the parameter value, transmission grant in the ISI_TX_INTERRUPT PDU, is set to 'transmission not granted', then an ISI_RESOURCE PDU shall be sent to all participating SwMI(s) to check if resources are still available before an ISI_TX_GRANTED PDU is sent from the controlling SwMI. See figure 46 and 47 for an ISI_RESOURCE PDU sequence.

**Figure 51: Information flow sequence -
Request to transmit interrupting current transmission, sheet 2 of 2**

5.2.1.8 Call maintenance procedures - Cease transmission

Figures 52 to 55 show the information flow sequence for cease of transmission from a TETRA user in a participating SwMI and the possible responses from the controlling SwMI.

NOTE: All participating SwMIs who are listening to the call should receive information about the cease of transmission with a group addressed ISI_TX_CEASED PDU as shown in figure 52.

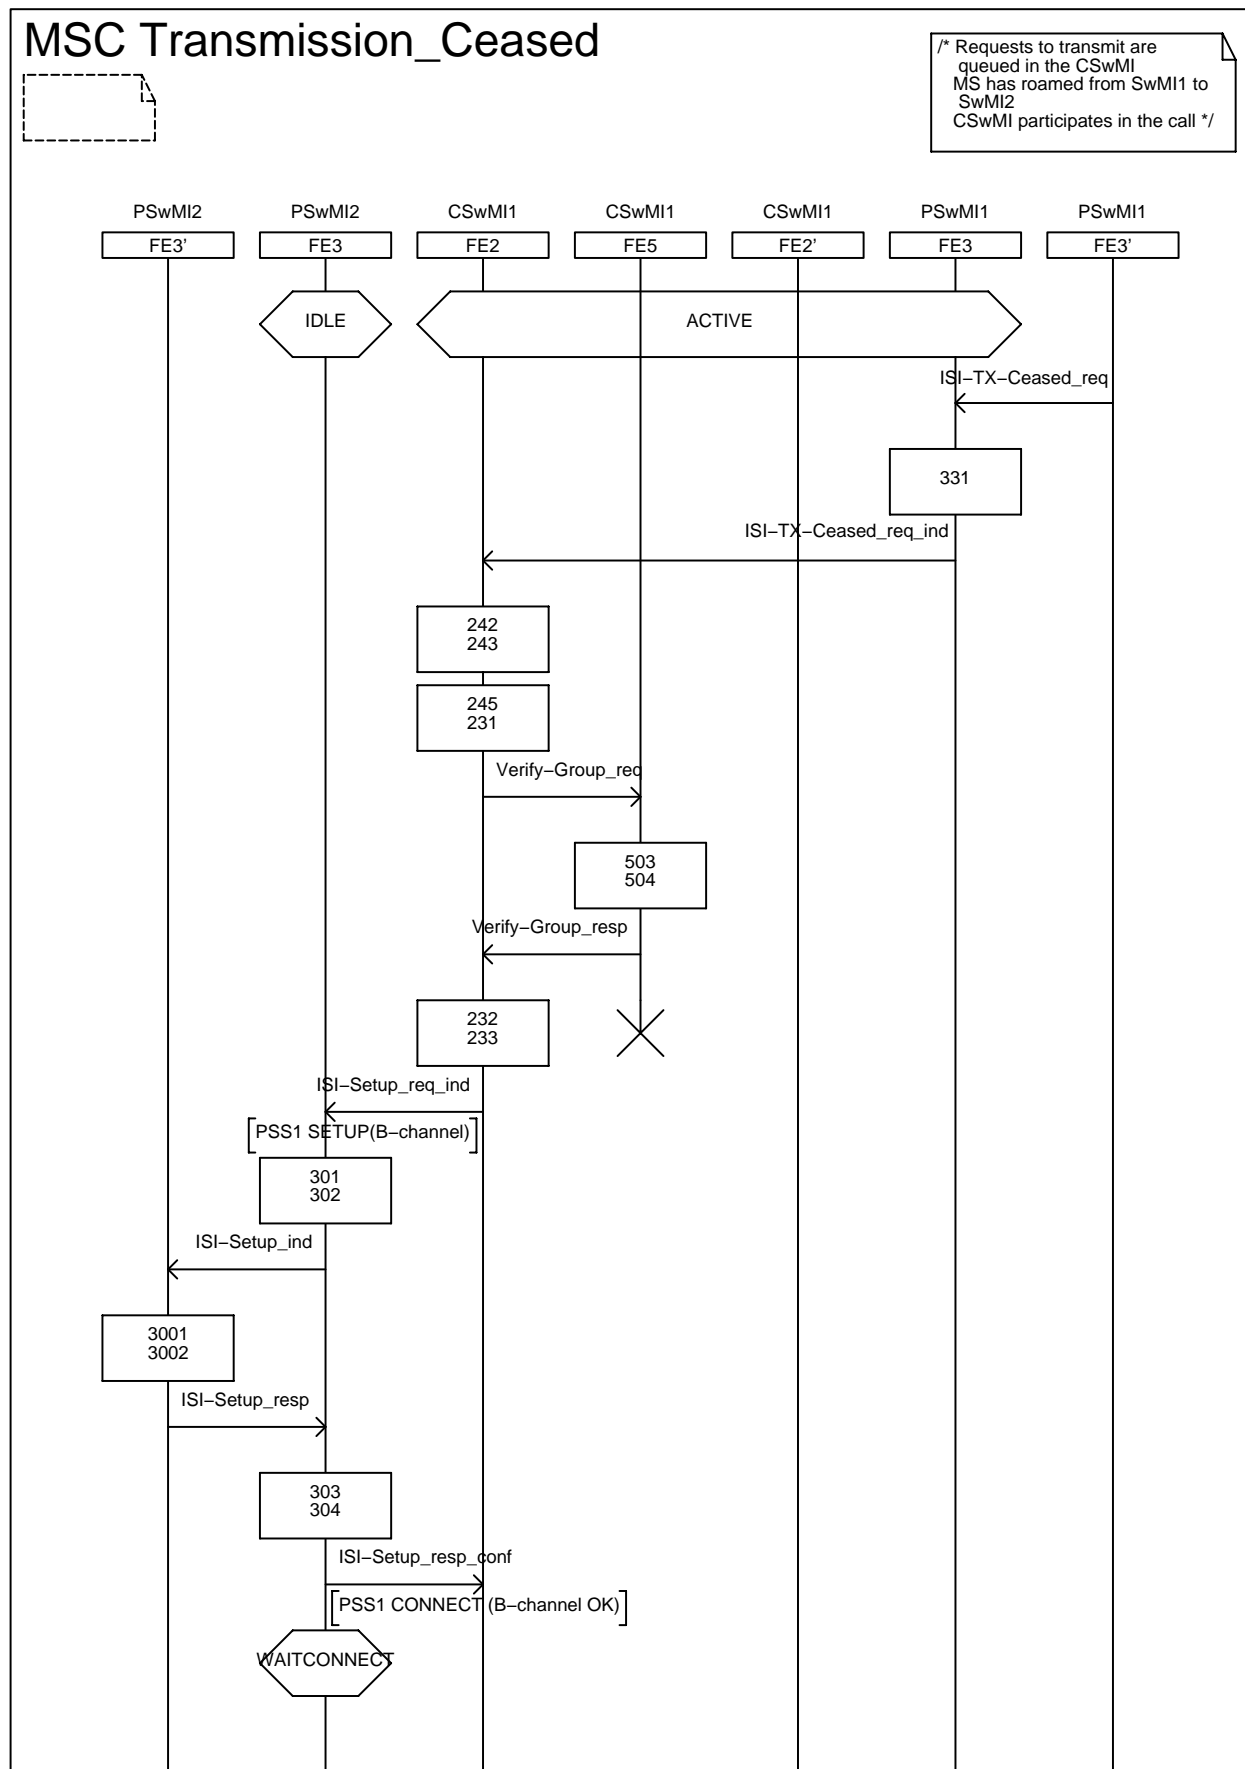

NOTE: No request have been queued by the controlling SwMI.

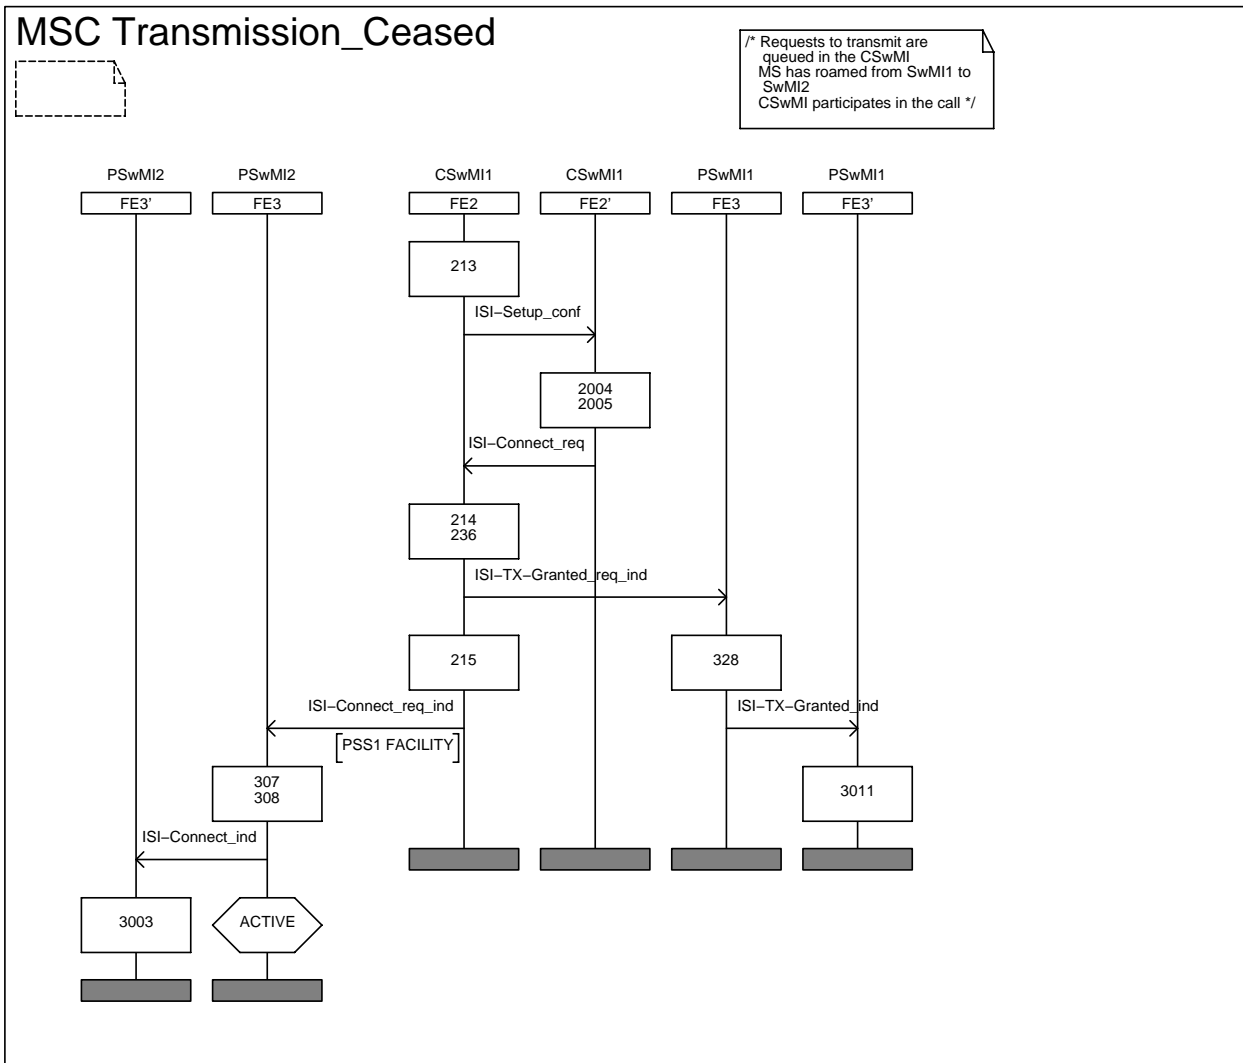

Figure 52: Information flow sequence - Request by participating SwMI to cease current transmission

Figure 53 and 54 shows the information flow sequence for cease of transmission from a TETRA user in a participating SwMI. Requests to transmit have been queued in the controlling SwMI. Permission to transmit granted to first in queue.

All participating SwMIs who are listening to the call should receive information about the new grant of transmission by a group addressed ISI_TX_GRANTED PDU as shown in figure 53 and 54. An ISI_TX_CEASED PDU shall not be sent out to the active group.

**Figure 53: Information flow sequence -
 Permission to transmit following a cease transmission sequence, sheet 1 of 2**

**Figure 54: Information flow sequence -
Permission to transmit following a cease transmission sequence, sheet 2 of 2**

Figure 55 shows the information flow sequence for a request, to withdraw a non-granted transmission request, from a TETRA user in a participating SwMI.

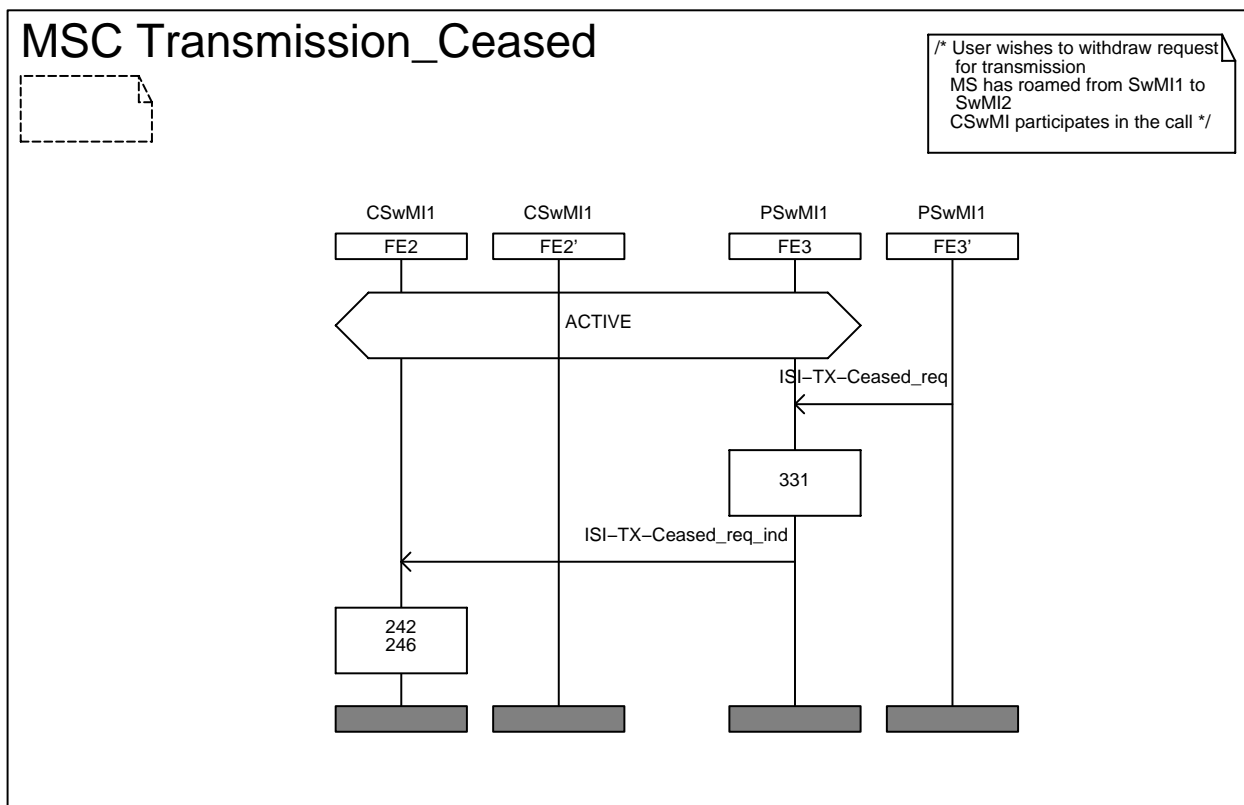

Figure 55: Information flow sequence - Request by participating SwMI to withdraw a transmission request

5.2.1.9 Call Maintenance procedures - Withdraw/Continue from an active group call

Figures 56 to 57 show the information flow sequence for a request, sent from a participating SwMI, to withdraw or continue from an active group call.

A participating SwMI may decide to interrupt transmission when resources are required for another call or when the SwMI requires that the call should temporarily pause. The controlling SwMI shall be informed of withdrawal.

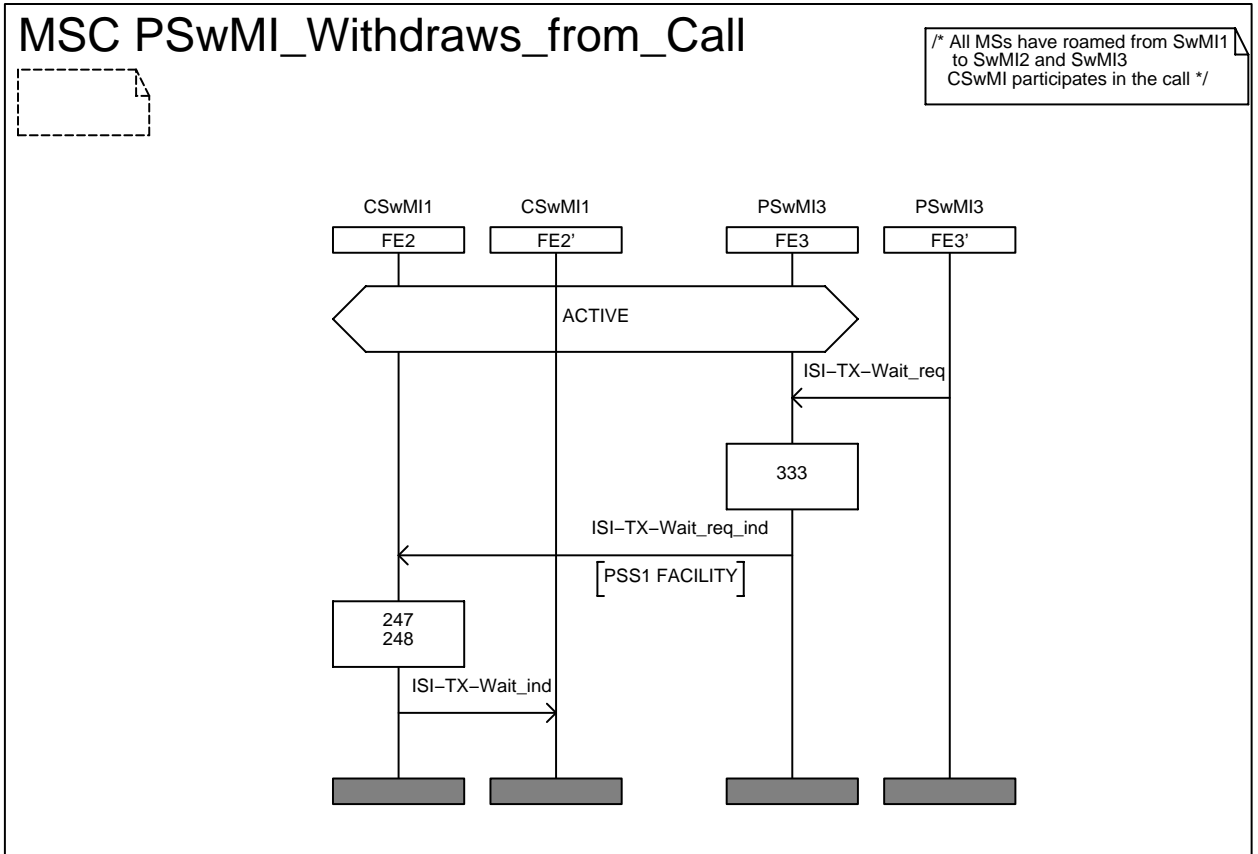

Figure 56: Information flow sequence - Request by participating SwMI to withdraw from the active call

When a withdrawn SwMI wishes to continue with an active call an ISI_TX_CONTINUE PDU should be sent to the controlling SwMI. If a user located in the withdrawn SwMI was transmitting at the time of withdrawal, permission to transmit shall not automatically be given to this user upon continuation in the active call. Users located in the withdrawn participating SwMI may request permission to transmit. However, if a queuing mechanism is not implemented in the controlling SwMI for transmission control, all transmission request sent from a withdrawn SwMI shall be rejected.

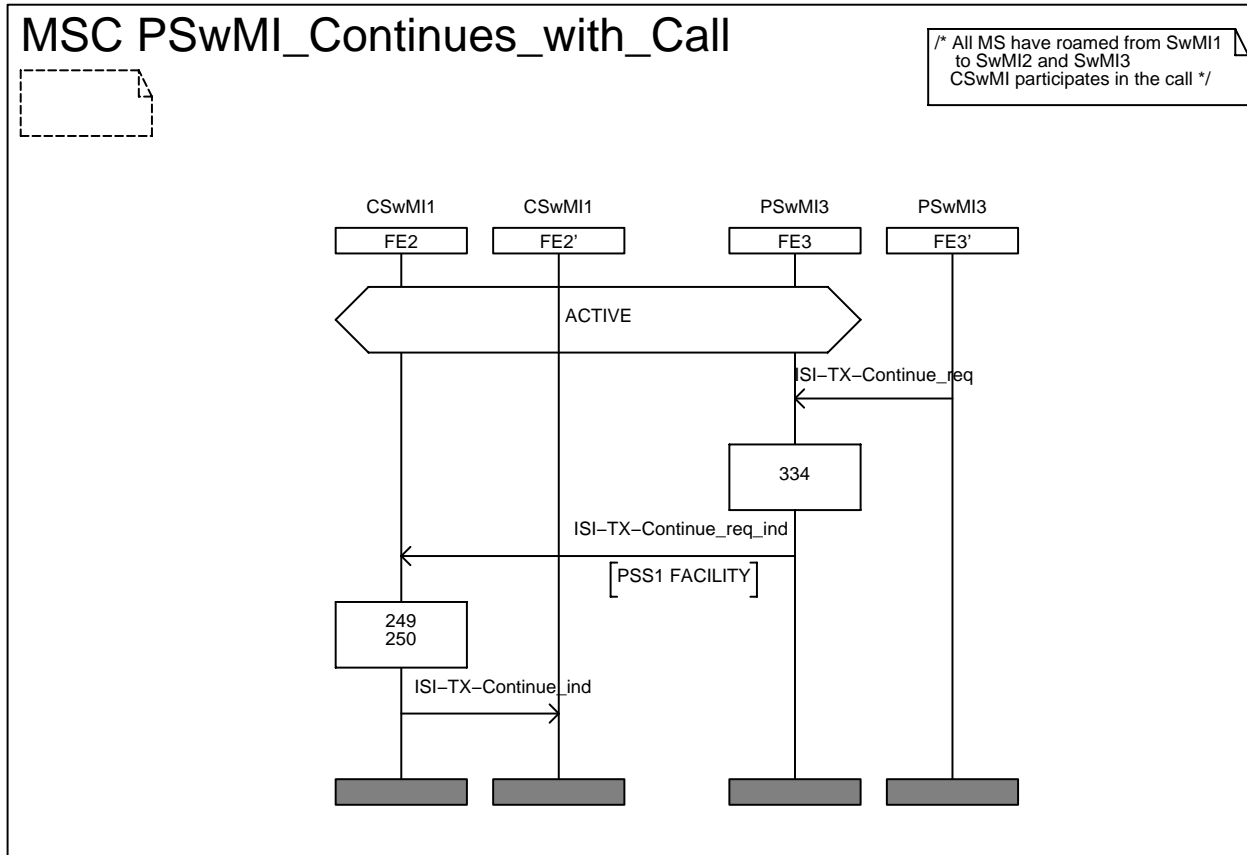

Figure 57: Information flow sequence - Request by participating SwMI to continue with the active call

5.2.1.10 Call Maintenance procedures - Information flow to participating SwMI(s)

The controlling and participating SwMI(s) may at any time during the maintenance phase of the group call send extra information to one another. The information shall be contained within the information flow ISI_INFO req.ind.

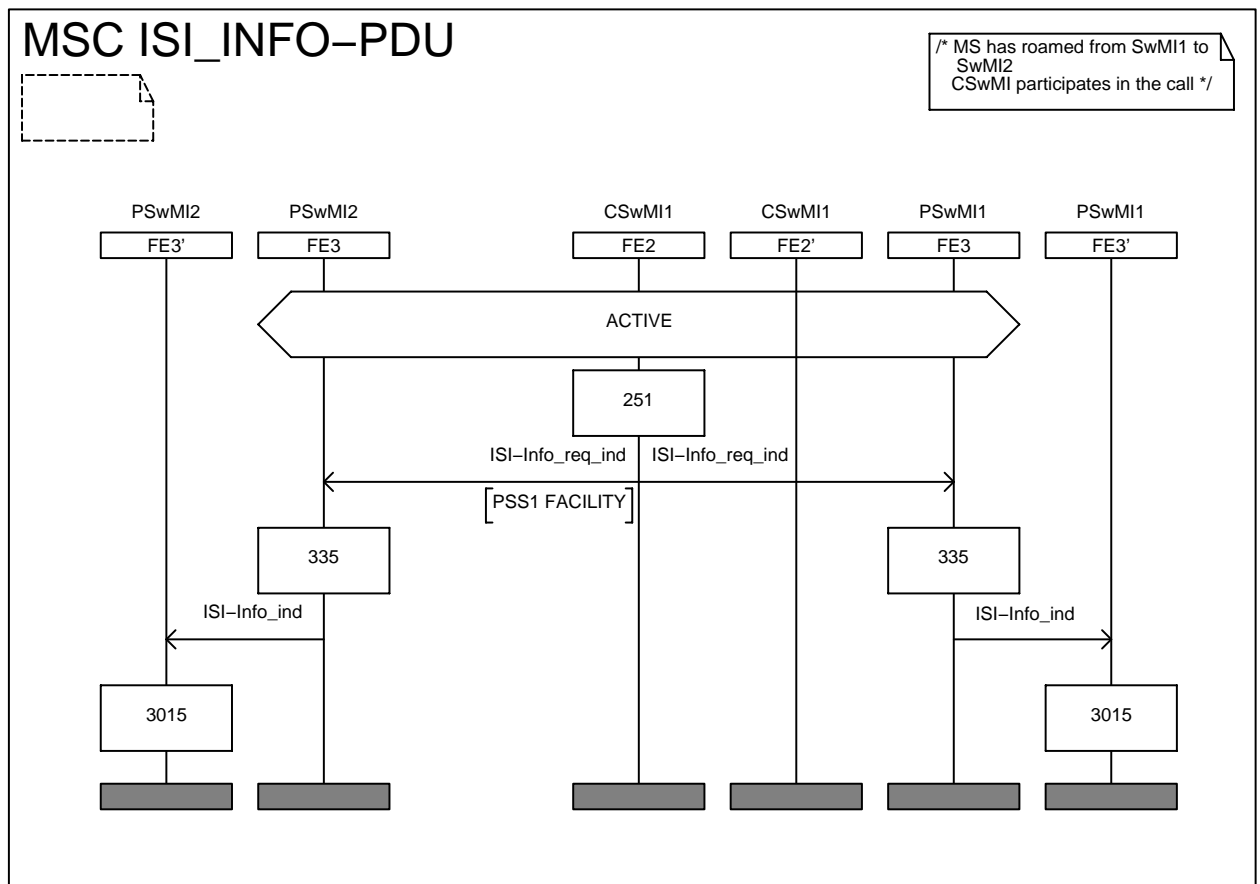

Figure 58: Information flow sequence - Information flow sent by the controlling SwMI

5.2.1.11 Call Maintenance procedures - Group call restoration over ISI using ANF-ISIGC

Figure 59 to 64 shows the information flow sequence for call restoration. The figures cover all three cases described in subclause 4.2.2.3.7 plus the case where a linking controlling SwMI exist and the case where the migrating users home SwMI does not coincide with the controlling SwMI and this SwMI is not participating in the group call. This shall be referred to as case 4 and 5 in this subclause.

For the **case 1 scenario** the user has migrated to a new FE3 where the group call does not exist. Figure 59 shows how the call is restored in the new FE3. Upon reception of the ISI-CALL RESTORATION req.ind. the new participating SwMI shall evaluate if resources necessary (air interface, mobile and infrastructure resources) for the group call are available. If a group call can be performed in the invoked SwMI, the necessary resources shall be reserved. The invoked SwMI shall then indicate in a set-up response back to the controlling SwMI the mode of operation used to allocate resources (temporary or permanent), used for transmission over the ISI, during the group call.

For the **case 2 scenario** the user has migrated to a new FE3 where the group call already exist. Figure 60 shows the interaction between the new FE3 and FE2.

For the **case 3 scenario** the user has migrated to a new FE3. The user was the last group member attached to the old FE3. Figure 61 shows how the group call and ISI-path is released from the old FE3.

For the **case 4 scenario** the user has migrated to a new FE3 where the group call does not already exist. The linking controlling SwMI performs call restoration. The old FE3 still has migrated users attached. Figure 62 and 63 shows how the linking controlling SwMI is informed of call restoration.

For the **case 5 scenario** the migrated user's home SwMI is not collocated with the controlling SwMI and the user's home SwMI is not participating in the group call. When the user's home SwMI receives a call restoration request from the collocated MM application, then this request shall be sent to the user's old visiting SwMI. Only this SwMI has information of the ongoing group call that the migrated user is participating in. The old visiting SwMI shall then inform the controlling SwMI that a call restoration request has been received for the migrated user. Figure 64 shows how this is performed.

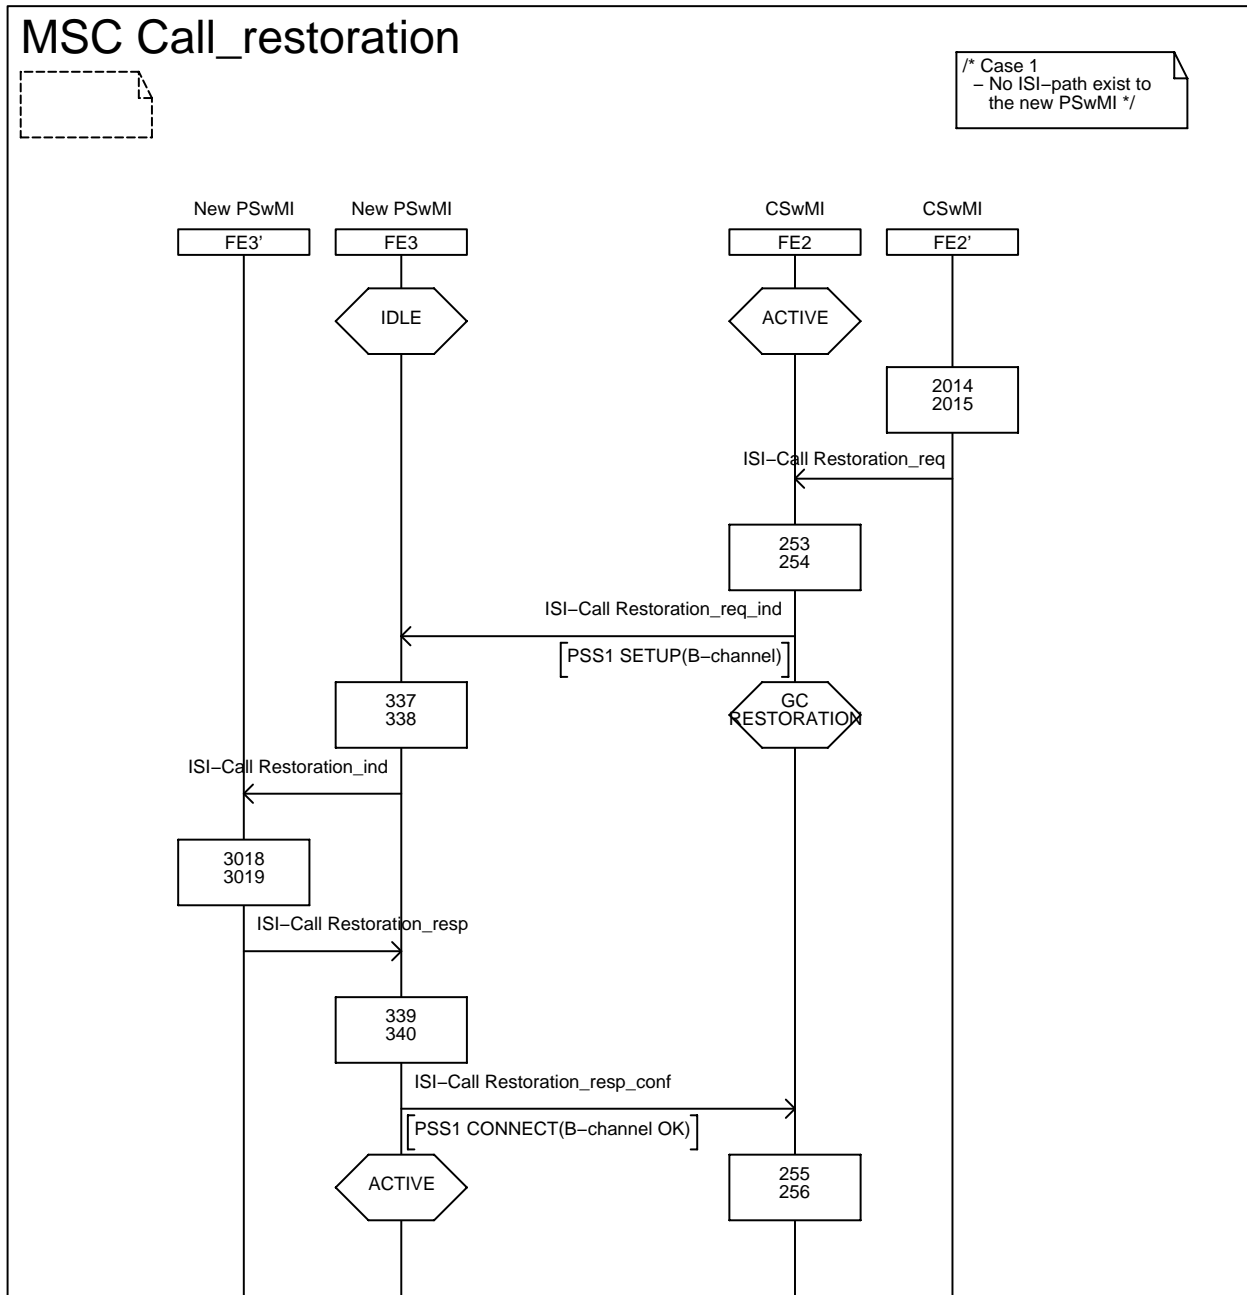

Figure 59: Information flow sequence - Group call restoration, case 1

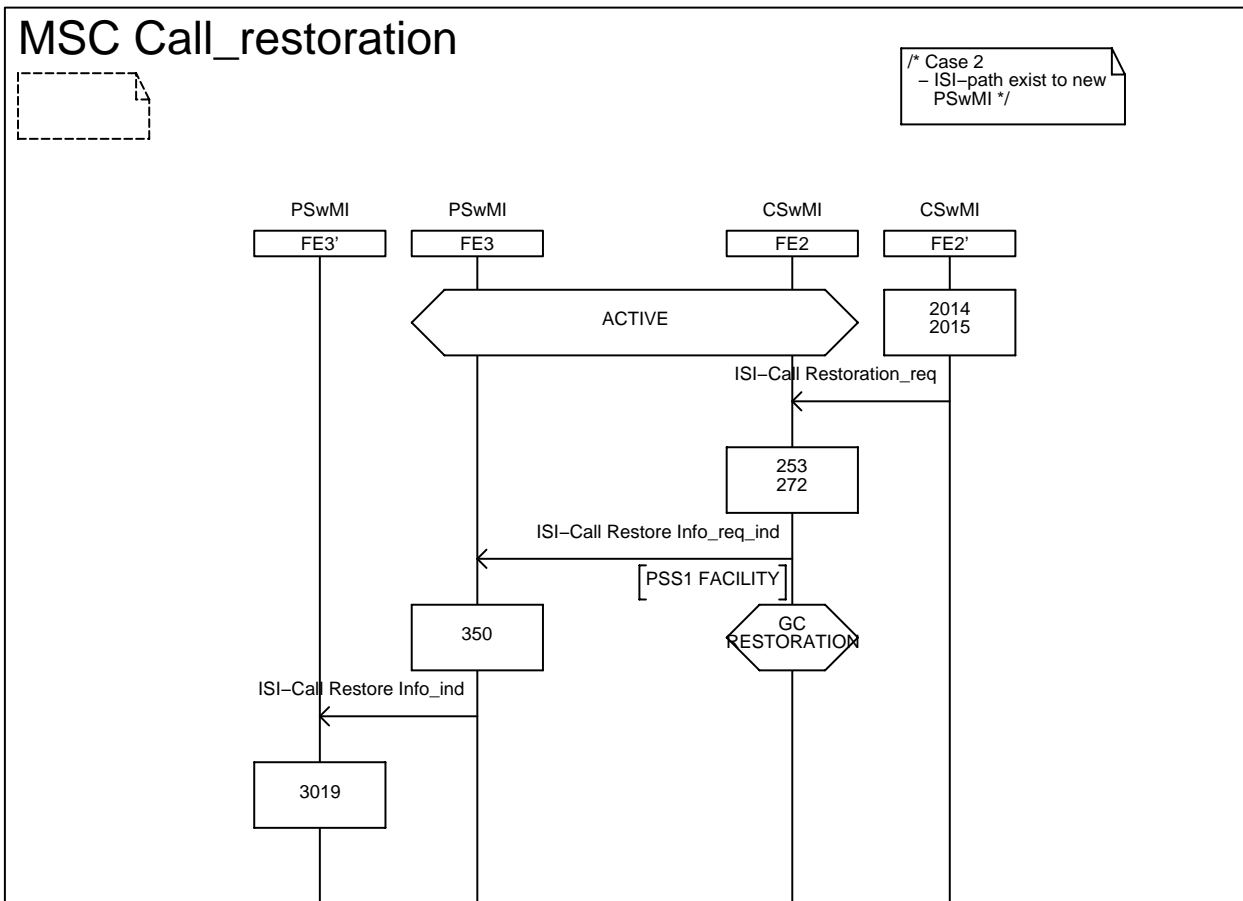

Figure 60: Information flow sequence - Group call restoration, case 2

MSC Call_restoration

/* Case 3
 - Last user has migrated
 from old PSwMI */

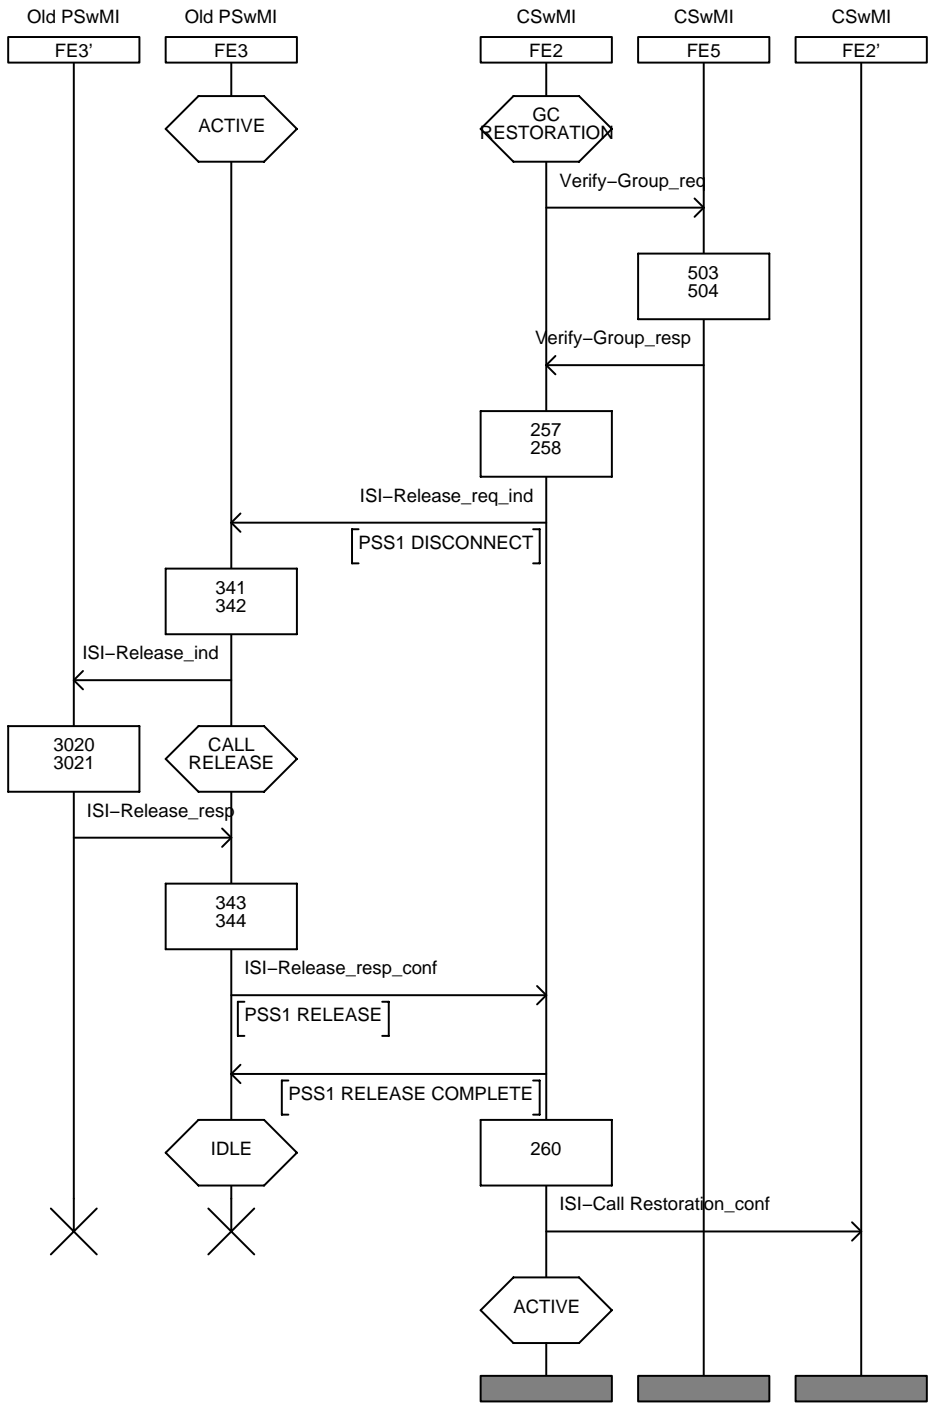

Figure 61: Information flow sequence - Group call restoration, case 3

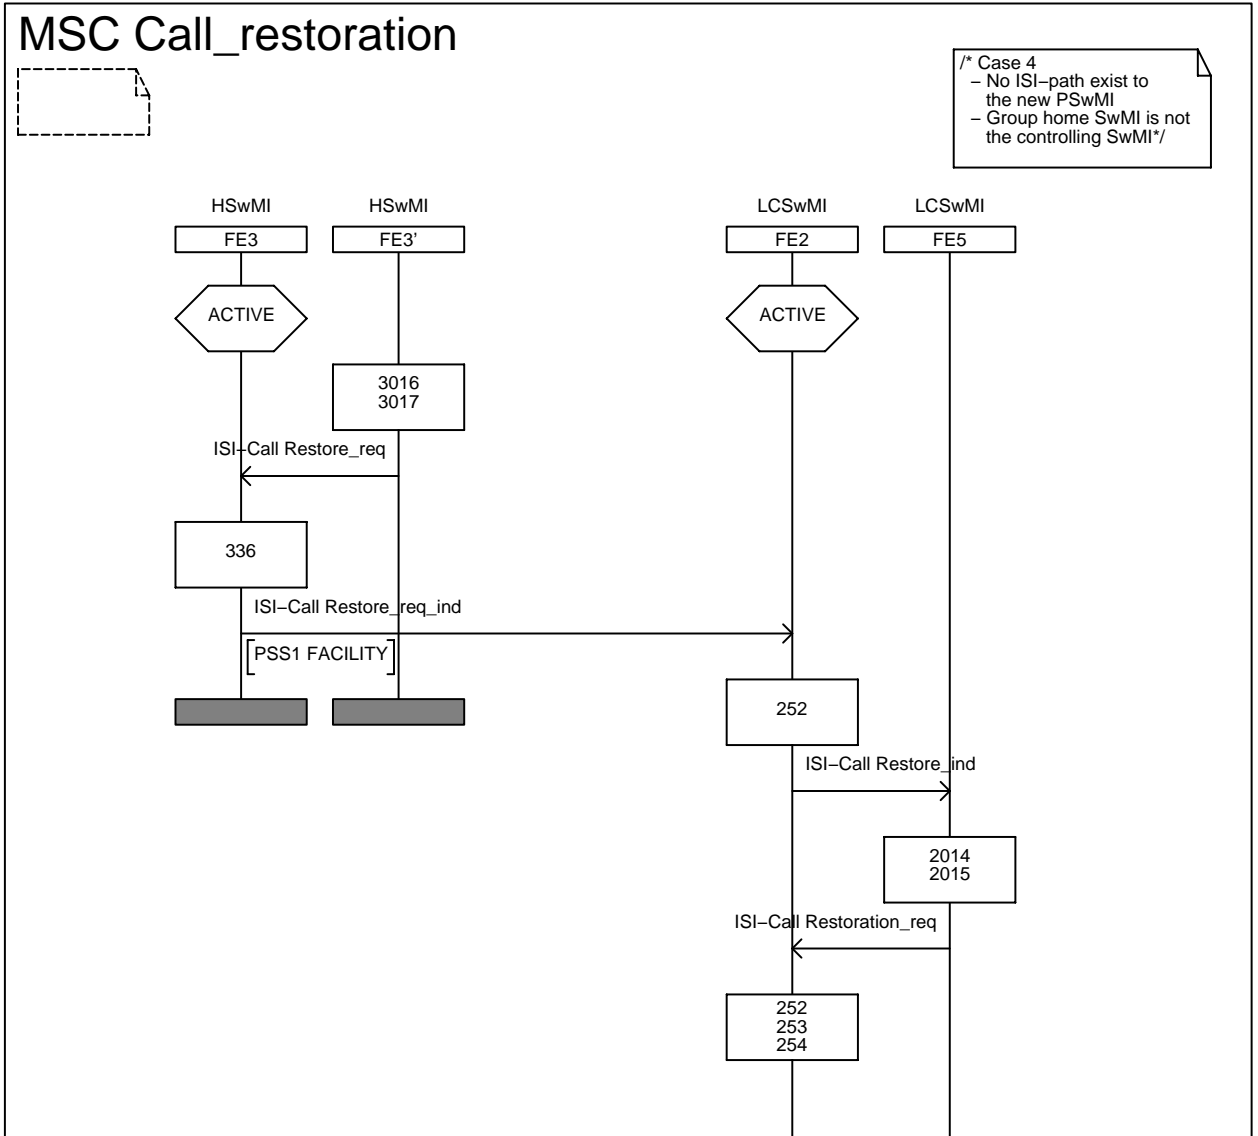

Figure 62: Information flow sequence - Group call restoration, case 4, sheet 1 of 2

MSC Call_restoration

/* Case 4
 - No ISI-path exist to the new PSwMI
 - Group home SwMI is not the controlling SwMI*/

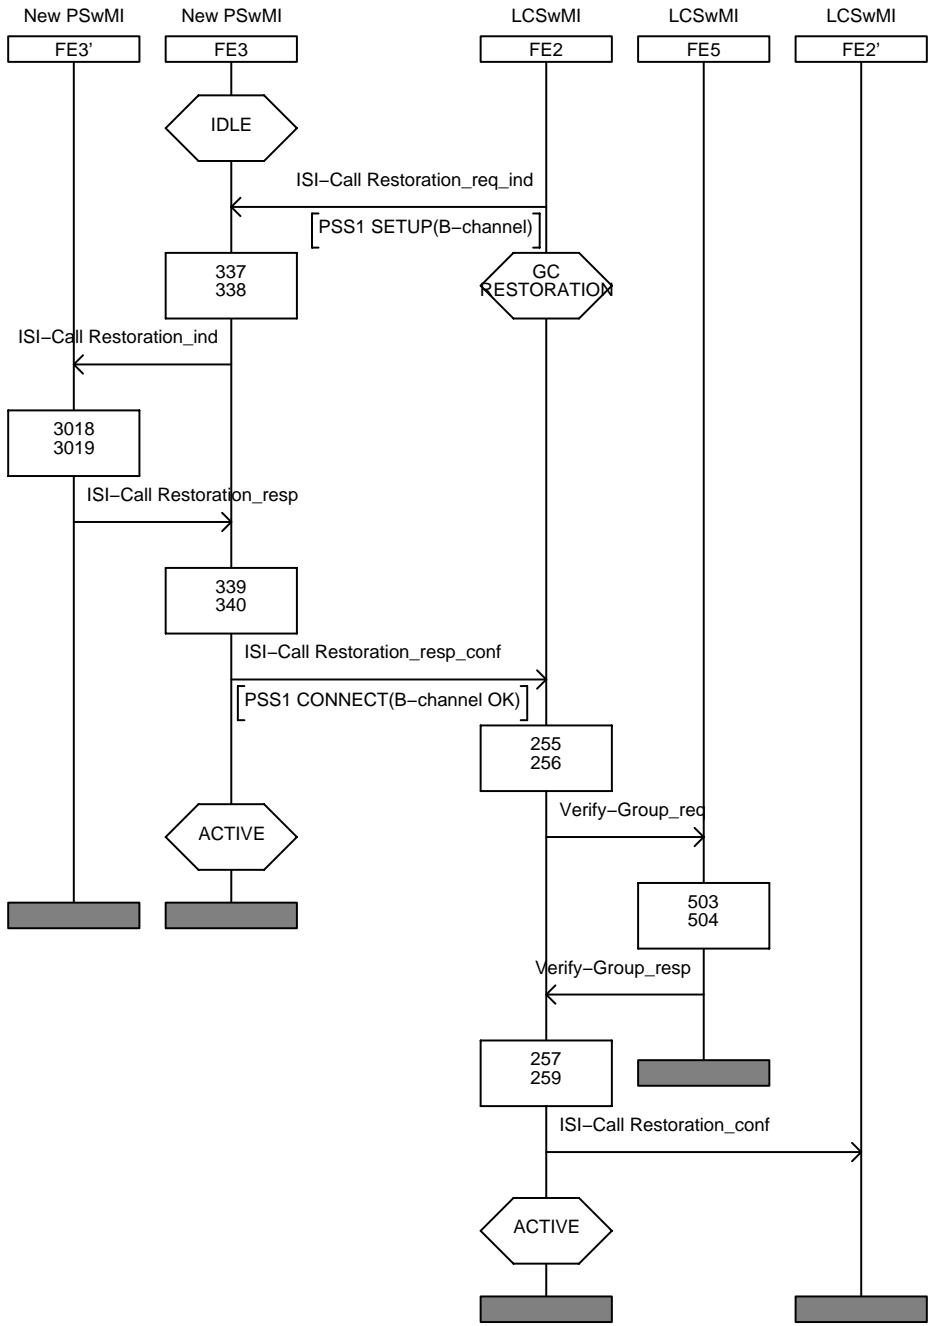

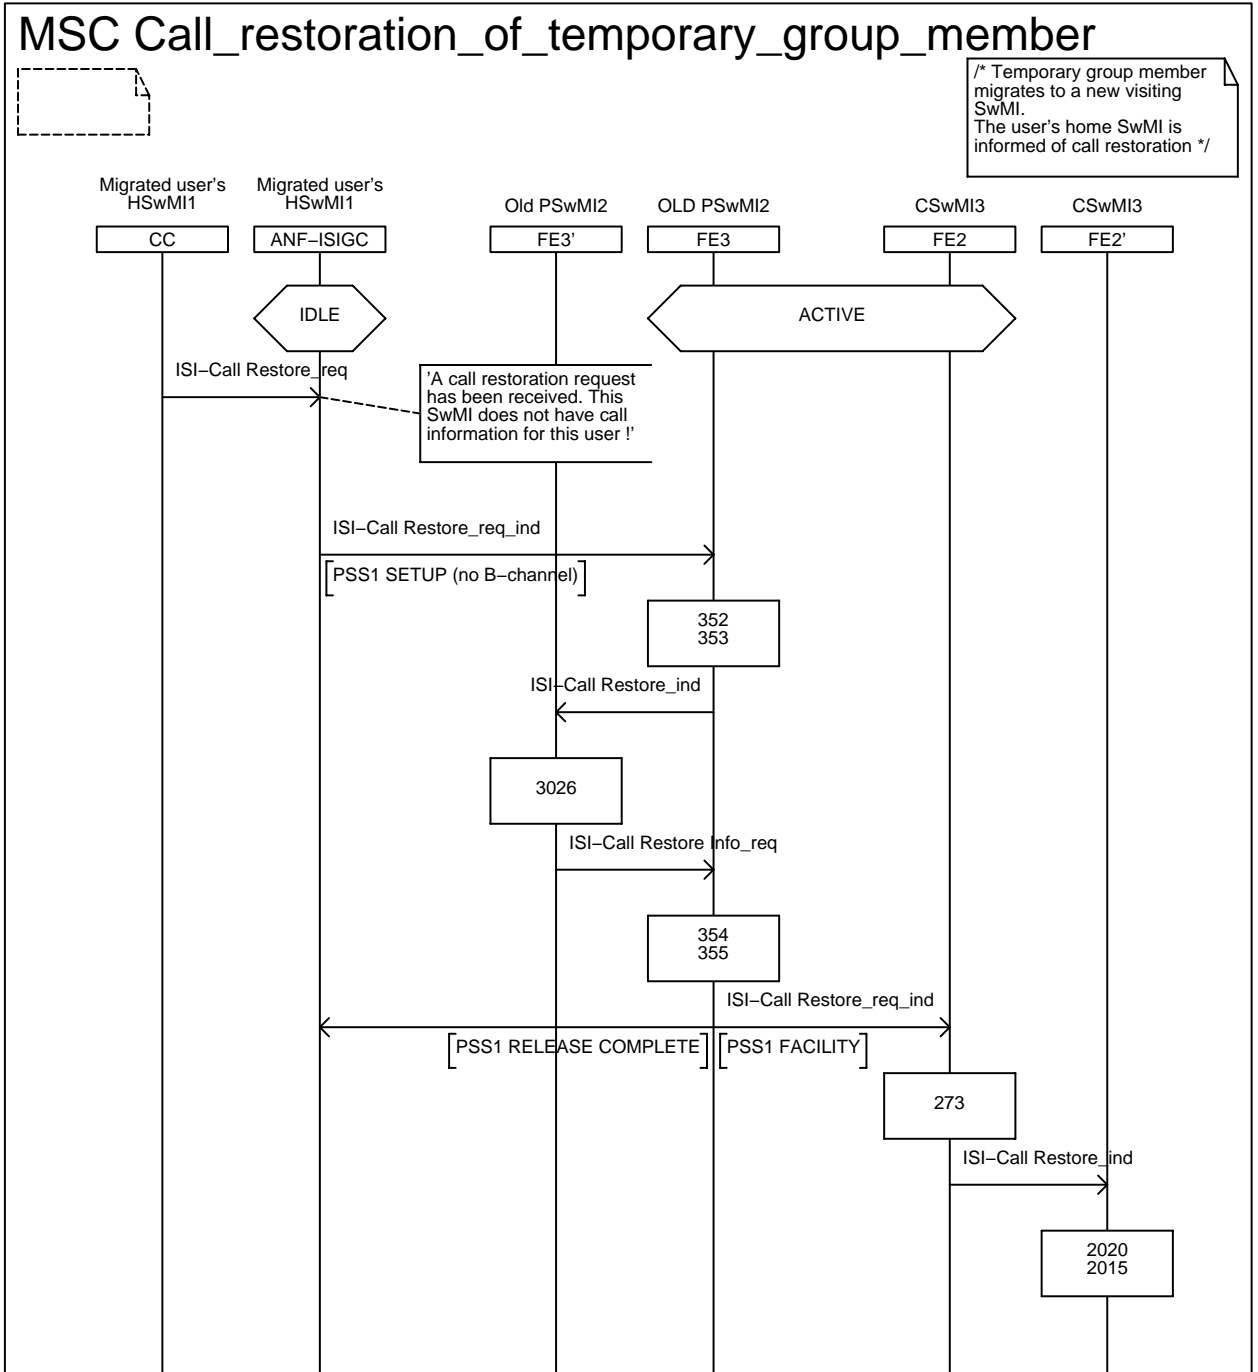

Figure 63: Information flow sequence - Group call restoration, case 4, sheet 2 of 2

NOTE: Call restoration shall continue as shown in either figure 59, 60 or 63 depending on whether other member's of the group call are located in the new visiting SwMI and depending on who is the controlling SwMI for the group call.

Figure 64: Information flow sequence - Group call restoration, case 5

5.2.1.12 Call Disconnection procedures - Controlling SwMI disconnects the call

Figure 65 shows the information flow sequence for disconnection of a group call initiated by the controlling SwMI. When a controlling SwMI disconnects a group call the entire group call shall be disconnected, i.e. all SwMIs involved in the call shall disconnect the call.

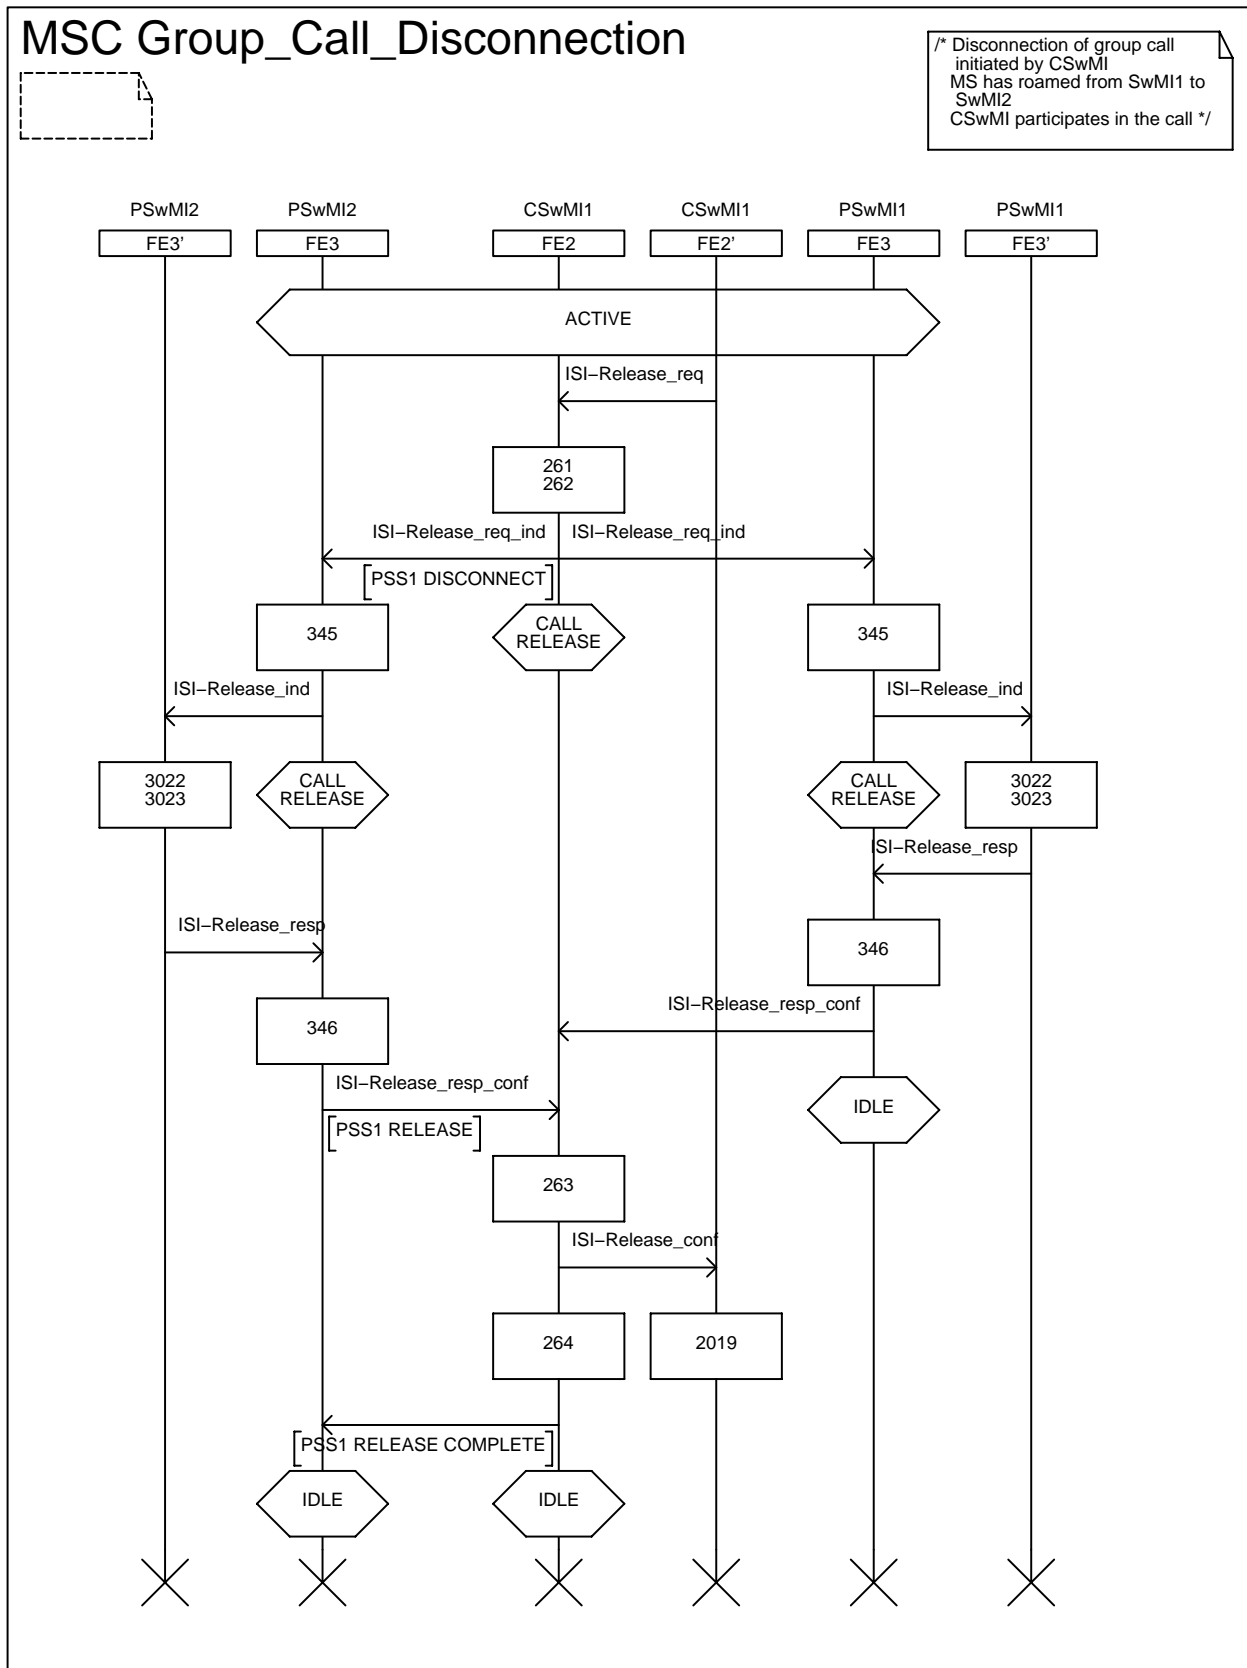

Figure 65: Information flow sequence - Group call disconnection by controlling SwMI

5.2.1.13 Call Disconnection procedures - Participating SwMI disconnects from the call

Figure 66 and 67 shows the information flow sequence for partial disconnection of a group call initiated by a participating SwMI. When a participating SwMI wishes to disconnect from a group call, the controlling SwMI shall be informed. The controlling SwMI shall always evaluate if the group call shall continue or if the call is to be released. If the controlling SwMI chooses not to release the call, the group call shall continue without the disconnected SwMI.

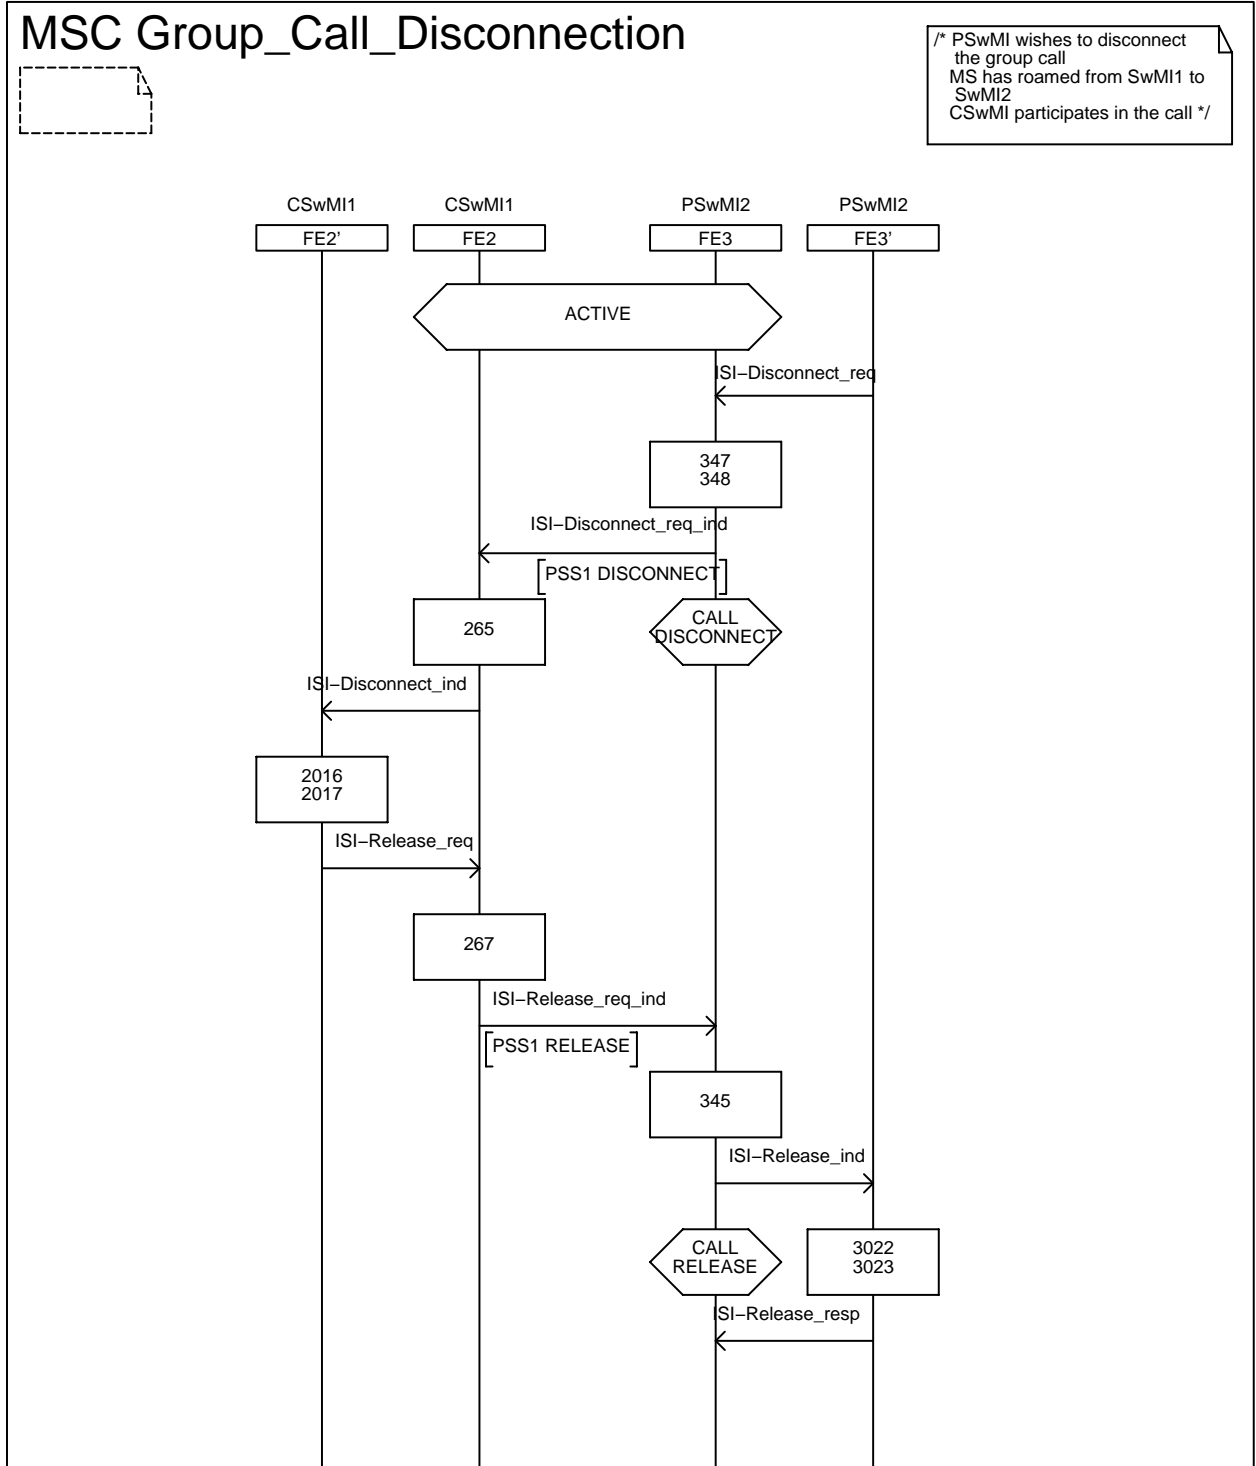

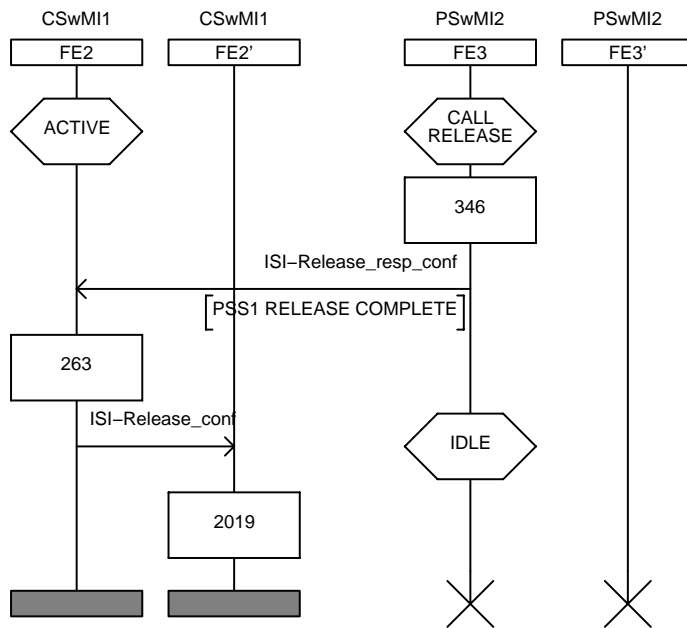

Figure 66: Information flow sequence - Partial Group call disconnection, sheet 1 of 2

MSC Group_Call_Disconnection

/* PSwMI wishes to disconnect the group call
MS has roamed from SwMI1 to SwMI2
CSwMI1 participates in the call */

NOTE: If required, FE3 may acquire additional information from FE5 when disconnecting.

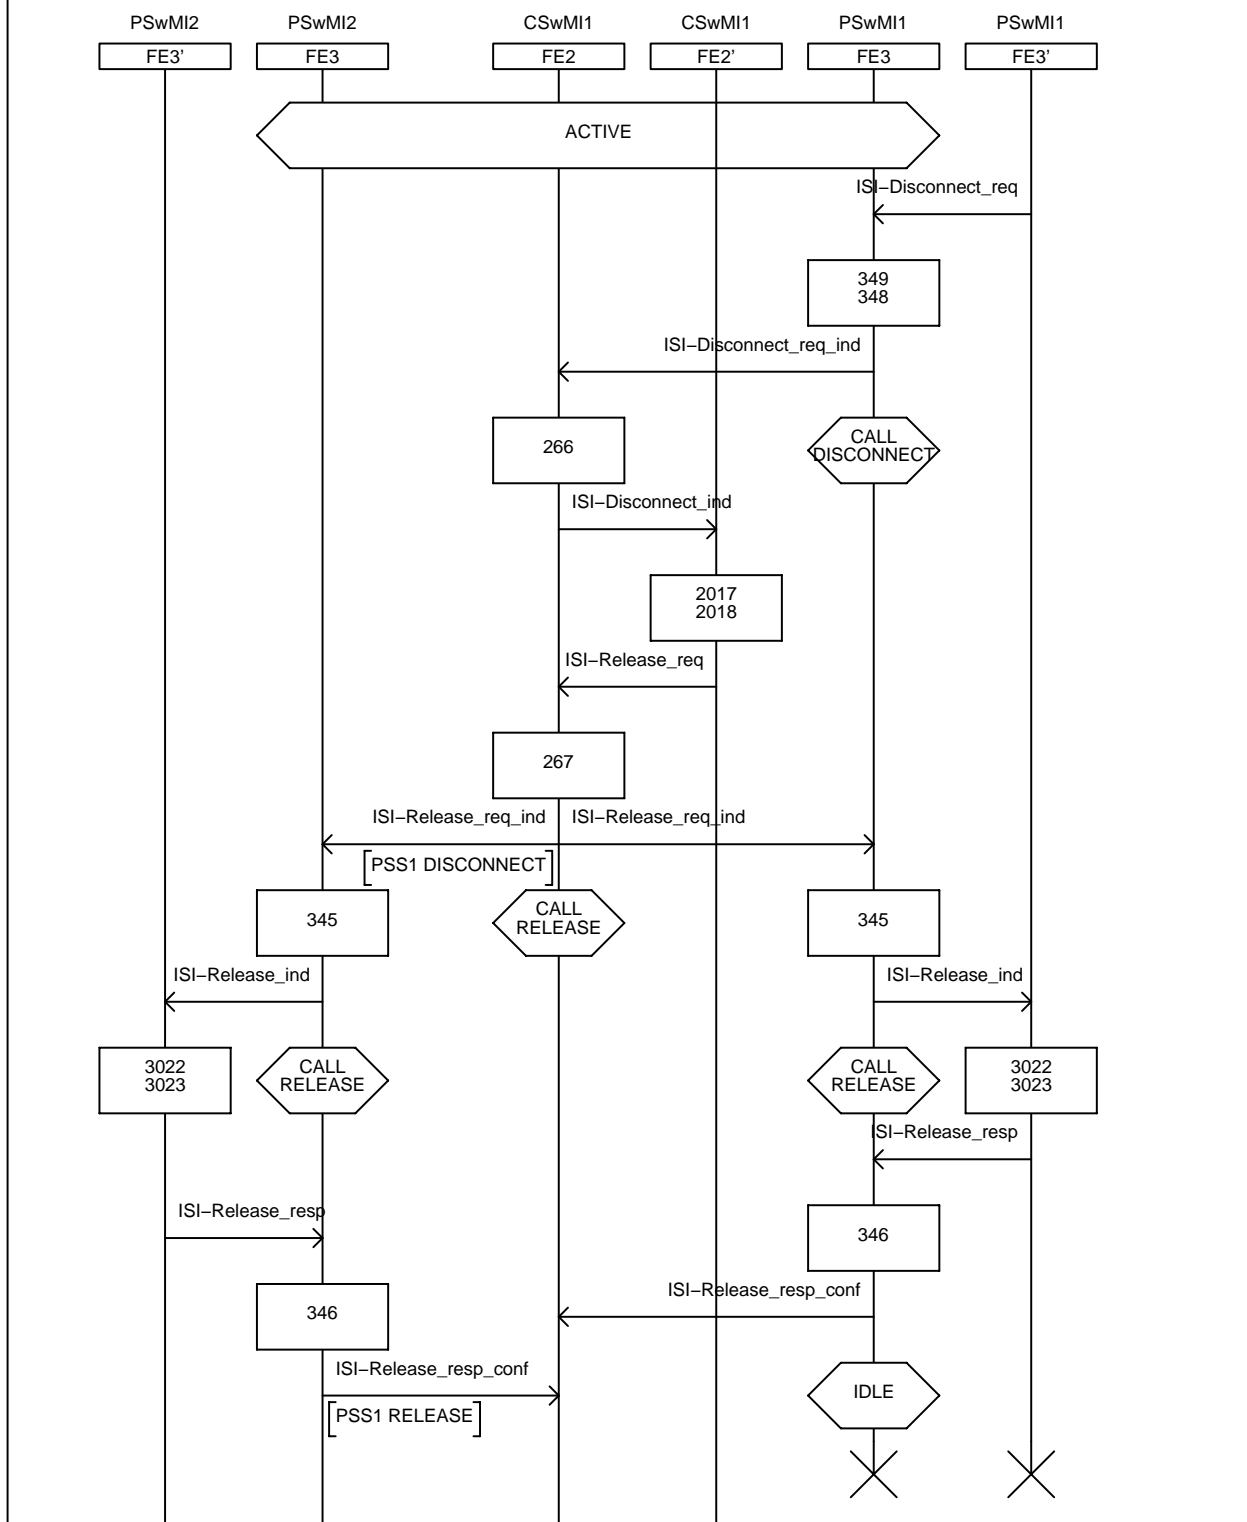

**Figure 67: Information flow sequence -
Partial Group call disconnection, sheet 2 of 2**

5.2.1.14 Call Disconnection procedures - Call Owner disconnects the whole call

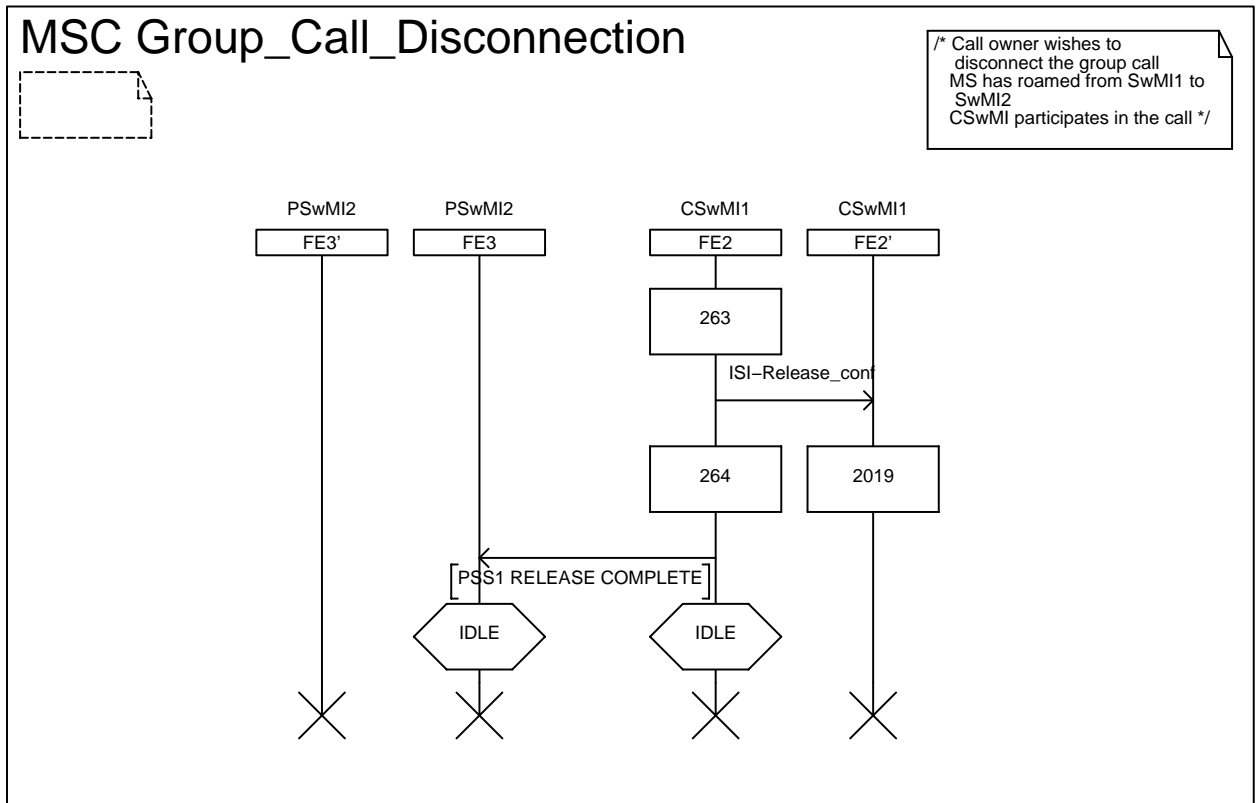

Figure 68 and 69 shows the information flow sequence for disconnection of a group call, initiated by the call owner, when the call owner is located in a participating SwMI. When the call owner wishes to disconnect a group call the controlling SwMI shall always release the whole group call. The controlling SwMI shall always be informed of a disconnection request, regardless of whether the disconnection request has been initiated by the call owner or not.

MSC Group_Call_Disconnection

/* Call owner wishes to disconnect the group call
 MS has roamed from SwMI1 to SwMI2
 CSwMI participates in the call */

**Figure 68: Information flow sequence -
 Group call disconnection by call owner, sheet 1 of 2**

NOTE: If required, FE3 may acquire additional information from FE5 when disconnecting.

**Figure 69: Information flow sequence -
 Group call disconnection by call owner, sheet 2 of 2**

5.2.2 Definitions of information flows

The tables below list the service elements in the information flows show in subclause 5.2.1. The columns headed "Request" indicates which of these service elements are mandatory (M) and which are optional (O) in a request/indication information flow. The columns headed "Confirm" indicates which of these service elements are mandatory (M) and which are optional (O) in a response/confirmation information flow.

5.2.2.1 ISI_CALL RESTORATION

ISI_CALL RESTORATION is a confirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_CALL RESTORATION request/indication information flow shall be sent to extend an active group call over ANF-ISIGC to a new SwMI not already participating in the group call. ISI_CALL RESTORATION response/confirm information flow shall be sent from the new participating SwMI as a response that the call can be established in the new participating SwMI.

Table 3 lists the service elements within the ISI_CALL RESTORATION information flow.

Table 3: Content of ISI_CALL RESTORATION

Service element	Request	Confirm
Controlling SwMI MNI	M	-
Participating SwMI MNI	M	-
Restoring subscriber number	M	-
Basic service information:		
Circuit mode service	M	M
Communication type	M	M
Data call capacity	C (note 1)	C (note 1)
Data service	C (note 1)	C (note 1)
Encryption flag	M	M
Speech service	C (note 1)	C (note 1)
Speech service used	O (note 2)	-
Security level at air interface	M	-
Call priority	M	-
Call ownership	M	-
Critical party	O	-
Call Status	M	-
Reset call time-out timer (T310)	M	-
Call time-out	M	-
SS-CLIR invoked for transmitting party	M	-
Connected party identity	M	-
Transmitting party identity	M	-
Temporary group member indication	M (note 3)	-
Individual basic migration profile	C (note 4)	-
SS-migration profile	C (note 5)	
Resource allocation	-	M
Transmission request permission	M	-
Transmission grant	M	-
Notification indicator	O	-
Proprietary	O	O
NOTE 1:	Depending on the value of circuit mode service.	
NOTE 2:	May be sent if the service requested is a speech service.	
NOTE 3:	This information element indicates if the restoring user is temporarily a member of the called group.	
NOTE 4:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.	
NOTE 5:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12 [10].	

5.2.2.2 ISI_CALL RESTORE INFO

ISI_CALL RESTORE INFO is a unconfirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_CALL RESTORE INFO request/indication information flow shall be sent to a participating SwMI when a user migrates into this SwMI. The call the migrated user is participating in, is already established at this SwMI. The information in this PDU is used to inform the participating SwMI of which call the user is allowed to restore and if the migrated user is temporarily a member of the called group.

Table 4 lists the service elements within the ISI_CALL RESTORE INFO information flow.

Table 4: Content of ISI_CALL RESTORE INFO

Service element	Request
Controlling SwMI MNI	M
Participating SwMI MNI	M
Restoring subscriber number	M
Call ownership	M
Critical party	O
Connected party identity	M
Temporary group member indication	M (note 1)
Individual basic migration profile	C (note 2)
SS-migration profile	C (note 3)
Transmission request permission	M
Transmission grant	M
Notification indicator	O
Proprietary	O
NOTE 1:	This information element indicates if the restoring user is temporarily a member of the called group.
NOTE 2:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.
NOTE 3:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12 [10].

5.2.2.3 ISI_CALL RESTORE

ISI_CALL RESTORE is an unconfirmed information flow:

- between the migrated user's home SwMI and the old visiting SwMI (FE3);
- and across relationship rg from FE3 to FE3' (old visiting SwMI);
- across relationship rf from FE3 (old visiting SwMI) to FE2;
- and across relationship rd from FE2 to FE2';
- across relationship FE3 (group home SwMI) to the controlling SwMI (FE2);
- and across relationship rd from FE2 to FE2'.

ISI_CALL RESTORE request/indication information flow shall be sent in the following situations:

- from a migrated user's home SwMI to the old participating SwMI when the user's home SwMI is not collocated with the controlling SwMI or the old participating SwMI and the user's home SwMI is not participating in the group call;
- from a migrated user's home SwMI to the controlling SwMI when the user's home SwMI is not collocated with the controlling SwMI and the user's home SwMI is participating in the group call;
- from the old participating SwMI to the controlling SwMI when a call restoration indication has been received from the migrated user's home SwMI and the old participating SwMI is not collocated with the controlling SwMI.

Table 5 lists the service elements within the ISI_CALL RESTORE information flow.

Table 5: Content of ISI_CALL RESTORE

Service element	Request
New participating SwMI MNI	M
Old participating SwMI MNI	M
Restoring party identity	M
Notification indicator	O
Proprietary	O

5.2.2.4 ISI_CONNECT

ISI_CONNECT is an unconfirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rf from FE2 to FE3;
- across relationship rg from FE3 to FE3';
- across relationship rc from FE2 to FE1;
- and across relationship ra from FE1 to FE1'.

ISI_CONNECT request/indication information flow shall be sent to the originating SwMI and participating SwMI(s) to inform them to through connect.

Table 6 lists the service elements within the ISI_CONNECT information flow.

Table 6: Content of ISI_CONNECT

Service element	Request
Set-up type (full, partial)	M
Basic service information	C (note 1)
Call priority (emergency, priority 1-14)	C (note 1)
Call ownership	C (note 1)
Call amalgamation	O
Transmission grant	M
Transmission request permission	M
Calling user identity	M (note 2)
Call diverted to a dispatcher	M
Notification indicator	O
Proprietary	O
NOTE 1:	Conditional on the value of call amalgamation. If the information element 'call amalgamation' is not set then the value of the information element shall be equal to the value received in the IS-SETUP request primitive.
NOTE 2:	In the case of call amalgamation, only one of the original calling users shall become calling user for the group call. This information element shall contain this user's identity.

5.2.2.5 ISI_DISCONNECT

ISI_DISCONNECT is a unconfirmed information flow:

- across relationship rg from FE3' to FE3;
- across relationship rf from FE3 to FE2;
- across relationship ra from FE1' to FE1;
- across relationship rc from FE1 to FE2;
- and across relationship rd from FE2' to FE2.

ISI_DISCONNECT request/indication information flow shall be used to clear the call at the originating SwMI or a participating SwMI. The ISI_DISCONNECT request/indication information flow shall only be sent when a SwMI wishes to be released from a group call or when the SwMI forwards a call release request made by the call owning user, when this user is located in the SwMI.

Table 7 lists the service elements within the ISI_DISCONNECT information flow.

Table 7: Content of ISI_DISCONNECT

Service element	Request
Call owner request	M
Disconnect cause	M
Proprietary	O

5.2.2.6 ISI_ORIGINATING SETUP

ISI_ORIGINATING SETUP is an unconfirmed information flow:

- across relationship rc from FE1 to FE2;
- and across relationship rd from FE2 to FE2'.

ISI_ORIGINATING SETUP request/indication information flow shall be sent when a group call set-up request has been made in a SwMI other than the group home SwMI or linking group home SwMI.

Table 8 lists the service elements within the ISI_ORIGINATING SETUP information flow.

Table 8: Content of ISI_ORIGINATING SETUP

Service element	Request
Originating SwMI MNI	M
Area selection	M
Basic service information:	
Circuit mode service	M
Communication type	M
Data call capacity	C (note 1)
Data service	C (note 1)
Encryption flag	M
Speech service	C (note 1)
Security level at calling user air Interface	M
Speech service requested	C (note 2)
Call priority (emergency, priority 1-14)	M
SS-CLIR invoked for calling party	M
Called party identity	M
Calling party identity	M
Temporary group member indication	C (note 3)
Request to transmit/send data	M
Group attachment indicator	M (note 4)
Speech services supported	O (note 5)
Proprietary	O
NOTE 1:	Depending on the value of circuit mode service.
NOTE 2:	May be sent if the service requested is a speech service.
NOTE 3:	This information element shall only be present when the group home SwMI has indicated that the calling user is temporarily a member of the called group.
NOTE 4:	This information element shall indicate whether the calling user is attached to the called group in the visited SwMI.
NOTE 5:	This element enables future additions to the TETRA air interface CODEC.

5.2.2.7 ISI_INFO

ISI_INFO is an unconfirmed information flow:

- across relationship rd from FE2' to FE2 or FE2 to FE2';
- across relationship rc from FE2 to FE1;
- across relationship ra from FE1 to FE1';
- across relationship rf from FE2 to FE3 or FE3 to FE2;
- and across relationship rg from FE3 to FE3' or FE3' to FE3.

ISI_INFO request/indication information flow shall be sent as a general information message from the controlling SwMI to participating SwMI(s) and/or originating SwMI or from a participating SwMI to the controlling SwMI.

Table 9 lists the service elements within the ISI_INFO information flow.

Table 9: Content of ISI_INFO

Service element	Request
Reset call time-out timer (T310)	M
Call time-out	O
Call time-out, set-up phase	O
Basic service information:	
Circuit mode service	O
Communication type	O
Data call capacity	C (note 1)
Data service	C (note 1)
Encryption flag	O
Speech service	C (note 1)
Call ownership	O
Call status	O
Poll result identifier	O (note 2)
Poll response percentage	C (note 3)
Poll response number	C (note 3)
DTMF digits	O
Group information	O
Critical called party identity	C (note 4)
Notification indicator	O (note 5)
Proprietary	O
NOTE 1:	Depending on the value of circuit mode service.
NOTE 2:	Shall be valid for acknowledge group calls only. For other types of calls it shall be set to 0.
NOTE 3:	Depending on the value of poll result identifier.
NOTE 4:	Conditional on the information element 'Group information'.
NOTE 5:	Element used by the SwMI for SS's to inform members of the group call of various events.

5.2.2.8 ISI_INTERACT

ISI_INTERACT is an unconfirmed information flow:

- from one FE2 to another FE2.

ISI_INTERACT request/indication information flow shall be sent from one entity to another when a call set-up request is to be merged with an active group call.

Table 10 lists the service elements within the ISI_INTERACT information flow.

Table 10: Content of ISI_INTERACT

Service element	Request
Controlling call identifier	M
Originating SwMI MNI	M
Notification indicator	M
Proprietary	M

5.2.2.9 ISI_POLL

ISI_POLL is a confirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_POLL request/indication information flow shall be sent when the controlling SwMI wishes to poll members of the group. ISI_POLL response/confirm information flow shall be used as a poll response sent from participating SwMI(s). The poll response shall indicate the actual status of group members located in the participating SwMI(s). Used for acknowledge group calls only.

Table 11 lists the service elements within the ISI_POLL information flow.

Table 11: Content of ISI_POLL

Service element	Request	Confirm
Poll request type	M	M
Poll response number	-	C (note)
Poll response percentage	-	C (note)
Poll response addresses	-	C (note)
Proprietary	O	O
NOTE: Depending on the value of the poll request type.		

5.2.2.10 ISI_REJECT

ISI_REJECT is an unconfirmed information flow:

- across relationship rd from FE2' to FE2 or FE2 to FE2';
- across relationship rc from FE2 to FE1 or FE1 to FE2;
- across relationship ra from FE1 to FE1' or FE1' to FE1;
- across relationship rf from FE2 to FE3 or FE3 to FE2;
- and across relationship rg from FE3 to FE3' or FE3' to FE3.

ISI_REJECT request/indication information flow shall be sent when a forward request can not be served by the group home SwMI or the linking controlling SwMI or when a set-up request cannot be served by an invoked SwMI (this can either be the originating SwMI or a participating SwMI).

Table 12 lists the service elements within the ISI_REJECT information flow.

Table 12: Content of ISI_REJECT

Service element	Request
Reject cause	M
Notification indicator	O (note)
Proprietary	O
NOTE: Element used by the SwMI for SS's to inform members of the group call of various events.	

5.2.2.11 ISI_RELEASE

ISI_RELEASE is a confirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rc from FE2 to FE1;
- across relationship ra from FE1 to FE1';
- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_RELEASE request/indication information flow shall be sent to clear the call at the originating SwMI or participating SwMI(s). The ISI_RELEASE request/indication information flow shall only be sent to a served SwMI after that SwMI has accepted a set-up request. ISI_RELEASE response/confirm information flow shall be sent as a response from the served SwMI that the call has been cleared.

Table 13 lists the service elements within the ISI_RELEASE information flow.

Table 13: Content of ISI_RELEASE

Service element	Request	Confirm
Disconnect type (full, partial, delay)	M	M
Disconnect cause	M	M
Notification indicator	O	-
Proprietary	O	O

5.2.2.12 ISI_REROUTE SETUP

ISI_REROUTE SETUP is a unconfirmed information flow:

- across relationship rd from FE2' to FE2;
- and across relationship rc from FE2 to FE1.

ISI_REROUTE SETUP request/indication information flow shall be sent by the group home SwMI when a linking controlling SwMI exist. The originating SwMI shall re-route the call to the indicated SwMI.

Table 14 lists the service elements within the ISI_REROUTE SETUP information flow.

Table 14: Content of ISI_REROUTE SETUP

Service element	Request
Controlling SwMI MNI	M
Temporary group member indication	M (note)
Notification indicator	O
Proprietary	O
NOTE: Indication to the originating SwMI that the calling user is temporarily a member of the called group.	

5.2.2.13 ISI_RESOURCE

ISI_RESOURCE is a confirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_RESOURCE request/indication information flow shall be sent to all participating SwMIs with temporary allocation of resources to evaluate if resources are available for transmission when a user has request to transmit. The ISI_RESOURCE response/confirm information flow is sent by participating SwMI(s) after evaluating if resources are available for transmission.

Table 15 lists the service elements within the ISI_RESOURCE information flow.

Table 15: Content of ISI_RESOURCE

Service element	Request	Confirm
Resource indicator	-	M
Notification indicator	O	-
Proprietary	O	O

5.2.2.14 ISI_SETUP

ISI_SETUP is a confirmed information flow:

- across relationship rd from FE2' to FE2;
- across relationship rc from FE2 to FE1;
- across relationship rf from FE2 to FE3;
- across relationship ra from FE1 to FE1';
- and across relationship rg from FE3 to FE3'.

The ISI_SETUP request/indication information flow enables the TETRA call to be set-up by the controlling SwMI to all SwMIs were members of the group call exist. The ISI_SETUP response/confirm information flow is sent by invoked SwMI(s) after evaluating if resources are available for set-up of a group call.

Table 16 lists the service elements within the ISI_SETUP information flows.

Table 16: Content of ISI_SETUP

Service element	Request	Confirm
Controlling SwMI MNI	M	-
Originating SwMI MNI	M	-
Participating SwMI MNI	M	-
Basic service information:		
Circuit mode service	M	M
Communication type	M	M
Data call capacity	C (note 1)	C (note 1)
Data service	C (note 1)	C (note 1)
Encryption flag	M	M
Speech service	C (note 1)	C (note 1)
Speech services chosen	C (note 2)	-
Security level at air interface	M	-
Call priority	M	-
Call ownership	M	-
Call time-out	M	-
SS-CLIR invoked for calling party	M	-
SS-CLIR invoked for the connected group	M	-
Called/Connected party identity	M	-
Critical called party identity	O	-
Calling party identity	M	-
Temporary group member indication	M (note 3)	-
Individual basic migration profile	C (note 4)	-
SS-migration profile	C (note 5)	
Resource allocation	-	M
Transmission request permission	M	-
Dispatcher acceptance	M	-
Notification indicator	O	-
Proprietary	O	O
NOTE 1:	Depending on the value of circuit mode service.	
NOTE 2:	May be sent if the service requested is a speech service.	
NOTE 3:	Indication to the originating SwMI that the calling user is temporarily a member of the called group.	
NOTE 4:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.	
NOTE 5:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12 [10].	

5.2.2.15 ISI_TX-CEASED

ISI_TX-CEASED is a unconfirmed information flow:

- across relationship rg from FE3' to FE3 or FE3 to FE3';
- and across relationship rf from FE3 to FE2 or FE2 to FE3.

ISI_TX-CEASED request/indication information flow shall be sent from a participating when a user wishes to cease transmission. ISI_TX-CEASED request/indication information flow shall be sent from the controlling SwMI to all participating SwMI(s) to indicate that the transmitting user has ceased transmission.

Table 17 lists the service elements within the ISI_TX-CEASED information flow.

Table 17: Content of ISI_TX-CEASED

Service element	Request
Requesting user identifier	M
Transmission request permission	C (note)
Notification indicator	O
Proprietary	O
NOTE: Shall only be valid when this PDU has been sent from the controlling SwMI.	

5.2.2.16 ISI_TX-CONTINUE

ISI_TX-CONTINUE is an unconfirmed information flow:

- across relationship rg from FE3' to FE3;
- across relationship rf from FE3 to FE2;
- and across relationship rd from FE2 to FE2'.

ISI_TX-CONTINUE request/indication information flow shall be sent from a participating SwMI when it wishes to continue with a withdrawn group call.

Table 18 lists the service elements within the ISI_TX-CONTINUE information flow.

Table 18: Content of ISI_TX-CONTINUE

Service element	Request
Participating SwMI MNI	M
Proprietary	O

5.2.2.17 ISI_TX-DEMAND

ISI_TX-DEMAND is a confirmed information flow:

- across relationship rg from FE3' to FE3;
- and across relationship rf from FE3 to FE2.

ISI_TX-DEMAND request/indication information flow shall be sent from a participating, when a member of the active group call wishes to transmit. ISI_TX-DEMAND response/confirm information flow shall be sent from the controlling SwMI when the transmission request is either queued or rejected.

Table 19 lists the service elements within the ISI_TX-DEMAND information flow.

Table 19: Content of ISI_TX-DEMAND

Service element	Request	Confirm
Requesting party identifier	M	M
SS-CLIR invoked for requesting party	M	-
TX demand priority	M	-
Encryption control	M	-
TX demand result	-	M
Notification indicator	M	-
Proprietary	O	O

5.2.2.18 ISI_TX-GRANTED

ISI_TX-GRANTED is an unconfirmed information flow:

- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_TX-GRANTED request/indication information flow shall be sent to the participating SwMI(s) to indicate that permission to transmit has been granted to a member of the active group call.

Table 20 lists the service elements within the ISI_TX-GRANTED information flow.

Table 20: Content of ISI_TX-GRANTED

Service element	Request
SS-CLIR invoked for transmitting party	M (note)
Transmission request permission	M
Transmission grant	M
Encryption control	M
Transmitting party identifier	O
Notification indicator	O
Proprietary	O
NOTE: Talking party identification shall be presented.	

5.2.2.19 ISI_TX-INTERRUPT

ISI_TX-INTERRUPT is an unconfirmed information flow:

- across relationship rf from FE2 to FE3;
- and across relationship rg from FE3 to FE3'.

ISI_TX-INTERRUPT request/indication information flow shall be sent to the participating SwMI(s) to indicate that transmission has been interrupted and granted to another user.

Table 21 lists the service elements within the ISI_TX-INTERRUPT information flow.

Table 21: Content of ISI_TX-INTERRUPT

Service element	Request
SS-CLIR invoked for transmitting party	M (note)
Transmission request permission	M
Transmission grant	M
Encryption control	M
Transmitting party identifier	M
Notification indicator	O
Proprietary	O
NOTE: Talking party identification shall be presented.	

5.2.2.20 ISI_TX-WAIT

ISI_TX-WAIT is an unconfirmed information flow:

- across relationship rg from FE3' to FE3;
- across relationship rf from FE3 to FE2;
- and across relationship rd from FE2 to FE2'.

ISI_TX-WAIT request/indication information flow shall be sent from a participating SwMI when it wishes to withdraw from an active group call.

Table 22 lists the service elements within the ISI_TX-WAIT information flow.

Table 22: Content of ISI_TX-WAIT

Service element	Request
Participating SwMI MNI	M
Proprietary	O

5.2.2.21 VERIFY_GROUP

VERIFY_GROUP is a confirmed information flow:

- across relationship re from FE2 to FE5.

The VERIFY_GROUP request information flow shall be sent by FE2 when routing and linking information is requested. The VERIFY_GROUP response information flow shall be used to return the requested information to FE2.

Table 23 lists the service elements within the VERIFY_GROUP information flow.

Table 23: Content of VERIFY_GROUP

Service element	Request	Confirm
Requesting Network (MCC+MNI)	M	M
Requested information indicator	M	M
GTSI	-	M
Location Information	-	O (note)
Group linking information	-	O (note)
NOTE: Depending on the value of requested information indicator.		

5.2.2.22 VERIFY_INDIV

VERIFY_INDIV is a confirmed information flow:

- across relationship rb from FE1 to FE4.

The VERIFY_INDIV request information flow shall be sent by FE1 when service information is required for the calling user. The VERIFY_INDIV response information flow shall be used to return the requested information to FE2.

Table 24 lists the service elements within the VERIFY_INDIV information flow.

Table 24: Content of VERIFY_INDIV

Service element	Request	Confirm
Requesting Network (MCC+MNI)	M	M
Requested information indicator	M	M
ITSI	-	M
Individual profile information	-	O (note)
Individual SS-profile information	-	O (note)
NOTE: Depending on the value of requested information indicator.		

5.3 Functional Entity Actions (FEAs)

The following FE actions shall occur at the points indicated in figures in subclause 5.2.1.

5.3.1 FEA of FE1

- 101 Detect an outgoing ISI group call request send from an originating SwMI CC application (FE1').
- 102 Send a VERIFY_INDIV req. to FE4 requesting the services profile of the calling MS and wait for a response.
- 103 Retrieve the service profile of the calling MS from FE4 and evaluate if the calling MS is a member of the group.
- 104 Obtain the routing information to the controlling SwMI, FE1. Send ISI_ORIGINATING SETUP req.ind. over the ISI to FE2 for further processing.
- 105 FE1 and FE2 are not collocated. Inform the originating SwMI FE1', that the call has been forwarded to the controlling SwMI, FE2, for further processing. A delay may occur.
- 106 Receive an ISI_SETUP req.ind. from FE2 requesting that a group call is to be set-up in this SwMI to all MSs attached to the called GTSI.
- 107 Forward the request to FE1' for evaluation.
- 108 Receive an ISI_SETUP resp. form FE1'.
- 109 Send an ISI_SETUP resp.conf. to FE2 confirming that the SwMI is able to participate in the call and ready for the through connection of the call. Wait for a response from FE2 on the through connection request.
- 110 Receive an ISI_CONNECT req.ind. from FE2 indicating that the group call is about to be through connected.
- 111 Inform FE1' to connect the calling user using the reserved resources. Initiate a FE3.
- 112 The group call set-up is to be delayed.
- 113 Inform FE1' of the delayed call with an ISI_RELEASE ind.

- 114 The reserved resources have been released. Call set-up has now been delayed.
- 115 Inform FE2 that call set-up has been delayed.
- 116 FE1 shall now be considered as a participating SwMI, FE3.
- 117 The group call request has been rejected by the group home SwMI.
- 118 Inform FE1' of the rejected group call request.
- 119 The group call set-up has been rejected. The call will be released.
- 120 Inform FE1' of the rejected call set-up with an ISI_RELEASE ind.
- 121 The reserved resources have been released. Release the ISI-path.
- 122 Inform FE2 that the ISI-path and group call has been released.
- 123 The group call request is merged to an active call.
- 124 An ISI_INFO req.ind. has been received from the controlling SwMI. Forward this information to FE1'.

5.3.2 FEA of FE1'

- 1001 Detect an outgoing group call request sent over the air interface. Analyse the calling MS's profiles and the called group identity (GTSI). Evaluate if the MS is allowed to initiate an ISI group call and whether or not the MS is allowed to use the requested tele or bearer service across the ISI.
- 1002 Forward the group call request to the originating FE1.
- 1003 Call control has been forwarded to the called groups home SwMI. Wait for a call set-up request.
- 1004 Evaluate if the necessary resources are available for a group call. If a group call can be performed in the originating SwMI(s), the necessary resources should be reserved.
- 1005 Send an ISI_SETUP resp. to FE1 confirming that the SwMI is able to participate in the call and ready for the through connection of the call. Wait for the through connection request.
- 1006 Connect calling user.
- 1007 The group call set-up is delayed. Release reserved resources. The ISI-path shall be maintained.
- 1008 The call set-up request has been rejected by the group home SwMI.
- 1009 The group call set-up is rejected. Release the reserved resources and the ISI-path.
- 1010 Evaluate the received call data (basic service information).
- 1011 An ISI_INFO PDU has been sent from the controlling SwMI. Inform the calling user.

5.3.3 FEA of FE2

- 201 Receive forwarded information as an ISI_ORIGINATING SETUP req.ind. from FE1 convey this information to FE2' to be evaluated.
- 202 Convey information to FE2' to be evaluated.
- 203 The called group has been evaluated by the group home or linking controlling SwMI. Set-up the group call to all indicated SwMIs.
- 204 Send a VERIFY_GROUP req. to FE5 requesting the called groups routing information.

- 205 Retrieve the routing information of the called group from FE5. Check if the called group is linked.
- 206 The called group is linked and the group home SwMI is not the linking controlling SwMI. FE1 and FE2 are not collocated. Inform the originating SwMI, FE1, to re-route the ISI-ORIGINATING SETUP req.ind. to the linking controlling SwMI. An ISI-REROUTE SETUP req.ind. is sent to the originating SwMI.
- 207 Inform the originating SwMI of the call time out for the set-up phase and of call status.
- 208 The called user group is linked and the group home SwMI is not the linking controlling SwMI. Analyse the called group number and obtain the routing information to the linking controlling SwMI. Send ISI_ORIGINATING SETUP req.ind. over the ISI to the new FE2 for further processing.
- 209 Inform the group home SwMI FE2', that the call has been forwarded to the linking controlling SwMI, new FE2, for further processing. A delay may occur.
- 210 Release the PISN connection oriented, call independent call between the linking controlling SwMI (new FE2) and the group home SwMI (FE2). The group home SwMI shall now be considered a participating SwMI, FE3.
- 211 If an ISI_ORIGINATING SETUP PDU has been received, then evaluate the set-up information received in the PDU. If services cannot be supported by the controlling SwMI, then the services shall be changed to supported values.
Send an ISI_SETUP req.ind. over the ISI to the SwMI(s) indicated by the routing information. The ISI_SETUP req.ind. shall also be sent to the originating SwMI. Wait for an ISI_SETUP resp.conf. from important or all invoked participating SwMIs (FE3s) and the originating SwMI.
- 212 Send an ISI_REJECT req.ind. over the ISI to the originating FE1. Release the PISN connection oriented, call related connection between the group home SwMI (FE2) and the originating SwMI (FE1).
- 213 Receive all ISI_SETUP resp.conf. and ISI_REJECT req.ind. from FE3s or FE1. Collect all responses and forward them to FE2'.
- 214 Receive an ISI_CONNECT req. from FE2'. Connect the group call to the FE3s and FE1 indicated in the ISI_CONNECT req.
- 215 Send an ISI_CONNECT req.ind. to the indicated SwMI(s).
- 216 Receive an ISI_RELEASE req. from a FE2'. Release the SwMIs (FE3s and FE1) indicated in the ISI_RELEASE req. If the call set-up is to be delayed the ISI-path shall be maintained.
- 217 Send the ISI_RELEASE req.ind. to the indicated SwMIs.
- 218 Inform FE2' that the group call is now delayed with an ISI-Release conf.
- 219 Receive an ISI_SETUP resp.conf. from the delaying FE3 confirming that the participating SwMI is able to set-up the call and requesting that the call is through connected.
- 220 Forward the ISI_SETUP conf. to FE2'.
- 221 Send an ISI_SETUP req.ind. to the delayed FE3s informing them that the group call set-up shall continue.
- 222 Receive an ISI_SETUP resp.conf. from all delayed SwMIs each of them confirming that the participating SwMI is able to set-up the call and requesting that the call is through connected.
- 223 An acknowledged group call is to be performed. The calling user has received permission to transmit before the polling request. However, permission to transmit can also be granted to the calling user during and after the polling request.
- 224 Send an ISI_POLL req.ind. to the FE3s informing that group members are to be polled.

- 225 Convey all received polling responses from FE3s back to FE2'.
- 226 The group call has been released. Complete the release of the ISI-path.
- 227 Inform FE2' that the release is complete.
- 228 The new B-channel received in the PSS1 CONNECT message is unacceptable. The call must be released.
- 229 AN ISI_TX_DEMAND req.ind. has been received from a participating SwMI. Evaluate if the transmission request conflicts with any currently granted transmission. Only one participating SwMI is awarded the right to transmit while other transmission requests shall be queued or rejected.
- 230 Send an ISI_RESOURCE req.ind. over the ISI to all participating FE3s with temporary resources.
- 231 Send a VERIFY_GROUP req. to FE5 requesting routeing information.
- 232 Retrieve the routeing information of the called group from FE5. Check FE5 if any new SwMIs (SwMIs not participating in the active group call) with group members are registered in the controlling SwMI.
- 233 Send an ISI_SETUP req.ind. over the ISI to the newly registered FE3s. Wait for ISI_SETUP resp.conf. from important or all FE3s.
- 234 Receive all ISI_SETUP resp.conf. and ISI_RESOURCE resp.conf. from FE3s. Collect all responses. Wait for an ISI_CONNECT or ISI_RELEASE PDU from FE2' if new SwMI(s) are being connected to the active call.
- 235 Evaluate if transmission can be granted to the requesting user.
- 236 Permission to transmit has been granted. Inform the granted user of the permission to transmit with an ISI_TX_GRANTED PDU. The parameter value, transmission grant, is set to 'transmission granted'. The other users involved in the call are also informed of the granted transmission by a ISI_TX_GRANTED PDU. The parameter value, transmission grant, is set to 'transmission granted to another user'. The ISI_TX_GRANTED PDU is group addressed, but it shall contain an individual address as to who has received transmission permission.
- 237 The transmission request has been queued. The requested user is informed of the queued request by setting the 'transmission request queued' parameter value in the ISI_TX_DEMAND resp.conf.
- 238 The transmission request has been rejected. The requested user is informed of the queued request by setting the 'transmission not granted' parameter value in the ISI_TX_DEMAND resp.conf.
- 239 A pre-emptive priority request has been received. Check if a user currently has transmission rights.
- 240 The transmitting user is interrupted by sending an ISI_TX_INTERRUPT req.ind. The parameter value, transmission grant, is set to 'transmission granted to another user'.
- 241 The other users involved in the call are informed of the interrupted transmission by sending an ISI_TX_INTERRUPT req.ind. The parameter value, transmission grant, is set to 'transmission granted to another user'. The ISI_TX_INTERRUPT PDU is group addressed, but it shall contain an individual address as to who has received transmission permission.
- 242 An ISI_TX_CEASED req.ind. has been received from a participating SwMI. Check if the PDU has been sent from the user that currently has transmission rights.
- 243 Transmission has seized. Check if requests to transmit have been queued in the controlling SwMI.
- 244 No requests to transmit has been queued in the controlling SwMI. Inform all users participating in the group call that transmission has ended.

- 245 Requests to transmit are queued in the controlling SwMI. Grant permission to transmit to the first user in queue with the highest priority transmission request.
- 246 A user wishes to withdraw a request to transmit in the controlling SwMI. Remove request. No response is sent back to the user.
- 247 AN ISI_TX_WAIT req.ind. has been received from a participating SwMI. Evaluate if the group call shall continue or be released.
- 248 The active group call is to continue without the withdrawn participating SwMI. No response is sent back to the withdrawn SwMI.
- 249 A withdrawn SwMI wishes to continue with the active group call. If a user located in the withdrawn SwMI was transmitting at the time of withdrawal, permission to transmit shall not automatically be given to this user upon continuation in the active call. Users located in the withdrawn participating SwMI may request permission to transmit during withdrawal. However, if a queuing mechanism is not implemented in the controlling SwMI for transmission control, all transmission request sent from a withdrawn SwMI shall be rejected. Transmission permission shall not be granted to a user in a withdrawn SwMI.
- 250 The withdrawn participating SwMI has rejoined the active group call. No response is sent back to the SwMI.
- 251 The controlling SwMI wishes to send information out to the participating SwMI(s).
- 252 A request is received from, the group home or linking controlling SwMI to perform call restoration.
- 253 Check if an ISI-path exist to the new participating SwMI.
- 254 Extend the group call to the new participating SwMI.
- 255 The call has been established in the new participating SwMI.
- 256 ISI-path exist at the new participating SwMI. Check in the group database, FE5, if the migrated user was the last member of the group at the old SwMI.
- 257 Check if the last user has migrated from the old participating SwMI.
- 258 The last user has migrated. Release the ISI-path to the old participating SwMI.
- 259 The last user has not migrated from the old participating SwMI. Call restoration is now complete.
- 260 The old participating SwMI has been released. Call restoration is now complete.
- 261 The controlling SwMI wishes to terminate the group call, e.g. resources are required for another call, failed service modification or the call time out timer has timed out.
- 262 The controlling SwMI shall inform all participating SwMI(s) of the call disconnection in an ISI_RELEASE req.ind. Reason for disconnection shall be sent along in the PDU.
- 263 Receive all ISI_RELEASE resp.conf. from FE3s. Collect all responses and forward them to FE2'.
- 264 Release the PISN connection oriented call related call, between the controlling SwMI (FE2) and all participating SwMI(s) (FE3).
- 265 A participating SwMI wishes to be released from the group call. Inform the FE2' for evaluation.
- 266 The call owner has initiated disconnection of the group call. Inform FE2' of the disconnection.
- 267 The controlling SwMI shall inform the release requesting SwMI of the call disconnection in an ISI_RELEASE req.ind. Reason for disconnection shall be sent along in the PDU.
- 268 This ANF-ISIGC entity is to interact with an active ANF-ISIGC entity.

- 269 A user who is not a member of the group call wishes to join the active group call.
- 270 Inform the originating SwMI that the group call request is to be merged with an active call. The calling user (merged user) will be indicated in the ISI-SETUP req.ind. The calling party information element shall indicate the current transmitting party.
- 272 An ISI path already exist to the SwMI. Inform the SwMI of which call the migrated user may restore and if the migrated user is a temporarily a member of the called group.
- 273 Forward call restoration information to the call control application (FE2').

5.3.4 Functional entity actions of FE2'

- 2001 Receive forwarded information as an ISI_ORIGINATING SETUP ind. from FE2 requesting that a group call be made to all MSs attached to the called GTSI. Evaluate if the group call can be performed. If the group call has been initiated by a user which is not a member of the group, then the group home SwMI shall evaluate the user profile of the called group. The group profile must indicate that a group call, made by a foreign user, can be initiated.
- 2002 Request FE2 to set-up the group call to all MSs attached to the called GTSI.
- 2003 The call set-up request is re-routed to the linking controlling SwMI.
- 2004 Receive an ISI_SETUP conf. from FE2 were all received set-up responses are collected. Evaluate the received responses. FE2' may at any time choose to proceed with the set-up towards the active phase although not all participating SwMIs have responded or participating SwMIs wish to delay the call.
- 2005 Send an ISI_CONNECT req. to FE2 requesting that the group call be through connected..
- 2006 The group call is to be delayed. Request FE2 to release the indicated SwMIs.
- 2007 No further actions are taken for this call. Wait for a response from the delaying SwMI(s).
- 2008 A partial group call is to be set-up. Send an ISI_CONNECT req. to FE2 requesting that the group call be through connected.
- 2009 Request FE2 to interact with an active ANF-ISIGC. A individual who is not a member of the group is to join the active group call.
- 2010 Resolve status on the existing call.
- 2011 Merge the calling user into the call.
- 2012 A group call can not be made to the called group. Request FE2 to reject the group call request.
- 2013 A group call can not be made to the called group. Request FE2 to release the group call request.
- 2014 The group home SwMI Mobility Management (MM) application has requested the Call Control (CC) application to perform call restoration.
- 2015 Inform FE2 to perform call restoration to a new participating SwMI.
- 2016 A participating SwMI wishes to be released from the group call. Evaluate if the group call should continue without the participating SwMI or if the call should be released.
- 2017 The call is to continue without the release requesting SwMI. Inform the SwMI that it shall release from the call.
- 2018 The call owner has initiated disconnection of the group call. Inform FE2 to send an ISI_RELEASE req.ind. to all indicated participating SwMI(s).

2019 Release is complete.

2020 Call restoration information has been received from the migrated user's old visiting SwMI.

5.3.5 FEA of FE3

301 Receive an ISI_SETUP req.ind. from FE2 requesting that a group call is to be set-up in this SwMI to all MSs attached to the called GTSI.

302 Forward the request to FE3' for evaluation.

303 Receive an ISI_SETUP resp. form FE3'.

304 Send an ISI_SETUP resp.conf. to FE2 confirming that the SwMI is able to participate in the call and ready for the through connection of the call. Wait for a response from FE2 on the through connection request.

305 Receive an ISI_REJECT req. from FE3'.

306 Forward the rejected call set-up to FE2. Wait for a response from FE2.

307 Receive an ISI_CONNECT req.ind. from FE2 indicating that the group call is about to be through connected.

308 Inform FE3' to connect members of the group call using reserved resources.

309 FE3 should co-ordinate the call identity with FE1 and then connect non active group members of the group call using reserved resources.

310 The group call set-up is to be delayed.

311 Inform FE3' of the delayed call with an ISI_RELEASE ind.

312 The reserved resources have been released. Call set-up has now been delayed.

313 Inform FE2 that call set-up has been delayed.

314 Receive an ISI_POLL req.ind. from FE2 indicating that group members must be polled.

315 Request the participating SwMI CC application to poll group members in the active call.

316 Result of polling request received.

317 Inform FE2 of the polling result in an ISI_POLL resp.conf. PDU.

318 The group call set-up is to be released.

319 Inform FE3' of call release with an ISI_RELEASE ind.

320 The reserved resources have been released. Release the ISI-path.

321 Inform FE2 that the ISI-path and group call has been released.

322 The indicated B-channel is not available. A new B-channel is reserved by the participating SwMI.

323 A user wishes to transmit. The request to transmit is forwarded to the controlling SwMI for evaluation.

324 Receive an ISI_RESOURCE req.ind. from FE2 requesting the SwMI to evaluate if resources are available for transmission.

325 Forward the request to FE3' for evaluation.

- 326 Receive an ISI_RESOURCE resp. form FE3'.
- 327 Send an ISI_RESOURCE resp.conf. to FE2 confirming that the SwMI is able to participate. Wait for a transmission grant from FE2.
- 328 An ISI_TX_GRANTED or an ISI_TX_DEMAND PDU has been received from the controlling SwMI. Inform FE3' of the transmission request result.
- 329 An ISI_TX_INTERRUPT req.ind. has been received. Interrupt transmission.
- 330 An ISI_TX_INTERRUPT req.ind. has been received from the controlling SwMI. Inform the users participating in the group call that transmission has been interrupted and granted to another user.
- 331 A user has ended transmission or wishes to withdraw a request for transmission. The controlling SwMI is informed with an ISI_TX_CEASED req.ind.
- 332 Transmission has seized. No user has currently received permission to transmit.
- 333 A participating SwMI wishes to withdraw from the active call. The controlling SwMI is informed of the withdrawal.
- 334 A participating SwMI wishes to continue with an active group call. The controlling SwMI is informed with an ISI_TX_CONTINUE req.ind.
- 335 An ISI_INFO req.ind. has been received from the controlling SwMI. Forward this information to FE3'.
- 336 Inform the linking controlling SwMI to perform call restoration.
- 337 A request to connect an active group call has been received.
- 338 Inform the new participating SwMI CC application, FE3', of the active group call.
- 339 Inform the controlling SwMI that an ISI-path exist to the new participating SwMI and that the active call has been restored in the new participating SwMI.
- 340 Send an ISI_CALL RESTORATION resp.conf. to FE2.
- 341 Receive an indication to remove the active ISI-path and group call connections.
- 342 Forward this information to the CC application of the SwMI, FE3'.
- 343 The group call has been released. Release the ISI-path.
- 344 Inform FE2 that the ISI-path and group call has been released.
- 345 An ISI-RELEASE req.ind. has been received. Inform the participating SwMI call control application that the call is to be disconnected immediately.
- 346 Inform the controlling SwMI that the call has been disconnected in the participating SwMI.
- 347 The participating SwMI wishes to be released from the group call, e.g. resources are required for another call or the call time out timer has timed out.
- 348 The participating SwMI shall inform the controlling SwMI(s) of the call disconnection in an ISI_DISCONNECT req.ind. Reason for disconnection shall be sent along in the PDU.
- 349 The call owner has initiated a disconnect of the entire group call.
- 350 Call restoration information is received for the migrated user. Inform FE3'.
- 351 Call restoration has been performed towards the migrated user.

- 352 The group call is to be restored to the migrated user in the new visiting SwMI.
- 353 Fetch call information.
- 354 Forward the call information necessary for call restoration in the group home SwMI.
- 355 Release the PISN connection oriented, call independent connection between the migrated user's home SwMI and the old visiting SwMI.
- 356 Receive an ISI_DELAY req. from FE3'.
- 357 Forward the delay request to FE2. Wait for a response from FE2.

5.3.6 Functional entity actions of FE3'

- 3001 Evaluate if the necessary resources are available and that group members exist in the participating SwMI. If a group call can be performed in the participating SwMI, the necessary resources should be reserved.
- 3002 Send an ISI_SETUP resp. to FE3 confirming that the SwMI is able to participate in the call and ready for the through connection of the call. Wait for through connection request.
- 3003 Connect group members using reserved resources.
- 3004 Send an ISI_DELAY req. to FE3 indicating that the SwMI wishes the call set-up to be delayed.
- 3005 Send an ISI_REJECT req. to FE3 indicating that the SwMI cannot support the group call set-up.
- 3006 The group call set-up is delayed. Release reserved resources. The ISI-path shall be maintained.
- 3007 The delaying SwMI now wishes to continue with call set-up. Inform the controlling SwMI that FE3 can now participate in the call.
- 3008 The participating SwMI CC application (FE3') is requested to poll all indicated users.
- 3009 The result of polling is sent back to FE3.
- 3010 The group call set-up to be released. Release the reserved resources and the ISI-path.
- 3011 Transmission is granted to the requesting user. Inform the requesting user and members of the group call of granted transmission.
- 3012 The transmission request has either been queued or rejected. May inform the requesting user of transmission request result.
- 3013 The current transmission is interrupted. Inform the transmitting user and the members of the group call of the interruption. Inform the requesting user that transmission is granted.
- 3014 Inform group members that transmission has seized.
- 3015 An ISI_INFO PDU has been sent from the controlling SwMI. Inform members of the group call.
- 3016 The group home SwMI Mobility Management application has requested the Call Control (CC) application to perform call restoration.
- 3017 The group is linked to another group and this SwMI is not the linking controlling SwMI. The linking controlling SwMI shall perform call restoration.
- 3018 Establish group call in the new participating SwMI.
- 3019 Group call can now be restored in the new participating SwMI. The call is restored to the migrated user.

3020 Release all used and reserved resources in the group call.

3021 Inform FE3 that the group call has been released.

3022 The group call is to be disconnected. Release all used and reserved resources. Inform the members of the group call of the disconnection.

3023 The members of the group call have been disconnected and all resources are released.

3024 Evaluate if the necessary resources are available and that group members exist in the participating SwMI. If transmission can be performed in the participating SwMI(s), the necessary resources should be reserved.

3025 Send an ISI_RESOURCE resp. to FE3 confirming that the SwMI is able to participate. Wait for transmission granted.

3026 Fetch call information for the migrated user.

5.3.7 Functional entity actions of FE4

401 Receive a VERIFY_INDIV req. from FE1' indicating a query for service profile and attributes of an individual MS. Retrieve the requested information from the database.

402 Send a VERIFY_INDIV ind. back to the FE1' with the result of the service profile query, i.e. either the detailed individual MS information or a rejection of the VERIFY_INDIV req.ind.

5.3.8 Functional entity actions of FE5

501 Receive a VERIFY_GROUP req. from FE2 indicating a query for the user profile and the routing information of the called group. Retrieve the requested information from the database.

502 Send a VERIFY_GROUP ind. to FE2 containing the user profile and routing information of the called group including, if appropriate, the assigned VGSSI or GSSI for the participating SwMI.

503 Receive a VERIFY_GROUP req. from FE2 indicating a query for migration information of the called group. Retrieve the requested information from the database.

504 Send a VERIFY_GROUP ind. to FE2 containing the migration information of the called group.

6 ANF-ISIGC stage 3 specification

6.1 ANF-ISIGC description

See clause 4.

6.2 ANF-ISIGC operational requirements

The requirements specific for each type of SwMI are stated below. In addition, each SwMI shall comply with the requirements stated in:

- annex ZA of ISO/IEC 11572 [12], for the support of the PSS1 message segmentation/re-assembly procedures; and
- subclause 8.4 of ETS 300 392-3-1 [4], for the support of the ROSE protocol.

6.2.1 PISN connection oriented call related connection

6.2.1.1 Requirements on the originating SwMI

6.2.1.1.1 PSS1 SETUP message

The originating SwMI shall invoke an ANF-ISIGC entity to support a connection oriented call related connection used for sending a forward group call set-up request. The invoked ANF-ISIGC entity shall support call related establishment and clearing procedures as for an originating PINX, as specified in ISO/IEC 11572 [12] (subclause 10.5). In addition, the following rules shall apply for the information elements of the PSS1 SETUP message:

- the sending complete information element shall be included because the called party number is always complete;

NOTE 1: For calls originating from an incoming gateway, the gateway application in the originating SwMI must send the called party identity en-bloc.

- the bearer capability information element shall be encoded with information transfer capability code equal to unrestricted digital information, and an information transfer rate code equal to 64 kbit/s;
- no progress indicator information element shall be included;
- the calling party number information element shall be included. The corresponding number shall be a PISN number identifying the originating SwMI, or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the calling party information element shall not include octet 3a);

NOTE 2: The type of number associated to the calling party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

NOTE 3: The calling party identity (identity identifying the calling user) is part of the complementary TETRA forward information (see table 25).

- no calling party subaddress information element shall be included;
- the number included in the called party number information element shall be a PISN number identifying the called group's home SwMI or the controlling SwMI or one of its entities. The PISN number for the controlling SwMI shall be used when the call has been re-routed. Thus its numbering plan identification shall be equal to either private numbering plan or unknown;

NOTE 4: The type of number associated to the called party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

- no called party subaddress information element shall be included;
- no lower layer or high layer compatibility information elements shall be included;
- and the transit counter information element, defined in ETS 300 172 [1], may be included.

Generic procedures for call related signalling of supplementary services to and from an End PINX, specified in ISO/IEC 11582 [14], shall apply for sending or receiving TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information elements in the PSS1 SETUP message.

6.2.1.2 Requirements on the group home SwMI

6.2.1.2.1 PSS1 RELEASE COMPLETE message

The group home SwMI shall release the call related connection to the originating when the group home SwMI is not the controlling SwMI and the call is to be re-routed or if the group home SwMI cannot accept the incoming group call. A PSS1 RELEASE COMPLETE message shall be sent to the originating SwMI. The following rules shall apply for the cause information element of the PSS1 RELEASE COMPLETE message:

- the location area shall be set to private network serving the local user;
- the cause value shall be set to normal, unspecified when the call is to be re-routed.

6.2.1.3 Requirements on the controlling SwMI

6.2.1.3.1 PSS1 RELEASE COMPLETE message

The controlling SwMI shall release the call related connection to the originating SwMI when the controlling SwMI cannot accept the incoming group call. A PSS1 RELEASE COMPLETE message shall be sent to the originating SwMI. The following rules shall apply for the cause information element of the PSS1 RELEASE COMPLETE message:

- the location area shall be set to private network serving the local user.

6.2.1.3.2 PSS1 SETUP message

The controlling SwMI shall use the invoke ANF-ISIGC entity (see subclause 6.2.1.3.3) to support call establishment and call clearing procedures as for an Originating PINX, as specified in ISO/IEC 11572 [12]. In addition, the following rules shall apply for the information elements of the PSS1 SETUP message:

- the sending complete information element shall always be included. The complete called number shall always be received from the originating SwMI in the forward group call set-up request;
- the bearer capability information element shall be encoded with information transfer capability equal to unrestricted digital information, and an information transfer rate equal to 64 kbit/s;
- no progress indicator information element shall be included;
- the calling party number information element shall be included. The corresponding number shall be a PISN number identifying the participating SwMI or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the calling party information element shall not include octet 3a);

NOTE 1: The type of number associated to the calling party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

- no calling party subaddress information element shall be included;
- the number included in the called party number information element shall be a PISN number identifying the controlling SwMI or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown;

NOTE 2: The type of number associated to the called party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

- no called party subaddress information element shall be included;
- no lower layer or high layer compatibility information elements shall be included;
- and the transit counter information element, defined in ETS 300 172 [1], may be included.

Generic procedures for the call related control of supplementary services, specified in ISO/IEC 11582 [14] for an End PINX, shall apply for sending or receiving TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information element in the PSS1 SETUP message.

6.2.1.3.3 PSS1 CONNECT message

The controlling SwMI shall invoke an ANF-ISIGC entity to support call establishment and call clearing procedures as for an terminating PINX, as specified in ISO/IEC 11572 [12], when a call set-up request is received from the originating SwMI. When the controlling SwMI has accepted the call set-up request, a PSS1 CONNECT message shall be sent to the originating SwMI as a response to the PSS1 SETUP message. The following rules shall apply for the contents of the connected number and connected subaddress information elements in the PSS1 CONNECT message:

- the connected number information element shall be included. The connected number shall correspond to the controlling SwMI or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the connected information element shall not include octet 3a);
- no connected party subaddress information element shall be included;
- no progress indicator should be included, since no tones or announcements are sent, and it shall not be considered that an interworking situation occurs for inter-TETRA group calls. For the same reason, no PSS1 PROGRESS message should be sent;
- the channel indication information element may indicate a new information channel as described in subclause 10.1.2 of ISO/IEC 11572 [12].

Generic procedures for the call related control of supplementary services, specified in ISO/IEC 11582 [14] for an End PINX, shall apply for receiving or sending TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information elements in the PSS1 CONNECT messages.

6.2.1.4 Requirements on the participating SwMI

6.2.1.4.1 PSS1 RELEASE COMPLETE message

The participating SwMI shall release the call related connection to the controlling SwMI when the participating SwMI cannot accept the incoming group call. A PSS1 RELEASE COMPLETE message shall be sent to the controlling SwMI. The following rules shall apply for the cause information element of the PSS1 RELEASE COMPLETE message:

- the location area shall be set to private network serving the local user.

6.2.1.4.2 PSS1 CONNECT message

The participating SwMI shall invoke an ANF-ISIGC entity to support call establishment and call clearing procedures as for an terminating PINX, as specified in ISO/IEC 11572 [12]. When the participating SwMI is aware that the called group can be connected, a PSS1 CONNECT message shall be sent to the controlling SwMI as a response to the PSS1 SETUP message. The following rules shall apply for the contents of the connected number and connected subaddress information elements in the PSS1 CONNECT message:

- the connected number information element shall be included. The connected number shall correspond to the connected number received in the PSS1 SETUP message. The connected numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the connected information element shall not include octet 3a);
- no connected party subaddress information element shall be included;

- no progress indicator should be included, since no tones or announcements are sent, and it shall not be considered that an interworking situation occurs for inter-TETRA group calls. For the same reason, no PSS1 PROGRESS message should be sent;
- the channel indication information element may indicate a new information channel as described in subclause 10.1.2 of ISO/IEC 11572 [12].

Generic procedures for the call related control of supplementary services, specified in ISO/IEC 11582 [14] for an End PINX, shall apply for receiving or sending TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information elements in the PSS1 CONNECT messages.

6.2.1.5 Requirements on the originating SwMI with PSTN/ISDN/PISN incoming gateway

6.2.1.5.1 PSS1 SETUP message

The originating SwMI shall invoke an ANF-ISIGC entity to support call establishment and call clearing procedures as for an incoming gateway PINX, as specified in ISO/IEC 11572 [12]. In addition, the following rules shall apply for the information elements of the PSS1 SETUP message:

- the sending complete information element shall be included. The complete called number shall always be sent from the originating SwMI in the forward group call set-up request;
- the bearer capability information element shall be encoded with information transfer capability equal to unrestricted digital information, and an information transfer rate equal to 64 kbit/s;
- one, two or three progress indicator information elements shall be included, depending on network sending the SETUP message. The following rules shall apply for the progress indicator numbers for the different networks:
 - for a PSTN call the following progress description numbers shall be used:
 - a CCITT progress description number 1 "call is not end-to-end ISDN, further call progress information may be available in-band";
 - an ISO/IEC progress description number 16 "interworking with a public network";
 - and, if the PSTN access line interface used at the gateway cannot deliver a release signal (e.g. standard PSTN extension line - with no battery reversal signal), an ISO/IEC progress description number 17 "interworking with a network unable to supply a release signal" (or an ISO/IEC progress description number 18 or 19, depending on whether it can supply a release signal after answer, but not before, or before answer, but not after);
 - for a public ISDN call, an ISO/IEC progress description number 16 "interworking with a public ISDN" shall be used;
 - and for a PISN call: an ECMA progress description number 20 "interworking with a another private network" shall be used.
- the calling party number information element shall be included. The corresponding number shall be a PISN number identifying the gateway SwMI or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the calling party information element shall not include octet 3a);

NOTE 1: The type of number associated to the calling party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

NOTE 2: The calling party identity (identity identifying the calling user) is part of the complementary TETRA forward information (see table 25).

- no calling party subaddress information element shall be included;
- the number included in the called party number information element shall be a PISN number received from a PSTN, public ISDN or PISN network identifying the called group's home SwMI or the controlling SwMI or one of its entities. The PISN number for the controlling SwMI shall be used when the call has been re-routed. Thus its numbering plan identification shall be equal to either private numbering plan or unknown;

NOTE 3: The type of number associated to the called party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

- no called party subaddress information element shall be included;
- no lower layer or high layer compatibility information elements shall be included;
- and the transit counter information element, defined in ETS 300 172 [1], may be included.

Generic procedures for the call related control of supplementary services, specified in ISO/IEC 11582 [14] for an originating PINX, shall apply for sending or receiving TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information element in the PSS1 SETUP message.

6.2.2 PISN connection oriented, call independent connection

A PISN connection oriented, call independent connection shall be used when a call restoration request is received in a SwMI that is not participating in the group call. This situation can occur when a migrated user's home SwMI differs from the controlling SwMI or the group home SwMI is not the controlling SwMI and this SwMI does not have any called group members located in the SwMI.

The SwMI receiving the call restoration request shall then invoke an ANF-ISIGC entity to support a connection oriented call unrelated connection used for sending the ISI-CALL RESTORE INITIATE PDU. The invoked ANF-ISIGC entity shall support call unrelated establishment and clearing procedures as for an originating PINX, as specified in ISO/IEC 11582 [14] (subclause 7.3.1). In addition, the following rules shall apply for the information elements of the PSS1 SETUP message:

- the sending complete information element shall be included when the called party number is complete;

NOTE 1: Although it is expected that the called party number be sent en-bloc, the use of (PISN) overlap sending (see subclauses 10.1.1, 10.1.3 and 10.1.4 of ISO/IEC 11572 [12] for the corresponding descriptions) is not prevented by the present document.

- no progress indicator information element shall be included;
- the calling party number information element shall be included. The corresponding number shall be a PISN number identifying either the migrated user's home SwMI, the old visiting SwMI or the group home SwMI, or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown. No presentation or screening indicators shall be included (i.e. the calling party information element shall not include octet 3a);

NOTE 2: The type of number associated to the calling party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

NOTE 3: The restoring party identity (identity identifying the migrated user) is part of the complementary TETRA restore information (see table 54).

- no calling party subaddress information element shall be included;
- the number included in the called party number information element shall be a PISN number identifying either the old visiting SwMI or the controlling SwMI, or one of its entities. Thus its numbering plan identification shall be equal to either private numbering plan or unknown;

NOTE 4: The type of number associated to the called party number information element is defined as shown in table 26 of ISO/IEC 11572 [12].

- no called party subaddress information element shall be included;
- no lower layer or high layer compatibility information elements shall be included;
- and the transit counter information element, defined in ETS 300 172 [1], may be included.

Generic procedures for call independent signalling of supplementary services to and from an End PINX, specified in ISO/IEC 11582 [14], shall apply for sending or receiving TETRA specific messages or TETRA information complementary to PSS1 basic call messages. Such messages or complementary information shall be encoded as ROSE operation Invoke APDUs in facility information elements. Notably, the encoded APDUs shall be sent in facility information elements in the PSS1 SETUP message.

6.3 ANF-ISIGC coding requirements

TETRA specific messages or TETRA information complementary to PSS1 basic call messages shall be sent using an Invoke APDU of the ROSE operation `tetraSiMessage` defined in table 10 of ETS 300 392-3-1 [4]. This table has been reproduced in the informative annex D.

More precisely:

- the TETRA specific messages or TETRA information complementary to PSS1 basic call messages shall be the TETRA PDUs defined in subclause 6.3.1; and
- those PDUs shall be included in the `tetraMessage` data element of the ROSE operation `tetraSiMessage`.

The resulting ROSE APDU shall be sent in a facility information element in the relevant PSS1 message (see ISO/IEC 11582 [14] clause 10).

6.3.1 TETRA ANF-ISIGC PDUs

The information contained in the following PDU descriptions shall be encoded using the same rule as defined in subclause 14.7 of ETS 300 392-2 [3] (for TETRA air interface PDUs).

NOTE 1: As a general rule, the definition of these PDUs have been made on the basis of the corresponding air interface downstream messages. In other words, the sending SwMI is preparing the corresponding message to be sent by the other SwMI on its air interface.

Thus generally these PDUs include the same information elements as air interface messages. However, no facility information elements are included in those PDUs since ANF-ISISS is used instead (see clauses 9 and 10 of ETS 300 392-9 [8]).

NOTE 2: Even when only one TETRA PDU type has been defined for inclusion in a given PSS1 message (e.g. in the CONNECT ACK message), the information element PDU type has been included in this TETRA PDU. The reason for this, is to allow the possibility of defining other TETRA PDU types in the same PSS1 message in the future. Additionally it might ease the processing of these PDUs by the destination SwMI call control application.

The definitions of all possible TETRA PDUs, in the various PSS1 messages, are given below.

6.3.1.1 PISN connection oriented call related connection

6.3.1.1.1 TETRA PDU giving complementary information in the PSS1 SETUP message

6.3.1.1.1.1 TETRA PDU sent by the originating SwMI - used to forward a call set-up request

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 SETUP message sent by the originating SwMI shall be as defined in table 25.

Table 25: Contents of TETRA PDU in the PSS1 SETUP message sent by the originating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-ORIGINATING SETUP
Area Selection	8	1	ANF	M	
Originating SwMI MNI	24	1	ANF	M	
Basic service information	8	1	CCAp	M	
Speech service requested	3	1	CCAp	C	note 1
Request to transmit/send data	1	1	CCAp	M	
Call priority	4	1	CCAp	M	
Called party type identifier	2	1	CCAp	M	
Called party SSI	24	1	CCAp	M	note 2
Called party extension	24	1	CCAp	M	note 2
SS-CLIR invoked for calling party	1	1	SS	M	
Group attachment indicator	1	1	CCAp	M	note 3
Calling party type identifier	2	1	CCAp	M	
Calling party SSI	24	1	CCAp	M	note 4
Calling party extension	24	1	CCAp	M	note 4
External subscriber number length	5	1	CCAp	M	note 5
External subscriber number digits	variable	1	CCAp	C	note 6
External subscriber number parameters	12	1	CCAp	C	note 7
Temporary group member indication	1	2	CCAp	C	note 8
Speech services supported	5	2	CCAp	O	note 9
Proprietary		3	-	O	

NOTE 1: Conditional on the binary value of the information sub-element 'circuit mode type' in the information element 'basic service information' being equal to 0 (i.e. the call requested is a speech call).

NOTE 2: This element shall always indicate the actual called group identity and not a possible linked group identity if the called group is linked.

NOTE 3: This information element shall indicate whether the calling user is attached to the called group in the visited SwMI.

NOTE 4: In the case of an external incoming call, the calling party SSI and the calling party extension shall be those of the incoming gateway SwMI.

NOTE 5: Shall be equal to 00000₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.

NOTE 6: The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 2), i.e. this information element shall be conditional on the value of N.

NOTE 7: This information element shall be present only when the external subscriber number length value N is not 00000₂.

NOTE 8: This information element shall only be present when the group home SwMI has indicated that the calling user is temporarily a member of the called group.

NOTE 9: This element enables future additions to the TETRA air interface CODEC.

NOTE 1: The originating SwMI MNI has been included in the definition of the TETRA PDU in table 25 to ease the identification of the originating SwMI by the group home SwMI by or the linking controlling SwMI.

The SwMI MNI identifications are necessary:

- for enforcing security mechanisms agreed between operators; or
- to identify whether or not a proprietary feature can be used over the ISI.

6.3.1.1.2 TETRA PDU sent by the controlling SwMI - used for setting up a group call

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 SETUP message sent by the controlling SwMI shall be as defined in table 26.

Table 26: Contents of TETRA PDU in the PSS1 SETUP message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark

Critical user list	variable	2	CCAp	C	note 12
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	Conditional on the binary value of the information sub-element 'circuit mode type' in the information element 'basic service information' being equal to 0 (i.e. the call requested is a speech call).				
NOTE 2:	This information element is defined as the information element 'Called party type identifier' in the standard ETS 300 392-2 [6].				
NOTE 3:	In the case of an external incoming call, the calling party SSI and the calling party extension shall be those of the incoming gateway SwMI.				
NOTE 4:	Shall be equal to 00000 ₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.				
NOTE 5:	The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 3), i.e. this information element shall be conditional on the value of N.				
NOTE 6:	This information element shall be present only when the external subscriber number length value N is not 00000 ₂ .				
NOTE 7:	Indication to the originating SwMI that the calling user is temporarily a member of the called group.				
NOTE 8:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.				
NOTE 9:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12.				
NOTE 10:	The information element is set when SS-CAD has been invoked for a call and the dispatcher has accepted the call set-up. The information element is used to prevent subsequent invocations of SS-CAD.				
NOTE 11:	Equal to 0 when no critical users are identified for the group call.				
NOTE 12:	This information element shall be conditional on the information element 'Number of critical users' when this value differs from 0. Shall be repeated as a set according to the value of the information element 'Number of critical users' when this value is larger than 1.				

NOTE 2: The originating SwMI MNI has been included in the definition of the TETRA PDU in table 26 to ease the identification of the originating SwMI by the controlling SwMI.

The SwMI MNI identifications are necessary:

- for enforcing security mechanisms agreed between operators; or
- to identify whether or not a proprietary feature can be used over the ISI.

The calling party SSI and extension shall correspond to the transmitting party when call set-up is initiated by the controlling SwMI towards SwMI(s) currently not participating in the active group call.

6.3.1.1.1.3 TETRA PDU sent by the controlling SwMI - used for call restoration

When a member of a group call migrates during the call, the call control application in that users home SwMI shall be informed, by an ANF-ISIMM entity, about migration. This information shall include the PISN number to be used for establishing a connection between the controlling SwMI and the new SwMI. A new ANF-ISIGC connection shall only be established if no connection exists for this call to the new SwMI. This occurs when the new SwMI does not coincide with any of the existing participating SwMIs or the controlling SwMI.

If an ANF-ISIGC connection between the controlling SwMI and the new SwMI does not exist, then this connection shall be set-up by the ANF-ISIGC entity for this call in the controlling SwMI. If the existing call is an inter-TETRA call, the ANF-ISIGC entity will have already been invoked in the controlling SwMI. If the established call is an intra-TETRA call, an ANF-ISIGC entity shall be invoked to establish the ANF-ISIGC connection to the new SwMI. In both cases, the controlling SwMI shall send a PSS1 SETUP message containing a TETRA PDU. The contents and the encoding of which shall be as defined in table 27.

NOTE 3: If the group home SwMI does not coincide with the controlling SwMI, an ISI-CALL RESTORE INITIATE PDU shall be sent from the group home SwMI to the controlling SwMI (see table 35) when a request to perform call restoration has been given by the ANF-ISIMM entity.

NOTE 4: If a ANF-ISIGC connection exist to the new visited SwMI, an ISI-CALL RESTORE INFO PDU (see table 36) is sent to the SwMI to indicate call restoration conditions for the migrated user.

Table 27: Contents of TETRA PDU in PSS1 SETUP message sent by the controlling SwMI in the case of migration to a new participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-CALL RESTORATION

Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	This information element is defined as the information element 'Called party type identifier' in the standard ETS 300 392-2 [3].				
NOTE 2:	This information element indicates if the restoring user is temporarily a member of the called group.				
NOTE 3:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.				
NOTE 4:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12 [10] when valid at this point in the call.				

To indicate that the new SwMI can perform call restoration when requested by the migrated user, the new SwMI shall send a PSS1 CONNECT message containing the TETRA PDU as defined in table 31. Call restoration between the migrated user and the new SwMI shall then occur when requested by the migrated user (U-CALL RESTORE over the air interface).

6.3.1.1.2 TETRA PDU giving complementary information in the PSS1 CONNECT message

6.3.1.1.2.1 TETRA PDU sent by the controlling SwMI - used to send call information

When a forward group call request has been queued or the controlling SwMI wishes to inform the originating SwMI of call time-out for the set-up phase before group call set-up, the PSS1 CONNECT message shall include a TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 28.

Table 28: Contents of TETRA PDU sent in the PSS1 CONNECT message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-INFO
Call time-out, set-up phase	3	2	CCAp	O	
Call status	3	2	CCAp	O	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	

6.3.1.1.2.2 TETRA PDU sent by the originating or a participating SwMI - used as a call set-up response

To acknowledge the TETRA PDU (ISI-SETUP INITIATE) sent in the PSS1 SETUP message, the originating SwMI and participating SwMI(s) shall send an ISI-SETUP ACKNOWLEDGE PDU. By sending this TETRA PDU the originating and participating SwMI(s) confirms that air interface, mobile and infrastructure resources are available for connecting the called group.

This PDU shall be sent in a PSS1 CONNECT message. The contents and the encoding of which shall be as defined in table 29.

Table 29: Contents of TETRA PDU sent in a PSS1 CONNECT message to acknowledge the PSS1 SETUP message

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-SETUP ACKNOWLEDGE
Basic service information	8	1	CCAp	M	note
Resource allocation	1	1	ANF	M	
Call resource time	3	1	CCAp	M	
Proprietary		3	-	O	
NOTE:	The binary value of the information sub-element communication type in the information element basic service information may be changed from the value received in either ISI-SETUP INITIATE. The new value shall indicate the communication type supported by the SwMI, if the received value is not supported. All other sub-elements shall be returned unchanged.				

6.3.1.1.2.3 TETRA PDU sent by the originating or a participating SwMI - used to delay call set-up

When the originating or a participating SwMI wishes to delay call set-up, the PSS1 CONNECT message shall be returned to the controlling SwMI with the following TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 30.

Table 30: Contents of TETRA PDU sent in the PSS1 CONNECT message sent by the originating or a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-DELAY
Proprietary		3	-	O	

6.3.1.1.2.4 TETRA PDU sent by a participating SwMI - used as a call restoration response

To acknowledge the TETRA PDU (ISI-CALL RESTORATION) sent in the PSS1 SETUP message, the new participating SwMI shall send an ISI-CALL RESTORED PDU. By sending this TETRA PDU the new participating SwMI confirms that air interface, mobile and infrastructure resources are available for connecting the called group.

This PDU shall be sent in a PSS1 CONNECT message. The contents and the encoding of which shall be as defined in table 31.

Table 31: Contents of TETRA PDU sent in a PSS1 CONNECT message to acknowledge call restoration

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-CALL RESTORED
Basic service information	8	1	CCAp	M	note
Resource allocation	1	1	ANF	M	
Proprietary		3	-	O	
NOTE:	The binary value of the information sub-element communication type in the information element basic service information may be changed from the value received in the ISI-CALL RESTORATION PDU. The new value shall indicate the communication type supported by the SwMI, if the received value is not supported. All other sub-elements shall be returned unchanged.				

6.3.1.1.3 TETRA PDU giving complementary information in the PSS1 FACILITY message

6.3.1.1.3.1 TETRA PDU sent by the controlling SwMI - used for connecting the call

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by the controlling SwMI shall be as defined in table 32.

Table 32: Contents of TETRA PDU in the PSS1 FACILITY message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-CONNECT
Set-up type	1	1	CCAp	M	
Basic service information	8	1	CCAp	C	note 1
Transmission grant	2	1	ANF	M	
Transmission request permission	1	1	CCAp	M	
Call priority	4	1	CCAp	C	note 1
Call ownership	1	1	CCAp	C	note 1
Calling party type identifier	2	1	CCAp	M	
Calling party SSI	24	1	CCAp	M	note 2
Calling party extension	24	1	CCAp	M	note 2
Call diverted to dispatcher	1	1	SS	M	note 3
Call amalgamation	1	2	CCAp	O	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	Conditional on the value of call amalgamation. If the information element 'call amalgamation' is not set, then the value of the information element shall be equal to the value received in the ISI-SETUP INITIATE PDU.				
NOTE 2:	In the case of call amalgamation, only one of the original calling users shall become calling user for the group call. This information element shall contain this user's identity.				
NOTE 3:	This indication shall be used to indicate direct call set-up to a dispatcher.				

Upon reception of this TETRA PDU the originating SwMI shall connect the calling user (D_CONNECT PDU sent over the air interface). The originating SwMI's status shall then change from an originating SwMI to a participating SwMI and the called user(s) shall be connected to the group call (a D-SETUP PDU is sent over the air interface).

The participating SwMI(s) shall connect the called user(s) upon reception of this TETRA PDU (a D-SETUP PDU is sent over the air interface).

When a group call is connected (ISI-CONNECT sent to the originating and participating SwMI(s)), only the calling user shall receive transmission permission. If transmission is not granted to the calling user during call set-up, transmission shall only be granted to a member of the group call, upon request for transmission from that user.

When several group calls are amalgamated, more than one calling user shall exist. Therefore, it shall be up to the controlling SwMI to decide which calling user shall receive transmission grant, if any.

When two or more calls are amalgamated call ownership is not given to a calling user. The controlling SwMI shall become the call owner.

6.3.1.1.3.2 TETRA PDU sent by the controlling SwMI - used for polling

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by the controlling SwMI shall be as defined in table 33.

Table 33: Contents of TETRA PDU sent in the PSS1 FACILITY message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-POLL USER
Poll request type	1	1	CCAp	M	
Proprietary		3	-	O	

TETRA PDU sent by a participating SwMI - used as a polling response

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by a participating SwMI shall be as defined in table 34.

Table 34: Contents of TETRA PDU sent in the PSS1 FACILITY message sent by a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-POLL RESPONSE
Poll request type	1	1	CCAp	M	
Poll response number	6	2	CCAp	C	note 1
Poll response percentage	6	2	CCAp	C	note 1
Poll response addresses		3	CCAp	C	note 2
Proprietary		3	-	O	
NOTE 1:	Conditional on the chosen value of the information element poll request type.				
NOTE 2:	Shall be included if the information element poll request type is set to poll response number wanted.				

6.3.1.1.3.3 TETRA PDU sent by the migrated user's home SwMI - used to initiate call restoration

When a indication to initiate call restoration is received in a participating SwMI then this indication shall be forwarded to the controlling SwMI.

This PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 35.

Table 35: Contents of TETRA PDU sent in a PSS1 FACILITY message used to initiate call restoration

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-CALL RESTORE INITIATE
Old participating SwMI MNI	24	1	ANF	M	
New participating SwMI MNI	24	1	ANF	M	
Restoring party type identifier	2	1	CCAp	M	note
Restoring party SSI	24	1	CCAp	M	
Restoring party extension	24	1	CCAp	M	
Proprietary		3	-	O	
NOTE:	This information element is defined as the information element 'Called party type identifier' in the standard ETS 300 392-2 [3].				

6.3.1.1.3.4 TETRA PDU sent by the controlling SwMI - used for call restoration

When a member of a group call migrates during the call, the call control application in that users home SwMI shall be informed, by an ANF-ISIMM entity, about migration. This information will include the PISN number to be used for establishing a connection between the controlling SwMI and the new visiting SwMI.

When the new visiting SwMI is already participating in the group call, then call information necessary for evaluating the migrated user shall be sent from the controlling SwMI. This information shall include, which group call the migrated user can re-establish and if the migrated user is temporarily a member of the called group.

This PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 36.

Table 36: Contents of TETRA PDU sent in a PSS1 FACILITY message in the case of migration to a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU type	6	1	CCAp	M	ISI-CALL RESTORE INFO
Controlling SwMI MNI	24	1	ANF	M	
New participating SwMI MNI	24	1	ANF	M	
Transmission grant	2	1	CCAp	M

SS-migration profile	variable	1	SS	C	note 4
Critical party	1	2	CCAp	O	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	This information element is defined as the information element 'Called party type identifier' in the standard ETS 300 392-2 [3].				
NOTE 2:	This information element indicates if the restoring user is temporarily a member of the called group.				
NOTE 3:	Depending on the value of temporary group member indication. The profile shall reflect the actual call being connected.				
NOTE 4:	Depending on the value of temporary group member indication. The contents of SS-ISI PROFILE shall be as defined, if applicable, for the supplementary service in each supplementary service subpart of ETS 300 392-12 [10].				

Call restoration between the migrated user and the new SwMI occurs when requested by the migrated user (U-CALL RESTORE over the air interface).

6.3.1.1.3.5 TETRA PDU sent by the controlling SwMI - used to send call information

When the controlling SwMI wishes to inform participating SwMI(s) (and the originating SwMI if it exist) of changed or updated group call information, the PSS1 FACILITY message shall be sent containing a TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 37.

Table 37: Contents of TETRA PDU sent in the PSS1 FACILITY message used to send call information

Information element	Length	Type	Owner	C/O/M	Remark

Proprietary		3	-	O	
NOTE 1:	Used during call restoration to indicate a change in resource allocation.				
NOTE 2:	Shall be valid for acknowledge group calls only. For other types of calls it shall be set to 0.				
NOTE 3:	Depending on the value of poll result identifier.				
NOTE 4:	Conditional on the information element Group information is set to 1 ('Call not established to critical party').				

A participating SwMI (or the originating SwMI if it exist) may also choose to send this TETRA PDU, to inform the controlling SwMI of received DTMF digits.

6.3.1.1.3.6 TETRA PDU sent by the originating or a participating SwMI - used to request transmission permission

To request transmission permission an ISI-TX DEMAND PDU must be sent to the controlling SwMI. This PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 38.

Table 38: Contents of TETRA PDU sent in a PSS1 FACILITY message to request transmission grant

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	ANF	M	ISI-TX DEMAND

Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	This information element is defined as the information element 'Transmitting party type identifier' in the standard ETS 300 392-2 [3].				
NOTE 2:	If transmission is granted to an external user then this information element's 24 bits shall be set to 0.				
NOTE 3:	Shall be equal to 00000 ₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.				
NOTE 4:	The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 3), i.e. this information element shall be conditional on the value of N.				
NOTE 5:	This information element shall be present only when the external subscriber number length value N is not 00000 ₂ .				

6.3.1.1.3.7 TETRA PDU sent by the controlling SwMI - used as a transmission request response

When the transmission request has either been rejected or queued by the controlling SwMI the following TETRA PDU shall be returned to the requesting user.

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by the controlling SwMI shall be as defined in table 39.

Table 39: Contents of TETRA PDU sent in the PSS1 FACILITY message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark

Proprietary		3	-	O	
NOTE 1:	This information element is defined as the information element 'Transmitting party type identifier' in the standard ETS 300 392-2 [3].				
NOTE 2:	If transmission is granted to an external user then this information element's 24 bits shall be set to 0.				
NOTE 3:	Shall be equal to 00000 ₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.				
NOTE 4:	The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 3), i.e. this information element shall be conditional on the value of N.				
NOTE 5:	This information element shall be present only when the external subscriber number length value N is not 00000 ₂ .				

6.3.1.1.3.8 TETRA PDU sent by the controlling SwMI - used to request reservation of resources

The following TETRA PDU is sent to SwMI(s) with temporary allocated resources, before transmission is granted to a user during the call maintenance phase. The SwMI shall upon reception of this PDU reserve the necessary air interface, mobile and infrastructure resources needed for transmission.

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by the controlling SwMI shall be as defined in table 40.

Table 40: Contents of TETRA PDU sent in the PSS1 FACILITY message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-RESOURCE
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	

6.3.1.1.3.8 TETRA PDU sent by a participating SwMI - used as a resource response

This PDU shall indicate the result of resource reservation in a participating SwMI.

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by a participating SwMI shall be as defined in table 41.

Table 41: Contents of TETRA PDU sent in the PSS1 FACILITY message sent by a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	ANF	M	ISI-RESOURCE RESPONSE
Resource indicator	1	1	ANF	M	
Proprietary		3	-	O	

6.3.1.1.3.9 TETRA PDU sent by the originating or a participating SwMI - used to request cease of transmission

To request cease of transmission, an ISI-TX CEASED PDU shall be sent to the controlling SwMI. The PDU shall be sent either to cease an ongoing transmission or to remove a transmission request from the transmission queue.

The ISI-TX CEASED PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of this PDU shall be as defined in table 42.

Table 42: Contents of TETRA PDU sent in a PSS1 FACILITY message to request cease of transmission

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	ANF	M	ISI-TX CEASED
Transmission request permission	1	1	ANF	M	note 1
Requesting party type identifier	2	1	CCAp	M	note 2
Requesting party SSI	24	1	ANF	M	note 3
Requesting party extension	24	1	ANF	M	note 3
External subscriber number length	5	1	CCAp	M	note 4
External subscriber number digits	variable	1	CCAp	C	note 5
External subscriber number parameter	12	1	CCAp	M	note 6
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	Shall only be valid when this TETRA PDU has been sent from the controlling SwMI.				
NOTE 2:	This information element is defined as the information element 'Transmitting party type identifier' in the standard ETS 300 392-2 [3].				
NOTE 3:	If transmission is granted to an external user then this information element's 24 bits shall be set to 0.				
NOTE 4:	Shall be equal to 00000 ₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.				
NOTE 5:	The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 4), i.e. this information element shall be conditional on the value of N.				
NOTE 6:	This information element shall be present only when the external subscriber number length value N is not 00000 ₂ .				

6.3.1.1.3.10 TETRA PDU sent by the controlling SwMI - used to indicate cease of transmission

Indication sent from the controlling SwMI that transmission has been ceased. The PDU shall be sent to indicate that an ongoing transmission has been ceased. The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 FACILITY message sent by the controlling SwMI shall be as defined in table 42.

6.3.1.1.3.11 TETRA PDU sent by the controlling SwMI - used to inform grant of transmission

This TETRA PDU is sent from the controlling SwMI when transmission has been granted to a requesting user. The PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 43.

Table 43: Contents of TETRA PDU sent in a PSS1 FACILITY message to grant transmission permission

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-TX GRANTED

Transmission request permission	1	1	CCAp	M	
Encryption control	1	1	CCAp	M	
SS-CLIR invoked for transmitting party	1	1	SS	M	
Transmitting party type identifier	2	1	CCAp	M	
Transmitting party SSI	24	2	CCAp	C	note 1
Transmitting party extension	24	2	CCAp	C	note 1
External subscriber number length	5	1	CCAp	M	note 2
External subscriber number digits	variable	1	CCAp	C	note 3
External subscriber number parameter	12	1	CCAp	M	note 4
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE 1:	If transmission is granted to an external user then this information element's 24 bits shall be set to 0.				
NOTE 2:	Shall be equal to 00000 ₂ in the case of inter-TETRA calls, and to N, N being the number of digits of the external calling party number in the case of an external incoming call from PSTN/ISDN/PISN if the calling party identification is delivered by that external network.				
NOTE 3:	The number of digits included in this information element shall be equal to N, the value of the external subscriber number length (see note 2), i.e. this information element shall be conditional on the value of N.				
NOTE 4:	This information element shall be present only when the external subscriber number length value N is not 00000 ₂ .				

The SwMI containing the granted user, shall send an individual addressed D-TX GRANTED PDU over the air interface to this user, upon reception of an ISI-TX GRANTED. A group addressed D-TX GRANTED PDU shall be sent to members of the group call upon reception of the ISI-TX GRANTED.

6.3.1.1.3.12 TETRA PDU sent by the controlling SwMI - used to inform interruption of transmission

When a transmitting user is to be interrupted, the TETRA PDU ISI-TX INTERRUPT shall be sent to the originating SwMI and the participating SwMI(s). The PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 44.

Table 44: Contents of TETRA PDU sent in a PSS1 FACILITY message to interrupt transmission

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-TX INTERRUPT
Transmission grant	2	1	CCAp	M	
Transmission request permission	1	1	CCAp	M	
Encryption control	1	1	CCAp	M	
SS-CLIR invoked for transmitting party	1	1	SS	M	
Transmitting party type identifier	2	1	CCAp	M	
Transmitting party SSI	24	2	CCAp	C	
Transmitting party extension	24	2	CCAp	C	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	

The SwMI containing the user currently transmitting, shall send an individual addressed D-TX INTERRUPT PDU over the air interface to this user, upon reception of an ISI-TX INTERRUPT. A group addressed D-TX INTERRUPT PDU should be sent to members of the group call upon reception of the ISI-TX INTERRUPT.

The SwMI containing the granted user, should send an individual addressed D-TX GRANTED PDU over the air interface to this user, after the group addressed D-TX INTERRUPT PDU has been sent.

6.3.1.1.3.13 TETRA PDU sent by a participating SwMI - used to inform of continuation in an active group call

When a participating SwMI continues with an active group call that it previously had withdrawn from, the controlling SwMI shall be informed. It is then up to the CC application of the controlling SwMI to determine if any actions shall be taken.

This PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 45.

Table 45: Contents of TETRA PDU sent in a PSS1 FACILITY message by a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-TX CONTINUE
Participating SwMI MNI	24	1	CCAp	M	
Proprietary		3	-	O	

6.3.1.1.3.14 TETRA PDU sent by a participating SwMI - used to inform of withdrawal from an active group call

When a participating SwMI withdraws from an active group call, the controlling SwMI shall be informed. It is then up to the CC application of the controlling SwMI to determine if any actions shall be taken.

This PDU shall be sent in a PSS1 FACILITY message. The contents and the encoding of which shall be as defined in table 46.

Table 46: Contents of TETRA PDU sent in a PSS1 FACILITY message by a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-TX WAIT
Participating SwMI MNI	24	1	CCAp	M	
Proprietary		3	-	O	

6.3.1.1.4 TETRA PDU giving complementary information in the PSS1 DISCONNECT message

6.3.1.1.4.1 TETRA PDU sent by the originating SwMI - used as a call set-up reject

When an ISI-SETUP INITIATE cannot be accepted by the originating SwMI, the PSS1 DISCONNECT message shall be returned to the controlling SwMI with the following TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 47.

Table 47: Contents of TETRA PDU sent in the PSS1 DISCONNECT message sent by the originating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-REJECT
Reject cause	6	1	CCAp	M	
Proprietary		3	-	O	

6.3.1.1.4.2 TETRA PDU sent by the originating SwMI or a participating SwMI - used to disconnect from the call

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 DISCONNECT message sent by the originating SwMI or a participating SwMI shall be as defined in table 48.

Table 48: Contents of TETRA PDU sent in the PSS1 DISCONNECT message sent by the originating SwMI or a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-DISCONNECT
Call owner request	1	1	CCAp	M	note
Disconnect cause	6	1	CCAp	M	
Proprietary		3	-	O	
NOTE:	When requested by the call owner, the controlling SwMI shall disconnect the complete call.				

6.3.1.1.5 TETRA PDU giving complementary information in the PSS1 DISCONNECT or PSS1 RELEASE message

6.3.1.1.5.1 TETRA PDU sent by the controlling SwMI - used for releasing the call

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 DISCONNECT or PSS1 RELEASE message sent by the controlling SwMI shall be as defined in table 49.

Table 49: Contents of TETRA PDU sent in the PSS1 DISCONNECT or PSS1 RELEASE message sent by the controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-RELEASE
Disconnect type	2	1	CCAp	M	
Disconnect cause	6	1	CCAp	M	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	

6.3.1.1.6 TETRA PDU giving complementary information in the PSS1 RELEASE or PSS1 RELEASE COMPLETE message

6.3.1.1.6.1 TETRA PDU sent by the originating or a participating SwMI - used as a call release response

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 RELEASE or PSS1 RELEASE COMPLETE message sent by the originating or participating SwMI shall be as defined in table 50.

Table 50: Contents of TETRA PDU sent in the PSS1 RELEASE or PSS1 RELEASE COMPLETE message

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-RELEASE COMPLETE
Disconnect type	2	1	CCAp	M	
Disconnect cause	6	1	CCAp	M	
Proprietary		3	-	O	

6.3.1.1.7 TETRA PDU giving complementary information in the PSS1 RELEASE COMPLETE message

6.3.1.1.7.1 TETRA PDU sent by the group home SwMI or the linking controlling SwMI - used to re-route the call

The contents and the encoding of the TETRA PDU giving complementary information in the PSS1 RELEASE COMPLETE message sent by the group home SwMI or the linking controlling SwMI shall be as defined in table 51.

Table 51: Contents of TETRA PDU sent in the PSS1 RELEASE COMPLETE message sent by the group home SwMI or the linking controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-REROUTE SETUP
Group/Linking home SwMI MNI	24	1	ANF	M	
Temporary group member indication	1	1	CCAp	M	note
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	
NOTE:	Indication to the originating SwMI that the calling user is temporarily a member of the called group.				

6.3.1.1.7.2 TETRA PDU sent by the group home SwMI or the linking controlling SwMI - used to reject a forward set-up

When a forward group call request is rejected by either the group home SwMI or the linking controlling SwMI, the PSS1 RELEASE COMPLETE message shall include the following TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 52.

Table 52: Contents of TETRA PDU sent in the PSS1 RELEASE COMPLETE message sent by the group home SwMI or the linking controlling SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-REJECT
Reject cause	6	1	CCAp	M	
Notification indicator	6	2	SS	O	
Proprietary		3	-	O	

The group home SwMI or the linking controlling SwMI shall, according to subclause 10.2.2 of ISO/IEC 11572 [12], send a PSS1 RELEASE COMPLETE message, instead of a PSS1 DISCONNECT message, when no prior PSS1 message has been sent by the SwMI.

6.3.1.1.7.3 TETRA PDU sent by a participating SwMI - used as a call set-up reject

When an ISI-SETUP INITIATE can not be accepted by a participating SwMI, the PSS1 RELEASE COMPLETE message shall be returned to the controlling SwMI with the following TETRA PDU. The contents and the encoding of this TETRA PDU shall be as defined in table 53.

Table 53: Contents of TETRA PDU sent in the PSS1 RELEASE COMPLETE message sent by a participating SwMI

Information element	Length	Type	Owner	C/O/M	Remark
PDU Type	6	1	CCAp	M	ISI-REJECT
Reject cause	6	1	CCAp	M	
Proprietary		3	-	O	

6.3.1.2 PISN connection oriented, call independent connections

6.3.1.2.1 TETRA PDU giving complementary information in the PSS1 SETUP message

6.3.1.2.1.1 TETRA PDU sent by the migrated user's home SwMI - used to initiate call restoration

When a user participating in a group call migrates, then this user home SwMI will receive migration indication from the collocated ANF-ISIMM entity. If this user's home SwMI is not collocated with the controlling SwMI for the group call and not participating in the group call, the controlling SwMI MNI will not be known by the user's home SwMI.

Therefore, when indication to initiate call restoration is received, this indication shall be forwarded to the old visiting SwMI, where call information is available. The old visiting SwMI shall then initiate call restoration in the controlling SwMI.

This PDU shall be sent in a PSS1 SETUP message. The contents and the encoding of which shall be as defined in table 35.

6.3.2 TETRA PDU information element coding

The majority of information elements included in the TETRA PDU definitions in subclause 6.3.1 are equal to those defined for the air interface PDUs - see subclause 14.8 of ETS 300 392-2 [3] for these definitions. However, a few ISI specific information elements have been included.

NOTE: A given PDU information element already defined for the air interface may or may not take all its possible values when used in ISI TETRA PDUs.

6.3.2.1 Additional information to existing information element at the ISI

6.3.2.1.1 Call time-out, set-up phase

As opposed to the definition for the air interface protocol (subclause 14.8.17 of ETS 300 392-2 [3]) this information element is not be used to set the call time-out timer, for the set-up phase at the air interface of the calling user (T302). It is simply used to inform the originating SwMI of the call set-up time used by the controlling SwMI during the set-up phase.

NOTE: It is up to the originating SwMI to decide if the relevant timer in the MS/LS should be equivalent to or greater than the received value.

The coding of this information element, shall be as defined in table 105 of ETS 300 392-2 [3]. However, no predefined value shall be used (i.e. the value 000₂ shall be reserved). The coding shall be as defined in table 54.

Table 54: Call time-out, set-up phase information element contents

Information element	Length	Value	Remark
Call time-out, set-up phase	3	000 ₂	Reserved
		001 ₂	1 seconds
		010 ₂	2 seconds
		011 ₂	5 seconds
		100 ₂	10 seconds
		101 ₂	20 seconds
		110 ₂	30 seconds
		111 ₂	60 seconds

6.3.2.1.2 Call time-out

This information element is also only used to inform the originating and participating SwMI(s) of the call length time used by the controlling SwMI during the maintenance phase of the call.

NOTE: It is up to the originating and participating SwMI(s) to decide if the relevant timer in the MS/LS should be equivalent to or greater than the received value.

The coding of this information element, shall be as defined in table 104 of ETS 300 392-2 [3].

6.3.2.1.3 Disconnect cause information element

The purpose of the disconnection cause information element is to inform either the participating SwMI(s) or the controlling SwMI of the reason for the release/disconnection. This information element shall be coded as defined in table 55.

Table 55: Disconnect cause information element contents

Information element	Length	Value	Remark
Disconnect cause	6	000000 ₂	Cause not defined or unknown
		000001 ₂	User requested disconnect (note)
		000010 ₂	Called party busy
		000011 ₂	Called party not reachable
		000100 ₂	Called party does not support encryption
		000101 ₂	Congestion in infrastructure
		000110 ₂	Not allowed traffic case
		000111 ₂	Incompatible traffic case
		001000 ₂	Requested service not available
		001001 ₂	Pre-emptive use of resource
		001010 ₂	Invalid call identifier
		001011 ₂	Call rejected by the called party
		001100 ₂	No idle air interface call control protocol sub-entity
		001101 ₂	Expiration of timer
		001110 ₂	SwMI requested disconnection
		001111 ₂	Acknowledged service not completed
		010000 ₂	Reserved
		...etc.	...etc.
		011111 ₂	Reserved
ISI specific disconnection cause		100000 ₂	Call not established to critical user
		100001 ₂	Call could not be restored to call owner
NOTE: The call owner is the only user that can disconnect the complete group call.			

NOTE: 6 bits are used for encoding the disconnect cause information element. This is one more bit than what is used at the air interface for the disconnect cause information element. The binary values 000000₂ to 011111₂ have remained unchanged while the values from 100000₂ to 111110₂ shall be used as ISI specific definitions.

6.3.2.1.4 Individual basic migration profile

The individual basic migration profile is defined in ETS 300 392-3-5 [6]. The profile shall reflect the actual call being connected. The profile status shall indicate that this is a temporary profile only to be used for the duration of the call. The profile shall only be valid for the temporary group member.

6.3.2.1.5 PDU type

The purpose of the PDU type information element is to identify the type of TETRA PDU sent over the ISI in a PSS1 message. This information element shall be coded as defined in table 56.

NOTE 1: A PDU type value exist for each TETRA PDU, even though only one TETRA PDU will be sent in the given PSS1 (basic call) message.

Table 56: PDU type information element contents

Information element	Length	Value	Remark
PDU Type	6	000000 ₂	<u>Reserved</u>
		000001 ₂	<u>Reserved</u>
		000010 ₂	<u>Reserved</u>
		000011 ₂	<u>Reserved</u>
		000100 ₂	<u>Reserved</u>
		000101 ₂	ISI-INFO (see table 28 and 37)
		000110 ₂	ISI-RELEASE (see table 49)
		000111 ₂	<u>Reserved</u>
		001000 ₂	<u>Reserved</u>
		001001 ₂	ISI-TX CEASED (see tables 42)
		001010 ₂	<u>Reserved</u>
		001011 ₂	ISI-TX GRANTED (see table 43)
		001100 ₂	<u>Reserved</u>
		001101 ₂	ISI-TX INTERRUPT (see table 44)
		001110 ₂	<u>Reserved</u>
		010000 ₂	<u>Reserved</u>
		010001 ₂	<u>Reserved</u>
		...etc.	...etc.
		011111 ₂	<u>Reserved</u>
		ISI specific PDU Type	
...etc.	...etc.		
110000 ₂	Reserved for ANF-ISIIC		
110001 ₂	ISI-ORIGINATING SETUP (see table 25)		
110010 ₂	ISI-REROUTE SETUP (see table 51)		
110011 ₂	ISI-SETUP INITIATE (see table 26)		
110100 ₂	ISI-SETUP ACKNOWLEDGE (see table 29)		
110101 ₂	ISI-CONNECT (see table 32)		
110110 ₂	ISI-POLL USER (see table 33)		
110110 ₂	ISI-POLL RESPONSE (see table 34)		
110111 ₂	ISI-REJECT (see table 47, 52 and 53)		
111000 ₂	ISI-DISCONNECT (see table 48)		
111001 ₂	ISI-RELEASE COMPLETE (see table 50)		
111010 ₂	ISI-TX DEMAND (see table 38)		
111010 ₂	ISI-TX DEMAND RESPONSE (see table 39)		
111011 ₂	ISI-TX WAIT (see table 46)		
111100 ₂	ISI-TX CONTINUE (see table 45)		
111101 ₂	ISI-CALL RESTORATION (see table 27)		
111110 ₂	ISI-CALL RESTORE INFO (see table 36)		
111111 ₂	ISI-CALL RESTORED (see table 31)		
110000 ₂	ISI-CALL RESTORE INITIATE (see table 35)		
110000 ₂	ISI-RESOURCE (see table 40)		
110000 ₂	ISI-RESOURCE RESPONSE (see table 41)		
110000 ₂	ISI-DELAY (see table 30)		

NOTE 2: 6 bits are used for encoding the PDU type information element. This is one more bit than what is used at the air interface for the PDU type information element. The PDU types having the binary values 000000₂ to 011111₂ shall correspond to downlink PDUs defined in table 114 of ETS 300 392-2 [3] while the binary values from 100000₂ to 111111₂ shall be used as ISI specific definitions.

6.3.2.1.6 SS-migration profile

The SS-migration profile is defined in ETS 300 392-3-5 [6]. The profile shall reflect the actual call being connected. The profile status shall indicate that this is a temporary profile only to be used for the duration of the call. The profile shall only be valid for the temporary group member.

6.3.2.2 New information elements used at the ISI

6.3.2.2.1 Call resource time-out

This information element is used to inform the controlling SwMI of the call resource time-out timer. This timer shall indicate the period of time the participating/originating SwMI shall hold resources reserved within the SwMI.

The coding of this information element, shall be as defined in table 57.

Table 57: Call resource time-out information element contents

Information element	Length	Value	Remark
Call connect time-out	3	000 ₂	Reserved
		001 ₂	5 seconds
		010 ₂	10 seconds
		011 ₂	15 seconds
		100 ₂	20 seconds
		101 ₂	25 seconds
		110 ₂	30 seconds
		111 ₂	Reserved

6.3.2.2.2 Call diverted to dispatcher

This information element shall be coded as defined in table 58.

Table 58: Call diverted to dispatcher information element contents

Information element	Length	Value	Remark
Call diverted to dispatcher	1	0	Call not diverted to a dispatcher
		1	Call diverted to a dispatcher

6.3.2.2.3 Call owner request

This information element shall be coded as defined in table 59.

Table 59: Call owner request information element contents

Information element	Length	Value	Remark
Call owner request	1	0	Call owner has not requested disconnect
		1	Call owner requested disconnect

6.3.2.2.4 Called/calling/critical connected/transmitting party type identifier

The coding of these information elements shall be the same as in table 93, 97 and 128 of ETS 300 392-2 [3].

6.3.2.2.5 Connected party SSI and extension

The coding of these information elements shall be the same as in tables 95 and 96 of ETS 300 392-2 [3]. The information element shall always identify a group of subscriber (TETRA group identity).

6.3.2.2.6 Controlling/originating/participating SwMI MNI

This information element shall be coded as defined in table 60.

Table 60: Controlling/group home/linking home/originating/participating SwMI MNI information element contents

Information sub-element	Length	Value	Remark
Country Code	10		See ETS 300 392-1 [2], clause 7
Network Code	14		See ETS 300 392-1 [2], clause 7

6.3.2.2.7 Critical connected party/requesting party/restoring party/transmitting party SSI and extension

The coding of these information elements shall be the same as in tables 95 and 96 of ETS 300 392-2 [3]. The information element shall always identify an individual subscriber.

6.3.2.2.8 Critical party

This information element shall be coded as defined in table 61.

Table 61: Critical party information element contents

Information element	Length	Value	Remark
Critical party	1	0	The restoring party is not a critical member
		1	The restoring party is a critical member

6.3.2.2.9 Critical user list

This information element shall be coded as defined in table 62.

Table 62: Critical user list element contents

Critical connected party type identifier	2	1	CCAp	M	see subclause 6.3.2.2.4 for definition
Critical connected party SSI	24	2	CCAp	M	see subclause 6.3.2.2.7 for definition
Critical connected party extension	24	2	CCAp	M	see subclause 6.3.2.2.7 for definition

6.3.2.2.10 Disconnect type

This information element shall be coded as defined in table 63.

Table 63: Disconnect type information element contents

Information element	Length	Value	Remark
Disconnect type	2	00 ₂	Full disconnection of call
		01 ₂	Partial disconnection of call
		10 ₂	Delay group call set-up
		11 ₂	Reserved

6.3.2.2.11 Dispatcher acceptance

This information element shall be coded as defined in table 64.

Table 64: Dispatcher acceptance information element contents

Information element	Length	Value	Remark
Dispatcher acceptance	1	0	SS-CAD has not been invoked
		1	The dispatcher has accepted the call

6.3.2.2.12 External subscriber number digits

The information element external subscriber number digits is a binary string with a length equal to 4 times N, where N is equal to the value of the information element 'external subscriber number length'. The 'external subscriber number length' information element shall always precede the 'external subscriber number digits' in TETRA PDUs. The first 4 bits of the binary string shall be the coded value of the first digit (or symbol) of the external subscriber number, the next four bits shall be the coded value of the second digit (or symbol), and so on forth until the Nth digit has been coded.

Each digit of the external subscriber number shall be coded into its binary value using 4 bits, the "*" sign shall be coded as "1010₂" the "#" as "1011₂" and the four letters A, B, C and D, as "1100₂", "1101₂", "1110₂" and "1111₂", respectively. The order of these digits shall be that in which they would be dialled: the first one would then be entered first, and so on.

Table 65 illustrates this definition.

Table 65: External subscriber number digits information element contents

Information element	Length	Value
External subscriber number digits	4 x N	(xxx ₂)(xxx ₂)(xxx ₂)(xxx ₂) etc. ... 1st digit 2nd digit 3rd digit 4th digit

6.3.2.2.13 External subscriber number length

This information element shall be coded as defined in table 66.

Table 66: External subscriber number length information element contents

Information element	Length	Value	Remark
External subscriber number length	5	00000 ₂	note 1
		xxxxx ₂	note 2
NOTE 1: The presence of the information element 'external subscriber number digits' shall be conditional on the value of this information element being different from 0.			
NOTE 2: The number of digits in the information element 'external subscriber number digits' shall be equal to N, the decimal number corresponding to the binary value xxxxx ₂ .			

NOTE: The external subscriber number length is needed according to the PDU encoding rules defined in subclause 14.7 of ETS 300 392-2 [3], for encoding the number digits (the length of which is variable) as "a type 1 element".

6.3.2.2.14 External subscriber number parameter

This information element external subscriber number parameter in the case of interworking shall be encoded as defined in table 67.

Table 67: External subscriber number parameter information element contents

Information element	Length	Type	Owner	C/O/M	Remark
Numbering plan identifier	4	1	CCAp	M	see table 70 for definition
Type of Number	6	1	ANF	M	see table 83 for definition
Screening indicator	6	2	SS	O	see table 76 for definition

6.3.2.2.15 Group attachment indicator

This information element shall be coded as defined in table 68.

Table 68: Group attachment indicator information element contents

Information element	Length	Value	Remark
Group attachment indicator	1	0	The calling user has attached to the called group
		1	The calling user has not attached to the called group

6.3.2.2.16 Group information

This information element group information in the case of interworking shall be encoded as defined in table 69.

Table 69: Group information information element contents

Information element	Length	Value	Remark
Group information	2	0	Reserved
		1	Call not established to critical user
		2	Reserved
		3	Reserved

6.3.2.2.17 Numbering plan identifier

This information element shall be coded as defined in table 70.

Table 70: Numbering plan identifier information element contents

Information element	Length	Value	Remark
Numbering plan identifier	4	0	unknown (note)
		1	(TETRA) (note)
		2	E.164 (PSTN/ISDN/GSM) (note)
		3	X.121 (PDN) (note)

NOTE: All digits are BCD (binary coded decimal)

6.3.2.2.18 Poll request type

This information element shall be coded as defined in table 71.

Table 71: Poll request type information element contents

Information element	Length	Value	Remark
Poll request type	1	0	Poll response number wanted
		1	Poll response percentage wanted

6.3.2.2.19 Poll result identifier

This information element shall be coded as defined in table 72.

Table 72: Poll result identifier information element contents

Information element	Length	Value	Remark
Poll result identifier	1	0	Poll response number given
		1	Poll response percentage given

6.3.2.2.20 Reject cause information element

The purpose of the reject cause information element is to inform either the originating SwMI or the controlling SwMI of the reason for rejection. This information element shall be coded as defined in table 73.

Table 73: Reject cause information element contents

Information element	Length	Value	Remark
Reject cause	6	000000 ₂	Cause not defined or unknown
		000001 ₂	Reserved
		000010 ₂	Called party busy
		000011 ₂	Reserved
		000100 ₂	Called party does not support encryption
		000101 ₂	Congestion in infrastructure
		000110 ₂	Not allowed traffic case
		000111 ₂	Incompatible traffic case
		001000 ₂	Requested service not available
		001001 ₂	Reserved
		001010 ₂	Invalid call identifier
		001011 ₂	Call rejected by the originating/participating SwMI
		001100 ₂	No idle air interface call control protocol sub-entity
		001101 ₂	Reserved
		001110 ₂	Reserved
		001111 ₂	Reserved
		010001 ₂	Reserved
		...etc.	...etc.
		011111 ₂	Reserved

6.3.2.2.21 Resource allocation

This information element shall be coded as defined in table 74.

Table 74: Resource allocation information element contents

Information element	Length	Value	Remark
Resource allocation	1	0	Permanently allocated resources
		1	Temporary allocated resources

6.3.2.2.22 Resource indicator

This information element shall be coded as defined in table 75.

Table 75: Resource indicator information element contents

Information element	Length	Value	Remark
Resource indicator	1	0	Resources are reserved
		1	Resources could not be reserved

6.3.2.2.23 Screening indicator

This information element shall be coded as defined in table 76.

Table 76: Screening indicator information element contents

Information element	Length	Value	Remark
Screening indicator	6	0	None, not implemented or unknown (note 1 and 2)
		1	Network provided number (note 1 and 3)
		2	User provided, verified and passed (note 1 and 4)
		3	User provided, not screened (note 1)
		4	Number not available due to inter-working (note 1)
NOTE 1: All digits are BCD (binary coded decimal)			
NOTE 2: Used when calling user is located in a PSTN network.			
NOTE 3: Provided by TETRA network.			
NOTE 4: Used when calling user is located in a ISDN network.			

6.3.2.2.24 Security level at air interface/Security level used in other network

This information element is coded as defined in table 82 of ETS 300 392-7 [7], the contents of which is reproduced in table 77.

Table 77: Security level information element contents

Information element	Length	Value	Remark
Security level (..)	2	00 ₂	SwMI type 1
		01 ₂	SwMI type 2
		10 ₂	SwMI type 3a
		11 ₂	SwMI type 3b

6.3.2.2.25 Set-up type

This information element shall be coded as defined in table 78.

Table 78: Set-up type information element contents

Information element	Length	Value	Remark
Set-up type	2	0	Complete set-up of group call
		1	Partial set-up of group call

6.3.2.2.26 Speech service chosen/requested/used

This information element shall be coded as defined in table 79.

Table 79: Speech service chosen/requested/used information element contents

Information element	Length	Value	Remark
Speech service chosen/ requested/used	3	000 ₂	CODEC defined in ETS 300 395-2 [11]
		xx1 ₂	Reserved
		x10 ₂	Reserved
		100 ₂	Reserved

6.3.2.2.27 Speech services supported

This information element is a bit-map field indicating which TETRA CODEC are supported. The meaning of each bit setting in this information element shall be as defined in table 80.

Table 80: Speech services supported information element contents

Information element	Length	Value	Remark
Speech services supported	5	00000 ₂	Reserved
		00001 ₂	CODEC defined in ETS 300 395-2 [11] supported
		00010 ₂	Reserved
		00100 ₂	Reserved
		01000 ₂	Reserved
		10000 ₂	Reserved

6.3.2.2.28 SS-CLIR invoked for calling/transmitting/connected party

This information element shall be coded as defined in table 81.

Table 81: SS-CLIR invoked for calling/transmitting/connected party information element contents

Information element	Length	Value	Remark
SS-CLIR invoked for calling/transmitting/connected party	1	0	SS-CLIR not invoked for the party
		1	SS-CLIR invoked for the party

6.3.2.2.29 Temporary group member indication

This information element shall be coded as defined in table 82.

Table 82: Temporary group member indication information element contents

Information element	Length	Value	Remark
Temporary group member indication	1	0	The calling, restoring or indicated user is a member of the group
		1	The calling, restoring or indicated user is a temporary member of the group

6.3.2.2.30 Type of number

This information element shall be coded as defined in table 83.

Table 83: Type of number information element contents

Information element	Length	Value	Remark
Type of number	6	0	unknown (note)
		1	Local (note)
		2	National (note)
		3	International (note)
		4	TETRA (note)
NOTE: All digits are BCD (binary coded decimal)			

6.3.3 PSS1 facility information element

The ROSE operation tetraIcsiMessage referred to in subclause 6.3 shall be coded in a PSS1 facility information elements in accordance to ISO/IEC 11582 [14]. The PSS1 facility information elements shall always include a Network Facility Extension (NFE).

The destinationEntity and sourceEntity data elements of the Network Facility Extension (NFE) shall contain the value endPINX. The sourceEntity and destinationEntity data elements of the argument of the ROSE operation tetraIcsiMessage shall contain the value ANF-ISIGC.

Whenever the ANF-ISIGC Invoke APDU of the ROSE operation tetraIcsiMessage is included in a PSS1 SETUP message, the Interpretation APDU shall be included with the value "clearCallIfAnyInvokePduNotRecognised".

NOTE: According to subclause 8.6 of ETS 300 392-3-1 [4], if a called SwMI does not support inter-TETRA group calls, i.e. the SwMI does not have an ANF-ISIGC entity, the ROSE entity within this SwMI shall upon reception of a PSS1 SETUP message:

- reject the ROSE Invoke APDU received; and
- clear the PSS1 call attempt due to the specific value of the Interpretation APDU received together with the ROSE Invoke APDU.

The same applies for call restoration, when a new participating SwMI does not support inter-TETRA group calls (see subclause 6.5.2.3).

The Interpretation APDU shall not be included in any other ANF-ISIGC Invoke APDUs of the ROSE operation tetraIcsiMessage other than the ANF-ISIGC Invoke APDUs sent in the PSS1 SETUP messages.

In accordance with ETS 300 392-3-1 [4] subclause 8.4, the receiving ANF-ISIGC entity in the destination SwMI shall trigger the sending of a returnError APDU when one or more of the error causes listed in this subclause has occurred upon reception of an Invoke APDU.

When the ROSE entity in the source SwMI receives a returnError APDU or a reject APDU, it shall pass it on to the call control application in this SwMI. The decision taken by this call control application when the destination SwMI has not already cleared the call is an implementation matter (e.g. clearing the call or if the Invoke APDU was not essential, continue the call).

6.4 ANF-ISIGC state definitions

6.4.1 States at the originating SwMI

6.4.1.1 IDLE

This is the initial state for the originating SwMI ANF-ISIGC entity. In this state FE1 shall:

- upon request from the CC application, fetch and analyse the calling users profile information;
- analyse the destination group identity (GTSI) and evaluate if an inter-TETRA connection needs to be established for the call set-up request;
- obtain routing information to the group home SwMI and route the call over an inter-TETRA connection.

From this state FE1 can go to state FORWARD CALL or WAIT CONNECT.

6.4.1.2 FORWARD CALL

This is the state where the originating SwMI ANF-ISIGC entity waits for approval or rejection of the call set-up request. In this state FE1 should:

- receive information about call status and the call set-up time used by the controlling SwMI and forward this information to the originating SwMI CC application.

In this state FE1 shall:

- either receive information that the call set-up request has been rejected by the group home/controlling SwMI and forward this information to the originating SwMI CC application; or
- receive set-up information from the controlling SwMI and forward this information to the originating SwMI CC application;
- receive information from the originating SwMI CC application that either:
 - the call is ready for through connect and forward this information to the controlling SwMI; or
 - start timer T2 as indicated in subclause 6.8;
 - the call has been rejected and forward this information to the controlling SwMI; or
 - the CC application wishes to delay the call set-up and forward this information to the controlling SwMI (this is not valid for a call set-up initiated by an external user);
- release reserved resources upon expiration of timer T2.

In this state FE1 may:

- receive a request to re-route the call set-up request from the group home SwMI to either the linking controlling SwMI or to a new group home SwMI (when SS-CFU has been invoked).

From this state FE1 can go to state WAIT CONNECT, DELAY ENTRY or IDLE.

6.4.1.3 WAIT CONNECT

This is the state where call set-up has been initiated and the originating SwMI ANF-ISIGC entity is waiting for the call to be through connected. In this state FE1 shall:

- receive indication that the calling user is to be through connected and forward this information to the originating SwMI CC application; or
 - change status from an originating SwMI to a participating SwMI. The originating shall become idle;
- receive indication that the call is to be delayed and forward this information to the originating SwMI CC application;
 - receive indication that the originating SwMI CC application has accepted the delay and forward this information to the controlling SwMI.

In this state FE1 may:

- receive indication that this SwMI is being released from the call and forward this information to the originating SwMI CC application;
- receive information from the originating SwMI CC application that the call is to be disconnected in the originating SwMI and forward this information to the controlling SwMI.

From this state FE1 can go to state IDLE, DELAY GROUP CALL, CALL RELEASE or CALL DISCONNECT.

6.4.1.4 DELAY ENTRY

This is the state used by the originating SwMI ANF-ISIGC entity when the CC application has informed the entity to delay the call set-up. In this state FE1 shall:

- receive information from the originating SwMI CC application that the SwMI is now ready for through connect and forward this information to the controlling SwMI; or
- receive indication that this SwMI is being released from the call and forward this information to the originating SwMI CC application; or
- receive information from the originating SwMI CC application that the call is to be disconnected in the originating SwMI and forward this information to the controlling SwMI.

From this state FE1 can go to state WAIT CONNECT, CALL DISCONNECT or CALL RELEASE.

6.4.1.5 DELAY GROUP CALL

This is the state where the originating SwMI ANF-ISIGC entity has been delayed during call set-up. In this state FE1 shall:

- receive set-up information from the controlling SwMI and forward this information to the originating SwMI CC application. The call is no longer delayed; or
 - receive information from the originating SwMI CC application that the call is ready for through connect and forward this information to the controlling SwMI.
 - receive information from the originating SwMI CC application that the CC application wishes to delay the call set-up and forward this information to the controlling SwMI;
- receive indication that this SwMI is being released from the call and forward this information to the originating SwMI CC application; or
- receive information from the originating SwMI CC application that the call is to be disconnected in the originating SwMI and forward this information to the controlling SwMI.

From this state FE1 can go to state WAIT CONNECT, CALL RELEASE or CALL DISCONNECT.

6.4.1.6 CALL DISCONNECT

The originating SwMI ANF-ISIGC entity is in this state when the CC application has made a request to be disconnected from the call. In this state FE1 shall:

- receive indication that this SwMI is being released from the call and forward this information to the originating SwMI CC application.

From this state FE1 can go to state CALL RELEASE.

6.4.1.7 CALL RELEASE

This is the state where the call is being released within the originating SwMI. This state may be used to collect call information, before the call is completely released. In this state FE1 shall:

- wait for confirmation from the originating SwMI CC application that release has been performed;
- complete the release the ANF-ISIGC (inter-TETRA) connection.

From this state FE1 can go to state IDLE.

6.4.2 States at the controlling SwMI

6.4.2.1 IDLE

This is the initial state for the controlling SwMI ANF-ISIGC entity. In this state FE2 shall:

- receive a request for group call set-up from an originating SwMI and forward this information to the controlling SwMI CC application;
- upon call set-up acceptance from the CC application:
 - fetch and analyse the called groups routing information and evaluate if the group is linked;
 - obtain routing information to the linking controlling SwMI if this is not to be the controlling SwMI for the call;
 - inform the originating SwMI that the call set-up request shall be re-routed, due to group linking or call forwarding unconditionally if this has occurred;
 - merge this call request to an already active call;
 - analyse the migration information for the group and evaluate if any inter-TETRA connection needs to be established for the call set-up;
 - obtain routing information to the participating SwMI(s) and route the call over an inter-TETRA connection to the originating SwMI and the participating SwMI(s).
- upon call set-up rejection from the CC application inform the originating SwMI that the call cannot be performed.

In this state FE2 should:

- send call status and call time out information for the set-up phase, to the originating SwMI.

From this state FE2 can go to state GROUP CALL INITIATE.

6.4.2.2 GROUP CALL INITIATE

This is the state used by the controlling SwMI ANF-ISIGC entity when waiting for call set-up responses from the originating and the participating SwMI(s). The decision to through connect the call, delay the call or release the call is made in this state. In this state FE2 shall:

- receive call set-up responses from participating SwMI(s) and the originating SwMI and forward this information to the controlling SwMI CC application;
- when indicated by the CC application, inform the participating SwMI(s) and the originating SwMI of one of the following:
 - the call is now to be through connected;
 - the call is to be delayed;
 - the call is to be released in the specified SwMI(s).

From this state FE2 can go to state DELAY GROUP CALL, ACTIVE or CALL RELEASE.

6.4.2.3 DELAY GROUP CALL

This is the state used when the controlling SwMI CC application has evaluated that the call set-up is to be delayed. In this state FE2 shall:

- receive delay acceptances from the participating SwMI(s) and the originating SwMI and forward this information to the controlling SwMI CC application;
- receive call set-up responses from delaying SwMI(s) and forward this information to the controlling SwMI CC application;
 - upon call set-up acceptance from the CC application, send a call set-up to all delayed SwMI(s);
- inform indicated SwMI(s) that the call is to be released when the CC application has indicated that the call shall be released in the specified SwMI(s).

In this state FE2 may:

- receive a request from a participating SwMI or the originating SwMI that it wishes to either be release from the call or it wishes to release the complete call;

From this state FE2 can go to state GROUP CALL INITIATE or CALL RELEASE.

6.4.2.4 ACTIVE

This is the state used by the controlling SwMI ANF-ISIGC entity when the call is through connected and active. In this state FE2 shall:

- when requested by the controlling SwMI CC application:
 - poll participating SwMI(s);
 - convey polling responses from participating SwMI(s) to the controlling SwMI CC application;
 - send call information to participating SwMI(s);
 - analyse migration information for the active group call and evaluate if a new inter-TETRA connection needs to be established for call restoration or if call restoration information shall be sent to an existing participating SwMI;
 - obtain routing information to the new participating SwMI and route the call restoration request over a new inter-TETRA connection;
 - obtain routing information to the existing participating SwMI and send call restoration information to this SwMI;
 - inform SwMI(s) specified by that the CC application that the call is to be released;
- obtain routing information to the new participating SwMI (SwMIs with newly registered users or merged users) and route the call set-up information over a new inter-TETRA connection;
 - receive call set-up responses from participating SwMI and forward this information to the controlling SwMI CC application;
 - inform the participating SwMI(s) that the call is now to be through connected when indicated by the CC application;

- receive transmission and cease request from participating SwMI(s) and evaluate this information;
 - check for resource availability in participating SwMI(s);
 - inform requesting SwMI(s) of transmission grant, interrupted, ceased, queued or rejected;
 - inform participating SwMI(s) of transmission grant, interrupted or ceased;
- receive information concerning withdrawal or continuation from an active group call from participating SwMI(s) and forward this information to the controlling SwMI CC application.

In this state FE2 may:

- receive indication that a seized ANF-ISIGC entity is to interact with an entity already active for the called group (the calling user shall be merged into the call);
- receive a request from a participating SwMI that it wishes to either be release from the call or it wishes to release the complete call.

From this state FE2 can go to state GC RESTORATION or CALL RELEASE.

6.4.2.5 GC RESTORATION

This is the state used when the controlling SwMI ANF-ISIGC entity has been requested to perform call restoration. In this state FE2 shall:

- receive indication from the new participating SwMI that the new inter-TETRA connection has been established;
- analyse if the migrated user was the last member of the group in the old participating SwMI;
 - release the call and the ANF-ISIGC connection from the old participating SwMI;
- inform the controlling SwMI CC application that call restoration has been performed.

In this state FE2 may:

- receive a request from a participating SwMI or the originating SwMI that it wishes to either be release from the call or it wishes to release the complete call;
- inform indicated SwMI(s) that the call is to be released when the CC application has indicated that the call shall be released in the specified SwMI(s).

From this state FE2 can go to state ACTIVE and CALL RELEASE.

6.4.2.6 CALL RELEASE

This is the state where the complete call is being released. This state may be used to collect call information, before the call is completely released. In this state FE2 shall:

- wait for confirmation that the call has been released from participating SwMI(s) and the originating SwMI;
- complete the release of the ANF-ISIGC connections.

From this state FE2 can go to state IDLE.

6.4.3 States at the participating SwMI

6.4.3.1 IDLE

This is the initial state for the participating SwMI ANF-ISIGC entity. In this state FE3 shall:

- receive set-up information from the controlling SwMI and forward this information to the participating SwMI CC application;
- receive information from the participating SwMI CC application that:
 - the call is ready for through connect and forward this information to the controlling SwMI;
 - start timer T2 as indicated in subclause 6.8;
 - the call has been rejected and forward this information to the controlling SwMI;
 - the CC application wishes to delay the call set-up and forward this information to the controlling SwMI;
- release reserved resources upon expiration of timer T2;
- receive indication from the originating SwMI ANF-ISIGC entity for this call that this entity has changed status from originating to participating;
- inform the participating SwMI CC application to connect members of the group call using resources reserved by the originating SwMI ANF-ISIGC entity.

In this state FE3 may:

- receive call restoration information from the controlling SwMI and forward this information to the participating SwMI CC application.

From this state FE3 can go to state WAIT CONNECT, DELAY ENTRY or ACTIVE.

6.4.3.2 WAIT CONNECT

This is the state where call set-up has been initiated and the participating SwMI ANF-ISIGC entity is waiting for the call to be through connected. In this state FE3 shall:

- receive indication that the called user is to be through connected and forward this information to the participating SwMI CC application; or
- receive indication that the call is to be delayed and forward this information to the participating SwMI CC application; or
 - receive indication that the participating SwMI CC application has accepted the delay and forward this information to the controlling SwMI;
- receive indication that this SwMI is being released from the call and forward this information to the participating SwMI CC application; or
- receive information from the participating SwMI CC application that the call is to be disconnected in the participating SwMI and forward this information to the controlling SwMI.

From this state FE3 can go to state ACTIVE, DELAY GROUP CALL, CALL DISCONNECT or CALL RELEASE.

6.4.3.3 DELAY ENTRY

This is the state used by the participating SwMI ANF-ISIGC entity when the CC application has informed the entity to delay the call set-up. In this state FE3 shall:

- receive information from the participating SwMI CC application that the SwMI is now ready for through connect and forward this information to the controlling SwMI; or
- receive indication that this SwMI is being released from the call and forward this information to the participating SwMI CC application; or
- receive information from the participating SwMI CC application that the call is to be disconnected in the participating SwMI and forward this information to the controlling SwMI.

From this state FE3 can go to state WAIT CONNECT, CALL DISCONNECT or CALL RELEASE.

6.4.3.4 DELAY GROUP CALL

This is the state where the participating SwMI ANF-ISIGC entity has been delayed during call set-up. In this state FE3 shall:

- receive set-up information from the controlling SwMI and forward this information to the participating SwMI CC application. The call is no longer delayed; or
 - receive information from the participating SwMI CC application that the call is ready for through connect and forward this information to the controlling SwMI;
 - receive information from the participating SwMI CC application that the CC application wishes to delay the call set-up and forward this information to the controlling SwMI;
- receive indication that this SwMI is being released from the call and forward this information to the participating SwMI CC application; or
- receive information from the participating SwMI CC application that the call is to be disconnected in the participating SwMI and forward this information to the controlling SwMI.

From this state FE3 can go to state WAIT CONNECT, DELAY ENTRY, CALL RELEASE or CALL DISCONNECT.

6.4.3.5 ACTIVE

This is the state used by the participating SwMI ANF-ISIGC entity when the call is through connected and active. In this state FE3 shall:

- when requested by the controlling SwMI:
 - poll members of the group call;
 - convey a polling response back to the controlling SwMI;
 - check if resources are available for transmission and reserve these resources. Forward this information to the participating SwMI CC application;
 - inform the controlling SwMI of resource reservation when requested by the participating SwMI CC application;
- receive transmission and cease request from the participating SwMI CC application and inform the controlling SwMI of transmission and cease request;
- receive transmission grant, interrupted, ceased, queued or rejected information from the controlling SwMI and forward this information to the participating SwMI CC application;

- receive information that the participating SwMI CC application wishes to either withdraw or continue with an active group call and forward this information to the controlling SwMI;
- receive call information from the controlling SwMI and forward this information to the participating SwMI CC application;
- receive an indication from the participating SwMI CC application that call restoration must be performed and forward this information to the controlling SwMI (only valid for the group home SwMI when this SwMI differs from the controlling SwMI or the old visiting SwMI when the migrated user is not a member of the called group);
- receive indication that this SwMI is being released from the call and forward this information to the participating SwMI CC application;
- receive information from the participating SwMI CC application that the call is to be disconnected in the participating SwMI and forward this information to the controlling SwMI.

From this state FE3 can go to state CALL DISCONNECT or CALL RELEASE.

6.4.3.6 CALL DISCONNECT

The participating SwMI ANF-ISIGC entity is in this state when the CC application has made a request to be disconnected from the call. In this state FE3 shall:

- receive indication that this SwMI is being released from the call and forward this information to the participating SwMI CC application.

From this state FE3 can go to state CALL RELEASE.

6.4.3.7 CALL RELEASE

This is the state where the call is being released within a participating SwMI. This state may be used to collect call information, before the call is completely released. In this state FE3 shall:

- wait for confirmation from the participating SwMI CC application that release has been performed;
- complete the release of the ANF-ISIGC connection.

From this state FE3 can go to state IDLE.

6.5 ANF-ISIGC signalling procedures

The signalling procedures below specify the conditions under which the SwMI ANF-ISIGC entities send or receive:

- the TETRA ISI PDUs defined in subclause 6.3.1; and
- PISN basic call primitives together with some of these TETRA PDUs.

The specific parameters of some of those PISN basic call primitives have been defined in subclause 6.2.

To simplify the text below, only the results of those PISN basic call primitives have been specified, e.g. sending of a PSS1 SETUP or CONNECT message.

NOTE: From a formal point of view the SwMI PSS1 protocol control entities are not part of the ANF-ISIGC entities.

The SDL representation showing the behaviour of an ANF-ISIGC entity at the originating SwMI is shown in figures A.1 to A.4, at the group home/controlling SwMI in figure A.5 to A.10 and at the participating SwMI in figures A.11 to A.13 of annex A.

6.5.1 Call set-up procedures

6.5.1.1 Forward set-up request and PISN called number sending

A group call shall be initiated by a primitive sent from the CC application to an ANF-ISIGC entity in the originating SwMI. The ANF-ISIGC entity shall then send the PSS1 SETUP message as defined in subclause 6.2.1.1 including the ISI-ORIGINATING SETUP PDU defined in table 25.

The procedures defined in ISO/IEC 11582 [14] for connection oriented, call related connections shall apply. En bloc sending method shall be used.

The information element 'Group attachment indicator' in the ISI-ORIGINATING SETUP PDU shall be used to indicate if the calling user is attached to the called group within the originating SwMI. According to the ANF-ISI Mobility Management standard ETS 300 392-3-5 [6], the group home SwMI does not necessarily have knowledge of each group attachment made by migrated users in a visiting SwMI.

6.5.1.2 Group linking

When the group home SwMI does not coincide with the controlling SwMI, then the ISI-ORIGINATING SETUP PDU sent from the originating SwMI shall be re-routed to the controlling SwMI (linking home SwMI). An ISI-REROUTE SETUP PDU shall be sent from the group home SwMI in a PSS1 RELEASE COMPLETE message as defined in subclause 6.2.1.2.1 to the originating SwMI. The controlling SwMI MNI shall be indicated in this PDU.

The group home SwMI call control application shall confirm the group call before re-routing the call request.

NOTE: When groups are linked, the group profile information for groups located in SwMI(s) other than the linking controlling SwMI are not given to the linking controlling SwMI. Therefore, call acceptance according to the group profile information must be performed by the group home SwMI.

When the calling user is not a member of the called group or the calling user is not attached to the called group in the originating SwMI and the group home SwMI has evaluated that this user can participate in the requested group call, the information element 'temporary group member indication' shall be set to 1 in the ISI-REROUTE SETUP PDU sent to the originating SwMI. This information element shall also be set in the re-routed ISI-ORIGINATING SETUP PDU sent to the controlling SwMI.

When groups are linked, the linking controlling SwMI has no knowledge of the individuals belonging to each group that is linked. Therefore, the group home SwMI shall inform the controlling SwMI of whether or not the calling user may initiate a group call to the requested group.

6.5.1.3 Call request, information channel selection and PISN called number sending

The controlling SwMI shall evaluate whether the calling user shall be allowed to perform a call to the requested group (received in the ISI-ORIGINATING SETUP) based on whether the calling user is a member of the called group or not, the calling user's profile information if available and on the group attachment indicator received in the ISI-ORIGINATING SETUP PDU.

If the controlling SwMI grants the calling user permission to perform a call to the requested group, group call establishment shall be initiated by a primitive sent from the CC application to an ANF-ISIGC entity in the controlling SwMI. The ANF-ISIGC entity should first inform the originating SwMI of the call status and call set-up time used by the controlling SwMI in a ISI-INFO PDU as defined in table 28. This PDU shall be carried in a PSS1 CONNECT message. The ANF-ISIGC entity shall then initiate group call set-up in the participating and the originating SwMI. A PSS1 SETUP message as defined in subclause 6.2.1.3.2 including the ISI-SETUP INITIATE PDU defined in table 26 shall be sent to the participating SwMI(s). The originating SwMI shall receive the ISI-SETUP INITIATE PDU in a PSS1 FACILITY message.

NOTE 1: Upon receiving the ISI-INFO PDU, the originating SwMI call control application should inform the air interface CC application of the call status and call set-up time (T302) used in the controlling SwMI.

NOTE 2: If the ISI-INFO PDU is not sent to the originating SwMI, then the ISI-SETUP INITIATE PDU is sent in the PSS1 CONNECT message.

When the calling user is not a member of the called group or the calling user is not attached to the called group in the originating SwMI and the controlling SwMI has evaluated that this user can participate in the requested group call, the information element 'temporary group member indication' shall be set to 1 in the ISI-SETUP INITIATE PDU sent to the originating SwMI. This information element indicates that the calling user shall only have permission to participate in the call, to the connected group, for the duration of the call. Once the calling user disconnects from the group call or is released from the call, a new call set-up sequence shall be performed before this user can participate in a call to the same group.

When it has been evaluated by the controlling SwMI that group profile information is needed for the calling user in the originating SwMI, the information elements 'individual basic migration profile' and 'SS-migration profile' shall be sent in the ISI-SETUP INITIATE PDU sent to the originating SwMI. The profiles information sent shall only contain information needed during the call maintenance phase and shall only be valid for the duration of the group call.

The procedures defined in ISO/IEC 11572 [12] for information channel selection, called number sending and call connection shall apply. En bloc sending method shall be used.

6.5.1.4 Call confirmation and call characteristics notification by the originating and participating SwMI(s)

The procedures defined in ISO/IEC 11572 [12] for call confirmation indication and PSS1 call connected shall apply.

Group call acceptance shall be indicated from the CC application in the originating and participating SwMI(s) to its ANF-ISIGC entity invoked for the call. This ANF-ISIGC entity in the participating SwMI shall send a PSS1 CONNECT message as defined in subclause 6.2.1.4.2 including the ISI-SETUP ACKNOWLEDGE PDU defined in table 29. This PDU shall be sent in a PSS1 FACILITY message from the originating SwMI. At the same time the ANF-ISIGC entity in the originating and participating SwMI shall start timer T2. The value of this timer shall be sent to the controlling SwMI in the ISI-SETUP ACKNOWLEDGE PDU.

Upon expiration of this timer the participating/originating SwMI shall release all resources reserved for the call and request to disconnect. An ISI-DISCONNECT PDU shall be sent to the controlling SwMI in a PSS1 DISCONNECT message.

The participating SwMI may indicate to the controlling SwMI in the ISI-SETUP ACKNOWLEDGE PDU its supported value for the sub-element 'communication type' in the information element 'basic service information' when the value received in the PSS1 SETUP message cannot be support (i.e. normal, acknowledge or broadcast calls). Likewise each SwMI (originating and participating) shall indicate which method of resource allocation is used (temporary or permanent). See table 74.

Group call delay may be indicated from the CC application in the originating SwMI or a participating SwMI to its ANF-ISIGC entity invoked for the call if the SwMI wishes to delay call set-up. This participating ANF-ISIGC entity shall then send a PSS1 CONNECT message as defined in subclause 6.2.1.4.2 including the ISI-DELAY PDU as defined in table 30. This originating ANF-ISIGC entity shall send this PDU in a PSS1 FACILITY message.

6.5.1.5 Call confirmation indication and call connected by the controlling SwMI

The controlling SwMI ANF-ISIGC entity shall send a PSS1 FACILITY message including the ISI-CONNECT PDU defined in table 32 when call set-up responses from the originating and participating SwMI(s) have been evaluated by the CC application in the controlling SwMI and call confirmation has been indicated.

Upon reception of the ISI-CONNECT PDU in the originating and participating SwMI(s), the timer T2 shall be stopped.

If the CC application chooses to delay the group call, an ISI-RELEASE PDU as defined in table 49 shall be sent out to the SwMI(s) who had accepted call set-up (ISI-SETUP ACKNOWLEDGE PDU sent to the controlling SwMI). This PDU shall be sent in a PSS1 FACILITY message. At the same time the ANF-ISIGC entity in the controlling SwMI shall start timer T1.

Upon expiration of this timer the controlling SwMI shall release the ISI connections to the delaying SwMI(s). The controlling SwMI shall then either set-up the group call between the delayed SwMI(s) or decide to release all ANF-ISIGC connections.

6.5.1.6 Delay of call set-up

Delaying SwMI(s) may request continuation of call set-up to the controlling SwMI by sending the ISI-SETUP ACKNOWLEDGE PDU as defined in table 29 in a PSS1 FACILITY message.

This indication shall be forwarded to the CC application of the controlling SwMI for evaluation. If call set-up already is complete the delaying SwMI shall receive an ISI-CONNECT PDU sent in the PSS1 FACILITY message if connection was allowed by the CC application.

If the CC application indicates that the call set-up now shall continue, the timer T1 is stopped and call set-up shall be performed to delayed SwMI(s). An ISI-SETUP PDU shall be sent in a PSS1 FACILITY message. The delayed SwMI(s) can then either respond positive by sending an ISI-SETUP ACKNOWLEDGE PDU or negative by sending an ISI-DELAY PDU in a PSS1 FACILITY message. The delayed SwMI(s) may wish to continue to delay the call. The CC application shall then again evaluate the received responses. The CC application may choose to connect the call (ISI-CONNECT PDU sent in a PSS1 FACILITY message) or delayed it again. If the call is to continue to be delayed, all SwMI(s) who had accepted the call, shall once again receive an ISI-RELEASE PDU as described in subclause 6.5.1.5.

The CC application may also choose to continue the delay of the call when a delaying SwMI request for continuation of call set-up. This shall occur when other SwMI(s) have also delayed the call set-up. An ISI-RELEASE PDU shall be sent back to the delaying SwMI, this SwMI shall then become a delayed SwMI. The ISI-RELEASE PDU shall be sent in a PSS1 FACILITY message.

6.5.1.7 Failure of call establishment

If the call attempt is rejected by the controlling SwMI (because of e.g. incompatibility basic service information or internal congestion), an ISI-REJECT PDU as defined in table 52 shall be sent to the originating SwMI, with the appropriate reject cause. The PDU shall be sent in a PSS1 RELEASE COMPLETE message.

If the call attempt is rejected by the originating or a participating SwMI (because e.g. of internal congestion or the security level is not support), the ISI-REJECT PDU as defined in table 47 and 53 shall be sent to the controlling SwMI with the appropriate reject cause. When sent from the originating SwMI the PDU shall be sent in a PSS1 DISCONNECT message. From the participating SwMI the PDU shall be sent in a PSS1 RELEASE COMPLETE message.

6.5.2 Acknowledge group call

The controlling SwMI may poll group members after call set-up, by sending a ISI-POLL USER PDU (table 33) to participating SwMI(s) as described in stage 1, subclause 4.2.2.3.5. This PDU shall be sent in a PSS1 FACILITY message. Participating SwMI(s) shall poll group members when requested by the controlling SwMI and return the requested polling response to the controlling SwMI in an ISI-POLL RESPONSE PDU sent in a PSS1 FACILITY message.

If the calling user has requested transmission and is not granted transmission during call set-up, the information element 'transmission grant' in the ISI-CONNECT PDU shall indicate that the transmission request is queued. When the controlling SwMI decides that the calling user shall receive permission to transmit, a solicited ISI-TX GRANTED PDU shall be sent to the calling user indicating that transmission has now been granted.

The controlling SwMI may inform the participating SwMI(s) of the poll result by using a ISI-INFO PDU as defined in table 37. This PDU shall also be sent in a PSS1 FACILITY message.

6.5.3 Call maintenance procedures

No ISI hang timer exist for releasing the ISI connection between the controlling and participating SwMI(s). The ISI connection shall be permanently available for the duration of the call. The ISI connections shall only be release when the controlling SwMI or a participating SwMI initiates a full or partial group call release.

6.5.3.1 Transmission control procedures

When a transmission request is received in a participating SwMI, this request shall be forwarded to the controlling SwMI ANF-ISIGC entity in an ISI-TX DEMAND PDU as defined in table 38. This PDU shall be sent in a PSS1 FACILITY message. Depending on the result of the received request (see subclause 4.2.2.3.7) in the controlling SwMI, the requesting SwMI may either receive a ISI-TX DEMAND RESPONSE PDU as defined in table 39, an ISI-TX GRANTED PDU as defined in table 43 or an ISI-TX INTERRUPT PDU as defined in table 44.

If transmission is to be granted to the requesting user, resource allocation shall be performed in SwMI(s) with temporary allocated resources. An ISI-RESOURCE PDU (table 40) shall be sent to the participating SwMI(s) in a PSS1 FACILITY message. If the SwMI could reserve resources for the new transmission, then this SwMI shall indicated so in the ISI-RESOURCE RESPONSE PDU in a PSS1 FACILITY message. Otherwise an indication that resources could not be reserved, shall be sent in the same PDU. The ANF-ISIGC entity shall then decide if transmission is to be granted.

When a cease of transmission request is received in a participating SwMI, this request shall be forwarded to the controlling SwMI ANF-ISIGC entity in an ISI-TX CEASED PDU as defined in table 42. This PDU shall be sent in a PSS1 FACILITY message. Depending on the result of the received request (current transmission is ceased or a queued transmission request has been granted permission to transmit) in the controlling SwMI, the requesting SwMI may either receive a ISI-TX CEASED PDU as defined in table 42 or an ISI-TX GRANTED PDU. If a queued transmission request has been removed from the transmission queue, then no response to the ISI-TX CEASED PDU shall be sent from the controlling SwMI to the requesting SwMI.

Each time transmission is granted to a new user, the ANF-ISIGC entity in the controlling SwMI should check if any SwMI(s) with group members not currently participating in the active call, exist. If so, a group call connection shall be established towards these SwMI(s) as defined in subclause 6.5.1 before transmission is granted to the requesting user.

When a participating SwMI wishes to withdraw from a active group call or rejoin a active group call, an ISI-TX WAIT PDU as defined in table 46 or an ISI-TX CONTINUE PDU shall be sent to the controlling SwMI. The PDU shall be sent in a PSS1 FACILITY message.

6.5.3.2 Call modification and/or continuation

The controlling SwMI may wish to inform the participating SwMI(s) a change in the call time-out time. When requested by the CC application of the controlling SwMI, the ANF-ISIGC entity shall send an ISI-INFO PDU to the participating SwMI(s) as defined in table 37. This PDU shall be sent in a PSS1 FACILITY message.

The same PDU carried in the PSS1 FACILITY message may also be used to request call modification in the participating SwMI(s) (as specified in subclause 14.5.2.2 of ETS 300 392-2 [3]).

If the received modifications cannot be accepted by the SwMI, an ISI-DISCONNECT PDU as defined in table 48 shall be returned to the controlling SwMI. This PDU shall be carried in a PSS1 DISCONNECT message.

6.5.3.3 Call restoration

According to ANF-ISIMM (ETS 300 392-3-5 [6]), the group home SwMI CC application shall always be informed when call restoration is to occur in a participating SwMI. It is therefore the group home SwMI's responsibility to ensure that an ANF-ISIGC connection is established to the participating SwMI if this SwMI is not already participating in the group call. And to inform the new participating SwMI of the necessary call information (basic service info, call priority and so on).

Call restoration to a new SwMI shall be performed by sending a ISI-CALL RESTORATION PDU as defined in table 27 in a PSS1 SETUP message from the ANF-ISIGC entity in the controlling SwMI.

NOTE 1: It is assumed that the group home and controlling SwMI are collocated.

If the new SwMI could accept the received call information and call restoration can be performed in this SwMI (resources are available), an ISI-CALL RESTORED PDU shall be returned to the controlling SwMI in a PSS1 CONNECT message.

If the new SwMI cannot support call restoration, an ISI-REJECT PDU with an appropriate reject cause shall be returned to the controlling SwMI contained within the PSS1 RELEASE COMPLETE message.

When an ANF-ISIGC connection already exist to the participating SwMI where the migrated user is located, an ISI-CALL RESTORE INFO PDU shall be sent to this SwMI. This PDU shall indicate the condition for which the migrated user may re-establish the call in the SwMI. No response to this PDU shall be sent back from the participating SwMI. The ISI-CALL RESTORE INFO PDU shall be sent in the PSS1 FACILITY message.

When the migrated user is only allowed to participate in the given call for the duration of this call, the information element 'temporary group member indication' shall be set to 1 in the ISI-CALL RESTORATION or ISI-CALL RESTORE INFO PDU. When it has been evaluated by the controlling SwMI that group profile information is needed for the migrated user in the participating SwMI, the information elements 'individual basic migration profile' and 'SS-migration profile' shall also be sent in the ISI-CALL RESTORATION or ISI-CALL RESTORE INFO PDU. The profiles information sent shall only be valid for the call restoring user for the duration of the group call.

Following call restoration to the new SwMI, call release shall be performed towards the old SwMI, if the last member of the group call has migrated. The ANF-ISIGC entity in the controlling SwMI shall send an ISI-RELEASE PDU in a PSS1 DISCONNECT message to the old SwMI. The old SwMI shall then confirm call release by sending the ISI-RELEASE COMPLETE PDU (defined in table 50) to the controlling SwMI in a PSS1 RELEASE message. Confirmation that the PSS1 connection has been released is sent to the old SwMI by sending a PSS1 RELEASE COMPLETE message.

After the old SwMI has been released, the call control application in the controlling SwMI shall be informed of the call restoration result.

When a user has migrated and this user's home SwMI differs from the controlling SwMI, an ISI-CALL RESTORE INITIATE PDU shall be sent in a PSS1 FACILITY message to the controlling SwMI to inform it of call restoration. When the migrated user's home SwMI is not participating in the group call the ISI-CALL RESTORE INITIATE PDU shall be sent in a PISN connection oriented, call independent PSS1 SETUP message to the old visiting SwMI. This SwMI shall then forward the request to the controlling SwMI.

If the migrated user's call restoration request fails and this user is either the call owner or a critical user as defined in the PDU ISI-CALL RESTORATION or ISI-CALL RESTORE INFO, the restoring SwMI shall send an ISI-INFO PDU to the controlling SwMI informing it that the call could not be re-established to the call owner or critical user. It shall be up to the controlling SwMI to decide if the call should continue or if it should be disconnected.

NOTE 2: When the call owner is no longer participating in the group call the controlling SwMI should release the complete call.

6.5.3.4 DTMF procedures

The DTMF information shall be sent over the ISI in a PSS1 FACILITY message including the ISI-INFO PDU defined in table 37 (see also subclause 6.5.2.2).

NOTE: According to ISO/IEC 11582 [14], a PSS1 FACILITY can only be sent by the originating SwMI after a PSS1 signalling path has been established (i.e. a first PSS1 message has been received from the controlling SwMI, e.g. PSS1 ALERTING or CONNECT message). This originating SwMI will therefore have to store the DTMF information that it has received until the signalling path is established. According to ETS 300 392-2 [3], the air interface U-INFO PDU can carry DTMF information as soon as a call reference has been allocated by the (originating) SwMI.

6.5.4 Call disconnection procedures

When the originating SwMI or a participating SwMI wishes to be disconnected from the group call, an ISI-DISCONNECT PDU shall be sent to the controlling SwMI in a PSS1 DISCONNECT message. This information is forwarded to the CC application in the controlling SwMI for evaluation.

NOTE 1: The originating SwMI may wish to be released from the call after sending the ISI-SETUP ACKNOWLEDGE PDU but before the ISI-CONNECT PDU is received.

The CC application may choose to release the requesting SwMI or release the complete call. If only the release requesting SwMI is to be released, an ISI-RELEASE PDU shall be sent to this SwMI in a PSS1 RELEASE message. Upon call release, this SwMI shall then confirm that release is complete by sending an ISI-RELEASE COMPLETE PDU (defined in table 50) to the controlling SwMI in a PSS1 RELEASE COMPLETE message.

NOTE 2: When the disconnection request has been sent from the call owner, the complete call is always released (the information element 'call owner request' has been set in the ISI-DISCONNECT PDU).

If the complete call is to be released, an ISI-RELEASE PDU shall be sent out to all SwMI(s) participating in the group call. The PDU shall be carried in a PSS1 RELEASE message to the release requesting SwMI and a PSS1 DISCONNECT message to all other SwMI(s). Upon call release, the released SwMI(s) shall send an ISI-RELEASE COMPLETE PDU (defined in table 50) to the controlling SwMI. This TETRA PDU shall be carried in a PSS1 RELEASE COMPLETE message by the release requesting SwMI and by a PSS1 RELEASE message by all other SwMI(s). Confirmation that the PSS1 connection has been released is sent back to the released SwMI(s) by sending a PSS1 RELEASE COMPLETE message.

When the group call is release upon request from the CC application in the controlling SwMI, the same procedures as described for complete call release above shall be performed.

No TETRA PDU shall be included in the case of call clearing by the PSS1 network (PSS1 RELEASE COMPLETE).

6.5.5 Call collisions

In the case of call collision because two adjacent PISN nodes (including SwMIs involved in the call establishment or restoration) both attempt to seize the same PISN B_Q channel the procedure defined in ISO/IEC 11572 [12] for call collision shall apply.

See stage 1 subclause 4.2.2.3.6, for the description of colliding calls between two originating SwMI(s).

6.6 ANF-ISIGC impact from interworking with ISDN/PISN/PSTN

6.6.1 Call set-up procedures

For an external incoming group call (i.e. to a TETRA group) routed over the ISI, the incoming gateway shall send the number of the calling party in the external network, if available, to an invoked ANF-ISIGC entity in the originating SwMI. This entity shall then forward the group call request in an ISI-ORIGINATING SETUP PDU as defined in table 25 to the controlling SwMI. This PDU shall also include PSS1 information elements (notably the progress indicator elements) as defined in subclause 6.2.1.5.1. Call set-up shall then continue in the controlling SwMI as described in subclause 6.5.1.

NOTE 1: It is assumed that the group home SwMI and the controlling SwMI coincide.

However, the following exceptions to subclause 6.2.1.5.1 shall apply:

- the controlling SwMI shall provide the external subscriber number and the incoming gateway identity (calling party identity information element) in the ISI-SETUP INITIATE PDU;
- when the incoming gateway is the only member of the called group in the originating SwMI, then resource reservation shall always be set to permanent resource allocation;

NOTE 2: If new group members join the call in this SwMI, e.g. due to migration or late entry, resource reservation may be changed to temporary resource allocation by indicating so in the ISI-SETUP ACKNOWLEDGE, ISI-CALL RESTORED or in an ISI-INFO PDU.

- the controlling SwMI shall always give call ownership to the incoming gateway entity, to ensure that when the external calling user wishes to release the call, the complete call is released;
- call set-up shall not be delayed when the calling user is an external user.

6.6.2 Call maintenance procedures

The calling user may send a request to transmit or a request to cease transmission to the controlling ANF-ISIGC entity either by sending explicit requests through the external network or by using a voice detection mechanism at the incoming gateway to generate transmission cease and requests.

NOTE 1: The exact mechanisms for voice detection and its algorithm is outside the scope of this ETS.

To ensure that the external calling user can receive transmission grant before starting to speak, transmission shall always be granted to this user when no other called group member is transmitting. Therefore, when the controlling SwMI receives an ISI-TX CEASED PDU, it shall always respond with an ISI-TX GRANTED PDU to either queued request from TETRA users or to the external calling user.

NOTE 2: Transmission is always granted to requesting TETRA users before granting transmission to the external calling user.

If a TETRA user requests permission to transmit while the external calling user is transmitting, transmission shall be interrupted towards the external calling user and transmission granted to the requesting TETRA user.

6.6.3 Call disconnection procedures

See subclause 6.5.4.

6.7 Protocol interaction between ANF-ISIGC and supplementary services and other ANFs

6.7.1 Call Forwarding Unconditional (SS-CFU)

ANF-ISIGC shall interact with SS-CFU when a group call is forwarded to a group located in a SwMI other than the called group's home SwMI.

When the called group's home SwMI does not coincide with the forwarded to group's home SwMI, then an ISI-REROUTE SETUP PDU as defined in table 51 shall be sent in a PSS1 RELEASE COMPLETE message back to the originating SwMI. To re-route the call, the ANF-ISIGC entity in the originating SwMI shall initiate a new call establishment, using the group home SwMI MNI received in the ISI-REROUTE SETUP PDU.

NOTE 1: If the calling user and the called group have the same home SwMI and the calling user has not migrated, the call will be an intra-TETRA call. In such cases, if SS-CFU is activated for the called group and if the forwarded-to group is registered in a different SwMI, SS-CFU will invoke an ANF-ISIGC for the establishment of the call.

NOTE 2: When SS-CFU is invoked for a call, i.e. for a group, the SS-CFU notification information is transported transparently between group home SwMI(s) or between the group home SwMI and the originating SwMI.

When a group call request is forwarded unconditionally to an individual, then the group home SwMI shall invoke ANF-ISIIC. ANF-ISIIC shall then consider the ISI-ORIGINATING SETUP PDU sent from the originating SwMI as an individual call set-up indication.

6.7.2 Call Authorized by Dispatcher (SS-CAD)

When SS-CAD is invoked for an incoming group call and the operation of SS-CAD entails the establishment of a call between the calling user and the dispatcher (i.e. diversion to the dispatcher) and the calling user is located in a SwMI other than the restricted groups home SwMI, a group call set-up shall be made between the calling user in the originating SwMI and the dispatcher. (See subclause 6.5.1 for call set-up.) When sending the ISI-SETUP INITIATE PDU to the originating SwMI, the information element 'Call diverted to dispatcher' shall be set. This information element shall be used to indicate to the originating SwMI that SS-CAD has been invoked by the group home SwMI for the called group and direct set-up shall be made to the dispatcher.

NOTE 1: This caters for the case where the originating SwMI does not support SS-CAD.

Upon reception of the TETRA PDU ISI-CONNECT (defined in table 32), the originating SwMI shall however, remain to exist. The originating SwMI shall not change status to a participating SwMI and any called group members located in the SwMI shall not be connected.

The originating SwMI shall only upon reception of the TETRA PDU ISI-THROUGH CONNECT (defined in table B.1 in annex B) sent from the controlling SwMI change status to a participating SwMI and connect any called group members located in the SwMI. At this point the originating SwMI shall cease to exist. Even though the originating SwMI does not support SS-CAD, the TETRA PDU ISI-THROUGH CONNECT shall be supported.

When the dispatcher is located in a SwMI other than the restricted groups home SwMI in the case above, call set-up to this dispatcher shall be performed as described in ETS 300 392-11-6 [9].

NOTE 2: When the calling user is located in the restricted groups home SwMI and the dispatcher is located in another SwMI, SS-CAD shall invoke ANF-ISIIC to the dispatcher as described in ETS 300 392-3-2 [5].

When the operation of SS-CAD does not entail the establishment of a call between the calling user and the dispatcher (i.e. interception by the dispatcher), only the PISN connection shall be through connected. This connection shall be used to inform the calling user of acceptance or rejection by the dispatcher or of a possible diversion to the dispatcher. The TETRA call set-up shall continue depending upon the received response.

NOTE 3: See annex B for information flow diagrams describing the interaction between ANF-ISIGC and SS-CAD.

6.7.3 Area Selection (SS-AS)

The information element "area selection" shall be carried in the TETRA ISI-ORIGINATING SETUP PDU sent in the PSS1 call related SETUP message. The information element shall be used by the group/linking home SwMI during call set-up, in the cases of late entry and may be used during call restoration.

6.7.4 Priority Call (SS-PC)

If SS-PC has been activated and call set-up operates by queuing, then each group call shall be established according to the queuing mechanism implemented in the SwMI(s) for priority.

The calling user shall send the call priority level to the controlling SwMI in the ISI-ORIGINATING SETUP PDU when the calling user is not located in the called group's home SwMI. The controlling SwMI may then accept this priority level or change it. The priority level given for the call shall be sent in the ISI-SETUP INITIATE PDU.

6.7.5 Pre-emptive Priority Call (SS-PPC)

SS-PPC shall interact with ANF-ISIGC to pre-empt a inter-TETRA connection with the lowest CRV among those which may be used to route the priority call. SS-PPC shall invoke pre-emption by forcing the clearing of the chosen inter-TETRA connection. An ISI-RELEASE PDU shall be sent out to participating SwMI(s) being released from the group call (see subclause 6.5.4 for complete release of a group call). The controlling SwMI shall then invoking a new ANF-ISIGC at the corresponding ISI by sending an ISI-SETUP INITIATE PDU (see subclause 6.5.1 for call set-up sequence).

NOTE 1: The correct time to tear down the inter-TETRA connections and allocate new inter-TETRA connections, should be when the controlling SwMI has received positive indication back from the participating SwMI that it can and will support the group call (ISI-SETUP ACKNOWLEDGE PDU sent from the participating SwMI(s)).

NOTE 2: When a call extends between several TETRA systems, different call retention values may be used for resources allocated within each system. SwMIs should therefore, give it's own resources lower call retention values than resources owned by other SwMIs. This then insures that a SwMI will always pre-empt it's own resources.

6.7.6 Include Call (SS-IC)

When the group call owner wishes to include a user or group of users who are not members of the active group call and who are registered in a SwMI other than the controlling SwMI, call set-up shall be initiated by sending an ISI-SETUP INITIATE PDU as defined in table 26 from the controlling SwMI ANF-ISIGC entity. This TETRA PDU shall be carried in a PSS1 SETUP message if no inter-TETRA connection to the new SwMI exist.

NOTE: The controlling SwMI must always approve the inclusion of a user or group of users before call set-up is initiated towards the specified user(s).

Group call acceptance shall be indicated from the CC application in the new participating SwMI(s) to it's ANF-ISIGC entity invoked for the call. This ANF-ISIGC entity shall send a PSS1 CONNECT message as defined in subclause 6.2.1.4.2 including the ISI-SETUP ACKNOWLEDGE PDU.

The controlling SwMI ANF-ISIGC entity shall then send a PSS1 FACILITY message including the ISI-CONNECT PDU defined in table 32 when call set-up responses from the participating SwMI(s) have been evaluated by the CC application in the controlling SwMI and call confirmation has been indicated.

If an inter-TETRA connection already exist the above TETRA PDUs shall be carried by an PSS1 FACILITY message. See subclauses 6.5.1.4 to 6.5.1.7 for a complete description of call set-up procedures.

6.7.7 Call Retention (SS-CRT)

The CRV is dynamically assign by a SwMI, to inter-TETRA connection used to route the group call. This value may differ in SwMIs using the same inter-TETRA connection for the group call. The CRV is only know locally within the SwMIs.

6.7.8 Interactions with other supplementary services

At the time the present document was written, no other supplementary service has been identified which could require for its invocation or its operation of an interaction with ANF-ISIGC.

NOTE: Such supplementary services require only the transport of their PDUs (i.e. SS PDUs) through ANF-ISISS, as defined in clauses 9 and 10 of ETS 300 392-9 [8].

6.8 ANF-ISIGC parameter values (timers)

ANF-ISIGC shall use the mandatory timers defined in ISO/IEC 11572 [12]. It shall not use the optional PSS1 timer T301 (for the outgoing side, started by the reception of the PSS1 ALERTING message). This timer might conflict with the call set-up phase TETRA timer T302. Nor shall ANF-ISIGC use the optional timer T313 (for the incoming side, started when sending PSS1 CONNECT). PSS1 CONNECT ACKNOWLEDGE is not used for group calls over the ISI.

ANF-ISIGC shall use timer T1 as defined in subclauses 6.5.1.5 and 6.5.1.6 when a group call is delayed. The timer is used to release ISI channel resources and delaying SwMI(s), if no response is received from the delaying SwMI within a certain period of time. The value of this timer shall be 30 seconds.

ANF-ISIGC shall use timer T2 as defined in subclauses 6.5.1.4 and 6.5.1.5 when an ISI-SETUP ACKNOWLEDGE PDU is sent from the originating or participating SwMI(s). The timer is used to release air interface, mobile and infrastructure resources if no ISI-CONNECT PDU is received from the controlling within a certain period of time. The minimum value of this timer shall be 5 seconds, and its maximum value, 30 seconds.

The ISI connection shall be permanently available for the duration of the call. Therefore, no ISI hang timer exist for releasing the ISI connection between the controlling and participating SwMI(s).

Annex A (normative): Specification and Description Language (SDL) representation of procedures

The diagrams in this annex use the Specification and Description Language defined in ITU-T Recommendation Z.100 [19].

The diagrams represents the behaviour of ANF-ISIGC entities within each SwMI participating in a group call.

At a SwMI, an output symbol represents a primitive. The output primitive results from an ANF-ISIGC PDU being received. The output primitive bears the name of the received ANF-ISIGC PDU.

When needed, the following abbreviations are used:

CNNCT for CONNECT;

DMD for DEMAND;

GRT for GRANTED;

IRT for INTERRUPT.

A.1 SDL representation of an ANF-ISIGC entity at FE1

Figure A.1 shows the behaviour of an ANF-ISIGC entity at the originating SwMI.

The following conventions are used:

- the input signals from the left represent primitives from the originating SwMI call control application;
- the output signals to the left represent primitives to the originating SwMI call control application;
- the input signals from the right represent primitives from the group home/controlling SwMI ANF-ISIGC entity;
- the output signals to the right represent primitives to the group home/controlling SwMI ANF-ISIGC entity.

Annex B (normative): Stage 2 description of the interactions between ANF-ISIGC and SS-CAD when invoked for the called group

B.1 Information flow diagrams

B.1.1 Group call set-up when SS-CAD is invoked for called group

In the case of incoming calls to a restricted group, the supplementary service CAD shall be invoked by the group home SwMI when a call request to the restricted group is received. If authorization is required by a dispatcher, three methods of call set-up may be made.

For the **case 1 scenario** direct call set-up shall be made between the calling user and the dispatcher. Indication sent to the calling user, that the call has been temporarily diverted, is optional. If the call is authorized by the dispatcher, indication of acceptance should be sent to the calling user and the dispatcher should be released. Figure B.1 to B.5 shows a call set-up sequence using direct call set-up.

For the **case 2 scenario** a connection is made between the group home SwMI and the dispatcher. Indication sent to the calling user, that the call has been intercepted, is optional. If the call is authorized by the dispatcher, indication of acceptance should be sent to the calling user and the dispatcher should be released. Figure B.6 to B.8 shows a call set-up sequence using call to dispatcher without call set-up to the calling user.

For the **case 3 scenario** call set-up shall only be made between the calling user and the dispatcher on-demand from the dispatcher. Indication sent to the calling user, that the call has been intercepted, is optional. If the dispatcher wishes to set-up a call to the calling user, call set-up will continue as for direct call set-up (see figure B.2 to B.5). If the call is authorized by the dispatcher, indication of acceptance should be sent to the calling user and the dispatcher should be released. Figure B.9 and B.10 shows a call set-up sequence using on-demand call set-up to the calling user.

 Dispatcher has migrated from group SwMI
 SS-CAD invoked for called group
 Group HSwMI not collocated with OSwMI*/

Figure B.5: Information flow sequence - Direct call set-up to dispatcher, sheet 5 of 5

Upon reception of the group addressed ISI-SETUP ind. with the SS_CAD indicator set, the originating SwMI shall evaluate if the group call can be performed and reserve resources for the group call. However, the group members shall not be connected until a ThroughConnect ind. is received from the controlling SwMI.

The resources reserved in the originating SwMI shall upon reception of the group ISI-SETUP ind. remain reserved until a ThroughConnect ind. or ISI-RELEASE ind. is received. At this point, the group call is either connected to the members of the group call in the originating SwMI using the reserved resources or the resources are released because the call could not be set-up.

NOTE: See figure CAD2 to CAD5 for the call set-up sequence.

Figure B.10: Information flow sequence - On-demand call set-up, sheet 2 of 2

B.2 Definition of information flows

The information flow PDUs have been defined for SS_CAD when additional information needs to be added to the PDU. For a complete list of SS-CAD PDU's see ETS 300 392-11-6 [9].

B.2.1 ISI_THROUGH CONNECT

ISI_THROUGH CONNECT is an unconfirmed information flow:

- across relationship rc from FE2 to FE1;
- and across relationship ra from FE1 to FE1'.

ISI_THROUGH CONNECT request/indication information flow shall be sent to the originating SwMI to inform it to through connect group members located in the originating SwMI.

Table B.1 lists the service elements within the ISI_THROUGH CONNECT information flow.

Table B.1: Content of ISI_THROUGH CONNECT

Service element	Request
Set-up type (full, partial)	M
Basic service information	C (note 1)
Call priority (emergency, priority 1-14)	C (note 1)
Call ownership	C (note 1)
Call amalgamation	M
Transmission grant	M
Transmission request permission	M
Calling user identity	M (note 2)
Call diverted to a dispatcher	M
Notification indicator	O
Proprietary	O
NOTE 1:	Conditional on the value of call amalgamation. If the information element 'call amalgamation' is not set, then the value of the information element shall be equal to the value received in the ISI-SETUP request primitive.
NOTE 2:	In the case of call amalgamation, only one of the original calling users shall become calling user for the group call. This information element shall contain this user's identity.

B.3 Functional Entity Actions (FEAs)

Only the SS-CAD specific actions are stated below. For the complete list of basic call functional entity actions see subclause 5.3.

B.3.1 Functional entity actions of FE1

- OCAD1 SS-CAD has been invoked for the called group. The group call request has been diverted.
- OCAD2 SS-CAD has been invoked for the called group. The group call request has been intercepted.
- OCAD3 Direct call set-up will be made to the dispatcher.
- OCAD4 Call set-up will not be made to the dispatcher or on-demand call set-up will be made with the dispatcher.
- OCAD5 Receive an individual addressed ISI_SETUP req.ind.
- OCAD6 Forward the set-up request to FE1'.

- OCAD7 Inform FE1' to connect the calling user using the reserved resources.
- OCAD8 The dispatcher has accepted the call. Call set-up to the called group will continue.
- OCAD9 The call is now to be through connected.
- OCAD10 Inform FE1' of the accepted call.

B.3.2 Functional entity actions of FE1'

- OCAD'1 The call has been diverted. Wait for a call set-up request to the dispatcher.
- OCAD'2 The call has been intercepted. Wait for acceptance from the dispatcher.
- OCAD'3 Wait for ISI_THROUGH CONNECT req. to the called group.
- OCAD'4 Wait for normal group call set-up.

B.3.3 Functional entity actions of FE2

- CCAD1 Send an ISI_DIVERTED req.ind. to the FE1.
- CCAD2 Send an ISI_INTERCEPT req.ind. PDU in the PSS1 CONNECT message.
- CCAD3 Set-up the call to the dispatcher as an individual call and indicate that SS-CAD has been invoked (SS PDU REQUEST).
- CCAD4 Request the dispatcher to authorize the incoming group call.
- CCAD5 Send an ISI_CONNECT to FE1 to indicate that the calling user is to be connected and an ISI_CONNECT ACKNOWLEDGE to FE3 to indicate that the dispatcher is to be through connected.
- CCAD6 The call is to be diverted to the dispatcher (On-demand call set-up by dispatcher).
- CCAD7 The call has been accepted. Inform FE1 and FE2.
- CCAD8 Release the call to the dispatcher.
- CCAD9 Release the PISN connection to the dispatcher's SwMI.

B.3.4 Functional entity actions of FE2'

- CCAD'1 The supplementary service SS-CAD has been invoked on the called group number. Direct call set-up will be made to the dispatcher. Inform the originating SwMI that the call has been diverted.
- CCAD'2 The supplementary service SS-CAD has been invoked on the called group. A call will not be set-up with the dispatcher. However, the dispatcher can choose to set-up a call with the calling user on demand.
- CCAD'3 Perform a direct set-up between the originating SwMI, FE1, and the participating SwMI were the dispatcher is located.
- CCAD'4 The call is to be authorized by a dispatcher. Send the SS PDU REQUEST to the SwMI where the dispatcher is located to indicate that the call has been intercepted.
- CCAD'5 Send an ISI_CONNECT req. to FE2 requesting that the diverted call be through connected.
- CCAD'6 The group call is accepted. Group call set-up can continue.

B.3.5 Functional entity actions of FE3

- PCAD1 Send a request to a dispatcher to authorize the incoming group call.
- PCAD2 Inform FE2 that the call shall be diverted to the dispatcher.
- PCAD3 Receive an individual addressed ISI_SETUP req.ind. to a dispatcher.
- PCAD4 Forward the request to FE3'.
- PCAD5 Forward the connect to FE2.
- PCAD6 Inform the dispatcher to through connect.
- PCAD7 Inform FE2 of the dispatcher acceptance.
- PCAD8 Release the dispatcher.
- PCAD9 Confirm that the PISN connection has been released.

B.3.6 Functional entity actions of FE3'

- PCAD'1 Inform the dispatcher to evaluate the group call.
- PCAD'2 Evaluate if the necessary resources are available and that the migrated dispatcher exist in the SwMI. If the call can be performed in the participating SwMI, then send a set-up request to the dispatcher.
- PCAD'3 The dispatcher has accepted the call. Inform the controlling SwMI.
- PCAD'4 The dispatcher wishes to set-up a call to the calling user (on-demand call set-up).
- PCAD'5 Send the connect acknowledge PDU to the dispatcher.
- PCAD'6 The incoming group call has been accepted by the dispatcher.

Annex C (informative): Static description of the TETRA group call bearer service, using attributes

Reformulating the corresponding information defined in ETS 300 392-2 [3] leads to the static description of TETRA bearer service attributes given below using the relevant attributes with the corresponding values as defined in ITU-T Recommendation I.140 [16].

- 1) Information transfer mode: circuit
- 2) Information transfer rate: from 2,4 kbit/s up to 4 x 7,2 kbit/s (= 28.8 kbit/s) (in the case of data transmission) - see 14.8.2 of ETS 300 392-2 [3]
- 3) Information transfer capability: all TETRA circuit mode bearer and tele- services
- 4) Structure:
for single slot communications: "service data unit integrity" for telephony calls and for end-to-end encrypted data calls, and "unstructured" for other data calls;

for multislots communications: "Time Slot Sequence Integrity" (TSSI).

NOTE: According to subclause 4.5.1 of ETS 300 392-2 [3] the air interface time slots comprise 510 bits (possibly only half, in special cases), sent at a data rate of 36 kbit/s (hence a timeslot duration of 14.167 ms). Depending on the type of traffic channel that they carry, these 510 bit time slots carry layer 3 service data units possibly completed by error control bits and interleaved between N time slots of different lengths (e.g. 432 bits for 7,2 kbit/s traffic channel, or 288 bits for 4,8 kbit/s traffic channel). The above statement about the value of the attribute structure in the case of telephony calls and of end-to-end encrypted data calls means that the corresponding layer 3 service data units have to be delivered transparently to the destination access point.

On the other hand, it is clear that the order of the time slots at the air interface should be kept end-to-end in multi-slot communications, hence the structure "TSSI".

- 5) Establishment of communication: demand
- 6) Symmetry: bi-directional symmetric for duplex operation, and unidirectional for half-duplex operation.
- 7) Communication configuration: point-to-multipoint (since the communication is an group call)
- 8) Access channel and rate: TDMA timeslot, at a rate of 9 kbit/s
- 9) Access protocol: air interface protocols for both signalling and user information - as defined in ETS 300 392-2 [3]
- 10) Supplementary services provided: in line with ITU-T Recommendation I.210 [17], the definition of the value of this attribute is under study
- 11) Quality of service: in line with ITU-T Recommendation I.210 [17], the definition of the value of this attribute is under study
- 10) Interworking capability: according to ITU-T Recommendation I.140 [16], the possible values of this attribute remain to be defined
- 11) Operational and commercial aspects: according to ITU-T Recommendation I.140 [16], the possible values of this attribute remain to be defined
