## Foreword

This European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) Technical Committee of the European Telecommunications Standards Institute (ETSI).

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.15.0.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3 conformity specifications for which mobile stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

### The graphical form ATS

The TTCN.GR representation of this ATS is contained in a PDF file (L3-4150.PDF<sup>1)</sup>) which accompanies this ETS and in annex A of this ETS.

### The machine processable ATS

The TTCN.MP representation corresponding to this ATS for Layer 3 is contained in an ASCII file (L3-4150.MP<sup>1)</sup>) which accompanies this ETS.

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1	Digital cellular telecommunications system (Phase 2); Mobile Station (MS) conformance specification; Part 1: Conformance specification  Reference: GSM 11.10-1.
ETS 300 607-2	Digital cellular telecommunications system (Phase 2); Mobile Station (MS) conformance specification; Part 2: Protocol Implementation Conformance Statement (PICS) proforma specification  Reference: GSM 11.10-2.
<b>ETS 300 607-3</b>	<b>Digital cellular telecommunications system (Phase 1); Mobile Station (MS) conformance specification; Part 3: Layer 3 (L3) Abstract Test Suite (ATS)</b>  <b>Reference: GSM 11.10-3.</b>

Reference is made within this draft ETS to GSM-TSs (note).

NOTE: TC-SMG has produced documents which give the technical specifications for the implementation of the European digital cellular telecommunications system. Historically, these documents have been identified as GSM Technical Specifications (GSM-TSs). These TSs may have subsequently become I-ETSs (Phase 1), or ETSS (Phase 2), whilst others may become ETSI Technical Reports (ETRs). GSM-TSs are, for editorial reasons, still referred to in current GSM ETSS.

## 1 Scope

This European Telecommunications Standard specifies the Abstract Test Suite (ATS) and partial PIXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) mobile stations (MS) conforming to the ETSs for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

## 4.3 Test groups

### 4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

### 4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct

but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

#### **4.4 Test Step Structure**

##### **4.4.1 Preambles**

The preamble is defined for each test purpose.

##### **4.4.2 Postambles**

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

### **5 Test Purposes (TP)**

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

#### **5.1 TP and test case naming convention**

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the subclause (section) numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

“Test Purpose Identifier” = “Test Case Name” = TPI = TC\_NN\_A\_B\_C\_D\_E, where NN, A, B, C, D and E are digits used in the corresponding subclause numbers of prETS 300 607-1. For example, the test case name TC\_26\_5\_6\_2 is the TTCN specification corresponding to the conformance requirements in the subclause (section) 26.5.6.1.2 in the prETS 300 607-1. In case where the subclause has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC\_26\_7\_4\_2\_4\_1, TC\_26\_7\_4\_2\_4\_2, TC\_26\_7\_4\_2\_4\_3, TC\_26\_7\_4\_2\_4\_4 and TC\_26\_7\_4\_2\_4\_5, respectively.

### **6 Abstract test method and test configurations**

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a man-machine interface as an upper tester at the SUT.

#### **6.1 Test system model**

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see fig. 1).

**Figure 3: Test system and distributed test method**

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO,
- Interface to the management functional unit via TTCN test suite operations,
- Interface to the MS man-machine interface (MMI) via a test operator.

## 6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management,
- Channel management,
- TRx management.

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system,
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

| OC_OctToInvokedType converts the OCTETSTRING `o` into InvokedType, with the MSB of `o` representing the negative value $-2^{\exp(n-1)}$ , for example '80'O->'10000000'B-> -128. The rest of the bits can code positive values up to $+2^{\exp(n-2)-1}$ , for example '4F'O->'01111111'B-> +127. |                                    |

**Description**

OC\_SubchOfSacch4 operation returns a logic channel identifier for SACCH4 subchannel indicated by the input parameters `subch` and `cell`, where `subch` is the TDMA offset, `cell` is the cell identifier which the channel belongs to.

for example:

```

OC_SubchOfSacch4('00'B, C_CellA) = C_SACCHC40_A;
OC_SubchOfSacch4('01'B, C_CellA) = C_SACCHC41_A;
OC_SubchOfSacch4('10'B, C_CellA) = C_SACCHC42_A;
OC_SubchOfSacch4('11'B, C_CellA) = C_SACCHC43_A;
OC_SubchOfSacch4('00'B, C_CellB) = C_SACCHC40_B;
OC_SubchOfSacch4('01'B, C_CellB) = C_SACCHC41_B.

```

| <p>OC_TimingCHK operation checks if a certain event took place fulfilling the timing requirements described by the time, the tolerance, and the mode between the frame numbers fn1 and fn2 .</p> <p>The frame numbers fn1 and fn2 are used to calculate the time elapsed:<br/> First the number of frames between fn1 and fn2 is calculated. The frame numbers fn1 and fn2 can be calculated from T1' as frame numbers mod 42432 only (T1' is specified in GSM 04.08, e.g. in subclauses 10.5.2.30 or 10.5.2.38). Therefore the frames fn1 and fn2 must be either in the same group of 42432 frames or in adjacent groups of 42432 frames with a maximum distance of 42432 frames between them. This means that the calculation is correct if the time between fn1 and fn2 is less then 196 seconds (approximately). The number of frames between fn1 and fn2 is calculated by:<br/> fn1 &lt; fn2: fn_delta := fn2 - fn1<br/> fn1 &gt; fn2: fn_delta := fn2 - fn1 + 42432 (In that case fn2 is in the next group of 42432 frames),<br/> One frame is equivalent to 4.615 ms, the time in ms between fn1 and fn2 is:<br/> time_delta := fn_delta * 4.615</p> <p>The time_delta is then compared with the requirements given by 'time', the tolerance 'tol' and the 'mode'.<br/> The mode specifies how the tolerance parameters 'time' and 'tol' have to be interpreted:<br/> mode = 0:<br/> If the elapsed time is within `time` the operation returns TRUE, otherwise it returns FALSE. The tolerance value is ignored.<br/> The result of OC_TimingCHK is calculated by:<br/> IF time_delta &lt;= time, OC_TimingCHK := TRUE<br/> IF time_delta &gt; time, OC_TimingCHK := FALSE<br/> mode = 1:<br/> The tolerance value is the time tolerance expressed in ms. If the elapsed time interval is within `time`-`tol` to `time`+`tol` the operation returns TRUE, otherwise it returns FALSE.<br/> The result of OC_TimingCHK is calculated by:<br/> IF time - tol &lt;= time_delta &lt;= time + tol, OC_TimingCHK := TRUE<br/> IF (time_delta &lt; time - tol) OR (time_delta &gt; time + tol), OC_TimingCHK := FALSE<br/> mode = 2:<br/> The tolerance value is the the tolerance percentage relative to 'time'. If the time interval is within `time`-`tol`% to `time`+`tol`% the operation returns TRUE, otherwise it returns FALSE.<br/> The result of OC_TimingCHK is calculated by:<br/> IF time * (1 - (tol/100)) &lt;= time_delta &lt;= time * (1 + (tol/100)), OC_TimingCHK := TRUE<br/> IF (time_delta &lt; time * (1 - (tol/100))) OR (time_delta &gt; time * (1 + (tol/100))), OC_TimingCHK := FALSE<br/> Any other value for the mode shall leads OC_TimingCHK := FALSE.</p> |                                                                                                                                                                                                                                                                                                                                                                                                      |

| OM_BmInfo operation checks whether the MS stops transmitting Bm channel information according to the information transfer capability `itc`, and transmits the Bm channel information in another information transfer capability instead. The operation returns FALSE if the MS transmits Bm channel information according to the information transfer capability `itc`. If, instead, it transmits the Bm channel information in another information transfer capability it returns TRUE. |                                                                          |

| OM_CphMd operation passes ciphering parameters for channel `ch` to lower layer and sets the channel `ch` in the ciphering mode `cphmod`. This operation puts the channel `ch` into specified ciphering mode `cphmod` immediately without the 3-step ciphering mode setting sequence. |                                                    |

| <p>OM_FHCHK operation derives frequencies, hopping sequence and starting time from the input parameters `ca`, `ma`, `cd`, `t` and `fn`, then checks whether the MS transmits on the frequencies and whether the transmissions started on the correct frame, this check is performed at the RF burst level. The operation returns TRUE if the MS behaviour is correct, otherwise it returns FALSE.</p> <p>If `t` = 0 the operation checks that the new frequencies starts "without delay".</p> <p>If <math>32024 \leq t \leq 42431</math> the operation checks that the new frequencies starts "without delay".</p> <p>If <math>0 \leq t \leq 31000</math> the operation checks that the new frequencies starts "on" the frame number of <math>(X + t) \bmod 42432</math>, where <math>x = 51 * ((fn.t3 - fn.t2) \bmod 26) + fn.t3 + 1326 * fn.t1_</math>.</p> <p>If <math>31000 &lt; t &lt; 32024</math><br/> or <math>t &lt; 0</math> (assuming TTCN has negative integers)<br/> or <math>t &gt; 42431</math><br/> then the test has been configured incorrectly and should be re-run with a permitted value for `t`.</p> <p>Note:<br/> The inverted commas around "without delay" and "on" are used because, for example, the mobile's SDCCH might not 'exist' in a particular frame. In such cases the mobile shall use the new frequencies when it next transmits. Basically after the frame indicated by 't', the mobile shall not transmit using the old frequency set.</p> |                                                                 |

| This TSO checks that the MS does not send any L3 message on the main signalling link but still continues sending L2 fill frames on the logic channel `ch`. The first call of the TSO passing the TRUE value to `strt` starts L2 fill frame checking. The second call of the TSO passing the FALSE value to the `strt` stops checking. The TSO returns TRUE if only valid L2 fill frames on the channel `ch` were correctly received between the two calls. The TSO returns FALSE otherwise. |                                            |

| OM_PgFill operation sets up the contents of paging filling frame to be sent on all paging subchannels continuously. If the contents of paging filling frame in cell `cellid` have not been set up, the operation sets the contents to `msg`. If paging filling frame in cell `cellid` has been set up, the operation changes the paging filling message to `msg`. After the required action has been taken it returns. |                                                   |

| <p>The operation stops the RF transmissions on channel `ch1` and/or `ch2`. After all RF transmissions have been stopped it returns TRUE. There is no TSO for (re)starting channels. The OM_ChConf and OM_Assoc together with the test steps sending system information messages on a cell (re)start the stopped channels. If a logical channel is not in use in the TSO a "dummy" value is assigned to the channel. The `ch1` and `ch2` shall be in the same channel configuration (appearing in the same OM_ChConf call). The TSO can be called to stop (to turn off) a cell. If in a test case more than one channel configuration exists on a cell (i.e. the OM_ChConf is called more then once for the cell), then for each channel configuration the OM_StopTran shall be called to stop the cell.</p> <p>The following description gives an implementation example.</p> <p>OM_StopTran stops the RF transmission on the timeslot(s) associated with the logical channel identifier in the parameter list. The logical channels should all be in the same cell. Two or more logical channel identifiers may relate to the same timeslot on a cell and this will be determined by the TSO. Depending on the type of channel the following is performed:</p> <ul style="list-style-type: none"> <li>- BCCH and/or SDCCH/4</li> </ul> <p>The TSO stops the RF transmission of BCCH, SCH (if present), FCCH (if present), SDCCH/4 &amp; SACCH/C4 (if present) on the slot the BCCH/SDCCH/4 is present.</p> <ul style="list-style-type: none"> <li>- SDCCH/8</li> </ul> <p>The TSO stops the RF transmission of SDCCH/8 &amp; SACCH/C8 on the slot on which the SDCCH/8 is present.</p> <ul style="list-style-type: none"> <li>- FACCH/F or FACCH/H</li> </ul> <p>The TSO stops the RF transmission of FACCH/F&amp; TCH/F &amp; SACCH/TF or all two FACCH/H&amp; TCH/H &amp; SACCH/TH on the slot on which the FACCH is present.</p> <p>Any other channel types are not used in the TSO.</p> |                                                                                                                                                                                                                                                                                                                                |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the `character` is indicated by the DTMF indicator of the MS. If the operator informs (e.g. from the control console of the test system) the test system that the MS does not give the indication of `character`, the operation returns FALSE. If the operator informs the test system that the MS gives the indication, the operation returns TRUE. |                                    |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the Mobile Station presents a list of available PLMNs. The list shall include the MNC and MCC of cells 1 to 7, but not cell 8 (for GSM900) or cells 1 to 6, but not cell 7 (for DCS1800). If the operator informs (e.g. from the control console of the test system) the test system that the MS correctly presents the list, the operation returns TRUE. If the operator informs the test system that the list is incorrect, the operation returns FALSE. |             |

| <p>This operation first requests (e.g. from the control console of the test system) the test operator to check whether the TCH is through connected. The SS has to generate a noise pattern so that the operator can check this. ### Structured Type Constraint

**Constraint Name:** Bcap\_Setup\_B121\_300\_2  
**Structured Type:** BCAP  
**Derivation Path:**  
**Comments:** To check a Bearer Capability IE of a Setup PDU acc. to table in clause B.1.2.1 of GSM 07.01 for the UR 300 Bits/s. This constraint corresponds to the combination:  
 NDB: 8 bits  
 NPB: none  
 Since the path acc. to comment 2) in GSM 07.01, clause B.1.2.1, is not for Setup messages, the rate 300 Bit/s can only be achieved with IR 16 kBits/s and the path acc. to comment 1), which is for CE: NT or "both" only. So the path CE: T is discarded.  
**ANY CHANGE IN THIS CONSTRAINT MUST BE MADE IN THE CORRESPONDING LOWER LAYER COMPATIBILITY CONSTRAINT ALSO!**

### Structured Type Constraint

**Constraint Name:** Bcap\_Setup\_B121\_2400\_2  
**Structured Type:** BCAP  
**Derivation Path:**  
**Comments:** To check a Bearer Capability IE of a Setup PDU acc. to table in clause B.1.2.1 of GSM 07.01 for the UR 2400 Bits/s. This constraint corresponds to the combination:  
 NDB: 8 bits  
 NPB: none  
 Since the path acc. to comment 2) in GSM 07.01, clause B.1.2.1, is not for Setup messages, the rate 2400 Bit/s can only be achieved with IR 16 kBits/s and the path acc. to comment 1), which is for CE: NT or "both" only. So the path CE: T is discarded.  
**ANY CHANGE IN THIS CONSTRAINT MUST BE MADE IN THE CORRESPONDING LOWER LAYER COMPATIBILITY CONSTRAINT ALSO!**

### Structured Type Constraint

**Constraint Name:** Bcap\_Setup\_B121\_9600\_2  
**Structured Type:** BCAP  
**Derivation Path:**  
**Comments:** To check a Bearer Capability IE of a Setup PDU acc. to table in clause B.1.2.1 of GSM 07.01 for the UR 9600 Bits/s. This constraint corresponds to the combination:  
 CE: NT, bothNT, bothT  
 S: SDU  
 UIL2P: ISO 6429  
 NDB: 8 bits  
 NPB: none  
 The rate 9600 Bit/s can only be achieved with IR 16 kBits/s either using the path with CE: NT or "both" or using the path with CE:T. (See other steps for this table and rate)  
**ANY CHANGE IN THIS CONSTRAINT MUST BE MADE IN THE CORRESPONDING LOWER LAYER COMPATIBILITY CONSTRAINT ALSO!**

### Structured Type Constraint

**Constraint Name:** Bcap\_Setup\_B121\_9600\_4  
**Structured Type:** BCAP  
**Derivation Path:**  
**Comments:** To check a Bearer Capability IE of a Setup PDU acc. to table in clause B.1.2.1 of GSM 07.01 for the UR 9600 Bits/s. This constraint corresponds to the combination:  
 CE: T  
 S: unstructured  
 UIL2P: NAV  
 NDB: 8 bits  
 NPB: none  
 The rate 9600 Bit/s can only be achieved with IR 16 kBits/s either using the path with CE: NT or "both" or using the path with CE:T. (See other steps for this table and rate)  
**ANY CHANGE IN THIS CONSTRAINT MUST BE MADE IN THE CORRESPONDING LOWER LAYER COMPATIBILITY CONSTRAINT ALSO!**

### Structured Type Constraint

**Constraint Name:** Bcap\_Setup\_B121\_120075\_2  
**Structured Type:** BCAP  
**Derivation Path:**  
**Comments:** To check a Bearer Capability IE of a Setup PDU acc. to table in clause B.1.2.1 of GSM 07.01 for the UR 300 Bits/s. This constraint corresponds to the combination:  
 NDB: 8 bits  
 NPB: none  
 Since the path acc. to comment 2) in GSM 07.01, clause B.1.2.1, is not for Setup messages, the rate 1200/75 Bit/s can only be achieved with IR 16 kBits/s and the path acc. to comment 1), which is for CE: NT or "both" only. So the path CE: T is discarded.  
**ANY CHANGE IN THIS CONSTRAINT MUST BE MADE IN THE CORRESPONDING LOWER LAYER COMPATIBILITY CONSTRAINT ALSO!**
