| <b>Detailed Comments:</b>  | 1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters. |          |

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH and SDCCH4 channels.
2. If the MS supports TS62 but not TS61, then TS61 is not tested.
3. To test the supported basic service.
4. To test the non-supported basic service.
5. To set the channel back to non-cipherring mode for next test execution.

| <b>Purpose:</b>        | <p>1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Bearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.</p> <p>This is verified for one Mobile Terminated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.</p> <p>2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.</p> |

| <b>Group:</b> GSM_L3_MS_v4160/InitialTest/                                                                                                                                                                                                                                                                           |       |                                                                                                          |                                        |     |          |
| <b>Purpose:</b>                                                                                                                                                                                                                                                                                                      |       |                                                                                                          |                                        |     |          |
| 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0.7 seconds after reception of the PAGING message.                                                                                                                                                                  |       |                                                                                                          |                                        |     |          |
| 2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision. |       |                                                                                                          |                                        |     |          |
