Foreword

This draft European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) Technical Committee of the European Telecommunications Standards Institute (ETSI) and is now submitted for the Unified Approval Procedure (UAP) phase of the ETSI standards approval procedure.

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.15.0.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3 conformity specifications for which mobile stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

The graphical form ATS

The TTCN.GR representation of this ATS is contained in a PDF file (L3-4170.PDF¹⁾) which accompanies this ETS and in annex A of this ETS.

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the self-extracting archive file oev06073.exe (Layer 3) on the diskette included as a part of this ETS (Part 3).

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1 Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;
Part 1: Conformance specification

Reference: GSM 11.10-1.

ETS 300 607-2 Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;
Part 2: Protocol Implementation Conformance Statement (ICS)
proforma specification

Reference: GSM 11.10-2.

**ETS 300 607-3 Digital cellular telecommunications system (Phase 1);
Mobile Station (MS) conformance specification;
Part 3: Layer 3 (L3) Abstract Test Suite (ATS)**

Reference: GSM 11.10-3.

Reference is made within this draft ETS to GSM-TSs (note).

NOTE: TC-SMG has produced documents which give the technical specifications for the implementation of the European digital cellular telecommunications system. Historically, these documents have been identified as GSM Technical Specifications (GSM-TSs). These TSs may have subsequently become I-ETSs (Phase 1), or ETSSs (Phase 2), whilst others may become ETSI Technical Reports (ETRs). GSM-TSs are, for editorial reasons, still referred to in current GSM ETSSs.

1 Scope

This European Telecommunications Standard specifies the Abstract Test Suite (ATS) and partial IXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) mobile stations (MS) conforming to the ETSS for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

This ETS incorporates by dated and undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this ETS only when incorporated in it by amendment or revision. 4.3 Test groups

4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct

but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

4.4 Test Step Structure

4.4.1 Preambles

The preamble is defined for each test purpose.

4.4.2 Postambles

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

5 Test Purposes (TP)

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

5.1 TP and test case naming convention

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the subclause (section) numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

“Test Purpose Identifier” = “Test Case Name” = TPI = TC_NN_A_B_C_D_E, where NN, A, B, C, D and E are digits used in the corresponding subclause numbers of prETS 300 607-1. For example, the test case name TC_26_5_6_2 is the TTCN specification corresponding to the conformance requirements in the subclause (section) 26.5.6.1.2 in the prETS 300 607-1. In case where the subclause has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC_26_7_4_2_4_1, TC_26_7_4_2_4_2, TC_26_7_4_2_4_3, TC_26_7_4_2_4_4 and TC_26_7_4_2_4_5, respectively.

6 Abstract test method and test configurations

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a man-machine interface as an upper tester at the SUT.

6.1 Test system model

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see fig. 1).

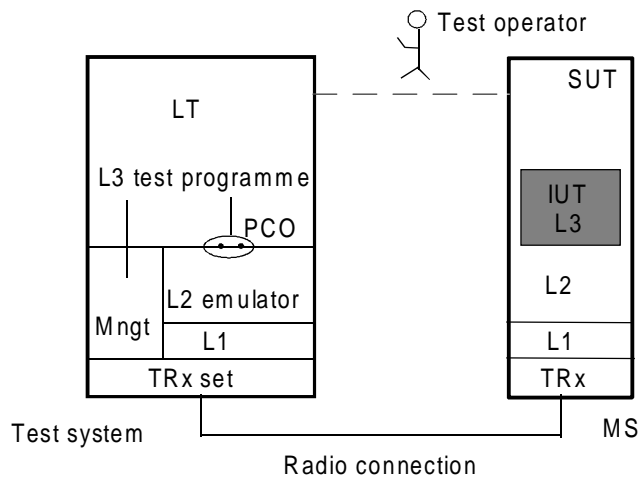

Figure 3: Test system and distributed test method

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO,
- Interface to the management functional unit via TTCN test suite operations,
- Interface to the MS man-machine interface (MMI) via a test operator.

6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management,
- Channel management,
- TRx management.

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system,
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

The result of this operation is the octetstring of the octets 'firstoct' to 'lastoct' (16 octets for the first message block, 22 octets for the 2nd, 3rd and 4th blocks), with the octets of the cell broadcast short message being numbered from 1 to 82. | |

3. For $ex < > 0$, there are maximum 13 scans. In each scan a new value is assigned to `buf[0].ra`. If there is a 'non-match' in one of the 13 scans the `buf[0]` is returned. In case of 'all-match' for the 13 scans, the pair of `(buf[i].ra + '00000001')` at the last scan, `buf[idx].fn` is returned (`idx` is ranged between 10 - 13).

Test Suite Operation Definition

Operation Name: OC_TimingCHK(fn1, fn2:FN; time, tol, mode:INTEGER)
Result Type: BOOLEAN
Comments: Time unit is in ms.

Description

OC_TimingCHK operation checks if a certain event took place fulfilling the timing requirements described by the time, the tolerance, and the mode between the frame numbers fn1 and fn2 .

The frame numbers fn1 and fn2 are used to calculate the time elapsed:

First the number of frames between fn1 and fn2 is calculated. The frame numbers fn1 and fn2 can be calculated from T1' as frame numbers mod 42432 only (T1' is specified in GSM 04.08, e.g. in subclauses 10.5.2.30 or 10.5.2.38). Therefore the frames fn1 and fn2 must be either in the same group of 42432 frames or in adjacent groups of 42432 frames with a maximum distance of 42432 frames between them. This means that the calculation is correct if the time between fn1 and fn2 is less then 196 seconds (approximately). The number of frames between fn1 and fn2 is calculated by:

fn1 < fn2: $fn_delta := fn2 - fn1$

fn1 > fn2: $fn_delta := fn2 - fn1 + 42432$ (In that case fn2 is in the next group of 42432 frames),

One frame is equivalent to 4.615 ms, the time in ms between fn1 and fn2 is:

$time_delta := fn_delta * 4.615$

The time_delta is then compared with the requirements given by 'time', the tolerance 'tol' and the 'mode'.

The mode specifies how the tolerance parameters 'time' and 'tol' have to be interpreted:

mode = 0:

If the elapsed time is within 'time' the operation returns TRUE, otherwise it returns FALSE. The tolerance value is ignored.

The result of OC_TimingCHK is calculated by:

IF $time_delta \leq time$, OC_TimingCHK := TRUE

IF $time_delta > time$, OC_TimingCHK := FALSE

mode = 1:

The tolerance value is the time tolerance expressed in ms. If the elapsed time interval is within 'time' - 'tol' to 'time' + 'tol' the operation returns TRUE, otherwise it returns FALSE.

The result of OC_TimingCHK is calculated by:

IF $time - tol \leq time_delta \leq time + tol$, OC_TimingCHK := TRUE

IF $(time_delta < time - tol) \text{ OR } (time_delta > time + tol)$, OC_TimingCHK := FALSE

mode = 2:

The tolerance value is the the tolerance percentage relative to 'time'. If the time interval is within 'time' - 'tol' % to 'time' + 'tol' % the operation returns TRUE, otherwise it returns FALSE.

The result of OC_TimingCHK is calculated by:

IF $time * (1 - (tol/100)) \leq time_delta \leq time * (1 + (tol/100))$, OC_TimingCHK := TRUE

IF $(time_delta < time * (1 - (tol/100))) \text{ OR } (time_delta > time * (1 + (tol/100)))$, OC_TimingCHK := FALSE

Any other value for the mode shall leads OC_TimingCHK := FALSE.

Detailed Comments: In OC_TimingCHK, fn1 denotes
 (1) the first frame number for sending PhyInfo message or handover command message, or
 (2) the first frame number of the received handover access message.
 while fn2 denotes the first received frame number of the received handover complete message.
 The TSO is not implemented in the TTCN stand alone tester in the short term.

| Operation Name: | OM_Deactivate(ch1, ch2:LOGICCH) |
| Result Type: | BOOLEAN |
| Comments: | |
| Description | |
| OM_Deactivate operation deactivates the logical channels `ch1` and `ch2`, then returns TRUE. | |
| The ch1 can be a DCCH or a TCH, the ch2 is the associated SACCH. | |
| Deactivation of an active SDCCH channel can be done by stopping transmission; this means that for the bursts on the BCCH carriers, dummy bursts shall be transmitted, for other bursts nothing shall be transmitted. Alternatively the deactivation of a SDCCH can be done by transmitting bad blocks on the SACCH with the parity bits set incorrectly. This will lead to a radio link failure in the MS. | |
| Deactivation of a TCH channel can be done by stopping transmission if it is non-BCCH. | |
| Deactivation of a SACCH_T can be done by transmitting bad blocks on the SACCH_T with the parity bits set incorrectly. The wrong channel coding on the SACCH will lead to a radio link failure in the MS after several seconds depending on the system information messages.. | |
| Detailed Comments: | The TSO is called in TC_26_7_3_2, TC_26_7_4_3_2, TC_26_7_4_3_3, TC_26_7_4_3_4 on a SDCCH/4/SACCH/C4 channel in downlink, TC_26_2_4_1, TC_26_2_4_2, TC_26_8_2_1, TC_26_8_2_2, TC_26_8_2_3 on TCH/SACCH_T channel in both directions. |

If the operator informs (e.g. from the control console of the test system) the test system that the MS does not stop tone generation, the operation returns FALSE. If the operator informs the test system that the MS stops tone generation, the operation returns TRUE. | |
| Definition of "tone generation": | |
| -During MO call: MS generates alerting tone/presents inband information sent by the network. | |
| -During MT call: MS generates ringing tone. | |

| Detailed Comments: | 1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters. | |

Test Case Dynamic Behaviour

Test Case Name: TC_11_1_2
Group: GSM_L3_MS_v4170/General/
Purpose: 1. To verify that the MS generates a SETUP message which includes a single or multiple Bearer Capability and a single LLC, according to the actual configuration on the MS.

This is verified for all Mobile Originated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the SETUP message.

Default: OtherEventsFail
