| <b>Detailed Comments:</b>   |       | <p>1. To generate a CALL COMKFIRMED based on the required basic service and IXIT parameters, and ask operator to configure the MS for the required basic service.</p> <p>2. To setup physical channel for BCCH,CCCH and SDCCH4 channels.</p> <p>3. To send a SETUP_PDU without bearer capabilities and lower and higher layer compatibility.</p> <p>4. To check whether the received CALL COMFIRM PDU is correct.</p>                                                                                                                                                                                                                                                      |                                      |     |          |

**Test Case Dynamic Behaviour**

**Test Case Name:** TC\_11\_3  
**Group:** GSM\_L3\_MS\_v4180/General/  
**Purpose:**

1. To verify that an MS claiming to not support AOCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AOCC information acknowledges the CONNECT message but ignores and does not acknowledge the AOCC information sent within the CONNECT.
2. To verify that an MS claiming to not support AOCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.
3. To verify that an MS claiming to not support AOCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.
4. To verify that an MS claiming to not support AOCC and in the U10 call active state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.

**Default:** OtherEventsFail

**Detailed Comments:**

1. To setup physical channels for BCCH, CCCH, SDCCH4 and traffic channels.
2. To verify non-supported AOCC information carried by CONNECT message in the case of MO call state U4.
3. To verify non-supported AOCC information carried by FACILITY message in the case of MO call state U4.
4. To verify non-supported AOCC information carried by FACILITY message in the case of MT call state U9.
5. To verify non-supported AOCC information carried by FACILITY message in the case of MO call state U10.

| <b>Purpose:</b>                    |       | 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0.7 seconds after reception of the PAGING message.<br><br>2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.                                                                                         |                                                     |     |          |
| <b>Default:</b>                    |       | OtherEventsFail_01                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                     |     |          |
| <b>Comments:</b>                   |       | The default tree OtherEventsFail_01 throws away any possible retransmitted channel request messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                     |     |          |

To analyse the delay of channel request msg.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                     |     |          |

2. The channel request messages are not spread equally.
3. To get the frame number on which paging request was sent.
4. To calculate the rach slots between paging request and channel request.
5. To record the delay of channel request msg.
6. MS is too slow to answer a paging msg.
7. Rach TDMA frame mapping is not correct.

| <b>Purpose:</b>                    |       | To verify that an MS produces different random references for a CHANNEL REQUEST. If a MS always produces the same random reference, it makes possible that different MSs of the same product series produce the same random reference.                                                                                                                                                                                                                                                                                                                                 |                                        |   |          |

**Detailed Comments:**

1. To set ATT = 1 for procedures3 and procedures4.
2. To switch off or power down the MS.
3. The test system checks for 5 seconds that MS shall not initiate the IMSI detach procedure.
4. To switch on or power up the MS.
5. The test system checks for 30 seconds that MS shall not initiate the IMSI attach procedure.
6. If possible to remove the SIM.
7. To insert the SIM to the MS under test.
8. The MS initiate IMSI detach procedure.
9. The location updating type shall be IMSI attach
10. To allocate a new TMSI.

**Detailed Comments:**

1. The Max\_retrans = 7.
2. To set NECl = 1.
3. To attempt a speech call.
4. The establishment cause shall be '111'B, otherwise the test case fails in the default tree OtherEventsFail.
5. The test system waits for 30 seconds.
6. The establishment cause shall be '111'B if the MS does not support half rate speech.
7. The establishment cause shall be '0100'B if the MS supports half rate speech.

**Detailed Comments:**

1. To send a PAGING REQUEST TYPE1 message with paging indication = any channel.
2. The establishment cause shall be '100'B.
3. The test system waits for 5 seconds.
4. To send a PAGING REQUEST TYPE1 message with paging indication = SDCCH.
5. The establishment cause shall be '0001'B.
6. To send a PAGING REQUEST TYPE1 message with paging indication = TCH/F.
7. The establishment cause shall be '100'B, if the MS capability is full rate only.
8. The establishment cause shall be '0010'B, if the MS capability is dual rate.
9. The establishment cause shall be '0001'B, if the MS capability is SDCCH only.
10. To send a PAGING REQUEST TYPE1 message with paging indication = TCH/H or TCH/F

11. The establishment cause shall be '100'B, if the MS capability is full rate only.
12. The establishment cause shall be '0011'B, if the MS capability is dual rate.
13. The establishment cause shall be '0001'B, if the MS capability is SDCCH only.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_2\_4\_7  
**Group:** GSM\_L3\_MS\_v4180/InitialTest/  
**Purpose:** To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following case:  
     If the MS supports a non call related supplementary service operation:  
         when the NECI bit is set to 0 and a supplementary service operation is attempted at the MS.  
         when the NECI bit is set to 1 and a supplementary service operation is attempted at the MS.  
**Default:** OtherEventsFail

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_2\_4\_8  
**Group:** GSM\_L3\_MS\_v4180/InitialTest/  
**Purpose:** To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following case:  
 If the MS supports SMS/PP MO:  
 when the NECI bit is set to 0 and a mobile originated short message service transaction is attempted.  
 when the NECI bit is set to 1 and a mobile originated short message service transaction is attempted.  
**Default:** OtherEventsFail

| <b>Purpose:</b>             |       | To verify that in manual mode the MS is able to obtain normal service on a PLMN which is neither the better nor a preferred PLMN and that it tries to obtain service on VPLMN if and only if the user selects it manually.                                                                                                                                                                                                                                                                                                                                   |                                                                                                                        |     |                         |
| <b>Default:</b>             |       | OtherEventsFail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                        |     |                         |
| <b>Comments:</b>            |       | For the test the preferred PLMN list of the SIM does not contain PLMN2('02'O) but contains PLMN3('03'O). The MS shall be set to manual mode before the test starts.                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                        |     |                         |

**Detailed Comments:**

1. To set the Max\_Retrans = 2.
2. To send an invalid IMMEDIATE ASSIGNMENT message with skip indicator = 1.
3. Retransmission of Channel request within 1s indicates that mobile ignored the message with invalid skip indicator.
4. To send an invalid IMMEDIATE ASSIGNMENT REJECT message with skip indicator = 2.
5. To send an invalid CIPHERING MODE COMMAND message with skip indicator = 3.
6. To send an invalid ASSIGNMENT COMMAND message with skip indicator = 4.
7. To send an invalid HANOVER COMMAND message with skip indicator = 5.
8. To check that there is no HANOVER FAILURE or RR-STATUS message on old channel.
9. To send an invalid CHANNEL RELEASE message with skip indicator = 6.

| <b>Purpose:</b>             |       | To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM-STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC. |                                |     |          |

| <b>Purpose:</b>             |       | To verify that a MS supporting the call control protocol for at least one BC, having a call in CC-state U10, "active", on receipt of an inopportune CC message, returns a STATUS message with reject cause value #98 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the inopportune CC message is a CALL PROCEEDING message relating to the active call.                                                                                                         |                                           |     |          |

| <b>Purpose:</b>             |       | To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM-STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.                                                                                                                    |                                       |     |          |

| <b>Purpose:</b>             |       | To verify that an MS having been paged and having an RR connection established ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM-STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; the fact that the MS otherwise ignores the message is checked by testing that it answers as usual to an incoming SETUP message.                                                                                                          |                                      |     |          |

**Detailed Comments:**

1. To lower the RF level of cell A until the MS selects cell B.
2. To send a LOCATION UPDATING ACCEPT message containing comprehension required IE.
3. To send a LOCATION UPDATING ACCEPT message containing location area identification = cell B and mobile identity = TMSI.

4. Local Postamble: to ensure that the test case terminates with the default TMSI.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_5\_6\_2\_1  
**Group:** GSM\_L3\_MS\_v4180/BiBo/  
**Purpose:** To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of the CC message being a CALL PROCEEDING message received by the MS in state U1.  
**Default:** OtherEventsFail

| Nr | Label | Behaviour Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | CRef                                               | V | Comments |

**Detailed Comments:**  
 1. To send an invalid CALL PROCEEDING message containing optional unknown IE.  
 2. To check whether the MS enters the state U3, the verdict is assigned in the test step.

| <b>Group:</b>               |       | GSM_L3_MS_v4180/BiBo/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                    |     |          |
| <b>Purpose:</b>             |       | To verify that the MS ignores the value of spare bits in the special case of the spare bits occurring in the P1 Rest Octets IE of a PAGING REQUEST TYPE 1 message. That the spare bits are ignored is checked by addressing the MS in that PAGING REQUEST message and verifying that the MS responds to that paging.                                                                                                                                                                                                                                                 |                                                    |     |          |

| <b>Purpose:</b> To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case where these spare bits are contained in S13 rest octets IE and S14 rest octets IE. That the MS ignores the value of the spare bits is checked by changing the LAI in those message and observing the MS initiating a location update though the spare bits do not all have the default value. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                    |     |          |

| <b>Purpose:</b>             |       | To verify that the MS goes to the allocated SDCCH/4 and sends a PAGING RESPONSE message containing its identity and its classmark. To verify that the MS goes to the allocated SDCCH/8 and sends a PAGING RESPONSE message containing its identity and its classmark. To verify that the MS can correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message. To verify that the MS only reacts to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS. |                                                                                                                              |   |          |

**Detailed Comments:**

1. To broadcast sys\_info messages with default contents for RR tests with exception for Max\_Retrans that is set to 7 and also to set up a physical channel as combined CCCH/SDCCH.
2. Non combined CCCH/SDCCH, 5 slots for Tx-int, 7 retransmission.
3. To send immediate Assignment Extended message with Request reference (TCV\_Rqr) for MS1,  
and with request reference (TCV\_Rqr9) for MS2.
4. To send immediate Assignment Extended message with Request reference (TCV\_Rqr) for MS2,  
request reference (TCV\_Rqr9) for MS1.
5. Reception of the first TSPX\_nPara Channel Request messages.
6. To have a request reference pertaining to the TSPX\_i1Para\_i-th Channel Request where TSPX\_i1Para\_i-th is within {max(1, TSPX\_nPara - 2), TSPX\_nPara}
7. To have a request reference different from any request reference the MS has generated.
8. Reception of TSPX\_kPara Channel Request messages. TSPX\_kPara within the set{4...8}.
9. To have a request reference pertaining to the TSPX\_i2Para\_i-th Channel Request where TSPX\_i2Para\_i-th is within {max(1...TSPX\_kPara - 3)}
10. To have a request reference different from any request reference the MS has generated.
11. Channel Request 8 - TSPX\_kPara Channel Requests are sent.
12. Check that the MS does not transmit any layer 2 frames for at least 3 seconds.
13. Reception of TSPX\_rPara Channel Request messages.
14. To have a request reference pertaining to the TSPX\_i3Para\_i-th Channel Request where TSPX\_i3Para\_i-th is within {max(TSPX\_rPara - 2...TSPX\_rPara)}.
15. This local tree is used to collect and store the frame number and the request reference which are included in each ChReq(ChRequest\_17) primitive received.

**Detailed Comments:**

1. To setup a physical channel as combined CCCH/SDCCH, 5 for Tx-int, 7 retransmission used as cell A.
2. To setup a physical channel as combined ccch/sdcch4 used as cell B.

3. To send PAGING REQUEST message every 5 multiframes of the mobile station's paging subgroup for  $x+1$  seconds.
4. The MS responds the paging after  $x+1$  s. expires, pass.
5. The MS responds the paging in cell B, pass.

| <b>Purpose:</b>                    |       | To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 1 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 1 message. It is tested that the MS ignores fill paging.                                                                                                                                                                            |                                         |     |          |

| <b>Purpose:</b>             |       | To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 2 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 2 message. It is tested that the MS ignores a PAGING REQUEST TYPE 2 message that does not address it.                                                                                                                             |                                         |     |          |

**Detailed Comments:**

1. Within the paging request message, the 1st MI contains TMSI of the IUT, the 2nd has the TMSI of an another MS, the 3rd is absent.
2. Within the paging request message, the 1st MI contains TMSI of an another MS, the 2nd has the TMSI of the IUT, the 3rd is absent.
3. Within the paging request message, the 1st and 2nd MI contain TMSI of an another MS, the 3rd has the TMSI of the IUT.
4. Within the paging request message, the 1st and 2nd MI contain TMSI of an another MS, the 3rd has the IMSI of the IUT.
5. Within the paging request message, the 1st and 2nd MI contain TMSI of an another MS, the 3rd has the TMSI of the IUT but with the type of no identity.
6. If received any L3 frame FAIL.

**Detailed Comments:**

1. Tx-integer = 5, Max-Retrans = 2.
2. To send PAGING REQUEST TYPE 1 message with normal page mode in the next but one paging subblock on the same CCCH as previous paging message.
3. The page mode = normal paging, wait time = 5 seconds.
4. The page mode = "extended paging", request reference is different from any one already sent by the MS.
5. The page mode = "same as before", address the MS by TMSI, in the next but one paging subblock on the same CCCH.
6. The page mode = "extended paging", request reference is different from any one already sent by the MS. The ImmAsgnX message is sent on the MS paging channel.
7. The page mode = "extended paging", address the MS by TMSI, in the next but one paging subblock on the same CCCH.
8. Extended paging, not address the MS.
9. The page mode = "same as before", address the MS with IMSI.
10. normal paging, address the MS by IMSI.

| <b>Group:</b>          | GSM_L3_MS_v4180/RR/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Purpose:</b>        | <p>1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.</p> <p>2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.</p>                                                                                                                                                                                                               |

**Detailed Comments:**

- The interval between 2 successive layer 2 frames containing MEASUREMENT REPORT exceeds one layer 2 frame, fail.
- To allow the MS camp in cell H again.

| <b>Purpose:</b>        | <p>1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition</p> <ol style="list-style-type: none"> <li>1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot</li> <li>1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot</li> <li>1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot</li> <li>1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H</li> <li>1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H</li> <li>1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.</li> </ol> <p>2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.</p> <p>3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.</p> <p>4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.</p> |

| <b>Purpose:</b> To test that when the MS is ordered to make a Non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                  |   |                                                                             |

| <b>Purpose:</b> To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                               |   |                                                                             |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.                                              |                                                                                       |   |                                                                             |

| <b>Purpose:</b> To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                       |   |                                                                             |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.                                                                                             |                                                                                                                        |   |                                                                                   |

| <b>Purpose:</b> To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                        |   |                                                                             |
