Foreword

This draft European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) Technical Committee of the European Telecommunications Standards Institute (ETSI) and is now submitted for the One-step Approval Procedure (OAP) of the ETSI standards approval process.

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.18.0.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3 conformity specifications for which mobile stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

The graphical form ATS

The TTCN.GR representation of this ATS is contained in annex A of this ETS.

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4180.mp¹⁾ (Layer 3) on the diskette included as a part of this ETS (Part 3).

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1	Digital cellular telecommunications system (Phase 2); Mobile Station (MS) conformance specification; Part 1: Conformance specification; Reference: GSM 11.10-1.
ETS 300 607-2	Digital cellular telecommunications system (Phase 2); Mobile Station (MS) conformance specification; Part 2: Protocol Implementation Conformance Statement (ICS) proforma specification Reference: GSM 11.10-2.
ETS 300 607-3	Digital cellular telecommunications system (Phase 1); Mobile Station (MS) conformance specification; Part 3: Layer 3 (L3) Abstract Test Suite (ATS) Reference: GSM 11.10-3.

Reference is made within this draft ETS to GSM-TSs (note).

NOTE: TC-SMG has produced documents which give the technical specifications for the implementation of the European digital cellular telecommunications system. Historically, these documents have been identified as GSM Technical Specifications (GSM-TSs). These TSs may have subsequently become I-ETSS (Phase 1), or ETSS (Phase 2), whilst others may become ETSI Technical Reports (ETRs). GSM-TSs are, for editorial reasons, still referred to in current GSM ETSS.

1 Scope

This European Telecommunications Standard specifies the Abstract Test Suite (ATS) and partial IXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) mobile stations (MS) conforming to the ETSS for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

4.3 Test groups

4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct

but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

4.4 Test Step Structure

4.4.1 Preambles

The preamble is defined for each test purpose.

4.4.2 Postambles

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

5 Test Purposes (TP)

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

5.1 TP and test case naming convention

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the section numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

"Test Purpose Identifier" = "Test Case Name" = TPI = TC_NN_A_B_C_D_E, where NN, A, B, C, D and E are digits used in the corresponding section numbers of prETS 300 607-1. For example, the test case name TC_26_5_6_2 is the TTCN specification corresponding to the conformance requirements in the section 26.5.6.1.2 in the prETS 300 607-1. In case where the section has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC_26_7_4_2_4_1, TC_26_7_4_2_4_2, TC_26_7_4_2_4_3, TC_26_7_4_2_4_4 and TC_26_7_4_2_4_5, respectively.

6 Abstract test method and test configurations

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a Man-Machine Interface as an upper tester at the SUT.

6.1 Test system model

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see figure 1).

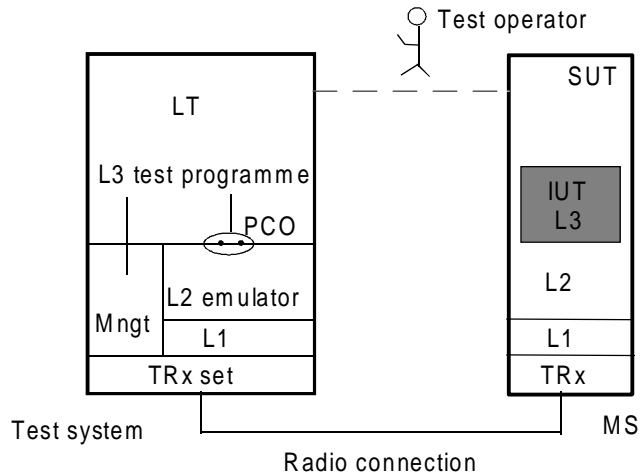

Figure 3: Test system and distributed test method

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO,
- Interface to the management functional unit via TTCN test suite operations,
- Interface to the MS man-machine interface (MMI) via a test operator.

6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management,
- Channel management,
- TRx management.

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system,
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

Annex A: Abstract Test Suite

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4180.mp²) (Layer 3) on the diskette included as a part of this ETS (Part 3).

The graphical form ATS

The TTCN.GR representation of this ATS is contained in the remainder of this annex.

| <p>OC_RachSlots calculates the number of RACH slots between frame number 'fn1' and 'fn2' excluding the slots in 'fn1' and 'fn2', then return the result of the calculation.</p> <p>If mode=0, 'fn1' denotes the (first) frame number for sending Paging Request, while 'fn2' denotes the (first) frame number for the received Channel Request. If mode=1 'fn1' and 'fn2' denote the (first) frame number for the received two subsequent Channel Requests. Any other values for mode is not allowed.</p> <p>Since the number of RACH slots depends on the RACH being combined or not with dedicated channels, the parameter 'cmbn' is needed: TRUE --&gt; combined, FALSE--&gt; not combined.</p> <p>It is assumed that the distance between fn1 and fn2 is not more than one group of 42432 TDMA frames (modulo 42432 is used to calculate t1' of fn1 and fn2). This is equivalent to approximately 196 seconds. 3. For  $ex < > 0$ , there are maximum 13 scans. In each scan a new value is assigned to `buf[0].ra`. If there is a 'non-match' in one of the 13 scans the `buf[0]` is returned. In case of 'all-match' for the 13 scans, the pair of (`buf[i].ra + '00000001'` at the last scan, `buf[idx].fn` is returned (`idx` is ranged between 10 - 13).

| <p>This TSO is to change the RF level of the cell 'cellid1' to the RF level 'bspwr1' and the RF level of the cell 'cellid2' to the RF level 'bspwr2' [dBuVemf], then the TSO returns TRUE.</p> <p>The major purpose of the TSO is to force the MS to reselect a new cell according to the GSM 05.08, subclause 6.6.2. The following example shows the use of the TSO.</p> <p>The default cell selection parameters in the ATS are set as:</p> <p>Cell reselect hysteresis: 12db<br/>                     MX TXPWR MX CCH:     minimu level (0)<br/>                     ACS:                 no additional cell selection parameter (0)<br/>                     RXLEV ACCESS MIN:     minimum (0).</p> <p>Therefore the path loss criterion parameter C1 equals to the reselection criterion parameter C2. In the whole ATS the C1 and C2 keeps greater than 10 (e.g. TC_26_7_4_2_3) for a cell not suitable. The MS received level average from a not suitable cell keeps also greater than 10 (-100 dBm) corresponding to the reference sensitivity level of DCS 1800 MS.</p> <p>For GSM arfcn = 20, F = 941 MHz , the fields strengths (E) on tester integral antenna:<br/>                     E (dB microV/m) &gt;= (-110 + 10) (dBm) + 20log(941) + 77.2 = 36.7,<br/>                     For DCS arfcn = 590, F = (-110 + 10) (dBm) + 20log(1820.8) + 77.2 = 42.4 (the formula see GSM 05.05, clause 5 and GSM 05.08, subclause 8.1.4).</p> <p>In order to keep C1, C2 greater 10, a reasonable field strength making a cell not suitable is set to C_E_notsuitable = 45 in comparison with the default field strength C_E_default = 63. Considering that the cell reselect hysteresis is set to 12 db, the field strength of a cell being reselected need to be set to greater than 57. In the ATS the default value C_E_default (63) and C_E_notsuitable (45) are used for this TSO to force MS making cell reselection assuming that the two cells have different location area..</p> <p>If two cells have the same location area (e.g. in TC_26_6_1_3), or although two cells have different LAI, the test cases needs to lower a cell power to a certain low level (e.g. in TC_26_7_4_2_4_1 and TC_26_7_4_2_4_5), C1 needs to be less than zero to force the MS reselect a better cell. For GSM, E &lt;= 26.7, for DCS, E &lt;= 32.4. The value C_E_notsuitable_sameLAI = 24 applies to the TSO to force the MS making cell reselection.</p> |                                                                                      |

control channel configuration with same CellID.

If new channel = "C\_FCCH\_SCH\_BCCH\_CCCH" (non-combined) then use any combined, combined + SMS or non-combined control channel configuration with the same CellID.

If new channel = "C\_BCCH\_CCCH\_2", "C\_BCCH\_CCCH\_3" or "C\_BCCH\_CCCH\_4" (ccch-group) then re-use any existing ccch-group control channel configuration with the same CellID and the slot, or re-use any existing combined, combined + SMS with the same CellID.

If new channel = "C\_TCHF\_ACCHF\_1", "C\_TCHF\_ACCHF\_2", "C\_TCHH\_ACCHH\_1", "C\_TCHH\_ACCHH\_2" (traffic) or "C\_SDCCH8\_SACCHC8\_1", "C\_SDCCH8\_SACCHC8\_2", "C\_SDCCH8\_SACCHC8\_3" (dedicated) then re-use any existing traffic or dedicated channel with the same channel description.

### Test Suite Operation Definition

**Operation Name:** OM\_ChMdModi(ch:LOGICCH; chmod: CHMOD)

**Result Type:** BOOLEAN

**Comments:**

#### Description

OM\_ChMdModi operation passes channel mode IE for channel 'ch' to lower layer emulator and requests the emulator to set the 'ch' to the mode 'chmod'. After the mode changed, it returns.

**Operation Name:** OM\_CphMdChg(ch:LOGICCH; cphmod: CPHMS; key:BITSTRING)

**Result Type:** BOOLEAN

**Comments:**

#### Description

OM\_CphMdChg operation passes ciphering parameters for channel 'ch' to lower layer and sets the lower layer emulator into a special operation mode in which lower layer starts the 3-step ciphering mode setting sequence when the next L3 message on the channel 'ch' arrives.

**Result Type:** BOOLEAN

#### Description

OM\_CphMd operation passes ciphering parameters for channel 'ch' to lower layer and sets the channel 'ch' in the ciphering mode 'cphmod'. This operation puts the channel 'ch' into specified ciphering mode 'cphmod' immediately without the 3-step ciphering mode setting sequence.

**Operation Name:** OM\_ComingFn(ch:LOGICCH)

**Result Type:** FN

**Comments:**

#### Description

OM\_ComingFn operation returns the frame number (FN modulo 42432) which is about 5 seconds later than current frame number and is able to carry L3 message on the channel 'ch'.

**Detailed Comments:** The delay of about 5 seconds ensures that there is still enough time left for higher layer controller to prepare next TTCN send event after the OM\_ComingFn returns. the exact delay value is up to the implementor.

| <p>OM_Deactivate operation deactivates the logical channels 'ch1' and 'ch2', then returns TRUE.</p> <p>The ch1 can be a DCCH or a TCH, the ch2 is the associated SACCH.</p> <p>Deactivation of an active SDCCH channel can be done by stopping transmission; this means that for the bursts on the BCCH carriers, dummy bursts shall be transmitted, for other bursts nothing shall be transmitted. Alternatively the deactivation of a SDCCH can be done by transmitting bad blocks on the SACCH with the parity bits set incorrectly. This will lead to a radio link failure in the MS.</p> <p>Deactivation of a TCH channel can be done by stopping transmission if it is non-BCCH.</p> <p>Deactivation of a SACCH_T can be done by transmitting bad blocks on the SACCH_T with the parity bits set incorrectly. | <p>After the SS has been configured to start / change frequency hopping at a particular start time, this TSO instructs the SS to check whether the MS correctly uses the hopping frequencies on and after the expected start time according to the frequency parameters.</p> <p>If 't' = 0 or <math>32024 \leq t \leq 42431</math> the operation checks that the new frequencies starts "without delay".<br/>           If <math>0 &lt; t \leq 31000</math> the operation checks that the new frequencies starts "on" the frame number of <math>(X + t) \bmod 42432</math>, where <math>x = 51 * ((fn.t3 - fn.t2) \bmod 26) + fn.t3 + 1326 * fn.t1</math>.<br/>           If <math>31000 &lt; t &lt; 32024</math>, or <math>t &lt; 0</math> or <math>t &gt; 42431</math><br/>           then the test has been configured incorrectly and should be re-run with a permitted value for 't'.</p> <p>This check is performed at the uplink RF burst level by sampling for a period of 3 seconds from the start time and should therefore be called immediately after the SS has been configured to start / change hopping. | <p>OM_FreqDef operation passes the frequency hopping parameters for channel 'ch' to lower layer emulator. The emulator starts using these frequency parameters at the frame number indicated by starting time 'st'. | OM_PgFill operation sets up the contents of paging filling frame to be sent on all paging subchannels continuously. If the contents of paging filling frame in cell 'cellid' have not been set up, the operation sets the contents to 'msg'. If paging filling frame in cell 'cellid' has been set up, the operation changes the paging filling message to 'msg'. OM_ResumUAforDISC resumes the L2 emulator to a normal L2 operational mode.</p> <p>OM_ResumeUAforDISC cancels the effect of OM_NoUAforDISC, returning L2 on the channel 'ch' to normal operation in the multiple-frame established state.</p> <p>Then the TSO returns TRUE.</p> |                                                     |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the 'character' is indicated by the DTMF indicator of the MS. If the operator informs (e.g. from the control console of the test system) the test system that the MS does not give the indication of 'character', the operation returns FALSE. If the operator informs the test system that the MS gives the indication, the operation returns TRUE. |                                    |

| This TSO requests (e.g. from the control console of the test system) the test operator to setup the external interface, or configuration of the MS in such a way that the MS is able to successfully receive the call for telephony service. If the MS supports both telephony without immediate connection mode and telephony with immediate connection mode, set the MS in telephony without immediate connection mode. After the operator finishes the required action and informs the test system, the TSO returns with value TRUE.<br><br>This TSO is used in MO call test cases except TC_11_2, where this TSO is call for single-numbering scheme MT testing. |                      |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the Mobile Station under test is in normal service state ("Idle, updated")-- listening to CCCH and BCCH and with U1 UPDATED status. If the operator informs (e.g. from the control console of the test system) the test system that the MS does not give any service indication, the operation returns FALSE. If the operator informs the test system that the MS gives service indication, the operation returns TRUE. |                 |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the Mobile Station presents a list of available PLMNs. The list shall include the MNC and MCC of cells 1 to 7, but not cell 8 (for GSM900) or cells 1 to 6, but not cell 7 (for DCS1800). If the operator informs (e.g. from the control console of the test system) the test system that the MS correctly presents the list, the operation returns TRUE. If the operator informs the test system that the list is incorrect, the operation returns FALSE. |             |

| This operation requests (e.g. from the control console of the test system) the test operator to recall and display an SM stored in the ME of the MS under test e.g. by means of the MMI. Then the operator checks whether the short message contents represented by 'msg' is correctly displayed. The TSO returns<br>TRUE: if SM can be recalled and displayed correctly in comparison with the 'msg',<br>FALSE: if SM can not be recalled or displayed, or displayed incorrectly in comparison with the 'msg'.<br>The TSO needs to convert the 'msg' into IA5 string according to the packing character rules specified in the subclause 6.1.2 of ETS 300 628 (GSM 03.38). The 'NumbOfIA5chara' indicates the number of IA5 characters in the 'msg'. |                                                                  |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the TCH is through connected. The SS has to generate a noise pattern so that the operator can check this. If the operator informs (e.g. from the control console of the test system) the test system that the TCH is through connected, the operation returns TRUE. If the operator informs the test system that the TCH is not through connected, the operation returns FALSE. |                   |

| 1) In order to give to the lower tester enough time to dequeue and to send out the call SETUP and the other call establishment related messages in the sending buffer before starting sending of ASSIGNMENT COMMAND message, the default value 5s is used in the test step AssCh_complete. In the test step AssCh_failure the timer value is set to 4s. For the TC_26_6_4_1, 600ms is used. |                |      |                             |
