| <b>Group:</b> GSM_L3_MS_v4180/RR/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                           |   |                                                                             |
| <b>Purpose:</b> To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                           |   |                                                                             |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.                                                                                            |                                                                                                                                          |   |                                                                                   |

| <b>Purpose:</b> To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                       |   |                                                                             |

| <b>Group:</b>               |       | GSM_L3_MS_v4180/RR/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                       |   |                                                                             |
| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.                                               |                       |   |                                                                             |

| <b>Purpose:</b> To test that when the MS is ordered to make a finely synchronised handover to a synchronised cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                     |   |                                                                                                                                                                              |

| <b>Purpose:</b> To test that when the MS is ordered to make a finely synchronised handover to a synchronised cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                      |   |                                                                                                                                                                              |

| <b>Purpose:</b> To test that when the MS is ordered to make a finely synchronised handover to a synchronised cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                     |   |                                                                                                                                                                              |

| <b>Purpose:</b> To test that when the MS is ordered to make a finely synchronised handover to a synchronised cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                     |   |                                                                                                                                                                              |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a pre-synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To test that the MS correctly reports on the time difference between the cells.                                                                                                                                          |                                                                                                                                               |   |          |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a pseudo synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells.                                                                                                                                                                                                                                                                                                                |                                                |     |          |

**Detailed Comments:**

1. Cell A with BCCH, CCCH, SDCCH4 and a traffic channel.
2. Cell B with BCCH, CCCH, SDCCH4 and a traffic channel.
3. In cell A the timing advance = TSPX\_y2.
4. pseudo-synch, rot = 1, nc1, = 0, real time difference = 2\*TSPX\_k2 + 10., handover reference = TSPX\_HoRefH.
5. The Mobile Time Difference = (2\*TSPX\_k2 + TSPX\_y2) mod 2 097 152 with tolerance of 2.
6. The time advance is correct.

| <b>Test Case Name:</b> | TC_26_6_8_4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Group:</b>          | GSM_L3_MS_v4180/RR/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Purpose:</b>        | <p>1 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS uses the cipher key stored in the SIM to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and that the MS responds with a CIPHERING MODE COMPLETE message.</p> <p>2 To verify that the MS is ready to transmit the CIPHERING MODE COMPLETE message before 500ms after the end of the CIPHERING MODE COMMAND message.</p> <p>3 To verify that when the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.</p> <p>4 To verify that when the MS receives a HANOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key</p> <p>5 To verify that when the MS is in the "ciphered" mode and receives the CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS loads the cipher key stored in the SIM into the ME, stops ciphering and deciphering and, responds with a CIPHERING MODE COMPLETE message.</p> <p>6 To verify that the MS responds to an AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the cipher key obtained from the previous authentication procedure.</p> <p>7 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering", the does not start ciphering or deciphering, but does respond with a CIPHERING MODE COMPLETE message.</p> <p>8 To verify that when the MS receives a HANOVER COMMAND message and the handover fails, the MS sends a HANOVER FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.</p> <p>9 To verify that when the MS receives an ASSIGNMENT COMMAND message and the assignment fails, the MS sends an ASSIGNMENT FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.</p> |

**Detailed Comments:**

1. 1 cell, default parameters.
2. New ciphering key sequence number and new ciphering key L.
3. New SDCCH4 subchannel different from the one in use, start ciphering.
4. Load new key L, no ciphering.
5. New SDCCH4 subchannel different from the one in use, start ciphering.
6. New SDCCH4 subchannel different from the one in use, start ciphering.
7. New SDCCH4 subchannel different from the one in use, no ciphering.
8. To generate new ciphering key M.
9. New SDCCH4 subchannel different from the one in use, start ciphering.
10. New SDCCH4 subchannel different from the one in use, no ciphering, new channel not activated.
11. New SDCCH4 subchannel different from the one in use, no ciphering, new channel not activated.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set a physical channel as hopping SDCCH8 channel, hopping parameters defined by PIXIT.
3. To setup the before time and after time channels for ASSIGNMENT COMMAND.
4. To assign the hopping SDCCH8 channel.
5. To calculate the STARTING TIME.
6. To check whether the after time frequency hopping is correct at the RF burst level.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for before time.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for before time.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for before time.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set two physical channels, one as hopping channel for immediate assignment another one as hopping channel for after time channel, parameters defined by PIXIT.
3. To calculate the starting time for frequency redefinition.
4. To send FREQUENCY REDIFINITION message.
5. To calculate the starting time and send the ASSIGNMENT COMMAND on special frame TCV\_Fn. The assigned channel not activated in the tester.
6. To check whether the after time frequency hopping is correct at the RF burst level.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set two physical channels, one as hopping channel for immediate assignment another one as hopping channel for after time channel, parameters defined by PIXIT.
3. To calculate the starting time for frequency redefinition.
4. To send FREQUENCY REDIFINITION message.
5. To calculate the starting time and send the ASSIGNMENT COMMAND on special frame TCV\_Fn. The assigned channel not activated in the tester.
6. The expected ASSIGNMENT FAILURE message received on the channel defined by frequency redefinition.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH for cell A.
2. To setup a physical channel as BCCH, CCCH for cell B.
3. To setup a physical channel as SDCCH8 in cell A and setup 2 physical channels as hopping channels in cell B.
4. To get the future frame number for sending HANOVER COMMAND and calculate starting time.
5. If the required channel is full rate channel, setup the before time full rate hopping channel.
6. If the required channel is half rate channel, setup the before time half rate hopping channel.
7. If the required channel is SDCCH8 channel, setup the before time SDCCH8 hopping channel.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH for cell A.
2. To setup a physical channel as BCCH, CCCH for cell B.
3. To setup a physical channel as SDCCH8 in cell A and setup a physical channel as hopping channels in cell B.
4. To get the future frame number for sending HANDOVER COMMAND and calculate starting time.
5. If the required channel is full rate channel, setup the after time full rate hopping channel.
6. If the required channel is half rate channel, setup the after time half rate hopping channel.
7. If the required channel is SDCCH8 channel, setup the after time SDCCH8 hopping channel.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set a physical channel as BCCH, CCCH for Cell B.
3. To setup a physical channel for immediate assignment.
4. To calculate the starting time for frequency redefinition.
5. To send FREQUENCY REDIFINITION message.
6. To calculate the starting time and send the HANDOVER COMMAND on special frame TCV\_Fn.

The assigned channel not activated in the tester.

7. To check whether the after time frequency hopping is correct at the RF burst level.
8. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment.
9. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment.
10. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set a physical channel as BCCH, CCCH for Cell B.
3. To setup a physical channel for immediate assignment.
4. To calculate the starting time for frequency redefinition.
5. To send FREQUENCY REDIFINITION message.
6. To calculate the starting time and send the HANDOVER COMMAND on special frame TCV\_Fn.  
The assigned channel not activated in the tester.
7. The HANDOVER FAILURE message received on the channel using the after time hopping parameters of the frequency redefinition message.
8. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment.
9. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment.
10. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment.

| <b>Purpose:</b> To verify that the MS is able to receive and acknowledge a new TMSI by means of an explicit TMSI reallocation procedure. To verify that the MS has stored the TMSI in a non-volatile memory. The implicit reallocation procedure is tested in section 26.7.4.1.                                                                |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |      |   |             |

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_3\_1  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** 1) To verify that the MS sends identity information as requested by the system in the following cases: IMSI and TMSI are requested in non-ciphered mode, IMEI is requested in ciphered mode.  
 2) To verify that the MS sends its IMEI, when requested to do so, in non-ciphered mode.  
 3) To verify that the MS sends its IMEISV, when requested to do so, in non-ciphered mode.  
**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS:  
 The MS has valid TMSI. It is "idle updated" on the cell.  
  
 Foreseen final state of the MS:  
 The MS has valid TMSI. It is "idle updated" on the cell.  
 In the 11.10 there are two test sequences. In TTCN they are combined to only one.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_1  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** To test the behaviour of the MS if the network accepts the location updating of the MS. For the network response three different cases are identified:  
 1) TMSI is allocated,  
 2) Location updating accept contains neither TMSI nor IMSI,  
 3) Location updating accept contains IMSI.  
**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS:  
 The MS has valid TMSI(TMSI1), CKSN(CKSN1) and Kc.It is "idle updated" on cell A.  
  
 Foreseen final state of the MS:  
 The MS has no valid TMSI and no CKSN. It is "idle updated" on cell B.

**Detailed Comments:**

- 1) Location updating rejected with cause = PLMN not allowed.
- 2) MS shall perform normal location updating after switching to a new LAC in the same PLMN and when that PLMN is selected manually.
- 3) The PLMN of cell B is suppressed on the SIM's forbidden PLMN list.

**Detailed Comments:** 1) Reject of Location Updating with the cause Roaming is not allowed.

- MS shall
- 2) not perform periodic updating
  - 3) reset the list of "forbidden location areas for national roaming" when powered down.
  - 4) Location Updating Accept with LAI belonging to PLMN2 and without Mobile Identity.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_2\_4\_2  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** Test purpose 2  
 To test that if no cell is available, the MS does not answer to paging with TMSI, rejects a request from CM entity except other than emergency calls.  
**Default:** OtherEventsFail  
**Comments:** This testcase includes only the procedure of part 2 of GSM 11.10-1, section 26.7.4.2.4.

Initial Conditions of MS:  
 The MS has valid TMSI, CKSN and Kc.It is "idle updated" on cell B.

Foreseen final state of the MS:  
 The MS has no valid TMSI and no CKSN. It is in the "limited service" state on cell A.

| Nr | Label | Behaviour Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | CRef | V | Comments |

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_2\_4\_5  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** Test purpose 5  
 To test that if the SIM is removed the list of "forbidden location areas for roaming" is cleared.  
**Default:** OtherEventsFail  
**Comments:** This testcase includes only the procedure of part 5 of GSM 11.10-1, section 26.7.4.2.4.

Initial Conditions of MS:  
 The MS has valid TMSI, CKSN and Kc.It is "idle updated" on cell B.

Foreseen final state of the MS:  
 The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

| <b>Purpose:</b>             |       | To verify that the MS performs normal location updating procedures when its attempt counter is smaller than 4. To check that the MS does not perform the IMSI detach procedure when "idle not updated". To verify that when "idle not updated" the MS can perform an emergency call. To verify that when "idle not updated" the MS uses requests from CM layer other than emergency call as triggering of a normal location updating procedure. To verify that the MS performs a normal location updating procedure if it enters a new cell while being "idle not updated". |      |   |           |

**Detailed Comments:**

1. Test of Conformance Requirement 1
  - 1.1. Reject of Location Updating in cell B
  - 1.2. MS shall wait the period of T3211 and restart the normal location updating procedure when the attempt counter is smaller than 4.
  - 1.3. Radio Link Failure extends the period of delay for next location updating.
2. Test of Conformance Requirement 2
  - 2.1. Reject of Location Updating in cell A
  - 2.2. MS shall not answer to paging
  - 2.3. All of location updating requests shall be rejected.
  - 2.4. MS shall not perform the IMSI detach procedure.
3. Test of Conformance Requirement 3
  - 3.1. Failure during Location Updating in cell A
  - 3.2. MS shall support emergency call.
  - 3.3. MS shall wait at most 15 sec. for location updating
4. Test of Conformance Requirement 4
  - 4.1. Failure during Location Updating Procedure
  - 4.2. MS shall use a request from Cm entity other than emergency call as a trigger for a normal location updating procedure.
  - 4.3. After the Location Updating Procedure MS can (optional) start automatically the Cm entity service again. It is optional and shall observed only 15 sec.
6. Test of Conformance Requirement 6
  - 6.1. Failure during Location Updating Procedure
  - 6.2. MS shall start the location Updating Procedure as soon as it enters a new cell.

**Detailed Comments:**

1. To test conformance requirement 1
  - 1.1. Attempt counter is now equal to 4
  - 1.2. MS shall perform location updating after T3212
  - 1.3. MS shall initiate location updating procedure, if the updating was unsuccessful.
- 2.) To test conformance requirement 2
  - 2.1. Attempt counter is now equal to 4
  - 2.2. MS shall perform request for emergency call
  - 2.3. MS shall not perform an IMSI detach procedure
- 3.) To test conformance requirement 3 and 4
  - 3.1. Attempt counter is now equal to 4
  - 3.2. MS shall use a request from CM entity for MM connection for a service other than emergency call as a trigger for a normal location updating procedure.
  - 3.3. MS shall reset the attempt counter after successful location updating procedure.
  - 3.4. Attempt counter is now equal to 4
  - 3.5. MS shall perform the normal location updating procedure after entering a new cell.
  - 3.6. If the location updating procedure unsuccessful, the MS shall trigger the location updating after T3211 again.

**Detailed Comments:**

1. Test of Conformance Requirement 1
  - 1.1. failure during a periodic location updating procedure
  - 1.2. - then the MS shall be able to attempt an CM connection
  - 1.3. - then the MS shall not attempt a location updating procedure
2. Test of Conformance Requirement 2
  - 2.1. failure during imsi attach procedure
  - 2.2. - then the MS shall be able to establish an MM connection
  - 2.3. - then the MS shall not attempt a location updating procedure
3. Test of Conformance Requirement 3
  - 3.1. When a failure during a periodic location updating procedure and the attempt counter is smaller than 4 then the MS shall execute a periodic location updating procedure after T3211 expiry.
  - 3.2. When the attempt counter reaches 4 after T3212 expiry the MS shall make a LUP any type.
4. Test of Conformance Requirement 4
  - 4.1. The attempt counter reaches the value 4
  - 4.2. then the MS shall use a request from CM layer for an emergency call as a trigger for a LUP.
  - 4.3. this part is optional
5. Test of Conformance Requirement 5
  - 5.1. When a failure during an imsi attach procedure and the attempt counter is smaller than 4 then  
the MS shall execute a location updating procedure(imsi attach) after T3211expiry.
  - 5.2. Attempt Counter reaches the value 4
  - 5.3. When the attempt counter reaches 4 after T3212 expiry the MS shall make a normal LUP.
6. Test of Conformance Requirement 6
  - 6.1. Failure during an imsi attach procedure and the attempt counter reaches the value 4.
  - 6.2. then the MS shall use a request from CM layer for an emergency call as a trigger for a LUP.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_5\_3  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** To verify that the MS stops and resets the timer T3212 of the periodic location updating procedure when a Location Updating Accept or a Location Updating Reject message is received.  
**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS:  
 The MS has valid TMSI and CKSN. It is "idle updated" on cell A.  
  
 Foreseen final state of the MS:  
 The MS has valid TMSI and CKSN. It is "idle updated" on cell B.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_5\_4\_2  
**Group:** GSM\_L3\_MS\_v4180/MM/  
**Purpose:** To verify that no HPLMN Search is performed when the MS is not in automatic mode  
**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS:  
 The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes.  
 The Location Area Information on the SIM is deleted.

Foreseen final state of the MS:  
 The MS has valid TMSI and CKSN. It is "idle updated" on cell B.

**Detailed Comments:** After ABORT with the cause\_value 'illegal\_me' the MS shall

1. Conformance requirement 1:  
MS shall wait for network command.
2. Conformance requirement 2:
  - 2.1. not perform location updating
  - 2.2. not perform periodic location updating
  - 2.3. not respond to paging with TMSI
  - 2.4. reject any request for MOC establishment with except emergency call.
  - 2.5. not perform IMSI detach.
3. Conformance requirement 3:  
if it support speech, perform emergency call.
4. Conformance requirement 4:  
delete stored LAI, CKSN and TMSI
