Foreword

This European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) of the European Telecommunications Standards Institute (ETSI).

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.18.1.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3 conformity specifications for which Mobile Stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

The graphical form ATS

The TTCN.GR representation of this ATS is contained in annex A of this ETS.

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4180.mp¹⁾ (Layer 3) on the diskette included as a part of this ETS (Part 3).

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1 Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;
Part 1: Conformance specification;

Reference: GSM 11.10-1.

ETS 300 607-2 Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;
Part 2: Protocol Implementation Conformance Statement (ICS)
proforma specification

Reference: GSM 11.10-2.

**ETS 300 607-3 Digital cellular telecommunications system (Phase 1);
Mobile Station (MS) conformance specification;
Part 3: Layer 3 (L3) Abstract Test Suite (ATS)**

Reference: GSM 11.10-3.

1 Scope

This European Telecommunications Standard specifies the Abstract Test Suite (ATS) and partial IXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) Mobile Stations (MS) conforming to the ETSS for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

4.3 Test groups

4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct

but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

4.4 Test Step Structure

4.4.1 Preambles

The preamble is defined for each test purpose.

4.4.2 Postambles

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

5 Test Purposes (TP)

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

5.1 TP and test case naming convention

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the section numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

"Test Purpose Identifier" = "Test Case Name" = TPI = TC_NN_A_B_C_D_E, where NN, A, B, C, D and E are digits used in the corresponding section numbers of prETS 300 607-1. For example, the test case name TC_26_5_6_2 is the TTCN specification corresponding to the conformance requirements in the section 26.5.6.1.2 in the prETS 300 607-1. In case where the section has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC_26_7_4_2_4_1, TC_26_7_4_2_4_2, TC_26_7_4_2_4_3, TC_26_7_4_2_4_4 and TC_26_7_4_2_4_5, respectively.

6 Abstract test method and test configurations

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a Man-Machine Interface as an upper tester at the SUT.

6.1 Test system model

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see figure 1).

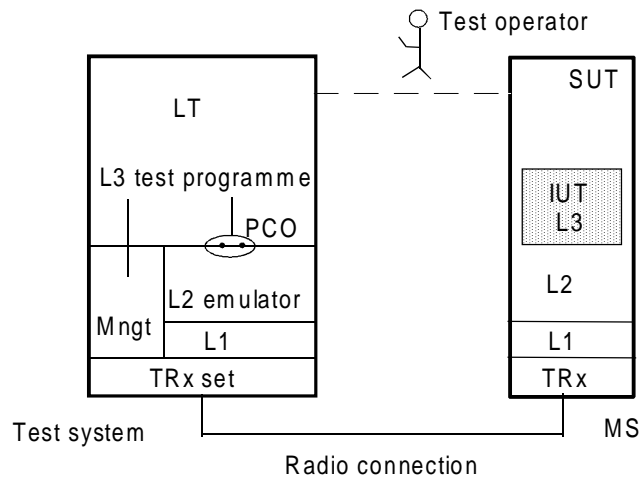

Figure 3: Test system and distributed test method

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO,
- Interface to the management functional unit via TTCN test suite operations,
- Interface to the MS man-machine interface (MMI) via a test operator.

6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management,
- Channel management,
- TRx management.

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system,
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

Annex A: Abstract Test Suite

Description

OC_SubchOfSacch4 operation returns a logic channel identifier for SACCH4 subchannel indicated by the input parameters 'subch ' and 'cell', where 'subch' is the TDMA offset, 'cell' is the cell identifier which the channel belongs to.

for example:

```

OC_SubchOfSacch4('00'B, C_CellA) = C_SACCHC40_A;
OC_SubchOfSacch4('01'B, C_CellA) = C_SACCHC41_A;

Result Type: BOOLEAN

Description

OM_Assoc operation associates the sub logic channel identifiers 'sublgch1' to 'sublgch8' and 'sublgch9' to 'sublgch16' with the generic "parent" channel identifier 'lgch1' and 'lgch2' respectively, therefore the subchannel identifiers can refer to the corresponding channels configured by OM_ChConf operation.

The 'lgch1' can be an identifier for SDCCH4, SDCCH8, FACCH and the 'lgch2' can be SACCH4, SACCH8, and SACCH.

"dummy" in the actual parameter list means the corresponding parameter is not used.

Naming convention for logical channel constants:

C_<channel type>[<rate>][<subchannel>][<cell>][<instance>]

e.g: C_FACCH H 0 _C _3 => C_FACCHH0_C_3

channel type: FCCH, SCH, BCCH, CBCH, PCH, RACH, FACCH, SACCH, SDCCH, DCCH

rate: F(ull), H(alf), 4 (fourths, C4 for SACCH4), 8 (eighths, C8 for SACCH8).

subchannel: H: 0, 1
(C)4: 0, ..., 3
(C)8: 0, ..., 7

cell: A, ..., H

instance: 1, ..., 3 When several channels of the same type can exist in one cell simultaneously (in different time slots and / or on different frequencies) they are identified by their instance. The parameters of ChConf are used to specify the frequency and slot of this instance of the channel type.

Not all possible combinations of this naming syntax have been used. According to the elements that are used / omitted the name can have a special meaning.

Examples: Comments:

C_FCCH_A	FCCH of cell A.
C_SCH_A	SCH of cell A.
C_BCCH_A_1	First instance of a BCCH in cell A.
C_CBCH_A	CBCH of cell A.
C_PCH_A_1	First instance of a PCH in cell A (there is one instance of the PCH per BCCH in the cell).
C_AGCH_A_1	First instance of a AGCH in cell A (there is one instance of the AGCH per BCCH in the cell).
C_RACH_A_1	First instance of a RACH in cell A.
C_FACCHF_A_1	First instance of a full rate FACCH in cell A.
C_FACCHH_A_1	First instance of a half rate FACCH in cell A (all subchannels).
C_FACCHH0_A_1	Subchannel 0 of the first instance of a half rate FACCH in cell A.
C_SACCHF_A_1	First instance of a full rate SACCH in cell A.
C_SACCHH_A_1	First instance of a half rate SACCH in cell A (all subchannels).
C_SACCHH1_A_1	Subchannel 1 of the first instance of a half rate SACCH in cell A.
C_SACCHC4_A	SACCH/4 of cell A (all subchannels).
C_SACCHC43_A	Subchannel 3 of the SACCH/4 of cell A.
C_SACCHC8_A_1	First instance of a SACCH/8 in cell A (all subchannels).
C_SACCHC87_A_1	Subchannel 7 of the first instance of a SACCH/8 in cell A.
C_SDCCH4_A	SDCCH/4 of cell A (all subchannels).
C_SDCCH42_A	Subchannel 2 of the SDCCH/4 of cell A.
C_SDCCH87_A_1	First instance of a SDCCH/8 in cell A (all subchannels).
C_SDCCH87_A_1	Subchannel 7 of the first instance of a SDCCH/8 in cell A.

This list covers all types of combinations used in the TTCN for the time being.

When the meaning refers to 'all' subchannels of a channel (e.g. C_FACCHH_A_1), it means that all active subchannels of this channel activated previously by OM_ChConf, are associated with a logical channel identifier in the OM_Assoc.

Operation Name: OM_ChangeRFOf2Cells(cellid1:CellID; bspwr1:INTEGER; cellid2:CellID; bspwr2:INTEGER)
Result Type: BOOLEAN
Comments:

Description

This TSO is to change the RF level of the cell 'cellid1' to the RF level 'bspwr1' and the RF level of the cell 'cellid2' to the RF level 'bspwr2' [dBuVemf], then the TSO returns TRUE.

The major purpose of the TSO is to force the MS to reselect a new cell according to the GSM 05.08, subclause 6.6.2. The following example shows the use of the TSO.

The default cell selection parameters in the ATS are set as:

Cell reselect hysteresis: 12db

MX TXPWR MX CCH: minimum level (0)

ACS: no additional cell selection parameter (0)

RXLEV ACCESS MIN: minimum (0).

Therefore the path loss criterion parameter C1 equals to the reselection criterion parameter C2. In the whole ATS the C1 and C2 keeps greater than 10 (e.g. TC_26_7_4_2_3) for a cell not suitable. The MS received level average from a not suitable cell keeps also greater than 10 (-100 dBm) corresponding to the reference sensitivity level of DCS 1800 MS.

For GSM arfcn = 20, F = 941 MHz, the fields strengths (E) on tester integral antenna:

$E \text{ (dB microV/m)} \geq (-110 + 10) \text{ (dBm)} + 20\log(941) + 77.2 = 36.7$,

For DCS arfcn = 590, $F = (-110 + 10) \text{ (dBm)} + 20\log(1820.8) + 77.2 = 42.4$ (the formula see GSM 05.05, clause 5 and GSM 05.08, subclause 8.1.4).

In order to keep C1, C2 greater 10, a reasonable field strength making a cell not suitable

is set to C_E_notsuitable = 45 in comparison with the default field strength C_E_default = 63. Considering that the cell reselect hysteresis is set to 12 db, the field strength of a cell being reselected need to be set to greater than 57. In the ATS the default value C_E_default (63) and C_E_notsuitable (45) are used for this TSO to force MS making cell reselection assuming that the two cells have different location area..

If two cells have the same location area (e.g. in TC_26_6_1_3), or although two cells have different LAI, the test cases needs to lower a cell power to a certain low level (e.g. in TC_26_7_4_2_4_1 and TC_26_7_4_2_4_5),

C1 needs to be less than zero to force the MS reselect a better cell. For GSM, $E \leq 26.7$, for DCS, $E \leq 32.4$. The value C_E_notsuitable_sameLAI = 24 applies to the TSO to force the MS making cell reselection.

PCO declarations

PCO Declarations			
PCO Name	Type	Role	Comments
L	SAP0_3	LT	
Detailed Comments:			
1. The PCO consists of multiple SAPs: the SAP0 and SAP3. 2. The lower tester (LT) is the user of the data link layer service. 3. The SAP0 at the lower tester controlling and observing the exchange of CC, MM, RR and SS PDUs (messages) on the DCCH, SACCH and/or RACH, BCCH, CCCH channels. 4. The SAP3 at the lower tester controlling and observing the exchange of SMS PDUs (messages) on the DCCH or SACCH channels.			

Timer declarations

Timer Declarations			
Timer Name	Duration	Unit	Comments
T_dly		ms	general purpose delay timer
T_dly1		ms	general purpose delay timer
T_dly2		ms	general purpose delay timer
T_dlyAss	5000	ms	AssCmd timer, 1)
T_guard	300	s	guard timer
T_release	C_release_time	s	release timer
Detailed Comments:			
1) In order to give to the lower tester enough time to dequeue and to send out the call SETUP and the other call establishment related messages in the sending buffer before starting sending of ASSIGNMENT COMMAND message, the default value 5s is used in the test step AssCh_complete. In the test step AssCh_failure the timer value is set to 4s. For the TC_26_6_4_1, 600ms is used.

Detailed Comments:	1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters.

Test Case Dynamic Behaviour

Test Case Name: TC_11_2
Group: GSM_L3_MS_v4180/General/
Purpose: 1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Bearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.

This is verified for one Mobile Terminated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.

Default: OtherEventsFail

Detailed Comments:

1. To generate a CALL COMFIRMED based on the required basic service and IXIT parameters, and ask operator to configurate the MS for the required basic service.
2. To setup physical channel for BCCH,CCCH and SDCCH4 channels.
3. To send a SETUP_PDU without bearer capabilities and lower and higher layer compatibility.
4. To check whether the received CALL COMFIRM PDU is correct.

Test Case Dynamic Behaviour					
Test Case Name: TC_26_2_1_1					
Group: GSM_L3_MS_v4180/InitialTest/					
Purpose:					
1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0.7 seconds after reception of the PAGING message.					
2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

Purpose: To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM-STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC.

Test Case Dynamic Behaviour					
Test Case Name: TC_26_6_2_5					
Group: GSM_L3_MS_v4180/RR/					
Purpose:					
1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.					
2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.					
Default: OtherEventsFail					
Comments:					
The configuration is Tx-integer = 5, Max-Retrans = 1 and CCCH-CONF, BS-AG-BLKS-RES and BS-PA-MFRMS are from PIXIT parameters.					
In the PIXITs CCCH-CONF is set to 3, BS-AG-BLKS-RES = 2 and BS-PA-MFRMS = 3.					
For this test to be useful, we need					
(((IMSI mod 10000) mod (cc * (9 - bsagres) * bspamfrms)) > (9 - bsagres) * bspamfrms)					
ie. ((IMSI mod 1000) mod 3*7*9) > 7*9					
thus if the last 3 digits of the IMSI are 065 then this test will work.					
When the CCCHs that are not on timeslot zero are set, the SYNC channel must not be started on them. The SYNC channel is used by mobiles to identify TS zero. (the FCCH is supposed to be excluded as well)

Test Case Dynamic Behaviour

Test Case Name:	TC_26_6_4_1
Group:	GSM_L3_MS_v4180/RR/
Purpose:	<p>1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition</p> <p>1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot</p> <p>1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot</p> <p>1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot</p> <p>1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H</p> <p>1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H</p> <p>1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.</p> <p>2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.</p> <p>3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.</p> <p>4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.</p>

Test Case Dynamic Behaviour					
Test Case Name:		TC_26_6_5_6			
Group:		GSM_L3_MS_v4180/RR/			
Purpose:		To test that when the MS is ordered to make a pseudo synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells.

Test Case Dynamic Behaviour

Test Case Name:	TC_26_7_3_2
Group:	GSM_L3_MS_v4180/MM/
Purpose:	To check that the MS behaves correctly when activated with an IMSI of length less than the maximum length. In this condition, the MS shall: <ol style="list-style-type: none"> 1. perform location updating 2. answer to paging with IMSI 3. give the correct IMSI when asked by an IDENTITY REQUEST 4. attempt CM connection establishment when requested to 5. attempt call re-establishment when needed 6. attempt IMSI detach when needed 7. erase its TMSI when the IMSI is sent by the network in a LOCATION UPDATING ACCEPT or a TMSI REALLOCATION COMMAND message.
Default:	OtherEventsFail
Comments:	Initial Conditions of MS: The MS has no valid TMSI. It is "idle updated" on the cell. The IMSI has the value '001011234'. This test case shall use the SIM Card 2 with 'IMSI=001011234' and HPLMN_search_period=6min. Foreseen final state of the MS: The MS has no valid TMSI. It is "idle updated" on the cell.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_4_2_4_1
Group: GSM_L3_MS_v4180/MM/
Purpose: Test purpose 1
 To test that on receipt of a rejection using the Roaming cause code, the MS ceases trying to update on that cell, that this situation continues for at least one periodic location interval period, and that the corresponding list is re-set by powering down the MS (the requirement in TS GSM 04.08 is that the list shall be retained for at least 12 hours. This aspect is not formally tested).
Default: OtherEventsFail
Comments: This testcase includes only the procedure of part 1 of GSM 11.10-1, section 26.7.4.2.4.

Initial Conditions of MS:
 The MS has valid TMSI, CKSN and Kc.It is "idle updated" on cell B.

Foreseen final state of the MS:
 The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

(This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an L frame on layer 2 of the FACCH.)</p> <p>6) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.</p> <p>7) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.</p> <p>These test purposes are tested for all rates supported by the MS (full rate/half rate).</p>

Purpose:	<p>1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message.</p> <p>2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.</p> <p>3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.</p> <p>4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radion path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)</p>

Purpose:					
1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of a password for all call restriction services, sending a CM-SERVICE REQUEST.					
2) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all call restriction services.					
3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.					
4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).					
Those checks are performed with a call transaction already established for:					
all call restriction services, the RELEASE COMPLETE message being sent at the beginning of the procedure with a facility IE containing a return_error(error) where error is "SS subscription violation".

Purpose:

- 1) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in the subsequent CM-SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of a group of call restriction services.
- 4) To check that upon receipt of FACILITY message requiring the password, the MS provides the appropriate user indication (as described by the manufacturer).
- 5) To check that the MS is able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).
- 6) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

- a) all restrictions, for basic service group "speech".
- b) barring of outgoing calls, for all facsimile.

Test Step Dynamic Behaviour					
Test Step Name: Chmod(rate:RATE; ce:B_2; ur:B_4; svc:SERVICES)					
Group: GSM_L3_MS_v4180/Preambles/					
Objective: To assign correct values to the test case variables TCV_ChMod and TCV_ChModb.					
Default: OtherEvents					
Comments: The rules for assignment are in table 10-1 of GSM 11.10 section 10.3. If the value for ce is "BothT", the rule for transparent is used. If the value for ce is "BothNT", the rule for non transparent is used. That means the preferred value will be used in test configuration.

Annex B: Partial IXIT proforma

Notwithstanding the provisions of the copyright clause related to the text of this ETS, ETSI grants that users of this ETS may freely reproduce the PIXIT proforma in this annex so that it can be used for its intended purposes and may further publish the completed PIXIT.

Introduction

This partial IXIT proforma contained in this ETS, after augmented by the Test Realizer, is proposed to be provided to the client for completion, when the related Abstract Test Suite is to be used against client's Implementation Under Test (IUT).

Text in *italics* is comments for guidance for the production of a IXIT, and is not to be included in the actual IXIT.

The completed IXIT will normally be used in conjunction with the completed ICS, as it adds precision to the information provided by the ICS.

This clause is completed by the client in conjunction with the test laboratory.

In the following tables, the client identifies relevant information concerning each ancillary protocol in the SUT other than the IUT itself. One table for one ancillary protocol

Based on the MOT the test laboratory should create question proforma for each ancillary protocol in the blank space following each table. The information required is dependent on the MOT and the SUT, and covers all the addressing, parameter values, timer values and facilities (relevant to ETSS) as defined by the ICS for the ancillary protocol.

B.7.2 Parameter Values

B.7.2.1 Parameters related to Physical Resources

B.7.2.1.1 Parameter TSPX_AltNb

In the default test condition, there are two set of ARFCNs for neighbour cells BCCH/CCCH carriers available, one set is {10, 80, 90, 100, 110, 120} for GSM 900 or {520, 600, 700, 780, 810, 870} for DCS1 800, an alternative is {15, 85, 95, 105, 115, 122} for GSM 900 or {530, 610, 710, 790, 820, 880} for DCS1 800. The value of TRUE selects the alternative set.

Table 19: Parameter TSPX_AltNb

Parameter Name	TSPX_AltNb
Parameter Type	BOOLEAN
Parameter Value	
References: TSPX_AltNb is used in: all test cases except RR and MM test group.	

B.7.2.1.2 Parameter TSPX_BCCHcarrierA

In the default test condition, BCCH/CCCH carrier for cell A could be one of the following ARFCNs 20, 40 and 60 for GSM 900 or one of the following ARFCNs 590, 690 and 830 for DCS1 800. The parameter TSPX_BCCHcarrierA specifies which one is used in the test.

Parameter Type	INTEGER
Parameter Value	
References: TSPX_BCCHcarrierA is used in: all test cases except RR and MM test group.	

B.7.2.1.3 Parameter TSPX_BCCHcarrierB

In invalid/inopportune test, Idle mode test, and CC test group, an emulation of two cells, cell A and cell B, is needed. The parameter TSPX_BCCHcarrierB specifies the ARFCN used for BCCH/CCCH carrier of cell B. the value of TSPX_BCCHcarrierB can be selected from {10, 80, 90, 100, 110,120} for GSM 900 or {520, 600, 700, 780, 810, 870} for DCS1 800 when the TSPX_AltNb = FALSE, or form {15, 85, 95, 105, 115, 122} for GSM 900 or {530, 610, 710, 790, 820, 880} for DCS! 800 when the TSPX_AltNb = TRUE.

B.7.2.5 Parameters for Setup message

The following tables are used by the test laboratory to control the setup message used in testing. they shall be filled by the test lab according to the ICS answers from the mobile station manufacturer.

For each basic service, there are three setup messages: TSPX_Setup????_1, TSPX_Setup????_2 and TSPX_Setup????_3.

- If the MS under test supports that basic service, TSPX_Setup????_1 shall be filled. If the MS supports more than one bearer capabilities, the TSPX_????more shall be filled with TRUE and TSPX_Setup????_2 shall also be filled. Parameters in TSPX_Setup????_2 shall be different from TSPX_Setup????_1 as many as possible. The TSPX_Setup????_3 is skipped.

- If the MS does not support the basic service, TSPX_Setup????_1 and TSPX_Setup????_2 are skipped. TSPX_Setup????_3 shall be filled with values which are arbitrarily selected among those defined in GSM 07.01 annex B for the basic service.
