| <b>Purpose:</b> To test that when the MS is ordered to make a finely synchronised handover to a synchronised cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                       |   |                                                                                                                                                                                                |

| <b>Purpose:</b>             |       | To test that when the MS is ordered to make a pre-synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To test that the MS correctly reports on the time difference between the cells.                                                                                                 |                                                                                                                              |   |          |

## Test Case Dynamic Behaviour

|                        |                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Test Case Name:</b> | TC_26_6_5_6                                                                                                                                                                                                                                                                                                |
| <b>Group:</b>          | GSM_L3_MS_v4200/RR/                                                                                                                                                                                                                                                                                        |
| <b>Purpose:</b>        | To test that when the MS is ordered to make a pseudo synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells. |

Detailed Comments:

1. Cell A with BCCH, CCCH, SDCCH4 and a traffic channel.

2. Cell B with BCCH, CCCH, SDCCH4 and a traffic channel.
3. In cell A the timing advance =  $TSPX\_y2$ .
4. pseudo-synch,  $rot = 1$ ,  $nc1 = 0$ , real time difference =  $2 * TSPX\_k2 + 10$ ., handover reference =  $TSPX\_HoRefH$ .
5. The Mobile Time Difference =  $(2 * TSPX\_k2 + TSPX\_y2) \bmod 2\ 097\ 152$  with tolerance of 2.
6. The time advance is correct.

**Detailed Comments:**

1. Cell A with BCCH, CCCH, SDCCH4 and a traffic channel.
2. Cell B with BCCH, CCCH, SDCCH4 and a traffic channel.
3. In cell A the timing advance = TSPX\_y3.
4. non-synch, rot = 1, nci = 0, handover reference = TSPX\_HoRefB.

**Detailed Comments:**

1. To setup BCCH, CCCH, SDCCH4 and a full rate traffic channel for cell A.
2. To setup BCCH, CCCH, SDCCH4 and a full rate traffic channel for cell B.
3. To bring the MS into the U10 state.
4. Non-synchronised handover, power level = 8.
5. On old channel.
6. Power level is the old one (TSPX\_MSTxpwrMax)

**Detailed Comments:**

1. To setup BCCH, CCCH, SDCCH4 and a full rate traffic channel for cell A.
2. To setup BCCH, CCCH, SDCCH4 and a receiving only full rate traffic channel for cell B.
3. To bring the MS into the U10 state.
4. Non-synchronised handover, power level = 8.
5. On old channel.

6. Power level is the old one (TSPX\_MSTxpwrMax)

| <b>Purpose:</b>             |       | To verify that the MS starts ciphering when it receives a CIPHERING MODE COMMAND message with Cipher Mode Setting = "Start Ciphering". To verify that it continues to use the old cipher key after it receives an AUTHENTICATION REQUEST whilst in ciphered mode.                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                  |   |                         |

**Test Case Dynamic Behaviour**

**Test Case Name:** TC\_26\_6\_8\_4  
**Group:** GSM\_L3\_MS\_v4200/RR/  
**Purpose:**

- 1 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS uses the cipher key stored in the SIM to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and that the MS responds with a CIPHERING MODE COMPLETE message.
- 2 To verify that the MS is ready to transmit the CIPHERING MODE COMPLETE message before 500ms after the end of the CIPHERING MODE COMMAND message.
- 3 To verify that when the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.
- 4 To verify that when the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key
- 5 To verify that when the MS is in the "ciphered" mode and receives the CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS loads the cipher key stored in the SIM into the ME, stops ciphering and deciphering and, responds with a CIPHERING MODE COMPLETE message.
- 6 To verify that the MS responds to an AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the cipher key obtained from the previous authentication procedure.
- 7 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering", the does not start ciphering or deciphering, but does respond with a CIPHERING MODE COMPLETE message.
- 8 To verify that when the MS receives a HANDOVER COMMAND message and the handover fails, the MS sends a HANDOVER FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.
- 9 To verify that when the MS receives an ASSIGNMENT COMMAND message and the assignment fails, the MS sends an ASSIGNMENT FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

**Default:** OtherEventsFail

**Detailed Comments:**

1. 1 cell, default parameters.
2. New ciphering key sequence number and new ciphering key L.
3. New SDCCH4 subchannel different from the one in use, start ciphering.
4. Load new key L, no ciphering.
5. New SDCCH4 subchannel different from the one in use, start ciphering.
6. New SDCCH4 subchannel different from the one in use, start ciphering.
7. New SDCCH4 subchannel different from the one in use, no ciphering.
8. To generate new ciphering key M.
9. New SDCCH4 subchannel different from the one in use, start ciphering.
10. New SDCCH4 subchannel different from the one in use, no ciphering, new channel not activated.
11. New SDCCH4 subchannel different from the one in use, no ciphering, new channel not activated.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set a physical channel as hopping SDCCH8 channel, hopping parameters defined by PIXIT.
3. To setup the before time and after time channels for ASSIGNMENT COMMAND.
4. To assign the hopping SDCCH8 channel.
5. To calculate the STARTING TIME.
6. To check whether the after time frequency hopping is correct at the RF burst level.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for before time.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for before time.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for before time.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set a physical channel as hopping SDCCH8 channel, hopping parameters defined by PIXIT.
3. To setup the after time channels for ASSIGNMENT COMMAND.
4. To assign the hopping SDCCH8 channel.
5. To calculate the STARTING TIME.
6. To check whether the after time frequency hopping is correct at the RF burst level.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for after time.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for after time.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for after time.

| <b>Purpose:</b>             |       | To verify that the MS, after receiving a FREQUENCY REDEFINITION message and then an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the assignment and returning on the old channel, and ready to access before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.         |                                                                                             |   |                         |

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To set two physical channels, one as hopping channel for immediate assignment another one as hopping channel for after time channel, parameters defined by PIXIT. Note: Although the test case is designed for TCH/F, TCH/H & SDCCH8 the TSPX\_Chtp5 should be assigned to an SDCCH8 subchannel because calculations of starting time T1 for TCH/F & TCH/H have not yet been carried out. No simple values can be defined.
3. To calculate the starting time for frequency redefinition.
4. To send FREQUENCY REDIFINITION message.
5. To calculate the starting time and send the ASSIGNMENT COMMAND on special frame TCV\_Fn. The assigned channel not activated in the tester.
6. The expected ASSIGNMENT FAILURE message received on the channel defined by frequency redefinition.
7. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment.
8. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment.
9. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To setup a physical channel for immediate assignmemnt.
3. To calculate the starting time for frequency parameters change.
4. To inform the test system to change frequency parameters after starting time.
5. To check whether the MS transmitting on the after time frequency parameters.
6. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment before time.
7. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment before time.
8. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment before time.

**Detailed Comments:**

1. To setup a physical channel as BCCH, CCCH.
2. To setup a physical channel for immediate assignment.
3. To calculate the starting time for immediate assignment.
4. To paging response message received on the channel with after time frequency parameters.
5. If the selected channel type is TCH/F, setup a physical channel as full rate channel for immediate assignment after time.
6. If the selected channel type is TCH/H, setup a physical channel as half rate channel for immediate assignment after time.
7. If the selected channel type is SDCCH8, setup a physical channel as SDCCH8 channel for immediate assignment after time.

**Detailed Comments:**

- 1) Initial condition: CKSN2, which has the default value.
- 2) Check of purpose 1.3
- 3) Check of purpose 1.4
- 4) Check of purpose 1.4, emergency call
- 5) Check of purpose 1.1
- 6) Check of purpose 1.2
- 7) Check of purpose 1.5
- 8) Check normal location update after SimOutIn or SwitchOnOff or PowerOnOff.
- 9) CKSN1 takes the value different from the default value.

**Detailed Comments:** 1) Location updating rejected with cause = PLMN not allowed.

MS shall

- 2) not perform periodic updating
- 3) not perform IMSI detach when switched off.
- 4) not perform normal location updating after switching to a new LAC in the same PLMN and when that PLMN is not selected manually.
- 5) reject any request from CM entity for MM connection other than for emergency call.
- 6) switch to a new cell with a new PLMN.
- 7) perform normal location updating after entering in a new PLMN.
8. The PLMN of cell B is suppressed on the SIM's forbidden PLMN list.

**Detailed Comments:**

1) Reject of Location Updating with the cause Roaming is not allowed.

MS shall

2) perform normal updating when a new location area is entered.

3a) not respond to paging with TMSI in cell a.

3b) not respond to paging with TMSI in cell b.

4) reject any request from CM entity for MM connection other than for emergency call.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_2\_4\_3  
**Group:** GSM\_L3\_MS\_v4200/MM/  
**Purpose:** Test purpose 3  
 To test that at least 6 entries can be held in the list of "forbidden location areas for roaming" (the requirement in TS GSM 04.08 is to store at least 10 entries. This is not fully tested by this procedure).  
**Default:** OtherEventsFail  
**Comments:** This testcase includes only the procedure of part 3 of GSM 11.10-1, section 26.7.4.2.4.

Initial Conditions of MS:

The MS has valid TMSI, CKSN and Kc.It is "idle updated" on cell B.

Foreseen final state of the MS:

The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

**Detailed Comments:**

- 1) MS shall select cell A, cell B is not available.
- 2) To send Max-Retrans+1 times Channel Requests in cell A
- 3) MS shall not try to establish a connection during a period of a cell reselection (4 seconds).
- 4) MS shall perform a normal location updating procedure as it is necessary. The time difference between the channel request in the test step and the last channel request in the ltree\_ra shall be in the range of 4-9 seconds.
- 5) Cell A is not available and MS shall switch to cell B
- 6) To send Max-Retrans+1 times Channel Requests in cell B
- 7) Cell A is available again.
- 8) MS shall not repeat the complete procedure if the original cause of the normal location updating procedure has disappeared.

| <b>Purpose:</b>                    | To verify that the MS performs normal location updating procedures when its attempt counter is smaller than 4. To check that the MS does not perform the IMSI detach procedure when "idle not updated". To verify that when "idle not updated" the MS can perform an emergency call. To verify that when "idle not updated" the MS uses requests from CM layer other than emergency call as triggering of a normal location updating procedure. To verify that the MS performs a normal location updating procedure if it enters a new cell while being "idle not updated". |

**Detailed Comments:**

1. Test of Conformance Requirement 1
  - 1.1. Reject of Location Updating in cell B
  - 1.2. MS shall wait the period of T3211 and restart the normal location updating procedure when the attempt counter is smaller than 4.
  - 1.3. Radio Link Failure extends the period of delay for next location updating.
2. Test of Conformance Requirement 2
  - 2.1. Reject of Location Updating in cell A
  - 2.2. MS shall not answer to paging
  - 2.3. All of location updating requests shall be rejected.
  - 2.4. MS shall not perform the IMSI detach procedure.
3. Test of Conformance Requirement 3
  - 3.1. Failure during Location Updating in cell A
  - 3.2. MS shall support emergency call.

3.3. MS shall wait at most 15 sec. for location updating

4. Test of Conformance Requirement 4

4.1. Failure during Location Updating Procedure

4.2. MS shall use a request from Cm entity other than emergency call as a trigger for a normal location updating procedure.

4.3. After the Location Updating Procedure MS can (optional) start automatically the Cm entity service again. It is optional and shall be observed only 15 sec.

6. Test of Conformance Requirement 6

6.1. Failure during Location Updating Procedure

6.2. MS shall start the location Updating Procedure as soon as it enters a new cell.

### Test Case Dynamic Behaviour

**Detailed Comments:**

1. To test conformance requirement 1
  - 1.1. Attempt counter is now equal to 4
  - 1.2. MS shall perform location updating after T3212
  - 1.3. MS shall initiate location updating procedure, if the updating was unsuccessful.
- 2.) To test conformance requirement 2
  - 2.1. Attempt counter is now equal to 4
  - 2.2. MS shall perform request for emergency call
  - 2.3. MS shall not perform an IMSI detach procedure
- 3.) To test conformance requirement 3 and 4
  - 3.1. Attempt counter is now equal to 4
  - 3.2. MS shall use a request from CM entity for MM connection for a service other than emergency

call as a trigger for a normal location updating procedure.

3.3. MS shall reset the attempt counter after successful location updating procedure.

3.4. Attempt counter is now equal to 4

3.5. MS shall perform the normal location updating procedure after entering a new cell.

3.6. If the location updating procedure unsuccessful, the MS shall trigger the location updating after T3211 again.

### Test Case Dynamic Behaviour

**Detailed Comments:**

## 1. Test of Conformance Requirement 1

- 1.1. failure during a periodic location updating procedure
- 1.2. - then the MS shall be able to attempt an CM connection
- 1.3. - then the MS shall not attempt a location updating procedure

## 2. Test of Conformance Requirement 2

- 2.1. failure during imsi attach procedure
- 2.2. - then the MS shall be able to establish an MM connection
- 2.3. - then the MS shall not attempt a location updating procedure

## 3. Test of Conformance Requirement 3

- 3.1. When a failure during a periodic location updating procedure and the attempt counter is smaller than 4 then the MS shall execute a periodic location updating procedure after T3211 expiry.
- 3.2. When the attempt counter reaches 4 after T3212 expiry the MS shall make a LUP any type.

4. Test of Conformance Requirement 4

4.1. The attempt counter reaches the value 4

4.2. then the MS shall use a request from CM layer for an emergency call as a trigger for a LUP.

4.3. this part is optional

5. Test of Conformance Requirement 5

5.1. When a failure during an imsi attach procedure and the attempt counter is smaller than 4 then

the MS shall execute a location updating procedure(imsi attach) after T3211 expiry.

5.2. Attempt Counter reaches the value 4

5.3. When the attempt counter reaches 4 after T3212 expiry the MS shall make a normal LUP.

6. Test of Conformance Requirement 6

6.1. Failure during an imsi attach procedure and the attempt counter reaches the value 4.

6.2. then the MS shall use a request from CM layer for an emergency call as a trigger for a LUP.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_4\_5\_4\_2  
**Group:** GSM\_L3\_MS\_v4200/MM/  
**Purpose:** To verify that no HPLMN Search is performed when the MS is not in automatic mode  
**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS:  
 The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes.  
 The Location Area Information on the SIM is deleted.  
  
 Foreseen final state of the MS:  
 The MS has valid TMSI and CKSN. It is "idle updated" on cell B.

**Detailed Comments:**

PR1) Initial condition: The PLMN of cell B is entered in the SIM's forbidden PLMN list.  
 PR2) Initial condition: Idle updated in cell A.

- 1) MS is in automatic network selection mode.
- 2) IMSI attach procedure
- 3) Conformance Requirement 1  
 Delay for 11 min and 40 seconds. In this time MS may not location update in cell A.
- 4) The MS shall execute the periodic location updating after 12 min.
- 5) Conformance Requirement 5  
 No Reaction in 7 min. In this time MS may not location update in cell B.
- 6) The MS shall execute the periodic location updating before 17 min after last periodic LUP.

PS1) Final postamble: The PLMN of cell B is suppressed on the SIM's forbidden PLMN list.

### Test Case Dynamic Behaviour

**Test Case Name:** TC\_26\_7\_5\_8\_3  
**Group:** GSM\_L3\_MS\_v4200/MM/  
**Purpose:**

- 1) To check that a MS that has no CM application request pending sets the Follow-On-Request bit to No follow-on request pending in a LOCATION UPDATING REQUEST message.
- 2) To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending does not attempt to establish a new MM connection on that RR connection.
- 3) To check that the MS accepts establishment by the network of a new MM connection on the existing RR connection.

**Default:** OtherEventsFail  
**Comments:** Initial Conditions of MS: The MS has valid TMSI and is deactivated.

**Detailed Comments:**

1. To select a circuit switched basic service for testing.
2. To check if the TCH is connected through if the channel mode is speech, so that the inband information may be heard.
3. To check if the TCH is not connected through if the channel mode is not speech.
4. To check that CC is in state U3.
5. To check that the MS has stopped T310
6. To check that CC is still in state U3.
7. To check if the TCH is connected through if the channel mode is speech.
