The algorithm for derivation of BS61 Bearer Capabilities:

The data Bearer Capability for 1st SETUP (used for an MT call):

```

IF TSPX_BS_61_A
 ur= TSPX_BS_61_A_ur1
 IF TSPX_BS_61_A_ur1_T_NT OR (TSPX_BS_61_A_ur1_ce = NT)

ELSE
 IF TSPX_BS_61_S
 ur= TSPX_BS_61_S_ur1 use coding of sec. 11.8.1.3.3 with (ur & ce=T)

```

The 2nd Bearer Capability for second SETUP ( used for TC\_11\_1\_1):

Note: the 2nd BC is derived IF  
(TSPX\_BS\_61\_A OR (TSPX\_BS\_61\_S AND TSPX\_BS\_61\_S\_more\_ur))

```

IF TSPX_BS_61_A AND TSPX_BS_61_S

The algorithm for derivation of BS81 Bearer Capabilities is same as above except all parameters are changed to corresponding BS81's parameters.

| <b>Comments:</b> The rules for assignment are in Table 10-1 of GSM 11.10 section 10.3. If the value for ce is "BothT", the rule for transparent is used. If the value for ce is "BothNT", the rule for non transparent is used. That means the preferred value will be used in test configuration. |            |                                                                                         |      |   |                |

| <b>Comments:</b>            |       | TCV_TI0 contains the transaction identifier from the MS, and TCV_TI contains the transaction identifier for test system to send CC message. Their values are used in test body. The calling tree shall prepare two variables for the step: TCV_ch for the SDCCH4 subchannel; TCV_CphKey for ciphering key. |                                    |   |                             |

| <b>Comments:</b>            |            | The supported bearer capability is specified in the input parameter setup, test case variable TCV_TI holds the transaction ID and the transaction ID =0. This is generic call set up procedure. The calling tree shall prepare three variables for the step: TCV_ch for SDCCH4 subchannel, TCV_chTch for traffic channel, TCV_CphKey for ciphering key. This test step is used for non RR testing. |                                               |     |          |

| <b>Comments:</b>            |            | The supported bearer capability is specified in the input parameter setup, test case variable TCV_TI holds the transaction ID and the transaction ID =0. This is generic call set up procedure. The calling tree shall prepare three variables for the step: TCV_ch for SDCCH4 subchannel, TCV_chTch for traffic channel, TCV_CphKey for ciphering key. This test step is used for non RR testing. |                                               |     |          |

| <b>Comments:</b>            |            | The supported bearer capability is specified in the input partameter setup, test case variable TCV_TI holds the transaction ID and the transaction ID =0. This is generic call set up procedure. The calling tree shall prepare three variables for the step: TCV_ch for SDCCH4 subchannel, TCV_chTch for traffic channel, TCV_CphKey for ciphering key. The timing advance is parameter. For RR testing. |                                                                                                                    |   |                         |

### Test Step Dynamic Behaviour

**Test Step Name:** PreEnterCCstateU10\_21( sub:B\_2; slot:SN; tsc:TSC; ta:TA)  
**Group:** GSM\_L3\_MS\_v4200/Preambles/  
**Objective:** To bring the MS into CC state U10 by procedure in table 26.8.1.2/1. This is used in CC testing.  
**Default:** OtherEvents  
**Comments:** TCV\_TI0 contains the transaction identifier from the MS, and TCV\_TI contains the transaction identifier for test system to send CC message. The values of them are used in test body. The calling tree shall prepare two variables for the step: TCV\_ch for the SDCCH4 subchannel; TCV\_CphKey for ciphering key.

| <b>Comments:</b>            |       | TCV_TI0 contains the transaction identifier from the MS, and TCV_TI contains the transaction identifier for test system to send CC message. The values of them are used in test body. The calling tree shall prepare two variables for the step: TCV_ch for the SDCCH4 subchannel; TCV_CphKey for ciphering key. |                                                                            |   |          |

The 1st Bearer Capability ( used for an MT call):  
 ur= TSPX\_TS\_62\_ur1  
 IF TSPX\_TS\_62\_T\_NT OR (TSPX\_TS\_62\_ce = NT)  
     use coding 11.8.1.5.2 with (ur & ce=NT)  
 ELSE  
     use coding 11.8.1.5.1 with (ur & ce=T)

The 2nd Bearer Capability ( used for TC\_11\_1\_1):  
 IF TSPX\_TS\_62\_more\_ur  
     ur=TSPX\_TS\_62\_ur2  
 ELSE  
     ur=TSPX\_TS\_62\_ur1  
 IF TSPX\_TS\_62\_T\_NT  
     use coding 11.8.1.5.1 with (ur & ce=T)  
 ELSE  
     use coding 11.8.1.5.2 with(ur & ce=both/T)

**Annex B (normative): Partial IXIT proforma**

Notwithstanding the provisions of the copyright clause related to the text of this ETS, ETSI grants that users of this ETS may freely reproduce the PIXIT proforma in this annex so that it can be used for its intended purposes and may further publish the completed PIXIT.

**Introduction**

This partial IXIT proforma contained in this ETS, after augmented by the Test Realizer, is proposed to be provided to the client for completion, when the related Abstract Test Suite is to be used against client's Implementation Under Test (IUT).

Text in *italics* is comments for guidance for the production of a IXIT, and is not to be included in the actual IXIT.

The completed IXIT will normally be used in conjunction with the completed ICS, as it adds precision to the information provided by the ICS.

In the following tables, the client identifies relevant information concerning each ancillary protocol in the SUT other than the IUT itself. One table for one ancillary protocol.

Based on the MOT the test laboratory should create question proforma for each ancillary protocol in the blank space following each table. The information required is dependent on the MOT and the SUT, and covers all the addressing, parameter values, timer values and facilities (relevant to ETSs) as defined by the ICS for the ancillary protocol.

| <b>Detailed Comments:</b> One of the six tpdu is contained in the RPUSRDATA. Since the structures of the messages SMS-Deliver-Report and SMS-Submit-Report are identical, they have been combined to tpdlvr_sbmt_rpt and therefore only five tp message types exist in this type definition. |                 |          |

| The operation codes a part of the contents for a cell broadcast short message. The cell broadcast short message, is 82 octets long, i.e. 93 characters, each represented by 7 bits. As many as possible different characters are sent, the characters are those corresponding to the 7-bit representation of the integers 0, 1, 2, ..., 92. The bits are arranged acc. to GSM 03.38, clause 6.1.2.1.1. The result of this operation is the octetstring of the octets 'firstoct' to 'lastoct' (16 octets for the first message block, 22 octets for the 2nd, 3rd and 4th blocks), with the octets of the cell broadcast short message being numbered from 1 to 82. |                                                          |

| This operation provides a short message's contents with a specified number of characters 'NumberOfCharacters', each represented by 7 bits. As possible different characters are sent, the characters are those corresponding to the 7-bit representation of 0, 1, 2, ... up to ('NumberOfCharacters' - 1). If more than 128 characters are sent, the rest of the characters is the corresponding to 0, 1, ... up to (NumberOfCharacters - 128 - 1), e.g. for 160 characters: 0, 1, ..., 127, 0, 1, ..., 31. Test Suite Operation Definition	
Operation Name:	OC_OeBit(bcddigits:HEXSTRING)
Result Type:	BITSTRING
Comments:	The input parameter `bcddigits` is really BCD string (subset of HEXSTRING), the result is BITSTRING[1].
Description	
<p>The function of the OC_OeBit is as the following:</p> <ol style="list-style-type: none"> 1. it returns '1'B, if the length of the `bcddigits` is odd, 2. it returns '0'B, if the length of the `bcddigits` is even. <p>for example:</p> <p>OC_OeBit('12583') = '1'B, OC_OeBit('87259957') = '0'B.</p>

Description	
<p>OC_OctToInvokeIDType converts the OCTETSTRING `o` into InvokeIDType, with the MSB of `o` representing the negative value $-2^{\exp(n-1)}$, for example '80'O->'10000000'B-> -128. The rest of the bits can code positive values up to $+2^{\exp(n-2)-1}$, for example '4F'O->'01111111'B-> +127.</p> <p>for example:</p> <p>OC_OctToInvokeIDType('80'O) = -128; OC_OctToInvokeIDType('81'O) = -128+1 = -127; OC_OctToInvokeIDType('40'O) = +64. OC_OctToInvokeIDType('7F'O) = +127. OC_OctToInvokeIDType('C0'O) = -128+64 = -64.</p>

Result Type:	OCTETSTRING
Comments:	The input parameter `bcddigits` is really BCD string (subset of HEXSTRING), the result is an even BCD digits except that the next to last may either be 'F'H or a BCD digit.
Description	
<p>The function of the OC_OtherDigi is as the following:</p> <ol style="list-style-type: none"> 1. If the number of the `bcddigits` is odd, the operation removes the most significant digit, and then reverses the order of each pair of digits; 2. If the number of the `bcddigits` is even, first the operation suffixes the `bcddigits` with 'F'H, then removes the most significant digit, and then reverses the order of each pair of digits. <p>for example:</p> <p>OC_OtherDigi('12345') = '3254', OC_OtherDigi('12345678') = '325476F8'.</p>

Test Suite Operation Definition	
Operation Name:	OM_2Msgs(ch:LOGICCH; pgg:PGG; mode:SENDINGMODE)
Result Type:	BOOLEAN
Comments:	
Description	
OM_2Msgs puts the layer 2 emulator into a special operation mode then returns. In this special mode the layer 2 emulator sends the next two consecutive messages in the following way:	
<ul style="list-style-type: none"> - send the first message on the paging subchannel indicated by the `pgg` and `ch`; - if the `mode` = C_NxtButOne, send the second message in the next but one paging sub block; - if the `mode` = C_FmrAGB, send the second message in a former access grant block; - if the `mode` = C_BfReOcc, send the second message before the MS's original paging subchannel re-occurs but later than the next paging block of that CCCH (paging block not belong to the MS); - if the `mode` = C_NxtButOneNxt, nothing is sent in the next but one paging sub block, then send the second message in the next paging subblock of the MS's paging subchannel. 	
Detailed Comments:	

This list covers all types of combinations used in the TTCN for the time being.

When the meaning refers to 'all' subchannels of a channel (eg. C_FACCHH_A_1), it means that all active subchannels of this channel activated previously by OM_ChConf, are associated with a logical channel identifier in the OM_Assoc.

Operation Name:	OM_BmInfo(ch:LOGICCH; mode:B_8)
Result Type:	BOOLEAN
Comments:	mode is of type BITSTRING[8], imode is a part of the channel mode IE
Description	
OM_BmInfo operation checks whether the MS starts transmitting Bm channel information according to the new channel mode 'mode'. The operation returns TRUE if the result of the check is correct otherwise the TSO returns FALSE.

Test Suite Operation Definition	
Operation Name:	OM_ChangeRFOf2Cells(cellid1:CellID; bspwr1:INTEGER; cellid2:CellID; bspwr2:INTEGER)
Result Type:	BOOLEAN
Comments:	
Description	
<p>This TSO is to change the RF level of the cell 'cellid1' to the RF level 'bspwr1' and the RF level of the cell 'cellid2' to the RF level 'bspwr2' [dBuVemf], then the TSO returns TRUE.</p> <p>The major purpose of the TSO is to force the MS to reselect a new cell according to the GSM 05.08, section 6.6.2. The following example shows the use of the TSO.</p> <p>The default cell selection parameters in the ATS are set as:</p> <p>Cell reselect hysteresis: 12db</p> <p>MX TXPWR MX CCH: minimu level (0)</p> <p>ACS: no additional cell selection parameter (0)</p> <p>RXLEV ACCESS MIN: minimum (0).</p> <p>Therefore the path loss criterion parameter C1 equals to the reselection criterion parameter C2. In the whole ATS the C1 and C2 keeps greater than 10 (e.g. TC_26_7_4_2_3) for a cell not suitable. The MS received level average from a not suitable cell keeps also greater than 10 (-100 dBm) corresponding to the reference sensitivity level of DCS 1800 MS.</p> <p>For GSM arfcn = 20, F = 941 MHz , the fields strengths (E) on tester integral antenna: $E \text{ (dB microV/m)} \geq (-110 + 10) \text{ (dBm)} + 20\log(941) + 77.2 = 36.7,$</p> <p>For DCS arfcn = 590, F = (-110 + 10) (dBm) + 20log(1820.8) + 77.2 = 42.4 (the formula see GSM 05.05, section 5 and GSM 05.08, section 8.1.4).</p> <p>In order to keep C1, C2 greater 10, a reasonable field strength making a cell not suitable is set to C_E_notsuitable = 45 in comparison with the default field strength C_E_default = 63. Considering that the cell reselect hysteresis is set to 12 db, the field strength of a cell being reselected need to be set to greater than 57. In the ATS the default value C_E_default (63) and C_E_notsuitable (45) are used for this TSO to force MS making cell reselection assuming that the two cells have different location area..</p> <p>If two cells have the same location area (e.g. in TC_26_6_1_3), or although two cells have different LAI, the test cases needs to lower a cell power to a certain low level (e.g. in TC_26_7_4_2_4_1 and TC_26_7_4_2_4_5), C1 needs to be less than zero to force the MS reselect a better cell. For GSM, $E \leq 26.7$, for DCS, $E \leq 32.4$. The value C_E_notsuitable_sameLAI = 24 applies to the TSO to force the MS making cell reselection.</p>

<ol style="list-style-type: none"> 1. The PCO consists of multiple SAPs: the SAP0 and SAP3. 2. The lower tester (LT) is the user of the data link layer service. 3. The SAP0 at the lower tester controlling and observing the exchange of CC, MM, RR and SS PDUs (messages) on the DCCH, SACCH and/or RACH, BCCH, CCCH channels. 4. The SAP3 at the lower tester controlling and observing the exchange of SMS PDUs (messages) on the DCCH or SACCH channels. 			

Timer declarations

Timer Declarations			
Timer Name	Duration	Unit	Comments
T_dly		ms	general purpose delay timer
T_dly1		ms	general purpose delay timer
T_dly2		ms	general purpose delay timer
T_dlyAss	5000	ms	AssCmd timer, 1)
T_guard	300	s	guard timer
T_release	C_release_time	s	release timer
Detailed Comments:			
1) In order to give to the lower tester enough time to dequeue and to send out the call SETUP and the other call establishment related messages in the sending buffer before starting sending of ASSIGNMENT COMMAND message, the default value 5s is used in the test step AssCh_complete. In the test step AssCh_failure the timer value is set to 4s. For the TC_26_6_4_1, 600ms is used.

1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters.

Purpose:	<p>1) In acceptance to a SETUP message indicating speech, the MS shall indicate and include in the CALL CONFIRMED message all the speech versions that it supports.</p> <p>2) To verify that upon receipt of the ASSIGNMENT COMMAND message specifying either speech full rate version 1 or speech full rate version 2 or speech half rate version 1 (for an MS also supporting half rate), the mobile station continues a mobile terminating call establishment with early assignment of traffic channel</p> <p style="padding-left: 20px;">a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message and,</p> <p style="padding-left: 20px;">b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect, or by sending an ALERTING message otherwise.</p> <p>3) To verify that for speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.</p>

Test Step Dynamic Behaviour					
Test Step Name:		EFR_BasicServiceMT(svc:SERVICES; rate:RATE)			
Group:		GSM_MS_EFR_4200/Preambles/			
Objective:		To generate a EFR Bcap (to match against received CALL CONNECTED Bcap), an MT SETUP or ESETUP message (to be sent to EFR mobile) and an appropriate channel mode based on the service and rate, as well as on several IXIT parameters, itc, ce, ur, synchronous bit for an MT call. EFR Bcap shall match the correct NUMBER of speech versions that the EFR mobile supports.

Operation Name:	OC_OctToInvokelDType(o:OCTETSTRING)
Result Type:	InvokelDType
Comments:	
Description	
<p>OC_OctToInvokelDType converts the OCTETSTRING `o` into InvokelDType, with the MSB of `o` representing the negative value $-2^{\exp(n-1)}$, for example '80'O->'10000000'B-> -128. The rest of the bits can code positive values up to $+2^{\exp(n-2)-1}$, for example '4F'O->'01111111'B-> +127.</p> <p>for example:</p> <p>OC_OctToInvokelDType('80'O) = -128; OC_OctToInvokelDType('81'O) = -128+1 = -127; OC_OctToInvokelDType('40'O) = +64. OC_OctToInvokelDType('7F'O) = +127. OC_OctToInvokelDType('C0'O) = -128+64 = -64.</p>

Operation Name:	OC_OtherDigi(bcddigits:HEXSTRING)
Result Type:	OCTETSTRING
Comments:	The input parameter `bcddigits` is really BCD string (subset of HEXSTRING), the result is an even BCD digits except that the next to last may either be 'F'H or a BCD digit.
Description	
The function of the OC_OtherDigi is as the following: 1. If the number of the `bcddigits` is odd, the operation removes the most significant digit, and then reverses the order of each pair of digits; 2. If the number of the `bcddigits` is even, first the operation suffixes the `bcddigits` with 'F'H, then removes the most significant digit, and then reverses the order of each pair of digits. for example: OC_OtherDigi('12345') = '3254', OC_OtherDigi('12345678') = '325476F8'.

When the meaning refers to 'all' subchannels of a channel (eg. C_FACCHH_A_1), it means that all active subchannels of this channel activated previously by OM_ChConf, are associated with a logical channel identifier in the OM_Assoc.

Operation Name: OM_BmInfo(ch:LOGICCH; mode:B_8)
Result Type: BOOLEAN
Comments: mode is of type BITSTRING[8], imode is a part of the channel mode IE

Description

OM_BmInfo operation checks whether the MS starts transmitting Bm channel information according to the new channel mode 'mode'. The operation returns TRUE if the result of the check is correct otherwise the TSO returns FALSE.

Test Suite Operation Definition

Operation Name: OM_ChangeRFOfCell(cellid1:CellID; bspwr1:INTEGER)
Result Type: BOOLEAN
Comments:

Description

This TSO is to change the RF level of the cell 'cellid1' to the RF level 'bspwr1', then the TSO returns TRUE.

The major purpose of the TSO is to force the MS to reselect a new cell according to the GSM 05.08, section 6.6.2. The following example shows the use of the TSO.

The default cell selection parameters in the ATS are set as:

Cell reselect hysteresis: 12db

MX TXPWR MX CCH: minimum level (0)

ACS: no additional cell selection parameter (0)

RXLEV ACCESS MIN: minimum (0).

Therefore the path loss criterion parameter C1 equals to the reselection criterion parameter C2. In the whole ATS the C1 and C2 keeps greater than 10 (e.g. TC_26_7_4_2_3) for a cell not suitable. The MS received level average from a not suitable cell keeps also greater than 10 (-100 dBm) corresponding to the reference sensitivity level of DCS 1800 MS.

For GSM arfcn = 20, F = 941 MHz, the fields strengths (E) on tester integral antenna:

$E \text{ (dB microV/m)} \geq (-110 + 10) \text{ (dBm)} + 20\log(941) + 77.2 = 36.7$,

For DCS arfcn = 590, F = (-110 + 10) (dBm) + 20log(1820.8) + 77.2 = 42.4 (the formula see GSM 05.05, section 5 and GSM 05.08, section 8.1.4).

In order to keep C1, C2 greater 10, a reasonable field strength making a cell not suitable

is set to C_E_otsuitable = 45 in comparison with the default field strength C_E_default = 63. Considering that the cell reselect hysteresis is set to 12 db, the field strength of a cell being reselected need to be set to greater than 57. In the ATS the default value C_E_default (63) and C_E_otsuitable (45) are used for this TSO to force MS making cell reselection.

C1 needs to be less than zero to force the MS reselect a better cell. For GSM, $E \leq 26.7$, for DCS, $E \leq 32.4$. The value C_E_otsuitable_sameLAI = 24 applies to the TSO to force the MS making cell reselection.

Operation Name:	OM_Deactivate(ch1, ch2:LOGICCH)
Result Type:	BOOLEAN
Comments:	
Description	
OM_Deactivate operation deactivates the logical channels `ch1` and `ch2`, then returns TRUE.	
The ch1 can be a DCCH or a TCH, the ch2 is the associated SACCH.	
Deactivation of an active SDCCH channel can be done by stopping transmission; this means that for the bursts on the BCCH carriers, dummy bursts shall be transmitted, for other bursts nothing shall be transmitted. Alternatively the deactivation of a SDCCH can be done by transmitting bad blocks on the SACCH with the parity bits set incorrectly. This will lead to a radio link failure in the MS.	
Deactivation of a TCH channel can be done by stopping transmission if it is non-BCCH.	
Deactivation of a SACCH_T can be done by transmitting bad blocks on the SACCH_T with the parity bits set incorrectly. The wrong channel coding on the SACCH will lead to a radio link failure in the MS after several seconds depending on the system information messages..	
Detailed Comments:	The TSO is called in TC_26_7_3_2, TC_26_7_4_3_2, TC_26_7_4_3_3, TC_26_7_4_3_4 on a SDCCH/4/SACCH/C4 channel in downlink, TC_26_2_4_1, TC_26_2_4_2, TC_26_8_2_1, TC_26_8_2_2, TC_26_8_2_3 on TCH/SACCH_T channel in both directions.

Test Suite Operation Definition	
Operation Name:	OM_FHCHK(ch:LOGICCH; ca:CCHD; ma:MA; cd:CCHD; t :INTEGER; fn:FN)
Result Type:	BOOLEAN
Comments:	
Description	
After the SS has been configured to start / change frequency hopping at a particular start time, this TSO instructs the SS to check whether the MS correctly uses the hopping frequencies on and after the expected start time according to the frequency parameters.	
If $t = 0$ or $32024 \leq t \leq 42431$ the operation checks that the new frequencies starts "without delay".	
If $0 < t \leq 31000$ the operation checks that the new frequencies starts "on" the frame number of $(X + t) \bmod 42432$, where $x = 51 * ((fn.t3 - fn.t2) \bmod 26) + fn.t3 + 1326 * fn.t1$.	
If $31000 < t < 32024$, or $t < 0$ or $t > 42431$ then the test has been configured incorrectly and should be re-run with a permitted value for t .	
This check is performed at the uplink RF burst level by sampling for a period of 3 seconds from the start time and should therefore be called immediately after the SS has been configured to start / change hopping. The operation returns TRUE if the MS behaviour is correct, otherwise it returns FALSE.	
Note: before this TSO is called, a layer 3 message must be sent to the MS to command the MS to start / change hopping using the same frequency hopping parameters.

Result Type:	BOOLEAN
Comments:	
Description	
OM_FreqDef operation passes the frequency hopping parameters for channel `ch` to lower layer emulator. The emulator starts using these frequency parameters at the frame number indicated by starting time `st`. The parameter `frmn` indicates a reference frame number at which the first burst of the message, FREQUENCY REDEFINITION, ASSIGNMENT COMMAND or HANDOVER COMMAND, containing starting time is sent in the concerned cell. If $0 \leq (st - frmn) \bmod 42432 \leq 31623$, the indicated time is the next time when frame number mod 42432 is equal to st. If $32024 \leq (st - frmn) \bmod 42432 \leq 42431$, the indicated time has already elapsed. After completely sending out the message containing the parameter starting time the tester starts frequency hopping.

Operation Name:	OM_SendSMSCBWhilePaging(ch:LOGICCH)
Result Type:	BOOLEAN
Comments:	The result returned by the operation is not used.
Description	
The TSO makes the lower layers send the second SMSCB message at the same time as the MS is paged.	
This shall be achieved by paging the MS immediately after the first block of the CB message has been sent. The SS shall ensure that the page is transmitted on the radio interface prior to the transmission of the 4th block of the CB message.

Operation Name:	OM_SendNextOn(ch:LOGICCH; fn:FN)
Result Type:	BOOLEAN
Comments:	
Description	
OM_SendNextOn operation sets the lower layer emulator into a special operation mode then returns. In the special mode the lower layer emulator sends the next L3 message on the indicated frame number 'fn' on the 'ch' channel. After the next L3 message is sent, the lower layer resumes normal operation automatically.

PCO declarations

PCO Declarations			
PCO Name	Type	Role	Comments
L	SAP0_3	LT	
Detailed Comments:			
1. The PCO consists of multiple SAPs: the SAP0 and SAP3. 2. The lower tester (LT) is the user of the data link layer service. 3. The SAP0 at the lower tester controlling and observing the exchange of CC, MM, RR and SS PDUs (messages) on the DCCH, SACCH and/or RACH, BCCH, CCCH channels. 4. The SAP3 at the lower tester controlling and observing the exchange of SMS PDUs (messages) on the DCCH or SACCH channels.			

Timer declarations

Timer Declarations			
Timer Name	Duration	Unit	Comments
T_dly		ms	general purpose delay timer
T_dly1		ms	general purpose delay timer
T_dly2		ms	general purpose delay timer
T_dlyAss	5000	ms	AssCmd timer, 1)
T_guard	300	s	guard timer
T_release	C_release_time	s	release timer
T_pause		ms	pause timer
Detailed Comments:			
1) In order to give to the lower tester enough time to dequeue and to send out the call SETUP and the other call establishment related messages in the sending buffer before starting sending of ASSIGNMENT COMMAND message, the default value 5s is used in the test step AssCh_complete. In the test step AssCh_failure the timer value is set to 4s. For the TC_26_6_4_1, 600ms is used.

Field Name	Field Value	Comments
p1roct	'09021234784BFFFF2B2B2B2B'O	
Detailed Comments:	'agressive' rest octet coding for 26.5.7.1.1. The first byte is coded in a manner that indicates comprehension required to a mobile that is incorrectly using the L2 pseudo length. The length of this IE is the octet after '09' and is set to 2. After the two bytes of content is the "next IEI". This is 78 which was the IEI allocated (but never used) in phase 1 to the RACH control parameters. The "RACH Control Parameters" are "set" to indicate that the cell barred and all access classes are prohibited.

1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters.

Test Group CellSelection

Test Case Dynamic Behaviour					
Test Case Name: TC_20_1					
Group: GSM_MS_CS_4200/CellSelection/					
Purpose: 1. To verify that: The MS shall be able to select the correct (forth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes that a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1. 2. To verify that: 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN. 2.2 The MS does not select a cell which is "barred". 2.3 The MS does not select a cell with C1<0. 3. To verify that the MS selects suitable cells in descending order of received signal strength. 4. To verify that the MS does not select a cell with C1<0.					
Default: OtherEventsFail					
Comments: This test case achieves the test purpose in one phase rather than the two described in ETS 300-607-2

Test Case Dynamic Behaviour

Test Case Name: TC_20_2
Group: GSM_MS_CS_4200/CellSelection/
Purpose: 1. The MS shall:

1.1 The MS shall search all RF channels in the system, take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

1.2 The averaging is based on at least five measurement samples per RF carrier spread over T_{av} (3 to 5 s).

1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm.

Default: OtherEventsFail

Test Case Dynamic Behaviour					
Test Case Name:		TC_20_8			
Group:		GSM_MS_CS_4200/CellSelection/			
Purpose:		<p>1. To verify that at least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate the C1 and C2 for non serving cells (if necessary). The MS shall then check whether the path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss has become too high.</p> <p>2. To verify that whilst camped on a cell of the selected PLMN, the MS may need to select a different cell. The path loss criterion (C1) for the current serving cell falling below zero triggers cell reselection.</p>

Test Case Dynamic Behaviour					
Test Case Name:		TC_20_9			
Group:		GSM_MS_CS_4200/CellSelection/			
Purpose:		<p>1. To verify that if the MS calculates a received level average (over 5 seconds) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.</p> <p>2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluated period.</p>

Test Case Dynamic Behaviour

Test Case Name:	TC_20_15
Group:	GSM_MS_CS_4200/CellSelection/
Purpose:	<p>1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purpose 2, 3 and 4.</p> <p>2. To verify that the MS will not reject a cell for camping on because the cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.</p> <p>3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform cell-reselection. Cell reselection is triggered if there is a better cell in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).</p> <p>4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered.</p>

Test Case Dynamic Behaviour

Test Case Name:	TC_20_16
Group:	GSM_MS_CS_4200/CellSelection/
Purpose:	<p>1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.</p> <p>2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to 90/N). This is verified indirectly.</p> <p>3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC is decreased by 4. This is verified indirectly.</p> <p>4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.</p>

Detailed Comments:

1. validate IXIT values
2. select sync or async mode and corresponding CE
3. If the MS supports both synchronous and asynchronous mode, selete the asynchronous mode
4. The BS61 or BS81 Bearer Capabilities and SETUP messages for MO is constructed according to section 11.8.2.5.1, section 11.8.2.5.2 and section 11.8.2.5.3 of GSM 11.10 and section B.1.6.1, section B.1.6.2.1, section B.1.6.2.2, section B.2.2.2 and section B.2.3.2 of GSM 07.01.

The algorithm for selecting parameters for BS61 basice service:

```

IF (TSPX_BS_61_A)
    TCV_sa := C_Asynchronous
    IF (TSPX_BS_61_A_ur1_T_NT)
        TCV_ce := C_nottransparent
    ELSE
        TCV_ce := TSPX_BS_61_A_ur1_ce
    use (TCV_sa, TCV_ce, TSPX_BS_61_A_ur1, svc) for OO_IFsetup_BS61orBS81_MO
ELSE
    TCV_sa := C_Synchronous
    use (TCV_sa, C_transparent, TSPX_BS_61_S_ur1, svc) for
OO_IFsetup_BS61orBS81_MO

```

The algorithm for selecting parameters for BS61 basice service is the same as above except using corresponding IXIT parameters.

Test Step Name:		Chmod(rate:RATE; ce:B_2; ur:B_4; svc:SERVICES)			
Group:		GSM_MS_CS_4200/Preambles/			
Objective:		To assign correct values to the test case variables TCV_ChMod and TCV_ChModb.			
Default:		OtherEvents			
Comments:		The rules for assignment are in Table 10-1 of GSM 11.10 section 10.3. If the value for ce is "BothT", the rule for transparent is used. If the value for ce is "BothNT", the rule for non transparent is used. That means the preferred value will be used in test configuration.
