## Foreword

This draft eighth edition European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) Technical Committee of the European Telecommunications Standards Institute (ETSI) and is now submitted for the One-step Approval Procedure (OAP) phase of the ETSI standards approval procedure.

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.22.0.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3, signalling for MS supporting Enhanced Full Rate Speech, and cell selection conformity specifications for which Mobile Stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

### The graphical form ATS

The TTCN.GR representation of these ATSs are contained in annex A, annex D and annex E of this ETS.

### The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4m0.mp (Layer 3), EF-4m0.mp (Enhanced Full Rate), and CS-4m0.mp (Cell Selection) <sup>1)</sup> on the diskettes included as a part of this ETS (Part 3).

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1            Digital cellular telecommunications system (Phase 2);  
Mobile Station (MS) conformance specification;  
Part 1: Conformance specification

Reference: GSM 11.10-1.

ETS 300 607-2            Digital cellular telecommunications system (Phase 2);  
Mobile Station (MS) conformance specification;  
Part 2: Protocol Implementation Conformance Statement (ICS)  
proforma specification

Reference: GSM 11.10-2.

**ETS 300 607-3            Digital cellular telecommunications system (Phase 1);  
Mobile Station (MS) conformance specification;  
Part 3: Layer 3 (L3) Abstract Test Suite (ATS)**

**Reference: GSM 11.10-3.**

## 1 Scope

This European Telecommunication Standard (ETS) specifies the Abstract Test Suite (ATS) and partial IXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) mobile stations (MS) conforming to the ETSs for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

4.3 Test groups

4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

## 4.4 Test Step Structure

### 4.4.1 Preambles

The preamble is defined for each test purpose.

### 4.4.2 Postambles

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

## 5 Test Purposes (TP)

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

### 5.1 TP and test case naming convention

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the section numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

"Test Purpose Identifier" = "Test Case Name" = TPI = TC\_NN\_A\_B\_C\_D\_E, where NN, A, B, C, D and E are digits used in the corresponding section numbers of prETS 300 607-1. For example, the test case name TC\_26\_5\_6\_2 is the TTCN specification corresponding to the conformance requirements in the section 26.5.6.1.2 in the prETS 300 607-1. In case where the section has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC\_26\_7\_4\_2\_4\_1, TC\_26\_7\_4\_2\_4\_2, TC\_26\_7\_4\_2\_4\_3, TC\_26\_7\_4\_2\_4\_4 and TC\_26\_7\_4\_2\_4\_5, respectively.

## 6 Abstract test method and test configurations

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a Man-Machine Interface (MMI) as an upper tester at the SUT.

### 6.1 Test system model

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see figure 1).

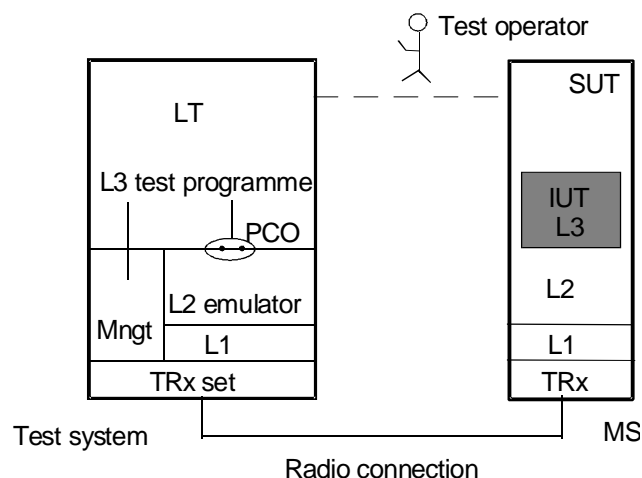

Figure 3: Test system and distributed test method

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO;
- Interface to the management functional unit via TTCN test suite operations;
- Interface to the MS Man-Machine Interface (MMI) via a test operator.

## 6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management;
- Channel management;
- TRx management;

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system.
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

**Annex A (normative): Layer 3 Abstract Test Suite****The machine processable ATS**

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for EFR are contained in the file l3-4m0.mp<sup>2)</sup> (Layer 3) on the diskette included as a part of this ETS (Part 3).

**The graphical form ATS**

The TTCN.GR representation of this ATS is contained in the remainder of this annex.

| OC_OctToInvokeIDType converts the OCTETSTRING `o` into InvokeIDType, with the MSB of 'o' representing the negative value $-2^{\exp(n-1)}$ , for example '80'O->'10000000'B-> -128. The rest of the bits can code positive values up to $+2^{\exp(n-2)-1}$ , for example '4F'O->'01111111'B-> +127. |                                     |

| <p>OC_RachSlots calculates the number of RACH slots between frame number `fn1` and `fn2` excluding the slots in `fn1` and `fn2`, then return the result of the calculation.</p> <p>If mode=0, 'fn1' denotes the (first) frame number for sending Paging Request, while 'fn2' denotes the (first) frame number for the received Channel Request. If mode=1 'fn1' and 'fn2' denote the (first) frame number for the received two subsequent Channel Requests. Any other values for mode is not allowed.</p> <p>Since the number of RACH slots depends on the RACH being combined or not with dedicated channels, the parameter 'cmbn' is needed: TRUE --&gt; combined, FALSE--&gt; not combined.</p> <p>It is assumed that the distance between fn1 and fn2 is not more than one group of 42432 TDMA frames (modulo 42432 is used to calculate t1' of fn1 and fn2). This is equivalent to approximately 196 seconds. ### Test Suite Operation Definition

**Operation Name:** OM\_2Msgs(ch:LOGICCH; pgg:PGG; mode:SENDINGMODE)

**Result Type:** BOOLEAN

**Comments:**

#### Description

OM\_2Msgs puts the layer 2 emulator into a special operation mode then returns. In this special mode the layer 2 emulator sends the next two consecutive messages in the following way:

- send the first message on the paging subchannel indicated by the `pgg` and `ch`;
- if the `mode` = C\_NxtButOne, send the second message in the next but one paging sub block;
- if the `mode` = C\_FmrAGB, send the second message in a former access grant block;
- if the `mode` = C\_BfReOcc, send the second message before the MS's original paging subchannel re-occurs but later than the next paging block of that CCCH (paging block not belong to the MS);
- if the `mode` = C\_NxtButOneNxt, nothing is sent in the next but one paging sub block, then send the second message in the next paging subblock of the MS's paging subchannel.

This list covers all types of combinations used in the TTCN for the time being.

When the meaning refers to 'all' subchannels of a channel (eg. C\_FACCHH\_A\_1), it means that all active subchannels of this channel activated previously by OM\_ChConf, are associated with a logical channel identifier in the OM\_Assoc.

### Test Suite Operation Definition

**Operation Name:** OM\_BmlInfo(ch:LOGICCH; mode:B\_8)  
**Result Type:** BOOLEAN  
**Comments:** mode is of type BITSTRING[8], imode is a part of the channel mode IE

#### Description

OM\_BmlInfo operation checks whether the MS starts transmitting Bm channel information according to the new channel mode 'mode'. The operation returns TRUE if the result of the check is correct otherwise the TSO returns FALSE.

#### Description

This TSO is used to change the RF level of the cell 'cellid1' to the RF level 'bspwr1' and the RF level of the cell 'cellid2' to the RF level 'bspwr2' [dBuVemf], then the TSO returns TRUE.

The main use of this TSO is to force the Mobile Station(MS) to select a new cell according to the GSM 05.08 and GSM 03.22.

For the MS to select the new cell then the path loss criterion parameter (C1) of the old will have to be less than zero (C1 < 0). This criterion is defined as:

$$C1 = (A - \max(B, 0))$$

when

A - Received Level Average - (RXLEV\_ACCESS\_MIN)  
 B - MS\_TXPWR\_MAX\_CCH - P {non DCS 1800}  
 MS\_TXPWR\_MAX\_CCH + POWEROFFSET - P {DCS 1800}

RXLEV\_ACCESS\_MIN - Minimum received level at the MS required for access to the system.

MS\_TXPWR\_MAX\_CCH - Maximum TX power level an MS may use when accessing the system until otherwise commanded.

POWER OFFSET - The power offset to be used in conjunction with the MS TXPWR MAX CCH parameter by the class 3 DCS 1 800 MS.

P - Maximum RF output power of the MS.

All values are expressed in dBm.

In most test cases MS\_TXPWR\_MAX\_CCH and the POWER\_OFFSET will be set at their minimum values thus C1 = A (B always being negative). Suitable levels of cells will be either 63 dBuV(C\_E\_default), 53 dBuV(C\_E\_neighbourdefault) or 45 dBuV(C\_E\_suitable). Assuming that the MS uses a RXLEV\_ACCESS\_MIN between -110 and -115 dBm then to ensure that C1 < 0 the test system's output needs to be set to ensure the level input detected by the MS is less than -123 dBm or lower (-115 plus an 8dB for discrimination between C1 or C2 values and 0, GSM 11.10-1 section 20). This value of -123 dBm corresponds to -10 dBuV (C\_E\_notsuitable)

If new channel = "C\_FCCH\_SCH\_BCCH\_CCCH" (non-combined) then use any combined, combined + SMS or non-combined control channel configuration with the same CellID.

If new channel = "C\_BCCH\_CCCH\_2", "C\_BCCH\_CCCH\_3" or "C\_BCCH\_CCCH\_4" (ccch-group) then re-use any existing ccch-group control channel configuration with the same CellID and the slot, or re-use any existing combined, combined + SMS with the same CellID.

If new channel = "C\_TCHF\_ACCHF\_1", "C\_TCHF\_ACCHF\_2", "C\_TCHH\_ACCHH\_1", "C\_TCHH\_ACCHH\_2" (traffic) or "C\_SDCCH8\_SACCHC8\_1", "C\_SDCCH8\_SACCHC8\_2", "C\_SDCCH8\_SACCHC8\_3" (dedicated) then re-use any existing traffic or dedicated channel with the same channel description.

### Test Suite Operation Definition

**Operation Name:** OM\_ChMdModi(ch:LOGICCH; chmod: CHMOD)

**Result Type:** BOOLEAN

**Comments:**

#### Description

OM\_ChMdModi operation passes channel mode IE for channel `ch` to lower layer emulator and requests the emulator to set the `ch` to the mode `chmod`. After the mode changed, it returns.

**Operation Name:** OM\_CphMdChg(ch:LOGICCH; cphmod: CPHMS; key:BITSTRING)

**Result Type:** BOOLEAN

**Comments:**

#### Description

OM\_CphMdChg operation passes ciphering parameters for channel `ch` to lower layer and sets the lower layer emulator into a special operation mode in which lower layer starts the 3-step ciphering mode setting sequence when the next L3 message on the channel `ch` arrives.

**Result Type:** BOOLEAN

#### Description

OM\_CphMd operation passes ciphering parameters for channel `ch` to lower layer and sets the channel `ch` in the ciphering mode `cphmod`. This operation puts the channel `ch` into specified ciphering mode `cphmod` immediately without the 3-step ciphering mode setting sequence.

**Operation Name:** OM\_ComingFn(ch:LOGICCH)

**Result Type:** FN

**Comments:**

#### Description

OM\_ComingFn operation returns the frame number (FN modulo 42432) which is about 5 seconds later than current frame number and is able to carry L3 message on the channel `ch`.

**Detailed Comments:** The delay of about 5 seconds ensures that there is still enough time left for higher layer controller to prepare next TTCN send event after the OM\_ComingFn returns. the exact delay value is up to the implementor.

| <p>OM_Deactivate operation deactivates the logical channels `ch1` and `ch2`, then returns TRUE.</p> <p>The ch1 can be a DCCH or a TCH, the ch2 is the associated SACCH.</p> <p>Deactivation of an active SDCCH channel can be done by stopping transmission; this means that for the bursts on the BCCH carriers, dummy bursts shall be transmitted, for other bursts nothing shall be transmitted. Alternatively the deactivation of a SDCCH can be done by transmitting bad blocks on the SACCH with the parity bits set incorrectly. This will lead to a radio link failure in the MS.</p> <p>Deactivation of a TCH channel can be done by stopping transmission if it is non-BCCH.</p> <p>Deactivation of a SACCH_T can be done by transmitting bad blocks on the SACCH_T with the parity bits set incorrectly. The wrong channel coding on the SACCH will lead to a radio link failure in the MS after several seconds depending on the system information messages..</p> |                                                                                                                                                                                                                                                          |

| <p>After the SS has been configured to start / change frequency hopping at a particular start time, this TSO instructs the SS to check whether the MS correctly uses the hopping frequencies on and after the expected start time according to the frequency parameters.</p> <p>If <math>t = 0</math> or <math>32024 \leq t \leq 42431</math> the operation checks that the new frequencies starts "without delay".</p> <p>If <math>0 &lt; t \leq 31000</math> the operation checks that the new frequencies starts "on" the frame number of <math>(X + t) \bmod 42432</math>, where <math>x = 51 * ((fn.t3 - fn.t2) \bmod 26) + fn.t3 + 1326 * fn.t1</math>.</p> <p>If <math>31000 &lt; t &lt; 32024</math>, or <math>t &lt; 0</math> or <math>t &gt; 42431</math> then the test has been configured incorrectly and should be re-run with a permitted value for <math>t</math>.</p> <p>This check is performed at the uplink RF burst level by sampling for a period of 3 seconds from the start time and should therefore be called immediately after the SS has been configured to start / change hopping. The operation returns TRUE if the MS behaviour is correct, otherwise it returns FALSE.</p> <p>Note: before this TSO is called, a layer 3 message must be sent to the MS to command the MS to start / change hopping using the same frequency hopping parameters.</p> |                                                                 |

| <p>OM_FreqDef operation passes the frequency hopping parameters for channel `ch` to lower layer emulator. The emulator starts using these frequency parameters at the frame number indicated by starting time `st`. The parameter `frmn` indicates a reference frame number at which the first burst of the message, FREQUENCY REDEFINITION, ASSIGNMENT COMMAND or HANDOVER COMMAND, containing starting time is sent in the concerned cell.</p> <p>If <math>0 \leq (st - frmn) \bmod 42432 \leq 31623</math>, the indicated time is the next time when frame number mod 42432 is equal to st.</p> <p>If <math>32024 \leq (st - frmn) \bmod 42432 \leq 42431</math>, the indicated time has already elapsed. | <p>OM_GetHoaccPara instructs the lower layer emulator to return the total number of the handover access bursts received on channel `ch`, the observed minimum and maximum power levels in dBm modulo 256 and the observed minimum and maximum timing advance in bits modulo 256. The lower layer emulator starts the observation of handover access bursts as soon as sending out a HANDOVER COMMAND message. The TSO returns an accumulative result of the observation when it is called.</p> |                             |

| OM_NoUAforDISC and OM_ResumUAforDISC are a pair of TSOs. OM_NoUAforDISC forces the L2 emulator to enter a specific mode. OM_ResumUAforDISC resumes the L2 emulator to a normal L2 operational mode. |                                                     |
| OM_ResumeUAforDISC cancels the effect of OM_NoUAforDISC, returning L2 on the channel 'ch' to normal operation in the multiple-frame established state.                                              |                                                     |
| Then the TSO returns TRUE.                                                                                                                                                                          |                                                     |

| This operation requests (e.g. from the control console of the test system) the test operator to check whether the MS under test has correctly received the cell broadcast short message represented by 'msg'. Then the TSO returns<br>TRUE: if the CBSM has been correctly received,<br>FALSE: if non or an incorrect CBSM has been received.<br>The TSO needs to convert the 'msg' into IA5 string according to the packing character rules specified in the section 6.1.2 of ETS 300 628 (GSM 03.38). The 'NumbOfIA5chara' indicates the number of IA5 characters in the 'msg'. |                                                              |

| This operation requests (e.g. from the control console of the test system) the test operator to check if the mobile station under test indicates that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the message contents represented by 'msg' is correctly displayed. Then the operation returns<br>TRUE: if the MS indicates SM reception (and displays correct message),<br>FALSE: if the MS does not indicate SM reception (or displays incorrect message).<br>The TSO needs to convert the 'msg' into IA5 string according to the packing character rules specified in the section 6.1.2 of ETS 300 628 (GSM 03.38). The 'NumbOfIA5chara' indicates the number of IA5 characters in the 'msg'. |                                                                   |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the `character` is indicated by the DTMF indicator of the MS. If the operator informs (e.g. from the control console of the test system) the test system that the MS does not give the indication of `character`, the operation returns FALSE. If the operator informs the test system that the MS gives the indication, the operation returns TRUE. |                                    |

| <p>This TSO requests (e.g. from the control console of the test system) the test operator to setup the external interface, or the MS configuration in such a way that the MS, when triggered, is able to initiate the call for the BS2x or BS3x service `srv` with the specified itc, sacp, ce values. After the operator finishes the required action and informs the test system, the TSO returns with value TRUE.</p> <p>This TSO is used in MO call test cases except TC_11_2, where this TSO is call for single-numbering scheme MT testing.</p> <p>Three negotiable parameters, number of stop bit, number of data bit, parity information, are asked as global IXIT paramters for all TE configurations. | This operation first requests (e.g. from the control console of the test system) the test operator to check whether the Mobile Station under test is in normal service state ("Idle, updated")-- listening to CCCH and BCCH and with U1 UPDATED status. If the operator informs (e.g. from the control console of the test system) the test system that the MS does not give any service indication, the operation returns FALSE. If the operator informs the test system that the MS gives service indication, the operation returns TRUE. |                 |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the Mobile Station presents a list of available PLMNs. The list shall include the MNC and MCC of cells 1 to 7, but not cell 8 (for GSM900) or cells 1 to 6, but not cell 7 (for DCS1800). If the operator informs (e.g. from the control console of the test system) the test system that the MS correctly presents the list, the operation returns TRUE. If the operator informs the test system that the list is incorrect, the operation returns FALSE. |             |

| This operation first requests (e.g. from the control console of the test system) the test operator to check the user indication of the result of the supplementary service `svc`. If the operator informs (e.g. from the control console of the test system) the test system that the indication is correct, the operation returns TRUE. If the operator informs the test system that the indication is wrong, the operation returns FALSE. |                             |

| This operation first requests (e.g. from the control console of the test system) the test operator to check whether the TCH is through connected. The SS has to generate a noise pattern so that the operator can check this. If the operator informs (e.g. from the control console of the test system) the test system that the TCH is through connected, the operation returns TRUE. If the operator informs the test system that the TCH is not through connected, the operation returns FALSE. |                   |
