Foreword

This final draft European Telecommunication Standard (ETS) has been produced by the Transmission and Multiplexing (TM) Technical Committee of the European Telecommunications Standards Institute (ETSI), and is now submitted for the Voting phase of the ETSI standards approval procedure.

Proposed transposition dates	
Date of latest announcement of this ETS (doa):	3 months after ETSI publication
Date of latest publication of new National Standard or endorsement of this ETS (dop/e):	6 months after doa
Date of withdrawal of any conflicting National Standard (dow):	6 months after doa

Introduction

The purpose of this ETS is to define only those antenna parameters necessary to ensure optimum frequency co-ordination between communication services in the frequency range 3 GHz to 60 GHz. Additional parameters appropriate to system implementation may be subject to agreement between the equipment purchaser and supplier. Further guidance is provided in annex A.

Blank page

1 Scope

This European Telecommunication Standard (ETS) addresses the minimum requirements for single main beam, linear polarization, directional antennas to be adopted in conjunction with Point-to-Point (P-P) systems operating in the frequency range 3 GHz to 60 GHz.

Single polarization antennas, dual polarization antennas, dual band/single polarized antennas and dual band/dual polarization antennas are considered.

A regulatory authority may impose tighter requirements than the minimum values given in this ETS, in order to maximize the use of the scarce spectrum resources.

2 References

This ETS incorporates by dated or updated reference, provisions from other publications. These normative references are cited at the appropriate place in the text, and the publications are listed hereafter. For dated references, subsequent amendments to, or revisions of, any of these publications apply to this ETS only when incorporated in it by amendment or revision. For undated references, the latest edition of the publication referred to applies.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of this ETS, the following definitions apply:

antenna inter port isolation: it is the ratio in dB of the power level applied to one port of a multi-port antenna to the power level received in any other port of the same antenna as function of frequency.

antennas: that part of the transmitting or receiving system that is designed to radiate and/or receive electromagnetic waves.

co-polar pattern: a diagram representing the radiation pattern of the antenna under test when the reference antenna is similarly polarized, scaled in dBi or dB relative to the measured antenna gain.

cross-polar discrimination: the difference in dB between the co-polarized main beam gain and the cross-polarized signal measured within a defined region.

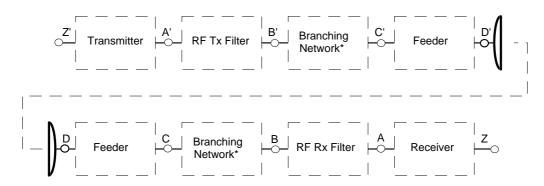

cross-polar pattern: a diagram representing the radiation pattern of the antenna under test when the reference antenna is orthogonally polarized, scaled in dBi or dB relative to the measured antenna gain.

frequency band: the frequency band of an antenna is the band of frequencies over which the performance characteristics of the antenna are within specified limits.

gain: the ratio of the radiation intensity, in the main beam axis to the radiation intensity that would be obtained if the power accepted by the antenna were radiated isotropically. Value measured in dBi.

half power beamwidth: the angle, relative to the main beam axis, between the two directions at which the measured co-polar pattern is 3 dB below the value on the main beam axis.

input port(s): the flange(s) or connector(s) through which access to the antenna system is provided. This is shown in the following figure 1 at points D and D'.

NOTE: The points shown above are reference points only; points B, C and D, B', C' and D' may coincide.

Figure 1: System block diagram

isotropic radiator: a hypothetical, lossless antenna having equal radiation intensity in all directions.

main beam axis: the direction for which the radiation pattern intensity is the maximum.

main beam: the radiation lobe containing the direction of maximum radiation.

radiation pattern envelope: an envelope below which the radiation pattern shall fit.

radiation pattern: a diagram relating power flux density at a constant distance from an antenna to direction relative to the antenna main beam axis.

radome: a cover of dielectric material, intended for protecting an antenna from the effects of the physical environment.

3.2 Symbols

For the purposes of this ETS, the following symbols apply:

dB deciBel

dBi deciBels relative to an isotropic radiator

GHz GigaHertz

3.3 Abbreviations

For the purposes of this ETS, the following abbreviations apply:

HPBW Half Power BeamWidth

P-P Point-to-Point RL Return Loss

RPE Radiation Pattern Envelope
VSWR Voltage Standing Wave Ratio

WARC World Administrative Radio Conference

XPD cross-Polar Discrimination

4 Frequency ranges

This ETS applies to sub-bands within 3 GHz to 60 GHz frequency band. Fixed link frequency allocations are in accordance with the WARC 1992 Final Acts [1] as given in ITU-R Recommendation F.746-2 [2] and other frequency plans.

For the purposes of this ETS, the overall frequency range 3 GHz to 60 GHz is divided into six frequency ranges as follows:

Range 1: 3 GHz to 14 GHz; Range 2: 14 GHz to 20 GHz; Range 3: 20 GHz to 24 GHz; Range 4: 24 GHz to 30 GHz; Range 5: 30 GHz to 47 GHz; Range 6: 47 GHz to 60 GHz.

5 Classification of antennas

With respect to antenna gain, two gain categories are applicable:

Gain category 1: those antennas which require low gain for co-ordination purposes;

Gain category 2: those antennas which require high gain for co-ordination purposes.

With respect to Radiation Pattern Envelope (RPE), four classes have been identified:

Class 1: those antennas required for use in networks where there is a low interference

potential;

Class 2: those antennas required for use in networks where there is a high interference

potential;

Class 3: those antennas required for use in networks where there is a very high

interference potential;

Class 4: those antennas required for use in networks where there is an extremely high

interference potential.

With respect to cross-Polar Discrimination (XPD), two XPD performance categories have been identified (refer to subclause 6.2, table 1):

XPD category 1: those antennas required to have standard cross-polar discrimination;

XPD category 2: those antennas required to have high cross-polar discrimination.

6 Electrical characteristics

The antenna manufacturer shall state, for each antenna type, the frequency band of operation and antenna gain at least at the frequency band edges and at mid-band. An antenna which employs a radome shall meet the requirements of this ETS with the radome in place.

The antenna system shall radiate a linear (single or dual) polarized wave.

The method of measurement shall be in accordance to IEC 835-2-2 [3].

6.1 Radiation Pattern Envelope (RPE)

RPE(s) for each class are included, in order to present the maximum flexibility to administrations for optimized co-ordination.

The co-polar and cross-polar radiation pattern measured in the azimuth plane for both polarizations, shall not exceed the RPE(s) defined in the following list:

Range 1: Class 1: figure 2a); Class 2: figure 2b); Class 3: figure 2c); Class 4: figure 2d). Range 2: Class 1: figure 3a); Class 2: figure 3b); Class 3: figure 3c). Range 3: Class 1: figure 4a); Class 2: figure 4b); Class 3: figure 4c). Range 4: Class 1: figure 5a); Class 2: figure 5b). Range 5: Class 1: figure 6a); Class 2: figure 6b); Class 3: figure 6c), vertically polarized only. Range 6: Class 1: figure 7a);

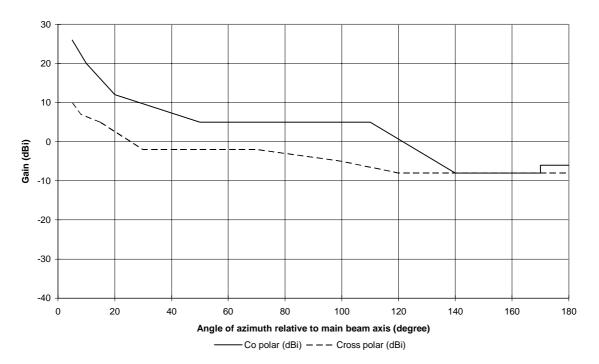

figure 7b);

6.2 **Cross-Polar Discrimination (XPD)**

The XPDs corresponding to the RPEs referenced in subclause 6.1 shall be equal to or higher than those values defined in table 1.

In figures 8 and 9, masks are given for XPD measurements around the main beam axis.

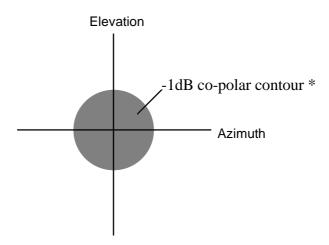

Table 1: XPD values corresponding to RPE values in subclause 6.1

main beam axis.

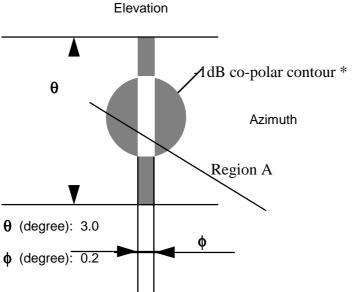

NOTE 2: Referred to region A in figure 9.

NOTE 3: n.a. = not applicable.

^{*} For the dual band antennas -1 dB contour for highest frequency band shall be used.

Figure 8: Mask for XPD measurements around the main beam axis

^{*} For the dual band antennas -1 dB contour for highest frequency band shall be used.

Figure 9: Mask for XPD measurements around the main beam axis

6.3 Antenna gain

The gain of the antenna shall be expressed relative to an isotropic radiator (dBi). Antenna gain shall exceed the minimum value throughout its operational frequency range. There are two categories of minimum antenna gain covered by this ETS as follows:

Gain Category 1: 28 dBi;

Gain Category 2: 32 dBi.

Regulators will specify one gain category which is to be used for each co-ordination task.

7 Conformance tests

For antenna parameters, EN 301 126-1 [4] shall apply.

Annex A (informative): Additional information

A.1 Mechanical characteristics

A.1.1 Environmental characteristics

The antennas should be designed to operate within a temperature range of -45 °C to +45 °C with a relative humidity up to 100 % with salt mist, industrial atmosphere, UV-irradiation etc.

The temperature range could be divided in two parts where at least one of the following ranges should be covered:

- 1) -33 °C to +40 °C;
- 2) -45 °C to +45 °C.

The antennas should be designed to meet wind survival ratings specified in table A.1:

Table A.1

Antenna type	Wind velocity m/s (km/h)	Ice load (density 7 kN/m³)
Normal duty	55 (200)	25 mm radial ice
Heavy duty	70 (252)	25mm radial ice

A.1.2 Antenna stability

The antenna equipment should be stable under the most severe operational conditions at the site of intended application.

For installation on trellis or towers, the deviation of the antenna main beam axis should not be more than 0,3 times the -3 dB beam width under the conditions specified in table A.2:

Table A.2

Antenna type	Wind velocity m/s (km/h)	Ice load (density 7 kN/m ³)
Normal duty	30 (110)	25 mm radial ice
Heavy duty	45 (164)	25 mm radial ice

A.2 Antenna input connectors

When flanges are provided at the input port of the antenna they should be in accordance with IEC 154.

For antennas which are integrated to the radio equipment proprietary connection designs may be utilized.

For antennas using coaxial input ports the connectors should conform to IEC 169.

Other interconnection design should be agreed between the equipment supplier and purchaser in line with the overall system design requirements.

A.3 Return loss at the input ports

The minimum return loss should be agreed between the equipment supplier and purchaser in line with the overall system design requirements.

For guidance, antennas with a Voltage Standing Wave Ratio (VSWR) in a range of 1,06 to 1,2 are typical.

Page 32

Final draft prETS 300 833: March 1999

A.4 Inter-port isolation

The isolation between the input ports of a dual polarized antenna should be agreed between the equipment supplier and purchaser in line with the overall system design requirements.

For guidance the isolation between ports may be between 35 dB to 50 dB.

A.5 Antenna labelling

It is recommended that the antennas should be clearly identified with a weather-proof and permanent label showing the manufacturers name, antenna type, serial number and type approval reference number which identifies the country of origin.
