DECTTM, PLUGTESTSTM, UMTSTM and the ETSI logo are Trade Marks of ETSI registered for the benefit of its Members. **3GPP**[™] and **LTE**[™] are Trade Marks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners.

GSM® and the GSM logo are Trade Marks registered and owned by the GSM Association.

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://ipr.etsi.org).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Report (TR) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <u>http://webapp.etsi.org/key/queryform.asp</u>.

Foreword

This Technical Report has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document analyses and evaluates the definition of a Reference Data Model (RDM) for Ud interface between Front-Ends (FEs) for the HSS application and the User Data Repository (UDR).

The stage 3 of the Ud interface in the User Data Convergence (UDC architecture) is defined in 3GPP TS 29.335 [2].

The Reference Data Model (RDM) shall comply with the Common Baseline Information Model for UDC as defined in 3GPP TS 32.182 [3] and it shall follow the concepts of the Framework for Model Handling and Management as defined in 3GPP TS 32.181 [4].

The analysis will comprise the general considerations impacting the RDM for HSS.

The analysis will comprise the following topics:

- The general considerations impacting the RDM for HSS;
- Attributes definition: names, syntax, semantics;
- Object classes & Directory Information Tree: object classes names, attributes grouping, LDAP entries, Distinguished Names and Relative Distinguished Names.

Directory information trees, object classes and attributes in this report should be considered informative since they are subject to additions and/or modification depending on the specific implementation as illustrated in the presented alternatives in this technical report. Even the assignment of attributes to object classes may be redistributed, for example, because the normalization of object classes across different domains may result in attributes being moved to a superclass. Naming is provisional. Diagrams used and naming convention are not standardized.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

Reference Data Model for HSS: Reference Data Model for HSS is an Application Data Model that operations on Ud interfaces supporting HSS applications shall comply to.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1].

CB	Call Barring
CDIV	Call Diversion
LDAP	Lightweight Directory Access Protocol
MMTEL	Multimedia Telephony
RDM	Reference Data Model
TAS	Telephony Application Server

UDC User Data Convergence

4 General considerations

4.1 General syntax definitions

The LDAP attributes in this document are defined as having a syntax specified in IETF RFC 4517 [6] or a derived syntax that will be specified in this section. The description of a derived syntax will contain the name of the IETF RFC 4517 [6] syntax from which it was derived as well as any additional structure and value constraints. Syntax names should follow the rules set by IETF RFC 4517 [6] (mixed case with first letter of word capitalized), e.g. NumericString.

Derived Syntax name	Description
UInt8	This syntax is derived from the Integer syntax [6]. The structure is further constrained to a
	maximum length of 1 and the values are further constrained from 0 to 255.
UInt16	This syntax is derived from the Integer syntax syntax [6]. The structure is further
	constrained to a maximum length of 2 and the values are further constrained from 0 to
	65535.
UInt32	This syntax is derived from the Integer syntax syntax [6]. The structure is further
	constrained to a maximum length of 4 and the values are further constrained from 0 to
	4294967295.
HexString	This syntax is derived from the PrintableString syntax [6]. The values are further
	constrained to the decimal digits (0 through 9), characters "a" to "f" or characters "A" to
11. 01. 00	
HexString32	This syntax is derived from the HexString syntax. The structure is further constrained to a
FODN	maximum length of 32 characters.
FQDN	I his syntax is used to represent an Fully Qualified Domain Name (FQDN) (see IETF
	RFC 1035 [17]) and is derived from the PrintableString syntax [6]. The structure is junifier
	constrained to a maximum length of 255 and the values are further constrained to one of
	digite (otherwise 0), character leaf the leaf of the l
	digits (0 through 9), characters a to z, characters A to z, the hypnen (-) character
	and has a maximum length of 63 characters. Caseignore
IPv4Address	This syntax is derived from the PrintableString syntax [6] and is used to represent IPv4
	addresses formatted in dot-decimal notation without leading zeros. The structure is further
	constrained to a maximum length of 15 and values are further constrained to the decimal
	digits (0 through 9) and the period (.) character.
IPv6Address	This syntax is derived from the PrintableString syntax [6] and is used to represent IPv6
	addresses formatted in hexadecimal colon-separated notation without leading zeros in
	each group and with the largest run of consecutive zero groups collapsed into a single
	empty group (see IETF RFC 4291 [8]). The structure is further constrained to a maximum
	length of 39 and the values are further constrained to the decimal digits (0 through 9),
	characters "a" to "f" or characters "A" to "F" and the colon (:) character.
IPv6Prefix	This syntax is derived from the PrintableString syntax [6] and is used to represent an IPv6
	prefix formatted in CIDR (Classless Inter-domain Routing) notation, i.e. an IPv6 address
	(formatted in IPv6Address syntax), a slash (/) character and a decimal value indicating
	the size in bits of the address prefix (see IETF RFC 4291 [8]). The structure is further
	constrained to a maximum length of 43 and the values are further constrained to the
	decimal digits (0 through 9), characters "a" to "f" or characters "A" to "F", the colon (:)
	character and the slash (/) character.
Name10	This syntax is derived from the PrintableString syntax [6]. The structure is further
	constrained to a maximum length of 10 characters. CaseIgnore.
String	This syntax corresponds to Printable String syntax according to IETF RFC 4517 [6].
Enumerated	This syntax corresponds to Numeric String syntax according to IETF RFC 4517 [6], where
	the maximum length is defined by the number of included numerals.

Table 4.1-1

4.2 MMTEL data

4.2.1 Introduction

The specification of the MMTEL data in the Reference Data Model over Ud has to define for which Application FEs it will be applied. Two cases are identified.

- MMTEL data specification over Ud applies to the Ud interface between a Telephony Application Server Frontend (TAS-FE) and the UDR.
- MMTEL data specification over Ud applies to the Ud interface between a HSS-FE (supporting IMS) and the UDR.

4.2.2 MMTEL data with a TAS-FE

The Ud interface supported by a TAS is an alternative way to store its MMTEL data in a UDR instead of using the Sh interface and an HSS-FE. For this purpose another protocol (i.e. reusing Ud protocol) to centrally store MMTEL Data in addition to Sh has to be assessed and confirmed. This is out of the scope in the present release of the specifications.

4.2.3 MMTEL data with an HSS-FE

With a HSS-FE, MMTEL data are transported over a Sh interface as transparent data within repository data. Then, regarding to the storage on the UDR by the HSS-FE, two sub-cases are identified:

- It is normally stored as transparent data in the UDR in the same way as any other transparent data coming from an AS over Sh, so not requiring a data modelling of the MMTEL data over the Ud between a HSS-FE and the UDR.
- The transparent data is analysed by the HSS-FE application logic and translated into data complying with the MMTEL RDM over Ud. In the other way, the HSS-FE application logic builds a Sh transparent data from the MMTEL data retrieved from the UDR and complying with the MMTEL RDM over Ud. It is to be noted that the concept of transparent data that still applies to Sh is no more applied on the transparent storage in the HSS in this sub-case.

To address the second sub-case, the HSS-FE will rely on the standardisation of MMTEL Data over Sh in 3GPP TS 29.364 [19]. Two coding options are defined, a binary one and a XML one. An objective is that the same MMTEL RDM over Ud can be mapped with both options. The same MMTEL RDM should also be applicable to the case described in 4.2.2. This is out of the scope in the present release of the specifications.

With the XML option, the data configuring each of the CDIV and CB MMTEL Services is structured in a set of multiple rules, each rule may contain multiple conditions and an action, structure that was not retained for the binary option aimed to handle the subset of MMTEL services corresponding to PSTN/ISDN and CS supplementary services.

How the MMTEL RDM over Ud can address the configuration data for CDIV and CB services for both the XML and the binary option is out of the scope in the present release of the specifications.

4.2.4 MMTEL Data and CS Supplementary Services data

In some cases, the supplementary services execution and/or their configuration when user is in the CS domain may have to rely on the CS supplementary services and not MMTEL ones. It may drive to maintain the consistency between the MMTEL services and the CS supplementary services. Two approaches that impact RDM for Ud may be considered:

- MMTEL Data and CS supplementary Service data are considered as separate data in the RDM for Ud, considering that their consistency will be handled by the concerned application logics. This approach may be more in line with current 3GPP specifications where CS supplementary Services and MMTEL services are defined in different 3GPP specifications.
- A subset of MMTEL data and CS supplementary service data are merged in the RDM over Ud and describe a supplementary service independently of the access (CS or PS). This approach may impact stage 1 and stage 2 specifications on supplementary services.

Which one of the two approaches is the most relevant and if it impacts existing specifications on supplementary services (CS and MMTEL) is out of the scope in the present release of the specifications.

4.2.5 Supplementary Services RDM principle

It should be possible to define the Supplementary Services that are common to MMTEL and CS only once and not separately in the Reference Data Model. Using this approach the synchronization of common MMTEL and CS Supplementary Services is implicitly reached. At the same time, it should be possible to have separate Supplementary Services data for MMTEL and CS in order that the operators could provide differentiated services. The operator has to choose between these alternatives. The RDM specification for MMTEL and CS Supplementary services should allow these two approaches.

Only a subset of MMTEL Supplementary Services defined in [19] is shared with the Circuit domain.

Here are described three possible structures of the RDM.

Figure 4.2.5-1: Reference Data Model referring to MMTEL services

Figure 4.2.5-2: Reference Data Model referring to CS services

Figure 4.2.5-3: Reference Data Model referring to the common services

Depending on the implementation any of the above data structures for MMTEL and CS SS or a combination of them can be selected for the RDM.

5 Identifier

5.1 Object classes and their attributes

Table 5.1-1

Derived Syntax name	Description
IMSI	This syntax is used to represent international mobile subscriber identity (IMSI) [7] and is derived from the NumericString syntax [6]. The structure is further constrained to a maximum length of 15 and the values are further constrained to decimal digits (0 through 9) only.
PublicIdentity	This syntax is used to represent the public identity of a user in the IMS and is derived from the PrintableString syntax [6]. The structure is further constrained to a SIP URI (with the format defined in IETF RFC 3261 [20] and IETF RFC 2396 [21]) or a TEL URI (with the format defined in IETF RFC 3966 [22]). Both SIP URI and TEL URI shall be in canonical form, as described in 3GPP TS 23.003 [7].
PrivateIdentity	This syntax is used to represent the private identity of a user in the IMS and is derived from the PrintableString syntax [6]. The structure is further constrained to a NAI with the form username@realm as specified in IETF RFC 4282 [23].
E164Number	This syntax is used to represent an E.164 Number and is derived from the NumericString syntax [6]. The structure is further constrained to a maximum length of 15 and the values are further constrained to decimal digits (0 through 9) only.

6 UDC Service Profile

6.1 Object classes and their attributes

Object classes and attributes for UDC Service Profile are out of scope of the present release.

6.2 Directory Information Tree

6.2.1 Alternative A

Figure 6.2.1-1: DIT Structure for UDC with alternative A

For definition of End User see 3GPP TS 32.182 [3].

6.2.2 Alternative B

In this alternative, the parent of the different domain data entities is a Subscription entity. This Subscription entity may be not limited to one user, for example, IMS data belongs to a IMS subscription that, according to TS 23.228, may be multiuser. How to support subscription with several IMS users is not described in the present clause.

It introduces privateIdentityAlias and publicIdentityAlias entities that cover Private and Public Service Identities as well as Private and Public User Identities.

Figure 6.2.2-1: DIT Structure for UDC with alternative B

6.2.3 Alternative C

In alternative C, as for alternative B, the diagram contains Subscription, privateIdentityAlias and publicIdentityAlias entities. How to support subscription with several IMS users is not described in the present clause.

The different domains for data are organised differently. This alternative allows attributes that are applicable to several domains to be defined once. For example:

- an attribute that is the same in the GPRS and EPS domains should be defined in the entity PS-Data
- an attribute that is the same in the CS and PS domains should be defined in the entity Access-Data.

The compatibility with new 3GPP releases extending the use of data defined for a domain to other domains is out of the scope of the present document.

Figure 6.2.3-1: DIT Structure for UDC with alternative C

6.2.4 Alternative D

In this alternative, the parent of the different domain data entities is a Subscription entity. This Subscription entity may not limited to one user, for example, IMS data belongs to a IMS subscription that, according to 3GPP TS 23.228, may be multiuser.

The RDN of the Individual user data classes AuC-Data, CS-Data, PS-Data and EPS-Data is defined with the IMSI + svcType in order to allow for multiuser.

The Alias MSISDN class, in addition to providing a reference to the Subscription object, also contain an IMSI attribute. This is done to assist in MSISDN based message processing, such as MAP Send Routing Info. i.e., such a request would have to search for the Alias MSISDN object to obtain the subscriber's IMSI prior to obtaining the specific SvcType class associated with the IMSI.

Figure 6.2.4-1: DIT Structure for UDC with alternative D

7 UDC Service Data shared by several domains

The data defined in this section are examples of data shared by several domains.

Data sharing among multiple domains may impact data model and is out of the scope of the present document.

7.1 Object classes and their attributes

7.1.1 AuC Subscriber Data

Table 7.1.1-1

Object Class	SS ACSUBDATA					
Type of Obect Class	t tbd					
Description	This clas	ss represents the Da	ta Container for a	all Subscriber Data relevant to the AuC		
Superior OCL			tbd			
Attribute	Туре	HSS-FE access	Properties	Description		
Name		rights				
imsi	IMSI	read	Naming Attribute mandatory single-valued	3GPP TS 23.003.		
acSubscrType	UInt8	read	optional single-valued	Type of Subscriber. Possible values: 0 - GSM 1 - UMTS		
acEncKey	HexString32	read	optional single-valued	The subscriber's encrypted long term secret key. This is a hexadecimal string with fixed length of 32 bytes. For definition of a UMTS subscriber's long term secret key K see 3GPP TS 33.102. For definition of a GSM subscriber's long term secret key Ki see 3GPP TS 43.020.		
acSeqNum	HexString32	read, write	optional single-valued	Sequence Number for UMTS subscriber. This is a hexadecimal string with fixed length of 12 bytes. For definition of a UMTS subscriber's Sequence Number SQN _{HE} see 3GPP TS 33.102.		
acAMF	HexString32	read	optional single-valued	Authentication Management Field for UMTS subscriber. This is a hexadecimal string with fixed length of 4 bytes For definition of a UMTS subscriber's Authentication Management Field AMF see 3GPP TS 33.102.		
acKdbld	Uint16	read	optional single-valued	The reference to the key used to encrypt the subscriber's long term secret key. tbc.		
acAlgorithId	Uint16	read	optional single-valued	AC Algorithm Identifier. Specifies the algorithm used for the generation of authentication vectors. tbc.		

8

UDC CS Service Data

Object classes, attributes and Directory Information Tree for CS Service Data are out of scope of the present release.

9 UDC GPRS Service Data

Object classes, attributes and Directory Information Tree for GPRS Service Data are out of scope of the present release.

10 UDC EPS Service Data

Object classes, attributes and Directory Information Tree for EPS Service Data are out of scope of the present release.

11 UDC IMS Service Data

11.1 Object classes and their attributes

11.1.1 General

The application of the common data concept described in 3GPP TR 23.845 [25] may bring a significant optimisation and may impact the structure of the object classes described in the presented hereafter alternatives.

In the following sub-sections more attributes of some object class may be needed and are left to implementations. Different alternatives are described in order to show how different implementations may differ.

11.1.2 Alternative A

11.1.2.1 IMS Data

Object Class	ImsData					
Description	This class represents the Data Container for subscriber-specific IMS Data					
Superior OCL			tbd			
Class Type			STRUCTU	RAL		
Direct			tbd			
Superclass(es)						
Attribute Name	Туре	HSS-FE access rights	Properties	Description		
imsDataId	Unt8	read	Naming Attribute mandatory single-valued	Fixed "1"		
mdtrCap	UInt32	read	optional multi-valued	Mandatory capabilities of S-CSCF		
optCap	UInt32	read	optional multi-valued	Optional capabilities of S-CSCF		
authorizedCscf	String	read	optional multi-valued	S-CSCF names that may be delivered to the I-CSCF		
scscfName	String	read, write	optional single-valued	S-CSCF Name assigned		
primaryChargel d	UInt16	read	optional single-valued	Identification of the primary charging server		
secondaryCharg eld	UInt16	read	optional single-valued	Identification of the primary charging server		
primaryEventId	UInt16	read	optional single-valued	Identification of the primary event server		
SecondaryEvent Id	UInt16	read	optional single-valued	Identification of the primary event server		

Table 11.1.2.1-1

11.1.2.2 Service Profile Data

11.1.2.2.1 Service Profile

Т	ab	le	1	1.1	1.2	.2	.1-	1

Description		This class represe	ents the Data Co	ntainer for a Service Profile		
Superior OCL			ImsData	3		
Attribute	Туре	FE access rights	Properties	Description		
Indille						
serviceProfileId	UInt32	read	Naming Attribute mandatory single-valued	The service profile identification associated with the public user identity		
subscribedMed iaProfiled	String	read	optional single-valued	Subscribed media profile identification		
serviceIdList	UInt32	read	optional multi-valued	List of service identifications		
sharedIfcList	Ulnt16	read	optional multi-valued	List of shared IFC identifications		

11.1.2.2.2 Initial Filter Criteria

Table 11.1.2.2.2-1

Object Class	IFC						
Description		This class represents the Data Container for an Initial Filter Criteria					
Superior OCL			ServicePro	ofile			
Attribute	Туре	FE access rights	Properties	Description			
Name							
ifcld	UInt16	read	Naming Attribute mandatory single-valued	IFC identification			
asServerName Id	tbd	read	mandatory single-valued	AS identification			
ifcPriority	UInt32	read	mandatory single-valued	Priority of the IFC			
profilePartIndic ator	UInt8	read	optional single-valued	Indicator of the Profile Type with 3 values according if applicable to Registered or Unregistered or both			
tpParams	String	read	optional single-valued	Trigger Points description			
defaultHandlin g	UInt8	read	optional single-valued	Default Handling			
svcInfo	String	read	optional single-valued	Transparent information related to the trigger points only used by the application server			

11.1.2.3 Implicit Registration Set

Object Class	IRSET					
Description		This class represents	the Data Contain	ner for Implicit Registration Set		
Superior OCL			ImsData	a		
Attribute Name	Туре	FE access rights	Properties	Description		
irSetId	UInt32	read	Naming Attribute mandatory single-valued	Implicit registration set identification		
irsPuidList	tbd	read	mandatory multi-valued	List of identifications of public identities sharing the implicit registration set		
registrationStat us	Uint8	read, write	mandatory single-valued	Registration status of the implicit registration set		

Table 11.1.2.3-1

11.1.2.4 Public Identity

Table 11.1.2.4-1

Object Class	PublicIdentity					
Description	This class represents the Data Container for Public Identity					
Superior OCL			ImsData	3		
Attribute	Туре	FE access rights	Properties	Description		
Name						
puidld	tbd	read	Naming Attribute mandatory single-valued	Identification of the public identity		
puidUsername	String	read	mandatory single-valued	User name part of the public identity		
puidDomainna me	String	read	optional Single-valued	Domain name part of the public identity		
irSetId	UInt32	read	optional Single-valued	Identification of the implicit registration set		
puidType	UInt8	read	mandatory single-valued	Type of the public identity. Possible values: 0: IMPU 1: PSI 2: wildcard PSI 3: wildcard IMPU		
serviceProfileId	Uint32	read	mandatory single-valued	Identification of the service profile associated to the public identity		
pridList	tbd	read	mandatory multi-valued	List of the identifications of the private identities the public identity is associated with		
barringIndicatio n	boolean	read	optional single-valued	The barring indication of the public user identity		
unregSvcInd	Boolean			Indicates whether the public user identity has in unregistered state		
aliasGroupId	UInt8	read	optional single-valued	Identification of the Alias Group associated to the public user identity		

11.1.2.5 Private Identity

Object Class	Privateldentity					
Description	This class represents the Data Container for Private Identity					
Superior OCL			ImsData	3		
Attribute	Туре	FE access	Properties	Description		
Name		rights				
pridld	tbd	read	Naming Attribute mandatory single-valued	Identification of the private identity		
pridUsername	String	read	mandatory single-valued	User name part of the private identity		
pridDomainna me	String	read	optional Single-valued	Domain name part of the private identity		
puidList	tbd	read	mandatory multi-valued	List of the identification s of the public identities the private identity is associated with		
puidRegistratio nStatusList	tbd	read, write	optional multi-valued	Registration status of a Prid Puid pair		
authSchema	Uint8	read	mandatory single-valued	Authentication scheme associated to the private identity		

Table 11.1.2.5-1

11.1.3 Alternative B

11.1.3.1 IMS Data

Table 11.1.3.1-1

Object Class	ImsData						
Description	This class represents the Data Container for subscriber-specific IMS Data						
Superior OCL		tbd					
Class Type			STRUCTU	RAL			
Direct			tbd				
Superclass(es)		-					
Attribute Name	Туре	HSS-FE access rights	Properties	Description			
svcType	Name10	read	Naming Attribute mandatory single-valued	Fixed "IMS".			
mandatoryCapa bilities	UInt32	read	optional multi-valued	Mandatory capabilities of S-CSCF used by I- CSCF to select a S-CSCF.			
optionalCapabilit ies	UInt32	read	optional multi-valued	Optional capabilities of S-CSCF used by I- CSCF to select a S-CSCF.			
serverNames	String	read	optional multi-valued	Statically configured S-CSCF names to be selected by the I-CSCF.			
assignedSCSCF	String	read. write	optional single-valued	Assigned S-CSCF for a user.			
primaryECFNa me	FQDN	read	optional single-valued	Address of the Primary Online Charging Function.			
secondaryECFN ame	FQDN	read	optional single-valued	Address of the Secondary Online Charging Function.			
PrimaryCCFNa me	FQDN	read	optional single-valued	Address of the Primary Charging Data Function.			
secondaryCCFN ame	FQDN	read	optional single-valued	Address of the Primary Charging Data Function.			

11.1.3.2 Service Profile Data

11.1.3.2.1 Service Profile

Object Class		ServiceProfile				
Description		This class represents the Data Container for a Service Profile				
Superior OCL			tbd			
Attribute Name	Туре	FE access rights	Properties	Description		
serviceProfileI D	Ulnt32	read	Naming Attribute mandatory single-valued	The service profile Identification associated with the public user identity.		
coreNet- SubscribedMe diaProfileId	UInt32	read	optional Single-valued	Subscribed media profile Identification which identifies a media profile in the S-CSCF for the authorization of media parameters.		
coreNet- ServiceIdList	String	read	optional multi-valued	List of Service Ids which identify the IMS Communication Service Identifiers that the subscriber is authorized to use.		
sharedFilterCrit eriaSets	UInt32	read	optional mandatory multi-valued	The Shared iFC Set ID ist.		

11.1.3.2.2 Initial Filter Criteria

Table 11.1.3.2.2-1

Object Class	InitialFilterCriteria				
Description	This class represents the Data Container for an Initial Filter Criteria				
Superior OCL			tbd		
Attribute Name	Туре	FE access rights	Properties	Description	
initialFilterCrite riald	UInt32	read	Naming Attribute mandatory single-valued	The Identification of the associated initial filter criteria.	
applicationServ erName	String	read	mandatory single-valued	SIP URI of the application server to contact if the corresponding trigger points are met.	
priority	Ulnt32	read	mandatory single-valued	Priority of the IFC.	
profilePartIndic ator	UInt8	read	optional single-valued	Indicator of the Profile Type as defined in the 3GPP TS 29.228 [24], i.e. whether the iFC is part of the registered or unregistered user profile. Possible values: 0 - UNREGISTERED 1 - REGISTERED	
triggerPoints	String	read	optional single-valued	Trigger Points as defined in the 3GPP TS 29.228 [24].	
defaultHandlin g	UInt8	read	optional single-valued	Default Handling as defined in the 3GPP TS 29.228 [24]. Possible values: 0 - SESSION_CONTINUED 1 - SESSION_TERMINATED	
serviceInfo	String	read	optional single-valued	Transparent information related to the trigger points only used by the application server.	

11.1.3.3 Implicit Registration Set Data

11.1.3.3.1 Implicit Registration Set

Table 11.1.3.2.2-1

Object Class Description Superior OCL	ImplicitRegistrationSet This class represents the Data Container for Implicit Registration Set Thd				
Attribute Name	Type FE access rights Properties Description				
implicitRegistra tionSetID	UInt32	read	Naming Attribute mandatory single-valued	Indentification of the corresponding Implicit Registration Set.	
publicIdList	PublicIdentity	read	mandatory multi-valued	Public User Identities belonging to the implicit registration set.	

11.1.3.3.2 Alias Group

Table 11.1.3.3.2-1

Object Class	AliasGroup			
Description		This class repre	esents the Data C	Container for Alias Group
Superior OCL			Tbd	
Attribute	Туре	FE access rights	Properties	Description
Name				
aliasGroupID	UInt32	read	Naming Attribute mandatory single-valued	Indentification of the corresponding Alias Group.
publicIdList	PublicIdentity	read	mandatory multi-valued	Public User Identities belonging to the alias group.

11.1.3.3 Public Identity

Table 11.1.3.3.3-1

Object Class	PublicIdentity					
Description	This class represents the Data Container for Public Identity					
Superior OCL			tbd			
Attribute Name	Туре	FE access rights	Properties	Description		
publicId	PublicIdentity	read	Naming Attribute mandatory single-valued	Public Identity of the subscriber.		
idType	UInt8	read	mandatory single-valued	Type of Public Identity. Possible values: 0 - IMPU 1 - PSI		
barringIndicatio n	UInt8	read	optional single-valued	The Barring Indicator of the IMPU. Possible values: 0 - NOT BARRED 1 - BARRED		
implicitRegistrit ionSetID	UInt32	read	optional single-valued	Identification of the Implicit Registration Set the Public User Identity belongs to. This attribute only applies to the Public User Identity.		
serviceProfileI D	UInt32	read	mandatory single-valued	Identification of the Service Profile the Public Identity is associated with.		
privateIdList	Privateldentit v	read	mandatory multi-valued	Private Identities the Public Identity is associated with.		

registrationStat us	UInt8	read, write	mandatory multi-valued	The registration status related to the Public Identity. Possible values: 0 - NOT REGISTERED 1 - UNREGISTERED 2 - REGISTERED
registeredPriva teldList	Privateldentit y	read, write	optional multi-valued	Private Identities the Public Identity is registered with.
aliasGroupID	UInt32	read	optional single-valued	Identification of the Alias Group the public user identity belongs to. It only applies to the Public User Identity.

11.1.3.4 Repository Data

Object Class		RepositoryData				
Description		This class represe	ents the Data Co	ntainer for Repository Data		
Superior OCL			tbd			
Attribute Name	Туре	FE access rights	Properties	Description		
serviceIndicati on	String	read, write	Naming Attribute mandatory single-valued	Identifier of one set of service related transparent data.		
sequenceNum ber	UInt32	read, write	optional single-valued	Sequence number of the Repository data updated.		
serviceData	OctetString	read, write	optional single-valued	The corresponding service data.		

11.1.3.5 Private Identity

Object Class	Privateldentity					
Description	This class represents the Data Container for Private Identity					
Superior OCL	tbd					
Attribute	Туре	FE access	Properties	Description		
Name		rights				
privateId	PrivateIdentity	read	Naming Attribute mandatory single-valued	Private Identity of the subscriber.		
idType	UInt8	read	mandatory single-valued	Type of Public Identity. Possible values: 0 - IMPI 1 - PSI		
publicIdList	PublicIdentity	read	mandatory multi-valued	Public Identities the Private Identity is associated with.		
pendingStatus	UInt8	read, write	Optional single-valued	The authentication pending flag. Possible values: 0 - NOT PENDING 1 - PENGDING		
lineldentifier	OctetString	read	optional multi-valued	Fixed broadband access line identifiers associated to the user.		
userName	String	read	optional single-valued	The user name related to the IMPI, which is used to calculate HA1		
password	String	read	optional single-valued	The password related to the IMPI, which is used to calculate HA1		
Realm	String	read	optional single-valued	The password related to the IMPI, which is used to calculate HA1		
ipv4Addr	IPv4Address	read	optional single-valued	IPv4 address related to the IMPI for GIBA.		
ipv6Prefix	IPv6Prefix	read	optional single-valued	IPv6 prefix related to the IMPI for GIBA.		
iPv6Addr	IPv6Address	read	optional single-valued	IPv6 address related to the IMPI for GIBA.		

Table 11.1.3.3.5-1

11.1.3.6 Reference Location Information

Table 11.1.3.3.6-1

Object Class	ReferenceLocationInfor					
Description	This	This class represents the Data Container for Reference Location Information				
Superior OCL			tbd			
Attribute	Туре	FE access rights	Properties	Description		
Name						
referenceLocat	UInt8	read	Naming	Identifier of one set of reference location		
ionInforId			Attribute	information.		
			mandatory			
			single-valued			
accessType	String	read	optional	The type of access (e.g. ADSL).		
	-		single-valued			
accessInfo	String	read	optional	The type of the access information (e.g. dsl-		
			single-valued	location).		
accessValue	String	read	optional	The location information (e.g. line identifier in		
	-		single-valued	fixed access networks).		

11.1.4 Alternative C

11.1.4.1 IMS Subscription

Table	11.1	.4.1-1
1 4 4 1 0		

Object Class	IMS-Subscription				
Description	This class represents the root node for IMS subscription specific data				
Superior OCL			IMS-Da	ita	
Class Type			STRUCTU	JRAL	
Direct			top		
Superclass(es)					
Attribute Name	Туре	HSS-FE access rights	Properties	Description	
subscriptionId	tbd	read	Naming Attribute mandatory single-valued	UDR-Internal identification of an IMS- Subscription.	
sharedIFCsupport	Boolean	read, write	optional single-valued	Indicates whether the assigned S-CSCF (if any) supports shared iFCs.	
scscfMandCap	tbd	read	optional multi-valued	Mandatory Capabilities an S-CSCF must support to serve the subscription	
scscfOptCap	tbd	read	optional multi-valued	Optional Capabilities an S-CSCF may support to serve the subscription	
scscfHost	FQDN	read, write	optional single valued	Diameter Identity of the assigned S-CSCF	
scscfRealm	FQDN	read, write	optional single valued	Diameter Identity of the assigned S-CSCF	
ccfPrim	FQDN	read	mandatory single valued	Diameter Identity of the Primary Charging Collection Function	
ccfSec	FQDN	read	mandatory single valued	Diameter Identity of the Secondary Charging Collection Function	
ecfPrim	FQDN	read	mandatory single valued	Diameter Identity of the Primary Event Charging Function	
ecfSec	FQDN	read	mandatory single valued	Diameter Identity of the Secondary Event Charging Function	

11.1.4.2 Service Profile

Table 11.1.4.2-1

serviceProfileId	tbd	read	Naming	UDR-Internal identification of a Service		
			Attribute	Profile.		
			mandatory			
			single-valued			
sharedFilterIDs	tbd	read	optional	List of pointers to shared IFCs within		
			multi-valued	CommonData		
subMediaProfld	tbd	read	optional	Core Network Service Authorization:		
			single-valued	Subscribed Media Profile Id		
serviceld	tbd	read	optional	Core Network Service Authorization:		
			multi-valued	List of Service Ids		

11.1.4.3 Initial Filter Criteria

Object Class		Filter				
Description		This o	class represents	user specific filter		
Superior OCL			ServiceP	rofile		
Class Type			STRUCTL	JRAL		
Direct			top			
Superclass(es)			-			
Attribute Name	Туре	Type HSS-FE access Properties Description				
initialFilterCriterial d	tbd	read	Naming Attribute mandatory single-valued	UDR-Internal identification of a Filter.		
profilePartInd	tbd	read	optional single-valued	Profile Part Indicator		
priority	tbd	read	optional single-valued	Priority		
applicationServer	tbd	read	optional single-valued	SIP URL of the Applicatio Server		
serviceInfo	tbd	read	optional single-valued	Service Information		
triggerPoint	tbd	read	optional single-valued	The Filter's trigger point		

Table 11.1.4.3-1

11.1.4.4 Implicit Registration Set

Object Class		ImplicitRegistrationSet					
Description		This clas	s represents Imp	olicit Registration Sets			
Superior OCL			IMS-Subso	cription			
Class Type			STRUCT	URAL			
Direct			top				
Superclass(es)							
Attribute Name	Туре	HSS-FE access rights	Properties	Description			
implicitRegistration SetId	tbd	read	Naming Attribute mandatory single-valued	UDR-Internal identification of an Implicit Registration Set.			
authenticationPendi ng	Boolean	read, write	mandatory single-valued	Authentication-Pending flag			
registrationStatus	tbd	read, write	mandatory single-valued	Registration Status			
privateIdentity	tbd	read	mandatory multi-valued	List of Private User Identities			
forbiddenPLMNsId	tbd	read	optional single-valued	pointer to a list of forbidden PLMNs within CommonData			

11.1.4.5 Public Identity

Table 11.1.4.5-1

Object Class		PublicIdentity					
Description	This class represents IMS Public Identities						
Superior OCL			ImplicitRegis	trationSet			
Class Type			STRUCT	URAL			
Direct			top				
Superclass(es)							
Attribute Name	Туре	HSS-FE access rights	Properties	Description			
publicIdentity	tbd	read	Naming Attribute mandatory single-valued	Public User Identity or Public Service Identity			
barredIndicator	Boolean	read	mandatory single-valued	Indicates whether the PublicIdentity is barred			
defaultIndicator	Boolean	read	mandatory single-valued	Indicates whether the public identity is the default public identity within the implicit registrationset			
serviceProfileId	tbd	read	optional single-valued	Name of the service profile associated to the public identity			
displayName	tbd	read	optional single-valued				
aliasId	tbd	read	optional single-valued	Identifies the alias group to which the public identity belongs			
psiIndicator	Boolean	read	mandatory single-valued	Indicates whether the public identity is a PSI			

11.1.4.6 Repository Data

Object Class		RepositoryData				
Description		This	s class represent	s Repository Data

ImsServProfld	String	read	Mandatory single-valued	This attribute indicates the Service Profile associated to this Alias Group.		

11.2 Directory Information Tree

11.2.0 General

In the following sub-sections more object classes may be needed and are left to implementations. Different alternatives are described in order to show how different implementations may differ.

11.2.1 Alternative A

Figure 11.2.1-1: DIT Structure for IMS-Data with Alternative A

The dotted arrow indicates the relationship between PublicIdentity and PrivateIdentity which is expressed by the attributes PrivateIdList and PublicIdList.

The superior OCL description of the ImsData object class and some more detailed description of object classes and attributes are FFS.

11.2.2 Alternative B

Figure 11.2.2-1: DIT Structure for IMS-Data with Alternative B

CoreNet-SubscribedMediaProfileId, CoreNet-ServiceIdList and SharedFilterCriteriaSets are optional attributes in Service Profile entry.

The dotted arrow indicates the relationship between PublicIdentity and PrivateIdentity which is expressed by the attributes PrivateIdList and PublicIdList.

Multiple instances of ReferenceLocInfo (refLocInfo=xxx) is for future releases.

11.2.3 Alternative C

Figure 11.2.3-1: DIT Structure for IMS-Data with Alternative C

If an ImplicitRegistrationSet contains a PublicIdentity which is a PSI then it shall not contain any other PublicIdentity.

If an ImplicitRegistrationSet contains a single PublicIdentity, this Public Identity is not implicitly registered with any other Public Identity and therefore in stage 2 terms is not considered to belong to an Implicit Registration Set.

The concept of multiple IMS-Subscriptions within IMS-Data is not described in the present document.

11.2.4 Alternative D

Figure 11.2.4-1: DIT Structure for IMS-Data with Alternative D

11.3 UML model

This section covers the information model for IMS Data and all its permanent data entities. The term IMS Data may also include temporary data as shown in the corresponding DITs.

Some data entities are already defined in 3GPP TS 32.182 [3].

Figure 11.3-1 covers some basic IMS entities with two possible approaches:

- Approach A: where IMPU and PSI are considered as different basic entities;
- Approach B: where a Public Identity basic IMS entity may identify a Public User Identity or a Public Service Identity and a Private Identity basic IMS entity may identify a Private User Identity or a Private Service Identity. The rational of Approach B is that Public User Identity and Public Service Identity have many common points. They have the same inheritance diagram with SIP URI or Tel URI. Public User Identity or Public Service Identity have compatible associations with other entities such as IMS Data or IMS Service profile. This modelling reduces the number of IMS basic entities and associations. Then, the differentiation between a Public User Identity and a Public Service Identity may be done by an attribute within the Public identity.

It is left to implementation to identify the most suited approach according to the further model inputs.

Figure 11.3-2 covers IMS Public User Identity and its relationship with other IMS data entities.

Figure 11.3-2 Information model for IMS Public User Identity and some surrounding entities

Figure 11.3-3 covers IMS Public Service Identity and its relationship with other IMS data entities.

Figure 11.3-3 Information model for IMS Public Service Identity and some surrounding entities

Figure 11.3-4 covers IMS Public User Identity Implicit Registration Set and its relationship with Alias Group, and IMS Public User Identity.

NOTE: Alias Group is used as a simplification of the 3GPP TS 23.228 defined term Alias Public User Identities. In 3GPP TS 23.228 this is referred sometimes as well as Alias Public User Identity Group or Alias Public User Identity Set.

Following constrains apply:

- All Public User Identities of an Implicit Registration set must be associated to the same Private User Identities.
- Each IMPU can only be included in one Alias Group

Figure 11.3-4 Information model for IMS Public User Identity Implicit Registration Set and its relationship with IMS Public User Identity and Alias Group

Figure 11.3-5 covers IMS Data and its relationship with Public Identity that provides coherence between approach A and approach B, since IMPU and PSI are derived entities from the more generic Public Identity

The figure implies that a Public Identity can not exist without IMS Data. On the other hand, IMS Data is defined for IMPU(s) or PSI(s), but not for both at the same time.

12 Conclusion and Recommendation

The present study, although focused on IMS data model and not fully completed, has shown that different alternatives for UDC Service Profile (section 7) and UDC IMS Service Data (section 12) are supported in current deployments and implementations and that a common base could not be found. This is mainly due to the fact that existing FE application logics may be impacted when changing the data model and this has been evaluated as not acceptable during the work.

For the above reasons a standardized Reference Data Model (RDM) for the Ud interface between Front-Ends for the HSS application (HSS-FEs) and the User Data Repository (UDR) is not agreeable.

It is therefore recommended not to start normative specification work on the definition of a Reference Data Model.

It is further recommended to add text to 3GPP TS 29.335 indicating that specifying a standardized RDM is out of scope of 3GPP specifications and hence Ud data model is proprietary.

For multivendor interoperability between FEs and UDR specific integration projects are needed in order to accommodate data required by different vendors FEs into UDR. To this end the present document may represent a valid example of data models implementation in operator's network.
