## Introduction

The TETRA standard was developed to meet the needs of Professional Mobile Radio (PMR) user organizations for secure, reliable and robust critical communications. In particular, the following important services have been specified:

- Wide area fast call set-up "all informed net" group calls.
- Direct Mode Operation (DMO) allowing "back to back" communications between radio terminals independent of the network.
- High level voice encryption to meet the security needs of public safety organisations.
- An Emergency Call facility that gets through even if the system is busy.
- Full duplex voice for PABX and PSTN telephony communications.
- In addition to the needs of traditional PMR users, TETRA has been developed to meet the needs of Public Access Mobile Radio (PAMR)operators.

To meet the ever-changing user requirements and utilise the latest in technology developments, TETRA continues to be evolved and enhanced with the development of new standards including:

- TETRA Release 2, which incorporates the TETRA Enhanced Data Service (TEDS) that provides wideband high-speed data communication services.
- The interfacing between TETRA systems and mission-critical broadband services in order to allow interworking.
- TETRA Releases 2.x are defined in the Terms of Reference of ETSI Project TETRA for TETRA Release 2 [i.1] and are continuously maintained.

- Work has been ongoing since 2010 in developing specifications and reports related to the evolution to broadband critical communications and these are listed as they are either directly relevant to TETRA r2.2. e.g. interworking between TETRA and broadband systems or indirectly e.g. aspects of security for critical communications broadband systems.

# 1 Scope

The present document identifies ETSI specifications and reports for TETRA V+D and DMO Release 2.2. It also includes ETSI specifications and reports relating to Critical Communications evolution undertaken by TC TCCE as well as specifications produced by other ETSI technical committees

ENs relating to TETRA specifications are often updated by first introducing an ETSI Technical Specification (TS) which will contain new features and change requests. Therefore, both the latest specification is shown along with the previous version if one is an EN and the other a TS. In the same way, EN versions of the same specification will also be updated replacing a TS in some cases. Release 2.2 specifications were functionally frozen after the 52<sup>nd</sup> TC TCCE meeting in October 2018.

Release 2.2 specifications contain corrections and enhancements to Release 2.1 including a major development of the Inter System Interface specifications to develop separate specifications for IP and PSS1 over E.1 transport layers as well as transport layer independent parts.

NOTE 1: Functionally frozen means that no further functionality/features may be incorporated into the set of specifications, and that only corrective Change Requests (CRs) are to be accepted and agreed.

NOTE 2: It can be expected that corrective CRs will be introduced into the Release 2.2 specifications.

NOTE 3: Some of the CRs that will be produced will be for the next Release as they add new functionalities/features.
