Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, PLUGTESTS™, UMTS™ and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. 3GPP™ and LTE™ are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. oneM2M™ logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. GSM® and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Intelligent Transport Systems (ITS).

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Introduction

Cooperative awareness within road traffic means that road users and roadside infrastructure are informed about each other's position, dynamics and attributes. Road users are all kind of road vehicles like cars, trucks, motorcycles, bicycles or even pedestrians and roadside infrastructure equipment including road signs, traffic lights or barriers and gates. The awareness of each other is the basis for several road safety and traffic efficiency applications with many use cases, for example as described in ETSI TR 102 638 [i.1]. It is achieved by regular exchange of information among vehicles (V2V, in general all kind of road users) and between vehicles and road side infrastructure (V2I and I2V) based on wireless networks, called V2X network and as such is part of Intelligent Transport Systems (ITS).

The information to be exchanged for cooperative awareness is packed up in the periodically transmitted Cooperative Awareness Message (CAM). The construction, management and processing of CAMs is done by the Cooperative Awareness service (CA service), which is part of the facilities layer within the ITS communication architecture ETSI TS 103 898 [i.2] supporting several ITS applications.
The CA service is a mandatory facility for all kind of ITS-Stations (ITS-S), which take part in the road traffic (vehicle ITS-S, personal ITS-S, etc.). The present document focuses on the specifications for CAMs transmitted by all vehicle ITS-Ss participating in the V2X network. Nevertheless, the present document defines the CAM format with flexibility in order to be easily extendable for the support of other types of ITS-Ss or future ITS applications.

The requirements on the performance of the CA service, the content of the CAM and the quality of its data elements are derived from the Basic Set of Applications (BSA) as defined in ETSI TR 102 638 [i.1] and in particular from the road safety applications as defined in the C2C-CC Basic System Profile [i.3] and the C-Roads Release [i.5]. Further use cases are specified in the C2C-CC Roadmap [i.4].

The Release 1 edition of the CA service has been published as ETSI EN 302 637-2 [i.6]. The present document is the first Release 2 version and provides the improved specification of the Release 1 version as a basis for future Release 2 versions of the CA service: future versions of the present document will specify extensions to the CAM Release 2 format to support use cases based on BSA in a way allowing the facilities layer standard to be used with different security and lower layer technologies.

To ensure backward compatibility, all future CA service Release 2 versions will be based on this first CA service Release 2 version. Further it will be ensured that the Release 1 implementations can receive and decode Release 2 CAM and utilize the Release 1 content without the need to understand the Release 2 content.
1 Scope

The present document provides the specification of the Release 2 Cooperative Awareness (CA) service. This includes definition of the syntax and semantics of the Cooperative Awareness Message (CAM) and detailed specifications on the message handling.

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the terms given in ETSI TS 103 898 [i.2], LDM given in ETSI TS 103 938 [i.7] and the following apply:

**Basic Set of Applications**: group of applications, supported by vehicular communication system

NOTE: The basic set of applications is defined in ETSI TR 102 638 [i.1].

**Cooperative Awareness (CA) service**: facility at the ITS-S facilities layer to generate, receive and process the CAM
Cooperative Awareness Message (CAM): CA service PDU

Cooperative Awareness Message (CAM) data: partial or complete CAM payload

Cooperative Awareness Message (CAM) protocol: ITS facilities layer protocol that operates the CAM transmission and reception

empty vehicle: complete vehicle kerb mass as defined in ISO 1176 [i.8], clause 4.6

ITS-G5: access technology to be used in frequency bands dedicated for European intelligent transport System (ITS) as defined in ETSI EN 302 663 [i.9]

LTE-V2X: access technology to be used in frequency bands dedicated for European intelligent transport System (ITS) as defined in ETSI TS 103 613 [i.10]

V2X: vehicle to everything, e.g. Vehicle to Vehicle (V2V), Vehicle to Infrastructure (V2I) and/or Infrastructure to Vehicle (I2V), Vehicle to Pedestrian (V2P) and/or Pedestrian to Vehicle (P2V), and Vehicle to Network (V2N) and/or Network to Vehicle (N2V)

3.2 Symbols

For the purposes of the present document, the following symbols apply:

- IF.CAM: Interface between CAM service and LDM or ITS application
- IF.FAC: Interface between CAM service and other facilities layer entities
- IF.N&T: Interface between CAM service and ITS networking & transport layer
- IF.SEC: Interface between CAM service and ITS security entity

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

- API: Application Programming Interface
- ASN.1: Abstract Syntax Notation 1
- BSA: Basic Set of Applications
- BTP: Basic Transport Protocol
- C2C-CC: Car to Car Communication Consortium
- CA: Cooperative Awareness
- CAM: Cooperative Awareness Message
- DCC: Decentralized Congestion Control
- DDP: Device Data Provider
- DE: Data Element
- DENM: Decentralized Environmental Notification Message
- DF: Data Frame
- DTLS: Datagram Transport Layer Security
- FL-SDU: Facility Layer Service Data Unit
- GN: GeoNetworking
- HF: High Frequency
- HMI: Human Machine Interface
- I2V: Infrastructure-to-Vehicle
- ID: IDentifier
- ISO: International Organization for Standardization
- ITS: Intelligent Transport Systems
- ITS-AID: ITS-Application IDentifier
- ITS-S: ITS Station
- ITU-T: International Telecommunication Union - Telecommunications
- LDM: Local Dynamic Map
- LF: Low Frequency
- LTE: Long Term Evolution
- MIB: Management Information Base
- MSB: Most Significant Bit
4 CA service introduction

4.1 Background

Cooperative Awareness Messages (CAMs) are messages exchanged in the ITS network between ITS-Ss to create and maintain awareness of each other and to support cooperative performance of vehicles using the road network. A CAM contains status and attribute information of the originating ITS-S. The content varies depending on the type of the ITS-S. For vehicle ITS-Ss the status information includes time, position, motion state, activated systems, etc. and the attribute information includes data about the dimensions, vehicle type and role in the road traffic, etc. On reception of a CAM the receiving ITS-S becomes aware of the presence, type, and status of the originating ITS-S. The received information can be used by the receiving ITS-S to support several ITS applications. For example, by comparing the status of the originating ITS-S with its own status, a receiving ITS-S is able to estimate the collision risk with the originating ITS-S and if necessary may inform the driver of the vehicle via HMI or in-vehicle system. Multiple ITS applications may rely on the CA service. It is assigned to domain application support facilities in ETSI TS 102 894-1 [i.11].

Besides the support of applications the awareness of other ITS-S gained by the CA service may be used in the networking & transport layer for the position dependent dissemination of messages, e.g. DENM [i.12] by GeoBroadcasting as specified in ETSI TS 103 836-4-1 [i.13]. The generation and transmission of CAM is managed by the CA service by implementing the CAM protocol.

4.2 Services provided by CA service

The CA service is a facilities layer entity that operates the CAM protocol. It provides two services: sending and receiving of CAMs. The CA service uses the services provided by the protocol entities of the ITS networking & transport layer to disseminate the CAM.

4.3 Sending CAMs

The sending of CAMs comprises the generation and transmission of CAMs. In the course of CAM generation the originating ITS-S composes the CAM, which is then delivered to the ITS networking & transport layer for dissemination. The dissemination of CAMs may vary depending on the applied communication system. CAMs may be sent by the originating ITS-S to all ITS-Ss within the direct communication range. This communication range may, inter alia, be influenced in the originating ITS-S by changing the transmit power.

CAMs are generated periodically with a frequency controlled by the CA service in the originating ITS-S. The generation frequency is determined taking into account the change of own ITS-Ss status, e.g. change of position or speed as well as the radio channel load.
4.4 Receiving CAMs

Upon receiving a CAM, the CA service makes the content of the CAM available to the ITS applications and/or to other facilities within the receiving ITS-S, such as a Local Dynamic Map (LDM) [i.7].

5 CA service functional specification

5.1 CA service in the ITS architecture

The CA service is a facilities layer entity of the ITS-S architecture as defined in ETSI TS 103 898 [i.2]. It may interface with other entities of the facilities layer and with the ITS application layer in order to collect relevant information for CAM generation and to forward the received CAM content for further processing. The CA service within the ITS-S architecture and the logical interfaces to other layers and potentially to entities within the facility layer are presented in Figure 1.

In ITS-S, entities for the collection of data may be the Device Data Provider (DDP) and the Position and Time management (POTI) and for received data the Local Dynamic Map (LDM) and/or ITS application as receiving entities. For vehicle ITS-S, the DDP is connected with the vehicle network and provides the vehicle status information. The POTI provides the position of the ITS-S and time information. The LDM as outlined in ETSI TS 103 938 [i.7] is a database in the ITS-S, which may be updated with received CAM data. ITS applications may retrieve information from the LDM for further processing.

The CA service interfaces through the IF-N&T with the Networking & Transport (N&T) layer for exchanging of CAMs with other ITS-Ss, the IF-Sec with the security entity to access security services for CAM transmission and CAM reception, the IF-Mng with the management entity and the IF-App with the application layer if received CAM data are provided directly to the applications.

The operation of the CA service on ITS infrastructure devices is specified in ETSI TS 103 301 [i.14].

The functionalities of the CA service are defined in clause 5.2, the interfaces in Figure 2 are defined in clause 5.3.

Figure 1: CA service within the ITS-S architecture

5.2 CA service functional architecture

The CA service is part of the Application support domain of the facilities layer according to ETSI TS 102 894-1 [i.11]. Figure 2 shows the functional block diagram with the functional blocks of the CA service and interfaces to other facilities and layers, which are detailed in the following. The interfaces to other entities and layers are defined in clause 5.3.
For sending and receiving CAMs, the CA service shall provide the following sub-functions:

- **Encode CAM:**
  - This sub-function constructs the CAM according to the format specified in annex A. The most recent device data shall be included in CAM.

- **Decode CAM:**
  - This sub-function decodes the received CAMs.

- **CAM transmission management:**
  - This sub-function implements the protocol operation of the originating ITS-S, as specified in clause C.2, including in particular:
    - Activation and termination of CAM transmission operation.
    - Determination of the CAM generation frequency.
    - Trigger the generation of CAM.

- **CAM reception management:**
  - This sub-function implements the protocol operation of the receiving ITS-S, as specified in clause C.3, including in particular:
    - Trigger the "decode CAM" function at the reception of CAM.
    - Provision of the received CAM data to LDM and/or ITS applications of the receiving ITS-S.
    - Optionally, checking the information of received CAMs.

### 5.3 Interfaces of the CA service

#### 5.3.1 Interface to ITS application layer

An ITS application is an application layer entity that implements the logic for fulfilling one or more ITS use cases. Example ITS applications are defined in the C2C-CC Basic System Profile [i.3], the C2C-CC Roadmap [i.4] and the C-Roads Release [i.5].

For the provision of received data the CA service provides the interface IF.CAM to LDM or to ITS application layer, as illustrated in Figure 2.
NOTE: The interface to the ITS application layer may be implemented as API and data are exchanged between the CA service and ITS applications via this API. In another possible implementation, the interface to the application layer may be implemented as IF-App.

5.3.2 Interface to data provisioning facilities

For the generation of CAMs, the CA service interacts with other facilities layer entities in order to obtain the required data. This set of facilities that provides data for CAM generation is referred to as data provisioning facilities. Data are exchanged between the data provisioning facilities and the CA service via the interface IF.FAC.

NOTE: Specifications of the interface to the data provisioning facilities and the corresponding protocols are out of scope of the present document.

5.3.3 Interface to the networking & transport layer

The CA service exchanges information with ITS networking & transport layer via the interface IF.N&T as depicted in Figure 2.

At the originating ITS-S, the CA service shall provide the CAM embedded in a Facility-Layer Service Data Unit (FL-SDU) together with Protocol Control Information (PCI) to the ITS networking & transport layer. At the receiving ITS-S, the ITS networking & transport layer will pass the received CAM to the CA service, if available.

The minimum data set that shall be passed between CA service and ITS networking & transport layer for the originating and receiving ITS-S is specified in Table 1.

<table>

<td>Optional</td>
<td></td>
</tr>
</tbody>
</table>

The interface between the CA service and the networking & transport layer relies on the services of the GeoNetworking/BTP stack as specified in clause 5.3.4.1 or to the IPv6 stack and the combined IPv6/GeoNetworking stack as specified in clause 5.3.4.2.

5.3.4 Interfaces protocol stacks of the networking & transport layer

5.3.4.1 Interface to the GeoNetworking/BTP stack

A CAM may rely on the services provided by the GeoNetworking/BTP stack. If this stack is used, the GN packet transport type Single-Hop Broadcasting (SHB) shall be used. In this scenario only nodes in direct communication range may receive the CAM.

PCI being passed from CA service to the GeoNetworking/BTP stack shall comply with Table 1 and Table 2.
Table 2: PCI from CA service to GeoNetworking/BTP at the originating ITS-S

</tr>
</tbody>
</table>

NOTE: When a global registration authority for ITS application as specified in ISO 17419 [i.16] is operational, the BTP destination port registered with this authority shall be used.
5.3.4.2 Interface to the IPv6 stack and the combined IPv6/GeoNetworking stack

A CAM may use the IPv6 stack or the combined IPv6/GeoNetworking stack for CAM dissemination as specified in ETSI TS 103 836-3 [i.17].

NOTE 1: When the CAM dissemination makes use of the combined IPv6/GeoNetworking stack, the interface between the CA service and the combined IPv6/GeoNetworking stack may be identical to the interface between the CA service and IPv6 stack. The transmission of CAM over the IPv6 stack is out of scope of the present document.

NOTE 2: If IP-based transport is used to transfer the facility layer CAM between interconnected actors, security constraints as outlined in Clause 6.2.2 may not be applicable. In this case trust among the participating actors, e.g. using mutual authentication, and authenticity of information can be based on other standard IT security methods, such as IPSec, DTLS, TLS or other VPN solutions that provide an end-to-end secure communication path between known actors.

NOTE 3: Security methods, sharing methods and other transport related information, such as messaging queuing protocols, transport layer protocol, ports to use etc. can be agreed among interconnected actors.

5.3.5 Interface to the Management entity

The CA service may exchange primitives with management entity of the ITS-S via the IF.Mng interface as depicted in Figure 1. In case of the ITS-G5 access layer, an originating ITS-S the CA service gets information for setting the $T_{GenCam\_DCC}$ from the management entity defined in clause 6.1.2 via the IF.Mng interface, as depicted in Figure 2.

NOTE: Specifications of the IF.Mng and the corresponding protocol are out of scope of the present document.

5.3.6 Interface to the Security entity

The CA service may exchange primitives with the Security entity of the ITS-S via the IF-Sec interface as depicted in Figure 1 using the IF.Sec interface provided by the Security entity as depicted in Figure 2.

NOTE: Specifications of the IF-Sec and the corresponding protocol are out of the scope of the present document.

6 CAM dissemination

6.1 CAM dissemination concept

6.1.1 CA service activation and termination

CA service activation may vary for different types of ITS-S, e.g. vehicle ITS-S, road side ITS-S, personal ITS-S. As long as the CA service is active, the CAM generation shall be triggered and managed by the CA service.

6.1.2 CAM generation frequency management for vehicle ITS-Ss

The CAM generation frequency is managed by the CA service; it defines the time interval between two consecutive CAM generations.

Considering the requirements as specified in the C2C-CC Basic System Profile [i.3], the C2C-CC Roadmap [i.4] and the C-Roads Release [i.5]. The upper and lower limits of the transmission interval are set as follows:

- The CAM generation interval shall not be inferior to $T_{GenCamMin} = 100 \text{ ms}$. This corresponds to the CAM generation rate of 10 Hz.
- The CAM generation interval shall not be superior to $T_{GenCamMax} = 1 000 \text{ ms}$. This corresponds to the CAM generation rate of 1 Hz.
Within these limits the CAM generation shall be triggered depending on the originating ITS-S dynamics and the channel congestion status. In case the dynamics of the originating ITS-S lead to a reduced CAM generation interval, this interval should be maintained for a number of consecutive CAMs. The conditions for triggering the CAM generation shall be checked repeatedly every $T_{\text{CheckCamGen}}$. $T_{\text{CheckCamGen}}$ shall be equal to or less than $T_{\text{GenCamMin}}$.

In the case of ITS-G5, the parameter $T_{\text{GenCamDcc}}$ shall provide the minimum time interval between two consecutive CAM generations in order to reduce the CAM generation according to the channel usage requirements of Decentralized Congestion Control (DCC) as specified in ETSI TS 102 724 [i.18]. This facilitates the adjustment of the CAM generation rate to the remaining capacity of the radio channel in case of channel congestion. The parameter $T_{\text{GenCamDcc}}$ shall be provided by the management entity as specified in clause 5.3.5 in the unit of milliseconds. The value range of $T_{\text{GenCamDcc}}$ shall be limited to $T_{\text{GenCamMin}} \leq T_{\text{GenCamDcc}} \leq T_{\text{GenCamMax}}$. If the management entity provides this parameter with a value above $T_{\text{GenCamMax}}$, $T_{\text{GenCamDcc}}$ shall be set to $T_{\text{GenCamMax}}$ and if the value is below $T_{\text{GenCamMin}}$ or if this parameter is not provided, the $T_{\text{GenCamDcc}}$ shall be set to $T_{\text{GenCamMin}}$.

In the case of LTE-V2X, DCC and $T_{\text{GenCamDcc}}$ are not applicable. Channel congestion control is managed by the access layer defined in ETSI TS 103 574 [i.20].

The parameter $T_{\text{GenCam}}$ represents the currently valid upper limit of the CAM generation interval. The default value of $T_{\text{GenCam}}$ shall be $T_{\text{GenCamMax}}$. $T_{\text{GenCam}}$ shall be set to the time elapsed since the last CAM generation, if a CAM is triggered due to condition 1). After triggering the number of $N_{\text{GenCam}}$ consecutive CAMs due to condition 2), $T_{\text{GenCam}}$ shall be set to $T_{\text{GenCamMax}}$. The value of the parameter $N_{\text{GenCam}}$ can be dynamically adjusted according to some environmental conditions. The default and maximum value of $N_{\text{GenCam}}$ shall be 3.

**EXAMPLE:** $N_{\text{GenCam}}$ can be increased when approaching an intersection in order to increase the probability of CAM reception.

In detail the CAM generation trigger conditions shall be as follows:

1) The time elapsed since the last CAM generation is equal to or greater than $T_{\text{GenCamDcc}}$, as applicable, and one of the following ITS-S dynamics related conditions is given:

- the absolute difference between the current heading of the originating ITS-S and the heading included in the CAM previously transmitted by the originating ITS-S exceeds 4°;
- the distance between the current position of the originating ITS-S and the position included in the CAM previously transmitted by the originating ITS-S exceeds 4 m;
- the absolute difference between the current speed of the originating ITS-S and the speed included in the CAM previously transmitted by the originating ITS-S exceeds 0.5 m/s.

2) The time elapsed since the last CAM generation is equal to or greater than $T_{\text{GenCam}}$ and, in the case of ITS-G5, is also equal to or greater than $T_{\text{GenCamDcc}}$.

If one of the above two conditions is satisfied, a CAM shall be generated immediately.

When a CAM needs to be generated, the CA service shall construct the mandatory containers as specified in clause 7.1. The mandatory containers mainly include the high dynamic information of the originating ITS-S, as $\{\text{CAM.cam.basicContainer}\}$ and $\{\text{CAM.camParameters.highFrequencyContainer}\}$ as specified in annex A. Optionally, a CAM may include optional data. The optional data mainly include the status of the originating ITS-S which is less dynamic, as $\{\text{CAM.camParameters.lowFrequencyContainer}\}$ and specific information as included for a specific type of originating ITS-S, as $\{\text{CAM.camParameters.specialVehicleContainer}\}$ as specified in annex A.

The low frequency container shall be included in the first CAM generation since the CA service activation. After that, the low frequency container of CAM shall be included if time elapsed since the generation of the last CAM with the low frequency container generation is equal to or greater than 500 ms.

For special vehicles, the special-vehicle container shall be included in the first CAM generation since the CA service activation. After that, a special vehicle container shall be included if the time elapsed since the generation of the last CAM with a special vehicle container is equal to or greater than 500 ms.
6.1.3 CAM generation frequency management for RSU ITS-Ss

The CAM generation frequency for RSU ITS-Ss defined by the time interval between two consecutive CAM generations shall be set in such a way, that at least one CAM is transmitted while a vehicle is in the communication zone of the RSU ITS-S and that an inlineP2pcdRequest for an unknown authorization authority certificate from that same vehicle can be answered according to ETSI TS 103 097 [3] at least once thereafter. The time interval shall be greater than or equal to 500 ms.

NOTE: The probability for the reception of a CAM from an RSU by a passing vehicle depends on the generation rate of the CAM and the time the vehicle is within the communication zone, which depends on the vehicle speed and the RSU transmission power.

6.1.4 CAM time requirement

6.1.4.1 CAM generation time

Besides the CAM generation frequency the time required for the CAM generation and the timeliness of the data taken for the message construction are decisive for the applicability of data in the receiving ITS-Ss. In order to ensure proper interpretation of received CAMs, each CAM shall be time-stamped.

NOTE: An acceptable time synchronization between the different ITS-Ss is expected.

Time required for a CAM generation shall be less than 50 ms. The time required for a CAM generation refers to the time difference between time at which CAM generation is triggered and time at which the CAM is delivered to networking transport layer.

6.1.4.2 CAM Time stamp

The following requirements shall apply:

- The time stamp given in the vehicle ITS-S CAM shall correspond to the time at which the reference position of the originating ITS-S given in this CAM was determined. The format and range of the time stamp is defined in annex B.
- The time stamp given in the RSU ITS-S CAM shall be the time of generation.
- The difference between CAM generation time and time stamp shall be less than 32 767 ms.

NOTE 1: This requirement is set to avoid time stamp wrap-around situation.

NOTE 2: The specification of the ITS-S Time precision and synchronization is out of scope of the present document.

6.2 CAM dissemination constraints

6.2.1 General Confidence Constraints

Several data elements of the CAM may vary with regard to accuracy or confidence. For these data elements data frames are specified providing data element together with confidence information as presented in annex B.

6.2.2 Security constraints

6.2.2.1 Introduction

Clause 6.2.2 is applicable to ITS stations that use the trust model according to ETSI TS 102 940 [i.21] and ITS certificates according to ETSI TS 103 097 [3].

NOTE: For other scenarios, the trust model and the mechanisms for trust enforcement for inter-connected ITS stations can agreed among participating actors.
The security mechanisms for ITS consider the authentication of messages transferred between ITS-Ss with certificates. A certificate indicates its holder's permissions to send a certain set of messages and optionally privileges for specific data elements within these messages. The format for the certificates is specified in ETSI TS 103 097 [3].

Within the certificate the permissions and privileges are indicated by a pair of identifiers, the ITS-AID and the SSP.

The ITS-Application Identifier (ITS-AID) as given in ETSI TS 102 965 [i.19] indicates the overall type of permissions being granted: for example, there is an ITS-AID that indicates that the sender is entitled to send CAMs.

The Service Specific Permissions (SSP) is a field that indicates specific sets of permissions within the overall permissions indicated by the ITS-AID: for example, there may be an SSP value associated with the ITS-AID for CAM that indicates that the sender is entitled to send CAMs for a specific vehicle role.

An incoming signed CAM is accepted by the receiver if the certificate is valid and the CAM is consistent with the ITS-AID and SSP in its certificate.

### 6.2.2.2 Service Specific Permissions (SSP)

CAMs shall be signed using private keys associated to Authorization Tickets that contain SSPs of type BitmapSsp as specified in ETSI TS 103 097 [3].

The CAM-SSP octet scheme allows the SSP format to accommodate current and future versions of the present document. The octet scheme is constructed out of three octets as illustrated in Figure 3.

![Figure 3: Format for the Octets](image)

**EXAMPLE of bit order:** The decimal value 199 shall be represented as shown below:

```
 0 1 2 3 4 5 6 7
1 1 0 0 0 1 1 1
```

For each octet, the most significant bit (MSB) shall be the leftmost bit. The transmission order shall always be the MSB first. The first octet shall control the SSP version and be interpreted in the following way:

- 0: no version, length one octet; the value shall only be used for testing purposes.
- 1: first version, length three octets, SSP contains information as defined in the present document.
- 2 to 255: reserved for future usage.

The SSP has a maximum length as specified in ETSI TS 103 097 [3]. The first octet shall reflect the version of the present document. As future versions of the present document are published, the first octet shall be incremented only in case of changes in the assignment of the already assigned SSP bits. The remaining octets shall be based on the permissions described in the present document (see Table 3 and Table 4).

Length of SSP is the length of the Octet String.

### Table 3: Octet Scheme for CAM SSPs

#### 6.2.3 General priority constraints

If the GeoNetworking / BTP stack is used, the priority constraint is given by the Traffic Class as specified in ETSI TS 103 836-4-1 [i.13].

#### 7 CAM Format Specification

### 7.1 General structure of a CAM PDU

A CAM is composed of one common ITS PDU header and multiple containers, which together constitute a CAM.

The ITS PDU header is a common header that includes the information of the protocol version, the message type and the ITS-S ID of the originating ITS-S.

For vehicle ITS-Ss a CAM shall comprise one basic container and one high frequency container, and may also include one low frequency container and one or more other special containers:

- The basic container includes basic information related to the originating ITS-S.
- The high frequency container contains highly dynamic information of the originating ITS-S.
- The low frequency container contains static and not highly dynamic information of the originating ITS-S.

The special vehicle container contains information specific to the vehicle role of the originating vehicle ITS-S.
All CAMs generated by a RSU ITS-S shall include a basic container and optionally more containers.

The general structure of a CAM is illustrated in Figure 4.

Each container is composed of a sequence of optional or mandatory Data Elements (DE) and/or Data Frames (DF). DEs and DFs are mandatory unless specified otherwise. The present document provides CAM content specifications for vehicle ITS-Ss. CAM format and content specifications for other types of ITS-Ss is expected to be added in the future.

7.2 ITS PDU header

The ITS PDU header shall be as specified in ETSI TS 102 894-2 [1]. Detailed data presentation rules of the ITS PDU header in the context of CAM shall be as specified in annex B.

7.3 Basic container

The basic container provides basic information of the originating ITS-S:

- type of the originating ITS-S;
- the latest geographic position of the originating ITS-S as obtained by the CA service at the CAM generation.

The basic container shall be present for CAM generated by all ITS-Ss implementing the CA service.

Detailed data presentation rules shall be as specified in annex B.

7.4 Vehicle ITS-S containers

All CAMs generated by a vehicle ITS-S shall include at least a high frequency vehicle (Vehicle HF) container, and optionally a low frequency vehicle (Vehicle LF) container. The Vehicle HF container contains all fast-changing (dynamic) status information of the vehicle ITS-S such as heading or speed. The Vehicle LF container contains static or slow-changing vehicle data like the status of the exterior lights.

Vehicle ITS-Ss which use a value of vehicleRole in the Vehicle LF container, i.e. `{CAM.cam.basicVehicleContainerLowFrequency.vehicleRole}` other than the value `default(0)` shall provide further status information in special vehicle containers according to Table 5.
Table 5: Special vehicle container according to the vehicle role

</tr>
</tbody>
</table>

7.5 RSU ITS-S containers

RSU ITS-S CAMs shall provide at least one HF container. Additional LF containers may be added.

7.6 CAM format and coding rules

7.6.1 Common data dictionary

The CAM format makes use of the common data dictionary as defined in ETSI TS 102 894-2 [1].

Where applicable, DEs and DFs that are not defined in the present document shall be imported from the common data dictionary as specified in ETSI TS 102 894-2 [1].

NOTE: Detailed descriptions of all DEs and DFs in the context of CAM are presented in the annex B of the present document.

7.6.2 CAM data presentation

The CAM format is presented in ASN.1. Unaligned packed encoding rules (PER) as defined in Recommendation ITU-T X.691/ISO/IEC 8825-2 [2] shall be used for CAM encoding and decoding.

The ASN.1 representation of CAM shall be as specified in the annex A of the present document.
Annex A (normative):
ASN.1 specification of CAM syntax

This clause provides the normative ASN.1 module containing the syntactical specification of the CAM PDU, its containers, data frames and data elements defined in the present document.

The semantical specification of the CAM components, its containers, data frames, and data elements are contained in the same module, in the form of ASN.1 comments. For readability, the same semantical specification is presented in a different format in annex B.

The CAM-PDU-Descriptions module is identified by the Object Identifier {itu-t (0) identified-organization (4) etsi (0) itsDomain (5) wg1 (1) camPduRelease2 (103900) major-version-2 (2) minor-version-1 (1) }. The module can be downloaded as a file as indicated in Table A.1. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.

</tbody>
</table>
Annex B (informative):
Specification of CAM PDU components

The specification of CAM PDU components is available at the following URL:

Annex C (informative):
Protocol operation of the CA service

C.1 Introduction

This annex provides a timer controlled approach for the protocol operation as one potential variant compliant to the present document. It is distinguished between the originating ITS-S operation and the receiving ITS-S operation considered in the following clauses.

Following specification of the protocol operation is organized in three parts:

1) Protocol data setting rules specify the setting of the relevant data elements used by the protocol.

2) The general protocol operation specifies the sequence of protocol operations.

3) Exception handling specifies additional protocol operations that extend the general protocol operation. They are applied when special conditions, referred to exceptions (for example inconsistent data) occur.

An ITS-S maintains a local data structure, referred to as "ITS-S message table". This data structure holds information about sent or received CAM messages.

It is out of scope of the present document to describe how this data structure is implemented.

C.2 Originating ITS-S operation

C.2.1 Protocol data setting rules

The data settings for the originating ITS-S operation are specified in annex B.

C.2.2 T_CheckCamGen

The timer $T_{\text{CheckCamGen}}$ schedules the time at which the CAM generation conditions are checked by the CA service, its time out value is specified in clause 6.1.2.

C.2.3 Originating ITS-S message table

The CA service stores at least the following information for the CAM originating ITS-S operation:

- CAM generation time;
- ITS-S position as included in CAM;
- ITS-S speed as included in CAM;
- ITS-S heading as included in CAM.
C.2.4 General protocol operation

The originating ITS-S protocol starts when the CA service is activated as specified in clause 6.1.1. An originating ITS-S may execute the following operations:

1) set $T_{\text{CheckCamGen}}$ and start the timer;
2) when the timer $T_{\text{CheckGenCam}}$ expires, check the CAM generation conditions:
   a) if any of the condition is satisfied, continues the operation;
   b) if none of the condition is satisfied, skip step 3) to step 7);
3) collect data for mandatory containers;
4) check if optional containers are to be added for CAM generation:
   a) if yes, check the ITS-S type and ITS-S role and collect data for optional containers;
   b) if no, continue the operation;
5) encode CAM;
6) pass CAM to the ITS networking & transport layer;
7) save data required as specified in clause C.2.3 for next CAM generation;
8) restart the timer $T_{\text{CheckCamGen}}$.

C.2.5 CAM construction exception

If the CA service could not construct a CAM successfully in step 5) as defined in clause C.2.4, the CA service is expected to omit step 6) to step 8) and is expected to restart the timer $T_{\text{CheckCamGen}}$.

NOTE 1: The failure of the CAM construction may happen, if the CA service was not able to collect all required data for the CAM construction, or the collected data are not compliant to the CAM format as specified in annex A (e.g. the value of a data is out of authorized range of the ASN.1 definition).

NOTE 2: If the CAM construction failure was due to a data provided by other entities via the interface IF.FAC, CA service may provide a failure notification to the corresponding data provision facilities via the IF.FAC.

C.3 Receiving ITS-S operation

C.3.1 Protocol data setting rules

No protocol data need to be set for the receiving ITS-S.

C.3.2 General protocol operation

The ITS-S receiver protocol starts when the CA service receives a CAM and executes the following operations:

1) decode received CAM;
2) make CAM data available by e.g. passing to the ITS application layer or to the LDM;
3) end of operation, wait for the next CAM reception.
C.3.3 Exception handling

C.3.3.1 CAM decoding exception

If the CA service could not decode a CAM successfully in step 1) as defined in clause C.3.2, the CA service omits step 2) and step 3).

NOTE: The failure of the CAM decoding may happen, if the CA service checks that the data included in a received CAM is not compliant to the CAM format as specified in annex A (e.g. the value of a data is out of authorized range of the ASN.1 definition).
Annex D (informative):
Flow chart for CAM generation frequency management

Figures D.1 to D.3 illustrate the CAM frequency management specified in clause 6.1.2.
Figure D.1: Process CAM Generation
Figure D.2: Process Check Dynamics
Figure D.3: Procedure Check

Procedure Check

- If $T_{GenCam\_DCC} < T_{GenCamMin}$ then:
  - $T_{GenCam\_DCC} = T_{GenCamMin}$
  - Proceed to check

- If $T_{GenCam\_DCC} > T_{GenCamMax}$ then:
  - $T_{GenCam\_DCC} = T_{GenCamMax}$
  - Proceed to check

- If $T_{GenCam\_DCC} \geq T_{GenCamMin}$ and $T_{GenCam\_DCC} \leq T_{GenCamMax}$ then:
  - Proceed to check
Annex E (informative):
Extended CAM generation

This annex describes an additional trigger condition for the CAM message generation, which enables ITS applications to increase the CAM generation frequency.

Depending on the requirements of an ITS application it may provide the parameter $T_{\text{GenCam\_App}}$ representing the needed CAM generation interval. $T_{\text{GenCam\_App}}$ should be provided in the unit of milliseconds and with a value range of $T_{\text{GenCam\_Min}} \leq T_{\text{GenCam\_App}} \leq T_{\text{GenCam\_Max}}$. In case an ITS application provides this parameter with a value below $T_{\text{GenCam\_Min}}$, $T_{\text{GenCam\_App}}$ would be set to $T_{\text{GenCam\_Min}}$ and if the value is above $T_{\text{GenCam\_Max}}$ or this parameter is not provided, the $T_{\text{GenCam\_App}}$ would be set to $T_{\text{GenCam\_Max}}$. In case several ITS applications require different values the lowest generation interval would be applied.

In addition to the CAM trigger conditions defined in clause 6.1.2, the following condition would apply:

1) the time since last CAM generation is equal to or greater than $T_{\text{GenCam\_App}}$ and equal to or greater than $T_{\text{GenCam\_Dcc}}$.

In case the requested CAM generation frequency will not be achieved, the CA service should return a failure notification to the requesting application.
