Introduction

The present document defines the Card Application Toolkit (CAT) test conformance for the Terminal.

The aim of the present document is to ensure interoperability between an UICC and a Terminal independently of the respective manufacturer, card issuer or operator.

Application specific tests for applications residing on an UICC are specified in TS 131 124 [9].

1 Scope

The present document describes the technical characteristics and methods of test for testing the Card Application Toolkit implemented in Terminals for the UICC, in compliance with the relevant requirements, and in accordance with the relevant guidance given in ISO/IEC 9646-7 [3] and ETS 300 406 [4].

The present document is valid for Terminal implemented according to ETSI TS Release 4 or Release 5 or Release 6.

The present document covers the minimum characteristics considered necessary in order to provide sufficient performance for Terminal and to prevent interference to other services or to other users.

It does not necessarily include all the characteristics which may be required by a user or subscriber, nor does it necessarily represent the optimum performance achievable.

The present document is part of the ETSI-series of technical specifications. The present document neither replaces any of the other ETSI technical specifications or ETSI related ETSs or ENs, nor is it created to provide full understanding of (or parts of) the NAA. The present document lists the requirements, and provides the methods of test for testing the Card Application Toolkit implemented in a Terminal for conformance to the ETSI standard.

For a full description of the system, reference should be made to all the ETSI technical specifications or ETSI related ETSs or ENs. Clause 2 provides a complete list of the ETSI technical specifications, ETSI related ETSs, ENs, and ETRs, on which this conformance test specifications is based.

If there is a difference between this present conformance document, and any other ETSI technical specification or ETSI related ETS or EN, then the other ETSI technical specification or ETSI related ETS or EN shall prevail.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

Not applicable.

3 Definitions and abbreviations

3.1 Terminal definition and configurations

The terminal definition and configurations specified in the present document shall apply.

3.2 Applicability

3.2.1 Applicability of the present document

The present document applies to a terminal equipment that supports the Card Application Toolkit optional feature according to TS 102 223 [1].

3.2.2 Applicability of the individual tests

Table A.1 lists the optional features for which the supplier of the implementation states the support.

3.2.3 Applicability to terminal equipment

The applicability to terminal equipment specified in table B.1 in clause 3.4 of the present document shall apply, unless otherwise specified.

Terminals, which require a specific NAA to be present on the UICC, shall be tested according to the specific Card Application Toolkit enabled NAA dependent test specification (e.g. TS 131 124 [9] for USIM application, TS 100 607-4 [12] for SIM application). If there is no test specification defined for a specific Card Application Toolkit enabled NAA, terminals may be tested according to the present document. In this case, the simulated UICC shall include the specific NAA application, but the configuration and additional requirements of the specific Card Application Toolkit enabled NAA are out of scope in the present document.

3.2.4 Definitions

Void.

3.2.4.1 Format of the table of optional features

Option

The optional feature supported or not by the implementation.

Support Answer notation

The support columns shall be filled in by the supplier of the implementation. The following common notations, defined in ISO/IEC 9646-7 [3], are used for the support column in the tables below.

Y or y	supported by the implementation
N or n	not supported by the implementation
N/A, n/a or -	no answer required (allowed only if the status is N/A, directly or after evaluation of a conditional status)

Mnemonic column

The Mnemonic column contains mnemonic identifiers for each item.

3.2.4.2 Format of the applicability table

The applicability of every test in table B.1 is formally expressed by the use of Boolean expression defined in the following clause.

The columns in table B.1 have the following meaning:

- In the "Item" column a local entry number for the requirement in the table is given.
- In the "Description" column a short non-exhaustive description of the requirement is found.
- The "Release" column gives the Release applicable and onwards, for the item in the "Description" column.
- The "Test Sequence(s)" column gives a reference to the test sequence number(s) detailed in the present document and required to validate the implementation of the corresponding item in the "Description" column.
- For a given Release, the corresponding "Rel X Terminal" column lists the tests required for a Terminal to be declared compliant to this Release.
- The "Support" column is blank in the proforma, and shall be completed by the manufacturer in respect of each particular requirement to indicate the choices, which have been made in the implementation.
- The "Terminal Profile" column gives a reference to the corresponding bit that needs to be present in the Terminal Profile.

3.2.4.3 Status and notations

The "Release X Terminal" columns show the status of the entries as follows:

The following notations, defined in ISO/IEC 9646-7 [3], are used for the status column:

M	mandatory - the capability is required to be supported.
O	optional - the capability may be supported or not.
N/A	not applicable - in the given context, it is impossible to use the capability.
X	prohibited (excluded) - there is a requirement not to use this capability in the given context.
O.i	qualified optional - for mutually exclusive or selectable options from a set. "i" is an integer which identifies an unique group of related optional items and the logic of their selection which is defined immediately following the table.
Ci	conditional - the requirement on the capability ("M", "O", "X" or "N/A") depends on the support of other optional or conditional items. "i" is an integer identifying an unique conditional status expression which is defined immediately following the table. For nested conditional expressions, the syntax "IF... THEN (IF... THEN... ELSE...) ELSE..." shall be used to avoid ambiguities.

References to items

For each possible item answer (answer in the support column) there exists a unique reference, used, for example, in the conditional expressions. It is defined as the table identifier, followed by a solidus character "/", followed by the item number in the table. If there is more than one support column in a table, the columns shall be discriminated by letters (a, b, etc.), respectively.

EXAMPLE: A.1/4 is the reference to the answer of item 4 in table A.1.

3.3 Table of optional features

Support of Card Application Toolkit is optional for Terminal. However, if a Terminal states conformance with a specific SCP release, it is mandatory for the Terminal to support all functions of that release, as stated in table A.1.

The support of letter classes, which specify mainly Terminal hardware dependent features, is optional for the Terminal and may supplement the Card Application Toolkit functionality described in the present document. If a Terminal states conformance to a letter class, it is mandatory to support all functions within the respective letter class.

The supplier of the implementation shall state the support of possible options in table A.1.

3.5 Conventions for mathematical notations

The conventions for mathematical notations specified below shall apply.

3.5.1 Mathematical signs

The "plus or minus" sign is expressed by "±".

The sign "multiplied by" is expressed by "*".

The sign "divided by" is expressed by "/", or the common division bar.

The sign "greater than or equal to" is expressed by "≥".

The sign "less than or equal to" is expressed by "≤".

4 Test equipment

The test equipment depends on the NAA of the test environment.

5 Testing methodology in general

5.1 Testing of optional functions and procedures

Any function or procedure which is optional, as indicated in the present document, may be subject to a conformance test if it is implemented in the Terminal.

5.2 Test interfaces and facilities

The UICC interface provides the main test interfaces for the purpose of performing conformance tests.

The tests which require a network simulator shall not be carried out in this present document as the tests are intended to be independent of the NAA.

5.3 Information to be provided by the apparatus supplier

The information to be provided by the apparatus supplier specified in this present document shall apply.

In addition, the apparatus supplier shall provide the information with respect to the Supported Option table A.1 and to Terminal's default configuration table A.2.

9 Generic call set up procedures

The generic call set up procedure is not specified in this present document as this procedure is NAA dependent.

10 to 26 Void

27 Testing of the UICC/Terminal interface

This clause is to confirm the correct interpretation of the Card Application Toolkit commands and the correct operation of the Toolkit facilities.

The definitions, declarations and default values specified in this present document shall apply.

A UICC Simulator with the appropriate Card Application Toolkit functionality will be required. The UICC data defined below shall be used for all test cases unless otherwise specified within the test case.

The comprehension required flags in SIMPLE-TLV objects that are included in a TERMINAL RESPONSE or an ENVELOPE shall be set as described in TS 102 223 [1]. This means that in cases where it is up to the Terminal to decide if this flag is used or not, the corresponding Tag coding in the TERMINAL RESPONSEs and ENVELOPEs in the present document represents only one of the two valid possibilities.

27.1 to 27.21 Void

27.22 Card Application Toolkit

27.22.1a General Test purpose

Testing of functional conformance to Card Application Toolkit commands includes proactive UICC commands.

All facilities independent from a specific NAA given by the TERMINAL PROFILE as supported, for which tests exist in the present document, shall be tested.

Many of the proactive UICC commands include an alpha identifier data object. This is intended to be a short one or two word identifier for the Terminal to optionally display on the screen along with any other indications, at the same time as the Terminal performs the UICC command.

NOTE: The sequence of Card Application Toolkit commands are specific to the Toolkit Application being executed within the UICC, hence sequential testing of commands is not possible. The testing will therefore have to be performed on a command by command basis.

27.22.1b Definition of default values for Card Application Toolkit testing

A UICC containing the following default values is used for all tests of this clause unless otherwise stated.

For each item, the logical default values and the coding within the Elementary Files (EF) of the UICC as follows:

NOTE 1: Bx represents byte x of the coding.

NOTE 2: Unless otherwise defined, the coding values in binary.

See table E.1 in annex B.

27.22.2.2 Conformance requirement

The Terminal shall support the PROFILE DOWNLOAD command as defined in:

- TS 102 223 [1], clause 5.2.

27.22.2.3 Test purpose

1) Verify that the TERMINAL PROFILE indicates that Profile Download facility is supported.

2) Record which Card Application Toolkit facilities are supported by the Terminal, to determine which subsequent tests are required.

27.22.2.4 Method of test

27.22.2.4.1 Initial conditions

The Terminal is connected to the UICC Simulator. All elementary files are coded as the default Card Application Toolkit personalization.

27.22.2.4.2 Procedure

a) The Terminal is powered on.

b) After the Terminal sends the TERMINAL PROFILE command to the UICC Simulator, the UICC Simulator shall record the content of the TERMINAL PROFILE.

c) The UICC Simulator shall return SW1 / SW2 of '90 00'.

d) The contents of the TERMINAL PROFILE is recorded and compared to the corresponding table E.1 "status" column.

The test is terminated upon the Terminal sending the TERMINAL PROFILE command to the UICC Simulator.

27.22.2.5 Test requirement

1) After step a) the Terminal shall send the TERMINAL PROFILE command to the UICC Simulator with bit 1 of the first byte set to 1 (facility supported by Terminal).

2) In table E.1 for the corresponding Terminal Card Toolkit Release and Options, The TERMINAL PROFILE information "support" recorded must be in accordance with the "Status" column. Support of features defined only in releases later than present release shall be ignored.

27.22.3.1 Definition and applicability

See clause 3.2.2.

27.22.3.2 Conformance requirement

On detection of a pending Card Application Toolkit command from the UICC the Terminal shall perform the FETCH command to retrieve the proactive UICC command. The result of the executed command shall be transmitted from the Terminal to the UICC within a TERMINAL RESPONSE command.

The MORE TIME proactive command is used in this test. The Terminal shall have knowledge of this command, but may not support this Card Application Toolkit facility.

- TS 102 223 [1], clause 6.3.

27.22.3.3 Test purpose

To verify that the Terminal uses the FETCH command to obtain the proactive UICC command, after detection of a pending proactive UICC command. The pending proactive UICC command is indicated by the response parameters '91 xx' from the UICC.

To verify that the Terminal transmits the result of execution of the proactive UICC command to the UICC in the TERMINAL RESPONSE command.

27.22.3.4 Method of test

27.22.3.4.1 Initial conditions

The Terminal is connected to the UICC Simulator.

The elementary files are coded as the Card Application Toolkit default.

The UICC Simulator is configured to indicate that a proactive UICC command is pending.

The UICC Simulator is configured to monitor the UICC - Terminal interface.

27.22.3.4.2 Procedure

a) The Terminal is powered on.

b) After the Terminal has performed the PROFILE DOWNLOAD procedure, the UICC Simulator indicates that a Proactive UICC Command is pending with SW1 / SW2 of '91 0B'.

To verify that the Terminal sends an APDU command to the additional card identified in the PERFORM CARD APDU proactive UICC command, and successfully returns the result of the execution of the command in the TERMINAL RESPONSE command send to the UICC.

The Terminal-Manufacturer can assign the card reader identifier from 0 to 7.

This test applies for Terminals with only one additional card reader.

In this particular case the card reader identifier 1 is chosen.

In this particular case a special Test-SIM (TestSIM) with T=0 protocol is chosen as additional card for the additional Terminal card reader (for coding of the TestSIM see annex A).

27.22.4.17.1.4 Method of test

27.22.4.17.1.4.1 Initial conditions

The Terminal is connected to the UICC Simulator.

The TestSIM is inserted in the additional Terminal card reader.

Prior to this test the Terminal shall have been powered on and performed the PROFILE DOWNLOAD procedure.

If the Terminal supports a detachable card reader, the card reader shall be attached to the Terminal.

The elementary files of the TestSIM are coded as defined in annex A. Another card with different parameters may be used as TestSIM to execute these tests. In this case the UICC Simulator shall take into account the corresponding response data.

27.22.4.21.1.5 Test requirement

The Terminal shall operate in the manner defined in expected sequences 1.1 to 1.6.

27.22.4.21.2 ENVELOPE TIMER EXPIRATION (normal)

27.22.4.21.2.1 Definition and applicability

See clause 3.2.2.

27.22.4.21.2.2 Conformance requirement

The Terminal shall support the ENVELOPE (TIMER EXPIRATION) command as defined in the following technical specifications:

- TS 102 223 [1], clauses 4.10, 7.4.1 and 7.4.2.
- The Terminal shall support the TIMER MANAGEMENT as defined in the following technical specifications:
- TS 102 223 [1], clauses 5.2, 6.4.21, 6.8, 8.6, 8.7, 8.37 and 8.38.

27.22.4.21.2.3 Test purpose

To verify that the Terminal shall pass the identifier of the timer that has expired and its value using the ENVELOPE (TIMER EXPIRATION) command, when a timer previously started in a TIMER MANAGEMENT proactive command expires.

27.22.4.21.2.4 Method of test

27.22.4.21.2.4.1 Initial conditions

The Terminal is connected to the UICC Simulator.

The elementary files are coded as Card Application Toolkit default with the following exceptions.

Prior to this test the Terminal shall have been powered on and performed the PROFILE DOWNLOAD procedure.

The timer 1 is not started.

When the UICC is busy when the envelope TIMER EXPIRATION is sent, either the Terminal retries periodically to send the envelope, either it waits for a TERMINAL RESPONSE processed by the UICC with status '90 00'.

If the Terminal waits for a TR with status '90 00', the Terminal manufacturer shall specify how many TERMINAL RESPONSES with status '90 00' are expected before sending the TIMER EXPIRATION envelope.

27.22.4.22.1.5 Test requirement

The Terminal shall operate in the manner defined in expected sequences 1.1 to 1.7.

27.22.4.22.2 SET UP IDLE MODE TEXT (Icon support)

27.22.4.22.2.1 Definition and applicability

See clause 3.2.2.

27.22.4.22.2.2 Conformance requirement

27.22.4.22.2.3 Test purpose

To verify that the Terminal text and / or icon passed to the Terminal is displayed by the Terminal as an idle mode text.

To verify that the icon identifier provided with the text string can replace the text string or accompany it.

To verify that if both an alpha identifier or text string, and an icon are provided with a proactive command, and both are requested to be displayed, but the Terminal is not able to display both together on the screen, then the alpha identifier or text string takes precedence over the icon.

To verify that if the UICC provides an icon identifier with a proactive command, then the Terminal shall inform the UICC if the icon could not be displayed by sending the general result "Command performed successfully, but requested icon could not be displayed".

To verify that if the Terminal receives an icon identifier with a proactive command and either an empty, or no alpha identifier / text string is given by the UICC, than the Terminal shall reject the command with general result "Command data not understood by Terminal".

27.22.4.22.2.4 Method of test

27.22.4.22.2.4.1 Initial conditions

The Terminal is connected to both the UICC Simulator.

The elementary files are coded as Card Application Toolkit default.

Prior to this test the Terminal shall have been powered on and performed the PROFILE DOWNLOAD procedure.

NOTE: The Terminal Response contains as many channel status TLVs as channels are supported by the ME. The channel status TLV coding of the opened channel states "TCP in LISTEN state". Each other channel status TLV coding indicates the corresponding channel identifier and states "TCP in CLOSED state". As an example, if the mobile supports two channels and channel 1 is opened then the corresponding channel status data objects coding would be : 'B8 02 41 00 B8 02 02 00'.
