Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks. DECT™, PLUGTESTS™, UMTS™ and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. 3GPP™ and LTE™ are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. oneM2M™ is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. GSM® and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Intelligent Transport Systems (ITS).

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

Introduction

Security policies require that data structures such as messages used in Intelligent Transport Systems are secured when stored or transferred. For interoperability reasons, a common format for secure data structures featuring security headers and public key certificates needs to be provided.

The present document provides these definitions as a profile of the base standard IEEE Std 1609.2™-2016 [1] and its amendments IEEE 1609.2a™-2017 and IEEE Std 1609.2b™-2019. A profile makes use of the definitions in the base standard and defines the use of particular subsets or options available in the base standard. This implies that the present document is to be read and interpreted together with that base standard.

From time to time, new versions of the present document may be published that extend IEEE Std 1609.2™ [1] data types using ASN.1 extension mechanisms to define ETSI originated extensions that are not necessarily endorsed by IEEE.
The present document contains material from IEEE Std 1609.2™-2016 [1] and its amendment(s), reprinted with permission from IEEE, and Copyright © 2016.
1 Scope

The present document specifies the secure data structure including header and certificate formats for Intelligent Transport Systems. In addition to supporting the use of explicit certificates, the present document includes the amendment for the use of implicit certificates. As such, the present document is backwards compatible for the sender of secure data structures, but implies the additional implementation of implicit certificates on receiver side in order to support interoperability.

NOTE 1: The use of explicit certificates is allowed in previous versions (V1.3.1 and V1.4.1) of the present document.

NOTE 2: The use of implicit certificates is not allowed in previous versions of the present document.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference/.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

[2] ETSI TS 102 965: "Intelligent Transport Systems (ITS); Application Object Identifier (ITS-AID); Registration".

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

[i.1] ETSI TS 102 940: "Intelligent Transport Systems (ITS); Security; ITS communications security architecture and security management".

[i.2] ETSI TS 102 941: "Intelligent Transport Systems (ITS); Security; Trust and Privacy Management".

[i.3] ETSI TS 103 601: "Intelligent Transport Systems (ITS); Security; Security management messages communication requirements and distribution protocols".

4 Basic format elements

4.1 Based on the published version of IEEE Std 1609.2

Data structures in the present document are defined using Abstract Syntax Notation One (ASN.1) and shall be encoded using the Canonical Octet Encoding Rules (COER) as defined in Recommendation ITU-T X.696 [3]. This includes some data structures in the present document for which a "canonical encoding" is used as defined in IEEE Std 1609.2™ [1].

Clauses 5 and 6 specify and describe the data structures with reference to IEEE Std 1609.2™ [1]. The corresponding ASN.1 module is defined in annex A.

The validity of a certificate shall be assessed as defined in IEEE Std 1609.2™ [1] clause 5.1, using the Hash ID-based revocation method for EA and AA certificates, and no revocation method for authorization tickets and enrolment credentials.

NOTE 1: The CRL for EA and AA certificates is defined in ETSI TS 102 941 [i.2].
NOTE 2: The rules for verification of the Root CA certificate against the CTL are defined in ETSI TS 102 941 [i.2].

The validity of signed data shall be assessed as defined in IEEE Std 1609.2™ [1], clause 5.2.

4.2 Extensions

4.2.1 General process

NOTE 1: This clause and the following clause outline approaches for maintaining and extending the present document and do not directly specify functionality to be implemented.

IEEE Std 1609.2™ [1] structures are extensible using ASN.1 extension mechanisms.

For all extensible IEEE Std 1609.2™ [1] data types other than HeaderInfo, extensions will be done by adding new fields after the extension marker in the underlying IEEE Std 1609.2™ [1] data type. To avoid conflicts that might arise if multiple stakeholder groups want to extend the same IEEE Std 1609.2™ [1] data type at the same time, the rapporteur of the present document will need to coordinate with the editor of IEEE Std 1609.2™ [1] and ensure that different extension identifiers are associated with each different extension that is being simultaneously developed.

NOTE 2: In the above paragraph, "extension identifier" refers to the numeric identifier that the ASN.1 encoder automatically associates with an extension field in an ASN.1 structure. The numeric identifier is assigned automatically by the encoder based on the index of the extension field in the list of extension fields in that structure; it is not an identifier that is assigned through a registration process and visible to a human reader of the ASN.1.

4.2.2 HeaderInfo extensions

Background: The HeaderInfo type defined in IEEE Std 1609.2™ [1] has a structure including an ASN.1 "..." extension marker. The fields after the extension marker are the extension fields. The reader is referred to IEEE Std 1609.2™ [1] directly for the current IEEE definition.

In the present document, the type ToBeSignedData shall have the component headerInfo of type HeaderInfo as defined in IEEE Std 1609.2™ [1], clause 6.3.9, with the addition of:

- The component contributedExtensions as specified in clause A.2.2:
  - within the component contributedExtensions, an optional sequence of components of type EtsiOriginatingHeaderInfoExtension as specified in clause A.2.2.

HeaderInfo extensions are included in the component contributedExtensions.

The component contributedExtensions is of type ContributedExtensionBlocks and is a sequence of single extension "blocks" of type ContributedExtensionBlock. Each extension block is defined by an identified contributing organization. The ETSI TC ITS WG5 extension block shall be identified by the integer etsiHeaderInfoContributorId (2). Within the ETSI TC ITS WG5 extension block, each extension shall be of type EtsiOriginatingHeaderInfoExtension. ASN.1 implementing these design principles is specified in clause A.2.2.

The type EtsiOriginatingHeaderInfoExtension is defined in the module EtsiTs103097ExtensionModule specified in clause A.1 and composed of the component id and the component Extn. The component id shall be of type ExtId and shall uniquely identify the extension within the set of EtsiOriginatingHeaderInfoExtensions. The component content shall be associated to the related id according to the information object set EtsiTs103097HeaderInfoExtensions. The ETSI originated extensions shall be defined as information objects of the class Extension and shall be listed in the information object set EtsiTs103097HeaderInfoExtensions.
NOTE: This approach allows ETSI to specify new extensions as necessary, using an identifier that is entirely under ETSI's control (the EtsiTs103097HeaderInfoExtensionId) to identify those extensions and a separate module called EtsiTs103097ExtensionModule that can be updated by ETSI without a need to change the module IEEE1609dot2.

The data type ExtensionModuleVersion in the module EtsiTs103097ExtensionModule shall indicate the version of the module EtsiTs103097ExtensionModule and shall be imported into the EtsiTs103097Module.

ASN.1 implementing these design principles is specified in clause A.1.

5 Specification of secure data structure

5.1 EtsiTs103097Data

A secure data structure shall be of type EtsiTs103097Data as defined in annex A, which corresponds to a Ieee1609Dot2Data as defined in IEEE Std 1609.2™ [1], clause 6.3.2, with the constraints defined in this clause, in clause 5.2 and in clause 5.3.

The type Ieee1609Dot2Data shall support the following options in the component content:

- The option unsecuredData shall be used to encapsulate an unsecured data structure.
- The option signedData, corresponding to the type SignedData as defined in IEEE Std 1609.2™ [1], clause 6.3.4, shall be used to transfer a data structure with a signature.
- The option encryptedData, corresponding to the type EncryptedData as defined in IEEE Std 1609.2™ [1], clause 6.3.30, shall be used to transfer an encrypted data structure.

The following corresponding profiles of the type EtsiTs103097Data are defined in annex A:

- The parameterized type EtsiTs103097Data-Unsecured using the Ieee1609Dot2Data option unsecuredData.
- The parameterized type EtsiTs103097Data-Signed using the Ieee1609Dot2Data option signedData containing the data structure in the component tbsData.payload.data.
- The parameterized type EtsiTs103097Data-SignedExternalPayload using the Ieee1609Dot2Data option signedData containing the digest of the data structure in the component tbsData.payload.extDataHash.
- The parameterized type EtsiTs103097Data-Encrypted, using the Ieee1609Dot2Data option encryptedData containing the encrypted data structure in the component ciphertext.aes128ccm.ccmCiphertext.
- The parameterized type EtsiTs103097Data-SignedAndEncrypted, using the parameterized type EtsiTs103097Data-Encrypted containing an encrypted EtsiTs103097Data-Signed.
- The parameterized type EtsiTs103097Data-Encrypted-Unicast using the parameterized type EtsiTs103097Data-Encrypted further constraint to have one entry in the component recipients.
- The parameterized type EtsiTs103097Data-SignedAndEncrypted-Unicast using the parameterized type EtsiTs103097Data-Encrypted containing an encrypted EtsiTs103097Data-Signed and further constraint to have one entry in the component recipients.
5.2 SignedData

The type SignedData shall have the following constraints:

- The component hashId of SignedData shall indicate the hash algorithm to be used to generate the hash of the message according to IEEE Std 1609.2™ [1], clauses 6.3.5 and 5.3.3.
- The component tbsData of SignedData shall be of type ToBeSignedData as defined in IEEE Std 1609.2™ [1] clause 6.3.6. The type ToBeSignedData shall have the component payload of type SignedDataPayload as defined in IEEE Std 1609.2™ [1], clause 6.3.7, containing either:
  - the component data, containing the payload to be signed as an Ieee1609Dot2Data; or
  - the component extDataHash, containing the hash of data that is not explicitly transported within the structure.

The type ToBeSignedData shall have the component headerInfo of type HeaderInfo as defined in IEEE Std 1609.2™ [1], clause 6.3.9, and constrained to have the following security headers:

- The component psid containing the ITS-AID corresponding to the contained message.
- The component generationTime as defined in IEEE Std 1609.2™ [1], always present.
- The component expiryTime, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- The component generationLocation, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- The component p2pcdLearningRequest always absent.
- The component missingCrlIdentifier always absent.
- The component encryptionKey, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- The component inlineP2pcdRequest, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- The component requestedCertificate, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- The component pduFunctionalType, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of message profiles in clause 7.
- In the component contributedExtensions, any component of type EtsiOriginatingHeaderInfoExtension identified in the Information Object Set EtsiTcItsHeaderInfoExtensions present or absent according to the specification of the particular extension in the document that specifies it:
  - The extension EtsiTs102941CrlRequest, if present, indicates that the ITS-Station is requesting a CRL according to ETSI TS 103 601 [i.3], with format as defined in ETSI TS 102 941 [i.2]. The component issuerId shall indicate the issuer of the CRL and the component lastKnownUpdate, if present, shall indicate the value of the thisUpdate field of the latest CRL that the ITS-Station has available.
  - The extension EtsiTs102941DeltaCtlRequest, if present, indicates that the ITS-Station is requesting a delta CTL according to ETSI TS 103 601 [i.3], with format as defined in ETSI TS 102 941 [i.2], using the data structure EtsiTs102941CtlRequest. The component issuerId shall indicate the issuer of the CTL and the component lastKnownCtlSequence, if present, shall indicate the value of the ctlSequence field of the latest CTL that the ITS-Station has available.
- In the component `contributedExtensions`, any component of type other than `EtsiOriginatingHeaderInfoExtension` always absent.

**NOTE:** The present document does not specify `contributedExtensions` fields of type other than `EtsiOriginatingHeaderInfoExtension` and does not specify what an implementation that processes received secure data structures should do, based on such extensions. Anyhow, compliance to the present document requires an implementation to correctly parse received secure data structures that contain those extensions.

The component `signer` of `SignedData` shall be of type `SignerIdentifier` as defined in IEEE Std 1609.2™ [1], clause 6.3.24 and constrained to one of the following choices:

- `digest`, containing the digest of the signing certificate as defined in IEEE Std 1609.2™ [1], clause 6.3.26.
- `certificate`, constrained to only one entry in the `SequenceOfCertificate` list of type `TS103097Certificate`, containing the signing certificate as defined in clause 6 of the present document.

The component `signature` of `SignedData` shall be of type `Signature` as defined in IEEE Std 1609.2™ [1], clause 6.3.28 and shall contain the ECDSA signature as defined in IEEE Std 1609.2™ [1], clauses 6.3.29, 6.3.29a and 5.3.1.

### 5.3 EncryptedData

The type `EncryptedData` shall have the following constraints:

- The component `recipients` of `EncryptedData` shall be of type `SequenceOfRecipientInfo` as defined in IEEE Std 1609.2™ [1], clause 6.3.31. Every entry shall be either of option `pskRecipInfo` as defined in IEEE Std 1609.2™ [1], clause 6.3.32, of option `certRecipInfo`, or of option `signedDataRecipInfo`, as defined in IEEE Std 1609.2™ [1], clause 6.3.34.

- The encryption scheme used shall be ECIES as defined in IEEE Std 1609.2™ [1], clause 5.3.5. The component `ciphertext` of `EncryptedData` shall be of type `SymmetricCiphertext` as defined in IEEE Std 1609.2™ clause 6.3.37 and contain an `EtsiTs103097Data` encrypted according to IEEE Std 1609.2™ [1], clauses 6.3.38 and 5.3.8.

### 6 Specification of certificate format

A certificate contained in a secure data structure shall be of type `EtsiTs103097Certificate` as defined in annex A, which corresponds to a single `Certificate` as defined in IEEE Std 1609.2™ [1], clause 6.4.2, with the constraints defined in this clause. A certificate contained in a secure data structure shall be either of type explicit as defined in IEEE Std 1609.2™ [1] clause 6.4.6, or of type implicit as defined in IEEE Std 1609.2™, clause 6.4.5, at the discretion of the entity that sends the secure data structure.

**NOTE 1:** This implies that a receiver of secure data structures should be able to validate both types of certificates in order to support interoperability.

The component `toBeSigned` of the type `EtsiTs103097Certificate` shall be of type `ToBeSignedCertificate` as defined in IEEE Std 1609.2™ [1], clause 6.4.8 and constrained as follows:

- The component `id` of type `CertificateId` constrained to choice type `name` or `none`.
- The component `crcaId` set to `000000'H`.
- The component `crlSeries` set to `0'D`.
- The component `validityPeriod` with no further constraints.
- The component `region` of type `GeographicRegion` as defined in IEEE Std 1609.2 [1], present or absent according to the specification of certificate profiles in clause 7.
• The component assuranceLevel of type SubjectAssurance, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of certificate profiles in clause 7.

• The component appPermissions of type SequenceOfPsidSsp as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of certificate profiles in clause 7.

• The component certIssuePermissions of type SequenceOfPsidGroupPermissions, as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of certificate profiles in clause 7.

• At least one of the components appPermissions and certIssuePermissions shall be present.

• The component certRequestPermissions absent.

• The component canRequestRollover absent.

• The component encryptionKey of type PublicKey as defined in IEEE Std 1609.2™ [1], present or absent according to the specification of certificate profiles in clause 7.

• The component verifyKeyIndicator of type VerificationKeyIndicator as defined in IEEE Std 1609.2™ [1], present and constrained to the choice verificationKey if the certificate type is explicit; present and constrained to the choice reconstructionValue if the certificate type is implicit.

NOTE 2: The constraints on cracaId and crlSeries indicate that certificates defined in the present document are not revoked using mechanisms defined in IEEE Std 1609.2™ [1]. Revocation mechanisms are defined in ETSI TS 102 941 [i.2].

The component signature of EtsiTs103097Certificate shall be of type Signature as defined in IEEE Std 1609.2™ [1], clause 6.3.28 and shall contain the signature, calculated by the signer identified in the issuer component, as defined in IEEE Std 1609.2™ [1], clauses 6.3.29, 6.3.29a and 5.3.1.

7 Security profiles

7.1 Profiles for messages

7.1.1 Security profile for CAMs

The secure data structure containing Cooperative Awareness Messages (CAMs) shall be of type EtsiTs103097Data-Signed as defined in clause 5.1 and annex A, containing the CAM as the ToBeSignedDataContent, with the additional constraints defined in clause 5.2 and this clause:

• The component signer of SignedData shall be constrained as follows:

  - As default, the choice digest shall be included.
  - The choice certificate shall be included once, one second after the last inclusion of the choice certificate.
  - If the ITS-S receives a CAM signed by a previously unknown AT, it shall include the choice certificate immediately in its next CAM, instead of including the choice digest. In this case, the timer for the next inclusion of the choice certificate shall be restarted.
  - If an ITS-S receives a CAM that includes a tbsdata.headerInfo component of type inlineP2pcdRequest, then the ITS-S shall evaluate the list of certificate digests included in that component: If the ITS-S finds a certificate digest of the currently used authorization ticket in that list, it shall include the choice certificate immediately in its next CAM, instead of including the choice digest.
The component `tbsdata.headerInfo` of `SignedData` shall be further constrained as follows:

- **psid**: this component shall encode the ITS-AID value for CAMs as assigned in ETSI TS 102 965 [2].

- The component `inlineP2pcdRequest` shall be included and shall contain the digests of certificates currently unknown to the ITS-Station in the following cases:
  - if the ITS-S received a CAM with the component `signer` of `SignedData` set to the choice `digest`, and this digest points to an unknown authorization ticket;
  - if the ITS-S received a message with the component `signer` of `SignedData` set to the choice certificate, and this certificate is signed by an unknown authorization authority certificate, i.e. includes the component `issuer` referencing an unknown certificate.

- **requestedCertificate**: If an ITS-S receives a CAM with the component `tbsdata.headerInfo` including the component `inlineP2pcdRequest`, then the ITS-S shall evaluate the list of digests included in that component: If the ITS-S finds a digest of a valid certification authority certificate, it shall include the component `requestedCertificate` containing the requested certificate immediately in its next CAM:
  - unless before the generation of the next CAM, the ITS-S received another CAM including the component `requestedCertificate` containing the requested certification authority certificate: in this case the request shall be discarded;
  - unless the component `signer` of `SignedData` is of choice certificate according to the rules defined above: in this case the request shall be kept pending and the certificate shall be inserted in the next possible CAM, according to the same conditions.

- Any component of type `EtsiOriginatingHeaderInfoExtension` appearing in `contributedExtensions` may be present, absent, present under specified conditions, or optional. As different types of `EtsiOriginatingHeaderInfoExtension` are specified in future versions of the present document, those future versions will also state whether and under what circumstances those `EtsiOriginatingHeaderInfoExtension` types are included in CAMs.

- All other components of the component `tbsdata.headerInfo` allowed to be present according to clause 5 shall not be used and be absent.

### 7.1.2 Security profile for DENMs

The secure data structure containing Decentralized Environmental Notification Messages (DENMs) shall be of type `EtsiTs103097Data-Signed` as defined in clause 5.1 and annex A, containing the DENM as the `ToBeSignedDataContent`, with the additional constraints defined clause 5.2 and in this clause:

- The component `signer` of `SignedData` shall be of choice certificate.

- The component `tbsdata.headerInfo` of `SignedData` shall be further constrained as follows:
  - **generationLocation**: shall be present.
  - **psid**: this component shall encode the ITS-AID value for DENMs as assigned in ETSI TS 102 965 [2].

- Any component of type `EtsiOriginatingHeaderInfoExtension` appearing in `contributedExtensions` may be present, absent, present under specified conditions, or optional. As different types of `EtsiOriginatingHeaderInfoExtension` are specified in future versions of the present document, those future versions will also state whether and under what circumstances those `EtsiOriginatingHeaderInfoExtension` types are included in DENMs.

- All other components of the component `tbsdata.headerInfo` allowed to be present according to clause 5 shall not be used and be absent.
7.1.3 Generic security profile for other signed messages

The secure data structure containing signed messages other than CAM and DENM shall be of type:

- EtsiTs103097Data-Signed as defined in clause 5.1 and annex A, containing the message as the ToBeSignedDataContent, or of type;
- EtsiTs103097Data-SignedExternalPayload as defined clause 5.1 and in annex A, containing the message digest;

with the additional constraints defined in clause 5.2.

7.1.4 Security profile for encrypted messages

The secure data structure containing encrypted messages shall be of type EtsiTs103097Data-Encrypted as defined in clause 5.1 and annex A, containing the message as the ToBeEncryptedDataContent, with the additional constraints defined in clause 5.3.

7.1.5 Security profile for signed and encrypted messages

The secure data structure containing signed and then encrypted messages shall be of type EtsiTs103097Data-SignedAndEncrypted as defined in clause 5.1 and annex A, containing the message as the ToBeSignedAndEncryptedDataContent. This corresponds to an EtsiTs103097Data of type EtsiTs103097Data-Encrypted, containing an EtsiTs103097Data of type EtsiTs103097Data-Signed, containing the message as the ToBeSignedDataContent.

7.2 Profiles for certificates

7.2.1 Authorization tickets

This clause defines additional aspects of authorization tickets as defined in ETSI TS 102 940 [i.1]. Authorization tickets shall be of type EtsiTs103097Certificate as defined in clause 6, with the following constraints:

- The component issuer shall be of choice sha256AndDigest or sha384AndDigest as defined in IEEE Std 1609.2™ [1], clause 6.4.7.
- The toBeSigned component appPermissions shall be used to indicate message signing permissions, i.e. permissions to sign an EtsiTs103097Data.
- The toBeSigned component CertificateId shall be set to the choice none.
- The toBeSigned component certIssuePermissions shall be absent.

7.2.2 Enrolment credential

This clause defines additional aspects of enrolment credentials (i.e. long-term certificates) as defined in ETSI TS 102 940 [i.1]. Enrolment credentials shall be of type EtsiTs103097Certificate as defined in clause 6, with the following constraints:

- The certificate shall be of type explicit as specified in IEEE Std 1609.2™, clause 6.4.6.
- The component issuer shall be of choice sha256AndDigest or sha384AndDigest as defined in IEEE Std 1609.2™ [1] clause 6.4.7.
- The toBeSigned components appPermissions shall be used to indicate message signing permissions, i.e. permissions to sign a certificate request message contained in an EtsiTs103097Data.

NOTE: An example of certificate request messages is given in ETSI TS 102 941 [i.2].
• The `toBeSigned` component `CertificateId` shall be set to the choice `name` and shall contain a unique name associated to the enrolment credential.

• The `toBeSigned` component `certIssuePermissions` shall be absent.

### 7.2.3 Root CA certificates

This clause defines additional aspects of Root CA certificates as defined in ETSI TS 102 940 [i.1]. Root CA certificates shall be of type `EtsiTs103097Certificate` as defined in clause 6, with the following constraints:

• The certificate shall be of type `explicit` as specified in IEEE Std 1609.2, clause 6.4.6.

• The component `issuer` shall be set to `self`.

• These `toBeSigned` components shall be included in addition to those specified in clause 6:
  - `certIssuePermissions` shall be used to indicate issuing permissions, i.e. permissions to sign subordinate certification authority certificates with certain permissions.
  - `appPermissions` shall be used to indicate permissions to sign:
    - CRLs and contain the ITS-AID for the CRL as assigned in ETSI TS 102 965 [2].
    - CTLs and contain the ITS-AID for the CTL as assigned in ETSI TS 102 965 [2].

The `toBeSigned` component `CertificateId` shall be set to the choice `name` and shall contain a unique name associated to the root certification authority.

Additional requirements to Root CA certificates are defined in CPOC protocol [i.4].

### 7.2.4 Subordinate certification authority certificates

This clause defines additional aspects of subordinate certification authority certificates, i.e. enrolment and authorization authority certificates as defined in ETSI TS 102 940 [i.1]. Subordinate certification authority certificates shall be of type `EtsiTs103097Certificate` as defined in clause 6, with the following constraints:

• The certificate shall be of type `explicit` as specified in IEEE Std 1609.2™, clause 6.4.6.

• The component `issuer` shall be set to `sha256AndDigest` or `sha384AndDigest` as defined in IEEE Std 1609.2™ [1] clause 6.4.7.

• These `toBeSigned` components shall be included in addition to those specified in clause 6:
  - `encryption_key`: this component shall contain a public encryption key for ITS-Stations to encrypt messages to the enrolment / authorization authority.
  - `certIssuePermissions`: this component shall be used to indicate issuing permissions, i.e. permissions to sign an enrolment credential / authorization ticket with certain permissions.
  - `appPermissions`: this component shall be used to indicate message signing permissions, i.e. permissions to sign certificate response messages contained in an `EtsiTs103097Data`.

  **NOTE:** An example of certificate response messages is given in ETSI TS 102 941 [i.2].

The `toBeSigned` component `CertificateId` shall be set to the choice `name` contain a unique name associated to the certification authority, or shall be set to the choice `none`.

Additional requirements to Root CA certificates are defined in CPOC protocol [i.4].
7.2.5 Trust List Manager certificate

This clause defines additional aspects of Trust List Manager certificates. Trust List Manager certificates shall be of type EtsiTs103097Certificate as defined in clause 6, with the following constraints:

- The certificate shall be of type explicit as specified in IEEE Std 1609.2™, clause 6.4.6.
- The component issuer shall be set to self.
- These toBeSigned components shall be included in addition to those specified in clause 6:
  - appPermissions: this component shall contain the ITS-AID for the CTL as assigned in ETSI TS 102 965 [2].
- The toBeSigned component CertificateId shall be set to the choice name and contain the unique name string associated to the TLM.
- These toBeSigned components shall be absent:
  - encryptionKey.
  - certIssuePermissions.

Additional requirements to Root CA certificates are defined in CPOC protocol [i.4].
Annex A (normative):
ASN.1 Modules

A.1 ETSI TS 103 097 ASN.1 Modules

This clause provides the normative ASN.1 modules containing the syntactical definitions of the data types defined in the present document. The ASN.1 modules import data types from the ASN.1 modules defined in IEEE Std 1609.2™ [1].

The EtsiTs103097Module ASN.1 module is identified by the Object Identifier {itu-t(0) identified-organization(4) etsi(0) itsDomain(5) wg5(5) secHeaders(103097) core(1) version2(2)}. The module can be downloaded as a file as indicated in table A.1. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.

Table A.1: ETSI TS 103 097 ASN.1 module information

<table>
<thead>
<tr>
<th>Module name</th>
<th>EtsiTs103097Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>OID</td>
<td>{itu-t(0) identified-organization(4) etsi(0) itsDomain(5) wg5(5) secHeaders(103097) core(1) version3(3)}</td>
</tr>
<tr>
<td>Link</td>
<td><a href="https://forge.etsi.org/rep/ITS/asn1/sec_ts103097/blob/v2.1.1/EtsiTs103097Module.asn">https://forge.etsi.org/rep/ITS/asn1/sec_ts103097/blob/v2.1.1/EtsiTs103097Module.asn</a></td>
</tr>
<tr>
<td>SHA-256 hash</td>
<td>ef6d97bd97a8cfb080f25e9652a7b861dd2cd17e2586ed55729d631b5e909308</td>
</tr>
</tbody>
</table>

The ASN.1 extension module is identified by the Object Identifier {itu-t(0) identified-organization(4) etsi(0) itsDomain(5) wg5(5) secHeaders(103097) extension(2) version1(1)}. The module can be downloaded as a file as indicated in table A.2. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.

Table A.2: ETSI TS 103 097 ASN.1 extension module information

<table>
<thead>
<tr>
<th>Module name</th>
<th>EtsiTs103097ExtensionModule</th>
</tr>
</thead>
<tbody>
<tr>

</table>

A.2 IEEE 1609.2 ASN.1 modules

A.2.1 Actual IEEE 1609.2 ASN.1 modules

This clause provides the relevant ASN.1 modules from IEEE Std 1609.2™ [1] (and its amendments), reprinted with permission from IEEE, Copyright © 2016.

The IEEE 1609.2 schema ASN.1 module is identified by the Object Identifier {iso(1) identified-organization(3) ieee(111) standards-association-numbered-series-standards(2) wave-stds(1609) dot2(2) base(1) schema(1) major-version-2(2)}. The module can be downloaded as a file as indicated in table A.3. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.
The IEEE 1609.2 base types ASN.1 module is identified by the Object Identifier {iso(1) identified-organization(3) ieee(111) standards-association-numbered-series-standards(2) wave-stds(1609) dot2(2) base(1) base-types(2) major-version-2(2)}. The module can be downloaded as a file as indicated in table A.4. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.

### A.2.2 Provisional changes to the actual IEEE 1609.2 ASN.1 modules

This clause provides the relevant ASN.1 modules from IEEE Std 1609.2™ [1] (and its amendments), amended as specified in this clause.

The IEEE 1609.2 schema ASN.1 module is identified by the Object Identifier {iso(1) identified-organization(3) ieee(111) standards-association-numbered-series-standards(2) wave-stds(1609) dot2(2) base(1) schema(1) major-version-2(2) minor-version-3(3)}. The module can be downloaded as a file as indicated in table A.5. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.

<table>
<thead>
<tr>
<th>Module Name</th>
<th>IEEE1609Dot2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OID</td>
<td>{iso(1) identified-organization(3) ieee(111) standards-association-numbered-series-standards(2) wave-stds(1609) dot2(2) base(1) schema(1) major-version-2(2) minor-version-3(3)}</td>
</tr>
<tr>
<td>Link</td>
<td><a href="https://forge.etsi.org/rep/ITS/asn1/IEEE1609Dot2Crl.asn">https://forge.etsi.org/rep/ITS/asn1/IEEE1609Dot2Crl.asn</a></td>
</tr>
<tr>
<td>SHA-256 hash</td>
<td>607b9b85ed804dcdf2484e8e67d2b49a883d9796f418f2519cd3406a3aeabad1</td>
</tr>
</tbody>
</table>

The following modifications to the actual IEEE 1609.2 schema module indicated in table A.3 have been applied:

The module’s Object Identifier is modified as follows:

```
IEEE1609Dot2 {iso(1) identified-organization(3) ieee(111)
standards-association-numbered-series-standards(2) wave-stds(1609)
dot2(2) base(1) schema(1) major-version-2(2) minor-version-3(3)}
```

The IMPORTS statement to import the data type EtsiOriginatingHeaderInfoExtension is modified as follows:

```
EtsiOriginatingHeaderInfoExtension
FROM EtsiTs103097ExtensionModule {itu-t(0) identified-organization(4) etsi(0) itsDomain(5) wg5(5)
secHeaders(103097) extension(2) version1(1)} WITH SUCCESSORS;
```
The type `Ieee1609Dot2Content` is extended as follows:

```plaintext
Ieee1609Dot2Content ::= CHOICE {
    unsecuredData             Opaque,
    signedData                SignedData,
    encryptedData             EncryptedData,
    signedCertificateRequest  Opaque,
    ..., 
    signedX509CertificateRequest  Opaque
}
```

The type `HeaderInfo` is extended and the following structure definitions are added after it:

```plaintext
HeaderInfo ::= SEQUENCE {
    -- add the current elements of HeaderInfo here.
    contributedExtensions ContributedExtensionBlocks OPTIONAL
}

ContributedExtensionBlocks ::= SEQUENCE (SIZE(1..MAX)) OF ContributedExtensionBlock

ContributedExtensionBlock ::= SEQUENCE {
    contributorId       IEEE1609DOT2-HEADERINFO-CONTRIBUTED-EXTENSION.
    extns              SEQUENCE (SIZE(1..MAX)) OF IEEE1609DOT2-HEADERINFO-CONTRIBUTED-EXTENSION.
    &Extn((Ieee1609dot2HeaderInfoContributedExtensions)[@.contributorId])
}

IEEE1609DOT2-HEADERINFO-CONTRIBUTED-EXTENSION ::= CLASS {
    &id    HeaderInfoContributorId UNIQUE,
    &Extn
} WITH SYNTAX {&Extn IDENTIFIED BY &id}
```

Ieee1609dot2HeaderInfoContributedExtensions

The type `HashedData` is extended as follows:

```plaintext
HashedData ::= CHOICE {
    sha256HashedData  OCTET STRING (SIZE(32)),
    ..., 
    sha384HashedData  OCTET STRING (SIZE(48)),
    reserved          OCTET STRING (SIZE(32))
}
```

The type `ToBeSignedCertificate` is extended as follows:

```plaintext
ToBeSignedCertificate ::= SEQUENCE {
    id                      CertificateId,
    cracaId                 HashedId3,
    crlSeries               CrlSeries,
    validityPeriod          ValidityPeriod,
    region                  GeographicRegion OPTIONAL,
    assuranceLevel          SubjectAssurance OPTIONAL,
    appPermissions          SequenceOfPsidSsp OPTIONAL,
    certIssuePermissions    SequenceOfPsidGroupPermissions OPTIONAL,
    certRequestPermissions  SequenceOfPsidGroupPermissions OPTIONAL,
    canRequestRollover      NULL OPTIONAL,
    encryptionKey           PublicEncryptionKey OPTIONAL,
    verifyKeyIndicator      VerificationKeyIndicator,
    ..., 
    flags                   BIT STRING {cubk (0)} (SIZE (8)) OPTIONAL
}
```

NOTE: It is expected that the changes listed in this clause will be adopted in the next version of IEEE Std 1609.2™ [1].
The IEEE 1609.2 base types ASN.1 module is identified by the Object Identifier \{iso(1) identified-organization(3) ieee(111) standards-association-numbered-series-standards(2) wave-stds(1609) dot2(2) base(1) base-types(2) major-version-2(2) minor-version-3(3)\}. The module can be downloaded as a file as indicated in table A.6. The associated SHA-256 cryptographic hash digest of the referenced file offers a means to verify the integrity of that file.
