Intellectual Property Rights

**Essential patents**

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

**Trademarks**

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

**DECT™, PLUGTESTS™, UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™ and LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

**Foreword**

This Technical Specification (TS) has been produced by Joint Technical Committee (JTC) Broadcast of the European Broadcasting Union (EBU), Comité Européen de Normalisation ELECtrotechnique (CENELEC) and the European Telecommunications Standards Institute (ETSI).

The present document had initially been prepared by DASH-IF (http://dashif.org) and was sent to ETSI under the PAS agreement.

Comments on the present document may be provided at https://github.com/Dash-Industry-Forum/Watermarking/issues.

**NOTE:** The EBU/ETSI JTC Broadcast was established in 1990 to co-ordinate the drafting of standards in the specific field of broadcasting and related fields. Since 1995 the JTC Broadcast became a tripartite body by including in the Memorandum of Understanding also CENELEC, which is responsible for the standardization of radio and television receivers. The EBU is a professional association of broadcasting organizations whose work includes the co-ordination of its members’ activities in the technical, legal, programme-making and programme-exchange domains. The EBU has active members in about 60 countries in the European broadcasting area; its headquarters is in Geneva.

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

Executive summary

The present document describes proposed architecture and API for supporting forensic watermarking for Over The Top (OTT) on content that is delivered in an Adaptive Bit Rate (ABR) format. To the possible extend, the proposed solutions do not make assumptions on the ABR technology that is being used, it can be for example, DASH or HLS.

While digital watermarking can be used for different use cases, the present document focuses on forensic use cases. In this context, it is used to define the origin of content leakage. the watermarking technology modifies media content in a robust and invisible way in order to encode a unique identifier, e.g. a unique session ID. The embedded watermark provides means to identify where the media content, that has been redistributed without authorization, is coming from. In other words, the watermark is used to forensically trace the origin of content leakage.
1 Scope

The present document specifies DASH-IF Forensic A/B Watermarking.

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the following terms apply:

client-driven watermarking: action of watermarking content when the user device is performing some actions allowing it to make unique requests for content

NOTE: The user device embeds a watermarking agent that is integrated with the application.

client-side watermarking: action of watermarking when the user device is the sole responsible for doing the actual watermarking of content

NOTE: The user device embeds a watermarking agent that is integrated with the audio-visual rendering engine.

server-driven watermarking: action of watermarking content when the user device is not performing any other operation than conveying information such as tokens, between servers that are responsible for doing the actual watermarking of content that is delivered to the user device

sequencing: action of returning a Variant of a segment when it is requested, based on a watermark token

NOTE: Typically, this action is performed on a CDN edge server and is thus referred to as "edge sequencing".

variant: alternative representation of a given segment of a multimedia asset

NOTE: Typically, a Variant is a pre-watermarked version of the segment.

WaterMark (WM) pattern: series of A/B decisions for every segment that is unique per user device

3.2 Symbols

Void.

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

ABR Adaptive Bit Rate
AES Advanced Encryption Standard
AF Adaptation Field
API Application Programming Interface
AVC Advanced Video Codec
CBOR Concise Binary Object Representation
CDDL Concise Data Definition Language
CDN Content Delivery Network
CMAF Common Media Application Format
COSE CBOR Object Signing and Encryption
CPU Central Processing Unit
CWT CBOR Web Token
DAI Dynamic Ad Insertion
DASH Dynamic Adaptive Streaming over HTTP
DRM Digital Rights Management
The objective of forensic watermarking is to deliver a unique version of a media asset to the different users consuming the asset. This is somewhat in opposition with media delivery mechanisms that aim at delivering the same asset to all users for efficiency purposes. As a result, in the broadcast era, a typical approach was to perform the watermarking operation at the very last step of the media delivery pipeline, within the end user device e.g. a set-top box. This solution has the virtue of leaving the whole media delivery pipeline unaltered but raises security and interoperability challenges when a large variety of devices owned and operated by the end user shall be supported. This is for instance the case with Over The Top (OTT) media delivery where content is consumed on mobile phones, tablets, laptops, connected TVs, etc. As a result, new forensic watermarking solutions have gained momentum that do not perform security-sensitive and complex operations in the end user realm. While such approaches require minimal changes in the end-user devices, they do mandate the media delivery pipeline to be modified accordingly.

A notable example of such network-side watermarking solutions is OTT watermarking using Variants for Adaptive Bit Rate (ABR) content. In this case, the content is delivered by segments. The baseline idea is then to generate pre-watermarked Variants of each segment and to modify the delivery protocol so that each end user receives a unique sequence of Variants depending on a watermark pattern that has been assigned to the end user. The semantic of this pattern is context dependent and can be, for instance, a device identifier, an account identifier, a session identifier, etc. Figure 1 illustrates a particular case of this strategy, coined as A/B watermarking, where there are two Variants generated for each segment, each Variant containing a watermark that either encodes the information '0' or '1'. As a result, the watermarking system will require the transmission of a sequence of Variants as long as the length of the pattern to successfully recover the whole unique identifier.
Figure 1: A/B watermarking concept with (a) ABR content delivery and (b) A/B Variants delivery

When using Variants, the serialization process essentially boils down to delivering a unique sequence of Variants to each individual end user. There are two main families of methods to achieve this:

1) Server-driven methods, wherein the client does perform no operation related to watermarking. It simply fetches and forwards a token to the CDN that is responsible for delivering a unique sequence of Variants.

2) Client-driven methods, wherein the client is responsible for the serialization operation. For instance, it relies on some session-based digital object to tamper the URI ABR segments and thereby directly query a unique sequence of Variants from the CDN.

The present document is describing the server-driven methods. Client-driven methods are not part of the present document.

5 Server-Driven Architecture and Workflows

5.1 Introduction

In the server-driven architecture, the device is unaware that content it consumes is watermarked. The device only exchanges a token with servers allowing these servers, usually CDN edges, to make the decision on which A or B Variant it delivers to the device. In the present document, an end-to-end system is presented. It includes the definition of watermarking metadata that limits the need for naming conventions by allowing the encoder to send this metadata all the way to the edge through origins to enable the sequencing of bits. The following goes through the functional architecture and describes the workflows when preparing content and when consuming content.

In the following, it is assumed that the edge is a CDN edge. There are optional architectures, but this does impact the overall functional architecture and workflows. It is also assumed that multi-track content (audio and video multiplexed in one segment) is out of the scope of the present document. In addition, all the workflows are only examples of possible implementations.

5.2 Functional Architecture

Figure 2 shows the simplified high-level functional architecture and the different interaction between the components that are involved in the flows when a device consumes watermarked content. Note that this also shows that content is encrypted, as watermarking will likely be added for premium content that is also encrypted and protected by a DRM system.
Figure 2: Functional architecture

To consume content, a device needs, at minimum, to have an authorization token (for getting a DRM license) and a WM token that contains a WM pattern, a series of A or B decisions. The device is responsible for obtaining the required data before requesting segments to the CDN.

5.3 System Configuration

Enabling or disabling the edge sequencing logic is set through the configuration to the edge. As an example, this can be useful for a service of live sporting events where only premium events require watermarking enforcement. Other moments of the day do not require it. In this case, content is still watermarked but the edge is only configured to sequence during the limited period of time of the premium event. When sequencing is disabled, the edge shall consume segments on the endpoint for Variant A. If this endpoint is not working properly, the origin shall deliver any available Variant on this endpoint.

NOTE 1: When enabling watermarking, all devices that do not have a WM token will receive an error when requesting content, hence they are then forced to request such token.

NOTE 2: As an example, enabling and disabling sequencing can be done with an API enable (true/false).

Watermarked objects names shall include a pattern that the CDN can match to differentiate these objects from non-watermarked objects (initialization segments, subtitles, trickplay images). As an example, for a DASH manifest located at https://edge.hostname/path/to/endpoint/index.mpd that references video segments as:

```
<SegmentTemplate timescale="60000" media="video_segment_$RepresentationID$_$Time$.mp4"
initialization="video_init_$RepresentationID$.mp4" startNumber="10967120"
presentationTimeOffset="903486496960">
```

The pattern for the differentiation of these objects from non-watermarked objects is `video_segment_`.

One of the following identification schemes, referred as `variantId` in the present document, shall be used for the identification of the Variants:

- A lower-case letter beginning with 'a'. Variants are then 'a', 'b' and so on.
- A number beginning with 0. Variants are then 0, 1 and so on.

When addressing content, `variantId` shall be translated into `variantPath` as follows:

- `variantPath = ${variantId}` followed by '/' with the exception, that if `${variantId}` is 'a' or '0' then `${variantPath}` may be empty.
5.4 WM Token

A WM token provides a WM pattern which is unique (for example per streaming session or per user). This pattern allows the sequencing of A/B Variants.

Two tokenization schemes are defined in the present document. The first, named direct, embeds the WM pattern in the token and can be opened and interpreted by an edge irrespective of the underlying WM technology and provider. The second, named indirect, requires integration of a WM technology provider’s edge sequencing software at the edge.

The following are requirements on the WM token:

- The token shall be a CWT token, the basic structural requirements are defined in IETF RFC 8392 [6].
- The token shall be with integer keys in “deterministically encoded CBOR” as specified in IETF RFC 8949 [4], clause 4.2.
- Recipients shall process claims listed in IETF RFC 8392 [6], clause 3.1 when they are present. exp and iat shall be present.
- The token shall include either a WM pattern (direct mode) or data for deriving the WM pattern (indirect mode). Absence of a wmpattern claim implies that the token is in indirect mode.
- Recipients shall support direct mode and may support indirect mode.
- The token shall be signed as described in clause 7 of IETF RFC 8392 [6]. Recipients shall support the HMAC 256/256 (kty number 5) and ES256 (kty number -7) algorithms.
- The token shall be base64url-encoded as described in clause 5 of IETF RFC 4648 [7].

The following claims are defined and Table 1 provides the integer claim keys:

```plaintext
wmtoken = {
    wmver-label ^ => wmver-value,
    wmvnd-label ^ => wmvnd-value,
    wmpatlen-label ^ => wmpatlen-value,
    ? wmsegduration-label ^ => wmsegduration-value,
    wmtoken-direct // wmtoken-indirect,
    * wmext-label => any
}

wmver-value = uint .size 1
wmvnd-value = uint .size 1
wmpatlen-value = uint .size 2
wmsegduration-value = [(wmtimeticks : uint, wmtimescale : uint)]
wmext-label = int

; direct mode
wmtoken-direct = {
    wmpattern-label ^ => wmpattern-value
}

wmpattern-value = COSE_Encrypt0 // COSE_Encrypt // bytes

; indirect mode
wmtoken-indirect = {
    wmid-label ^ => wmid-value
    wmopid-label ^ => wmopid-value
    wmkeyver-label ^ => wmkeyver-value
}

wmid-value = text
wmopid-value = uint
wmkeyver-value = uint
```
Table 1: Integer Claim key values for the WM token

<table>
<thead>
<tr>
<th>Claim label</th>
<th>Integer key</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmver-label</td>
<td>300</td>
</tr>
<tr>
<td>wmvnd-label</td>
<td>301</td>
</tr>
<tr>
<td>wmpatlen-label</td>
<td>302</td>
</tr>
<tr>
<td>wmsegduration-label</td>
<td>303</td>
</tr>
<tr>
<td>wmpattern-label</td>
<td>304</td>
</tr>
<tr>
<td>wmid-label</td>
<td>305</td>
</tr>
<tr>
<td>wmopid-label</td>
<td>306</td>
</tr>
<tr>
<td>wmkeyver-label</td>
<td>307</td>
</tr>
</tbody>
</table>

wmver
The version of the WM Token. Recipients shall support this claim. The present document describes version 1.

wmvnd
The WM technology vendor. Recipients shall support this claim. This provides the context for the key material needed for signature verification. In the direct mode, it also provides the context for the key material needed for decrypting wmpattern if needed. In the indirect mode, it identifies the vendor specific core to use. A list of WM technology vendor identifiers is available at [10].

wmpatlen
The length in bits of the WM pattern. Recipients shall support this claim.

wmpattern
The WM pattern. Recipients shall support this claim in direct mode. It is recommended to encrypt the pattern. Recipients shall support ECDH-SS+A128KW (key type -32) as defined in IETF RFC 9053 [11].

wmsegduration
The nominal duration of a segment. This claim is optional. Recipients may support this claim. When WMPaceInfo data is not available, this may allow the edge to define the index to be considered in the WM pattern. If WMPaceInfo is available, this claim shall be ignored. The array contains exactly 2 values. The first value is a duration in time ticks where its base unit is defined by the second value. The second value is the scale in number of time ticks per second. As an example, [60'000, 10'000] means that the segments are 60'000 ticks long while the scale is 10'000 ticks per second, wmsegduration is then equal to 6 seconds.

wmid
Used as input to derive the WM pattern for indirect mode. Recipients shall support this claim in indirect mode. The derivation algorithm is not defined in the present document and is vendor specific.

wmopid
Used as additional input to derive the WM pattern for indirect mode. Recipients shall support this claim in indirect mode.

wmkeyver
The key to use for derivation of the WM pattern in indirect mode. Recipients shall support this claim in indirect mode.

Once the WM pattern is obtained from the token (either directly, decrypted or calculated), the CDN edge shall enforce big-endian convention to address a single bit in it when using the value of position (defined in clause 5.5.2).

The following is an example with a WM pattern equal to 0x0A0B0C0D.

<table>
<thead>
<tr>
<th>Byte</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>bit offset</td>
<td>01234567</td>
<td>01234567</td>
<td>01234567</td>
<td>01234567</td>
</tr>
<tr>
<td>binary</td>
<td>00001010</td>
<td>00001011</td>
<td>00001100</td>
<td>00001101</td>
</tr>
<tr>
<td>hex</td>
<td>0A</td>
<td>0B</td>
<td>0C</td>
<td>0D</td>
</tr>
</tbody>
</table>

For a value of position equal to 3, the bit to consider is highlighted in green (equal to 0). This is not any other bit, especially, those highlighted in red.
For the indirect mode, there is a vendor specific core (identified by wmvnd). It is recommended that, performance-wise and software-stack-wise, it is comparable with the direct case. In other words, the vendors specific core should be based on the crypto operations which are used in the direct mode, and its performance should be equivalent. For example, the direct mode relies on one decryption operation when wmpattern is encrypted, the vendor specific core should be consisting of the similar operations to preserve the quantity of operations comparable between these two modes.

5.5  WMPaceInfo

5.5.1  Introduction

When a device requests a segment, the edge sequencing logic needs to know which bit in the unique WM pattern to consider for retrieving either A or B Variant of the requested segment before delivering it to the device. WMPaceInfo contains this mapping in addition to some data needed for content preparation. It is transmitted from the encoder (that is combined with the watermarking pre-processor) to the following servers that may need it (packager, origin, or edge).

5.5.2  WMPaceInfo Data

WMPaceInfo is as shown in Table 2.

<table>
<thead>
<tr>
<th>Attribute</th>

<td>Egress packaging</td>
</tr>
</tbody>
</table>

Where

- variant gives the Variant identification, 0, 1 and so on. This information can be useful up to the edge for verifying that the right Variant has been obtained.

- position is the index in the WM pattern to consider for this segment. Positions are zero-based. When it is equal to -1, the corresponding segment is not watermarked. For example, position=33 indicates that this segment refers to position 34 of the WM pattern.

- firstpart informs whether this segment is the first one with this position value. It is equal to true if this is the case, otherwise it is equal to false. See clause 5.6.2 for further details.

- lastpart informs whether this segment is the last one with this position value. It is equal to true if this is the case, otherwise it is equal to false. See clause 5.6.2 for further details.

5.5.3  Conveying WMPaceInfo

5.5.3.1  Introduction

WMPaceInfo is delivered from the encoder to other servers. There is no unique mechanism for this. The present document does not recommend one preferred option applicable for all protocols, Table 3 only presents some possible options for conveying WMPaceInfo with a preferred option for some protocols (in bold in the table). The following goes through these different options.
Table 3: Possible options for conveying WMPaceInfo information

<table>
<thead>
<tr>

</tr>
<tr>
<td>File access protocol</td>
<td>ISO BMFF box, SEI, <strong>sidecar file</strong></td>
</tr>
</tbody>
</table>

5.5.3.2 Sidecar File

When segments (discrete files or byteranges) are delivered with a file transfer protocol, it may be convenient to have WMPaceInfo data in a sidecar file. For efficiency, the WMPaceInfo data is not copied directly as some would be included multiple times.

The sidecar file is of the following format (using CDDL representation in IETF RFC 8610 [5]), following recommendation of clause 5 of IETF RFC 8949 [4] and shall be encoded using deterministically encoded CBOR as specified in IETF RFC 8949 [4], clause 4.2 with integer keys.

```cddl
;---------------------------------------+
; Maps Integer Keys
version   = 1
segments  = 2
fileSize  = 3
startRange = 4
segmentRegex = 5
position  = 6
firstpart = 7
lastpart  = 8
;---------------------------------------+

discrete-segment = {
  ?segmentRegex : text,
  position :      int .size 2 .ge -1,
  ?firstpart :    bool,
  ?lastpart :     bool
}
byterange-segment = {
  startRange : uint .size 8,
  position :   int .size 2 .ge -1
}
sidecar-discrete = {
  version :  uint .size 1,
  segments : [ + discrete-segment ]
}
sidecar-byterange = {
  version :  uint .size 1,
  fileSize : uint .size 8,
  segments : [ + byterange-segment ]
}

sidecar = (sidecar-byterange // sidecar-discrete)
```

When segments are discrete files:
- **sidecar** shall contain only **sidecar-discrete** elements.
- **version** is set to 1 for sidecar files compliant to the present document.
- **segmentRegex** is a POSIX extended regular expression as described in clause 9 of [9]. It allows to define the filename of the segments for which the data applies. **segmentRegex** is optional.
- **position**, **firstpart** and **lastpart** are defined in clause 5.5.2. **firstpart** and **lastpart** are optional.
NOTE 1: Using regular expressions and file naming conventions allows reducing the number of required side car files. The same side car file could be used for all renditions for example. This allows the origin to reduce the number of sidecar files, but the edge will always receive several copies of the same data as caching is done on the exact filename. It is recommended to balance the advantages and disadvantages of regular expressions, because of its Central Processing Unit (CPU) load on the origin.

The following is an example for a set of segments where the filenames satisfy the segmentRegex expression. In this example, the filenames are in the form of video_segment_[repID]_123.mp4, video_segment_[repID]_124.mp4 and so on, allowing to have one sidecar file for all Representations (for DASH).

```
sidecar {
  /version/ 1,
  /segments/ [{/segmentRegex/ "video_segment_.+?_123.mp4", /position/ 21},
               {/segmentRegex/ "video_segment_.+?_124.mp4", /position/ 22}]
}
```

When segments are byteranges:

- sidecar shall contain only sidecar-byterange elements.
- version is set to 1 for sidecar files compliant to the present document.
- fileSize is the size of the track in bytes.
- startRange defines the position of the first byte in the byterange. This expressed as a byte offset from the beginning of the track sidecar-byterange elements in the array shall be ordered in increasing startRange values.
- position is defined in clause 5.5.2.

NOTE 2: The first byterange of a track contains the initialization segment. When segments are delivered with byteranges, it is not possible to differentiate the request for this part of the file from a request for a media segment when using a pattern as described in clause 5.3. The initialization segment is not watermarked, therefore position equal -1 for this segment.

The following is an example of a file with an initialization segment part of the byterange from 0 to 1117 and two segments.

```
Sidecar {
  /version/ 1,
  /fileSize/ 262445216,
  /segments/ [{/startRange/ 0, /position/ -1},
               {/startRange/ 1118, /position/ 0},
               {/startRange/ 1701212, /position/ 1},
               ...{/startRange/ 261083393, /position/ 118},
               {/startRange/ 262073936, /position/ 119}]
}
```

5.5.3.3 HTTP Header

When content is pushed, in the request header, under the WMPaceInfoIngest HTTP header field, the following JSON object is added:

```
WMPaceInfoIngest : { 
  "version": version,
  "variant": variant,
  "position": position,
  "firstpart": firstpart,
  "lastpart": lastpart
}
```

Where

- version is set to 1 for WMPaceInfoIngest compliant to the present document.
- variant, position, firstpart and lastpart are defined in clause 5.5.2.

When content is pulled, in the response header, under the WMPaceInfoEgress HTTP header field, the following CBOR object, base64url-encoded as described in clause 5 of IETF RFC 4648 [7], is added:

WMPaceInfoEgress : <sidecar-discrete>

Where

- sidecar-discrete is defined in clause 5.5.3.2 and contains exactly one discrete-segment object with data for that segment.

Below is an example of the JSON element added in a WMPaceInfoIngest header field where the payload of the HTTP request contains the full segment of Variant A.

```json
{
    "version": 1,
    "variant": 0,
    "position": 33,
    "firstpart": true,
    "lastpart": true
}
```

5.5.3.4 ISOBMFF Box

The format of WMPaceInfo class shall be:

```c
class WMPaceInfo {
    unsigned int(8)  version;
    unsigned int(8)  variant;
    unsigned int(1)  emulation_1;
    unsigned int(15) position;
    unsigned int(1)  emulation_2;
    unsigned int(1)  firstpart;
    unsigned int(1)  lastpart;
    unsigned int(5)  reserved;
}
```

Where

- version is set to 1 for WMPaceInfo compliant to the present document.
- variant, position, firstpart and lastpart are defined in clause 5.5.2.
- emulation_1 and emulation_2 are set to 1.

Within an ISOBMFF file, the WMPaceInfo class shall be carried in the following box:

- Box Type: 'wmpi'
- Container: Top level box
- Mandatory: No
- Quantity: Zero or one

```c
aligned(8) class WMPaceInfoBox extends Box('wmpi')
{
    WMPaceInfo();
}
```

This box should be inserted only at the beginning of a segment, after the styp box and before the moof box, in order to facilitate content manipulation when padding it (see clause 5.7.5.1).
5.5.3.5 SEI Message

SEI messages are inserted in the stream with a specific syntax depending on the codec. [8] provides the syntax for AVC, HEVC and AV1 video codecs in Annex B. In these messages:

- The UUID shall be equal to 0xbec4f824-170d-47cf-a826-ce008083e355.
- The watermarking metadata is the WMPaceInfo data with the format defined for the class WMPaceInfo() in clause 5.5.3.4.

This message should be inserted for the first frame of a segment to facilitate content manipulation when padding it (see clause 5.7.5.1).

5.5.3.6 TS Adaptation Field

Following clause U of [2], the format of the private adaptation field descriptor carrying the WMPaceInfo data is defined in Table 4.

<p>| Syntax |
|---|---|---|
| temi_WMPaceInfo_descriptor { |
| af_descr_tag |
| af_descr_length |
| WMPaceInfo() |
| } |</p>
<table>
<thead>
<tr>
<th>No. of bits</th>
<th>Mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>uimsbf</td>
</tr>
<tr>
<td>8</td>
<td>uimsbf</td>
</tr>
<tr>
<td>40</td>
<td>uimsbf</td>
</tr>
</tbody>
</table>

Where

- af_descr_tag is an 8-bit field that identifies this AF descriptor. It is equal to 0xDF.
- af_descr_length is an 8-bit field specifying the number of bytes of the AF descriptor immediately following af_descr_length field.
- WMPaceInfo() is a 40-bit field that carries the information defined for the class WMPaceInfo() in clause 5.5.3.4.

This message should be inserted for the first frame of a segment to facilitate content manipulation when padding it (see clause 5.7.5.1).

5.6 Content Preparation

5.6.1 Introduction

Content preparation means the generation of A/B Variants of the segments followed by the push of content on the origin. It is under a workflow manager responsibility in case of VOD and fully automated for Live content. The encoder generates the different Variants of the adaptive content. The encrypted segments, the DASH manifest and HLS playlists are generated by the packager and pushed to the origin. A simplified flow is shown in Figure 3 for the case of Live content if the DASH-IF ingest protocol is used [i.1] (note that content protection steps are omitted for clarity). For encrypted content, Variants of every segment part of the same Representation may be encrypted using the same encryption method and with the same content key, meaning the same DRM license allows decrypting the A and B Variants. In addition to the Variants, the encoder also pushes WMPaceInfo that contain information allowing the packager and the origin to properly associate the pieces of Variants that are pushed to a bit position on the WM pattern. In such flow, the packager can aggregate multiple ingest segments into one egress segment, with the limitation that only ingest segments carrying the same position value can be aggregated together.
5.6.2 Encoding Recommendations

This clause contains recommendation when encoding content. The goal is to facilitate the creation and management of A and B Variants in the delivery chain.

When segments are requested as byte ranges in a file or when chunks are requested as byte ranges in a segment, the segments and chunks in A and B Variants shall have the same size as the player receives only one DASH manifest or HLS playlist and will get byte range lengths from one sidx box only. How this is achieved is out of the scope of the present document (as an example, bit stuffing in the encoder is an option).

NOTE 1: This solution does not allow creating aligned segment when content is delivered with HLS in the form of MPEG-2 TS segments encrypted with AES sample encryption, because start code emulation prevention is re-applied over the entire NAL unit after encryption with MPEG-2 TS.

NOTE 2: An alternative solution is either to not use segments requested as byte ranges, but to use discrete files (in these cases, there is no need to align Variant A and B of the same segment) or use CMAF segments with HLS where start code emulation prevention is not re-applied after encryption.

5.6.3 Delivering Content and WMPaceInfo from the Encoder to the Packager

Only one option for conveying WMPaceInfo information from the encoder to the origin shall be used. Multiple concurrent formats are not allowed.

NOTE 1: When WMPaceInfo is delivered in TS adaptation field, ISOBMFF box, or SEI, it adds overhead in the delivery from the CDN to devices. The sidecar file and HTTP header delivery methods do not.

The encoder is sending part of segments to the packager, as the output of the encoder is not necessarily aligned on the segment length. Furthermore, when multiple streaming formats are used, it may happen that segments generated by the packager are not of the same size for every streaming protocol (for example, 2 seconds segments for DASH and 4 seconds segments for HLS). The encoder then needs a mechanism for announcing which parts of the Variants it sends can be aggregated in segments. This is achieved by using the firstpart and lastpart within WMPaceInfo.

NOTE 2: Where an encoder delivers additional metadata to instruct the packager how to aggregate the content into segments, the encoder ensures that metadata and firstpart and lastpart fields are consistent.

For example, the encoder could output the series of content elements of 1 second length with WMPaceInfo as shown in Figure 4.
If the encoder pushes over HTTP these elements, each one should carry a WMPaceInfoIngest HTTP header with the relevant data. Every server keeps the information within the header associated to the ingested segment. In some cases, for example when the origin does additional packaging, the header may be updated. The packager can then prepare segments according to the streaming protocol. From the example above, it can create segments of 2 or 4 seconds keeping the consistency of the watermarking.

NOTE 3: In this case, 2 consecutive segments of 2 seconds carry the same position value, hence a larger piece of content is required to retrieve an identifier compared to the case where 2 consecutive segments carrying different position values.

Other options are to carry WMPaceInfo in a sidecar file or SEI or ISOBMFF box or TS adaptation field. For cases where the origin can perform additional manipulation of the content, WMPaceInfo may be carried within the content instead providing it is overwritten as specified in clause 5.6.5.

### 5.6.4 Segment Ingress Path Structure on the Origin

#### 5.6.4.1 Introduction

The DASH manifest [1] and HLS playlist [3] served to the devices are “neutral”, meaning that:

- The same playlist or manifest is served to all devices of all end-users.
- It does not expose different names for A and B Variants of a given segment.

#### 5.6.4.2 Locating the Variants

Egress DASH manifests and HLS playlists shall be neutral, but ingest DASH manifests and HLS playlists include information about the A and B Variants being ingested, this is:

- The ingest path.
- Some signalling elements to describe if a DASH Adaptation Set includes the A or B Variants, or if an HLS media playlist includes A or B Variants.

The ingest of A and B Variants shall use specific ingest paths that include a Variant identification (${variantId})

DASH Ingest manifests shall include an AdaptationSet per Variant. The contents of the AdaptationSet shall be identical for every Variant apart from an EssentialProperty element that indicates the variantId and that the Variants are grouped (i.e. they reference the same media). It has the @schemeIdUri attribute equal to http://dashif.org/guidelines/watermarking_variant#${variantId} where ${variantId} identifies the Variant with which this EssentialProperty element is associated and @value attribute identifies the group to which the Variant belongs. If there are additional Variants (A, B and C for example), the @schemeIdUri attribute is different for each Variant, for example, for Variant C, @schemeIdUri attribute shall be equal to http://dashif.org/guidelines/watermarking_variant#c, if the schema with lower case letters is used.

The following is an example of a DASH ingest manifest with two Variants, A and B. The watermarking signalling is highlighted in bold. EssentialProperty elements indicate that Variant A and Variant B belong to the same group ("tv1"). In this example, lower case letters are used for variantId.

NOTE 1: Segment file naming with template based on segment $number or $time are possible.
For HLS ingest playlists, the multivariant playlist shall include all the A and B Variants with a custom attribute specifying the Variant (using `${variantId}` identification as defined in clause 5.3). The attribute is WATERMARKING-VARIANT. A combination of both audio and video watermarking can therefore be used in a single streamset. In the media playlists, the only specific signalling is the segments paths that reflects on which ingest path the Variants are ingested. The sub-paths in the media playlists shall use the same convention that the `${variantId}`.

The following is an example of HLS ingest playlists, the watermarking signalling is highlighted in bold (this theoretical example, both the video and audio are watermarked). In this example, lower case letters are used for `variantId`.

**Multivariant playlist**

```xml
#EXTM3U
#EXT-X-VERSION:4
#EXT-X-INDEPENDENT-SEGMENTS
#EXT-X-STREAM-INF:BANDWIDTH=5227200,AVERAGE-BANDWIDTH=3511200,CODECS="avc1.4d401f,mp4a.40.2",RESOLUTION=1280x720,FRAME-RATE=30.000,AUDIO="program_audio",WATERMARKING-VARIANT="a"video_1.m3u8
#EXT-X-STREAM-INF:BANDWIDTH=2719200,AVERAGE-BANDWIDTH=1861200,CODECS="avc1.77.30,mp4a.40.2",RESOLUTION=640x360,FRAME-RATE=30.000,AUDIO="program_audio",WATERMARKING-VARIANT="a"video_2.m3u8
#EXT-X-STREAM-INF:BANDWIDTH=8571200,AVERAGE-BANDWIDTH=5711200,CODECS="avc1.4d4028,mp4a.40.2",RESOLUTION=1920x1080,FRAME-RATE=30.000,AUDIO="program_audio",WATERMARKING-VARIANT="a"video_3.m3u8
#EXT-X-STREAM-INF:BANDWIDTH=5227200,AVERAGE-BANDWIDTH=3511200,CODECS="avc1.4d401f,mp4a.40.2",RESOLUTION=1280x720,FRAME-RATE=30.000,AUDIO="program_audio",WATERMARKING-VARIANT="b"video_4.m3u8
```
NOTE 2: While it is a legal signalling in HLS to have multiple EXT-X-MEDIA tags with the same GROUP_ID value, each tag has a different NAME value. As these playlists are not for devices to consume and to minimize the processing on the playlists, the ingest playlists do not follow this rule and multiple EXT-X-MEDIA share the same NAME value.

Media playlist (A Variant)

#EXTM3U
#EXT-X-VERSION:6
#EXT-X-DEPENDENT-SEGMENTS
#EXT-X-DESCRIPTION:6
#EXT-X-MEDIA-SEQUENCE:11352692
#EXT-X-MAP:URI="video_init_1.mp4"
#EXT-X-PROGRAM-DATE-TIME:2021-09-15T00:48:38.933Z
#EXTINF:6.000,
   a/video_segment_1_11352692.mp4
#EXTINF:6.000,
   a/video_segment_1_11352693.mp4
#EXTINF:6.000,
   a/video_segment_1_11352694.mp4
#EXTINF:6.000,
   a/video_segment_1_11352695.mp4
#EXTINF:6.000,
   a/video_segment_1_11352696.mp4

Media playlist (B Variant)

#EXTM3U
#EXT-X-VERSION:6
#EXT-X-DEPENDENT-SEGMENTS
#EXT-X-DESCRIPTION:6
#EXT-X-MEDIA-SEQUENCE:11352692
#EXT-X-MAP:URI="video_init_1.mp4"
#EXT-X-PROGRAM-DATE-TIME:2021-09-15T00:48:38.933Z
#EXTINF:6.000,
   b/video_segment_1_11352692.mp4
#EXTINF:6.000,
   b/video_segment_1_11352693.mp4
#EXTINF:6.000,
   b/video_segment_1_11352694.mp4
#EXTINF:6.000,
   b/video_segment_1_11352695.mp4
#EXTINF:6.000,
   b/video_segment_1_11352696.mp4

When the ingested content is not watermarked anymore, then:

- For DASH content, the EssentialProperty elements shall be removed from the ingest manifest and a new Period shall be created with a single AdaptationSet. The path to the segments shall be updated, removing any information on the Variant location (in the example above, the a/ shall be removed from the @media value of the SegmentTemplate element).
- For HLS content, the encoder shall create a new multivariant playlist that does not include **WATERMARKING-VARIANT** attributes. It also stops delivering the additional media playlists for the B Variant and others if present. The path to the segments in the media playlist delivered to devices shall be updated, removing any information on the Variant location (in the example above, the a/ shall be removed from the media playlist).

NOTE 3: Stopping watermarking content is different from toggling edge sequencing logic (see clause 5.3).

### 5.6.4.3 Locating the Sidecar File

The sidecar file is part of the ingest with the DASH manifest or HLS playlist, the link to this file is added in different places depending on the format.

DASH ingest manifests shall include an **EssentialProperty** element at the **Representation** level with a @schemeIdUri attribute equal to http://dashif.org/guidelines/watermarking_wmpaceinfo and @value attribute equal to the pointer to the sidecar file. The pointer is relative to the ingest manifest.

The following is an example of a DASH ingest manifest where the watermarking signalling is highlighted in bold. In this example, the absolute path for the sidecar file for the first representation is equal to https://dash.edgesuite.net/dash264/TestCases/1a/ElephantsDream_H264BPL30_0100.264.dash_wm_pace_info.

**NOTE:** This example also includes the signalling defined in clause 5.6.2 (for one Variant A). In this case, the **EssentialProperty** elements are added in the **Representation**.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<MPD xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xmlns="urn:mpeg:dash:schema:mpd:2011"
     type="static"
     mediaPresentationDuration="PT654S"
     minBufferTime="PT4S"
     ...
     <AdaptationSet mimeType="video/mp4" codecs="avc1.42401E" subsegmentAlignment="true"
       subsegmentStartsWithSAP="1" contentType='video' maxHeight="360"
       maxWidth="480" maxFrameRate="24" par="4:3">
       <Representation id="2" bandwidth="150000" width="480" height="360"
         frameRate="24">
         <EssentialProperty
           schemeIdUri="http://dashif.org/guidelines/watermarking_variant#a" value="tv1"/>
         <EssentialProperty
           schemeIdUri="http://dashif.org/guidelines/watermarking_wmpaceinfo" value="ElephantsDream_H264BPL30_0100.264.dash_wm_pace_info"/>
         <BaseURL>a/ElephantsDream_H264BPL30_0100.264.dash</BaseURL>
         <SegmentBase indexRange="984-11244">
           <Initialization range="0-983"/>
         </SegmentBase>
       </Representation>
       <Representation id="3" bandwidth="250000" width="480" height="360"
         frameRate="24">
         <EssentialProperty
           schemeIdUri="http://dashif.org/guidelines/watermarking_variant#a" value="tv1"/>
         <EssentialProperty
           schemeIdUri="https://dashif.org/guidelines/watermarking_wmpaceinfo" value="ElephantsDream_H264BPL30_0175.264.dash_wm_pace_info"/>
         <BaseURL>a/ElephantsDream_H264BPL30_0175.264.dash</BaseURL>
         <SegmentBase indexRange="984-11245">
           <Initialization range="0-983"/>
         </SegmentBase>
         </Representation>
       </Representation>
       ...<AdaptationSet>
     </MPD>

HLS ingest playlists shall include in the media playlist a custom tag specifying the pointer to the sidecar file. The pointer is relative to the ingest manifest. The tag is `#EXT-X-WMPACEINFO:<attribute-list>` where the defined attribute is `URI`, a quoted-string that gives the relative pointer to the sidecar file. In the media playlist for each Variant (A, B, C ...), the sidecar file referenced by the `#EXT-X-WMPACEINFO` tag is the same as the `variant` value shall not be considered.
The following is an example of a HLS media playlist, the watermarking signalling is highlighted in bold. Note that the multivariant playlist remains unmodified.

```m3u
#EXTM3U
#EXT-X-TARGETDURATION:8
#EXT-X-VERSION:7
#EXT-X-MEDIA-SEQUENCE:1
#EXT-X-PLAYLIST-TYPE:VOD
#EXT-X-INDEPENDENT-SEGMENTS
#EXT-X-WMPACEINFO:URI="main_wm_pace_info"
#EXT-X-MAP:URI="main.mp4",BYTERANGE="1118@0"
#EXTINF:7.98333,
a/main.mp4
#EXT-X-BYTERANGE:1700094@1118
#EXTINF:8.00000,
a/main.mp4
#EXTINF:8.00000,
a/main.mp4
#EXTINF:8.00000,
a/main.mp4
#EXTINF:8.00000,
a/main.mp4
#EXTINF:8.00000,
a/main.mp4
#EXTINF:7.26667,
a/main.mp4
#EXTINF:5.66667,
a/main.mp4
```

5.6.5 Packaging Recommendations

This clause contains requirements where packaged content is served to devices. The goal is to facilitate the creation and management of A and B Variants in the delivery chain. These requirements apply even if no re-packaging process exists.

**NOTE:** This implies that an encoder working against a completely passive receiver (e.g. interface 2 of [i.1]) publishes egress versions of the content directly.

The minimum segment duration should consider the embedding capabilities of the WM technology in order to ensure that a segment contains only information for A or B Variant. A segment carrying only one bit of information (Variant A or B) allows to match a segment to a bit value in the WM pattern.

As described in clause 5.6.3, a re-packaging process may aggregate received parts of content. It builds a segment beginning with the part of content with `firstpart=true` and then aggregates until `lastpart=true` for creating a segment until the targeted length has been reached. It shall begin creating a new segment if a part of content with `firstpart=true` is received before reaching the targeted length. The packager shall not aggregate segments that have inconsistent metadata, more precisely, only ingest segments carrying the same `position` value shall be aggregated together.

The transformation of ingest manifest into egress manifests requires the following actions:

- All `watermarking_wmpaceinfo` and `watermarking_variant` `EssentialProperty` elements in DASH manifests and `EXT-X-WMPACEINFO` tags in HLS playlists shall be removed from the egress manifests.
- HLS media playlists of a given rendition in HLS shall be merged into a single, neutral version of it (without `variantsPath`).
- DASH manifests shall be made neutral (without `variantsPath`).

While the manifests are made neutral when delivered to devices, the content shall remain stored with the structure defined in the ingest manifests. Doing so, when the CDN edge requests a Variant for a given segment in applying the logic defined in clause 5.7.5, the origin has a direct access to the requested Variant.

Additionally, when translating from ingress to egress, a re-packaging process shall:

- overwrite `WMPaceInfo` when carried as SEI messages, TS adaptation fields or ISOBMFF boxes. Overwriting shall prevent start code emulation. It is recommended to overwrite with `0xFF`;
- remove firstpart, lastpart, segmentRegex from sidecar-discrete elements.

5.7 Content Playback

5.7.1 Introduction

The flow for content playback is shown in the following clauses. The origin received content as explained in clause 5.5. It has access to the A/B Variants and the WMPaceInfo data.

This clause describes only the case where the WM token is used in direct mode and does not consider the value of wmseduration (hence using WMPaceInfo).

This clause is also not considering the case of download of content for later offline playback. Usually, content available for download is available in the form of byteranges and the device requests large byteranges that overlap those announced in the MPD or HLS playlists. When content is watermarked, this is not possible as only announced byteranges are addressable (see clause 5.7.5.4). The device shall therefore either use the announced byteranges only or a proxy shall ensure that the edge receives requests that are for announced byteranges.

Content playback is divided in three actions:
- Acquiring the WM token, the DASH manifest, or the HLS playlists
- Acquiring the initialization segment
- Acquiring media segments

While the first action is common to all type of content, the other ones have variations depending on the packaging and delivery mode of the content. Variation is, for example on the difference between content delivered as byterange or discrete segments. Another possible variation appears when HLS low latency is used for the chunks requested at the edge of live.

The following goes through the different actions by providing the expected workflows.

5.7.2 Dynamic Ad Insertion

In case of Dynamic Ad Insertion (DAI), the break may happen at any time. As every segment carries watermarking information allowing to perform the detection, there shall not be segments carrying conflicting data. While some techniques may recover from this mix of data, it will, in all cases, impact the length of content needed for retrieving the unique identifier.

For Live content, assuming that an ad replacement period is defined, then from the device perspective, the following consumption modes are possible.
- The device consumes ads from an alternative edge for the full duration of the ad break
- The device consumes ads from an alternative edge for a duration shorter than the replacement period
- The device consumes the original content as no replacement ad is proposed

Devices may therefore consume content differently during the ad break.

For VOD content, ads will be inserted or stitched with ad break (cue in/out points for example) markers. The device should consume them from an alternative edge for the full duration of the ad break.

The encoder shall watermark ads as part of the original content for Live content. The watermarking technology shall remain consistent between all these options. Some devices may receive the original content if no ad can be found for replacement. One consequence is that these devices receive content that is meant to be watermarked following the rules of the present document.

Devices receiving an ad for replacement shall receive it from a different edge that does not enforce watermarking. Such edge will then gracefully ignore the WM token.
The WM token is expected to be present in all playback requests during the session. In presence of a DAI manifest manipulator, depending on its behaviour, it may be necessary to tweak the configuration of the delivery pipeline to guarantee the propagation of the WM token. For instance, it may be required to perform some manifest manipulation at the edge to re-introduce the WM token in the response, e.g. when the token is transported as a query parameter and the DAI manifest manipulator is not piggybacking incoming query parameters in the rewritten manifest/playlist. Another case is when the watermark token is incorporated to the virtual path, stripped at the edge on its way to the DAI manifest manipulator (that remains therefore unaware of the WM token) which returns a manipulated playlist that contains absolute URLs.

5.7.3 WM Token, DASH Manifest and HLS Playlists Acquisition

The device acquires the WM token in an implementation specific manner. It may be retrieved directly from a WM token server, or it may be provided in a response from another server as part of other data required for playing back content.

The WM token may be added as part of the virtual path of the requested object, as a query string attribute or as part of the HTTP header when the device requests content to the edge. It is recommended to use the virtual path.

The WM token may be added by the device for requesting DASH manifest and HLS playlists. While these objects are not watermarked (the pattern in the name allows the edge to know this), the edge may validate or not the token and refuse to serve these objects if the token is not valid. The edge may also gracefully ignore the token. The origin cleans the served objects, removing any property related to location of objects (see clause 5.6.5). The manifest and playlist are neutral. This is summarized in Figure 5.

Figure 5: Token, DASH manifest and HLS playlist acquisition
5.7.4 Initialization Segment Acquisition

When content is delivered as byteranges, as the initialization segment is within the file, the token shall be added in the request as the requested file has a name that matches the pattern for watermarked content. The edge will then apply the exact same logic it applies for a media segment, it retrieves the sidecar file and extracts the WMPaceInfo for the first part of the track that contains the initialization segment (as defined in clause 5.7.5). It can then deliver the initialization segment to the device. As position is equal to -1 (not watermarked), it shall deliver the initialization segment from Variant A. One or several Variants may become unavailable on the origin for any reason, such as a lost connection with the encoder for these encoding pipelines. Such situation will result in a failed playback if Variant A is the one that is not available. The origin shall deliver to the edge the initialization segment from any available Variant in this case on the endpoint for Variant A.

NOTE: The token is evaluated and validated as the edge cannot make a difference between the initialization segment and a media segment.

When content is delivered as discrete segments, the name of the initialization segment shall not match the pattern for watermarked content as written in clause 5.3. The WM token may be added by the device for requesting the initialization segment. The edge may validate it or not and may refuse to serve these objects if it is not valid. The edge may also gracefully ignore it.

5.7.5 Media Segments and WMPaceInfo Acquisition

5.7.5.1 General Requirements

For the media segments, a token shall be attached to the HTTP requests. If not present, the edge shall reject the request and shall not deliver the segment. The edge shall validate the WM token (that can include checking signed data or decrypting some claims) which is attached to the requests and extracts the WM pattern so that the correct Variant can be sequenced.

Watermarked objects shall include in the sub-path in the edge forward requests to the origin the value of identifying Variants that is part of the configuration described in clause 5.3. A request received at the CDN edge for https://edge.hostname/path/to/endpoint/video_segment_5_8353305.mp4 shall be translated into a forward request for https://origin.hostname/path/to/endpoint/${variantPath}video_segment_5_8353305.mp4 where the value of ${variantPath} depends on the value extracted from the WM pattern for this segment. The same logic applies if the watermarking is done through audio segments.

The connection between the origin and the edge shall be restricted to legitimate requests. How this is achieved is out of the scope of the present document.

NOTE 1: A static secret (a shared key), dynamic signatures or access lists (based on IP addresses) are examples of tools for restricting the access.

There may be the need to disable watermarking within or upstream of the packager at any time, for example, one or several Variants may become unavailable on the origin for any reason, such as a lost connection with the encoder for these encoding pipelines. As devices request all Variants, this situation will result in intermittent black screens when requesting the affected Variants. In such case, position shall be set to -1 in WMPaceInfo, effectively announcing to the edge sequencing logic that segments are not watermarked. The edge shall then consume segment on the endpoint for Variant A. If this endpoint is not working properly, the origin shall deliver any available Variant on this endpoint.

NOTE 2: This is breaking the watermarking detection. The period when such contingency measure is applied is not to be used for detection. How the end-to-end system is synchronized is out of the scope of the present document. As an example, the origin can raise an alarm.
5.7.5.2 WMPaceInfo Acquisition

For each device request for /pathname/filename, the edge shall retrieve from the origin egress WMPaceInfo data associated to this object. The origin presents this information differently whether segments are discrete or byteranges:

- For byterange segment, the origin shall have a dedicated endpoint for delivering WMPaceInfo information as a sidecar file. For a segment requested by a device at /pathname/filename, the origin shall have an endpoint /pathname/WMPaceInfo/filename that makes the sidecar file available. The response payload shall contain the sidecar file (as defined in clause 5.5.3.2 for byterange segments). The origin shall not extract data and only provide the sidecar file to the edge. The Content-Type for this object is application/cbor.

- For discrete segment, the origin:
  - Shall have a dedicated endpoint /pathname/WMPaceInfo/filename for delivering WMPaceInfo for the requested segment. The response payload shall contain a sidecar file that contain a single WMPaceInfo object. The Content-Type for this object is application/cbor.
  - Shall add WMPaceInfo in the response header (as defined in clause 5.5.3.3) under the WMPaceInfoEgress header field when the edge requests the segment.

- It is the edge that defines which endpoint it uses.

If WMPaceInfo was delivered to the origin in ingress form (as part of the HTTP request headers, SEI message, ISOBMFF box, TS adaptation field or a sidecar file per track), that data shall be extracted and made available in egress form to the edge as both a HTTP header and dedicated endpoint.

Any direct request from a device with /pathname/WMPaceInfo/filename shall receive an error code 403.

Table 5 gives examples of content flows as ingest to the origin and egress of the origin to the edge.

<table>
<thead>
<tr>
<th>Ingest of the origin</th>
<th>Live content</th>
<th>VOD content</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>No sidecar file, data is delivered as part of HTTP headers, SEI messages, ISOBMFF boxes or TS adaptation field.</strong></td>
<td>For both discrete segments and byteranges, one sidecar file per track.</td>
<td></td>
</tr>
<tr>
<td><strong>One sidecar file per segment (note the special case of HLS low latency with byterange where multiple chunks are be linked to the same sidecar file, see clause 5.7.5.4) and HTTP header.</strong></td>
<td>For discrete segments, one sidecar file per segment and HTTP header.</td>
<td>For byterange, one sidecar file per track.</td>
</tr>
</tbody>
</table>

There are then three endpoints on the origin:

- WMPaceInfo /pathname/WMPaceInfo/filename
- Variant A: /pathname/${variantPath}filename
- Variant B: /pathname/${variantPath}filename

Where ${variantPath} is as defined in clause 5.3.

NOTE: Adding Variants creates additional endpoints.

5.7.5.3 Discrete Files

For the media segments delivered as discrete files, the flow is shown in Figure 6. The edge sequences the A or B Variant of a segment based on the WM pattern contained in the token. It has two options to know the position of the segment within the WM pattern:

- First make a request to the origin to retrieve the WMPaceInfo data. This is done with a GET request using the path /pathname/WMPaceInfo/filename. The origin provides the WMPaceInfo from the Variant A in the payload of the response as a sidecar file.
- Once, the data in \texttt{WMPaceInfo} is interpreted in conjunction with the WM pattern, the edge can request to the origin the right Variant corresponding to the position in the WM pattern that matches the value of \texttt{position} in \texttt{WMPaceInfo} and then deliver it to the device.

- Make a request for the A and B Variants, extract the \texttt{WMPaceInfo} from one response header and once, the data in \texttt{WMPaceInfo} is interpreted in conjunction with the WM pattern, the edge can deliver the right Variant to the device.

\textbf{NOTE:} There is a high probability that the edge will request both A and B Variants, hence adding \texttt{WMPaceInfo} to the response header allows avoiding an extra request to the origin.

The edge caches the Variants of a given segment with different cache keys and it should prevent the cache keys to be revealed through debug headers.
Figure 6: Media segment, as discrete file, acquisition
5.7.5.4 Byterange

For the media segments delivered as byteranges, the flow is shown in Figure 7. The edge delivers the A or B Variant of a segment based on the WM pattern contained in the token. To know which position in the WM pattern it has to consider, it needs to retrieve the sidecar file associated to this track. It first makes a HTTP GET request to the origin in order to retrieve the sidecar file.

Whilst sub ranges within segments, such as chunks, are allowed, the edge shall not deliver byteranges overlapping several segments with different position values in WMPaceInfo.

NOTE 1: An example is content delivered with HLS using the EXT-X-PART tag are byterange requests within a discrete segment. When the edge receives the request for this partial segment, it will request WMPaceInfo to the origin and will receive a sidecar file with only one WMPaceInfo. This allows the edge to know that it does not have enforce byterange validation for these requests.

NOTE 2: Only byteranges overlapping valid ranges are problematic, requests for byteranges included in an allowed range are not breaking the WM pattern that is created by the A/B Variants and thus can be served.

Once the data in WMPaceInfo is interpreted in conjunction with the WM pattern, the edge can deliver the correct Variant corresponding to the position in the WM pattern that matches the value of position in WMPaceInfo.
Figure 7: Media segment, as byterange, acquisition
5.8 Monitoring and Watermark Detection

If content is found, a detection of a WM pattern can be performed. A video acquisition that includes valuable content (no commercial breaks for example) is performed. As the unique ID is obtained by extracting information from segments (0 or 1 in every segment), the acquired content shall be of several minutes (the longer the segments are, the longer the acquired video is). The video is then processed by the watermarking provider in order to extract the unique ID. This ID is then provided to the relevant entity that can match it to a device, user or streaming session and take the desired actions.

How the detection is performed, and the revocation of the WM token is performed are out of the scope of the present document.
Annex A (normative):
Vendor Specific Core API

A.1 Introduction

In case of a token in indirect mode, it is expected that a vendor specific core (identified by wmvnd) generates the WM pattern (referred as wmpattern). This means that this requires some interaction between the edge and this vendor specific core. To facilitate this integration, the following defines the API made available by the vendor specific core.

A.2 Edge-Vendor Specific API

It is assumed that:
- The call to the API function is blocking and the edge waits for the vendor specific core to end its processing.
- The verification of the token is done before the call to the function. Verification includes the validation of the signature.

The inputs are the values of the claims of the token that are relevant for the generation of the WM pattern.

```javascript
const crypto = require('crypto');

function generate_wmpattern (token.wmpatlen, token.wmkeyver, token.wmid, token.wmopid)
{
    /* vendor specific processing */
    return wmpattern;
}
```
Annex B (informative):
Examples of Workflows

B.1 Introduction

This annex takes the DASH-IF ingest protocol [i.1] as a reference. There are two interfaces defined:

- Interface 1, where the combination of packager and origin is able to perform additional re-packaging hence the structure of ingest and egress may differ. Each POST/PUT contains one CMAF segment. This is often referred to as an active receiving entity as a Just In Time Packager (JITP).

- Interface 2, where the combination of packager and origin does not perform additional re-packaging, the structure of ingest and egress may be the same. The receiving entity is "passive", the source produces all objects in form that devices can consume. Each POST/PUT implicitly refers to one addressable object in an MPD or playlist.

Therefore, the receiving entity is either active (interface 1) or passive (interface 2) and this leads to the following possibilities:

- CMAF ingest, active receiving entity (JITP)
- HLS/DASH ingest, active receiving entity (JITP)
- HLS/DASH ingest, passive receiving entity

Given all the options for carrying $\text{WMPaceInfo}$ (see clause 5.5.3), the following describes some example flows for Live and VOD content.

B.2 Live Content Flows

For an active receiving entity (JITP), the grouping is non-trivial (as defined in [i.1] clause 6.2), therefore, as described in clause 5.6.4, the manifests are sent. The JITP may aggregate ingress segments according to $\text{(firstpart, lastpart)}$ and $\text{WMPaceInfoEgress}$ will reflect the aggregated result. In addition, evidence of WM process (such as the essential properties) is removed from egress playlists.

If using the $\text{WMPaceInfoIngest}$ header field on interface 1, the flow from the encoder to the edge is shown in Figure B.1.

Another possible option is using sidecar file, this leads to the flow shown in Figure B.2.
Another option is using SEI data. In this case, the receiving entity, either leaves WMPaceInfo in segment when storing and then overwrites it when serving after translating to WMPaceInfoEgress header or overwrites it before storing and saves the WMPaceInfo data somewhere else. The flow shown in Figure B.3.

With a passive receiving entity, there is no media manipulation downstream of ingest source, therefore transferring WMPaceInfo data within the media is not an option, as it is not possible to overwrite it. Figure B.4 shows a possible flow with sidecar files.
B.3 VOD Content Flows

If VOD content is prepared using live profile, then the permutations presented in clause B.2 are applicable. In addition, another option is that a single sidecar can describe all segments using regex for `segmentRegex`. This latter case leads to the flow shown in Figure B.5.

![Figure B.5: Flow when using sidecar files for VOD live profile](image)

If VOD content is prepared using on-demand profile, then the sidecar file is the only mechanism available to deliver `WMPaceInfo` data. This leads to the flow shown in Figure B.6.

![Figure B.6: Flow when using sidecar files for VOD on-demand profile](image)
Annex C (normative):
Registration Requests

C.1 General

This annex contains the registration requests for IANA (token claims) and MP4RA (4CC code).

C.2 IANA Considerations

The present document requests IANA to register the following claims in the following registry: https://www.iana.org/assignments/cwt/cwt.xhtml#claims-registry [12].

Version Claim
- Claim Name: wmver
- Claim Description: The version of the WM Token
- JWT Claim Name: wmver
- Claim Key: 300
- Claim Value Type: unsigned integer
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

Technology Vendor Claim
- Claim Name: wmvnd
- Claim Description: The WM technology vendor
- JWT Claim Name: wmvnd
- Claim Key: 301
- Claim Value Type: unsigned integer
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

Pattern Length Claim
- Claim Name: wmpatlen
- Claim Description: The length in bits of the WM pattern
- JWT Claim Name: wmpatlen
- Claim Key: 302
- Claim Value Type: unsigned integer
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document
Segment Duration Claim
- Claim Name: wmsegduration
- Claim Description: The nominal duration of a segment
- JWT Claim Name: wmsegduration
- Claim Key: 303
- Claim Value Type: map
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

Pattern Claim
- Claim Name: wmpattern
- Claim Description: The WM pattern
- JWT Claim Name: wmpattern
- Claim Key: 304
- Claim Value Types: COSE_Encrypt0 or COSE_Encrypt or byte string
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

ID Claim
- Claim Name: wmid
- Claim Description: Used as input to derive the WM pattern for indirect mode
- JWT Claim Name: wmid
- Claim Key: 305
- Claim Value Type: text string
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

Operator ID Claim
- Claim Name: wmopid
- Claim Description: Used as additional input to derive the WM pattern for indirect mode
- JWT Claim Name: wmopid
- Claim Key: 306
- Claim Value Type: unsigned integer
- Change Controller: DASH-IF
- Specification Document(s): Clause 5.4 of the present document

Key Version Claim
- Claim Name: wmkeyver
- Claim Description: The key to use for derivation of the WM pattern in indirect mode
C.3 MP4RA Registration

The present document requests MP4RA to register the following 4CC code.

1) The name, address, and URL of the organization requesting the code-point.

   DASH-IF
   
   3855 SW 153rd Dr., Beaverton, OR 97003, USA
   
   https://dashif.org/

2) The kind of code-point you wish to register (please choose from the set of registered types).

   Boxes (Atoms)

3) For all except object-type registrations, the suggested identifier (four-character code). Note that four-character codes use four 8-bit printable characters, usually from the first 128 Unicode characters (commonly thought of as plain ASCII), but at most from the first 256 Unicode characters.

   wmpi

4) The specification in which this code-point is defined, if possible. A copy of the specification would be appreciated, as it enables the authority to understand the registration better. If you are requesting a ‘codec’ code-point, a reference to the definition of the coding system itself, if separate from the definition of its storage in these files, would also be appreciated.

5) A brief ‘abstract’ of the meaning of the code-point, perhaps ten to twenty words.

   wmpi stands for WaterMarkPaceInfo. It carries A/B forensic watermarking information within the ISOBMFF file.

6) Contact information for an authorized representative for the code-point, including:

   a) Contact person’s name, title, and organization:

      DASH-IF Interoperability WG Chair

   b) Contact email:

      admin@dashif.org

7) Date of definition or implementation (if known) or intended date (if in future).

   July 31, 2023.

8) Statement of an intention to apply (implement) the assigned code-point.

   Expected to be implemented as part of DASH-IF conformance and reference tools according to the boilerplate in the specification.
Annex D (informative):
Code for Web Sequence Diagram

D.1 Introduction

This annex provides is the code for generating all workflows shown in Figures 3 to 7, excluding Figure 4 to be used on https://websequencediagrams.com [i.2].
