Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: “Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards”, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This Technical Specification (TS) has been produced by ETSI Partnership Project oneM2M (oneM2M).
1 Scope

The present document covers the protocol specific part of communication protocol used by oneM2M compliant systems as RESTful HTTP binding.

The scope of the present document is (not limited to as shown below):

- Binding oneM2M Protocol primitive types to HTTP method.
- Binding oneM2M response status codes (successful/unsuccessful) to HTTP response codes.
- Binding oneM2M RESTful resources to HTTP resources.

The present document is depending on Core Protocol specification (ETSI TS 118 104 [3]) for data types.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference/.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

[2] ETSI TS 118 103: "oneM2M; Security solutions (oneM2M TS-0003)".
[3] ETSI TS 118 104: "oneM2M; Service Layer Core Protocol Specification (oneM2M TS-0004)".
[6] ETSI TS 118 111: "oneM2M; Common Terminology (oneM2M TS-0011)".
2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

[i.1] oneM2M Drafting Rules.

3 Definition of terms, symbols and abbreviations

3.1 Terms

Void.

3.2 Symbols

Void.

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in ETSI TS 118 111 [6] apply and the following apply:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP</td>
<td>Hyper Text Transfer Protocol</td>
</tr>
<tr>
<td>TLS</td>
<td>Transport Layer Security</td>
</tr>
<tr>
<td>URI</td>
<td>Uniform Resource Identifier</td>
</tr>
</tbody>
</table>

4 Conventions

The keywords "Shall", "Shall not", "May", "Need not", "Should", "Should not" in the present document are to be interpreted as described in the oneM2M Drafting Rules [i.1].
5 Overview on HTTP Binding

5.0 Overview

HTTP binding specifies the equivalence between oneM2M request and response primitives and HTTP request and response messages, respectively. This clause provides a brief overview on the mapping relationship between oneM2M and HTTP message parameters.

This clause describes how oneM2M request/response primitives can be mapped to HTTP request/response messages and vice versa.

5.1 Introduction

Figure 5.1-1 illustrates an example oneM2M system configuration and its correspondence to an HTTP-based information system if HTTP binding as defined in the present document is applied. The upper diagram in figure 5.1-1 shows with solid line arrows the flow of a request primitive originating from an AE which is registered to an MN-CSE (Registrar of AE). The request primitive is assumed to address a resource which is hosted by another MN-CSE (Host of Resource). Both MN-CSEs are registered to the same IN-CSE.

When applying HTTP binding, the oneM2M entities of the upper diagram take the roles outlined in the lower diagram of a corresponding HTTP information system as defined in IETF RFC 7230 [1]. The AE takes the role of an HTTP client, the MN-CSE (Registrar of AE) takes the role of a HTTP Proxy Server, and both the IN-CSE and MN-CSE (Host of Resource) take the role of a HTTP server for this particular request message.

CSEs may also issue unsolicited request messages, shown with dashed line arrows in figure 5.1-1, and receive associated response messages. Therefore, for HTTP protocol binding, CSEs generally provides capability of both HTTP Server and HTTP Client. AE may provide HTTP Server capability optionally in order to be able to serve Notification request messages (see ETSI TS 118 104 [3] and ETSI TS 118 101 [7]).

Each individual request primitive will be mapped to single HTTP request message, and each individual response primitive will be mapped to a single HTTP response message, and vice-versa.
An HTTP request message consists of Request-Line, headers and message-body. An HTTP response message consists of Status-Line, headers and message-body (IETF RFC 7230 [1]). HTTP header names are case-insensitive and a Receiver shall accept headers that are either lower or upper or any mixture thereof. This clause describes how oneM2M request/response primitives are mapped to HTTP messages at a high level. Corresponding details are specified in clause 6.

5.2 Request-Line

The HTTP method of a request message is mapped to the Operation parameter, and vice-versa.

At the message originator side the HTTP Request-Target is derived from the To parameter of the request primitive, including a query string which carries other specific primitive parameters.

HTTP-Version is specified in clause 6.

5.3 Status-Line

HTTP Version is specified in clause 6.

The Status-Code of HTTP response messages is derived from the Response Status Code parameter of the response primitive. The Reason-Phrase is not applicable to oneM2M systems and is omitted.

6 HTTP Message Mapping

6.1 Introduction

Mapping between oneM2M primitives and HTTP messages shall be applied in the following four use cases:

1) Mapping of request primitive to HTTP request message at the request originator (HTTP client).
2) Mapping of HTTP request message to request primitive at the request receiver (HTTP server).
3) Mapping of response primitive to HTTP response message at the request receiver (HTTP server).
4) Mapping of HTTP response message to response primitive at the request originator (HTTP client).

All four use cases also appear at transit CSEs.

The following clauses specify the mapping between each oneM2M primitive parameter and a corresponding HTTP message field to compose a HTTP request/response message.

6.2 Parameter Mappings on Request-Line

6.2.1 Method

The HTTP 'Method' shall be derived from the Operation request primitive parameter of the request primitive.

<table>
<thead>
<tr>
<th>oneM2M Operation</th>
<th>HTTP Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>POST</td>
</tr>
<tr>
<td>Retrieve</td>
<td>GET</td>
</tr>
<tr>
<td>Update</td>
<td>PUT</td>
</tr>
<tr>
<td>Delete</td>
<td>DELETE</td>
</tr>
<tr>
<td>Notify</td>
<td>POST</td>
</tr>
</tbody>
</table>
At the Receiver, an HTTP request message with POST method shall be mapped either to a Create or Notify Operation parameter. Discrimination between Create and Notify operations can be accomplished by inspection of the content-type header. The Resource Type parameter is present in the content-type header only when the HTTP POST request represents a Create request (see clause 6.4.3). The Resource Type parameter is not present in the content-type header when the HTTP POST request represents a Notify request.

### 6.2.2 Request-Target

#### 6.2.2.1 Path component

The path component of the origin-form HTTP Request-Target shall be interpreted as the mapping of the resource identifier part of the To request primitive parameter. If the HTTP message is sent directly to the next hop CSE, the origin-form of Request-Target shall be employed (see clause 5.3.1 of IETF RFC 7230 [1]).

The resource identifier part of the To parameter can be represented in three different forms (see clause 6.2.3 of ETSI TS 118 104 [3] and clause 7.2 of ETSI TS 118 101 [7]):

- CSE-Relative-Resource-ID.
- SP-Relative-Resource-ID.
- Absolute-Resource-ID.

Each of the above three formats may include either a structured Resource ID (used for hierarchical addressing) or an unstructured Resource ID (used for non-hierarchical addressing) as defined in clause 7.2 of ETSI TS 118 101 [7].

For CSE-relative Resource ID representation, the path component of the HTTP request message shall be constructed as the concatenation of the literal “/” and the To request primitive parameter. For SP-relative Resource ID representation, the path component of the HTTP request message shall be constructed as the concatenation of the literal “~/” and the To request primitive parameter. For Absolute Resource ID representation, the path component of the HTTP request message shall be constructed by replacing the first “/” character of the To request primitive parameter with “/.”.

Table 6.2.2.1-1 shows valid mappings between the To request primitive parameter and the path component of the origin-form HTTP request target. In the shown examples, /myCSEID and /CSE178 represent applicable CSI-IDs, CSEBase represents the resource name of a <CSEBase> resource, CSEBase/ae12/cont27/contInst696 represents a structured CSE-relative resource ID, and cin00856 an unstructured CSE-relative resource ID.

<table>
<thead>
<tr>
<th>Resource-ID Type</th>
<th>To parameter value</th>
<th>path component (origin-form)</th>
</tr>
</thead>
<tbody>
<tr>
<td>structured CSE-Relative</td>
<td>CSEBase/ae12/cont27/contInst696</td>
<td>/CSEBase/ae12/cont27/contInst696/</td>
</tr>
<tr>
<td>unstructured CSE-Relative</td>
<td>cin00856</td>
<td>/cin00856</td>
</tr>
<tr>
<td>structured SP-Relative</td>
<td>/CSE178/CSEBase/ae12/cont27/contInst696</td>
<td>~/CSE178/CSEBase/ae12/cont27/contInst696</td>
</tr>
<tr>
<td>unstructured SP-Relative</td>
<td>/CSE178/cin00856</td>
<td>~/CSE178/cin00856</td>
</tr>
<tr>
<td>unstructured Absolute</td>
<td>//mym2msp.org/CSE178/cin00856</td>
<td>/_/mym2msp.org/CSE178/cin00856</td>
</tr>
</tbody>
</table>

At the HTTP server side, the reverse operations shall be applied to the path component of request-line to derive a replica of the original To request primitive parameter.

If the HTTP message is sent to a HTTP proxy instead directly to the next hop CSE, the absolute-form of Request-Target shall be employed (see clause 5.3.2 of IETF RFC 7230 [1]). The absolute-form is derived by prefixing the origin-form with the schema and the host address of the next hop CSE:

```
http://{host address of next hop CSE} {origin-form path-component}
```
6.2.2.2 Query component

The query component (e.g. query-string) may include the optional primitive parameters listed in Table 6.2.2.2-1 compliant with IETF RFC 7230 [1]. Each applicable request primitive parameters and elements of Filter Criteria parameter shown in Table 6.2.2.2-1 shall be represented as pair of field-name and value in query-string. Multiple such pairs shall be concatenated with an ampersand ‘&’ character used as separator between two pairs.

Table 6.2.2.2-1 also shows the permitted multiplicity of occurrence of field names in the query-string. Multiplicity ‘0..1’ means that a parameter is optional and can occur at most once. Parameters with multiplicity ‘0..n’, may occur multiple times in the query-string in the form of <query field name> = value. For example, if the resourceType element of the Filter Criteria parameter is represented by a list of 3 values ‘2 3 4’ (see clause 6.3.4.7 in ETSI TS 118 104 [3]), it would be mapped to ty=2+3+4 in the query-string. At the receiver side, this query string can be reverted back into the list type of representation. The same representation shall be applied for multiple occurrences of contentType and labels elements.

The 'attribute' element of the Filter Criteria request primitive parameter consists of two elements, name and value, which in XML notation would look for example as follows in case of multiplicity 2 (see clause 6.2.4.8 in ETSI TS 118 104 [3]):

```xml
<attribute>
  <name>attname1</name>
  <value>attvalue1</value>
</attribute>
<attribute>
  <name>attname2</name>
  <value>attvalue2</value>
</attribute>
```

Each name (e.g. attname1 and attname2) shall represent a valid resource attribute name of the resource types indicated in the ty field of the query-string. The sequence of attribute elements as shown in the above example will be mapped into the query-string as attname1=attvalue1&attname2=attvalue2. The attribute names (i.e. attname1 and attname2 in the above example) shall be expressed in the form of short names as defined in clause 8.2.3 of ETSI TS 118 104 [3]. Note that the <attribute> tag of the XML representation is omitted in the HTTP binding.

Examples of valid Request-Target representations are the following:

**EXAMPLE 1: Request-Target for 'nonBlockingRequestSynch'**

Primitive parameters: To: /CSE1234/RCSE78/container234 (SP-Relative-Resource-ID)  
Response Type: responseType = 1 (nonBlockingRequestSynch)

Result Persistence: P1Y2M3DT10H1M0S Request-Target: /CSE1234/RCSE78/container234?rt=1&rp=P1Y2M3DT10H1M0S

**EXAMPLE 2: Request-Target for Discovery**

When the entity wants to discover container resources where the creator attribute has the value 'Sam':

Primitive parameters: To: /CSE1234/RCSE78  
Filter Criteria: resourceType = 3 (container)  
attribute name: creator  
attribute value: Sam  
filterUsage = discovery

Request-Target: /CSE1234/RCSE78?ty=3&cr=Sam&fu=1

**EXAMPLE 3: Semantic Discovery**

The entity wants to discover resources whose semantic description stored in the descriptor attribute of a <semanticDescriptor> child resource fulfils the semantic filter specified in SPARQL. In this case, the semantic descriptor of the resource to discover has to contain information about a Thing of type Car based on the concept defined in the "myOnt" ontology.
Due to the use of reserved characters in SPARQL, the semanticsFilter requires "percent-encoding" (IETF RFC 3986 [9]).

Primitive parameters:

- **To:** /CSE1234/RCSE78

Filter Criteria:

```sparql
PREFIX rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#
PREFIX myOnt: http://www.onem2m.org/ontology/myontology#
SELECT ?car WHERE { ?car rdf:type myOnt:Car }
```

Request-Target:

```
/CSE1234/RCSE78?smf=PREFIX%20rdf%3A%20%3Chttp%3A%2F%2Fwww.w3.org%2F1999%2F02%22-rdf-syntax-ns%23%3E%20PREFIX%20myOnt%3A%20%3Chttp%3A%2F%2Fwww.onem2m.org%2Fontology%2Fmyontology%23%3E%20SELECT%20%3Fcar%20WHERE%20%7B%20%3Fcar%20%20rdf%3A%20type%20myOnt%3A%20Car%20%
```

Any of the short names listed in Table 6.2.2.2-1, with the exception of 'atr', may be used in the query-string. The short name 'atr' itself is not used. Instead, any of the resource attribute short names as listed in Tables 8.2.3-1 to 8.2.3-5 in ETSI TS 118 104 [3] may be used in the query-string in representations of attname=attvalue expressions, except those that shall be omitted (see clause 7.3.3.17.9 in ETSI TS 118 104 [3]).

</tbody>
</table>

For partial Retrieve request primitives, the *To* parameter may include the name of a single attribute separated by a '#' character from the resource ID. If multiple resource attributes are to be retrieved with a partial retrieve request primitive, these attributes are included in form of an attributeList object (as specified in Table 6.3.3-1 of ETSI TS 118 1043) in the *Content* parameter.
In both cases, the short resource attribute name(s) shall be included into the fragment component of request-target, i.e. it shall follow any required query-string separated by '#' character. If more than a single attribute name is included into the fragment component, these shall be separated by a '+' character.

For example, if three resource attributes with long names resourceID, labels and requestReachability are indicated in the Content primitive parameter, the query component atrl=ri+lbl+rr is attached to the request-target. In case just a single attribute "rr" is indicated in the To parameter separated by '#' character, the query component atrl=rr is attached to the request-target. The '#' character and following attribute name shall be omitted from the path component of the request line:

Case 1 Primitive Example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<m2m:rqp xmlns:m2m="http://www.onem2m.org/xml/protocols">
  <op>1</op>
  <to>//example.net/myCSE/-/Cont1</to>
  <fr>/myCSE/C2345</fr>
  <rqi>0002bf63</rqi>
  <ty>4</ty>
  <pc>
    <atrl>ri lbl rr</atrl>
  </pc>
</m2m:rqp>
```

Case 1 HTTP Binding:

//example.net/myCSE/-/Cont1?atrl=ri+lbl+rr

Case 2 Primitive Example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<m2m:rqp xmlns:m2m="http://www.onem2m.org/xml/protocols">
  <op>2</op>
  <to>//example.net/myCSE/-/Cont1#rr</to>
  <fr>/myCSE/C2345</fr>
  <rqi>0002bf63</rqi>
  <ty>4</ty>
</m2m:rqp>
```

Case 2 HTTP Binding:

//example.net/myCSE/-/Cont1?atrl=rr

At the HTTP server side, the reverse operation shall take place, when constructing the retrieve request primitive from the receive HTTP request message. Single attribute names in the query component may either be mapped back into the To parameter following a '#' character, or included into the Content parameter using the attributeList format with just a single list element included. Multiple attributes shall be included into the Content parameter as specified in ETSI TS 118 104 [3].

6.2.3 HTTP-Version

The present document defines binding compliant with HTTP 1.1 (IETF RFC 7230 [1]). The HTTP version field in HTTP request messages shall be set to "HTTP/1.1".

6.3 Status-Line

6.3.1 HTTP-Version

The HTTP version field in HTTP response messages shall be set to "HTTP/1.1".
6.3.2 Status-Code

The Response Status Code parameter of response primitives shall be mapped to the HTTP Status-Code. Since the Response Status Code parameter values have been defined with more detailed information than HTTP status codes, one or more Response Status Code value may be mapped to the same HTTP Status-Code. The original Response Status Code parameter value shall be carried in the X-M2M-RSC header (see clause 6.4.14).

The mapping of Response Status Code parameter value of oneM2M request primitive to Status-Code of HTTP request messages is specified in Table 6.3.2-1.

### 6.3.3 Reason-Phrase

The Reason-Phrase shall be omitted in HTTP response messages.

### 6.4 Header Fields

#### 6.4.0 Introduction

The header fields listed in this clause shall be supported by all entities of the oneM2M system when using HTTP binding. Any other unrecognized HTTP headers shall be ignored by the HTTP client and server.

#### 6.4.1 Host

The Host header shall be present in each HTTP request message.

While the Request-Target indicates a target resource on the Hosting CSE, the Host header indicates the FQDN or IP address of the Receiver CSE of the next hop in multi-hop communication scenarios. Therefore, the Request-Target is not changed but the Host header is changed each time when a request is forwarded to the next hop CSE.

When no HTTP proxy is used, the Host header shall be set as one of the pointOfAccess attribute values of the Receiver (i.e. pointOfAccess attribute of the corresponding <remoteCSE> resource). Selection of the appropriate Receiver is described in ETSI TS 118 104 [3]. In this case the origin-form of target URI shall be used (see clause 6.2.2).

If the HTTP request message is sent to a HTTP proxy rather than to the next hop CSE, the Host header shall be set to the FQDN or IP address of the proxy. In this case the absolute-form of target URI shall be used (see clause 6.2.2).

#### 6.4.2 Accept

The Originator may use the Accept header to indicate which media types are acceptable for the response. The Accept header shall be mapped to a set of media types among "application/xml", "application/json", "application/cbor" or the oneM2M defined media types defined in clause 6.7 of ETSI TS 118 104 [3]. Note that some of the oneM2M defined media types defined in clause 6.7 of ETSI TS 118 104 [3] are not applicable for the response. Note that this information is not included in a request primitive.

#### 6.4.3 Content-Type

Any HTTP request or response containing message-body shall include the Content-type header set to one of "application/xml", "application/json", or the oneM2M defined media types defined in clause 6.7 of ETSI TS 118 104 [3].

Content-Type of the HTTP response should be chosen by the Hosting CSE considering the Accept header given in the HTTP request.
The value of the Resource Type primitive parameter, which is present in Create request primitives only, shall be appended to the Content-type of the corresponding HTTP request message in the form ty=value, separated by a semicolon character. A valid Content-Type header in this case looks e.g. as follows:

   Content-Type: application/vnd.onem2m-res+xml; ty=3
   application/vnd.onem2m-res+json; ty=3
   application/vnd.onem2m-res+cbor; ty=3

6.4.4 Content-Location

The Content-Location header of the HTTP response to a Create request shall be set to the URI of the created resource, if this URI is present in the Content parameter of the Create response primitive. See clause 7.3.3.12 "Create a success response" in ETSI TS 118 104 [3].

6.4.5 Content-Length

If message-body is included into HTTP request or response messages, the Content-Length header shall be included indicating the length of the message-body in octets (8-bit bytes).

6.4.6 Etag

A response primitive sent in reply to a resource retrieval request primitive should include an Etag header [8] in combination with the resource representation in the HTTP message body.

Etag facilitates the use of conditional requests (i.e. using the if-match and if-none-match HTTP headers) [8].

If a CSE supports the Etag header, then the CSE shall support conditional requests compliant with IETF RFC 7232 [8].

6.4.7 X-M2M-Origin

The X-M2M-Origin header shall be mapped to the From parameter of request and response primitives and vice versa, if applicable.

6.4.8 X-M2M-RI

The X-M2M-RI header shall be mapped to the Request Identifier parameter of request and response primitives and vice versa.

6.4.9 Void

6.4.10 X-M2M-GID

The X-M2M-GID header shall be mapped to the Group Request Identifier parameter of request primitives and vice versa, if applicable.

6.4.11 X-M2M-RTU

The X-M2M-RTU header shall be mapped to the notificationURI element of the Response Type parameter of request primitives and vice versa, if applicable. If there are more than one value in the element, then the values shall be combined with "&" character.

6.4.12 X-M2M-OT

The X-M2M-OT header shall be mapped to the Originating Timestamp parameter of request and response primitives, and vice versa, if applicable.
6.4.13 X-M2M-RST

The X-M2M-RST header shall be mapped to the **Result Expiration Timestamp** parameter of request and response primitives, and vice versa, if applicable.

6.4.14 X-M2M-RET

The X-M2M-RET header shall be mapped to the **Request Expiration Timestamp** parameter of request primitives and vice versa, if applicable.

6.4.15 X-M2M-OET

The X-M2M-OET header shall be mapped to the **Operation Execution Time** parameter of request primitives and vice versa, if applicable.

6.4.16 X-M2M-EC

The X-M2M-EC header shall be mapped to the **Event Category** parameter of request and response primitives, and vice versa, if applicable.

6.4.17 X-M2M-RSC

The X-M2M-RSC header in a HTTP response message shall be mapped to the **Response Status Code** parameter of response primitives and vice versa only if the mapping between the **Response Status Code** and the HTTP Status Code is N:1 relationship (e.g. Response Status Code 4000 and 4102 are mapped to HTTP Status Code 400 in the table 6.3.2-1).

6.4.18 X-M2M-ATI

The X-M2M-ATI header in a HTTP response message shall be mapped to the **Assigned Token Identifiers** parameter of response primitives and vice versa.

The format of the X-M2M-ATI header shall be represented as a sequence of lti-value:tkid-value pairs separated by a colon “:’ and multiple pairs appended with ‘+’ character.

**EXAMPLE:** The header looks as follows:

X-M2M-ATI: lti-value1:tkid-value1 + lti-value2:tkid-value2 + …

if the XML representation of the **Assigned Token Identifiers** parameter is given as (using short element names):

```
<ati>
  <ltia>
    <lti>lti-value1</lti>
    <tkid>tkid-value1</tkid>
  </ltia>
  <ltia>
    <lti>lti-value2</lti>
    <tkid>tkid-value2</tkid>
  </ltia>
  …
</ati>
```

The data type m2m:dynAuthlocalTokenIdAssignments of the **Assigned Token Identifiers** parameter is defined in clause 6.3.5.43 of ETSI TS 118 104 [3].

6.4.19 Authorization

If a request primitive includes a **Tokens** parameter it shall be mapped to the Authorization header.

The **Tokens** primitive parameter is represented as a space separated list of JSON Web Signature (JWS) and JSON Web Encryption (JWE) strings in Compact Serialization format of datatype m2m:dynAuthJWT as defined in clause 6.3.3 of ETSI TS 118 104 [3].
When mapped into the Authorization header, each individual token in the *Tokens* primitive parameter shall be separated by '+' character.

For example, if the *Tokens* parameter consists of a list of two JWS/JWE Tokens:

```
eyJ0eXAiOiJK.eyJpc3MiOiJqb2UiLA0KIC.dBjftJeZ4CVP
eyJ0eXAiOiJK.eyJpc3MiOiJqb2UiLA0KIC.dBjftJeZ4CVP.5eym8TW_c8SuK.SdiwkIr3a.XFBoMYUZo
```

The Authorization header looks as follows:

```
Authorization: eyJ0eXAiOiJK.eyJpc3MiOiJqb2UiLA0KIC.dBjftJeZ4CVP+eyJ0eXAiOiJK.eyJpc3MiOiJqb2UiLA0KIC.dBjftJeZ4CVP.5eym8TW_c8SuK.SdiwkIr3a.XFBoMYUZo
```

The line break in the above example is for illustrative purposes and shall not be included into the Authorization header.

### 6.4.20 X-M2M-CTS

The X-M2M-CTS header shall be mapped to the *Content Status* parameter of response primitives and vice versa, if applicable.

### 6.4.21 X-M2M-CTO

The X-M2M-CTO header shall be mapped to the *Content Offset* parameter of response primitives, and vice versa, if applicable.

### 6.4.22 X-M2M-RVI

The X-M2M-RVI header shall be mapped to the *Release Version Indicator* parameter of request and response primitives, and vice versa.

### 6.4.23 X-M2M-VSI

The X-M2M-VSI header shall be mapped to the *Vendor Information* parameter of request and response primitives, and vice versa.

### 6.5 Message-body

Message-body shall be mapped to the *Content* parameter of request and response primitives, and vice versa, if applicable. This applies to the *Content* parameter of all primitives with the following exceptions:

1) For partial Retrieve request primitives. Attributes contained in the Content parameter of Retrieve request primitive shall be mapped to the fragment component of request-target, as specified in clause 6.2.2.2, and vice versa.

2) A *Token Request Information* parameter included in a response primitive shall be mapped into the message-body either as a XML or JSON serialized object. The Content-Type and Content-Length headers shall be set compliant with the data representation (i.e. Content-Type: application/xml or application/json depending on the serialization format). Note that the *Token Request Information* parameter is used in oneM2M error response primitives (X-M2M-RSC: 4103 “ORIGINATOR_HAS_NO_PRIVILEGE”) only, which do not carry any other primitive content.

Error response messages which include the *Token Request Information* parameter in the Message-Body shall not include any debugging information.
6.6 Message Routing

HTTP request and response message routing shall be performed as described in HTTP/1.1 [1].

7 Security Consideration

7.1 Authentication on HTTP Request Message

When sending the credential to be checked by the Registrar CSE, Proxy-Authorization header should be used as specified in HTTP/1.1 (see IETF RFC 7235 [4]).

When sending the credential to be checked by Hosting CSE, Authorization header should be used as specified in HTTP/1.1 [4].

When the credential to be checked by Hosting CSE is an Access Token which is compatible with OAuth 2.0 framework (see IETF RFC 6750 [5]), the Bearer authentication scheme shall be used as specified in OAuth 2.0 framework.

NOTE: The oneM2M Security Solutions (ETSI TS 118 101 [7]) does not provide any details on usage or provisioning of the token.

7.2 Transport Layer Security

oneM2M primitive parameters contained in HTTP messages may be protected by TLS in a hop-by-hop manner. For the details, see the oneM2M Security Solutions specification (ETSI TS 118 103 [2]).

NOTE: Some provisioning schemes of ETSI TS 118 103 [2] enable the provisioning of end-to-end credentials, but protocols to establish security associations between non-adjacent nodes are not addressed by oneM2M in the present document.
Annex A (informative):
Example Procedures

A.1  <container> resource creation

Figure A.1-1 is HTTP mapping of procedure described in clause 7.4.6.2.1 of ETSI TS 118 104 [3]. Note the example shown in the figure applies under the following assumptions:

- "CSE1" is the name (i.e. value of the resourceName attribute) of the <CSEBase> resource of the registrar CSE.
- "cont1" is the name of the created <container> resource chosen by the registrar CSE.

![Diagram of container creation](image)

**Step 1:** AE requests to create a <container> resource at ASN-CSE

```
POST /CSE1?rcn=0 HTTP/1.1
Host: 192.168.0.2
X-M2M-Origin: CAE1
X-M2M-RI: 0001
X-M2M-RVI: 2a
Content-Type: application/vnd.onem2m-res+xml; ty=3
Content-Length: 32

<m2m:cnt><mni>10</mni></m2m:cnt>
```

**Step 2:** Local Processing

Process the request and create "cont1" resource

**Step 3:** CSE responses OK

```
HTTP/1.1 201
X-M2M-RI: 0001
X-M2M-RVI: 2a
Content-Location: /CSE1/cont1
Content-Length: 0
```

Figure A.1-1: oneM2M HTTP Binding Example – container creation
Annex B (informative): WebSocket

B.1 Notification using WebSocket

WebSocket [i.4] can be used for transporting notifications to an AE/CSE. This can be useful for an AE/CSE which is not server-capable or cannot be reachable for delivery of unsolicited requests.

EXAMPLE: When an AE needs to receive a notification message from the CSE, the AE establishes a WebSocket connection to a CSE. When a new notification message is generated, the notification will be sent to the AE as the data frame of the WebSocket.
