Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs): Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x the first digit:
   1 presented to TSG for information;
   2 presented to TSG for approval;
   3 or greater indicates TSG approved document under change control.

y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z the third digit is incremented when editorial only changes have been incorporated in the document.
1 Scope

The present document describes several alternatives for the realisation of Mobile Number Portability.

The present document includes information applicable to network operators, service providers, switch and database manufacturers and national regulators.

It is left to operator and implementation decisions which option, or combination of options, is used, taking into account the regulatory and architectural constraints that may prevail. The possible implications of these options on internal node functions and on signalling performance are not covered in the present document.

Normative Annex A of the present document describes the technical realisation of the handling of calls to ported UMTS or GSM mobile subscribers using IN technology.

Normative Annex C of the present document describes the technical realisation of the handling of calls to ported UMTS or GSM mobile subscribers using Signalling Relay technology.

Normative Annex A and Normative Annex C describe alternative solutions. The network operator may choose the solution to be used in his network.

Normative Annex B of the present document describes the technical realisation of the handling of non-call related SCCP signalling for ported UMTS or GSM mobile subscribers using Signalling Relay technology.

The present document does not specify the porting process.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply.

**donor network**: subscription network from which a number is ported in the porting process. This may or may not be the number range holder network.

**interrogating network entity**: entity that submits a non-call related signalling message to interrogate the HLR.

**interrogating network**: network in which the interrogating network entity resides.

**mobile number portability**: ability for a mobile subscriber to change mobile network subscription within the same country whilst retaining his/her original MSISDN(s). Additional regulatory constraints apply in North America.

**mobile number portability information**: an information set relevant to Mobile Number Portability for a mobile subscriber. It may contain one or more of Routing Number, generic IMSI MSISDN, and Number Portability Status.

**network operator**: GSM PLMN operator.

**non-call related signalling message**: all signalling messages where the MSISDN is used to route the message on SCCP level except MAP SRI without OR parameter set (i.e. SRI_SMS, SRI for SOR, Send_IMSI, CCBS_Request etc).

**North American GSM Number portability**: the ability for a subscriber to change subscription between North American GSM networks and other subscription networks within a regulated geographical area within North America.

**number portability database**: operational database (used in real time at call set-up) which provides portability information.
number portability location register: internal MAP application terminating function (MATF) in the MNP-SRF network entity with an (unspecified) interface with a NPDB

number portability status: information indicating the status of number portability for a mobile subscriber. It may be one of: own number ported out, own number not ported out, foreign number ported in, foreign number ported to a foreign network, foreign number not known to be ported

number range holder network: network to which the number range containing the ported number has been allocated

originating network: network where the calling party is located

portability domain: set of GSM PLMs in a country between which MSISDNs may be ported or a set of North American GSM Mobile networks and other subscription networks within a regulated geographical area within North America

portability network: a PLMN or in North America, a PSTN or an ISDN network

portable number: E.164 number that can be ported between networks in one nation

ported number: portable number that has undergone the porting process

ported subscriber: subscriber of a ported number

porting process: description of the transfer of a number between network operators

recipient network: network that receives the number in the porting process. This network becomes the subscription network when the porting process is complete

routeing number: routeing number is the data stored against the ported number or the non-ported number in the Number Portability Database. The routeing number points to Subscription Network or Recipient Network

service key: service Key can identify to the entity holding the Number Portability Database that the service logic for Mobile Number Portability should apply. The Service Key value for Mobile Number Portability is administered in the MSC, and is passed transparently to the entity holding the Number Portability Database

service provider: entity that offers service subscriptions to individual subscribers and contracts with a network operator to implement services for a specific MSISDN. A service provider may contract with more than one network operator

service provider portability: transfer of numbers between two unique Service Providers

subscription network: network with which the customer’s Service Provider has a contract to implement the customer’s services for a specific MSISDN

NOTE: The term 'recipient network' is used during the porting process. The recipient network becomes the ‘subscription network’ after the completion of the porting process.

3.2 Abbreviations
For the purposes of the present document, the following abbreviations apply:

4 General

4.1 Overview

Mobile Number Portability (MNP) is the ability for a UMTS or GSM mobile subscriber to change the subscription network within a portability domain whilst retaining her original MSISDN or MSISDNs.

North American GSM Number Portability (NAGNP) is the ability for a subscriber to change subscription between North American GSM networks and other subscription networks within a regulated geographical area within North America.

As part of the porting process administrative actions have to be performed by the network operators of the number range holder network, donor network, recipient network and, as an option, by operators of other national UMTS or GSM networks as follows:

a) if the number range holder network is identical with the donor network:

<table>
<thead>
<tr>
<th>Recipient network:</th>
<th>add an entry in the HLR; add an entry in the Number Portability Database.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Donor network:</td>
<td>add an entry in the Number Portability Database; delete the entry related to the ported MSISDNs in the HLR.</td>
</tr>
<tr>
<td>Other networks in the portability domain:</td>
<td>add an entry in the Number Portability Database (if direct routeing is used).</td>
</tr>
</tbody>
</table>
b) if the number range holder network is identical with the recipient network:

<table>
<thead>
<tr>
<th>Recipient network:</th>
<th>add an entry in the HLR; delete any entry related to the ported MSISDN in the Number Portability Database.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Donor network:</td>
<td>delete any entry related to the ported MSISDN in the Number Portability Database; delete the entry related to the ported MSISDNs in the HLR.</td>
</tr>
<tr>
<td>Other networks in the portability domain:</td>
<td>delete any entry related to the ported MSISDN in the Number Portability Database.</td>
</tr>
</tbody>
</table>

c) if the number range holder network is different from both the recipient and the donor network:

<table>
<thead>
<tr>
<th>Recipient network:</th>
<th>add an entry in the HLR; add an entry in the Number Portability Database.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number range holder network:</td>
<td>update the Number Portability Database.</td>
</tr>
<tr>
<td>Donor network:</td>
<td>delete (or update) the entry in the Number Portability Database; delete the entry related to the ported MSISDNs in the HLR.</td>
</tr>
<tr>
<td>Other networks in the portability domain:</td>
<td>update the Number Portability Database (if an entry for the ported MSISDN exists).</td>
</tr>
</tbody>
</table>

Note that the order of sequence for the administrative actions to be performed both within a network and by different network operators is significant with respect to prevention of disruption in service to the mobile subscriber and prevention of looping calls between networks during the porting process.

Termination of a subscription for a ported number results in the deletion of any entry in an HLR and NPDB of that number.

If a call fails because databases are not correctly synchronised, the network entity that detects the inconsistency will raise an MNP specific alarm to the operation and maintenance subsystem.

The present document does not specify the porting process. It specifies the functionality needed to set-up calls to both ported and non ported subscribers including the functionality needed to query an NPDB for MNP information (in order to be able to charge correctly for CAMEL pre-paid calls and SMS) (Normative Annex A and Normative Annex C), and the functionality needed to relay non-call related signalling messages to the HLR in the subscription network (Normative Annex B).

4.2 Compatibility

The IAM sent to the subscription network may contain additional routing information. Within a portability domain the method how to convey the Routing Number in the IAM between two portability networks shall be agreed upon by the two network operators involved (for an ITU-T ISUP solution see [6] and for an ANSI ISUP solution see [8] and [9]).

In general, IN-based and MNP-SRF (call-related) solutions are compatible and may coexist in the same portability domain. The only restriction refers to the case where the number range holder network relays call-related MAP messages (i.e. SRI for national calls) to the subscription network. If this solution is selected by at least one network operator within a portability domain, all the portability networks and transit networks affected must fulfill the following requirements:

1. The SCCP interfaces between networks in a portability domain must be agreed. This refers to the SCCP addressing mechanism being used (e.g. number lengths, natures of address and translation types for call-related MAP messages).
   For messages that do not cross network boundaries the SCCP addressing mechanism is a choice of the network operator.

2. The subscription network must be able to generate the SRI ack to allow the onward routing of the call from the number range holder network to the subscription network.

In the rest of the possible architectures for MNP, no interworking problems have been identified. In these cases, network architectures used within one portability network (e.g. IN, MNP-SRF) are regarded as operator dependent.
In order to avoid loops and incompatibility situations, all the networks within a portability domain shall use the same routing convention either direct routing, indirect routing or indirect routing with reference to the Subscription network. As an alternative, indirect routing can interwork successfully with direct routing if the routing number is transferred in the IAM or if dedicated traffic connections are used.

4.3 Common Functionality of the MNP-SRF

In a PLMN that supports mobile number portability, SCCP messages sent to an HLR may be relayed by an MNP-SRF. Depending on the implemented solution (IN-based or MNP-SRF-based), on the type of message (call-related, non-call-related or MNP information request) and on the porting status of the called subscriber, the MNP-SRF may modify the SCCP called party address and route the message to a different HLR or to the subscription network, or terminate the dialogue and response to the INE.

Figure 1 shows the general steering functionality for SCCP message routing. It shows the SCCP routing principle for mobile number portability within a network.

Note that call related messages in the IN-based solution are not routed to the MNP-SRF. Therefore Normative Annex A of the present document does not mention the MNP-SRF.

However, the usage of the IN-based solution for the call-related messages should allow operators to have the routing of the non call-related messages determined in the same database. See [7] for the description of the access of the MNP-SRF (node with relay capability) to the NPDB (external database).

In order to guard against the possibility that the porting data for an MSISDN is inconsistent between PLMNs in a porting domain, the SCCP hop counter may be used to prevent indefinite looping of messages between PLMNs. The MNP-SRF would then decrement the SCCP hop counter for every message that is relayed. It should be noted that the use of the SCCP hop counter requires the use of non segmented SCCP XUDT messages as defined in ITU-T 1996 SCCP recommendations or in the ANSI T1.112-1996 SCCP recommendations for North America, reference [11].
Figure 1: Steering Function for SCCP Message routing

Figure 2 shows the process MNP_SRF in the MNP-SRF. The procedures MNP_SRF_MATF_Call_Related, MNP_SRF_Non_Call_Related and MNP_SRF_MATF_Info_Request are described in Normative Annex C and Normative Annex B of the present document. Note that in networks which support the IN-based solution for call related signalling, a distinction on SCCP level for call related and non-call related messages is needed and that the MNP-SRF does not require to include MATF’s since call related messages and MNP information request messages are not terminated at the MNP-SRF.

The test 'MNP info-request' is a test on the SCCP Translation Type if a dedicated Translation Type value for MNP information request messages is used in the network. The handling of SCCP messages in the MNP-SRF in networks which do not make use of a dedicated Translation Type value for MNP information request messages is for further study.
The test “call-related” is a test on the SCCP Translation Type if a dedicated Translation Type value for call related messages is used in the network. The handling of SCCP messages in the MNP-SRF in networks which do not make use of a dedicated Translation Type value for call related messages is for further study.

Figure 2: Process MNP_SRF
5 Common Architecture for call setup

Figure 3 shows the general architecture of a portability domain for routeing of calls. The more detailed architecture within the networks depends on the chosen solution (IN-based or MNP/SRF-based) and options and is described in Normative Annex A and Normative Annex C of the present document.

The architecture for non-call related signalling is described in Normative Annex B of the present document.

![Diagram](image-url)

**Figure 3: General architecture of a portability domain for routeing of calls**

The following routeing conventions are identified:

1. Direct Routeing of calls is a PLMN option that allows to route calls directly from the PLMN supporting this option to the ported subscriber's subscription network.

2. Indirect Routeing of calls is a PLMN option which allows to route calls from the PLMN supporting this option via the number range holder network to the ported subscriber's subscription network.

3. Indirect Routeing of calls with reference to the subscription network is a PLMN option for PLMN operators having chosen the MNP-SRF solution for call related signalling described in Normative Annex C. If all PLMNs within a portability domain support this option, calls are routed from the originating network to the number range holder network. The number range holder network obtains onward routeing information from the subscription network and routes the call onward to the ported subscriber's subscription network.

The following action in the different networks can be identified:

1. If the call is originated outside the portability domain, the IAM (1) is received by the number range holder network.

2a. If the call is originated in another national network and the other national network does not support originating call query (i.e. Indirect Routeing of calls is applicable), the IAM (2) is received by the number range holder network.
2b. If the call is originated in another national network and the other national network supports originating call query (i.e. Direct Routeing of calls is applicable), the IAM (7) containing the routeing number is sent to the subscription network. If the routeing number is not used in the IAM sent from the national originating network to the subscription network, all transit networks involved are required to look up an NPDB in order to retrieve routeing information to route the call to the subscription network without looping.

3a. If the call is originated in the subscription network and the subscription network does not support originating call query (i.e. Indirect Routeing of calls is applicable), the IAM (3) is received by the number range holder network.

3b. If the call is originated in the subscription network and the subscription network supports originating call query (i.e. Direct Routeing of calls is applicable), it sends an IAM (8) containing the MSRN to the visited network of the called subscriber.

3c. If the subscription network receives IAM (6 or 7) containing the routeing number, it sends an IAM (8) containing the MSRN to the visited network of the called subscriber.

4a. If the call is routed via the number range holder network, and the number range holder network supports the MNP-SRF/MATF solution with the option 'MATF in subscription network' described in Normative Annex C of the present document (i.e. Indirect Routeing of calls with reference to the subscription network is applicable), the number range holder network sends SRI (4) to the subscription network. The subscription network returns SRI ack (5) containing the routeing number. The number range holder network then sends IAM (6) containing the routeing number to the subscription network. If the routeing number is not used in the IAM sent from the number range holder network to the subscription network, all transit networks involved are required to look up an NPDB in order to retrieve routeing information to route the call to the subscription network without looping.

4b. If the call is routed via the number range holder network, and the number range holder network supports the IN solution described in Normative Annex A of the present document or the MNP-SRF/MATF solution with the option 'MATF inside number range holder network' described in Normative Annex C of the present document, the number range holder network sends IAM (6) containing the routeing number to the subscription network.
6 Functional requirements of network entities

6.1 Procedure MNP_MT_GMSC_Set_MNP_Parameters

The procedure MNP_MT_GMSC_Set_MNP_Parameters is shown in figure 4. It is called from the process MT_GMSC defined in 3G TS 23.018 [3].

Figure 4: Procedure MNP_MT_GMSC_Set_MNP_Parameters
6.2 Procedure MNP_MT_GMSC_Check_MNP_Indicators

The procedure MNP_MT_GMSC_Check_MNP_Indicators is shown in figure 5. It is called from the process MT_GMSC defined in 3G TS 23.018 [3].

Figure 5: Procedure MNP_MT_GMSC_Check_MNP_Indicators
6.3 Procedure MNP_SRF_Check_MNP_Indicator

The procedure MNP_SRF_Check_MNP_Indicator is shown in figure 6. It is called from the procedures MNP_SRF_Non_Call_Related and MNP_SRF_MATF_Call_Related.

Figure 6: Procedure MNP_SRF_Check_MNP_Indicator
Annex A (normative):
IN Call-Related Technical Realisation

A.1 Architecture

A.1.1 Network Options

There are two IN-based solutions for querying the NPDB:

i. ETSI Core INAP

ii. ANSI IN Query.

The following network operator options are defined for the MT calls in the GMSC:

- Terminating call Query on Digit Analysis (TQoD);
- Query on HLR Release (QoHR).

In a GSM network that supports the IN-based approach for call related MNP, each GMSC shall support at least one of these options.

The following network operator option is defined for MO calls in VMSCA and for forwarded calls in the GMSC and VMSCB:

- Originating call Query on Digit Analysis (OQoD).

In a GSM network which supports the IN-based approach for call related MNP, it is a network operator decision, taking into account the regulatory and architectural constraints that may prevail, whether or not VMSCs and GMSCs support this option.

The use of OQoD in transit switches in a PLMN while avoiding multiple database interrogations is for further study.

The interworking between the CCF and the SSF for MNP is for further study.

Note that for different number ranges different options may be chosen.

An IN-based solution for querying the NPDB may also be used by the gsmSCF in order to be able to apply different charging tariffs for CAMEL pre-paid subscribers’ calls or short messages established/sent when roaming in their home PLMN and directed to ported and non-ported mobile subscribers, depending on whether or not the called and the calling subscriber subscribe to the same PLMN.

......

A.1.2 No NP Query required – Number is not subject for portability

Figure A.1.2 shows the architecture for a call to a number that is not subject for portability. This can be for several reasons like for example:

- the national regulator has stipulated some number series as being non-portable or;
- in an initial phase only a limited amount of subscribers might port in certain number blocks and some operators might want to treat the call routing according to traditional routing plans without any change.
A.1.2 Call to a non-ported number, no NP query required

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the Number range holder network being the Subscription network.

2. When GMSCB receives the ISUP IAM, it requests routeing information by submitting a MAP SRI to the HLRB including the MSISDN in the request.

3. The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber currently is registered;

4. The MSC/VLRB returns an MSRN back to the HLRB.

5. The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

6. GMSCB uses the MSRN to route the call to VMSCB.

A.1.3 NP Query in Number Range Holder Network

A.1.3.1 TQoD – Number is not ported

Figure A.1.3.1 shows the architecture for a call where the Originating network has no knowledge whether the MSISDN is ported or not and uses the traditional routeing plans for routeing the call to the Number range holder network for further routeing decisions.
Figure A.1.3.1: Call to a non-ported number using TQoD procedure

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the Number range holder network being the Subscription network.

2. When GMSCB receives the ISUP IAM, it will send a database query to the NPDB as a result of analysis of the received MSISDN. The MSISDN is included in the query to the NPDB.

3. The NPDB detects that the MSISDN is not ported and responds back to the GMSCB to continue the normal call setup procedure for MT calls.

4. The GMSCB requests routing information by submitting a MAP SRI to the HLRB, including the MSISDN in the request.

5. The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber owning the MSISDN currently is registered.

6. The MSC/VLRB returns an MSRN back to the HLRB.

7. The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

8. GMSCB uses the MSRN to route the call to VMSCB.

Note that the NPDB may be outside the number range holder network if a shared NPDB is used.

A.1.3.2 TQoD – Number is ported

Figure A.1.3.2 shows the architecture for a call where the Originating network has no knowledge whether the MSISDN is ported or not and uses the traditional routing plans for routing the call to the Number range holder network for further routing decisions.
Figure A.1.3.2: Call to a ported number using TQoD procedure

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the Number range holder network.

2. When GMSCA receives the ISUP IAM, it will send a database query, including the MSISDN, to the NPDB as a result of analysis of the received MSISDN.

3. The NPDB detects that the MSISDN is ported and responds back to the GMSCA with a Routeing Number pointing out the Subscription network.

4. The call is routed to the Subscription network based on the Routeing Number carried in ISUP IAM message; also the MSISDN is included in IAM.

5. The GMSCB requests routeing information by submitting a MAP SRI to the HLRB, including the MSISDN in the request. The capability to route messages to the correct HLR is required.

6. The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber currently is registered.

7. The MSC/VLRB returns an MSRN back to the HLRB.

8. The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

9. GMSCB uses the MSRN to route the call to VMSCB.

Note that the NPDB may be outside the number range holder network if a shared NPDB is used.

A.1.3.3 QoHR – Number is ported

Figure A.1.3.3 shows the architecture for a call where the Originating network has no knowledge whether the MSISDN is ported or not and uses the traditional routeing plans for routeing the call to the Number range holder network for further routeing decisions.
Figure A.1.3.3: Call to a ported number using QoHR procedure

1 From an Originating Exchange a call is set up to MSISDN. The call is routed to the Number range holder network.

2 When GMSCA receives the ISUP IAM, it requests routing information by submitting a MAP SRI to the HLRA including the MSISDN in the request.

3 The HLRA returns a MAP SRI ack with an ‘Unknown Subscriber’ error since no record was found for the subscriber in the HLRA.

4 When GMSCA receives the error indication from the HLRA, this will trigger the sending of a database query to the NPDB, including the MSISDN in the query.

5 The NPDB detects that the MSISDN is ported and responds back to the GMSCA with a Routing Number pointing out the Subscription network.

6 The call is routed to the Subscription network based on the Routing Number carried in ISUP IAM message; also the MSISDN is included in IAM.

7 The GMSCB requests routing information by submitting a MAP SRI to the HLRB, including the MSISDN in the request. The capability to route messages to the correct HLR is required.

8 The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber currently is registered.

9 The MSC/VLRB returns an MSRN back to the HLRB.

10 The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

11 GMSCB uses the MSRN to route the call to VMSCB.

Note that the NPDB may be outside the number range holder network if a shared NPDB is used.

A.1.4 NP Query in Originating Network

A.1.4.1 OQoD – Number is not ported

Figure A.1.4.1 shows the architecture for a call where already the Originating network has the knowledge whether the MSISDN is ported or not and can route the call directly to the Subscription network that in this case is the same as the Number range holder network.
A call is initiated by Mobile Subscriber A towards Mobile Subscriber B, using the MSISDN of the called subscriber.

When VMSCA receives the call setup indication, it will send a database query to the NPDB as a result of analysis of the received MSISDN, including the MSISDN in the query.

The NPDB detects that the MSISDN is not ported and responds back to the VMSCA to continue the normal call setup procedure for MO calls. Depending on database configuration option, the NPDB could either return a Routeing Number on not ported calls, as done for ported calls, or the call is further routed using the MSISDN number only towards the Number range holder network.

The call is routed to the Number range holder/Subscription network based on the MSISDN or Routeing Number carried in ISUP IAM message.

The GMSCB requests routeing information by submitting a MAP SRI to the HLRB, including the MSISDN in the request.

The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber currently is registered.

The MSC/VLRB returns an MSRN back to the HLRB.

The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

GMSCB uses the MSRN to route the call to VMSCB.

Note that the NPDB may be outside the national originating network if a shared NPDB is used.

### A.1.4.2 OQoD – Number is ported

Figure A.1.4.2 shows the architecture for a call where already the Originating network has the knowledge that the MSISDN is ported and can route the call directly to the Subscription network without involving the Number range holder network.
1 A call is initiated by Mobile Subscriber A towards Mobile Subscriber B, using the MSISDN of the called subscriber.

2 When VMSCA receives the call setup indication, it will send a database query to the NPDB as a result of analysis of the received MSISDN including the MSISDN in the query.

3 The NPDB detects that the MSISDN is ported and responds back to the VMSCA with a Routeing Number pointing out the Subscription network.

4 The call is routed to the Subscription network based on the Routeing Number carried in ISUP IAM message; also the MSISDN is included in IAM.

5 The GMSCB requests routeing information by submitting a MAP SRI to the HLRB, including the MSISDN in the request. The capability to route messages to the correct HLR is required.

6 The HLRB requests an MSRN from the MSC/VLRB where the mobile subscriber currently is registered.

7 The MSC/VLRB returns an MSRN back to the HLRB.

8 The HLRB responds to the GMSCB by sending an SRI ack with an MSRN.

9 GMSCB uses the MSRN to route the call to VMSCB.

Note that the NPDB may be outside the national originating network if a shared NPDB is used.

A.1.4.3 IN-Query for CAMEL pre-paid service

Figure A.1.4.3 shows the architecture for a call or MO-Short-Message originated by a CAMEL pre-paid subscriber while roaming in the Home PLMN where the gsmSCF needs to know whether or not calling and called subscriber subscribe to the same PLMN in order to apply the correct charging tariff.
A call or short message is initiated by Mobile Subscriber A towards Mobile Subscriber B, using the MSISDN of the called subscriber.

When VMSCA receives the call setup indication, it will send a CAP IDP message to the gsmSCF. The IDP contains the called party’s MSISDN.

If the calling subscriber roams in her Home PLMN and the called subscriber’s MSISDN indicates that the called subscriber subscribes to a PLMN within the calling subscriber’s Home Country, the gsmSCF queries the NPDB based on the called party’s MSISDN. Otherwise the tariff to be applied does not depend on the called subscriber’s porting status and enough information to apply the correct tariff is available; go to 5.

The NPDB returns a routing number to the gsmSCF pointing out the called subscriber’s subscription network. Based on this information the gsmSCF applies the appropriate tariff for pre-paid subscriber A.

The gsmSCF returns CAP AC and CAP CUE messages to the VMSCA.

The call or short message is set up.

Note that the NPDB and gsmSCF may be integrated within one physical entity.
A.2 Information flows

In the following figures the NPDB is shown as belonging to the Number range holder network or to the national originating network. However, the NPDB may be shared within one portability domain i.e. nation-wide.

Figure A.2.1 shows the information flow for successful QoHR.
Figure A.2.2 shows the information flow for unsuccessful QoHR (unallocated number).

Figure A.2.6
A.3 Functional requirements of network entities

A.3.1 Functional requirement of GMSC

A.3.1.1 Procedure MOBILE_NUMBER_PORTABILITY_IN_QoHR

The procedure MOBILE_NUMBER_PORTABILITY_IN_QoHR is shown in figure A.1.3. It is called from the procedure Obtain_Routing_Address defined in 3G TS 23.018 [3].

The text in this clause is a supplement to the definition in the SDL diagrams; it does not duplicate the information in the SDL diagrams.

The query to NPDB contains the service key for MNP query and the called party’s MSISDN.
Figure A.3.1.1: Procedure MOBILE_NUMBER_PORTABILITY_IN_QoHR
A.3.1.2 Procedure MOBILE_NUMBER_PORTABILITY_IN_TQoD

The procedure MOBILE_NUMBER_PORTABILITY_IN_TQoD is shown in figure A.3.1.2. It is called from the procedure Obtain_Routing_Address defined in 3G TS 23.018 [3].

The text in this clause is a supplement to the definition in the SDL diagrams; it does not duplicate the information in the SDL diagrams.

The “query” to NPDB contains the service key for MNP query and the called party’s MSISDN.

Figure A.3.1.2: Procedure MOBILE_NUMBER_PORTABILITY_IN_TQoD
A.3.2 Functional requirement of MSC

A.3.2.1 Procedure MOBILE_NUMBER_PORTABILITY_IN_OQoD

The procedure MOBILE_NUMBER_PORTABILITY_IN_OQoD is shown in figure A.3.2.1. It is called from the procedure Outgoing_Call_Setup_MSC and from the process MT_CF_MSC defined in 3G TS 23.018 [3].

The text in this clause is a supplement to the definition in the SDL diagrams; it does not duplicate the information in the SDL diagrams.

The MSC may recognise own numbers as not being within the ported number range. For foreign numbers however, the MSC will not in general know whether the number is portable. The test 'called party number is a portable national MSISDN' takes the 'yes' exit if the number is a foreign national MSISDN or an own portable MSISDN.

The "query" to NPDB contains the service key for MNP query and the called party’s MSISDN.

A.3.3.1 Process IN_QUERY_NPDB

The process IN_QUERY_NPDB is shown in figure A.3.3.1.

![Process IN_QUERY_NPDB Diagram]

Figure A.3.3.1: Process IN_QUERY_NPDB
A.4 Contents of messages

This clause specifies the content of the following messages:

On the ISUP interface:

- IAM.

On the MSC - NPDB interface:

- "query";
- "routing";
- "result".

Messages in the MSC – NPDB interface are mapped into ETSI Core INAP or ANSI IN Query messages according to the protocols on this interface. This is listed in the following table:

<table>
<thead>
<tr>
<th>Messages in MSC-NPDB interface</th>
<th>INAP messages</th>
<th>ANSI IN Query messages</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;query&quot;</td>
<td>INITIAL DP</td>
<td>ProvideInstruction:Start</td>
</tr>
<tr>
<td>&quot;routing&quot;</td>
<td>CONNECT</td>
<td>ConnectionControl:Connect</td>
</tr>
<tr>
<td>&quot;result&quot;</td>
<td>CONTINUE</td>
<td>ConnectionControl:Connect</td>
</tr>
<tr>
<td></td>
<td>RELEASE CALL</td>
<td></td>
</tr>
</tbody>
</table>

In the tables that follow, information elements are shown as mandatory (M), conditional (C) or optional (O). A mandatory information element shall always be present. A conditional information element shall be present if certain conditions are fulfilled; if those conditions are not fulfilled it shall be absent. An optional element may be present or absent, at the discretion of the application at the sending entity.

A.4.1 Messages on the ISUP interface

A.4.1.1 IAM for ETSI ISUP interface

This message is specified in [14]. It is necessary for the IAM to contain the information needed to route the call to the subscription network of the ported subscriber. The ways in which this may be coded are shown in [14].

A.4.1.2 IAM for ANSI ISUP interface

This message is specified in [8] and [9]. It is necessary for the IAM to contain the information needed to route the call to the subscription network of the ported subscriber. The ways in which this may be coded are shown in [8] and [9].

A.4.2 Messages on the MSC - NPDB interface

A.4.2.1 INITIAL DP

This message is specified in [5]. The following information elements are required:

<table>
<thead>
<tr>
<th>Information element name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Key</td>
<td>M</td>
<td>Identifies the requested IN service (MNP query)</td>
</tr>
<tr>
<td>Called Party Number</td>
<td>M</td>
<td>The possibly ported MSISDN</td>
</tr>
</tbody>
</table>
A.4.2.2 INITIAL DP negative response

This message is specified in [5]. The negative response information element can take the following values:

1. missing parameter;
2. unexpected data value;
3. unexpected parameter;
4. system failure.

A.4.2.3 CONNECT

This message is specified in [5]. It shall be ensured that the information in the Connect message shall be aligned with the coding supported in the ISUP signalling.

A.4.2.4 CONTINUE

This message is specified in [5]. This message does not contain any information element.

A.4.2.5 RELEASE CALL

This message is specified in [5]. The following information elements are required:

<table>
<thead>
<tr>
<th>Information element name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cause</td>
<td>M</td>
<td>Indicates the reason for releasing the call</td>
</tr>
</tbody>
</table>

A.4.2.6 ProvideInstruction:Start

<table>
<thead>
<tr>

</tbody>
</table>

Note:

* = Value specific for number portability

1 = This mandatory parameter is required for the message but the content is not essential for number portability.
Annex B (normative):
Handling of Non-Call Related Signalling

B.1 Handling of Non-call Related Signalling

B.1.1 Routeing Conventions

Figure B.1.1 illustrates the routing of non-call related signalling messages between networks in a number portability environment.

If a non-call related signalling message is originated outside the portability domain, this message (1) is received by the number range holder network. The number range holder network routes the message (5) onward to the subscription network.

If a non-call related signalling message is originated in a network inside the portability domain and this network supports direct routing, this message (3) is routed to the subscription network.

If a non-call related signalling message is originated in a network inside the portability domain and this network does not support direct routing, the message (2, 4) is routed to the number range holder network. The number range holder network routes the message (5) onward to the subscription network. This is referred to as indirect routing.

B.1.2 Network Architecture

In a PLMN that supports MNP, non-call related signalling messages as mentioned in section B.1.1 are relayed by an MNP-Signalling Relay Function (MNP-SRF). The MNP-SRF provides re-routing capability for signalling messages addressed using the MSISDN. The MNP-SRF obtains routing information from the NP database to identify the subscription network associated with a particular national MSISDN. The interface between the MNP-SRF and the NP database is considered implementation dependent and is not detailed further. For further details see clause 4.3.
From the perspective of the PLMN in which the MNP-SRF resides, the MSISDN in the CdPA represents either:

1. An own number ported out.
2. An own number not ported out.
3. A foreign number ported in.
4. A foreign number ported to a foreign network.
5. A foreign number not known to be ported.

When a PLMN supports direct routeing (clause B.1.1), all non-call related signalling messages where the MSISDN in the CdPA belongs to a number range owned by a PLMN in the portability domain and all non-call related signalling messages which are relayed towards the network, are routed to the PLMN’s MNP-SRF for treatment.

In case 2 and 3 the MNP-SRF relays the message to the Subscriber Database supporting the Network Service e.g. HLR and Calling Name Database.

In case 1, 4 and 5 the MNP-SRF relays the message to subscription network.

When a PLMN does not support direct routeing, only non-call related signalling messages where the MSISDN in the CdPA belongs to a number range owned by the PLMN itself and all non-call related signalling messages which are relayed towards the network are routed to the PLMN’s MNP-SRF for treatment. All other messages are routed to the number range holder network.

For this routeing convention, only cases 1, 2 and 3 are applicable:

In case 2 and 3 the MNP-SRF relays the message to the Subscriber Database supporting the Network Service e.g. HLR and Calling Name Database.

In case 1 the MNP-SRF relays the message to the subscription network.
B.2 Signalling Scenarios

B.2.1 Non-call Related Signalling Message for a Non-ported Number – Indirect Routeing

Figure B.2.1 shows the MNP-SRF operation for routeing a non-call related signalling message for a non-ported number where the interrogating network is inside the portability domain and indirect routeing is used or the interrogating network is outside the portability domain.

Figure B.2.1: MNP-SRF operation for routeing a non-call related signalling message for a non-ported number where the interrogating network is inside the portability domain and indirect routeing is used or the interrogating network is outside the portability domain

NOTE: that the TT may have a different value, e.g. TT=17 in the case of CCBS Requests and TT=14 in the case of ANSI Routing of SRI_For_Short Message.

The Interrogating Network Entity (INE) submits a non-call related signalling message. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being non-ported using information that may be retrieved from an NP database. Figure B.2.1 shows an example where the MNP-SRF function then re-routes the message to HLRB.
B.2.2 Non-call Related Signalling Message for a Ported or Non-ported Number – Direct Routeing

Figure B.2.2 shows the MNP-SRF operation for routeing a non-call related signalling message for a ported or non-ported number where the interrogating network supports direct routeing. If the interrogating network is the subscription network, MNP-SRFA and MNP-SRFB coincide; i.e. the signalling message passes the MNP-SRF only once.

Figure B.2.2: MNP-SRF operation for routeing a non-call related signalling message for a ported or non-ported number where the interrogating network supports direct routeing

NOTE 1: the TT may have a different value, e.g. TT=17 in the case of CCBS Requests and TT=14 in the case of ANSI Routing of SRI_For_Short Message.

NOTE 2: the CdPA may have different values in the GT address and the nature of address fields.

The Interrogating Network Entity (INE) submits a non-call related signalling message. When MNP-SRFA receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the subscription network using information that may be retrieved from an NP database. The MNP-SRF function then modifies the CdPA according to the rules agreed for the portability domain and routes the message to MNP-SRFB in the subscription network.

When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information that may be retrieved from an NP database. Figure B.2.2 shows an example where the MNP-SRF function then re-routes the message to HLRB.
B.2.3 Non-call Related Signalling Message for a Ported Number - Indirect Routing

Figure B.2.3 shows the MNP-SRF operation for indirectly routing (i.e. via the number range holder network) a non-call related signalling message for a ported subscriber.

![Diagram](Insert_Diagram)

**NOTE 1:** the TT may have a different value, e.g. TT=17 in the case of CCBS Requests and TT=14 in the case of ANSI Routing of SRI_For_Short Message.

**NOTE 2:** the CdPA may have different values in the GT address and the nature of address fields.

The Interrogating Network Entity (INE) submits a non-call related signalling message. This message is routed on MSISDN global title to MNP-SRFA in the number range holder network.

When MNP-SRFA receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the subscription network using information that may be retrieved from an NP database. The MNP-SRF function then modifies the CdPA according to the rules agreed for the portability domain and routes the message to MNP-SRFB in the subscription network.

When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information that may be retrieved from an NP database. Figure B.2.3 shows an example where the MNP-SRF function then re-routes the message to HLRB.

B.3 Functional Requirements of Network Entities

B.3.1 Procedure MNP_SRF_Non_Call_Related

Figure B.3.1 shows the procedure MNP_SRF_Non_Call_Related. This procedure handles non-call related signalling messages. It is called from the process MNP_SRF (see chapter 4.3).

The check 'CdPA contains own number ported out?' identifies all mobile numbers from number ranges allocated to the network the MNP-SRF is located in and which are ported to other networks. In this case the message is relayed to the subscription network.
The check 'CdPA contains own number not ported out?' identifies all mobile numbers from the number ranges allocated to the network the MNP-SRF is located in and which are still served by the network the MNP-SRF is located in, i.e. the numbers are not ported out. In this case the message is relayed to the HLR in the network.

The check 'CdPA contains foreign number ported in?' identifies all mobile numbers from the number ranges not allocated to the network the MNP-SRF is located in and which are served by the network the MNP-SRF is located in, i.e. the numbers are ported in. In this case the message is relayed to the HLR in the network.

The check 'CdPA contains foreign number ported to a foreign network?' identifies all mobile numbers from the number ranges not allocated to the network the MNP-SRF is located in and which are not served by the network the MNP-SRF is located in and not served by the network the number range is allocated to, i.e. the numbers are ported to a foreign network. In this case the message is relayed to the subscription network.

The remaining numbers 'CdPA contains number not known to be ported ?' are mobile numbers from the number ranges not allocated to the network the MNP-SRF is located in and which are also not served by the network the MNP-SRF is located in. In this case the message is relayed to the number range holder network.

B.4  Signalling Scenarios (informative)

This (informative) chapter contains examples of signalling scenarios.

B.4.1  Delivery of SMS to a Non-ported Number – Direct Routeing – MNP-SRF acts as SCCP Relay

Figure B.4.1 shows the MNP-SRF operation for delivering an SMS message to a non-ported number.

1. The SMSC forwards a SM to the SMS-GMSC via a proprietary interface.
2. The SMS-GMSC generates a routeing enquiry for SM delivery. The MAP SRI_for_SM message is routed to the network's MNP-SRF.
3. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being non-ported using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
4. HLRB responds to the routeing enquiry by sending back an SRI_for_SM ack with the address of the VMSC.
5. The SMS-GMSC can now deliver the message to the VMSCB using a Forward_SMS message.
6. VMSCB further delivers the message to MSB.
B.4.2 Delivery of SMS to a Non-ported Number - Direct Routing – MNP-SRF acts as Higher-level Relay

Figure B.4.2 shows the MNP-SRF operation for delivering an SMS message to a non-ported number where the SRI_for_SM message is submitted by a national interrogating network. For further details of the higher level relay function (e.g. TC relay), the reader is referred to [7].

1. The SMSC forwards a SM to the SMS-GMSC via a proprietary interface.
2. The SMS-GMSC generates a routing enquiry for SM delivery. The MAP SRI_for_SM message is routed to the network’s MNP-SRF.
3. When MNP-SRFB receives the message it terminates the TCAP dialogue and an MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the TCAP portion of the message and identifies the MSISDN as being non-ported using information which may be retrieved from an NP database. The MNP-SRF function then initiates a new dialogue and routes the message to HLRB.
4. HLRB responds to the routing enquiry by sending back an SRI_for_SM ack with the address of the VMSC.
5. MNP-SRFB responds to the routing enquiry by sending back an SRI_for_SM ack with the address of the VMSC to the SMS-GMSC.
6. The SMS-GMSC can now deliver the message to the VMSCB using a Forward_SMS message.
7. VMSCB further delivers the message to MSB.
B.4.3 Delivery of SMS to a Ported Number – Indirect Routed

Figure B.4.3 shows the MNP-SRF operation for delivering an SMS message to a ported number where the interrogating network does not support direct routing.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRF(s). If the MNP-SRF(s) use(s) a higher-level relay function (e.g., TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

Figure B.4.3: SRF operation for delivering an SMS message to a ported number where the interrogating network does not support direct routing

1. The SMSC forwards a SM to the SMS-GMSC via a proprietary interface.
2. The SMS-GMSC generates a routeing enquiry for SM delivery. The MAP SRI_for_SM message is routed to the number range holder network’s MNP-SRF.
3. When MNP-SRF receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported using information which may be retrieved from an NP database. As the message is non-call related, the MNP-SRF function then populates the CdPA with either a routeing number or a concatenation of a routeing number and MSISDN. After modifying the CdPA, the message is routed to MNP-SRF in the subscription network.
4. When MNP-SRF receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
5. HLRB responds to the routing enquiry by sending back an SRI_for_SM ack with the address of the VMSC.
6. The SMS-GMSC can now deliver the message to the VMSCB using a Forward_SMS message.
7. VMSCB further delivers the message to MSB.

B.4.4 Delivery of SMS to a Ported Number – Direct Routeing

Figure B.4.4 shows the MNP-SRF operation for delivering an SMS message to a ported number where the interrogating network supports direct routing.
The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRFs. If the MNP-SRFs use a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

**Figure B.4.4: SRF operation for delivering an SMS message to a ported number where the interrogating network supports direct routing**

1. The SMSC forwards a SM to the SMS-GMSC via a proprietary interface.
2. The SMS-GMSC generates a routing enquiry for SM delivery. The MAP SRI_for_SM message is routed to the network’s MNP-SRF.
3. When MNP-SRFA receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported using information which may be retrieved from an NP database. As the message is non-call related, the MNP-SRF function then populates the CdPA with either a routing number or a concatenation of a routing number and MSISDN. After modifying the CdPA, the message is routed to MNP-SRFB in the subscription network.
4. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
5. HLRB responds to the routing enquiry by sending back an SRI_for_SM ack with the address of the VMSC.
6. The SMS-GMSC can now deliver the message to the VMSCB using a Forward_SMS message.
7. VMSCB further delivers the message to MSB.
B.4.5 International SOR for a Non-ported Number

Figure B.4.5 shows the MNP-SRF operation for optimally routeing an international call to a non-ported number.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRF. If the MNP-SRF uses a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

**Figure B.4.5: SRF operation for optimally routeing an international call to a non-ported number**

1. MSA originates a call to MSISDN.
2. VMSCA routes the call to the originating network’s GMSCA.
3. When GMSCA receives the ISUP IAM, it requests routeing information by submitting a MAP SRI with SOR parameter set to the number range holder network of the dialled MSISDN. Within the number range holder network, the message is routed to the network’s MNP-SRF.
4. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being non-ported using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
5. When HLRB receives the SRI, it responds to the GMSCA by sending back an SRI ack with a MSRN.
6. GMSCA uses the MSRN to route the call to VMSCB.
7. VMSCB further establishes a traffic channel to MSB.
B.4.6 SOR for a Ported Number – Indirect Routeing

Figure B.4.6 shows the MNP-SRF operation for optimally routeing a call (using SOR) to a ported number where the interrogating network does not support direct routeing.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRFs. If the MNP-SRFs use a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

Figure B.4.6: MNP-SRF operation for optimally routeing a call (using SOR) to a ported number where the interrogating network does not support direct routeing

1. MSA originates a call to MSISDN.
2. VMSCA routes the call to the network’s GMSCA.
3. When GMSCA receives the ISUP IAM, it requests routeing information by submitting a MAP SRI with SOR parameter set to the number range holder network of the dialled MSISDN. Within the number range holder network, the message is routed to the network’s MNP-SRF.
4. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported using information which may be retrieved from an NP database. As the message is non-call related, the MNP-SRF function then populates the CdPA with either a routeing number or a concatenation of a routeing number and MSISDN. After modifying the CdPA, the message is routed to MNP-SRFB in the subscription network.
5. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
6. When HLRB receives the SRI, it responds to the GMSCA by sending back an SRI ack with a MSRN.
7. GMSCA uses the MSRN to route the call to VMSCB.
8. VMSCB further establishes a traffic channel to MSB.
B.4.7 Any Time Interrogation for a Ported Number – Indirect Routeing

Figure B.4.7 shows the MNP-SRF operation for routeing an Any_Time_Interrogation message for a ported number where the interrogating network does not support direct routeing.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRFs. If the MNP-SRFs use a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

Figure B.4.7: MNP-SRF operation for routeing an Any_Time_Interrogation message for a ported number where the interrogating network does not support direct routeing

1. The gsmSCF generates an Any_Time_Interrogation (ATI) message. The message is routed to the number range holder network’s MNP-SRF.

2. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported using information which may be retrieved from an NP database. As the message is non-call related, the MNP-SRF function then populates the CdPA with either a routeing number or a concatenation of a routeing number and MSISDN. After modifying the CdPA, the message is routed to MNP-SRFB in the subscription network.

3. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.

4. HLRB responds to the ATI by sending back an ATI ack with the requested information.
B.4.8 Any Time Interrogation for a Ported Number – Direct Routeing

Figure B.4.8 shows the MNP-SRF operation for routeing an Any_Time_Interrogation message for a ported number where the interrogating network supports direct routeing.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRF. If the MNP-SRF uses a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

1. The gsmSCF generates an Any_Time_Interrogation (ATI) message. The message is routed to the network’s MNP-SRF.

2. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.

3. HLRB responds to the ATI by sending back an ATI ack with the requested information.
B.4.9 CCBS where the Busy Subscriber is a Ported Subscriber - Direct Routeing

Figure B.4.9 shows the MNP-SRF operation for routeing a CCBS Request for a ported number where the interrogating network supports direct routeing.

The message flows for this scenario are based on the use of an SCCP-relay function in the MNP-SRFs. If the MNP-SRFs use a higher-level relay function (e.g. TC-relay), then the response message will go via the MNP-SRF as shown in B.4.2. For further details of the signalling relay functions, the reader is referred to [7].

1. The VMSCA receives a ISUP Release message with cause value "subscriber busy" from VMSCB.
2. VLRA/VMSCA sends a Register_CC_Entry to HLRA using the HLRA address as CdPA on SCCP.
3. The HLRA sends a CCBS Request message to the networks MNP-SRFA.
4. When MNP-SRFA receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported using information which may be retrieved from an NP database. As the message is non-call related, the MNP-SRF function then populates the CdPA with either a routeing number or a concatenation of a routeing number and MSISDN. After modifying the CdPA, the message is routed to MNP-SRFB in the subscription network.
5. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an HLRB address. After modifying the CdPA, the message is routed to HLRB.
6. HLRB can now respond to HLRA by sending back a CCBSack message.
B.4.10 Calling Name Presentation Flows – MNP-SRF acts as SCCP Relay

Figure B.4.10 shows the MNP-SRF operation for delivering an CNAP message to an ANSI Calling Name Database.

1. An incoming call (an Initial Address message with Generic Name parameter set to ‘presentation allowed’ is received at a MSC. The MSC interrogates the VLR to determine if the called party is subscribed to the CNAP service. The VLR Response indicates that the called party is subscribed to CNAP;

2. The MSC generates a TCAP message ‘Query With Permission’. The Query With Permission message is routed to the network’s MNP-SRF;

3. When MNP-SRFB receives the message, MNP-SRF operation is triggered. The MNP-SRF functionality analyses the MSISDN in the CdPA and identifies which CNDB the MSISDN is populated using information which may be retrieved from an NP database. The MNP-SRF function then populates the CdPA with an CNDB address. After modifying the CdPA, the message is routed to CNDB;

4. CNDB responds to the routing enquiry by sending back a Query With Permission ack with the address of the MSC. The MSC can now deliver the Calling Name to the terminating subscriber.
Annex C (normative):
MNP Signalling Relay Function - Call Related Signalling

C.1 Handling of Call Related Signalling

The MAP messages affected by MNP are the MAP_SEND_ROUTING_INFORMATION (SRI) message without OR parameter set sent to the HLR and the MAP_ANY_TIME_INTERROGATION (ATI) message with parameter MNP-requestedInfo present terminated in the MNP-SRF.

In a PLMN supporting MNP with direct routeing using signalling relay, all incoming calls and calls originated in the network for which the called party number is within the ranges owned by any network in the portability domain, the gateway MSCs will send an SRI such that it will be handled by the MNP-SRF in that network.

In a PLMN supporting MNP with direct routeing, where the called party number is within the ranges owned by any network in the portability domain, the INE sends an MNP Information request (ATI) such that it will be handled by the MNP-SRF in the network.

In a PLMN supporting MNP with indirect routeing using signalling relay, all incoming calls and calls originating in the network, for which the called party number is within the range owned by the network, the gateway MSCs will send SRI such that it will be handled by the MNP-SRF in that network.

In a PLMN supporting MNP with indirect routeing, the INE sends an MNP Information Request (ATI) such that it will be handled by the MNP-SRF in the Number Range Holder Network.

The MNP-SRF obtains routeing information from the NP database to identify the subscription network associated with a particular national MSISDN. The interface between the MNP-SRF and the NP database is considered implementation dependent and is not detailed further.

From the perspective of the PLMN in which the MNP-SRF resides, the CdPA represents one of:

1. An own number ported out.
2. An own number not ported out.
3. A foreign number ported in.
4. A foreign number ported to a foreign network.
5. A foreign number not known to be ported.

Cases 4 and 5 are applicable only for direct routeing.

For SRI:

In case 1, the MNP-SRF may perform one of the following depending on agreements within the number portability domain.

a. An SRI response is sent containing the necessary routeing information to route the call to the subscription network. This is performed by an internal MAP Application Termination Function (MATF) known as the Number Portability Location Register (NPLR).

b. If indirect routeing of calls with reference to the subscription network is used, the message is relayed to the MNP-SRF in the subscription network, whose NPLR provides the necessary routeing information in an SRI response. The use of an NPLR in the subscription network can only be by agreement within the number portability domain.

In cases 2 and 3, the MNP-SRF relays the message to the HLR. For further details of the signalling relay function, the reader is referred to [7].

In case 4, an SRI response is sent, containing the necessary routeing information to route the call to the subscription network.
In case 5, an SRI response is sent, containing the necessary routeing information to route the call to the number range holder network.

For ATI:

In all cases the MNP information request (ATI) is sent to the MNP_SRF_MATF_Info_Request procedure/ MAP Application Termination Function (MATF) for handling. A response is sent to the INE containing MNP information or an error is returned.

---

C.2 Functional Requirements of Network Entities

C.2.1 Procedure MNP_SRF_MATF_Call_Related

Figure C.2.2 shows the procedure MNP_SRF_MATF_Call_Related. This procedure handles call-related signalling messages. It is called from the process MNP_SRF (see clause 4.3).

The check ‘message has been relayed’ identifies all call related signalling messages which are relayed from the number range holder network towards the subscription network in the case of Indirect Routeing with reference to subscription network implementation. These messages only refer to numbers ported into the network.

The check ‘own number not ported out’ identifies all mobile numbers from number ranges allocated to the network the MNP-SRF/MATF is located in and which are not ported to other networks. In this case the call related message is relayed to the HLR in the network.

The check ‘foreign number ported in’ identifies all mobile numbers from the number ranges not allocated to the network the MNP-SRF/MATF is located in and which are served by the network the MNP-SRF/MATF is located in. In this case the call related message is relayed to the HLR in the network.

The check ‘foreign number not known to be ported’ identifies all mobile numbers from the number ranges not allocated to the network the MNP-SRF/MATF is located in and which are not served by the network the MNP-SRF/MATF is located in. In this case the call related message is sent to the SRF_MATF procedure for handling.

The check ‘foreign number ported to foreign network’ identifies all mobile numbers from the number ranges not allocated to the network the MNP-SRF/MATF is located in and which are not served by the network the MNP-SRF/MATF is located in and not served by the network the number range is allocated to, i.e. the number is ported between two other networks. In this case the call related message is sent to the SRF_MATF procedure for handling.

The remaining cases ‘own number ported out’ are mobile numbers allocated to the network the MNP-SRF/MATF is located in and which are served by other networks, i.e. the number is ported out to another network. In this case the call is relayed to the MATF in the subscription network if this option is the one used by the operator, or sent to the SRF_MATF procedure for handling if not.

C.2.2 Process SRI_NPLR

Figure C.2.2.2 shows the process SRI_NPLR.

The check ‘unknown subscriber’ identifies a subscriber without any associated available information.

If the GMSC is in the database own network then a routeing number is provided to route to the number range holder network.

If the GMSC is not in the database own network then the enquiry has been routed from the number range holder network, so the call should fail.

The database query uses the MSISDN received at the application level in the SRI, rather then the CdPA of the SCCP level.

If an error must be set as a result of the check ‘terminate’, the user error ‘unknown subscriber’ shall be used. If version 3 or higher of the MAP protocol is in use, then the diagnostic ‘NPDB mismatch’ may be used.
The check 'HPLMN MSISDN Range' identifies if the MSISDN received in the SRI exists in a MSISDN Range owned by the HPLMN. This is a North American Network implementation option and allows a MAP Error 'Unknown Subscriber' to be sent to the GMSC instead of the MSISDN.

The check 'HPLMN RN Range' identifies if the Routeing Number assigned to the MSISDN within the SRI_NPLR is assigned to the HPLMN. This is a North American Network implementation option and allows a MAP Error 'Unknown Subscriber' to be sent to the GMSC instead of the RN+MSISDN.

C.2.3 Procedure MNP_SRF_MATF_Info_Request

Figure C.2.3.1 shows the procedure MNP_SRF_MATF_Info_Request. This procedure handles an information request signalling message to provide MNP information for a subscriber. It is called from the process MNP_SRF (see clause 4.3).

C.2.4 Process ATI_NPLR

Figure C.2.3.2 shows the process ATI_NPLR.

The database query uses the MSISDN received at the application level in the ATI, rather than the CdPA of the SCCP level.
Procedure MNP_SRF_MATF_Call_Related

C.3 Call Scenarios

The notation TT=SRI in diagrams in this section assumes that SRI="CRMNP for ETSI and SRI = Translation Type 14 for ANSI. The use of other translation types is for further study. The message flows for the following scenarios are based on the use of an SCCP relay function in MNP-SRF(s). The message flows for the higher level relay function (e.g.
TC relay in MNP-SRF are not covered here, but the principle can be found in B.4.2. For further details of the signalling relay function, the reader is referred to [7].

C.3.1 Call to a Non-Ported Number or Number Ported into the Network

Figure C.3.1 shows the signalling involved for a call to a non-ported number or number ported into the network (see 3G TS 23.018 [3]).

**Figure C.3.1: Call to a non-ported number**

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the subscription network being the number range holder network, if the number is non-ported.

2. When GMSCB receives the ISUP IAM, it requests routing information by submitting a MAP SRI to the MNP_SRF/MATF. The TT on SCCP may be set to "SRI".

3. When the MNP_SRF/MATF receives the message, the MNP_SRF/MATF analyses the MSISDN in the CdPA and identifies the MSISDN as being non-ported. The MNP_SRF/MATF function then replaces the CdPA by an HLRB address. After modifying the CdPA, the message is routed to HLRB.

4. When HLRB receives the SRI, it responds to the GMSCB by sending an SRI ack with an MSRN that identifies the MSB in the VMSCB.

5. GMSCB uses the MSRN to route the call to VMSCB.
C.3.2 Call to a Ported Number – Originating Network = Subscription Network – Direct Routeing

Figure C.3.2 shows the signalling involved for a call to a ported number via direct routing where the call is originated in the subscription network.

1. MSA originates a call to MSISDN.
2. VMSCA routes the call to the network’s GMSCA.
3. When GMSCA receives the ISUP IAM, it requests routing information by submitting a MAP SRI to the MNP_SRF/MATF. The TT on SCCP may be set to "SRI".
4. When the MNP_SRF/MATF receives the message, it analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network. The MNP_SRF/MATF function then replaces the CdPA by an HLRA address. After modifying the CdPA, the message is routed to HLRA.
5. When HLRA receives the SRI, it responds to the GMSCA by sending an SRI ack with an MSRN that identifies the MSB in the VMSCB.
6. GMSCA uses the MSRN to route the call to VMSCB.
C.3.3 Mobile Originated Call to a Ported or not known to be Ported Number – Originating Network ≠ Subscription Network – Direct Routening

Figure C.3.3 shows the signalling involved for a national mobile originated call to a number not Subscribed in the originating network via direct routening. The scenario describes signalling in the originating network using direct routening in the cases when an own number is ported out, a foreign number is not known to be ported or a foreign number is ported to other foreign network.

**Figure C.3.3: National mobile originated call to a ported number via direct routening**

1. MSA originates a call to MSISDN.
2. VMSCA routes the call to the network’s GMSCA.
3. When GMSCA receives the ISUP IAM, it requests routening information by submitting a MAP SRI to the MNP_SRF/MATF. The TT on SCCP may be set to "SRI".
4. When the MNP_SRF/MATF receives the message, it analyses the MSISDN in the CdPA and identifies the MSISDN as not known to be ported or being ported to another network. As the message is a SRI message, the MNP_SRF/MATF responds to the GMSCA by sending an SRI ack with a RN + MSISDN; For the case the number is not known to be ported the routening number may be omitted.
5. GMSCA uses the (RN +) MSISDN to route the call to GMSCB in the subscription network. Depending on the interconnect agreement, the RN will be added in the IAM or not.
C.3.4 Call to a Ported Number – Indirect Routing

Figure C.3.4 shows the signalling involved for a call to a ported number via indirect routing.

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the number range holder network.

2. When GMSCA in the number range holder network receives the ISUP IAM, it requests routing information by submitting a MAP SRI to MNP_SRV/MATF. The TT on SCCP may be set to “SRI”.

3. When the MNP_SRV/MATF receives the message, it analyses the MSISDN in the CdPA and identifies the MSISDN as being ported to another network. As the message is an SRI message, the MNP_SRV/MATF responds to the GMSCA by sending an SRI ack with a RN + MSISDN.

4. GMSCA uses the RN + MSISDN to route the call to GMSCB in the subscription network. Depending on the interconnect agreement, the RN will be added in the IAM or not.

![Figure C.3.4: Call to a ported number via indirect routing](image-url)
C.3.5 Call to a Ported Number – Indirect Routing with Reference to Subscription Network

Figure C.3.5 shows the signalling involved for a call to a ported number where indirect routing with reference to the subscription network is used.

1. From an Originating Exchange a call is set up to MSISDN. The call is routed to the number range holder network.
2. When GMSCA in the number range holder network receives the ISUP IAM, it requests routing information by submitting a MAP SRI to the MNP_SRF/MATF. The TT on SCCP may be set to "SRI".
3. When MNP_SRF/MATF receives the message, MNP_SRF/MATF operation is triggered. The MNP_SRF/MATF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported to another network. As the message is a SRI message, the MNP_SRF/MATF function relays the message to the subscription network by adding a routing number to the CdPA which information may be retrieved from a database. After modifying the CdPA, the message is routed to the subscription network.
4. When MNP_SRF/MATF in the subscription network receives the SRI, it responds to the GMSCA in the number range holder network by sending a SRI_ack with a RN + MSISDN.
5. GMSCA uses the (RN +) MSISDN to route the call to GMSCB in the subscription network; Depending on the interconnect agreement, the RN will be added in the IAM or not.
6. When GMSCB in the subscription network receives the ISUP IAM, it requests routing information by submitting a MAP SRI to MNP_SRF/MATF. The TT on SCCP may be set to "SRI".
7. When MNP_SRF/MATF receives the message, MNP_SRF/MATF operation is triggered. The MNP_SRF/MATF functionality analyses the MSISDN in the CdPA and identifies the MSISDN as being ported into the network. The MNP_SRF/MATF function then replaces the CdPA by an HLRB address which information may be retrieved from a database. After modifying the CdPA, the message is routed to HLRB.
8. When HLRB receives the SRI, it responds to the GMSCB by sending an SRI_ack with an MSRN that identifies the MSB in the VMSCB.
9. GMSCB uses the MSRN to route the call to VMSCB.

NOTE: The MNP_SRF/MATF in this scenario has only information about all ported numbers to one subscription network, except those for which subscription information is held in the subscription networks HLR. In this scenario the routing depends always on the number range holder and the subscription network.
C.3.6 MNP Info Query - Direct Routeing

In a PLMN using a MNP-SRF based MNP solution supporting direct routeing, the INE always sends the MNP information request, containing the CdPA, to the MNP-SRF in that network.

The INE may query the MNP information for the called party number or the calling party number.

The INE requesting MNP information may be a gsmSCF for prepaid services (see 3GPP TS 23.078 [18]).

In order to provide enough information for a CAMEL SCP to charge correctly for CAMEL Pre-Paid Calls and SMS to national MSISDNs originated in the HPLMN, operators should ensure that the NPDB contains, at least, MNP information for “own numbers ported out” and “foreign numbers ported in”.

Figure C.3.6: MNP-SRF operation for providing MNP Information where direct routeing applies
C.3.7 MNP Info Query - Indirect Routeing

The Interrogating Network Entity (INE) submits a MNP Information request message to the MNP-SRFB, which triggers MNP-SRF operation. The MNP-SRF functionality analyses the MSISDN in the application level and queries an MNP database to get the MNP information. The INE may query the MNP information for the called party number or the calling party number.

The INE requesting MNP information may be a gsmSCF for prepaid services (see 3GPP TS 23.078 [18]).
C.4 Information Flows

Figure C.4.1 shows the information flow for a successful delivery of a call to a non-ported number or number ported into the network. The figure is related to figure C.3.1.

Figure C.4.1: Successful delivery of a call to a non-ported subscriber or number ported into the network
Figure C.4.2 shows the signalling involved for a call to a ported number via direct routing where the call is originated in the subscription network. The figure is related to figure C.3.2.

Figure C.4.2: Successful delivery of a call to a ported number via direct routing where the call is originated in the subscription network.
Figure C.4.3 shows the signalling involved for a national mobile originated call to a ported number via direct routeing. The figure is related to figure C.3.3.

Figure C.4.3: Successful delivery of a national mobile originated call to a ported number via direct routeing
Figure C.4.4 shows the signalling involved for a national mobile originated call to a not known to be ported number via direct routeing. The figure is related to figure C.3.3.

Figure C.4.4: Successful delivery of a national mobile originated call to a not known to be ported number via direct routeing
Figure C.4.5 shows the signalling involved for a call to a ported number via indirect routing. The figure is related to figure C.3.4.

**Figure C.4.5: Successful delivery of a call to a ported number via indirect routing**
Figure C.4.6 shows the signalling involved for a call to a ported number where indirect routeing with reference to the subscription network is used. The figure is related to figure C.3.5.

Figure C.4.6: Successful delivery for a call to a ported number where indirect routeing with reference to the subscription network is used

C.5 Contents of the messages

This clause contains detailed description of the messages shown in this part B of the specification.

The contents of the messages used on the gsmSCF – MNP-SRF interface are specified in 3G TS 23.078 [19]. When the message is sent from the NPLR to the gsmSCF, the MNP specific information are defined as in clause C.5.2. The gsmSCF may transit the information received from NPLR to the gateway MSC with the CAP Connect message in order to avoid a subsequent SRI message.
C.5.1 Send Routeing Info

The contents of this message are specified in 3G TS 23.018 [3].

C.5.2 Send Routeing Info ack

The contents of this message are specified in 3G TS 23.018 [3]. In the case that the message is sent from the NPLR to the GMSC, the following MNP specific information is defined:

<table>
<thead>
<tr>
<th>Information element name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Imsi</td>
<td>M</td>
<td>The IMSI returned by an NPLR is a generic IMSI, i.e. it is not tied necessarily to the Subscriber. MCC and MNC values in this IMSI shall point to the Subscription Network of the B Subscriber.</td>
</tr>
<tr>
<td>Msrn</td>
<td>C</td>
<td>When returned from the NPLR, this parameter contains a Routeing Number that points to Subscription Network. If concatenate addressing is used, it also contains the MSISDN in addition to the Routeing Number. In the case of a number which is not known to be ported, the Routeing Number may be omitted as an operator option. If the routeing number is omitted, this parameter contains only the MSISDN.</td>
</tr>
<tr>
<td>Msisdn</td>
<td>C</td>
<td>MSISDN of the B subscriber. This information element shall be present if MSRN contains the routeing number to reach the subscription network for B subscriber and the MSISDN is not contained in the MSRN information element.</td>
</tr>
<tr>
<td>MNP Indicator</td>
<td>U</td>
<td>Indicates the number portability status of the subscriber.</td>
</tr>
</tbody>
</table>

C.6 Handling of MAP to ISUP mapping (informative)

Different configurations can be possible within a portability domain depending on the versions of MAP and ISUP protocols being used. The following sections describe possible interworking scenarios.

C.6.1 ETSI Mapping direction: ISUP to MAP

The GMSC always constructs the Send Routeing Info message using the MSISDN. If the incoming IAM corresponds to a ported number the GMSC shall retrieve the MSISDN from the corresponding parameter in the IAM.

C.6.2 ETSI Mapping direction: MAP to ISUP

In MAP SRIack messages from NPLR, MAP versions 1 and 2 only support concatenate addressing for MNP. If MSISDN parameter is present in the SRIack, this means that separate addressing is used in MAP; this is only possible if MAP version 3 is used. MAP version 3 can also support concatenate addressing. In all cases, when a Routeing Number is returned, it is included in the MSRN parameter of the SRIack.

Regardless of how MAP is established, the possible mappings of the parameters in ISUP IAM message is one of these 4 options (see also [6]):

1. CdPN parameter includes only the MSISDN.
2. CdPN parameter includes both RN and MSISDN concatenated.
3. CdPN parameter includes the MSISDN and NRN parameter includes the Routeing Number.
4. CdPN parameter includes the Routeing Number and CDN parameter includes the MSISDN.

In all cases, the method to transport the routeing number in the IAM depends on the interfaces agreed by the operators in the portability domain.
C.6.3 ANSI Mapping direction: ISUP to MAP

The GMSC always constructs the Send Routing Info message using the MSISDN. If the incoming IAM corresponds to a ported number the GMSC shall retrieve the MSISDN from the corresponding parameter in the IAM.

The IAM message is specified for ANSI ISUP implementation in [8] and [9].

C.6.4 ANSI Mapping direction: MAP to ISUP

In MAP SRlack messages from NPLR, MAP versions 1 and 2 only support concatenate addressing for MNP. If MSISDN parameter is present in the SRI Ack, this means that separate addressing is used in MAP; this is only possible if MAP version 3 is used. MAP version 3 can also support concatenate addressing. In all cases, when a Routing Number is returned, it is included in the MSRN parameter of the SRI Ack.

Regardless of how MAP is established, the possible mappings of the parameters in ISUP IAM message is one of these 4 options (see also [8] and [9]):

<table>
<thead>
<tr>
<th>MAP Parameters</th>
<th>SRI Ack</th>
<th>ISUP Parameters</th>
<th>IAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSI</td>
<td>Subscriber IMSI</td>
<td>CdPN</td>
<td>MSRN</td>
</tr>
<tr>
<td>MSRN</td>
<td>MSRN</td>
<td>MAPS TO</td>
<td>GAP</td>
</tr>
<tr>
<td>MSISDN</td>
<td>Not Present</td>
<td>FCI Bit M Indicator</td>
<td>1</td>
</tr>
<tr>
<td>MNP Indicator</td>
<td>Not Present</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>MAP Parameters</th>
<th>SRI Ack</th>
<th>ISUP Parameters</th>
<th>IAM</th>

</tr>
<tr>
<td>MSISDN</td>
<td>Not Present</td>
<td>FCI Bit M Indicator</td>
<td>1</td>
</tr>
<tr>
<td>MNP Indicator</td>
<td>NotKnownToBePorted</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>MAP Parameters</th>
<th>SRI Ack</th>
<th>ISUP Parameters</th>
<th>IAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSI</td>
<td>Default IMSI</td>
<td>CdPN</td>
<td>RN</td>
</tr>
<tr>
<td>MSRN</td>
<td>RN</td>
<td>MAPS TO</td>
<td>GAP</td>
</tr>
<tr>
<td>MSISDN</td>
<td>Dialled DN</td>
<td>FCI Bit M Indicator</td>
<td>1</td>
</tr>
<tr>
<td>MNP Indicator</td>
<td>OwnNumber PortedOut</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAP Parameters</td>
<td>SRI Ack</td>
<td>ISUP Parameters</td>
<td>IAM</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------</td>
<td>--------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>IMSI</td>
<td>Default IMSI</td>
<td>CdPN</td>
<td>RN</td>
</tr>
<tr>
<td>MSRN</td>
<td>RN</td>
<td>MAPS TO</td>
<td>GAP</td>
</tr>
<tr>
<td>MSISDN</td>
<td>Dialled DN</td>
<td></td>
<td>FCI Bit M Indicator</td>
</tr>
<tr>
<td>MNP Indicator</td>
<td>Foreign Number</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>PortedToForeign</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Network</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In all cases, the method to transport the routing number in the IAM depends on the interfaces agreed by the operators in the portability domain.
