Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECTTM, **PLUGTESTS**TM, **UMTS**TM and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP**TM and **LTE**TM are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M**TM logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM**[®] and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under https://webapp.etsi.org/key/queryform.asp.

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the <u>ETSI Drafting Rules</u> (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document describes a generic frame format for the Adaptive Multi-Rate (AMR) speech codec and the Enhanced Full Rate (GSM-EFR) speech codec. This format shall be used as a common reference point when interfacing speech frames between different elements of the 3G system and between different systems. Appropriate mappings to and from this generic frame format will be used within and between each system element.

Annex A describes a second frame format which shall be used when octet alignment of AMR frames is required.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

 TS 46.062: "EFR Speech Codec; Comfort Noise Aspects".

3 Definitions and Abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

AMR mode: one of the eight AMR codec bit-rates denoted also with indices 0 to 7 where 0 maps to the 4.75 kbis/s mode and 7 maps to the 12.2 kbit/s mode.

AMR codec mode: same as AMR mode.

RX_TYPE: classification of the received frame as defined in [2].

TX_TYPE: classification of the transmitted frame as defined in [2].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| CRC | Cyclic Redundancy Check |
|-----|--|
| FQI | Frame Quality Indicator |
| GSM | Global System for Mobile communication |
| LSB | Least Significant Bit |
| MSB | Most Significant Bit |
| RX | Receive |
| PDC | Personal Digital Communication (ARIB standard) |

SCR Source Controlled Rate operation

SID Silence Descriptor (Comfort Noise Frame)
TDMA Time Division Multiple Access (IS-641)

TX Transmit

4 AMR codec frame format (AMR IF1)

This clause describes the generic frame format for both the speech and comfort noise frames of the AMR speech codec. This format is referred to as AMR Interface Format 1 (AMR IF1). Annex A describes AMR Interface Format 2 (AMR IF2).

Each AMR codec mode follows the generic frame structure depicted in figure 1. The frame is divided into three parts: AMR Header, AMR Auxiliary Information, and AMR Core Frame. The AMR Header part includes the Frame Type and the Frame Quality Indicator fields. The AMR auxiliary information part includes the Mode Indication, Mode Request, and Codec CRC fields. The AMR Core Frame part consists of the speech parameter bits or, in case of a comfort noise frame, the comfort noise parameters bits. In case of a comfort noise frame, the comfort noise parameters replace Class A bits of AMR Core Frame while Class B and C bits are omitted.

Figure 1: Generic AMR frame structure

4.1 AMR Header and AMR Auxiliary Information

This subclause describes the AMR Header of figure 1.

4.1.1 Frame Type, Mode Indication, and Mode Request

Table 1a defines the 4-bit Frame Type field. Frame Type can indicate the use of one of the eight AMR codec modes, one of four different comfort noise frames, or an empty frame. In addition, three Frame Type Indices are reserved for future use. The same table is reused for the Mode Indication and Mode Request fields which are 3-bit fields each and are defined only in the range 0...7 to specify one of the eight AMR codec modes.

Table 1a: Interpretation of Frame Type, Mode Indication and Mode Request fields

| Frame Type | Mode Indication | Mode Request | Frame content (AMR mode, comfort noise, or other) |
|---------------|--------------------|-----------------|---|
| 0 | 0 | 0 | AMR 4,75 kbit/s |
| 1 | 1 | 1 | AMR 5,15 kbit/s |
| 2 | 2 | 2 | AMR 5,90 kbit/s |
| 3 | 3 | 3 | AMR 6,70 kbit/s (PDC-EFR) |
| 4 | 4 | 4 | AMR 7,40 kbit/s (TDMA-EFR) |
| 5 | 5 | 5 | AMR 7,95 kbit/s |
| 6 | 6 | 6 | AMR 10,2 kbit/s |
| 7 | 7 | 7 | AMR 12,2 kbit/s (GSM-EFR) |
| 8 | - | - | AMR SID |
| 9 | - | - | GSM-EFR SID |
| 10 | - | - | TDMA-EFR SID |
| 11 | - | - | PDC-EFR SID |
| 12-14 | - | - | For future use |
| 15 | - | - | No Data (No transmission/No reception) |

4.1.2 Frame Quality Indicator

The content of the Frame Quality Indicator field is defined in Table 1b. The field length is one bit. The Frame Quality Indicator indicates whether the data in the frame contains errors.

Table 1b: Definition of Frame Quality Indicator

| Frame Quality Indicator (FQI) | Quality of data |
|-------------------------------|--|
| 0 | Bad frame or Corrupted frame |
| | (bits may be used to assist error concealment) |
| 1 | Good frame |

4.1.3 Mapping to TX_TYPE and RX_TYPE

Table 1c shows how the AMR Header data (FQI and Frame Type) maps to the TX_TYPE and RX_TYPE frames defined in [2].

TX_TYPE or **Frame** Frame Type Comment Quality **RX_TYPE** Index Indicator 0-7 SPEECH_GOOD The specific Frame Type Index depends on the bit-rate being used. The specific Frame Type Index depends on the bit-rate 0 0-7 SPEECH_BAD being used. The corrupted data may be used to assist error concealment. For AMR: SID_FIRST and SID_UPDATE 1 8 SID_FIRST or 8 SID_UPDATE are differentiated using one Class A bit: STI. 0 8 SID_BAD For AMR For GSM-EFR 9 **GSM-EFR SID** 1 For GSM-EFR 0 9 **GSM-EFR** SID_BAD SID_UPDATE For TDMA-EFR and PDC-EFR 10-11 SID_BAD For TDMA-EFR and PDC-EFR 0 10-11 NO DATA Typically a non-transmitted frame or an erased or 15 stolen frame with no data usable to assist error concealment.

Table 1c: Mapping of Frame Quality Indicator and Frame Type to TX_TYPE and RX_TYPE [2], respectively

4.1.4 Codec CRC

Generic AMR codec frames with Frame Type 0.11 are associated with an 8-bit CRC for error-detection purposes. The Codec CRC field of AMR Auxiliary Information in figure 1 contains the value of this CRC. These eight parity bits are generated by the cyclic generator polynomial:

-
$$G(x)=D^8+D^6+D^5+D^4+1$$

which is computed over all Class A bits of AMR Core Frame. Class A bits for Frame Types 0.7 are defined in subclause 4.2.2 (for speech bits) and for Frame Types 8.11 in subclause 4.2.3 (for comfort noise bits).

When Frame Type Index of table 1a is 15 the CRC field is not included in the Generic AMR frame.

4.2 AMR Core Frame

This subclause contains the description of AMR Core Frame of figure 1. The descriptions for AMR Core Frame with speech bits and with comfort noise bit are given separately.

4.2.1 AMR Core Frame with speech bits: Bit ordering

This subclause describes how AMR Core Frame carries the coded speech data. The bits produced by the speech encoder are denoted as $\{s(1), s(2), ..., s(K)\}$, where K refers to the number of bits produced by the speech encoder as shown in table 2. The notation s(i) follows that of [1]. The speech encoder output bits are ordered according to their subjective importance. This bit ordering can be utilized for error protection purposes when the speech data is, for example, carried over a radio interface. Tables B.1 to B.8 in Annex B define the AMR IF1 bit ordering for all the eight AMR codec modes. In these tables the speech bits are numbered in the order they are produced by the corresponding speech encoder as described in the relevant tables of TS 26.090 [1]. The reordered bits are denoted below, in the order of decreasing importance, as $\{d(0), d(1), ..., d(K-1)\}$.

The ordering algorithm is described in pseudo code as:

- for j = 0 to K-1
- $d(j) := s(table_m(j)+1);$

where $table_m(j)$ refers to the relevant table in Annex B depending on the AMR mode m=0..7. The Annex B tables should be read line by line from left to right. The first element of the table has the index 0.

4.2.2 AMR Core Frame with speech bits: Class division

The reordered bits are further divided into three indicative classes according to their subjective importance. This class division is only informative and provides supporting information for mapping this generic format into specific formats. The three different importance classes can then be subject to different error protection in the network.

The importance classes are Class A, Class B, and Class C. Class A contains the bits most sensitive to errors and any error in these bits typically results in a corrupted speech frame which should not be decoded without applying appropriate error concealment. This class is protected by the Codec CRC in AMR Auxiliary Information. Classes B and C contain bits where increasing error rates gradually reduce the speech quality, but decoding of an erroneous speech frame is usually possible without annoying artefacts. Class B bits are more sensitive to errors than Class C bits. The importance ordering applies also within the three different classes and there are no significant step-wise changes in subjective importance between neighbouring bits at the class borders.

The number of speech bits in each class (Class A, Class B, and Class C) for each AMR mode is shown in table 2. The classification in table 2 and the importance ordering d(j), together, are sufficient to assign all speech bits to their correct classes. For example, when the AMR codec mode is 4.75, then the Class A bits are d(0)..d(41), Class B bits are d(42)..d(94), and there are no Class C bits.

| Frame Type | AMR codec mode | Total number of bits | Class A | Class B | Class C |
|------------|----------------------|----------------------------|---------|---------|---------|
| 0 | 4,75 | 95 | 42 | 53 | 0 |
| 1 | 5,15 | 103 | 49 | 54 | 0 |
| 2 | 5,90 | 118 | 55 | 63 | 0 |
| 3 | 6,70 | 134 | 58 | 76 | 0 |
| 4 | 7,40 | 148 | 61 | 87 | 0 |
| 5 | 7,95 | 159 | 75 | 84 | 0 |
| 6 | 10,2 | 204 | 65 | 99 | 40 |
| 7 | 12,2 | 244 | 81 | 103 | 60 |

Table 2: Number of bits in Classes A, B, and C for each AMR codec mode

4.2.3 AMR Core Frame with comfort noise bits

The AMR Core Frame content for the additional frame type with Frame Type Index 8 in table 1a is described in this subclause. This consists of the frame related to Source Controlled Rate Operation specified in [2].

The data content (comfort noise bits) of the additional frame types is carried in AMR Core Frame. The comfort noise bits are all mapped to Class A of AMR Core Frame and Classes B and C are not used. This is a notation convention only and the class division has no meaning for comfort noise bits.

The number of bits in each class (Class A, Class B, and Class C) for the AMR comfort noise bits (Frame Type Index 8) is shown in table 3. The contents of SID_UPDATE and SID_FIRST are divided into three parts (SID Type Indicator (STI), Mode Indication (mi(i)), and Comfort Noise Parameters (s(i)) as defined in [2]. In case of SID_FIRST the Comfort Noise Parameters bits (s(i)) shall be set to "0".

The comfort noise parameter bits produced by the AMR speech encoder are denoted as $s(i) = \{s(1), s(2), ..., s(35)\}$. The notation s(i) follows that of [3]. These bits are numbered in the order they are produced by the AMR encoder without any reordering. These bits are followed by the SID Type Indicator **STI** and the Mode Indication $mi(i) = \{mi(0), mi(1), mi(2)\} = \{LSB ... MSB\}$. Thus, the AMR SID or comfort noise bits $\{d(0), d(1), ..., d(38)\}$ are formed as defined by the pseudo code below.

- for j = 0 to 34;
- d(j) := s(j+1);
- $d(35) := \mathbf{STI};$
- for j = 36 to 38;
- d(j) := mi(j-36). Note: This mapping is different to the usual mapping: LSB first.

Note: The alternative would be: d(j) := mi(38-j): MSB first.

Table 3. Bit classification for Frame Type 8 (AMR SID)

| Frame Type Index | FQI | AMR TX_TYPE or RX_TYPE | Total number of bits | | Class A | | Class B | Class C |
|------------------------|-----|------------------------------|----------------------------|--------------------------------|-----------------------------|---------------------------------------|---------|---------|
| | | | | SID Type Indicator (STI) | Mode Indication mi(i) | Comfort Noise Parameter s(i) | | |
| 8 | 1 | SID_UPDATE | 39 | 1 (= "1") | 3 | 35 | 0 | 0 |
| 8 | 1 | SID_FIRST | 39 | 1 (= "0") | 3 | 35 (= "0") | 0 | 0 |
| 8 | 0 | SID_BAD | 39 | 1 | 3 | 35 | 0 | 0 |

The number of bits in each class (Class A, Class B, and Class C) for the comfort noise bits of Frame Types 9-11 is shown in Table 7.

Table 4: void

4.3 AMR frame composition

The generic AMR frame is formed as a concatenation of AMR Header, AMR Auxiliary Information and the AMR Core Frame, in this order. The MSB of the Frame Type is placed in bit 8 of the first octet (see example in table 5 below), the LSB of the Frame Type is placed in bit 5. Then the next parameter follows, which is the Frame Quality Indicator, and so on. Between Mode Request and Codec CRC five spare bits are inserted to align the Codec CRC and the AMR Core frame to the octet boundary. The first bit of the AMR Core frame d(0) is placed in bit 8 of octet 4. The last bit of the generic AMR frame is the last bit of AMR Core Frame, which is the last bit of speech bits or the last bit of comfort noise bits, as defined in subclauses 4.2.1 and 4.2.3. Table 5 shows the composition for the example of the Codec Mode 6.7kbit/s and table 6 shows the composition for the AMR SID frame.

Table 5: Mapping of an AMR speech coding mode into the generic AMR frame, AMR IF1, example: AMR 6.7 kbit/s, "good frame", Mode Request = 1.

| | MSB | | Mapping of bits AMR 6.7 | | | | | | | |
|-------|--------|--------------|-------------------------|---------------|--------------|--------|---------------|--------|--|--|
| Octet | bit 8 | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | | |

4.4 GSM-EFR Frame Composition

This subclause contains the description of the generic GSM-EFR Frame of Figure 1. The descriptions for the generic GSM-EFR Frame with speech bits and with comfort noise bit are given separately.

4.4.1 GSM-EFR Frame with speech bits

The generic GSM-EFR frame for speech data bits is formed like for the AMR mode 12.2 kbit/s. The same Frame Type (Frame Type 7) is used also for GSM-EFR. The Mode Indication and Mode Request fields are set to "7". The GSM-EFR Core Frame for speech data bits is identical to the AMR Core Frame for speech data bits in the AMR mode with 12.2 kbit/s.

4.4.2 GSM-EFR Frame with comfort noise bits

The GSM-EFR Frame content for the additional frame type with Frame Type Index 9 in Table 1a are described in this subclause. This consists of the frame related to GSM-EFR Comfort Noise Aspects as specified in [4] and [5].

The comfort noise bits are all mapped to Class A. Classes B and C are not used (see Table 7).

The contents of GSM-EFR SID is the Comfort Noise Parameters (s(i)) as defined in [4]. The Comfort noise parameters are computed as described in [5] by the GSM-EFR speech encoder and are denoted as $s(i) = \{s(1), s(2), ..., s(38), s(87), s(88), ..., s(91)\}$. The notation s(i) follows that of [4] (Table 6). The notation $d(j) = \{d(0), ..., d(42)\}$ is local to the present document and is formed as defined by the pseudo code below.

```
for j = 0 to 37

d(j) := s(j+1); /* LSP parameters in s(1) to s(38) */;

for j = 38 to 42

d(j) := s(j+49); /* fixed codebook gain parameter in s(87)-s(91) */
```

Table 8 shows the composition for the generic GSM-EFR SID frame.

Table 8: Mapping of the GSM-EFR SID frame into the generic AMR frame format, AMR IF1, Example of a good GSM-EFR SID frame (FQI=1).

Annex A (informative): AMR Interface Format 2 (with octet alignment)

This annex defines an octet-aligned frame format for the AMR codec. This format is useful, for example, when the AMR codec is used in connection with applicable ITU-T H-series of recommendations. The format is referred to as AMR Interface Format 2 (AMR IF2).

The AMR IF2 frame is formed by concatenation of the 4-bit Frame Type field (as defined for AMR IF1 in subclause 4.1.1) and the AMR Core Frame (as defined for AMR IF1 in subclause 4.2) as shown in figure A.1. The length of the AMR Core Frame field depends on the particular Frame Type. The total number of bits in the AMR IF2 speech frames in the different modes is typically not a multiple of eight and bit stuffing is needed to achieve an octet structure.

Figure A.1: Frame structure for AMR IF2

Table A.1a shows an example how the AMR 6.7 kbit/s mode is mapped into AMR IF2. The four LSBs of the first octet (octet 1) consist of the Frame Type(=3) for the AMR 6.7 kbit/s mode (see table 1a in AMR IF1 specification). This data field is followed by the 134 AMR Core Frame speech bits (d(0)...d(133)) which consist of 58 Class A bits and 76 Class B bits as described in table 2 for AMR IF1. This results in a total of 138 bits and 6 bits are needed for Bit Stuffing to arrive to the closest multiple of 8 which is 144 bits.

Table A.1a: Example mapping of the AMR speech coding mode 6.7kbit/s into AMR IF2.

The bits used for Bit Stuffing are denoted as UB (for "unused bit").

| | MSB | SB Mapping of bits AMR 6.7 | | | | | | | | |

Table A.1b shows the composition of AMR IF2 frames for all Frame Types in terms of how many bits are used for each field of figure A.1.

Tables A.2 to A.5 specify how the AMR Core Frame comfort noise bits of Frame Types 8-11 are mapped to AMR IF2. Table A.6 specifies the mapping for an empty frame ("no transmission").

Table A.1b: Composition of AMR IF2 Frames for all Frame Types.

| Frame | Frame content | Number of bits in | Number of Bits in | Number of Bits in | Number of |

Annex B (normative): Tables for AMR Core Frame bit ordering

This annex contains the tables required for ordering the AMR Core Frame speech bits corresponding to the different AMR modes. These tables represent $table_m(j)$ in subclause 4.2.1 where m=0..7 is the AMR mode. The tables are read from left to right so that the first element (top left corner) of the table has index 0 and the last element (the rightmost element of the last row) has the index K-1 where K is the total number of speech bits in the specific mode. For example, $table_0(20)$ =27, as defined in table B.1.

Table B.1: Ordering of the speech encoder bits for the 4.75 kbit/s mode: tableo(j)

| j=0 | j=1 | j=2 | | | | | | | |
|-----|-----|-----|----|----|----|----|----|----|----|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
