Important notice

The present document can be downloaded from the
[ETSI Search & Browse Standards application](#).

The present document may be made available in electronic versions and/or in print. The content of any electronic and/or print versions of the present document shall not be modified without the prior written authorization of ETSI. In case of any existing or perceived difference in contents between such versions and/or in print, the prevailing version of an ETSI deliverable is the one made publicly available in PDF format on [ETSI deliver repository](#).

Users should be aware that the present document may be revised or have its status changed,
this information is available in the [Milestones listing](#).

If you find errors in the present document, please send your comments to
the relevant service listed under [Committee Support Staff](#).

If you find a security vulnerability in the present document, please report it through our
[Coordinated Vulnerability Disclosure \(CVD\)](#) program.

Notice of disclaimer & limitation of liability

The information provided in the present deliverable is directed solely to professionals who have the appropriate degree of experience to understand and interpret its content in accordance with generally accepted engineering or other professional standard and applicable regulations.

No recommendation as to products and services or vendors is made or should be implied.

No representation or warranty is made that this deliverable is technically accurate or sufficient or conforms to any law and/or governmental rule and/or regulation and further, no representation or warranty is made of merchantability or fitness for any particular purpose or against infringement of intellectual property rights.

In no event shall ETSI be held liable for loss of profits or any other incidental or consequential damages.

Any software contained in this deliverable is provided "AS IS" with no warranties, express or implied, including but not limited to, the warranties of merchantability, fitness for a particular purpose and non-infringement of intellectual property rights and ETSI shall not be held liable in any event for any damages whatsoever (including, without limitation, damages for loss of profits, business interruption, loss of information, or any other pecuniary loss) arising out of or related to the use of or inability to use the software.

Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the [ETSI IPR online database](#).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™**, **LTE™** and **5G™** logo are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found at [3GPP to ETSI numbering cross-referencing](#).

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document contains an electronic copy of the ANSI-C code for the Floating-point Extended Adaptive Multi-Rate Wideband codec. Alternatively, fixed-point ANSI-C code is specified in 3GPP TS 26.273 [1]. The floating-point codec/encoder/decoder specified in this document or the fixed-point codec/encoder/decoder specified in [1] may be used depending on if the implementation platform is better suited for a floating-point or a fixed-point implementation. It has been verified that the fixed-point and floating-point codecs interoperate with each other without any artifacts.

The floating-point ANSI-C code in the present document defines, besides the fixed-point c-code specified in [1], one valid reference implementation of the Extended Adaptive Multi-Rate Wideband transcoder (3GPP TS 26.290 [2]). Standard conformance is enforced by meeting the conformance criteria defined in [3].

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

- [1] 3GPP TS 26.273: "ANSI-C code for the Fixed-point Extended AMR Wideband codec".
- [2] 3GPP TS 26.290: " Audio codec processing functions; Extended AMR Wideband codec; Transcoding functions ".
- [3] 3GPP TS 26.274: " Audio codec processing functions; Extended Adaptive Multi-Rate - Wideband (AMR-WB+) codec; Conformance testing ".
- [4] 3GPP TS 26.244: "Transparent end-to-end packet switched streaming service (PSS); 3GPP file format (3GP)"

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions are given in TS 26.290 [2].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AMR-WB+	Extended Adaptive Multi-Rate WideBand
ANSI	American National Standards Institute
GSM	Global System for Mobile communications
I/O	Input/Output
RAM	Random Access Memory
ROM	Read Only Memory

4 C code structure

This clause gives an overview of the structure of the C code and provides an overview of the contents and organization of the C code attached to the present document.

The C code has been verified on the following systems:

- IBM PC/AT compatible computers with Windows 2000 SP4 and Microsoft Visual C++ v.6.0 compiler.

ANSI-C was selected as the programming language because portability was desirable.

4.1 Contents of the C source code

The C code distribution has the files divided in five different directories, all present in the directory *c-code*. The directories are: *common*, *decoder*, *encoder*, *lib_amr* and *include*. The distributed files with suffix "c" contain the source code and the files with suffix "h" are the header files.

Project and workspace files are provided in the directory *MSVC*.

4.2 Program execution

The Extended Adaptive Multi-Rate Wideband codec is implemented in two programs:

- (*encoder*) audio encoder;
- (*decoder*) audio decoder.

The programs should be called like:

- encoder [encoder options] -if <audio input file> -of <parameter file>;
- decoder [decoder options] -if <parameter file> -of <audio output file>.

The input files contain one or two channels of 16-bit linear encoded PCM audio samples stored in the *wav* file format and the parameter files contain encoded audio data and some additional flags.

The encoder and decoder options will be explained by running the applications without input arguments. See the file *readme.txt* for more information on how to run the *encoder* and *decoder* programs.

4.3 Code hierarchy

Tables 1 and 2 are call graphs that show the functions used in the audio codec.

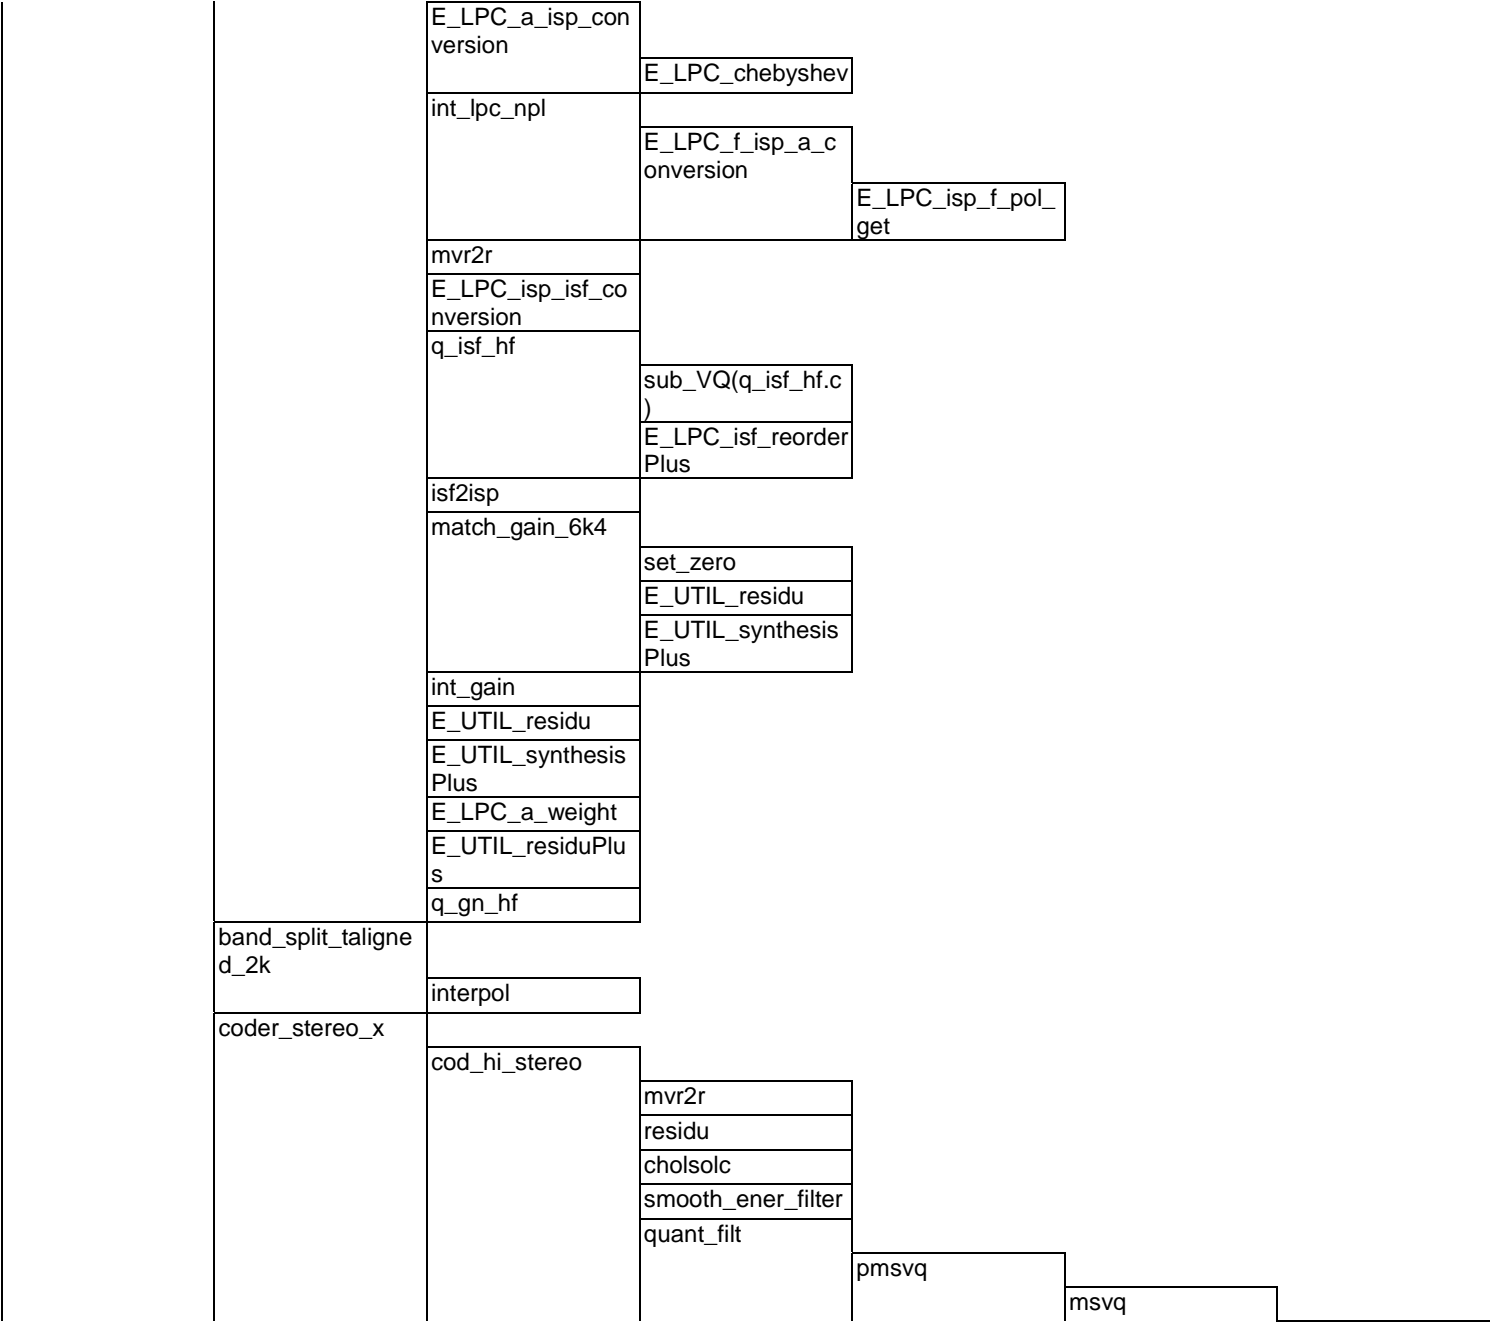

Each column represents a call level and each cell a function. The functions contain calls to the functions in rightwards neighbouring cells. The time order in the call graphs is from the top downwards as the processing of a frame advances. All standard C functions: *memcpy()*, *fwrite()*, etc. have been omitted. The initialization of the static RAM (i.e. calling the *_init* functions) is also omitted.

4.4 Variables, constants and tables

4.4.1 Description of fixed tables used in the C-code

This clause contains a listing of all fixed tables declared in tables_plus.c and tables_stereo.c files.

Table 3: Encoder fixed tables

Format	Table name	Size	Description
Float32	NBITS_CORE	8	Core bit-rates
Float32	T_sin	1152	FFT Sine table
Float32	T_cos	1152	FFT Cosine table
Float32	filter_32k	61	FIR table for decimation/oversampling
Float32	filter_32k_hf	61	FIR table for decimation/oversampling
Float32	filter_32k_7k	61	FIR table for decimation/oversampling
Float32	filter_48k	185	FIR table for decimation/oversampling
Float32	Filter_48k_hf	185	FIR table for decimation/oversampling
Float32	filter_8k	61	FIR table for decimation/oversampling
Float32	isf_init	16	Initial ISF memory
Float32	Mean_isf	16	Means of ISFs
Float32	Dico1_isf	2304	1st stage codebook, isf0 to isf8
Float32	Dico2_isf	1792	1st stage codebook, isf9 to isf15
Float32	Dico21_isf	192	2nd stage codebook, isf2_0 to isf 2_2
Float32	Dico22_isf	384	2nd stage codebook, isf2_3 to isf 2_5
Float32	Dico23_isf	384	2nd stage codebook, isf2_6 to isf 2_8
Float32	Dico24_isf	96	2nd stage codebook, isf2_9 to isf 2_11
Float32	Dico25_isf	128	2nd stage codebook, isf2_12 to isf 2_15
Float32	Dico21_isf_36b	640	1st stage codebook, (36b) split 1
Float32	Dico22_isf_36b	512	1st stage codebook, (36b) split 2
Float32	Dico23_isf_36b	448	1st stage codebook, (36b) split 3
Float32	Dico_gain_hf	512	Quantization table for one-stage HF gain
Float32	Mean_isf_hf_12k8	8	Means of ISFs (full band)
Float32	dico1_isf_hf_12k8	32	1nd stage isf codebook (full band)
Float32	mean_isf_hf_low_rate	8	Means of isfs
Float32	Dico1_isf_hf_low_rate	32	1st stage isf codebook
Float32	dico2_isf_hf	1024	2nd stage isf codebook
Float32	Lag_window	17	Lag window
Float32	Filt_lp	13	Low-pass fir filter for bass post filter
Float32	Sin20	20	Random phase
Float32	Inter4_2	65	¼ resolution interpolation filter
Float32	VadFiltBandFreqs	12	Open-loop classifier
Float32	Bw	12	Open-loop classifier
Float32	Lwg	8	Open-loop classifier
Float32	Gain_hf_ramp	64	HF gain ramp for wb->wb+ switching
Float32	Inter2_coef	12	Filter coefficients for band join/split
Float32	Filter_LP180	2341	Filter for 48 kHz interpolation
Float32	StereoNbits	18	Stereo bit-rates
Float32	Filter_2k	321	2k decimation filter
Float32	Cb_filt_hi_mean	9	Average filter
Float32	Filt_hi_mscb4a	16*9	
Float32	Filt_hi_mscb_7a	16*9	
Float32	Filt_hi_mscb_7b	8*9	
Float32	Cb_gain_hi_mean	2	Average gain vector
Float32	Gain_hi_mscb_2a	4*2	
Float32	Gain_hi_mscb_5a	32*2	
	TBC		

Table 4: Decoder fixed tables

Format	Table name	Size	Description
Same as encoder			

4.4.2 Static variables used in the C-code

In this clause two tables that specify the static variables for the encoder and decoder respectively are shown. All static variables are declared within a C **struct**.

Table 5: Encoder static variables

struct name	type	variable	size	description
Coder_StState				
	float	mem_decim	1608	speech decimated filter memory
	int	decim_frac	1	Fractional decimation factor

5 File formats

This clause describes the file formats used by the encoder and decoder programs.

5.1 Audio file (encoder input/decoder output)

Audio files read by the encoder must be formatted as 16 bits PCM wave (*.wav) files. The decoder output is written as a 16 bit PCM wave file (*.wav).

Note that the decoder, with proper command line switch, can produce a mono file from a stereo bit-stream.

5.2 Parameter bitstream file (encoder output/decoder input)

For AMR-WB+ operation, the files produced by the audio encoder/expected by the audio decoder are either according to the raw format defined in Reference [2] Section 8.2, or according to the 3GP file format [4], whereby the storage sample definition is found in Reference [2] Section 8.3.

Annex A (informative): AMR-WB+ user guide

This Annex contains a user guide on how to configure AMR-WB+ codec parameters. Due to the codec flexibility, different configurations can be used to operate the codec at a certain bit rate. The aim of this annex is ease the understanding of how to set the parameters of the AMR-WB+ audio codec.

There are two ways to set the AMR-WB+ parameters: in simple mode and flexible ("expert") mode. The simple mode uses a predefined set of configurations at different bit rates. In the flexible mode, the user chooses the core bit rate and the stereo extension rate, in case of stereo operation, and the internal sampling frequency, to attain a certain bit rate.

The AMR-WB+ audio codec processes input frames always equal to 2048 samples at an internal sampling frequency F_s . The internal sampling frequency (ISF) is independent from the audio sampling rate and is limited to the range from 12800-38400 Hz. The 2048-sample frames are split into two critically sampled equal frequency bands. This results in two superframes of 1024 samples corresponding to the low frequency (LF) and high frequency (HF) bands. Each superframe is divided into four 256-sample frames. Because the codec always requires 2048 samples then the input frame size or frame duration will vary for different ISFs.

A.1 Encoder usage

A.1.1 Simple mode

Simple mode is easy to use and requires no knowledge of AMR-WB+ to use the full capacity of the codec. The usage is as follows:

<pre>AmrwbPlusEncode -rate <bit rate> [-mono] [-ff <3gp raw>] -if <infile.wav> -of <outfile.wb+></pre>	
Where	
AmrwbPlusEncode	Name of the AMR-WB+ encoder program either compiled from the floating-point C-code of this specification or from the fixed-point C-code of [1].
-rate	Bit rate from 6-36 kbps for mono encoding or 7-48 kbps for stereo encoding
-mono	Forces mono encoding for stereo inputs. If this option is not used the encoder performs mono encoding for mono WAV files and stereo encoding for stereo WAV files.
-ff	File format: 3gp raw The default is 3gp file format.
-if	Input audio WAV file with one (mono) or two (stereo) channels Supported audio sampling rates are 8, 16, 24, 32, 48, 11.025, 22.05, 44.1 kHz
-of	Output file (according to the -ff argument)

The codec will use the best combination of mono and stereo bit rates and internal sampling frequency (ISF) according to the bit rate specified by the user. In this simple mode, the codec uses a set of predefined configurations in the bit rate range from 6-48 kbps. The codec will choose the closest configuration to the required bit rates. The configurations have been chosen to optimize the quality/bandwidth trade-off at a certain bit rate for 48 kHz sampled input.

Tables A.1 and A.2 show the default codec configurations for mono and stereo operation, respectively. In the tables, the mapping from selected bit rate to mode index and ISF index are given, and in addition the resulting bit rate factor and coded audio bandwidth (BW). The mode index (or frame type) is defined and explained in Table 25 of 26.290 [2] (modes 16 to 23 are mono modes and modes 24 to 47 are stereo modes). The mapping from ISF index to ISF, corresponding frame size and bit rate factor is defined in Table 24 of 26.290 [2].

Table A.1 Mono default configurations

bit rate (kbps)	Mode Index (bit rate at nominal ISF of 25.6 kHz)	ISF index (sampling frequency)	Bit rate factor	BW (kHz)
5.85	16 (10.4 kbps)	2 (14.4 kHz)	9/16	7.2
6.933	16 (10.4 kbps)	4 (17.067)	2/3	8.533
7.8	16 (10.4 kbps)	5 (19.2 kHz)	3/4	9.6
8.667	16 (10.4 kbps)	6 (21.33 kHz)	5/6	10.67
9.75	16 (10.4 kbps)	7 (24 kHz)	15/16	12
11.25	17 (12 kbps)	7 (24 kHz)	15/16	12
12	17 (12 kbps)	8 (25.6 kHz)	1	12.8
13.6	18 (13.6 kbps)	8 (25.6 kHz)	1	12.8
15.2	19 (15.2 kbps)	8 (25.6 kHz)	1	12.8
17.1	19 (15.2 kbps)	9 (28.8 kHz)	9/8	14.4
18.9	20 (16.8 kbps)	9 (28.8 kHz)	9/8	14.4
21.6	21 (19.2 kbps)	9 (28.8 kHz)	9/8	14.4
24	21 (19.2 kbps)	10 (32 kHz)	5/4	16
26	22 (20.8 kbps)	10 (32 kHz)	5/4	16
30	23 (24 kbps)	10 (32 kHz)	5/4	16
32	23 (24 kbps)	11 (34.13 kHz)	4/3	17.06
33.75	23 (24 kbps)	12 (36 kHz)	45/32	18
36	23 (24 kbps)	13 (38.4 kHz)	3/2	19.2

Table A.2: Stereo default configurations

bit rate (kbps)	Mode Index (bit rate at nominal ISF of 25.6 kHz)	ISF index (sampling frequency)	Bit rate factor	BW (kHz)
6.975	24 (12.4 kbps)	2 (14.4 kHz)	9/16	7.2
8.267	24 (12.4 kbps)	4 (17.067 kHz)	2/3	8.533
9.3	24 (12.4 kbps)	5 (19.2 kHz)	3/4	9.6
10.33	24 (12.4 kbps)	6 (21.33 kHz)	5/6	10.67
11.65	24 (12.4 kbps)	7 (24 kHz)	15/16	12
13.125	26 (14 kbps)	7 (24 kHz)	15/16	12
14.25	28 (15.2 kbps)	7 (24 kHz)	15/16	12
15	29 (16 kbps)	7 (24 kHz)	15/16	12
16	29 (16 kbps)	8 (25.6 kHz)	1	12.8
17.2	31 (17.2 kbps)	8 (25.6 kHz)	1	12.8
18	32 (18 kbps)	8 (25.6 kHz)	1	12.8
19.2	34 (19.2 kbps)	8 (25.6 kHz)	1	12.8
20	35 (20 kbps)	8 (25.6 kHz)	1	12.8
22.5	35 (20 kbps)	9 (28.8 kHz)	9/8	14.4
23.85	37 (21.2 kbps)	9 (28.8 kHz)	9/8	14.4
25.2	38 (22.4 kbps)	9 (28.8 kHz)	9/8	14.4
27	40 (24 kbps)	9 (28.8 kHz)	9/8	14.4
30	40 (24 kbps)	10 (32 kHz)	5/4	16
32	40 (24 kbps)	11 (34.13 kHz)	4/3	17.06
34.13	41 (25.6 kbps)	11 (34.13 kHz)	4/3	17.06
36	41 (25.6 kbps)	12 (36 kHz)	45/32	18
37.6875	43 (26.8 kbps)	12 (36 kHz)	45/32	18
40.2	43 (26.8 kbps)	13 (38.4 kHz)	3/2	19.2
43.2	44 (28.8 kbps)	13 (38.4 kHz)	3/2	19.2
45	46 (30 kbps)	13 (38.4 kHz)	3/2	19.2
48	47 (32 kbps)	13 (38.4 kHz)	3/2	19.2

A.1.2 Flexible mode

Flexible ("expert") mode requires more knowledge of AMR-WB+ to use the full capacity of the codec. In this mode, the user can choose the core bit rate and the stereo extension rate, in case of stereo operation, and the internal sampling frequency, to attain a certain bit rate.

The usage is as follows:

<pre>AmrwbPlusEncode -mi <mode> [-isf <factor>] [-lc] [-dtx] [-ff <3gp/raw>] -if <infile.wav> -of <outfile.wb+> [-cf <configfile.txt>]</pre>	
Where	
AmrwbPlusEncode	Name of the AMR-WB+ encoder program either compiled from the floating-point C-code of this specification or from the fixed-point C-code of [1].
-mi	Mode Index 0..8 AMR-WB 10..13 AMR-WB+ special modes 16..23 AMR-WB+ mono modes 24..47 AMR-WB+ stereo modes
-isf	Internal Sampling Frequency factor 0.5..1.5 If this option is missing, the default is 1.0
-lc	Low complexity (for AMR-WB+ modes) If this option is missing, the default is to use normal encoding. Note: This option is designed for terminal-based encoding. For optimal quality, it is recommended to not use this parameter.
-dtx	Enables VAD/DTX functionality (only for AMR-WB modes) If this option is missing, the default is NO DTX
-ff	File format: 3gp raw If this option is missing, the default is 3gp file format.
-if	Input audio WAV file Supported audio sampling rates are 8, 16, 24, 32, 48, 11.025, 22.05, 44.1 kHz Modes 0..8 require 16 kHz input audio sampling rate. Modes 10..13 require 16 or 24 kHz audio sampling rate.
-of	Output file (according to the -ff argument)
-cf	Configuration file: an auxiliary file that can be used for bit rate switching

The mode index (mi) can be found in Tables 21 and 25 of 26.290 [2] and the Internal Sampling Frequency (ISF) in Table 24 of 26.290 [2].

Table 21 of 26.290 [2] contains the AMR-WB-compatible modes and four AMR-WB+ special modes (mode index 10-13). The AMR-WB+ special modes have a fixed ISF (ISF index = 0 from Table 24 of 26.290 [2]). The codec can switch dynamically between the AMR-WB and AMR-WB+ special modes (Table 21 of 26.290 [2]) if AMR-WB+ is operated at 16 kHz.

Table 25 of 26.290 [2] contains the AMR-WB+ mono and stereo modes. The core and stereo mode indices of Table 25 of 26.290 [2] correspond to Tables 22 and 23 of 26.290 [2]. The bit rates specified in Table 25 of 26.290 [2] are for a nominal ISF of 25600 Hz (bit rate factor = 1.0). The output bit rate can be computed by multiplying the bit rate value from Table 25 of 26.290 [2] and the bit rate factor from Table 24 of 26.290 [2].

Stereo flexibility

In case of stereo operation, the flexible mode provides some degree of flexibility for trade-off between mono and stereo extension bit rates. This can be content dependent where higher or lower stereo extension bit rates can be used

depending on the correlation between the two channels. In Table 25 of 26.290 [2], there are 24 stereo modes (mode indices 24 to 47). These modes correspond to the 8 core mono modes where 3 different extension rates are combined with each core mode. For example, mode indices 39, 40, and 41 correspond to a core bit rate of 19.2 kbps combined with stereo extension rates of 4.0, 4.8, and 6.4 kbps, respectively. This results in total bit rates of 23.2, 24.0, and 25.6 kbps. In these stereo modes, the ratio between the stereo extension rate and the total bit rate is 17.1%, 20%, and 25%, respectively.

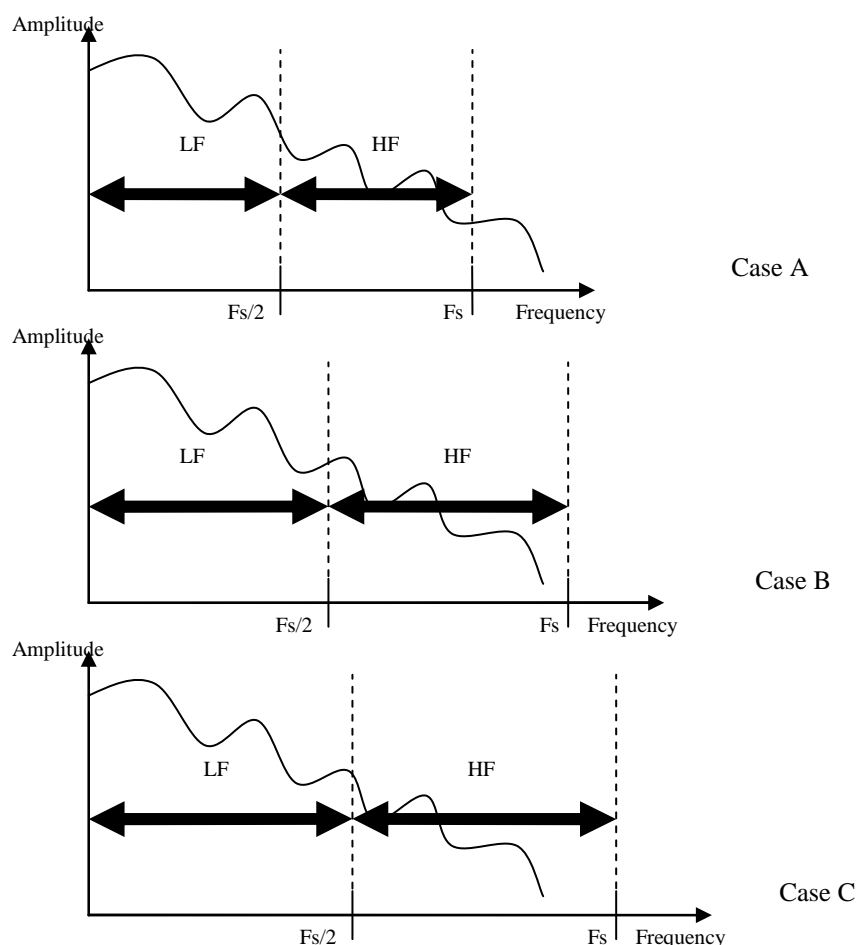

Choosing encoded bandwidth

The flexibility in choosing the ISF gives the user the choice to adjust the coded audio bandwidth depending on the input signal. For instance, in case of speech signals, a bandwidth up to 14 kHz is sufficient to attain transparent quality.

To determine the AMR-WB+ mode, one approach could be to first determine the bandwidth of the signal that required to be encoded. Table 24 of 26.290 [2] can be used to choose the ISF. Then the core and stereo rates are chosen from Tables 25, 22, and 23 of 26.290 [2]. (Note that these bit rates should be scaled with the bit rate factor from Table 24 of 26.290 [2].)

Further tuning can be done by adjusting the ISF. The HF encoding uses relatively few bits compared to the LF; therefore, the LF part of the signal has a higher definition than the HF. Therefore, increasing the ISF can be considered even in cases where the resulting bandwidth might exceed the input signal bandwidth if the bit budget allows it.

The graph below explains the three different possibilities.

Case A is when the ISF is set to be smaller than the signal spectrum. This can be used when the bit rate or the CPU load has to be reduced.

Case B is probably the most usual situation. The signal spectrum is matched with the ISF.

Case C can be used when high quality is required and an adequate bit rate budget is available. In this case, the HF exceeds the signal bandwidth, but the bits allocated for the HF will be used to encode the active part only. For example, this case can be used to encode a signal with input bandwidth limited to 14 kHz at a bit rate of 36 kbps. If we use mode index 36 (24 kbps at nominal ISF) and ISF of 38.4 kHz (bit rate factor 1.5), the resulting bit rate will be 36 kbps with the LF encoded up to 9.6 kHz and the HF from 9.6 to 14 kHz.

Bit rate switching using a configuration file

Bit rate switching can be simulated using an auxiliary configuration file. The option `-cf` refers to a text file that allows for changing Mode Index and ISF dynamically during a program run. The configuration file contains a time reference, a specific extension (AMR-WB or AMR-WB+), mode index (mi), and an internal sampling frequency (ISF), used to encode at that specific time. The encoder keeps the last setting to encode the remaining part of the file. To use `-cf` option to switch between AMR-WB and AMR-WB+ special modes, input files at 16 kHz sampling rate need to be used and the decoder needs to use the option `-fs 16000` (see Section A.2 below).

Each configuration file consists of 4 columns consisting of "time" "ext" "mode_index" "fscale".

"time" is specified in seconds and must always be > 0 .

"extension" is 0 or 1 for choosing AMR-WB or AMR-WB+ modes.

"mi" = [0..47], where [0..15] is AMR-WB and AMR-WB+ special modes, and [16..47] is for AMR-WB+ extension modes

"isf" = [0.5..1.5] for AMR-WB+ extension modes, and represent the bit rate factor. "isf" is set to zero for mode indices 0 to 15.

The following is an example of a configuration file for switching between AMR-WB and AMR-WB+ special modes.

#time	Extension	mi	isf
0.08	1	10	0.0
1.08	0	7	0.0
2.08	1	10	0.0
3.08	0	0	0.0

Here, "time" is in seconds, and "extension"=0 means AMR-WB and "extension"=1 means AMR-WB+. The value of "isf" for modes 0-15 must be zero. In this example, the encoder will use the initial configuration up to first 80 ms. At 80 ms it will start encoding with AMR-WB+ mode 10 (13.6 kbps). At time instant 1080 ms, it will start encoding with AMR-WB mode 7 (23.05 kbps). At time instant 2080 ms, it will start encoding with AMR-WB+ mode 10. Finally, at time instant 3080 ms, it will start encoding with AMR-WB mode 0 (6.6 kbps) till the end of the file. This can be seen as using the initial configuration for the first 80 ms, using mode 10 for 1 second, using mode 7 for 1 second, using mode 10 for 1 second, and using mode 0 for the remaining of the file.

In the above example, if the following command line is used:

```
AmrwbPlusEncode -ff raw -mi 12 -cf switch_amrwb.txt -if Input.wav -of bit_stream
```

then the first 80 ms will be encoded with AMR-WB+ mode 12.

The example below shows a configuration file where mode index and ISF are switched.

#time	Extension	mi	isf
0.5	1	16	1.0
1.0	1	20	1.5
2.0	1	23	1.5
3.0	1	35	0.8
4.0	1	40	1.0
5.0	1	47	1.5
10.0	1	23	1.0

A.2 Decoder usage

The decoder usage is as follows:

<pre>AmrwbPlusDecode [-ff <3gp/raw>] [-fs <fs_Hz>][-mono] [-limiter] -if <infile.wb+> -of <outfile.wav> [-fer <error.txt>]</pre>	
Where	
AmrwbPlusDecode	Name of the AMR-WB+ decoder executable either compiled from the floating-point C-code of this specification or from the fixed-point C-code of [1].
-ff	File format: 3gp raw The default is 3gp file format.
-fs	Output sampling rate (if this option is missing the default value of 48 kHz is used)
-mono	Forces mono decoding for stereo encoded inputs.
-limiter	To avoid output clipping (recommended)
-if	Input AMR-WB+ bitstream file (according to the -ff argument)
-of	Output audio WAV file
-fer	Frame erasure file for simulating frame erasures.

The output sampling rate can be chosen in function of the hardware. The decoder is able to support 8, 16, 24, 32 and 48kHz or 11.025, 22.050 and 44.1kHz. The sampling rate cannot be changed at run time. The default value is 48 kHz which is recommended. If the decoder receives modes 0 to 15 the default sampling frequency is 16 kHz.

The limiter option will increase quality when the signal contains saturations and will not degrade otherwise. It is recommended to always activate the limiter option.

Frame erasure text files can be used for simulating frame erasures. They are constructed as text files (ASCII) with one flag "0" or "1" per line. There is one line per codec (transmission) frame. "0" indicates proper reception of the frame and "1" a frame erasure.
