Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document describes the Diameter-based interfaces between the V2X Control Function in the HPLMN and the V2X Control Function in the VPLMN (V6 interface).

This specification defines the Diameter application for V6 reference points between the V2X Control Functions. The interactions between the V2X Control Functions are specified.

The stage 2 description for V2X service features in EPS is specified in 3GPP TS 23.285 [2].

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].

example: text used to clarify abstract rules by applying them literally.

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in 3GPP TR 21.905 [1].

ProSe	Proximity-based Services
V2X	Vehicle-to-Everything

4 General Description

4.1 Introduction

The V6 reference point is defined between a V2X Control Function in the HPLMN and a V2X Control Function in the VPLMN.

The definition of the V6 reference points and related functionalities are given in 3GPP TS 23.285 [2].

As defined in 3GPP TS 23.285 [2], the V6 reference point is used for:

- HPLMN control of service authorization for V2X.

5 Procedure Description

5.1 Introduction

This subclause describes the Diameter-based V6 interface related procedures and Information elements exchanged between functional entities.

In the tables that describe the Information Elements transported by each Diameter command, each Information Element is marked as (M) Mandatory, (C) Conditional or (O) Optional in the "Cat." column. For the correct handling of the Information Element according to the category type, see the description detailed in clause 6 of the 3GPP TS 29.228 [9].

5.2 V2X Service Authorization

5.2.1 General

The V2X Service Authorization Procedure shall be used between the V2X Control Function in the HPLMN and the V2X Control Function in the VPLMN to obtain service authorization information for V2X services. The procedure shall be invoked by the V2X Control Function in the HPLMN of the UE and is used:

- to request service authorization information for V2X related to the UE from the V2X Control Function in the VPLMN;

- to provide the V2X Control Function in the VPLMN with the UE identity (IMSI or MSISDN) in order to allow to perform charging:

This procedure is mapped to the commands ProSe-Authorization-Request/Answer (PAR/PAA) in the Diameter application specified in clause 6.

Table 5.2.1-1 specifies the involved information elements for the request.

Table 5.2.1-2 specifies the involved information elements for the answer.

Table 5.2.1-1: V2X Service Authorization Request

Information element name	Mapping to Diameter AVP	Cat.	Description
UE Identity (See 3GPP TS 29.336 [13])	User-Identifier	M	This information element shall contain either the user IMSI, formatted according to 3GPP TS 23.003 [8], subclause 2.2, or the user MSISDN, formatted according to 3GPP TS 29.329 [11].
PLMN Id (See 3GPP TS 29.272 [10])	Visited-PLMN-Id	M	This IE shall contain the PLMN-Id (3GPP TS 23.003 [8]) of the network in which the V2X Control Function is located.
Supported Features (See 3GPP TS 29.229 [6])	Supported-Features	O	If present, this information element shall contain the list of features supported by the origin host.

Table 5.2.1-2: V2X Service Authorization Answer

Information element name	Mapping to Diameter AVP	Cat.	Description
Result (See 6.4)	Result-Code / Experimental-Result	M	This IE shall contain the result of the operation. The Result-Code AVP shall be used to indicate success / errors as defined in the Diameter Base Protocol. The Experimental-Result AVP shall be used for V6 errors. This is a grouped AVP which shall contain the 3GPP Vendor ID in the Vendor-Id AVP, and the error code in the Experimental-Result-Code AVP. The following errors are applicable: - User Unknown - Unauthorized Service - Unauthorized Service in this PLMN
Supported Features (See 3GPP TS 29.229 [6])	Supported-Features	O	If present, this information element shall contain the list of features supported by the origin host.
V2X Authorization Data (See 6.3.2)	V2X-Authorization-Data	C	This Information Element shall contain the V2X authorization information of the user. It shall be present if success is reported.

5.2.2 Detailed behaviour of the V2X Control Function in the HPLMN

The V2X Control Function in the HPLMN shall make use of this procedure to request service authorization information for V2X related to the UE from the V2X Control Function in the VPLMN. The V2X Control Function shall include in the request the UE identity (IMSI or MSISDN) and the PLMN-Id identifying the PLMN of the requesting V2X Control Function.

When receiving a V2X Service Authorization response from the V2X Control Function in the VPLMN, the V2X Control Function in the HPLMN shall check the result code. If it indicates SUCCESS, the V2X Control Function shall merge with its own policy.

5.2.3 Detailed behaviour of the V2X Control Function in the VPLMN

When receiving a V2X Service Authorization request, the V2X Control Function in the VPLMN shall, in the following order:

1. Check whether the UE Identity (IMSI or MSISDN) exists. If not, a Result Code of `DIAMETER_ERROR_USER_UNKNOWN` shall be returned.
2. Check whether V2X is authorized for this UE Identity. If not, a Result Code of `DIAMETER_ERROR_UNAUTHORIZED_SERVICE` shall be returned.

If there is an error in any of the above steps then the V2X Control Function shall stop processing the request and shall return the error code specified in the respective step.

If the V2X Control Function cannot fulfil the received request for reasons not stated in the above steps, e.g. due to a database error or any of the required actions cannot be performed, it shall stop processing the request and set the Result Code to `"DIAMETER_UNABLE_TO_COMPLY"`.

Otherwise, when the UE is authorized to use V2X over PC5 or V2X over MBMS in this PLMN, the V2X Control Function shall include the V2X-Authorization-Data AVP in the response to return V2X permissions and the V2X Application Server information, and shall set the Result Code to `"DIAMETER_SUCCESS"`.

6 Protocol Specification and Implementations

6.1 Introduction

6.1.1 Use of Diameter base protocol

The Diameter base protocol as specified in IETF RFC 6733 [3] shall apply except as modified by the defined support of the methods and the defined support of the commands and AVPs, result and error codes as specified in this specification. Unless otherwise specified, the procedures (including error handling and unrecognised information handling) shall be used unmodified.

6.1.2 Securing Diameter Messages

For secure transport of Diameter messages, see 3GPP TS 33.210 [4].

6.1.3 Accounting functionality

Accounting functionality (Accounting Session State Machine, related command codes and AVPs) shall not be used on the V6 interface.

6.1.4 Use of sessions

Between the V2X Control Functions, Diameter sessions shall be implicitly terminated. An implicitly terminated session is one for which the server does not maintain state information. The client shall not send any re-authorization or session termination requests to the server.

The Diameter base protocol includes the Auth-Session-State AVP as the mechanism for the implementation of implicitly terminated sessions.

The client (server) shall include in its requests (responses) the Auth-Session-State AVP set to the value `NO_STATE_MAINTAINED` (1), as described in IETF RFC 6733 [3]. As a consequence, the server shall not maintain any state information about this session and the client shall not send any session termination request. Neither the Authorization-Lifetime AVP nor the Session-Timeout AVP shall be present in requests or responses.

6.1.5 Transport protocol

Diameter messages over the V6 interface shall make use of SCTP IETF RFC 4960 [5].

6.1.6 Routing considerations

This subclause specifies the use of the Diameter routing AVPs Destination-Realm and Destination-Host.

The Destination-Realm AVP shall contain the network domain name of the targeted V2X Control Function. The network domain name is either known by the sending V2X Control Function or derived from the PLMN-Id of the targeted V2X Control Function to construct the EPC Home Network Realm/Domain, as indicated in 3GPP TS 23.003 [8], subclause 19.2.

If a V2X Control Function knows the address/name of the V2X Control Function in charge of a given UE, and the associated network domain name, both the Destination-Realm and Destination-Host AVPs shall be present in the request.

If a V2X Control Function knows only the network domain name, the Destination-Realm AVP shall be present and the command shall be routed to the next Diameter node.

Consequently, the Destination-Realm AVP is declared as mandatory and the Destination-Host AVP is declared as optional in the ABNF for all requests initiated by a V2X Control Function.

If the Vendor-Specific-Application-Id AVP is received in any of the commands defined in this specification, it shall be ignored by the receiving node, and it shall not be used for routing purposes.

6.1.7 Advertising Application Support

The V2X Control Functions shall advertise support of the Diameter Inter V2X Control Functions Application by including the value of the application identifier in the Auth-Application-Id AVP within the Vendor-Specific-Application-Id grouped AVP of the Capabilities-Exchange-Request and Capabilities-Exchange-Answer commands.

The vendor identifier value of 3GPP (10415) shall be included in the Supported-Vendor-Id AVP of the Capabilities-Exchange-Request and Capabilities-Exchange-Answer commands, and in the Vendor-Id AVP within the Vendor-Specific-Application-Id grouped AVP of the Capabilities-Exchange-Request and Capabilities-Exchange-Answer commands.

The Vendor-Id AVP included in Capabilities-Exchange-Request and Capabilities-Exchange-Answer commands that is not included in the Vendor-Specific-Application-Id AVPs as described above shall indicate the manufacturer of the Diameter node as per IETF RFC 6733 [3].

6.1.8 Diameter Application Identifier

The Diameter Inter V2X Control Functions Application protocol shall be defined as an IETF vendor specific Diameter application, where the vendor is 3GPP. The vendor identifier assigned by IANA to 3GPP (<http://www.iana.org/assignments/enterprise-numbers>) is 10415.

The Diameter application identifier assigned to the Diameter Inter V2X Control Functions application is 16777356 (allocated by IANA). The Diameter application identifier is used over the V6 interface.

6.1.9 Use of the Supported-Features AVP

When new functionality is introduced on the V6 interface, it should be defined as optional. If backwards incompatible changes cannot be avoided, the new functionality shall be introduced as a new feature and support advertised with the Supported-Features AVP. The usage of the Supported-Features AVP on the V6 interface is consistent with the procedures for the dynamic discovery of supported features as defined in subclause 7.2 of 3GPP TS 29.229 [6].

When extending the application by adding new AVPs for a feature, the new AVPs shall have the M bit cleared and the AVP shall not be defined mandatory in the command ABNF.

As defined in 3GPP TS 29.229 [6], the Supported-Features AVP is of type grouped and contains the Vendor-Id, Feature-List-ID and Feature-List AVPs. On the all reference points as specified in this specification, the Supported-Features AVP is used to identify features that have been defined by 3GPP and hence, for features defined in this document, the Vendor-Id AVP shall contain the vendor ID of 3GPP (10415). If there are multiple feature lists defined for the reference point, the Feature-List-ID AVP shall differentiate those lists from one another.

6.2 Commands

6.2.1 Introduction

This subclause defines the Command code values and related ABNF for each command described in this specification.

6.2.2 Command-Code values

This subclause defines Command-Code values for the Diameter Inter V2X Control Functions application used over the V6 interface as allocated by IANA.

Every command is defined by means of the ABNF syntax IETF RFC 5234 [7], according to the rules in IETF RFC 6733 [3]. In the case, the definition and use of an AVP is not specified in this document, the guidelines in IETF RFC 6733 [3] shall apply.

The Vendor-Specific-Application-Id AVP shall not be included in any command sent by Diameter nodes supporting applications defined in this specification. If the Vendor-Specific-Application-Id AVP is received in any of the commands defined in this specification, it shall be ignored by the receiving node.

NOTE: The Vendor-Specific-Application-Id is included as an optional AVP in all Command Code Format specifications defined in this specification in order to overcome potential interoperability issues with intermediate Diameter agents non-compliant with IETF RFC 6733 [3].

The following Command Codes are defined in this specification:

Table 6.2.2-1: Command-Code values for Diameter V2X Inter Control Functions Application

Command-Name	Abbreviation	Code	Clause
ProSe-Authorization-Request	PAR	8388668	6.2.3
ProSe-Authorization-Answer	PAA	8388668	6.2.4

For these commands, the Application-ID field shall be set to 16777356 (application identifier of the Diameter Inter V2X Control Functions interface application, allocated by IANA).

6.2.3 ProSe-Authorization-Request (PAR) Command

The ProSe-Authorization-Request (PAR) Command, indicated by the Command-Code field set to 8388668 and the "R" bit set in the Command Flags field, is sent from the V2X Control Function in the HPLMN to the V2X Control Function in the VPLMN. The ProSe-Authorization-Request (PAR) is originally defined in 3GPP TS 29.345 [17].

Message Format when used over the V6 application:

```

< ProSe-Authorization-Request > ::= < Diameter Header: 8388668, REQ, PXY, 16777356 >
< Session-Id >
[ DRMP ]
[ Vendor-Specific-Application-Id ]
{ Auth-Session-State }
{ Origin-Host }
{ Origin-Realm }
[ Destination-Host ]
{ Destination-Realm }
*[ Supported-Features ]
[ OC-Supported-Features ]
{ User-Identifier }
{ Visited-PLMN-Id }
*[ AVP ]
*[ Proxy-Info ]
*[ Route-Record ]

```

6.2.4 ProSe-Authorization-Answer (PAA) Command

The ProSe-Authorization-Answer (PAA) Command, indicated by the Command-Code field set to 8388668 and the "R" bit cleared in the Command Flags field, is sent from the V2X Control Function in the VPLMN to the V2X Control Function in the HPLMN. The ProSe-Authorization- Answer (PAA) is originally defined in 3GPP TS 29.345 [17].

Message Format when used over the V6 application:

```
< ProSe-Authorization-Answer> ::= < Diameter Header: 8388668, PXY, 16777356 >
< Session-Id >
[ DRMP ]
[ Vendor-Specific-Application-Id ]
[ Result-Code ]
[ Experimental-Result ]
{ Auth-Session-State }
{ Origin-Host }
{ Origin-Realm }
*[ Supported-Features ]
[ OC-Supported-Features ]
[ OC-OLR ]
*[ Load ]
[ V2X-Authorization-Data ]
*[ AVP ]
[ Failed-AVP ]
*[ Proxy-Info ]
*[ Route-Record ]
```

6.3 Information Elements

6.3.1 General

The following table (table 6.3.1-1) specifies the Diameter AVPs defined for the V6 interface, their AVP Code values, types, possible flag values and whether or not the AVP may be encrypted. The Vendor-ID header of all AVPs defined in this specification shall be set to 3GPP (10415).

For all AVPs which contain bit masks and are of the type Unsigned32 e.g., PRR-Flags, bit 0 shall be the least significant bit. For example, to get the value of bit 0, a bit mask of 0x0001 shall be used.

Table 6.3.1-1: V6 specific Diameter AVPs

Attribute Name	AVP Code	Clause defined	Value Type	AVP Flag rules				
				Must	May	Should not	Must not	May Encr.
V2X-Authorization-Data	4700	6.3.2	Grouped					
V2X-Permission-in-VPLMN	4701	6.3.3	Unsigned32					
V2X-Application-Server	4702	6.3.4	Grouped					
NOTE 1: The AVP header bit denoted as "M", indicates whether support of the AVP is required. The AVP header bit denoted as "V" indicates whether the optional Vendor-ID field is present in the AVP header. For further details, see IETF RFC 6733 [3].								
NOTE 2: If the M-bit is set for an AVP and the receiver does not understand the AVP, it shall return a rejection. If the M-bit is not set for an AVP, the receiver shall not return a rejection, whether or not it understands the AVP. If the receiver understands the AVP but the M-bit value does not match with the definition in this table, the receiver shall ignore the M-bit.								

The following table (table 6.3.1-2) specifies the Diameter AVPs re-used by the V6 interface from existing Diameter Applications, including a reference to their respective specifications and when needed, a short description of their use within V6 interface.

Any other AVPs from existing Diameter Applications, except for the AVPs from the Diameter base protocol, do not need to be supported. The AVPs from the Diameter base protocol are not included in table 6.3.1-2.

Table 6.3.1-2: V6 re-used Diameter AVPs

Attribute Name	Reference	Comments	M-bit
Application-Server	3GPP TS 32.299 [14]	See subclause 6.3.5	
Geographical-Information	3GPP TS 29.272 [10]	See subclause 6.3.6	
Visited-PLMN-Id	3GPP TS 29.272 [10]		
User-Identifier	3GPP TS 29.336 [13]		
User-Name	IETF RFC 6733 [3]		
MSISDN	3GPP TS 29.329 [11]		
Supported-Features	3GPP TS 29.229 [6]		
Feature-List-ID	3GPP TS 29.229 [6]		
Feature-List	3GPP TS 29.229 [6]		
OC-Supported-Features	IETF RFC 7683 [12]	See subclause 6.3.7	Must set
OC-OLR	IETF RFC 7683 [12]	See subclause 6.3.8	Must set
DRMP	IETF RFC 7944 [15]	See subclause 6.3.9	Must not set
Load	IETF draft-ietf-dime-load-08 [18]	See subclause 6.3.10	Must not set
NOTE 1: The M-bit settings for re-used AVPs override those of the defining specifications that are referenced. Values include: "Must set", "Must not set". If the M-bit setting is blank, then the defining specification applies.			
NOTE 2: If the M-bit is set for an AVP and the receiver does not understand the AVP, it shall return a rejection. If the M-bit is not set for an AVP, the receiver shall not return a rejection, whether or not it understands the AVP. If the receiver understands the AVP but the M-bit value does not match with the definition in this table, the receiver shall ignore the M-bit.			

6.3.2 V2X-Authorization-Data

The V2X-Authorization-Data AVP is of type Group. It shall contain the V2X related authorization data.

AVP format

V2X-Authorization-Data ::= <AVP header: 4700 10415>

[V2X-Permission-in-VPLMN]

*[V2X-Application-Server]

*[AVP]

6.3.3 V2X-Permission-in-VPLMN

The V2X-Permission-in-VPLMN AVP is of type Unsigned32 and it shall contain a bit mask that indicates the permissions for V2X service in the visited PLMN for a user. The meaning of the bits shall be as defined in table 6.3.3-1:

Table 6.3.3-1: V2X-Permission-in-VPLMN

Bit	Name	Description
0	V2X communication over PC5 Allowed	This bit, when set, indicates that the user is allowed to use V2X communication over PC5 in the visited PLMN.
1	V2X communication over MBMS Allowed	This bit, when set, indicates that the user is allowed to use V2X communication over MBMS in the visited PLMN.
NOTE: Bits not defined in this table shall be cleared by the V2X Control Function in the VPLMN and discarded by the V2X Control Function in the HPLMN.		

6.3.4 V2X-Application-Server

The V2X-Application-Server AVP is of type Group. It shall contain the identifier of V2X Application Server (e.g. FQDN or IP address), and may contain a list of served geographical area which are associated with the given V2X Application Server.

AVP format

```
V2X-Application-Server ::= <AVP header: 4702 10415>
    { Application-Server }
    *[ Geographical-Information ]
    *[AVP]
```

6.3.5 Application-Server

The Application-Server AVP is of type UTF8String which is originally defined in 3GPP TS 32.299 [14]. It shall contain the identifier of V2X Application Server (e.g. FQDN or IP address).

6.3.6 Geographical-Information

The Geographical-Information AVP is of type UTF8String which is originally defined in 3GPP TS 29.272 [10]. It shall contain the served geographical area which is associated with a V2X Application Server.

6.3.7 OC-Supported-Features

The OC-Supported-Features AVP is of type Grouped and it is defined in IETF RFC 7683 [12]. This AVP is used to support Diameter overload control mechanism, see Annex A for more information.

6.3.8 OC-OLR

The OC-OLR AVP is of type Grouped and it is defined in IETF RFC 7683 [12]. This AVP is used to support Diameter overload control mechanism, see Annex A for more information.

6.3.9 DRMP

The DRMP AVP is of type Enumerated and it is defined in IETF RFC 7944 [15]. This AVP allows the V2X Control Function to indicate the relative priority of Diameter messages.

6.3.10 Load

The Load AVP is of type Grouped and it is defined in IETF draft-ietf-dime-load-08 [18]. This AVP is used to support Diameter load control mechanism, see Annex D for more information.

6.4 Result-Code AVP and Experimental-Result AVP Values

6.4.1 General

This subclause defines result code values that shall be supported by all Diameter implementations that conform to this specification.

6.4.2 Success

Result codes that fall within the Success category shall be used to inform a peer that a request has been successfully completed. The Result-Code AVP values defined in the Diameter base protocol IETF RFC 6733 [3] shall be applied.

6.4.3 Permanent Failures

6.4.3.1 General

Errors that fall within the Permanent Failures category shall be used to inform the peer that the request has failed, and should not be attempted again. The Result-Code AVP values defined in the Diameter base protocol IETF RFC 6733 [3] shall be applied. When one of the result codes defined here is included in a response, it shall be inside an Experimental-Result AVP and the Result-Code AVP shall be absent.

6.4.3.2 DIAMETER_ERROR_USER_UNKNOWN (5001)

This result code shall be sent by the HSS to indicate that the user identified by the IMSI is unknown. This error code is defined in 3GPP TS 29.229 [6].

6.4.3.3 DIAMETER_ERROR_UNKNOWN_V2X_SUBSCRIPTION (5690)

This result code shall be sent by the HSS to indicate that no V2X subscription is associated with the IMSI. This error code is defined in 3GPP TS 29.388 [16].

6.4.3.4 DIAMETER_ERROR_V2X_NOT_ALLOWED (5691)

This result code shall be sent by the HSS to indicate that V2X is not allowed to be used in the specific PLMN where the UE is registered. This error code is defined in 3GPP TS 29.388 [16].

Annex A (normative): Diameter overload control mechanism

A.1 General

Diameter overload control mechanism is an optional feature.

IETF RFC 7683 [12] specifies a Diameter overload control mechanism which includes the definition and the transfer of related AVPs between Diameter nodes.

It is recommended to make use of IETF RFC 7683 [12] on the V6 interface where, when applied, the requesting V2X Control Function shall behave as a reacting node and the responding V2X Control Function as a reporting node.

A.2 Responding V2X Control Function behaviour

The responding V2X Control Function requests traffic reduction from requesting V2X Control Function when it is in an overload situation, including OC-OLR AVP in answer commands as described in IETF RFC 7683 [12].

The V2X Control Function identifies that it is in an overload situation by implementation specific means. For example, the V2X Control Function may take into account the traffic over the V6 interfaces or other interfaces, the level of usage of internal resources (CPU, memory), the access to external resources, etc.

The V2X Control Function determines the specific contents of OC-OLR AVP in overload reports and the V2X Control Function decides when to send OC-OLR AVPs by implementation specific means.

A.3 Requesting V2X Control Function behaviour

The requesting V2X Control Function applies required traffic reduction received in answer commands to subsequent applicable requests, as per IETF RFC 7683 [12].

Requested traffic reduction is achieved by the requesting V2X Control Function by implementation specific means. For example, it may implement message throttling with prioritization or a message retaining mechanism for operations that can be postponed.

Annex B (Informative): Diameter overload node behaviour

B.1 Message prioritization

This clause describes possible behaviours of the requesting V2X Control Function receiving an overload indication from the responding V2X Control Function, regarding message prioritisation in an informative purpose.

The message prioritization on V6 interface is not applicable in this release.

Annex C (normative): Diameter message priority mechanism

C.1 General

IETF RFC 7944 [15] specifies a Diameter routing message priority mechanism that allows Diameter nodes to indicate the relative priority of Diameter messages. With this information, other Diameter nodes may leverage the relative priority of Diameter messages into routing, resource allocation and also abatement decisions when overload control is applied.

C.2 V6 interfaces

C.2.1 General

The Diameter message priority mechanism is an optional feature.

It is recommended to make use of IETF RFC 7944 [15] over the V6 interface of an operator network when the overload control defined in Annex A is applied on the V6 interface.

C.2.2 V2X Control Function behaviour

When the V2X Control Function supports the Diameter message priority mechanism over the V6 interface, the V2X Control Function shall comply with IETF RFC 7944 [15]. In particular, when priority is required, the V2X Control Function shall include the DRMP AVP indicating a priority level in the requests it sends, and prioritise received requests according to the priority level received within the DRMP AVP. It shall prioritise received answers according to the priority level received within the DRMP AVP if present, otherwise according to the priority level of the corresponding request. It shall include the DRMP AVP in the answer to a received request if the required priority of the answer is different from the one of the request. The V2X Control Function decisions for a required priority and for the priority level value are implementation specific.

Diameter requests related to high priority traffic should contain a DRMP AVP with a high priority of which the level value is operator dependent.

D.1 General

Diameter load control mechanism is an optional feature.

IETF draft-ietf-dime-load-08 [18] specifies a Diameter load control mechanism which includes the definition and the transfer of related AVPs between Diameter nodes.

It is recommended to make use of IETF draft-ietf-dime-load-08 [18] on the V6 interface where, when applied, the requesting V2X Control Function shall behave as a reacting node and the responding V2X Control Function as a reporting node.

D.2 Responding V2X Control Function behaviour

The responding V2X Control Function may report its current load by including a Load AVP of type HOST in answer commands as described in IETF draft-ietf-dime-load-08 [18].

The responding V2X Control Function calculates its current load by implementation specific means. For example, the responding V2X Control Function may take into account the traffic over the V6 interface or other interfaces, the level of usage of internal resources (e.g. CPU, memory), the access to external resources, etc.

The responding V2X Control Function determines when to send Load AVPs of type HOST by implementation specific means.

D.3 Requesting V2X Control Function behaviour

When performing next hop Diameter Agent selection for requests that are routed based on realm, the requesting V2X Control Function may take into account load values from Load AVPs of type PEER received from candidate next hop Diameter nodes, as per IETF draft-ietf-dime-load-08 [18].

Annex E (informative): Change history
