Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs): Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x the first digit:
   1 presented to TSG for information;
   2 presented to TSG for approval;
   3 or greater indicates TSG approved document under change control.

y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part of a TS-family covering the 3rd Generation Partnership Project: Technical Specification Group Services and System Aspects; Telecommunication management; as identified below:

32.111-1 "Fault Management; Part 1: 3G fault management requirements".

32.111-2 "Fault Management; Part 2: Alarm Integration Reference Point (IRP): Information Service (IS)".

32.111-3 "Fault Management; Part 3: Alarm Integration Reference Point (IRP): Common Object Request Broker Architecture (CORBA) Solution Set (SS)".

32.111-5 "Fault Management; Alarm Integration Reference Point (IRP): eXtensible Markup Language (XML) definitions".

32.111-7 "Fault Management; Alarm Integration Reference Point (IRP): SOAP Solution Set (SS)".

The present document is part of a set of TSs which describes the requirements and information model necessary for the Telecommunication Management (TM) of 3G systems. The TM principles and TM architecture are specified in 3GPP TS 32.101 [6] and 3GPP TS 32.102 [7].

A 3G system is composed of a multitude of Network Elements (NE) of various types and, typically, different vendors inter-operate in a co-ordinated manner in order to satisfy the network users' communication requirements. The occurrence of failures in a NE may cause a deterioration of this NE's function and/or service quality and will, in severe cases, lead to the complete unavailability of the NE. In order to minimize the effects of such failures on the Quality of Service (QoS) as perceived by the network users it is necessary to:

- detect failures in the network as soon as they occur and alert the operating personnel as fast as possible;

isolate the failures (autonomously or through operator intervention), i.e. switch off faulty units and, if applicable, limit the effect of the failure as much as possible by reconfiguration of the faulty NE/adjacent NEs;

- if necessary, determine the cause of the failure using diagnosis and test routines; and,

- repair/eliminate failures in due time through the application of maintenance procedures.
This aspect of the management environment is termed "Fault Management" (FM). The purpose of FM is to detect failures as soon as they occur and to limit their effects on the network QoS as far as possible. The latter is achieved by bringing additional/redundant equipment into operation, reconfiguring existing equipment/NEs, or by repairing/eliminating the cause of the failure.

Fault Management (FM) encompasses all of the above functionalities except commissioning/decommissioning of NEs and potential operator triggered reconfiguration (these are a matter of Configuration Management).

FM also includes associated features in the Operations System (OS), such as the administration of alarm list, the presentation of operational state information of physical and logical devices/resources/functions, and the provision and analysis of the alarm and state history of the network.
1 Scope

The present document defines the Alarm Integration Reference Point (IRP) Information Service (IS), which addresses the alarm surveillance aspects of Fault Management (FM), applied to the N Interface.

The purpose of the AlarmIRP is to define an interface through which a "system" (typically a Network Element Manager or a Network Element) can communicate alarm information for its managed objects to one or several Manager Systems (typically Network Management Systems).

The Alarm IRP IS defines the semantics of alarms and the interactions visible across the reference point in a protocol neutral way. It defines the semantics of the operations and notifications visible in the IRP. It does not define the syntax or encoding of the operations, notifications and their parameters.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.

For a specific reference, subsequent revisions do not apply.

For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TS 32.111-1 [9] and the following apply:

**active alarm**: an alarm that has not been cleared (i.e. an alarm whose perceivedSeverity is not Cleared).

**Event**: occurrence that is of significance to network operators, the NEs under surveillance and Network Management applications. Events do not have state.

**IRPAgent**: See 3GPP TS 32.150 [1].

**IRPManager**: See 3GPP TS 32.150 [1].

**IRP document version number string (IRPVersion)**: See 3GPP TS 32.312 [14].

**Matching-Criteria-Attributes**: which identifies a set of ITU-T Recommendation X.733 [2] defined attributes. Notifications carrying identical values for these attributes are considered to be carrying alarm information related to (a) the same network resource and (b) the same alarmed condition. The matching-criteria-attributes are: objectInstance, eventType, probableCause and specificProblem, if present.

**Notification**: which refers to the transport of events from IRPAgent to IRPManager.

In this IRP, notifications are used to carry alarm information from IRPAgent to IRPManager.

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

- DN: Distinguished Name
- EM: Element Manager
- FM: Fault Management
- IOC: Information Object Class
- IRP: Integration Reference Point
- IS: Information Service
- NE: Network Element
- NM: Network Manager
- OS: Operations System
- QoS: Quality of Service
- SS: Solution Set
- SupportIOC: Support Information Object Class
- TM: Telecommunication Management
- UML: Unified Modelling Language

4 Basic aspects

4.1 Void

4.2 System Context

The general definition of the System Context for the present IRP is found in 3GPP TS 32.150 [1] subclause 4.7. In addition, the set of related IRP(s) relevant to the present IRP is shown in the two diagrams below.
5 Information Object Classes

5.1 Information entities imported and local label

<table>
<thead>
<tr>
<th>Label reference</th>
<th>Local label</th>
</tr>

<td>ManagedGenericIRP</td>
</tr>
</tbody>
</table>
5.2 Class diagram

This clause introduces the set of classes (i.e. IOCs, SupportIOCs) that encapsulate information within the AlarmIRP. The intent is to identify the information required for the AlarmIRP implementation of its operations and notification emission. This clause provides the overview of all support object classes in UML. Subsequent clauses provide more detailed specification of various aspects of these support object classes.

5.2.1 Attributes and relationships

5.2.2 Inheritance
5.3 Information Object Class Definitions

5.3.1 AlarmInformation

5.3.1.1 Definition

AlarmInformation contains information about alarm condition of an alarmed MonitoredEntity.

One AlarmIRP is related to at most one AlarmList. The IRPAgent or its related AlarmIRP or the related AlarmList assigns an identifier, called alarmId, to each AlarmInformation in the AlarmList. An alarmId unambiguously identifies one AlarmInformation in the AlarmList.

5.3.1.2 Attribute

<table>
<thead>
<tr>

</tr>
<tr>
<td>serviceUser</td>
<td>O (see note 3)</td>
</tr>
<tr>
<td>serviceProvider</td>
<td>O (see note 3)</td>
</tr>
<tr>
<td>securityAlarmDetector</td>
<td>O (see note 3)</td>
</tr>
</tbody>
</table>

NOTE 1: This attribute may be "retired/removed" in Release 5 when Log IRP is introduced. Its removal implies that information carried in this attribute is no longer made accessible to IRPManager via the getAlarmList().

NOTE 2: These attributes and qualifiers are applicable only if the IRPAgent supports clearAlarms() (they are absent if clearAlarms() is not supported).

NOTE 3: These attributes must be supported if the IRPAgent emits notifyNewAlarm that carries security alarm information.

NOTE 4: This attribute is optionally populated whenever vendor specific attributes are needed. A specific condition for this optional population is when an alarm presented by the EM (e.g. EM user interface) has different values of perceived severity, and / or alarm type, compared with the values presented to the Itf-N.

5.3.1.3 State diagram

Alarms have states. The alarm state information is captured in AlarmInformation in AlarmList.

The solid circle icon represents the Start State. The double circle icon represents the End State. In this state, the alarm is Cleared and acknowledged. The AlarmInformation shall not be accessible via the IRP and is removed from the AlarmList.

Note the state diagram uses " X / Y ^ Z " to label the arc that indicates state transition. The meanings of X, Y and Z are:
- X identifies the triggering event
- Y identifies the action of AlarmIRP because of the triggering event
- Z is the notification to be emitted by AlarmIRP because of the triggering event

Note that acknowledgeAlarm\(^\text{notifyAckStateChanged}\) and the unacknowledgeAlarm\(^\text{notifyAckStateChanged}\) refer to cases when the request of the IRPManager is successful for the AlarmInformation concerned. They do not refer to the cases when the request is a failure since in the failure cases, no state transition would occur.

Note that, to reduce cluttering to the diagram, the setComment\(^\text{notifyComment}\) is not included in the figure. One transition should be applied from unack\&unclear to itself. Similarly, another transition should be applied from ack\&unclear to itself. Another one is from unack\&clear to itself.

"PS" used in the state diagram stands for "perceived severity".

Figure A is used if it supports \(^\text{notifyChangedAlarm}\) and Figure B is used if it does not support \(^\text{notifyChangedAlarm}\).
The MO alarm’s matching-criteria-attributes are not identical to the matching-criteria-attributes of any AlarmInformation in AlarmList. See appendix for the definition of matching-criteria-attributes.

MO emits alarm / IRPAgent creates a new AlarmInformation. **notifyNewAlarm**

**unack&unclear**

- acknowledgeAlarm **notifyAckStateChanged**
- unacknowledgeAlarm **notifyAckStateChanged**

**ack&unclear**

- MO emits the same alarm **notifyChangedAlarm**
- MO emits alarm / IRPAgent creates a new AlarmInformation. **notifyNewAlarm**

**unack&clear**

- MO emits alarm / IRPAgent creates a new AlarmInformation. **notifyNewAlarm**
- MO PS level changes to cleared **notifyClearedAlarm**
- MO PS changes & new level is not cleared **notifyChangedAlarm**
- MO PS changes to cleared **notifyClearedAlarm**

This is the terminal state (acknowledged and cleared)
This AlarmInformation no longer exists in the AlarmList.

**notifyChangedAlarm** supported
5.3.2 AlarmList

5.3.2.1 Definition

AlarmIRP maintains an AlarmList that contains currently active alarms (i.e. AlarmInformation whose perceivedSeverity is not Cleared) and alarms that are Cleared but not yet acknowledged.

5.3.2.2 Attribute

There is no additional attribute defined for this class besides those inherited.
5.3.3  AlarmIRP

5.3.3.1  Definition

AlarmIRP is the representation of the alarm management capabilities specified by the present document. This class inherits from ManagedGenericIRP class specified in 3GPP TS 32.312 [14].

5.3.3.2  Attribute

There is no additional attribute defined for this class besides those inherited.

5.3.3.3  Notification Table

<table>
<thead>
<tr>
<th>Name</th>
<th>Qualifier</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyAlarmListRebuilt</td>
<td>M</td>
<td>See 6.8.4.</td>
</tr>
<tr>
<td>notifyPotentialFaultyAlarmList</td>
<td>O</td>
<td>See 6.11.1.</td>
</tr>
</tbody>
</table>

5.3.4  Comment

5.3.4.1  Definition

Comment contains commentary and associated information such as the time when the commentary is made.

5.3.4.2  Attribute

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Support Qualifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>commentTime</td>
<td>M</td>
</tr>
<tr>
<td>commentText</td>
<td>M</td>
</tr>
<tr>
<td>commentUserId</td>
<td>M</td>
</tr>
<tr>
<td>commentSystemId</td>
<td>O</td>
</tr>
</tbody>
</table>

5.3.5  CorrelatedNotification

5.3.5.1  Definition

It identifies one MonitoredEntity. For that MonitoredEntity identified, a set of notification identifiers is also identified. One or more CorrelatedNotification instances can be related to an AlarmInformation. In this case, the information of the AlarmInformation is said to be correlated to information carried in the notifications identified by the CorrelatedNotification instances. See further definition of correlated notification in ITU-T Recommendation X.733 [2], clause 8.1.2.9.

The meaning of correlation is dependent on the type of notification itself. See the comment column of the correlatedNotification input parameter for each type of notification, such as notifyNewAlarm.

Notification carries AlarmInformation. The AlarmInformation instances referred to by the correlatedNotification may or may not exist in the AlarmList. For example, the AlarmInformation carried by the identified notification may have been acknowledged and Cleared and therefore, no longer exist in the AlarmList.

5.3.5.2  Attribute

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Support Qualifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>M</td>
</tr>
<tr>
<td>notificationIdSet</td>
<td>M</td>
</tr>
</tbody>
</table>
5.3.6 MonitoredEntity

5.3.6.1 Definition

It represents classes that can have an alarmed state. The types of classes that can have alarmed state are:

a) All classes whose Notification Tables include alarm notifications.

b) VSE subclass of 3GPP defined classes and VSE defined classes that can have alarmed state.

The objectClass and objectInstance of this class identifies an instance of this class. The AlarmInformation uses this information in two places. In one place, the information is used to identify the instance that is in alarmed state. In another place, the information is used to identify an instance that can be used as the back up network resource for the instance that is in alarmed state.

5.3.6.2 Attribute

There is no attribute for this class.
5.4 Information relationships definition

5.4.1 relation-AlarmIRP-AlarmList (M)

5.4.1.1 Definition
This represents the relationship between AlarmIRP and AlarmList.

5.4.1.2 Role
There is no role defined for this relationship.

5.4.1.3 Constraint
There is no constraint for this relationship.

5.4.2 relation-AlarmList-AlarmInformation (M)

5.4.2.1 Definition
This represents the relationship between AlarmList and AlarmInformation.

5.4.2.2 Role

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifyAlarmInformation</td>
<td>It represents a capability to obtain the information contained in AlarmInformation.</td>
</tr>
</tbody>
</table>

5.4.2.3 Constraint

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>inv_hasAlarmInformation1</td>
<td>No AlarmInformation playing the role of the AlarmInformation shall have its perceivedSeverity = &quot;cleared&quot; and its ackState = &quot;acknowledged&quot;.</td>
</tr>
<tr>
<td>inv_hasAlarmInformation2</td>
<td>The alarmId of all AlarmInformation instances playing the role of the AlarmInformation are distinct.</td>
</tr>
</tbody>
</table>
5.4.3  relation-AlarmInformation-Comment (M)

5.4.3.1  Definition
This represents the relationship between AlarmInformation and Comment.

5.4.3.2  Role

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>It represents a capability to obtain the information contained in Comment.</td>
</tr>
</tbody>
</table>

5.4.3.3  Constraint
There is no constraint.

5.4.4  relation-AlarmInformation-CorrelatedNotification (M)

5.4.4.1  Definition
This represents the relationship between AlarmInformation and CorrelatedNotification.

5.4.4.2  Role

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>correlatedNotification</td>
<td>It represents a capability to obtain the information contained in CorrelatedNotification.</td>
</tr>
</tbody>
</table>

5.4.4.3  Constraint
There is no constraint.

5.4.5  relation-AlarmedObject-AlarmInformation (M)

5.4.5.1  Definition
This represents the relationship between MonitoredEntity and AlarmInformation.
5.4.5.2 Role

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectClass/objectInstance</td>
<td>It represents the capability to obtain the identification, in terms of objectClass and objectInstance, of alarmed network resource.</td>
</tr>
</tbody>
</table>

5.4.5.3 Constraint

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>inv_relation-Al-ME</td>
<td>All AlarmInformation involved in this relationship with the same MonitoredEntity shall have at least one different value in the following attributes: eventType, probableCause and specificProblem.</td>
</tr>
</tbody>
</table>

5.4.6 relation-backUpObject-AlarmInformation (O)

5.4.6.1 Definition

The relationship represents the relationship between AlarmInformation and the backUpObject.

5.4.6.2 Role

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>backUpObject</td>
<td>It represents a capability to obtain the identification, in terms of objectClass and objectInstance, of the backUpObject.</td>
</tr>
</tbody>
</table>

</table>
### 5.5 Information attribute definition

#### 5.5.1 Definition and legal values

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
<th>Legal Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarmId</td>
<td>It identifies one AlarmInformation in the AlarmList.</td>
<td></td>
</tr>
<tr>
<td>notificationId</td>
<td>It identifies the notification that carries the AlarmInformation.</td>
<td></td>
</tr>
<tr>
<td>alarmRaisedTime</td>
<td>It indicates the date and time when the alarm is first raised by the alarmed resource.</td>
<td>All values indicating valid time.</td>
</tr>
<tr>
<td>alarmChangedTime</td>
<td>It indicates the last date and time when the AlarmInformation is changed by the alarmed resource. Changes to AlarmInformation caused by invocations of the IRPManager would not change this date and time.</td>
<td>All values indicating valid time.</td>
</tr>
<tr>
<td>alarmClearedTime</td>
<td>It indicates the date and time when the alarm is Cleared.</td>
<td>All values indicating valid time.</td>
</tr>
<tr>
<td>eventType</td>
<td>It indicates the type of event. See Annex A for information on event type.</td>
<td>See Annex A.</td>
</tr>
<tr>
<td>probableCause</td>
<td>It qualifies alarm and provides further information than eventType. See Annex B for a complete listing.</td>
<td>See Annex B.</td>
</tr>
<tr>
<td>perceivedSeverity</td>
<td>It indicates the relative level of urgency for operator attention.</td>
<td>Critical, Major, Minor, Warning, Indeterminate, Cleared: see ITU-T Recommendation X.733 [2]. This IRP does not recommend the use of indeterminate.</td>
</tr>
<tr>
<td>specificProblem</td>
<td>It provides further qualification on the alarm than probableCause. This attribute value shall be single-value and of simple type such as integer or string. See definition in ITU-T Recommendation X.733 [2] clause 8.1.2.2.</td>
<td>Provided by vendor.</td>
</tr>
<tr>
<td>backedUpStatus</td>
<td>It indicates if an object (the MonitoredEntity) has a back up. See definition in ITU-T Recommendation X.733 [2] clause 8.1.2.4.</td>
<td>All values that carry the semantics of backedUpStatus defined by ITU-T X.733 [2] clause 8.1.2.4.</td>
</tr>
<tr>
<td>trendIndication</td>
<td>It indicates if some observed condition is getting better, worse, or not changing.</td>
<td>“Less severe”, “no change”, “more severe”: see definition in ITU-T Recommendation X.733 [2] clause 8.1.2.6.</td>
</tr>
<tr>
<td>thresholdInfo</td>
<td>It indicates the crossed threshold information such as:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The identifier of the monitored attribute whose value has crossed a threshold,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The threshold settings,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The observed value that have crossed a threshold, etc.</td>
<td></td>
</tr>
<tr>
<td>monitoredAttributes</td>
<td>It indicates MO attributes whose value changes are being monitored. See definition in ITU-T Recommendation X.733 [2] clause 8.1.2.11.</td>
<td></td>
</tr>
<tr>
<td>additionalText</td>
<td>It carries semantics that is outside the scope of this IRP specification. It may provide the identity of the NE (e.g. RNC, Node-B) from which the alarm has been originated. It corresponds to the “user label” attribute of the object class representing the NE in the Generic Network Resource Model [10].</td>

6.2 Generic rules

Rule 1: each operation with at least one input parameter supports a pre-condition valid_input_parameter which indicates that all input parameters shall be valid with regards to their information type. Additionally, each such operation supports an exception operation_failed_invalid_input_parameter which is raised when pre-condition valid_input_parameter is false. The exception has the same entry and exit state.

Rule 2: Each operation with at least one optional input parameter supports a set of pre-conditions supported_optional_input_parameter_xxx where "xxx" is the name of the optional input parameter and the pre-condition indicates that the operation supports the named optional input parameter. Additionally, each such operation supports an exception operation_failed_unsupported_optional_input_parameter_xxx which is raised when (a) the pre-condition supported_optional_input_parameter_xxx is false and (b) the named optional input parameter is carrying information. The exception has the same entry and exit state.

Rule 3: each operation shall support a generic exception operation_failed_internal_problem that is raised when an internal problem occurs and that the operation cannot be completed. The exception has the same entry and exit state.

6.3 Interface AlarmIRPOperations_1 (M)

6.3.1 acknowledgeAlarms (M)

6.3.1.1 Definition

The IRPManager invokes this operation to acknowledge one or more alarms.

</tr>
</thead>
<tbody>
<tr>
<td>operation_failed</td>
<td><strong>Condition:</strong> Pre-condition is false or post-condition is false. <strong>Returned Information:</strong> The output parameter status. <strong>Exit state:</strong> Entry state.</td>
</tr>
</tbody>
</table>

### 6.3.2 getAlarmList (M)

#### 6.3.2.1 Definition

The IRPManager invokes this operation to request the AlarmIRP to provide either the complete list of AlarmInformation instances in the AlarmList or only a part of this list (partial alarm alignment).

The parameters baseObjectClass and baseObjectInstance are used to identify the part of the alarm list to be returned. If they are absent, then the complete alarm list shall be provided (full alarm alignment). If they identify a particular class instance, then only a) the AlarmInformation instances related to this class instance and b) the AlarmInformation instances related to the subordinate class instances of this class instance shall be provided (partial alarm alignment). An instance-a is said to be subordinate to instance-b if the DN of the latter is part of the DN of the former.

There are two modes of operation. One mode is synchronous. In this mode, the list of AlarmInformation instances in AlarmList is returned synchronously with the operation. The other mode is asynchronous. In this mode, the list of AlarmInformation instances is returned via notifications. In asynchronous mode of operation, the only information returned synchronously is the status of the operation. A method allowing to abort an ongoing alarm alignment process shall be available in the asynchronous mode. The mode of operation to be used is determined by means outside the scope of specification. To use asynchronous mode, the IRPManager must have established a subscription with the NotificationIRP via the subscribe operation specified in 3GPP TS 32.302 [5].
### 6.3.2.2 Input Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Qualifier</th>
<th>Information Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarmAckState</td>
<td>O</td>
<td>ENUM (all alarms, all active alarms, all active and acknowledged alarms, all Cleared and unacknowledged alarms, all unacknowledged)</td>
<td>It carries a constraint. The AlarmIRP shall apply it on AlarmInformation instances in AlarmList when constructing its output parameter AlarmInformationList.</td>
</tr>
<tr>
<td>baseObjectClass</td>
<td>O, see note 1</td>
<td>This parameter is either absent or carries the object class of a certain class.</td>
<td>See how this attribute is used to support full alarm alignment and partial alarm alignment in 6.3.2.1. See note 2.</td>
</tr>
<tr>
<td>baseObjectInstance</td>
<td>O, see note 1</td>
<td>This parameter is either absent or carries the DN of a certain class instance.</td>
<td>See how this attribute is used to support full alarm alignment and partial alarm alignment in 6.3.2.1. See note 2.</td>
</tr>
<tr>
<td>filter</td>
<td>O</td>
<td>N/A</td>
<td>It carries a filter constraint. If the filter is present, the AlarmIRP shall apply it on AlarmInformation instances in AlarmList when constructing its output parameter AlarmInformationList. If the filter is not present, all of the AlarmInformation instances included by the scope are selected.</td>
</tr>
</tbody>
</table>

**NOTE 1:** If the notification notifyAlarmListRebuilt supports indicating that only a part of the alarm list has been rebuilt then the operation getAlarmList shall support partial alarm alignment.

**NOTE 2:** The legal values of the parameters baseObjectClass and baseObjectInstance are restricted to those carried by the parameters baseObjectClass and baseObjectInstance in the recent notifyAlarmListRebuilt notifications. The timeline for ‘recent’ is vendor-specific.
### 6.3.2.3 Output Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Qualifier</th>

6.4 Interface AlarmIRPOperation_2 (O)

6.4.1 getAlarmCount (M)

6.4.1.1 Definition

An IRPManager wishes to know the amount of AlarmInformation kept in the AlarmList. The IRPManager requests the counts via this operation. Possible usage is for IRPManager to find out the number of AlarmInformation in AlarmList before invoking getAlarmList operation.

6.4.1.2 Input Parameters

</tbody>
</table>

6.8 Notification AlarmIRPNotifications_1 (M)

The present document does not specify methods for IRPManager to detect alarm loss. The use of alarmId to detect alarm loss is an arrangement made between IRPAgent and IRPManager. The use of such arrangement is outside the scope of the present document. For example, IRPAgent may use integer sequence (e.g. 1, 2, 3, 4, 5, …) as alarmId instances for its alarms. Based on this knowledge, IRPManager can detect alarm loss. This kind of arrangement may not be possible for all SS.

The present document does not specify how IRPAgent can determine if IRPManager has received alarms correctly. Not all SSs provide such capability.

The present document does not specify methods for IRPManager and IRPAgent to recover alarm loss. The only mechanism recommended to deal with alarm loss is the use of getAlarmList operation. The present document does not specify conditions under which IRPManager should invoke this operation.

The filter qualifiers in tables listing input parameters of notifications only refer to applying a filter constraint to that notification. In other words: The filter qualifiers Y(es)/N(o) specify if the input parameter can be used or not when constructing the input parameter filter of operations subscribe or changeSubscriptionFilter defined in 3GPP TS 32.302 [5].

6.8.1 notifyNewAlarm (M)

6.8.1.1 Definition

A new AlarmInformation has been added in the AlarmList. The subscribed IRPManager instances are notified of this fact if the added AlarmInformation satisfies the current filter constraint of their subscription.

There are two tables for Input Parameters. If alarmType parameter indicates "Communications Alarm", "Processing Error Alarm", "Environmental Alarm", "Quality Of Service Alarm" or "Equipment Alarm", the first table (see clause 6.8.1.2) shall be applicable for this notifyNewAlarm. If alarmType parameter indicates "Integrity Violation", "Operational Violation", "Physical Violation", "Security Service or Mechanism Violation" or "Time Domain Violation", the second table (see clause 6.8.1.3) shall be applicable.

<td>AlarmList contains an AlarmInformation holding information conveyed by the newly generated network alarm. This AlarmInformation is involved in relation-AlarmObject-AlarmInformation with the same MonitoredEntity as the one identified by the newly generated network alarm. The following attributes of the AlarmInformation shall be populated with information in the newly generated alarm: alarmId, notificationId, alarmRaisedTime, eventType, probableCause, perceivedSeverity. The following attributes of the same AlarmInformation shall be populated with information in the newly generated alarm if the information is present (in the newly generated alarm) and if the attribute is supported: specificProblem, backedUpStatus, trendIndication, thresholdInfo, stateChangeDefinition, monitoredAttributes, proposedRepairActions, additionalText, additionalInformation.</td>
</tr>
</tbody>
</table>

6.8.2 notifyAckStateChanged (M)

6.8.2.1 Definition

The subscribed IRPManager instances are notified regarding changes in alarm Acknowledgement State. The AlarmInformation carried in the notification shall satisfy the current filter constraint of the subscription.

The notification shall contain all parameters that are filterable and are present in the original (related) notifyNewAlarm notification.

The IRPManager and the EM can acknowledge and unacknowledge alarms as defined by 3GPP TS 32.111-1 [9]. Specifically, the AlarmIRP itself can acknowledge alarms.

The capability that IRPAgent itself acknowledges alarms is optional. The trigger, of such capability, is vendor defined. For example, it runs once a day, once every 4 hours, or always. The algorithm for determining which cleared alarm should be acknowledged is vendor specific. For example: acknowledge alarm records that have been cleared more than 24 hours or acknowledge alarm records whose highest perceived severity level has been MINOR. When acknowledged, the alarm ackState changes and the AlarmIRP shall emit the corresponding notifyAckStateChanged.

6.8.4 notifyAlarmListRebuilt (M)

6.8.4.1 Definition

The IRPAgent or its related AlarmIRP maintains an AlarmList. They can lose confidence in the integrity of its AlarmList. Under this condition, IRPAgent or its related AlarmIRP shall invoke notifyAlarmListRebuilt notification after the AlarmList has been rebuilt.

The AlarmIRP can also invoke notifyAlarmListRebuilt notification indicating that part of the AlarmList has been rebuilt. In this case, the notification carries the class instance indicating that the AlarmList only have been rebuilt for alarms concerning this class instance and its subordinate class instances. Furthermore, this notification indicates that there is no rebuilt going on for superior class instances of this class instance.

6.8.4.2 Input Parameters
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Qualifier</th>
<th>Matching Information</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectClass</td>
<td>M,Y</td>
<td>It identifies a) the class of the instance identified by systemDN or b) the class of MonitoredEntity.</td>
<td>Notification header - see [5]. If it identifies the class of the instance identified in systemDN, then all AlarmInformation instances in the AlarmList may have been rebuilt. If it identifies the class of MonitoredEntity, then some or all AlarmInformation instances in the AlarmList may have been rebuilt. See next parameter for the identification of the set of AlarmInformation that have been rebuilt.</td>
</tr>
<tr>
<td>objectInstance</td>
<td>M,Y</td>
<td>It identifies a) the instance identified by systemDN or b) an instance of MonitoredEntity.</td>
<td>Notification header - see [5]. If it identifies the instance identified by systemDN, then all AlarmInformation instances in the AlarmList may have been rebuilt. If it identifies an instance of MonitoredEntity, then the AlarmList only have been rebuilt for AlarmInformation of this instance and AlarmInformation of its subordinate instances.</td>
</tr>
<tr>
<td>notificationId</td>
<td>M,N</td>
<td>--</td>
<td>See Table 6.8.1.2.</td>
</tr>
<tr>
<td>eventTime</td>
<td>M,Y</td>
<td>--</td>
<td>Notification header - see [5]. It carries the time when the AlarmList is rebuilt.</td>

6.9 Notification `AlarmIRPNotification_2 (O)`

6.9.1 notifyChangedAlarm (M)

6.9.1.1 Definition

The subscribed IRPManager instances are notified regarding changes in AlarmInformation in AlarmList. This notification is only triggered by a change in perceivedSeverity attribute value (except to the value "Cleared"). The AlarmInformation carried in the notification shall satisfy the current filter constraint of the subscription.

The notification shall contain all parameters that are filterable and are present in the original (related) notifyNewAlarm notification.
6.9.1.2 Input Parameters

</tr>
</tbody>
</table>
6.10 Notification AlarmIRPNotification_3 (O)

6.10.1 notifyComments (M)

6.10.1.1 Definition

The subscribed IRPManager instances are notified regarding to the addition of a Comment instance to an AlarmInformation instance in the AlarmList. The AlarmInformation carried in the notification shall satisfy the current filter constraint of the subscription.

The notification shall contain all parameters that are filterable and are present in the original (related) notifyNewAlarm notification.

The IRPManager and the IRPAgent can add comments to instances of AlarmInformation as described in 3GPP TS 32.111-1 [9].

IRPAgent shall support this notification if it supports the operation setComment.

</tbody>
</table>

6.11 Notification AlarmIRPNotification_4 (O)

6.11.1 notifyPotentialFaultyAlarmList (M)

6.11.1.1 Definition

The IRPAgent or its related AlarmIRP maintains an AlarmList. They can lose confidence in the integrity of its AlarmList. Under this condition, IRPAgent or its related AlarmIRP or the related AlarmList shall invoke notifyPotentialFaultyAlarmList. They then can begin to rebuild the faulty AlarmList, if found necessary. After the successful rebuilt or the discovery that rebuilt is not necessary, they shall invoke notifyAlarmListRebuilt notification.

This notification can identify a set of AlarmInformation that is potentially faulty or unreliable. This identification is done in the following way. If the MOI of an AlarmInformation is the same or is a subordinate to the MOI carried in the notification, then the AlarmInformation may be faulty or unreliable.

This notification can identify all the AlarmInformation instances of the AlarmList that are potentially faulty or unreliable. In this case, the notification shall carry a MOI identifying the IRPAgent.

The IRPManager behaviour, on reception of this notifyPotentialFaultyAlarmList notification, is not specified. The IRPManager behaviour is considered not essential for the specification of the interface itself. However, the following are recommended actions the IRPManager should take, in case it receives this notification.

1) The IRPManager should not perform any task requiring the integrity of the AlarmInformation identified as faulty or unreliable by the subject notification.

2) The IRPManager should not invoke operations that require integrity of the AlarmList such as getAlarmList., acknolwedgeAlarms operations.

Annex A (normative):
Event Types

This annex lists and explains event types used by the present document.

The table below lists the event types referred to in the present document.

Notification IRP: Information Service in 3GPP TS 32.302 [5] defines a parameter called notificationType that shall be present in all notification. The present document defines a parameter called alarmType that shall be present in all notifications carrying alarm information. Examples of the notificationType are "notification of new alarm", "notification of AlarmList rebuilt", "notification of alarm cleared", etc. Examples of the alarmType are the event types defined in table below.

The present document also defines an attribute of AlarmInformation called eventType. The mapping of this eventType (internal attribute and not visible to IRPManager) to notificationType or alarmType (both visible to IRPManager) is defined in relevant sections of the present document. The choice of using "eventType" is to keep the list of attributes of AlarmList unchanged (compared to Release 99). One can replace this eventType with two attributes, called notificationType and alarmType so that mapping of these two attributes to the externally visible parameters of the same name will be straight-forward.

It is noted that the mapping of the IS notificationType and alarmType to CORBA event_name or other fields are specified in the respective Solution Set.

<table>
<thead>
<tr>
<th>Event Types</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communications Alarm</td>
<td>An alarm of this type is associated with the procedure and/or process required conveying information from one point to another (ITU-T Recommendation X.733 [2]).</td>
</tr>
<tr>
<td>Processing Error Alarm</td>
<td>An alarm of this type is associated with a software or processing fault (ITU-T Recommendation X.733 [2]).</td>

ETSI
Annex C (informative):
Examples of using notifyChangedAlarm

This annex describes a number of valid and invalid interactions governing the case when IRPAgent is reporting a specific fault of a particular network resource whose alarm severity level changes from, e.g. "Critical" to "Minor" and then to "Cleared".

In the following examples:

ni is notificationId,
moc is managedObjectClass,
moi is managedObjectInstance,
et is eventType,
pc is probableCause,
sp is specificProblem,
ps is perceivedSeverity and
ai is alarmId.

EXAMPLE 1: Valid sequence 1 to support the hypothetical case:
(1) NotifyNewAlarm
   (ni=1, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Critical)
(2) NotifyChangedAlarm
   (ni=2, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Minor)
(3) NotifyClearedAlarm
   (ni=3, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Cleared)

EXAMPLE 2: Valid sequence 2 to support the hypothetical case (assuming that the alarm with "ai=X" is acknowledged after either (1) or (2), but before (3)):
(1) NotifyNewAlarm
   (ni=1, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Critical)
NotifyClearedAlarm
   (ni=2, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Cleared)
(2) NotifyNewAlarm
   (ni=3, ai=Y, moc=A, moi=B, et=C, pc=D, sp=E, ps=Minor)
NotifyClearedAlarm
   (ni=4, ai=Y, moc=A, moi=B, et=C, pc=D, sp=E, ps=Cleared)

EXAMPLE 3: Invalid sequence 1 to support the hypothetical case:
(1) NotifyNewAlarm
   (ni=1, ai=X, moc=A, moi=B, et=C, pc=D, sp=E, ps=Critical)
(2) NotifyChangedAlarm
   (ni=2, ai=Y, moc=A, moi=B, et=C, pc=D, sp=E, ps=Minor)
(3) NotifyClearedAlarm

\((ni=3, \text{ai}=Y, \text{moc}=A, \text{moi}=B, \text{et}=C, \text{pc}=D, \text{sp}=E, \text{ps}=\text{Cleared})\)

Interaction (2) is illegal since it uses a different ai for the same alarm. It should use ai=X as in interaction (1).

EXAMPLE 4: Invalid sequence 2 to support the hypothetical case:

(1) NotifyNewAlarm

\((ni=1, \text{ai}=X, \text{moc}=A, \text{moi}=B, \text{et}=C, \text{pc}=D, \text{sp}=E, \text{ps}=\text{Critical})\)

(2) NotifyNewAlarm

\((ni=2, \text{ai}=X, \text{moc}=A, \text{moi}=B, \text{et}=C, \text{pc}=D, \text{sp}=E, \text{ps}=\text{Minor})\)

Interaction (2) is illegal since it invokes notifyNewAlarm using same ai value. It should use notifyChangedAlarm with the same ai value.
