# Intellectual Property Rights

## Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the [ETSI IPR online database](#).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

**DECT™**, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™**, **LTE™** and **5G™** logo are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

---

# Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found at [3GPP to ETSI numbering cross-referencing](#).

---

# Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

# Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# Introduction

The present document is part of a TS-family covering the 3<sup>rd</sup> Generation Partnership Project: Technical Specification Group Services and System Aspects; Telecommunication management; as identified below:

32.301: Configuration Management (CM); Notification Integration Reference Point (IRP): Requirements

32.302: Configuration Management (CM); Notification Integration Reference Point (IRP): Information Service (IS)

**32.306: Configuration Management (CM); Notification Integration Reference Point (IRP): Solution Set (SS) definitions**

Configuration Management (CM), in general, provides the operator with the ability to assure correct and effective operation of the 3G network as it evolves. CM actions have the objective to control and monitor the actual configuration on the Network Elements (NEs) and Network Resources (NRs), and they may be initiated by the operator or by functions in the Operations Systems (OSs) or NEs.

CM actions may be requested as part of an implementation programme (e.g. additions and deletions), as part of an optimisation programme (e.g. modifications), and to maintain the overall Quality of Service (QoS). The CM actions are initiated either as a single action on a NE of the 3G network or as part of a complex procedure involving actions on many NEs.

The Itf-N interface is built up by a number of Integration Reference Points (IRPs) and a related Name Convention, which realise the functional capabilities over this interface. The basic structure of the IRPs is defined in 3GPP TS 32.101 [1].

Network Elements (NEs) under management and element managers generate notifications of events about occurrences within the network. Different kinds of events carry different kinds of information, e.g. alarms or CM notification.

Information of an event is carried in notification. An IRPAgent (typically an EM or a NE) emits notifications. IRPManager (typically a network management system) receives notifications. The purpose of Notification IRP is to define an interface through which an IRPManager can subscribe to IRPAgent for receiving notifications.

This IRP bases its design on work captured in ITU-T Recommendation X.734 [20], and OMG Notification Service [14]. The central design ideas are:

- Separation of notification Consumers (IRPManagers) from Producers (IRPAgents);

- Notifications are sent to IRPManagers without the need for IRPManagers to periodically check for new notifications.

Common characteristics related to notifications in all other IRPs are gathered in one IRP.

---

# 1 Scope

The present document contains the Solution Sets for the IRP whose semantics is specified in Notification IRP: Information Service (TS 32.302 [7]).

These Solution Set specifications are related to 3GPP TS 32.302 V14.0.X [7].

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TS 32.101 [1], 3GPP TS 32.102 [2], 3GPP TS 32.301 [6], 3GPP TS 32.302 [7], and 3GPP TS 32.331 [11] apply.

**IRP document version number string (or "IRPVersion"):** See 3GPP TS 32.311 [8]

### 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

|       |                                            |
|-------|--------------------------------------------|
| CM    | Configuration Management                   |
| CORBA | Common Object Request Broker Architecture  |
| EC    | Event channel (OMG)                        |
| EM    | Element Manager                            |
| IDL   | Interface Definition Language (OMG)        |
| IOR   | Interoperable Object Reference             |
| IRP   | Integration Reference Point                |
| IS    | Information Service                        |
| MOC   | Managed Object Class                       |
| MOI   | Managed Object Instance                    |
| NC    | Notification Channel (OMG)                 |
| NE    | Network Element                            |
| NL    | Notification Log                           |
| NRM   | Network Resource Model                     |
| NV    | Name and Value pair                        |
| OMG   | Object Management Group                    |
| QoS   | Quality of Service                         |
| SS    | Solution Set                               |
| TMN   | Telecommunications Management Network      |
| UML   | Unified Modelling Language                 |
| WSDL  | Web Service Description Language           |
| WS-I  | Web Services Interoperability Organization |
| XML   | eXtensible Markup Language                 |

## 4 Solution Set Definitions

This specification defines the following 3GPP Notification IRP Solution Set Definitions:

Annex A provides the CORBA Solution Set.

Annex B provides the XML Definitions.

Annex C provides the SOAP Solution Set.

---

## Annex A (normative): CORBA Solution Set

This annex contains the CORBA Solution Set for the IRP whose semantics is specified in Notification IRP: Information Service (TS 32.302 [7]).

---

### A.1 Architectural Features

The overall architectural feature of the Notification IRP is specified in 3G TS 32.302 [7]. This clause specifies features that are specific to the CORBA SS.

#### A.1.1 Syntax for Distinguished Names

The syntax of a Distinguished Name is defined in 3GPP TS 32.300 [5].

#### A.1.2 Notification Services

In the CORBA Solution Set, notifications are emitted by IRPAgent using CORBA Notification service (OMG TC Document telecom [13]) and Structured Events.

CORBA Event service (OMG CORBA services [15]) provides event routing and distribution capabilities. CORBA Notification service provides, in addition to Event service, event filtering and support for Quality of Service (QoS) as well.

A subset of CORBA Notification services shall be used to support the implementation of notification. This CORBA Notification service subset, in terms of OMG Notification service (OMG TC Document telecom [13]) defined methods, is identified in the present.

#### A.1.3 Support of Push and Pull Style

OMG Notification Service defines two styles of interaction. One is called push style. In this style, IRPAgent pushes notifications to IRPManager as soon as they are available. The other is called pull style. In this style, IRPAgent keeps the notifications till IRPManager requests for them.

This CORBA SS specifies that support of Push style is Mandatory (M) and that support of Pull style is Optional (O).

#### A.1.4 Support of multiple notifications in one push operation

For efficiency, IRPAgent uses the following OMG Notification Service (OMG TC Document telecom [13]) defined interface to pack multiple notifications and push them to IRPManager using one method `push_structured_events`. The method takes as input a parameter of type `EventBatch` as defined in the `OMG CosNotification` module (OMG TC Document telecom [13]). This data type is a sequence of Structured Events (see clause 4). Upon invocation, this parameter will contain a sequence of Structured Events being delivered to IRPManager by IRPAgent to which it is connected.

The maximum number of events that will be transmitted within a single invocation of this operation is controlled by IRPAgent wide configuration parameter. The amount of time IRPAgent will accumulate individual events into the sequence before invoking this operation is controlled by IRPAgent wide configuration parameter as well.

IRPAgent may push `EventBatch` with only one Structured Event.

The OMG Notification service (OMG TC Document telecom [13]) defined IDL module is shown below.

```

module CosNotifyComm {
    ...
    Interface SequencePushConsumer : NotifyPublish {
        void push_structured_events(
            in CosNotification::EventBatch notifications)
            raises( CosEventComm::Disconnected);
        ...
    }; // SequencePushConsumer
    ...
}; // CosNotifyComm

```

## A.1.5 Support of filterable and non-filterable notification parameters

The OMG Notification service defined IDL `CosNotification::StructuredEvent` and `CosNotification::EventBatch` data types are shown below.

```

struct StructuredEvent {
    EventHeader header;
    FilterableEventBody filterable_data;
    any remainder_of_body;
}; // StructuredEvent

typedef sequence<StructuredEvent> EventBatch;

```

Notification IS parameters are mapped:

- either to the Structured Event header, i.e. above IDL `StructuredEvent` data structure field header;
- or to the Structured Event body, and in this case:
  - when defined in the IS as filterable, to the Structured Event filterable body fields, i.e. above IDL `StructuredEvent` data structure field `filterable_data`;
  - when defined in the IS as non-filterable, to the Structured Event remaining body, i.e. above IDL `StructuredEvent` data structure field `remainder_of_body`.

The OMG Notification service defined IDL `CosNotification::FilterableEventBody` data type and its supporting types are shown below.

```

struct Property {
    PropertyName name;
    PropertyValue value;
};

typedef sequence<Property> PropertySeq;

typedef PropertySeq FilterableEventBody;

```

In order to ensure uniform implementation for notification IS parameters mapped to Structured Event Name-Value pairs whether defined in the IS as filterable or as non-filterable, IDL `StructuredEvent` data structure field `remainder_of_body` of type any shall be mapped to the IDL data structure `NotificationIRPNotifications::NonFilterableEventBody` defined in annex clause A.4.6:

```

struct NonFilterableEventBody {
    CosNotification::PropertySeq name_value_pairs;
    any remainder_of_non_filterable_body;
};

```

---

## A.2 Mapping

### A.2.1 Operation mapping

Notification IRP: IS (3GPP TS 32.302 [7]) defines semantics of operations visible across this IRP. These operations are the operations of the IOCs defined in 3GPP TS 32.302 [7].

Table 1 maps the operations defined in Notification IRP: IS (3GPP TS 32.302 [7]) to their equivalents (methods) in this Solution Set (SS). Specifically, the table 1 maps the operations of the IOCs defined in 3GPP TS 32.302 [7] to their equivalents in this SS. Since one of the IOCs, the **NotificationIRP** IOC, inherits from the **ManagedGenericIRP** IOC [9], the table 1 also maps the operations of **ManagedGenericIRP** IOC to their equivalents (methods) in this SS.

Table 1 also qualifies if a method is Mandatory (M) or Optional (O).

Table 1: Mapping from IS Operation to SS Equivalents

| IS Operations in 3GPP TS 32.302 [7]                                                                                                                               | SS Methods                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Qualifier            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| subscribe                                                                                                                                                         | attach_push, attach_push_b, attach_pull                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | M, O, O              |
| unsubscribe                                                                                                                                                       | detach                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | M                    |

| NOTE: These 3 operations are operations of ManagedGenericIRP IOC specified in 3GPP TS 32.312 [9]. The NotificationIRP IOC of 3GPP TS 32.302 [7] inherits from it. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                      |

## A.2.2 Operation parameter mapping

3GPP TS 32.302 [7] defines semantics of parameters carried in operations across the Notification IRP. Table 2 through table 14 indicate the mapping of these parameters, as per operation, to their equivalents defined in this SS.

**Table 2: Mapping from IS subscribe parameters to SS attach\_push equivalents**

| IS Operation parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SS Method parameter                                                                                                                                                    | Qualifier |

| <p>NOTE 1: IRPManager creates a CosNotifyComm::SequencePushConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_push to IRPAgent. IRPAgent receives s1, performs CORBA::ORB::string_to_object to obtain the IRPManager's IOR and uses it for its future methods. IRPAgent also stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g. s1), finds a match, and performs the detach process. IRPAgent pushes sequence of Structured Events towards IRPManager via the CosNotifyComm::SequencePushConsumer object push_structured_events method, depending on the supplied notification categories and filter.</p> <p>NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [2]). This SS and the Alarm IRP: CORBA SS [4] shall use this grammar only.</p> |                                                                                                                                                                        |           |

**Table 3: Mapping from IS subscribe parameters to SS attach\_push\_b equivalents**

| <p>NOTE 1: IRPManager creates a CosNotifyComm::SequencePushConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_push_b to IRPAgent. IRPAgent receives s1 and stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g. s1), finds a match, and performs the detach process.</p> <p>NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [13]). This SS and the Alarm IRP: CORBA SS [4] shall use this grammar only.</p> <p>NOTE 3: IRPAgent provides this reference to which IRPManager can invoke methods to manage the subscription. Valid methods are not defined in this IRP. OMG CORBA Notification Service defines these methods. Read interface CosNotifyChannelAdmin::SequenceProxyPushSupplier and CosNotifyComm::SequencePushConsumer. IRPManager is expected to invoke connect_sequence_push_consumer method of this interface to connect its own cosNotifyComm::SequencePushConsumer with this reference. After successful connection, IRPAgent pushes sequence of Structured Events towards IRPManager.</p> |                                                                                                                                                                                                                           |           |

**Table 4: Mapping from IS subscribe parameters to SS attach\_pull equivalents**

| IS Operation parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | SS Method parameter                                                                                                                                                                                              | Qualifier |

| <p>NOTE 1: IRPManager creates a CosNotifyComm::SequencePullConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_pull to IRPAgent. IRPAgent receives s1 and stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g. s1), finds a match, and performs the detach process.</p> <p>NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [13]). This SS and the Alarm IRP: CORBA SS [4] shall use this grammar only.</p> <p>NOTE 3: IRPAgent provides this reference to which IRPManager can invoke methods to manage the subscription. Valid methods are not defined in this IRP. OMG CORBA Notification Service defines these methods. Read interface CosNotifyChannelAdmin::SequenceProxyPullSupplier and CosNotifyComm::SequencePullConsumer. IRPManager is expected to invoke connect_sequence_pull_consumer method of this interface to connect its own CosNotifyComm::SequencePullConsumer with this reference. After successful connection, IRPManager pulls sequence of Structured Events from IRPAgent.</p> |                                                                                                                                                                                                                  |           |

### A.2.3 Notification parameter mapping

Notification IRP: IS (3GPP TS 32.302 [7]) defines the semantics of common attributes carried in notifications. This SS does not provide the mapping of these attributes to their CORBA SS equivalents. Other IRPs such as Alarm IRP: IS (3GPP TS 32.111-2 [3]) identify and qualify these common attributes for use in their environment. Their corresponding SS documents define the mapping of these attributes to their SS equivalents.

---

## A.3 IRPAgent's Behaviour

This clause describes some IRPAgent's behaviour not captured by IDL.

### A.3.1 Subscription

IRPManager can invoke multiple `attach_push`, multiple `attach_push_b` or multiple `attach_pull` using different `manager_reference(s)`. As far as IRPAgent is concerned, the IRPAgent will emit notifications to multiple "places" with their independent filter requirements. IRPAgent will not know if the notifications are going to the same IRPManager.

If IRPManager invokes multiple `attach_push`, `attach_push_b` or `attach_pull` using the same `manager_reference` and with an already subscribed `notification_category`, IRPAgent shall raise `AlreadySubscribed` exception to all invocations except one.

IRPManager can invoke multiple `attach_push` using the same `manager_reference` and with one or more not-yet-subscribed `notification_categories`. In this case, if IRPAgent supports all the notification categories requested, IRPAgent shall accept the invocation; otherwise, it raises `AtLeastOneNotificationCategoryNotSupported` exception. IRPAgent shall have similar behaviour for `attach_push_b` and `attach_pull`.

When IRPManager is in subscription by invoking `attach_push`, IRPManager can change the filter constraint, using `change_subscription_filter`, applicable to the notification categories specified in the `attach_push`.

When IRPManager is in subscription by invoking `attach_push_b`, IRPManager can change the filter constraint during subscription using the OMG defined Notification Service Filter Interface. IRPManager shall not use `change_subscription_filter`; otherwise it shall get an exception.

### A.3.2 IRPAgent supports multiple categories of Notifications

IRPAgent may emit multiple categories of Notifications. IRPAgent may have mechanism for IRPManager to pull for notifications of multiple categories.

IRPManager can query IRPAgent about the categories of notifications supported by using `get_notification_categories`.

IRPManager uses a parameter, `notification_categories`, in `attach_push`, `attach_push_b` and `attach_pull` to specify one or more categories of notifications wanted.

IRPManager uses a zero-length sequence in `notification_categories` of `attach_push`, `attach_push_b` and `attach_pull` to specify that all IRPAgent supported categories of notifications are wanted. If IRPManager uses `attach_push` with zero-length sequence in `notification_categories` and if the operation is successful, IRPAgent shall reject subsequent `attach_push` operation, regardless if the `notification_categories` contains a zero-length sequence or one or more specific notification categories. IRPAgent shall have similar behaviour for `attach_push_b` and `attach_pull`.

### A.3.3 IRPAgent's integrity risk of attach\_push\_b Method

In the case that IRPAgent implements this method by extending or using OMG compliant Notification Service, the following IRPManager behaviour illustrates a risk to IRPAgent's integrity.

Given the object reference (IOR) of the `SequenceProxyPushSupplier` (as the mandatory output parameter of the subject method), IRPManager can invoke `SequenceProxyPushSupplier.MyAdmin` method.

IRPManager can then obtain the consumer admin object of the proxy. Then IRPManager can invoke `ConsumerAdmin.MyChannel` to get the IOR of the Notification Channel. IRPManager then can call `EventChannel.MyFactory` which will provide IRPManager the IOR of the `EventChannelFactory` itself. IRPManager can then able to invoke methods directly on the `EventChannelFactory`, like `get_all_channels` which lists all channel numbers and `create_channel` which allows IRPManager to create any number of additional channels.

A malicious IRPManager can, given access to the `EventChannelFactory`, get a list of existing channels and start connecting them together at random thus compromising the IRPAgent's integrity. Deployment of this `attach_push_b` needs strong authentication and authorisation mechanism in place.

The `attach_push` is mandatory. IRPAgent compliant to this IRP shall support it.

The `attach_push_b` is optional. It is recommended that IRPAgent concerned with integrity risk should not support the `attach_push_b` option.

### A.3.4 Quality of Service Parameters

The OMG Notification Service [13] supports a variety of Quality of Service (QoS) properties, such as reliability and priority, that may be expressed to indicate the delivery characteristics of notifications. The following OMG Notification Service QoS parameter settings shall be required when the IRPAgent uses the OMG Notification Service to support this SS:

1. The order policy shall be set to `FifoOrder` (First-in, First-out) [13].
2. The message priority shall be set to 0, i.e. no priority [13].
3. The Start Time Supported shall be set to false, i.e. do not use Start Time [13].
4. The Stop Time Supported shall be set to false, i.e. do not use Stop Time [13].

When the OMG Notification Service is not used, the IRPAgent shall provide First-in, First-out notification ordering, not provide message priority and not provide the support of Start Time and Stop Time.

---

## A.4 Solution Set definitions

### A.4.1 IDL definition structure

Clause A.4.2 defines the constants and types Generic IRP Operations [9] used by the Notification IRP.

Clause A.4.3 defines the Generic IRP Operations as defined by Generic NRM IRP [9] and performed by the Notification IRP Agent.

Clause A.4.4 defines the constants and types used by the Notification IRP.

Clause A.4.5 defines the operations that are performed by the Notification IRP agent.

Clause A.4.6 defines the notifications header to be used by IRP agent when emitting notifications.

```
//File: NotificationIRPNotifications.idl
#ifndef _NOTIFICATION_IRP_NOTIFICATIONS_IDL_
#define _NOTIFICATION_IRP_NOTIFICATIONS_IDL_

#include <CosNotification.idl>
#include <NotificationIRPConstDefs.idl>

// This statement must appear after all include statements
#pragma prefix "3gppsa5.org"

module NotificationIRPNotifications
{
    interface Notify
    {
        /**
         Notification IRP IS defines 6 attributes for the notification header.
         They are: objectClass, objectInstance, notificationId, eventTime,
         systemDN and notificationType.

         The first 2 attributes are mapped into 1 name-value pair. The name of
         the mapped IDL construct is MANAGED_OBJECT_INSTANCE. The const
         string of this mapped IDL construct is defined here.

         The notificationId, eventTime and systemDN are respectively mapped
         into 3 name-value pairs. The const string(s) of these 3 mapped IDL
         constructs are defined here.

         The notificationType is not mapped into any name-value pair
         but is mapped into the type_name position-dependent
         field of the CORBA structured-event. There is no need for a const string
         definition for it.
        */

## Annex B (normative): XML Definitions

This annex contains the XML Definitions for the Notification Integration Reference Point (Notification IRP) as it applies to Itf-N, in accordance with Notification IRP IS definitions [7].

This XML Definitions specification defines the Notification IRP XML Notification header format.

This specification is related to 3GPP TS 32.302 V10.0.X [7].

---

### B.1 Architectural Features

The overall architectural feature of Notification IRP is specified in 3G TS 32.302 [7]. This clause specifies features that are specific to the XML definitions.

#### B.1.1 Syntax for Distinguished Names

The syntax of a Distinguished Name is defined in 3GPP TS 32.300 [5].

---

### B.2 Mapping

Not present in the current version of this specification.

---

### B.3 Solution Set definitions

#### B.3.1 Notification IRP XML notification header Definitions

This clause provides XML definitions of Notification IRP notification header as defined in 3GPP TS 32.302 [3]. These definitions are to be used in conjunction with Notification Log IRP XML Definitions for Notification Log IRP XML Data File and the NL IRP XML Notification Format (3GPP TS 32.335 [4]).

The structure of the Notification IRP XML Notification header Format is shown in clause B.3.2.

The Notification IRP XML Notification header Format uses the definition of notifications in clause B.3.3.

B.3.2 Graphical Representation

Figure B-1: Notification IRP XML Notification header WSDL structure

### B.3.3 XML Schema “notification.xsd”

```
<?xml version="1.0" encoding="UTF-8"?>

    </sequence>
  </complexType>
  <element name="Notification" type="xe:Notification"/>
</schema>
```

## Annex C (normative): SOAP Solution Set

This annex specifies the SOAP Solution Set for the IRP whose semantics are specified in Notification IRP: Information Service (3GPP TS 32.302 [7]).

### C.1 Architectural features

The overall architectural feature of Notification IRP is specified in 3GPP TS 32.302 [7]. This clause specifies features that are specific to the SOAP solution set.

The SOAP 1.1 specification [16] and WSDL 1.1 specification [18] are supported.

The SOAP 1.2 specification [17] is supported optionally.

This specification uses "document" style in WSDL file.

This specification uses "literal" encoding style in WSDL file.

The IRPAgent shall support the push interface model that means IRPAgent sends notifications to IRPManager as soon as new events occur. IRPManager does not need to check ("pull") for events.

The "Notification" definition is imported from Notification IRP XML Definition, documented in Annex B of this specification.

This specification uses a number of namespace prefixes throughout that are listed in the Table below.

**Prefixes and Namespaces used in this specification**

| PREFIX              | NAMESPACE                                                                       |
|---------------------|---------------------------------------------------------------------------------|
| http                | http://schemas.xmlsoap.org/wsdl/http/                                           |
| soap                | http://schemas.xmlsoap.org/wsdl/soap/                                           |

| xsi                 | http://www.w3.org/2001/XMLSchema-instance                                       |
| ntfIRPSystem        | http://www.3gpp.org/ftp/specs/archive/32_series/32.306#NotificationIRPSystem    |
| ntfIRPData          | http://www.3gpp.org/ftp/specs/archive/32_series/32.306#NotificationIRPData      |
| ntfIRPNtfSystem     | http://www.3gpp.org/ftp/specs/archive/32_series/32.306#NotificationIRPNtfSystem |
| ntfIRPNtfData       | http://www.3gpp.org/ftp/specs/archive/32_series/32.306#NotificationIRPNtfData   |
| genericIRPSystem    | http://www.3gpp.org/ftp/specs/archive/32_series/32.316#GenericIRPSystem         |

The WSDL structure is as outlined in the figures below:

Figure C-1: Notification IRP SOAP Solution Set WSDL structure

Figure C-2: Notification IRP SOAP Solution Set Notification WSDL structure

### C.1.2 Syntax for Distinguished Names

The syntax of a Distinguished Name is defined in 3GPP TS 32.300 [5].

---

## C.2 Mapping

### C.2.1 Operation mapping

Notification IRP: IS (3GPP TS 32.302 [7]) defines semantics of operations visible across this IRP. These operations are the operations of the IOCs defined in 3GPP TS 32.302 [7].

The table maps the operations defined in Notification IRP: IS (3GPP TS 32.302 [7]) to their equivalents (methods) in this Solution Set (SS). Specifically, it maps the operations of the IOCs defined in 3GPP TS 32.302 [7] to their equivalents in this SS. Since one of the IOCs, the `NotificationIRP` IOC, inherits from the

ManagedGenericIRP IOC [9], the table below also maps the operations of ManagedGenericIRP IOC to their equivalents (methods) in this SS.

The table below also qualifies if a method is Mandatory (M) or Optional (O).

**Mapping from IS Operation to SS Equivalents**

| IS Operations in 3GPP TS 32.302 [7]                                                                                                                                  | SS Operations             | Qualifier |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|-----------|
| subscribe                                                                                                                                                            | subscribe                 | M         |
| unsubscribe                                                                                                                                                          | unsubscribe               | M         |
| getSubscriptionIds                                                                                                                                                   | getSubscriptionIds        | O         |

| getIRPVersion (see note.)                                                                                                                                            | getIRPVersion             | M         |
| getOperationProfile (see note.)                                                                                                                                      | getOperationProfile       | O         |
| getNotificationProfile (see note.)                                                                                                                                   | getNotificationProfile    | O         |
| NOTE: These 3 operations are operations of ManagedGenericIRP IOC specified in 3GPP TS 32.312 [9].<br>The NotificationIRP IOC of 3GPP TS 32.302 [7] inherits from it. |                           |           |

## C.2.2 Filter language

The filter language used in the SS is the XPath Language (see W3C XPath 1.0 specification [19]). IRPAgents may throw a FilterComplexityLimit fault when a given filter is too complex.

## C.2.3 Common datatype definition

### C.2.3.1 NotificationCategorySetType

```
<complexType name="NotificationCategorySetType">
  <complexContent>
    <extension base="ntfIRPData:VersionNumberSetType">
      </extension>
    </complexContent>
  </complexType>
```

### C.2.3.2 SubscriptionStateType

```
<simpleType name="SubscriptionStateType">
  <restriction base="string">
    <enumeration value="Suspended"/>
    <enumeration value="NotSuspended"/>
  </restriction>
</simpleType>
```

## C.2.4 Operation parameter mapping

3GPP TS 32.302 [7] defines semantics of parameters carried in operations across the Notification IRP. The tables below show the mapping of these parameters, as per operation, to their equivalents defined in this SS.

## C.2.4.1 Operation subscribe

### C.2.4.1.1 Input parameters

#### Mapping from IS subscribe input parameters to SS equivalents

| IS Operation parameter                                                                                                                                                                                                                                 | SS Method parameter                                           | Qualifier |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|-----------|
| managerReference                                                                                                                                                                                                                                       | anyURI managerReference                                       | M         |
| timeTick                                                                                                                                                                                                                                               | long timeTick                                                 | O         |
| notificationCategories                                                                                                                                                                                                                                 | ntfIRPData:NotificationCategorySetType notificationCategories | O         |
| filter                                                                                                                                                                                                                                                 | string filter (see note 1)                                    | O         |
|                                                                                                                                                                                                                                                        | anyURI ntfTransServiceNS (see note 2)                         | M         |
| NOTE1: The grammar of the filter string is XPath defined by W3C XPath 1.0 specification [19].                                                                                                                                                          |                                                               |           |
| NOTE2: This parameter is used to specify the name space of the Web Notification Transmission Service that will be used for sending notification.<br>The "http://www.3gpp.org/ftp/specs/archive/32_series/32.306#notification" URI should be supported. |                                                               |           |

Here is the XML schema fragment of the subscribe request:

```
<!-- subscribe Request -->
<element name="subscribe">
  <complexType>
    <sequence>
      <element name="managerReference" type="anyURI"/>
      <element name="timeTick" type="long" minOccurs="0"/>
      <element name="notificationCategories" type="ntfIRPData:NotificationCategorySetType"
        minOccurs="0"/>
      <element name="filter" type="string" minOccurs="0"/>
      <element name="ntfTransServiceNS" type="anyURI"/>
    </sequence>
  </complexType>
</element>
```

### C.2.4.1.2 Output parameters

#### Mapping from IS subscribe output parameters to SS equivalents

| IS Operation parameter | SS Method parameter       | Qualifier |
|------------------------|---------------------------|-----------|
| subscriptionId         | string subscriptionId     | M         |
| status                 | ntfIRPData:subscribeFault | M         |

Here is the XML schema fragment of the subscribe response:

```
<!-- subscribe Response -->
<element name="subscribeResponse">
  <complexType>
    <sequence>
      <element name="subscriptionId" type="string"/>
    </sequence>
  </complexType>
</element>
```

### C.2.4.1.3 Fault definition

```
<!-- subscribe Fault -->
<element name="subscribeFault">
  <complexType>
    <choice>
      <element name="AlreadySubscribedFault" type="string"/>
      <element name="AtLeastOneNotificationCategoryNotSupportedFault" type="string"/>
      <element name="subscribeFault" type="string"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
      <element ref="ntfIRPData:ParameterNotSupportedFault"/>
    </choice>
  </complexType>
```

</element>

## C.2.4.2 Operation unsubscribe

### C.2.4.2.1 Input parameters

#### Mapping from IS unsubscribe input parameters to SS equivalents

| IS Operation parameter | SS Method parameter     | Qualifier |
|------------------------|-------------------------|-----------|
| managerReference       | anyURI managerReference | M         |
| subscriptionId         | string subscriptionId   | O         |

Here is the XML schema fragment of the unsubscribe request:

```
<!-- unsubscribe Request -->
<element name="unsubscribe">
  <complexType>
    <sequence>
      <element name="managerReference" type="anyURI"/>
      <element name="subscriptionId" type="string" minOccurs="0"/>
    </sequence>
  </complexType>
</element>
```

### C.2.4.2.2 Output parameters

#### Mapping from IS unsubscribe output parameters to SS equivalents

| IS Operation parameter | SS Method parameter         | Qualifier |
|------------------------|-----------------------------|-----------|
| Status                 | ntfIRPData:unsubscribeFault | M         |

Here is the XML schema fragment of the unsubscribe response:

```
<!-- unsubscribe Response -->
<element name="unsubscribeResponse">
</element>
```

### C.2.4.2.3 Fault definition

```
<!-- unsubscribe Fault -->
<element name="unsubscribeFault">
  <complexType>
    <choice>
      <element name="unsubscribeFault" type="string"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
      <element ref="ntfIRPData:ParameterNotSupportedFault"/>
    </choice>
  </complexType>
</element>
```

## C.2.4.3 Operation getSubscriptionIds

### C.2.4.3.1 Input parameters

#### Mapping from IS getSubscriptionIds input parameters to SS equivalents

| IS Operation parameter | SS Method parameter     | Qualifier |
|------------------------|-------------------------|-----------|
| managerReference       | anyURI managerReference | M         |

Here is the XML schema fragment of the getSubscriptionIds request:

```

<!-- getSubscriptionIds Request -->
<element name="getSubscriptionIds">
  <complexType>
    <sequence>
      <element name="managerReference" type="anyURI"/>
    </sequence>
  </complexType>
</element>

```

### C.2.4.3.2 Output parameters

#### Mapping from IS getSubscriptionIds output parameters to SS equivalents

| IS Operation parameter | SS Method parameter                  | Qualifier |
|------------------------|--------------------------------------|-----------|
| subscriptionIdSet      | sequence of string subscriptionIdSet | M         |
| status                 | ntfIRPData:getSubscriptionIdsFault   | M         |

Here is the XML schema fragment of the getSubscriptionIds response:

```

<!-- getSubscriptionIds Response -->
<element name="getSubscriptionIdsResponse">
  <complexType>
    <sequence>
      <element name="subscriptionIdSet">
        <complexType>
          <sequence>
            <element name="subscriptionId" type="string" maxOccurs="unbounded"/>
          </sequence>
        </complexType>
      </element>
    </sequence>
  </complexType>
</element>

```

### C.2.4.3.3 Fault definition

```

<!-- getSubscriptionIds Fault -->
<element name="getSubscriptionIdsFault">
  <complexType>
    <choice>
      <element name="getSubscriptionIdsFault" type="string"/>
      <element ref="ntfIRPData:OperationNotSupportedFault"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
    </choice>
  </complexType>
</element>

```

## C.2.4.4 Operation getSubscriptionStatus

### C.2.4.4.1 Input parameters

#### Mapping from IS getSubscriptionStatus input parameters to SS equivalents

| IS Operation parameter | SS Method parameter   | Qualifier |
|------------------------|-----------------------|-----------|
| subscriptionId         | string subscriptionId | M         |

Here is the XML schema fragment of the getSubscriptionStatus request:

```

<!-- getSubscriptionStatus Request -->
<element name="getSubscriptionStatus">
  <complexType>
    <sequence>
      <element name="subscriptionId" type="string"/>
    </sequence>
  </complexType>

```

```
</element>
```

#### C.2.4.4.2 Output parameters

##### Mapping from IS getSubscriptionStatus output parameters to SS equivalents

| IS Operation parameter                                                                       | SS Method parameter                                           | Qualifier |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------|-----------|
| notificationCategories                                                                       | ntfIRPData:NotificationCategorySetType notificationCategories | C         |
| filterInEffect                                                                               | string filterInEffect (see note)                              | O         |
| SubscriptionState                                                                            | ntfIRPData:SubscriptionStateType SubscriptionState            | O         |
| timeTick                                                                                     | long timeTick                                                 | O         |
| status                                                                                       | ntfIRPData:getSubscriptionStatusFault                         | M         |
| NOTE: The grammar of the filter string is XPath defined by W3C XPath 1.0 specification [19]. |                                                               |           |

Here is the XML schema fragment of the getSubscriptionStatus response:

```
<!-- getSubscriptionStatus Response -->
<element name="getSubscriptionStatusResponse">
  <complexType>
    <sequence>
      <element name="notificationCategories" type="ntfIRPData:NotificationCategorySetType"
        minOccurs="0"/>
      <element name="filterInEffect" type="string" minOccurs="0"/>
      <element name="SubscriptionState" type="ntfIRPData:SubscriptionStateType"
        minOccurs="0"/>
      <element name="timeTick" type="long" minOccurs="0"/>
    </sequence>
  </complexType>
</element>
```

#### C.2.4.4.3 Fault definition

```
<!-- getSubscriptionStatus Fault -->
<element name="getSubscriptionStatusFault">
  <complexType>
    <choice>
      <element name="getSubscriptionStatusFault" type="string"/>
      <element ref="ntfIRPData:OperationNotSupportedFault"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
    </choice>
  </complexType>
</element>
```

#### C.2.4.5 Operation changeSubscriptionFilter

##### C.2.4.5.1 Input parameters

##### Mapping from IS changeSubscriptionFilter input parameters to SS equivalents

| IS Operation parameter                                                                       | SS Method parameter      | Qualifier |
|----------------------------------------------------------------------------------------------|--------------------------|-----------|
| subscriptionId                                                                               | string subscriptionId    | M         |
| filter                                                                                       | string filter (see note) | M         |
| NOTE: The grammar of the filter string is XPath defined by W3C XPath 1.0 specification [19]. |                          |           |

Here is the XML schema fragment of the changeSubscriptionFilter request:

```
<!-- changeSubscriptionFilter Request -->
<element name="changeSubscriptionFilter">
  <complexType>
    <sequence>
      <element name="subscriptionId" type="string"/>
      <element name="filter" type="string"/>
    </sequence>
  </complexType>
</element>
```

### C.2.4.5.2 Output parameters

#### Mapping from IS changeSubscriptionFilter output parameters to SS equivalents

| IS Operation parameter | SS Method parameter                       | Qualifier |
|------------------------|-------------------------------------------|-----------|
| status                 | ntfIRPData: changeSubscriptionFilterFault | M         |

Here is the XML schema fragment of the changeSubscriptionFilter response:

```
<!-- changeSubscriptionFilter Response -->
<element name="changeSubscriptionFilterResponse">
  </element>
```

### C.2.4.5.3 Fault definition

```
<!-- changeSubscriptionFilter Fault -->
<element name="changeSubscriptionFilterFault">
  <complexType>
    <choice>
      <element name="changeSubscriptionFilterFault" type="string"/>
      <element ref="ntfIRPData:OperationNotSupportedFault"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
    </choice>
  </complexType>
</element>
```

### C.2.4.6 Operation suspendSubscription

#### C.2.4.6.1 Input parameters

##### Mapping from IS suspendSubscription input parameters to SS equivalents

| IS Operation parameter | SS Method parameter   | Qualifier |
|------------------------|-----------------------|-----------|
| subscriptionId         | string subscriptionId | M         |

Here is the XML schema fragment of the suspendSubscription request:

```
<!-- suspendSubscription Request -->
<element name="suspendSubscription">
  <complexType>
    <sequence>
      <element name="subscriptionId" type="string"/>
    </sequence>
  </complexType>
</element>
```

#### C.2.4.6.2 Output parameters

##### Mapping from IS suspendSubscription output parameters to SS equivalents

| IS Operation parameter | SS Method parameter                 | Qualifier |
|------------------------|-------------------------------------|-----------|
| status                 | ntfIRPData:suspendSubscriptionFault | M         |

Here is the XML schema fragment of the suspendSubscription response:

```
<!-- suspendSubscription Response -->
<element name="suspendSubscriptionResponse">
  </element>
```

### C.2.4.6.3 Fault definition

```
<!-- suspendSubscription Fault -->
<element name="suspendSubscriptionFault">
```

```

    <complexType>
      <choice>
        <element name="suspendSubscriptionFault" type="string"/>
        <element ref="ntfIRPData:OperationNotSupportedFault"/>
        <element ref="ntfIRPData:InvalidParameterFault"/>
      </choice>
    </complexType>
  </element>

```

## C.2.4.7 Operation resumeSubscription

### C.2.4.7.1 Input parameters

#### Mapping from IS resumeSubscription input parameters to SS equivalents

| IS Operation parameter | SS Method parameter   | Qualifier |
|------------------------|-----------------------|-----------|
| subscriptionId         | string subscriptionId | M         |

Here is the XML schema fragment of the resumeSubscription request:

```

<!-- resumeSubscription Request -->
<element name="resumeSubscription">
  <complexType>
    <sequence>
      <element name="subscriptionId" type="string"/>
    </sequence>
  </complexType>
</element>

```

### C.2.4.7.2 Output parameters

#### Mapping from IS resumeSubscription output parameters to SS equivalents

| IS Operation parameter | SS Method parameter                | Qualifier |
|------------------------|------------------------------------|-----------|
| status                 | ntfIRPData:resumeSubscriptionFault | M         |

Here is the XML schema fragment of the resumeSubscription response:

```

<!-- resumeSubscription Response -->
<element name="resumeSubscriptionResponse">
</element>

```

### C.2.4.7.3 Fault definition

```

<!-- resumeSubscription Fault -->
<element name="resumeSubscriptionFault">
  <complexType>
    <choice>
      <element name="resumeSubscriptionFault" type="string"/>
      <element ref="ntfIRPData:OperationNotSupportedFault"/>
      <element ref="ntfIRPData:InvalidParameterFault"/>
    </choice>
  </complexType>
</element>

```

## C.2.4.8 Operation getNotificationCategories

### C.2.4.8.1 Input parameters

None.

Here is the XML schema fragment of the getNotificationCategories request:

```

<!-- getNotificationCategories Request -->

```

```
<element name="getNotificationCategories">
</element>
```

### C.2.4.8.2 Output parameters

#### Mapping from IS getNotificationCategories output parameters to SS equivalents

| IS Operation parameter   | SS Method parameter                                             | Qualifier |
|--------------------------|-----------------------------------------------------------------|-----------|
| NotificationCategoryList | ntfIRPData:NotificationCategorySetType NotificationCategoryList | M         |
| status                   | ntfIRPData:getNotificationCategoriesFault                       | M         |

Here is the XML schema fragment of the getNotificationCategories response:

```
<!-- getNotificationCategories Response -->
<element name="getNotificationCategoriesResponse">
  <complexType>
    <sequence>
      <element name="NotificationCategoryList" type="ntfIRPData:NotificationCategorySetType"/>
    </sequence>
  </complexType>
</element>
```

### C.2.4.8.3 Fault definition

```
<!-- getNotificationCategories Fault -->
<element name="getNotificationCategoriesFault">
  <complexType>
    <choice>
      <element name="getNotificationCategoriesFault" type="string"/>
      <element ref="ntfIRPData:OperationNotSupportedFault"/>
    </choice>
  </complexType>
</element>
```

## C.2.5 Parameter mapping

Notification IRP: IS (3GPP TS 32.302 [7]) defines the semantics of common attributes carried in notifications. This SS does not provide the mapping of these attributes to their SOAP SS equivalents. Other IRPs such as Alarm IRP: IS (3GPP TS 32.111-2 [3]) identify and qualify these common attributes for use in their environment. Their corresponding SS documents define the mapping of these attributes to their SS equivalents.

## C.2.6 NotificationIRPNotification Interface definition

The operation name is defined as “notify”.

### C.2.6.1 Input parameters

#### notify input parameters

| IS Operation parameter | SS Method parameter          | Qualifier |
|------------------------|------------------------------|-----------|
| -                      | xe:Notification notification | M         |
|                        |                              |           |

The notifications of the various IRPs extend the input parameter above.

Here is the XML schema fragment of the notify request:

```
<!-- notify Request -->
<element name="notify">
  <complexType>
    <sequence>
      <element name="notificationHeaderAndBody"
        type="ntfIRPNotificationData:AnySequenceType"/>
    </sequence>
  </complexType>
</element>
```

```
        </sequence>
      </complexType>
    </element>
    <complexType name="AnySequenceType">
      <sequence>
        <any namespace="##any" processContents="lax" maxOccurs="unbounded"/>
      </sequence>
    </complexType>
```

## C.2.6.2 Output parameters

None.

---

## C.3 IRPAgent's Behaviour

This clause describes some IRPAgent's behaviour not captured by WSDL.

### C.3.1 Subscription

IRPManager can invoke multiple `subscribe` operation using different `managerReference(s)`. As far as IRPAgent is concerned, the IRPAgent will emit notifications to multiple "places" with their independent filter requirements. IRPAgent will not know if the notifications are going to the same IRPManager.

If IRPManager invokes multiple `subscribe` using the same `managerReference` and with an already subscribed `notificationCategory`, IRPAgent shall raise `AlreadySubscribedFault` fault to all invocations except one.

IRPManager can invoke multiple `subscribe` using the same `managerReference` and with one or more not-yet-subscribed `notificationCategories`. In this case, if IRPAgent supports all the notification categories requested, IRPAgent shall accept the invocation; otherwise, it raises `AtLeastOneNotificationCategoryNotSupportedFault` fault.

---

## C.4 Solution Set definitions

### C.4.1 WSDL definition structure

Clause C.4.2 provides a graphical representation of the Notification IRP service.

Clause C.4.3 defines the services that are supported by the Notification IRP agent.

Clause C.4.4 defines the Notification Header definitions.

### C.4.2 Graphical Representation

Not present in the current version of this specification.

### C.4.3 WSDL specification "NotificationIRPSystem"

```
