Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the [ETSI IPR online database](#).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™**, **LTE™** and **5G™** logo are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found at [3GPP to ETSI numbering cross-referencing](#).

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document specifies for User Equipment (UE), in UMTS system, for FDD and TDD modes, those UE functions that are required for conformance testing purposes.

For conformance tests, functions are activated via the radio interface. These functions shall be capable of being activated when a test USIM is present. Any USIM related features such as subsidy-related UE features should also not interfere with the functions. In the loopback state, the UE shall be able to perform all functions specified in the present document except where otherwise stated; in addition however, the conformance testing functions must be operational.

USIM, in general, is described in TS 31.101 [7]. The ME recognises the test USIM by the Administrative Data Field. Test USIM data fields are described in TS 34.108 [10].

The present document applies to the unit that includes the hardware to establish a connection across the radio interface.

2 References

The following documents contain provisions that, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

UE (User Equipment): user equipment that is under test.

SS (System Simulator): test system (or equipment) that drives the test process between UE, like BS (Base Station) simulator.

User: test user, who handles the test and measurement process via the logical test interface.

Logical Test Interface: interface which provides the logical service to interwork and to communicate between UE and System Simulator during the test of a UE.

TC (Test Control): UE protocol entity used by the SS to control the UE specific testing functions.

3.2 Abbreviations

Abbreviations used in the present document are listed in TR 21.905 [6].

For the purposes of the present document, the following abbreviations apply:

IP	Internet Protocol
LB	Loop Back
RAB	Radio Access Bearer
RB	Radio Bearer
SAPI	Service Access Point Indicator
SS	System Simulator
TC	Test Control
TFT	Traffic Flow Template
UICC	UMTS Integrated Circuit Card
UL TFT	Uplink Traffic Flow Template

4 UE conformance test functions

4.1 General description

The SS performs activation and deactivation of the conformance test functions in the UE by sending standard NAS Layer 3 messages. A specific protocol discriminator value has been defined in TS 24.007 [1], subclause 11.2.3.1.1 for the UE test command messages. Figure 4.1.1 illustrates the Layer 3 protocol entity Test Control (TC) where the UE test command messages terminates.

NOTE: The protocol discriminator value used for the TC messages is the same as used in GSM for the MS specific testing functions, see TS 44.014 [13].

Figure 4.1.1: TC protocol termination (TC =Test Control)

Apart from sending the appropriate deactivation command to the UE the functions shall be deactivated by switching off the UE.

The following UE conformance testing functions can be activated (and deactivated):

- UE test loop function;
- UE radio bearer test mode;
- Electrical Man Machine Interface (EMMI).

In addition to the conformance testing functions listed above there is a set of reference measurement channels that a UE need to support to enable RF conformance testing. The reference measurement channels are defined in TS 34.121 [8], Annex C for FDD and in TS 34.122 [9], Annex C for TDD.

Example of reference measurement channels (RMC) essential to all UEs supporting FDD or TDD are:

- UL 12.2 kbps RMC (Reference Measurement Channel);
- DL 12.2 kbps RMC.

Example of reference measurement channels associated with UE service capabilities for FDD (DL and UL) and TDD (DL only) are:

- DL 64 kbps RMC;
- DL 144 kbps RMC;
- DL 384 kbps RMC;
- UL 64 kbps RMC;
- UL 144 kbps RMC;
- UL 384 kbps RMC.

4.2 UE radio bearer test mode

The UE radio bearer test mode is specified in subclause 5.2.

The following TC procedures are used to control the UE radio bearer test mode:

- Activate UE radio bearer test mode;
- Deactivate UE radio bearer test mode.

4.3 UE test loop

The UE test loop function is specified in subclause 5.3.

The following TC procedures are used to control the UE test loop function:

- Close UE test loop;
- Open UE test loop.

A prerequisite for the UE test loop function is that the UE radio bearer test mode is active.

4.4 EMMI

The EMMI is specified in clause 7.

No specific TC procedures are associated with EMMI.

5 Test Control (TC) protocol procedures and test loop operation

5.1 General description

The UE test loop function provides access to isolated functions of the UE via the radio interface without introducing new physical interfaces just for the reason of conformance testing.

NOTE: It should be emphasised that the UE test loop function only describes the functional behaviour of the UE with respect to its external interfaces; physical implementation of the UE test loop function is completely left open to the manufacturer.

The UE test loop function is activated by transmitting the appropriate Test Control (TC) message to the UE, see clause 6.

For the purposes of this specification only, the following definitions are used:

Bidirectional Radio Bearer:

If the "RB mapping info" information element ([5] subclause 10.3.4.21) for the currently active configuration of a radio bearer includes mappings to both uplink and downlink transport channels then this radio bearer is defined to be a bidirectional radio bearer.

Unidirectional Radio Bearer:

If the "RB mapping info" information element ([5] subclause 10.3.4.21) for the currently active configuration of a radio bearer includes mappings to only uplink or downlink transport channels then this radio bearer is defined to be a unidirectional radio bearer.

NOTE: This definition of unidirectional radio bearer is only applicable to RLC Unacknowledged Mode, in this version of the specification.

The UE test loop function can be operated in four different loopback modes:

- UE test loop mode 1;
- UE test loop mode 2;
- UE test loop mode 3; and
- UE test loop mode 4.

UE test loop mode 1, 2 and 4 provide loopback of data for bidirectional radio bearers. UE test loop mode 3 provides counting of successfully received RLC SDUs on a given MTCH.

The UE test loop mode 1 and 2 are mandatory to all UEs. The UE test loop mode 3 is mandatory for UEs supporting MBMS. The UE test loop mode 4 is mandatory for UEs supporting network initiated secondary PDP context.

Support of Update UE Location Information function is optional for the UE.

Figure 5.1.1 shows a functional block diagram of the UE test loop function for UE test loop mode 1.

Figure 5.1.2 shows a functional block diagram of the UE test loop function for UE test loop mode 3 applicable when testing reception of MBMS services not operating in MBSFN mode.

Figure 5.1.3 shows a functional block diagram of UE test loop function for UE test loop mode 3 applicable when testing MBMS services operating in MBSFN mode. Test loop command/response messages are sent on the unicast carrier while the UE test loop mode 3 operates on the MTCH on the MBSFN carrier.

Figure 5.1.4 shows a functional block diagram of UE test loop function for UE test loop mode 4 applicable when testing network initiated secondary PDP context and routing of UE uplink IP packets based on network signalled UL TFT.

For UE test loop mode 1 the loopback point is located above Layer 2. Depending on the actual radio bearer setup loopback is performed of RLC SDUs or PDCP SDUs according to the procedure specified in subclause 5.3.3.2.

For UE test loop mode 3 the UE counts each successfully received RLC SDU on the MTCH configured for RLC SDU counting.

The loop back point for UE test loop mode 1 has been selected above Layer 2 to separate the protocol configurations from the UE test loop function. By configuration of RLC and MAC layers other loop back points may functional be achieved. E.g. by transparent configuration of RLC and MAC layer functional loop back point at Transport channel level can be achieved to implement the reference measurement channels as specified by TS 34.121 [8], Annex C for FDD and by TS 34.122 [9], Annex C for TDD.

For UE test loop mode 2 both data and CRC are looped back. UE test loop mode 2 is intended for Blind Transport Format Detection (BTFD) testing and BLER testing of DL 12.2 kbps reference measurement channel for which loopback of downlink CRC is required. UE test loop mode 2 can also be used for BLER testing of DL 64, 144 and 384 kbps reference measurement channels if the UE supports correspondent UL reference measurement channels. Both received data and CRC bits for the DCH transport channel used for the BTFD test case is returned according to the procedure specified in subclause 5.3.3.3.

The loop back point for UE test loop mode 4 has been selected above UE's function for UL TFT handling. IP PDUs (=PDCP SDUs) received in downlink are returned to the UL TFT handling SAP in the UE. The UE shall perform normal operation of the UL TFT handling function while UE test loop mode 4 is active, i.e. the UE shall perform routing of uplink IP packets to the uplink radio bearers in accordance with the signalled UL TFT filters as specified in [20] and [2].

A specific radio bearer test mode is specified to be used together with the UE test loop function. The purpose of the radio bearer test mode is to put the UE into a mode where: SS can set up radio bearers to be terminated in the UE test loop function without having to involve CC or SM; and to disable any control mechanisms in NAS protocols or in any UE applications that otherwise could cause the RRC connection to be released.

Figure 5.1.1: UE Test Loop Mode 1 function (TC =Test Control, LB = Loop Back entity)

Figure 5.1.2: UE test loop mode 3 for testing MBMS services not operating in MBSFN mode

Figure 5.1.3: UE test loop mode 3 for testing MBMS services operating in MBSFN mode

Figure 5.1.4: Model for UE Test Loop Mode 4 for testing UE UL TFT handling

5.2 UE radio bearer test mode procedures

5.2.1 Activate UE radio bearer test mode

Figure 5.2.1.1: Activate UE radio bearer test mode procedure

5.2.1.1 General

The SS uses the activate UE radio bearer procedure to get the UE into a test mode where: the SS can set up radio bearers to be terminated in the UE test loop function without having to involve CC or SM; and to disable any control mechanisms in NAS protocols (TC protocol excluded) or in any UE applications that otherwise could cause the RRC connection to be released.

5.2.1.2 Initiation

The SS can initiate the UE radio bearer test mode when an RRC connection is established.

The SS requests the UE to activate the UE radio bearer test mode by transmitting an ACTIVATE RB TEST MODE message. The SS then starts timer TT01.

5.2.1.3 Reception of ACTIVATE RB TEST MODE message by UE

When the UE receives the ACTIVATE RB TEST MODE message then the radio bearer test mode shall be activated.

When the radio bearer test mode is active the UE shall:

- accept any requested radio bearer setup within the radio access capabilities of the UE;
- terminate all user plane radio bearer(s) in the UE test loop function;
- discard all SDUs delivered by the RLC layer to the UE test loop function for a radio bearer without a closed test loop if the configuration of that radio bearer does not include the PDCP layer;
- discard all SDUs delivered by the PDCP layer to the UE test loop function for a radio bearer without a closed test loop if the configuration of that radio bearer includes the PDCP layer (configured by "PDCP info" (see [5]));
- disable any control mechanisms in NAS protocols or in any UE applications that otherwise could cause the RRC connection to be released; and
- optionally, if the UE supports CSG Proximity Indication, ignore any non 3GPP radio signals which are normally used in determining proximity to a CSG (closed subscriber group) cell and delete any previously stored cell information for proximity detection.

NOTE: The UE may provide other means which would guarantee that the UE ignores any non 3GPP radio signals which are normally used in determining proximity to a CSG (closed subscriber group) cell and deletes any previously stored cell information for proximity detection. For such UEs the above mentioned CSG requirements in UE test mode may not apply.

When the radio bearer test mode has been activated the UE shall transmit the ACTIVATE RB TEST MODE COMPLETE message.

NOTE: For UEs not supporting UE test loop mode 4 then the UE does not need to provide any CC or SM functionality while the radio bearer test mode is active. For testing of UE uplink packet filtering using UE test loop mode 4 then SM procedures are used by the SS to configure uplink packet filters. Thus for UEs supporting UE test loop mode 4 then the UE has to provide SM functionality while the radio bearer test mode is active.

5.2.1.4 Reception of ACTIVATE RB TEST MODE COMPLETE message by SS

Upon reception of the ACTIVATE RB TEST MODE COMPLETE message the SS stops timer TT01.

The reception of the ACTIVATE RB TEST MODE COMPLETE message by SS confirms that the UE radio bearer test mode has been activated in the UE.

5.2.1.5 TT01 timeout

If TT01 expires, then the SS shall indicate this to the test case. The procedure is then completed.

5.2.2 Deactivate UE radio bearer test mode

Figure 5.2.2.1: Deactivate UE radio bearer test mode procedure

5.2.2.1 General

The purpose of this procedure is to deactivate the radio bearer test mode and return UE to normal operation.

5.2.2.2 Initiation

The SS can deactivate the UE radio bearer test mode when an RRC connection is established and the UE radio bearer test mode is active.

The SS requests the UE to deactivate the UE radio bearer test mode by transmitting a DEACTIVATE RB TEST MODE message. The SS then starts timer TT01.

5.2.2.3 Reception of DEACTIVATE RB TEST MODE message by UE

When the UE receives DEACTIVATE RB TEST MODE message then the radio bearer test mode shall be deactivated and UE shall be returned to normal operation.

When the UE has deactivated the radio bearer test mode the UE shall transmit the DEACTIVATE RB TEST MODE COMPLETE message using the RRC UPLINK DIRECT TRANSFER message.

5.2.2.4 Reception of DEACTIVATE RB TEST MODE COMPLETE message by SS

Upon reception of the DEACTIVATE RB TEST MODE COMPLETE message the SS stops timer TT01.

The reception of DEACTIVATE RB TEST MODE COMPLETE message by SS confirms that the UE radio bearer test mode has been deactivated in the UE.

5.2.2.5 TT01 timeout

If TT01 expires, then the SS shall indicate this to the test case. The procedure is then completed.

5.3 UE test loop procedures

5.3.1 General

The UE test loop function is intended for:

- Testing of receiver characteristics based on BER (Bit Error Ratio) measurement. The SS calculates BER from a bit-by-bit comparison of data sent to and received from UE. BER measurement requires symmetric RAB bit-rates.
- Testing of receiver performance based on BLER (Block Error Ratio) measurement. The SS calculates BLER based on the RLC STATUS SDU received from the UE operating in RLC acknowledged mode; or the SS

calculates BLER based on checking returned downlink data and downlink CRC by UE operating in UE test loop mode 2.

- Testing of UE Blind Transport Format Detection.
- Testing of UE transmitter characteristics.
- Testing of UE transmitter DTX characteristics.
- Testing of radio bearers (UE test loop function emulates terminal equipment).
- Counting received RLC SDUs on a given MTCH. This may be used for the estimation of RLC SDU error rate for testing of MTCH performance.
- Generating reliable data transmission flow on E-DPDCH for E-DCH testing (UE test loop mode 1).
- Testing of UE uplink packet filtering (UE test loop mode 4).

5.3.2 Close UE test loop

Figure 5.3.2.1: Close UE test loop procedure

5.3.2.1 General

The SS uses the close UE test loop procedure to start the UE Test Loop function in the UE. A prerequisite for UE test loop mode 1, UE test loop mode 2 and UE test loop mode 4 is that at least one bidirectional user plane radio bearer has been established between SS and UE. A prerequisite for UE test loop mode 3 is that at least one MTCH has been established. See TS 34.108 [10], clause 7 for generic setup procedures.

The UE shall provide for normal Uu layer 1, layer 2 and RRC functionality while the UE test loop function is active. This includes (but is not limited to) handover procedures and normal disconnection of the radio bearer. The loopback shall be maintained across handovers, but after radio bearer disconnection, the loopback shall cease to exist.

5.3.2.2 Initiation

The SS can request the UE to close a test loop in mode 1, mode 2 or mode 4 if at least one bidirectional user plane radio bearer is established and the UE radio bearer test mode is active.

When testing reception of MBMS services not operating in MBSFN mode the SS can request the UE to close the test loop in mode 3 if any MTCH is established and the UE radio bearer test mode is active.

When testing reception of MBMS services operating in MBSFN mode the SS can request the UE to close the test loop in mode 3 before or after any MTCH has been established on the MBSFN carrier and the UE radio bearer test mode is active.

The SS requests the UE to close its radio bearer test loop by transmitting a CLOSE UE TEST LOOP message. The SS then starts timer TT01.

5.3.2.3 Reception of CLOSE UE TEST LOOP message by the UE

If UE test loop mode 1, mode 2 or mode 4 has been selected and no user plane bidirectional radio bearers are established or the UE radio bearer test mode is not active, then the UE shall ignore any CLOSE UE TEST LOOP message.

If UE test loop mode 1, mode 2 or mode 4 has been selected and one or more user plane bidirectional radio bearers are established, the UE shall close the test loop on all user plane bidirectional radio bearers and then send back to the SS a CLOSE UE TEST LOOP COMPLETE message. The loopback shall be operational prior to the sending of the acknowledgement. The UE shall not close the UE test loop mode 1, mode 2 or mode 4 on any unidirectional user plane radio bearers.

If UE test loop mode 3 has been selected and a MTCH corresponding to the specified MBMS short transmission identity is established, the UE shall commence counting of received RLC SDUs on this MTCH. The counter value shall be reset to zero on reception of CLOSE UE TEST LOOP MODE 3 and the UE shall send back a CLOSE UE TEST LOOP COMPLETE message to the SS.

If UE test loop mode 3 has been selected, no MTCH corresponding to the specified MBMS short transmission identity is established and the UE supports MBMS service operating in MBSFN mode, the UE shall wait until a MTCH is established corresponding to this MBMS short transmission identity to close the test loop and commence counting of received RLC SDUs. The counter value shall be reset to zero when the MTCH is established, the test loop shall be closed and the UE shall send back a CLOSE UE TEST LOOP COMPLETE message to the SS.

If the test loop is already closed on one or more user plane radio bearers, the UE shall still respond as if the loop had been open, i.e. the CLOSE UE TEST LOOP COMPLETE message shall be sent.

NOTE: There is no requirement on the UE to read the content of the CLOSE UE TEST LOOP message if it is received while the test loop is closed.

If UE test loop mode 1 has been selected then the loop back scheme according to subclause 5.3.2.6 shall be performed by the UE.

If UE test loop mode 2 has been selected then the loop back scheme according to subclause 5.3.2.7 shall be performed by the UE.

If UE test loop mode 3 has been selected then the RLC SDU counting scheme according to subclause 5.3.2.8a shall be performed by the UE.

If UE test loop mode 4 has been selected then the loop back scheme according to subclause 5.3.2.8b shall be performed by the UE.

5.3.2.4 Reception of CLOSE UE TEST LOOP COMPLETE message by the SS

Upon reception of the CLOSE UE TEST LOOP COMPLETE message the SS stops timer TT01.

5.3.2.5 TT01 timeout

If TT01 expires, then the SS shall indicate this to the test case. The procedure is then completed.

5.3.2.6 UE test loop mode 1 operation

If the configuration of a user plane radio bearer with a closed UE test loop mode 1 includes the PDCP protocol layer, configured by "PDCP info" (see [5]), then the loop back scheme according to subclause 5.3.2.6.1 shall be performed by the UE for that radio bearer.

If the PDCP protocol layer is not used for a user plane radio bearer with a closed UE test loop mode 1 then the loop back scheme according to subclause 5.3.2.6.2 shall be performed by the UE for that radio bearer.

5.3.2.6.1 Loopback of PDCP SDUs

If UE test loop mode 1 has been closed on a user plane radio bearer and the setup of that radio bearer includes configuration of PDCP protocol layer, configured by "PDCP info" (see [5]), then the following loop back scheme shall be performed by the UE.

After the UE has closed UE test loop mode 1 on a user plane radio bearer, every PDCP SDU received by the UE on that radio bearer (downlink) shall be taken from the output of the PDCP service access point (SAP) and be input to the correspondent PDCP SAP and transmitted (uplink).

The UE shall provide for normal PDCP operation.

The PDCP loopback operation is illustrated in figure 5.3.2.6.1.1.

**Figure 5.3.2.6.1.1: Loop back of PDCP SDU
(DL RLC SDU size = UL RLC SDU size = N)**

5.3.2.6.2 Loopback of RLC SDUs

If UE test loop mode 1 has been closed on a user plane radio bearer and the setup of that radio bearer does not include configuration of the PDCP protocol layer ("PDCP info" is not configured (see [5]) then the following loop back scheme shall be performed by the UE.

After the UE has closed UE test loop mode 1 on a user plane radio bearer, every user data block received by the UE on that radio bearer (downlink) shall be taken from the output of the RLC service access point (SAP) and be input to the correspondent RLC SAP and transmitted (uplink). The UE reads the UL RLC SDU size parameter from the "LB Setup RB IE#k" parameter associated with that radio bearer, see subclause 6.2.

If no "LB Setup RB IE#k" parameter is associated with that radio bearer then the UE shall use the same UL RLC SDU size as the received DL RLC SDU.

For the case when the "UL RLC SDU size" parameter is set to "0" no data shall be returned.

For the case when the "UL RLC SDU size" parameter is set to the same value as the down link (DL) RLC SDU block size then the complete user data block shall be returned, see figure 5.3.2.6.2.1.

**Figure 5.3.2.6.2.1: DL and UL RLC SDU block size equal
(DL RLC SDU size = UL RLC SDU size = N)**

For the case when the "UL RLC SDU size" parameter is set to a value less than the down link (DL) RLC SDU block size then the UE shall return the first K bits of the received block, where K is the UL block size, see figure 5.3.2.6.2.2.

Figure 5.3.2.6.2.2: DL > UL RLC SDU block size
(DL RLC SDU size = N, UL RLC SDU size = K)

For the case when the "UL RLC SDU size" parameter is set to a value bigger than the down link (DL) RLC SDU block size then the UE shall pad the UL send block by repeating the received data block until the UL send block has been filled (truncating the last block if necessary), see figure 5.3.2.6.2.3.

Figure 5.3.2.6.2.3: DL < UL RLC SDU block size
(DL RLC SDU size = N, UL RLC SDU size = $2 \cdot N + K$)

For the case of loopback of data from DL HS-DSCH to UL E-DPDCH the following applies:

- For RLC unacknowledged mode, when the UL RLC SDU block does not fit in the Transmission buffer, the UE shall discard the UL RLC SDU block. The UE shall perform the discard either by the loopback entity or by the UM RLC entity as described in [19] subclause 9.7.3.5.
- For RLC unacknowledged mode the minimum total RLC UM buffer size supported by the UE shall be [10 kbytes]. See note 2.

NOTE 1: The minimum total RLC UM buffer size and the RLC SDU discard functionality has been specified to enable E-DCH RF performance testing.

NOTE 2: The value for minimum total RLC UM buffer size is preliminary set to 10kByte. The value is for further study to secure that the required buffer size is enough to cover all E-DCH RF testing scenarios and UE E-DCH categories.

5.3.2.7 UE test loop mode 2 operation

For UE test loop mode 2 to work correctly ciphering shall be disabled.

For the UE to be able to return downlink transport block data and CRC bits then the up link transport channel configuration shall include a transport format for which the block size is equal to or bigger than the sum of the downlink transport block size and the number of downlink CRC bits. If no such uplink transport format exists then the returned data and CRC bits will be truncated.

5.3.2.7.1 Loopback of downlink transport block data and downlink CRC

If UE test loop mode 2 has been closed on a user plane radio bearer then the following loop back scheme shall be performed by the UE for all transport channels associated with a single DTCH:

After the UE has closed test loop mode 2 on a user plane radio bearer then the UE shall copy the downlink transport block and CRC bits received on that radio bearer to the uplink transport block and transmit in the up link transport channel configured for that radio bearer.

If the uplink configuration for that radio bearer is of variable rate then the transport format with the smallest transport block size which fits the downlink transport block size and the downlink CRC bits shall be selected for the uplink. In case there is no uplink transport format that fits the downlink transport block data and the downlink CRC bits then the data and CRC bits shall be truncated using the transport format with the biggest transport block size configured for that uplink transport channel.

UE test loop mode 2 operation is illustrated for the case when the uplink transport block size is bigger than the sum of the downlink transport block size and size of downlink CRC in figure 5.3.2.7.1.

UE test mode 2 operation is illustrated for the case when uplink transport block size is smaller than the sum of downlink transport block size and size of downlink CRC in figure 5.3.2.7.2.

Figure 5.3.2.7.1. UE test loop mode 2 operation for the case when uplink transport block size is bigger than the sum of downlink transport block size and size of downlink CRC

Figure 5.3.2.7.2. UE test loop mode 2 operation for the case when uplink transport block does not fit downlink transport block and downlink CRC bits.

5.3.2.8 Void

5.3.2.8a UE Test Loop Mode 3 Operation

In UE test loop mode 3, the UE is required to count RLC SDUs received on a given MTCH, which must have been configured in the UE prior to closing UE test loop mode 3.

When the CLOSE UE TEST LOOP message is received by the UE, the counter value is reset to zero. After this, every user data block successfully received by the UE on the chosen MTCH shall cause the counter value to be incremented by one. A 32 bit counter shall be used and the UE counter value is undefined if more than 4294967295 RLC SDUs have been received by the UE.

Figure 5.3.2.8a.1: UE test loop mode 3 operation

5.3.2.8b UE test loop mode 4 operation

If the configuration of a user plane radio bearer with a closed UE test loop mode 4 includes the PDCP protocol layer, configured by "PDCP info" (see [5]), then the loop back scheme according to subclause 5.3.2.8b.1 shall be performed by the UE for that radio bearer.

If the PDCP protocol layer is not used for a user plane radio bearer with a closed UE test loop mode 4 then the UE behaviour is unspecified.

5.3.2.8b.1 Loopback of IP PDUs

If UE test loop mode 4 has been closed on a user plane radio bearer and the setup of that radio bearer includes configuration of PDCP protocol layer, configured by "PDCP info" (see [5]), then the following loop back scheme shall be performed by the UE.

After the UE has closed UE test loop mode 4 on a user plane radio bearer, every IP PDU (=PDCP SDU) received by the UE in downlink shall be taken from the output of the PDCP service access point (SAP) and be input to the SAP of the UL TFT handling function and transmitted in uplink.

The UE shall provide for normal PDCP operation and uplink packet filtering operation based on received UL TFT.

The IP PDU loopback operation is illustrated in figure 5.1.4 and 5.3.2.8b.1.1.

Figure 5.3.2.8b.1.1: Loop back of IP PDU
(DL IP PDU size = UL IP PDU size = N)

5.3.2.9 Loopback delay requirement

5.3.2.9.1 General loopback delay requirement

Loopback delay is specified as delay between received DL radio frames and their corresponding UL radio frames produced from the received data. The loopback delay is measured at the antenna connector of the UE and specified in the unit of radio frame(s). Timing offset between DL and UL radio frames, and timing errors are not included in the loopback delay.

For UE operating in UE test loop mode 1 the loopback delay requirement is applicable for a radio bearer with a closed test loop if the MAC and RLC protocols for that radio bearer are configured for transparent operation and if the downlink RLC SDU size is equal to the downlink transport block size, i.e. no segmentation/concatenation takes place.

For UE operating in UE test loop mode 1 the loopback delay requirement is not applicable for unacknowledged mode radio bearers configured on HS-DSCH and E-DPDCH.

NOTE 0: UE test loop mode 1 is used for E-DCH RF performance testing. For these test cases unacknowledged mode radio bearer configurations for HS-DSCH and E-DPDCH are used. This means that the data rate may vary depending on absolute and relative grants given by the SS. In addition overflow of UE UM buffer may happen as SS needs to guarantee continuous data in uplink..

For UE operating in UE test loop mode 2 the loopback delay requirement is applicable for any radio bearer configuration.

For UE operating in UE test loop mode 3, the received data is only counted, and is not looped back to the SS so the loopback delay requirement is not applicable.

The UE shall maintain a fixed loopback delay (the loopback delay shall not vary during a test) if the configuration of radio bearers with closed test loops remains unchanged. The loopback delay shall not exceed the number of radio frames correspondent to 10 times the TTI of the actual transport channel configuration.

The loopback delay requirement for the 10ms TTI case is illustrated in figure 5.3.2.9.1.

NOTE 1: See TS 25.211 [11], subclause 7.6.3 for definition of the timing offset between DL and UL radio frames for FDD mode.

NOTE 2: See TS 25.133 [12], subclause 7.1 for definition of the timing error for FDD mode.

Figure 5.3.2.9.1: Loopback delay requirement (TTI=10 ms)

5.3.2.9.2 Loopback delay requirement for RLC and PDCP SDUs (UE Test loop mode 1)

The maximum delay from receiving an RLC or PDCP SDU in a downlink SAP until returning an SDU in the correspondent uplink SAP shall be within the delay requirement specified in subclause 5.3.2.9.1.

The UE test loop function, operating in UE test loop mode 1, shall for every radio bearer with a closed test loop be able to return at least 4 SDUs within the time equal to the TTI of the actual radio bearer.

NOTE: To enable testing of the Conversational CS TM reference radio bearer combinations as specified in 34.108 subclause 6.10 a UE must be able to loop back 4 SDUs per TTI. E.g. for "Conversational / unknown / UL:64 DL:64 kbps / CS RAB" operated in TM RLC mode 4 SDUs are needed to fill the transport format existing of 4x640 bits.

NOTE: The loopback delay requirement in 5.3.2.9.2 does not impose any synchronisation mechanisms between the uplink RLC entity and the UE test loop function. Thus it could happen that a UE when having received 4 SDUs within one and the same TTI may deliver the SDUs to the uplink RLC entity in two subsequent TTIs. For a TM radio bearer requiring multiple SDUs to fill a transport block set then "Timer discard without explicit signalling" needs to be configured to secure that the TM RLC entity does not discard the SDUs in case they are delivered in subsequent TTIs.

5.3.3 Open UE test loop

Figure 5.3.3.1: Open UE test loop procedure

5.3.3.1 General

The SS uses the procedure open UE test loop to deactivate the UE test loop function in the UE.

5.3.3.2 Initiation

The SS requests the UE to open all closed radio bearer test loops by transmitting an OPEN_UE_TEST_LOOP_CMD message. The SS then starts timer TT01.

5.3.3.3 Reception of OPEN UE TEST LOOP message by the UE

If no bidirectional user plane radio bearers are established in UE Test loop mode 1 or UE test loop mode 2, the UE shall ignore any OPEN UE TEST LOOP message.

If one or more user plane radio bearer test loops are closed, the UE shall open all test loops and send back to the SS an OPEN UE TEST LOOP COMPLETE message.

If the test loops are already open, the UE shall still respond as if the loops had been closed, i.e. the OPEN UE TEST LOOP COMPLETE message should be sent prior to TT01 expiring.

5.3.3.4 Reception of OPEN UE TEST LOOP COMPLETE by the SS

Upon reception of the OPEN UE TEST LOOP COMPLETE message the SS stops timer TT01.

5.3.3.5 TT01 timeout

If TT01 expires, then the SS shall indicate this to the test case. The procedure is then completed.

5.4 UE Positioning test mode procedures

5.4.1 Reset UE Positioning Stored Information

5.4.1.1 General

The SS uses the reset UE positioning stored information procedure to command the UE to reset the already acquired UE POSITIONING information in preparation for subsequent test procedures.

5.4.1.2 Initiation

The SS requests the UE to reset the stored UE positioning information mode by transmitting a RESET UE POSITIONING STORED INFORMATION message.

5.4.1.3 Reception of RESET UE POSITIONING STORED INFORMATION message by UE

When UE receives RESET UE POSITIONING STORED INFORMATION message then the UE shall:

- 1> if the IE "UE Positioning Technology" has the value 'AGPS':

- 2> discard any stored GPS reference time, reference position, and any other aiding data obtained or derived during the previous test instance (e.g. expected ranges and Doppler).
- 1> if the IE "UE Positioning Technology" has the value 'AGNSS':
 - 2> discard any stored GPS and GANSS reference time, reference position, and any other aiding data obtained or derived previously (e.g. expected ranges and Doppler);
 - 2> temporarily disable any sensor data (if applicable) that can aid the positioning for the duration of the subsequent positioning procedure.
- 1> otherwise:
 - 2> ignore the message.

5.4.2 Update UE Location Information

Figure 5.4.2-1: Update UE Location Information procedure

5.4.2.1 General

The SS uses the Update UE Location information procedure to send positioning information to the UE and command it to store positioning information in preparation for subsequent test procedures.

5.4.2.2 Initiation

The SS requests the UE to store the positioning information contained in the message by transmitting a UPDATE UE LOCATION INFORMATION message.

5.4.2.3 Reception of UPDATE UE LOCATION INFORMATION message by UE

When UE receives UPDATE UE LOCATION INFORMATION message then the UE shall:

- 1> if the UE has location information values stored:
 - 2> discard the stored location information:
- 1> store the received location information (ellipsoidPointWithAltitude) and maintain it until reception of RESET UE POSITIONING STORED INFORMATION or UPDATE UE LOCATION INFORMATION message.
Information not supported by the UE may be discarded.

5.5 UE RLC SDU counter reporting procedure

Figure 5.5.1: UE RLC SDU counter reporting procedure

5.5.1 UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST and UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE

5.5.1.1 General

The SS may transmit a UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST message at any time when UE test loop mode 3 is active.

5.5.1.2 Initiation

The SS requests the UE to report its current RLC SDU counter value by sending the message UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST to the UE. The SS then starts timer TT01.

5.5.1.3 Reception of UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST by the UE

If UE test loop mode 3 is not active, the UE shall ignore the UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST message.

If UE test loop mode 3 is active, the UE shall respond by transmitting a UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE message, containing the current RLC SDU counter value.

5.5.1.4 Reception of UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE by the SS

Upon reception of the UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE message the SS stops timer TT01.

5.5.1.5 TT01 timeout

If TT01 expires, then the SS shall indicate this to the test case. The procedure is then completed.

6 Message definitions and contents

In this clause, only TC protocol messages are described. TC control messages are intended to be sent using the RRC downlink and uplink direct transfer procedures, see TS 25.331 [5], subclause 8.1.9 and subclause 8.1.10.

NOTE 1: A message received with skip indicator different from 0 will be ignored.

NOTE 2: For general definition of Layer 3 message format see TS 24.007 [1], clause 11.

NOTE 3: GSM and 3G test messages uses the same protocol discriminator value ("1111"). Following message type value series are reserved for GSM testing commands as specified by TS 44.014 [13]: 0000xxxx, 0001xxxx and 0010xxxx where x represent 0 or 1. For 3G test commands the message type value series 0100xxxx is reserved.

6.1 Timer values

TT01:

- for testing the reception of MBMS services operating in MBSFN mode: [15] seconds.
- otherwise: 2.5 seconds.

NOTE: For testing the reception of MBMS services operating in MBSFN mode a longer time is specified for TT01 as the response to the CLOSE UE TEST LOOP message by the UE may involve waiting for cluster selection and/or MTCH establishment on the MBSFN carrier.

6.2 CLOSE UE TEST LOOP

This message is only sent in the direction SS to UE.

Information Element	Reference	Presence	Format	Length
Protocol discriminator	TS 24.007 [1], subclause 11.2.3.1.1	M	V	1/2
Skip indicator	TS 24.007 [1], subclause 11.2.3.1.2	M	V	1/2
Message type		M	V	1
UE test loop mode		M	V	1
UE test loop mode 1 LB setup		C	LV	1-16
UE test loop mode 3 setup		C	V	1

where message type is:

8	7	6	5	4	3	2	1	bit no.
0	1	0	0	0	0	0	0	octet 1

where UE test loop mode is:

8	7	6	5	4	3	2	1	bit no.
0	0	0	0	0	0	X2	X1	octet 1

X2=0 and X1=0 then UE test loop mode 1 loop back scheme according to 5.3.2.6 shall be performed by the UE (loopback of RLC SDUs or PDCP SDUs).

X2=0 and X1=1 then UE test loop mode 2 loop back scheme according to 5.3.2.7 shall be performed by the UE (loopback of transport block data and CRC bits).

X2=1 and X1=0 then the UE test loop mode 3 RLC SDU counting scheme according to section 5.3.2.8a shall be performed by the UE (counting of received RLC SDUs).

X2=1 and X1=1 then the UE test loop mode 4 loop back scheme according to section 5.3.2.8b shall be performed by the UE (loopback of IP PDUs).

For backward compatibility reason, the bit 3 of octet 1 shall not be used and shall always be set to zero.

where UE test loop mode 1 LB setup is:

8	7	6	5	4	3	2	1
---	---	---	---	---	---	---	---

Length of UE test loop mode 1 LB setup IE	Octet 1
LB setup list	Octet 2 Octet N*3+1

N is the number of LB entities in the LB setup list and is less than or equal to 5.

where LB setup list is:

8	7	6	5	4	3	2	1	
LB setup RB IE#1								Octet 2 Octet 3 Octet 4
LB setup RB IE#2								Octet 5 Octet 6 Octet 7
...								
LB setup RB IE#N								Octet N*3-1 Octet N*3 Octet N*3+1

where LB Setup RB IE#k is:

8	7	6	5	4	3	2	1	bit no.
Z15	Z14	Z13	Z12	Z11	Z10	Z9	Z8	octet 1
Z7	Z6	Z5	Z4	Z3	Z2	Z1	Z0	octet 2
Reserved			Q4	Q3	Q2	Q1	Q0	octet 3

Z15..Z0 = Uplink RLC SDU size in bits 0.. 65535 (binary coded, Z15 is most significant bit and Z0 least significant bit). Support of Uplink RLC SDU sizes bigger than 12160 bits is optional for the UE, see Note 1.

Q4..Q0 = RB identity number, 5..32 (binary coded, Q4 is most significant bit and Q0 least significant bit), where RB identity identifies the radio bearer, see [5] TS 25.331. The range is limited to 5..32 due to RB0 to RB4 are reserved for signalling radio bearers.

NOTE: The parameter UL RLC SDU size is only applicable for UE test loop mode 1 and for radio bearers not using the PDCP protocol layer, see subclause 5.3.2.6.2. The UE capability for support of UL RLC SDU sizes bigger than 12160 bits is stated by the UE manufacturer as an Implementation Conformations Statement (ICS) as defined in TS 34.123-2 [17], subclause A.4.3.1 table A.13. The UE Total RLC AM buffer size according to the UE Radio Access Capabilities defined in TS 25.306 [18] shall not be exceeded.

And where UE test loop mode 3 setup is:

8	7	6	5	4	3	2	1	
UE test loop mode 3 setup IE								Octet 1

Where

8	7	6	5	4	3	2	1	bit no.
Reserved			Q5	Q4	Q3	Q2	Q1	octet 1

Q5..Q0 = MBMS short transmission identity number -1, 0..63 (binary coded, Q5 is most significant bit and Q0 least significant bit), where MBMS short transmission identity number identifies the MBMS Transmission identity (= MBMS service identity + MBMS session id) associated with the MTCH under test, see [5] TS 25.331. Test loop mode 3 operation is only defined for MTCH.

6.3 CLOSE UE TEST LOOP COMPLETE

This message is only sent in the direction UE to SS.

DLO23..DLO0 = "degreesLongitude" value -8388608..8388607 (two's complement binary coded as per ASN.1 encoding of an integer value, DLO23 is most significant bit and DLO0 is least significant bit).

A1 = "altitudeDirection" value 0=height and 1=depth

AD14..AD0 = "altitude" value 0..32767 (binary coded, AD14 is most significant bit and AD0 is least significant bit).

7 Electrical Man Machine Interface (EMMI)

The EMMI is used for automation of conformance testing. The commands used on the EMMI by the System Simulator, shall be limited to the AT commands specified in TS 27.005 [15], TS 27.007 [16] and TS 27.060 [17]. The EMMI and its use for automation of signalling testing are illustrated in figure 7.1 as an example.

At the System Simulator side, a logical EMMI using AT commands shall interface with the TTCN test cases. A physical EMMI interface may be a standard RS232 interface towards the UE. Other interfaces shall not be precluded.

At the UE side the physical interface may be of various types, and an adapter may be provided by the UE manufacturer for converting the AT commands between the System Simulator interface into the UE manufacturer specific interface and format.

The use of EMMI is optional for the UE.

Figure 7.1: An example of EMMI and its use for automation of signalling testing

8 UICC/ME test interface

8.1 General description

A special interface is required in order to perform the tests of the UICC/ME interface.

8.2 Formal aspects

It shall be possible to connect the UICC/USIM simulator to the ME. If an adapter is to be used, the manufacturer of the ME shall provide it.

When using the UICC/USIM simulator, the ME does not necessarily conform to all RF requirements.

When the UICC/USIM simulator is connected the ME shall be able to correctly send and receive on a DTCH and associated channels under ideal radio conditions.

8.3 Hardware and logical aspects of the interface

The signals on this interface are specified in TS 31.101 [7].

8.4 Mechanical characteristics of the interface

The mechanical interface is specified in TS 31.101 [7].

Annex A (informative): UE test loop use scenarios

A.1 Measurement of receiver characteristics (BER) using UE test loop mode 1 and RLC TM

SS can use the UE test loop mode 1 and RLC TM for measuring BER. For UE to be able to return all data it receives from SS it is required that the DL and UL transport block size are the same. It is also required that the UL RLC SDU size parameter of the CLOSE UE TEST LOOP message is set to the same value as the DL and UL transport block size.

A.1.1 Measurement of receiver characteristics (BER) - DL reference measurement channel (12.2 kbps)

In FDD mode, for measuring BER for the DL and UL reference measurement channel 12.2 kbps according to TS 34.121 [8], Annex C the configuration should be:

- DL and UL transport block size = 244 bits (RLC TM);
- UE test loop mode 1 parameter UL RLC SDU size = 244 bits.

In TDD mode, for measuring BER for the DL and UL reference measurement channel 12.2 kbps according to TS 34.122 [9], Annex C.

A.2 Measurement of receiver performance (BLER) using UE test loop mode 1 and RLC AM

To measure BLER UE test loop mode 1 can be used by having the DL RLC protocol operating in acknowledged mode (AM). The SS can calculate BLER from the ratio of number of UE retransmission requests and the total number of blocks sent by the SS.

In AM the UE indicates missing protocol units (=transport blocks) in the STATUS PDU message. There are different triggers for sending the STATUS PDU message. For the purpose of SS BLER measurement a timer based trigger such as receiver timer based STATUS PDU transfer can be used (see TS 25.322, subclause 9.7.2). The figure below illustrates the SS BLER measurement procedure. In the example in the figure block errors are detected by the UE of a total of N blocks. The BLER calculated by the SS is $4 / N$.

#Total = Number of sent blocks,
 #Retransmit = Number of UE retransmission requests

Figure A.2.1: Measuring BLER using UE test loop mode 1 and DL RLC AM

A.2.1 Measurement of receiver performance (BLER) - DL reference measurement channel (64,144,384 kbps)

By having downlink transport block size set to size of user data part according to the 64, 144 or 384 kbps reference measurement channels and using RLC acknowledge mode the UE test loop mode 1 can be used to measure BLER.

A.3 Measurement of receiver performance (BLER) using UE test loop mode 2

In addition to the method described in A.2 UE test loop mode 2 can be used to measure BLER if the UL transport block size is bigger or equal to the sum of DL transport block size and number of DL CRC bits.

The SS can calculate BLER by checking returned data and CRC and count number of block errors and the total number of sent blocks.

A.3.1 Measurement of receiver performance (BLER) - DL reference measurement channel (12.2 kbps)

TS 34.121 [8], subclauses C.2.1 and C.3.1 defines the DL and UL reference measurement channel 12.2 kbps for FDD mode.

TS 34.122 [9], subclauses C.2.1 and C.3.1 defines the DL and UL reference measurement channel 12.2 kbps for TDD mode.

To be able to measure BLER using UE test loop mode 2 the SS needs to configure the uplink transport block size to 260 bits to fit downlink transport block size (244 bits) and downlink CRC bits (16 bits), see figure A.3.1.

Figure A.3.1: UE test loop mode 2 operation for the 12.2 kbps BLER measurement case

A.3.2 Measurement of receiver performance (BLER) - DL reference measurement channel (64,144 and 384 kbps)

TS 34.121 [8], subclause C.2 defines the DL and UL reference measurement channel for 64, 144 and 384 kbps for FDD mode.

TS 34.122 [9], subclause C.2 defines the DL reference measurement channel for 64, 144 and 384 kbps for TDD mode.

If a UE supports downlink reference measurement channels for 64,144 or 384 kbps and also the correspondent uplink reference measurement channel then it is possible to use UE test loop mode 2 for measuring BLER for these reference measurement channels.

A.4 Measurement of transmitter characteristics

The SS sets up the radio bearer for DL and UL reference measurement channels 12.2 kbps using the generic setup procedure.

See TS 34.108 [10], clause 7 for specification of the generic setup procedure.

See TS 34.121 [8], subclauses C.2.1 and C.3.1 for definition of the DL and UL reference measurement channel 12.2 kbps for FDD mode.

See TS 34.122 [9], subclauses C.2.1 and C.2.2 for definition of the DL and UL reference measurement channel 12.2 kbps for TDD mode.

The SS orders the UE to close its UE test loop by transmitting a CLOSE UE TEST LOOP CMD message.

When the SS receives the CLOSE UE TEST LOOP COMPLETE message from the UE the SS starts transmission of data to the UE.

Perform the transmitter test.

The SS sends the OPEN UE TEST LOOP message to the UE to open the UE test loop.

A.5 Measurement of transmitter DTX characteristics

The SS requests the UE to enable DTX and sets up the radio bearer for DL and UL reference measurement channels 12.2 kbps using the generic setup procedure.

See TS 34.108 [10], clause 7 for specification of the generic setup procedure.

See TS 34.121 [8], subclauses C.2.1 and C.3.1 for definition of the DL and UL reference measurement channel 12.2 kbps for FDD mode.

See TS 34.122 [9], subclauses C.2.1 and C.2.2 for definition of the DL and UL reference measurement channel 12.2 kbps for TDD mode.

The SS orders the UE to close its UE test loop using UE test mode 1 by transmitting a CLOSE UE TEST LOOP message.

The UE confirms that the UE test loop is closed by sending the CLOSE UE TEST LOOP COMPLETE message to the SS.

Perform the transmitter DTX testing.

The SS sends the OPEN UE TEST LOOP message to the UE to open the UE test loop.

A.6 Using UE test loop mode 2 for testing of UE Blind Transport Format Detection (FDD mode)

When a UE operates in UE test loop mode 2 then the received downlink transport block and the downlink CRC data bits shall be returned in the uplink transport block, see subclause 5.3.2.7. The UE shall select the uplink transport format with the smallest transport block size, which fits both the received downlink transport block and the downlink CRC bits. Table A.6.1 gives an example of an uplink radio bearer configuration for variable rate having three transports formats TF0, TF1 and TF2. Table A.6.2 gives some examples of UE selected uplink transport format versus size of received downlink transport block and downlink CRC bits.

The SS can use UE test loop mode 2 for testing UE blind transport format detection by taken the possible downlink transport formats into consideration when configuring the uplink transport formats. I.e. for every downlink transport format there should be an uplink transport format for which the transport block size is equal to the sum of the downlink transport block size and the number of downlink CRC bits. Thus the SS can check the TFI of the UE transmitted transport format to verify that the UE has detected the correct downlink transport format. Table A.6.3 gives an example of a configuration for testing blind transport format detection using 9 possible downlink transport formats TF0 to TF8. The right hand column shows the minimum uplink transport block sizes the SS has to set-up to be able to test the UE blind transport format detection behaviour.

Table A.6.1: Uplink transport formats

UL transport format	Transport block size
TF0	0
TF1	55 bits
TF2	111 bits

Table A.6.2: Selected uplink transport format versus size of received downlink transport block and downlink CRC bits

DL transport block size	Number of DL CRC bits	Selected UL TF	Comment
39 bits	16 bits	TF1	$39 + 16 = 55$ i.e. TF1 ok
40 bits	16 bits	TF2	TF1 not possible ($40 + 16 = 56 > 55$) TF2 OK ($56 < 111$)
95 bits	16 bits	TF2	TF2 OK ($95+16=111$)
96 bits	16 bits	TF2	$96 + 16 = 112$ is bigger than TF2 block size but no bigger TF available i.e. TF2 is selected and returned DL data and CRC is truncated (one bit of the DL CRC is not returned)

Table A.6.3: Example of configuration for testing behaviour of UE blind transport format detection

DL TFI of DTCH		UL TFI of DTCH Minimum required UL transport block size if DL CRC size=12	
TF0	39 bits	TF0	51 bits ($39 + 12$)
TF1	95 bits	TF1	107 bits ($95 + 12$)
TF2	103 bits	TF2	115 bits ($103 + 12$)
TF3	118 bits	TF3	130 bits ($118 + 12$)
TF4	134 bits	TF4	146 bits ($134 + 12$)
TF5	148 bits	TF5	160 bits ($148 + 12$)
TF6	159 bits	TF6	171 bits ($159 + 12$)
TF7	204 bits	TF7	216 bits ($204 + 12$)
TF8	244 bits	TF8	256 bits ($244 + 12$)

A.7 Using UE test loop mode 1 for protocol testing

The parameter UL RLC SDU in CLOSE UE TEST LOOP message is used to control the behaviour of the UE test function behaviour regarding the uplink RLC SDU size.

In downlink the SS can control the downlink RLC SDU size by creating test data blocks of the size required for the test purpose.

Table A.7.1 describes the UE test function behaviour when operating in UE test loop mode 1 for different settings of DL and UL RLC SDU sizes:

Table A.7.1: UE test loop behaviour for different settings of DL and UL RLC SDU sizes.

UL RLC SDU size	UE test loop behaviour
= 0	Nothing is returned by UE in uplink
= DL RLC SDU size	All received data is returned by UE in uplink
< DL RLC SDU size	Received data is truncated by UE and sent in uplink
> DL RLC SDU size	Received data is repeated until UL RLC SDU block is filled and sent in uplink

Examples of different configurations are shown in figures A.7.1 and A.7.2.

Figure A.7.1 illustrates a configuration for testing of RLC reassemble and segmentation. SS sends DL RLC SDU block size > DL RLC PDU block size and have configured UL RLC SDU block size = DL RLC SDU size > UL RLC PDU block size.

NOTE: For this type of configuration the UE receiver buffer limitations need to be considered when designing the test.

Figure A.7.2 illustrates a configuration for BER measurements. SS sends DL RLC SDU block size = DL RLC PDU block size and have configured UL RLC SDU block size = UL RLC PDU block size = DL RLC PDU block size. RLC and MAC are configured for transparent mode.

Figure A.7.1: Configuration for testing of RLC reassembly in downlink and RLC segmentation in uplink

Figure A.7.2: Example of a configuration used for BER measurement
