### 9.12.2.2 TDD

For the parameters specified in Table 9.12.2.2-1 and Table 9.12.2.2-2 using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.12.2.2-3 by the following

- a) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha\%$  of the time;
- b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to [0.02].

## 9.13 CSI reporting for 8Rx UE

### 9.13.1 CQI reporting definition under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [6]. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

#### 9.13.1.1 Minimum requirement PUCCH 1-1 with Rank 4 (CSI Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

##### 9.13.1.2.1 Void

##### 9.13.1.2.2 TDD

The following requirements apply to UE Category 8 and DL Category 14, 17~20,  $\geq 22$ . For the parameters specified in table 9.13.1.2.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set {median  $\text{CQI}_1 - 1$ , median  $\text{CQI}_1$ , median  $\text{CQI}_1 + 1$ } for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.13.1.2.2-1: PUCCH 1-1 static test 4x8 (TDD)

| Parameter                                                                              |                                                                                                                                                                                                                                                                                                                                                                                | Unit         | Test 1 |     | Test 2                        |     |

| Note 1:                                                                                | Reference measurement channel RC.23 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.                                                                                                                                                                                                                                   |              |        |     |                               |     |
| Note 2:                                                                                | For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.                                                                                                                                                                                                                                    |              |        |     |                               |     |
| Note 3:                                                                                | To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.                                                                                                    |              |        |     |                               |     |
| Note 4:                                                                                | RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification. |              |        |     |                               |     |

## 10 Performance requirement (MBMS)

### 10.1 FDD (Fixed Reference Channel)

The parameters specified in Table 10.1-1 are valid for all FDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

**Table 10.1-1: Common Test Parameters (FDD)**

| Parameter                                                                                             | Unit      | Value       |
|-------------------------------------------------------------------------------------------------------|-----------|-------------|
| Number of HARQ processes                                                                              | Processes | None        |
| Subcarrier spacing                                                                                    | kHz       | 15 kHz      |
| Allocated subframes per Radio Frame (Note 1)                                                          |           | 6 subframes |
| Number of OFDM symbols for PDCCH                                                                      |           | 2           |
| Cyclic Prefix                                                                                         |           | Extended    |
| Note1: For FDD mode, up to 6 subframes (#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331. |           |             |

All tests specified in 10.1 and 10.3 the applicability rules are defined as the following. The requirements in clause 10.3 are applicable to UEs that support FeMBMS. The test case applicability is in according to Table 10.1-2 depending on set of supported UE capabilities.

**Table 10.1-2: FeMBMS PMCH tests applicability**

| Tests / clause | Applicable if UE indicates at least the following capability                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| 10.3.1         | FeMBMS support of <i>fembmsMixedCell</i> and <i>unicast-fembmsMixedSCell</i> with corresponding subcarrier spacing |
| 10.3.2         | FeMBMS support of <i>fembmsMixedCell</i> with corresponding subcarrier spacing                                     |
| 10.3.3         | FeMBMS support of <i>fembmsDedicatedCell</i> with corresponding subcarrier spacing                                 |

For FeMBMS capable UEs, if corresponding tests listed in clause 10.1 or 10.3.1 or 10.3.2 are tested, the test coverage can be considered fulfilled without executing the corresponding tests listed in clause 10.3.3.

### 10.1.1 Minimum requirement

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.1-1 and Table 10.1.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.1.1-2.

**Table 10.1.1-1: Test Parameters for Testing**

| Parameter                 | Unit      | Test 1-4 |
|---------------------------|-----------|----------|
| Downlink power allocation | $\rho_A$  | dB       |
|                           | $\rho_B$  | dB       |
|                           | $\sigma$  | dB       |
| $N_{oc}$ at antenna port  | dBm/15kHz | -98      |
| Note 1: $P_B = 0$ .       |           |          |

Table 10.1.1-2: Minimum performance

| Test number | Bandwidth | Reference Channel | OCNG Pattern | Propagation condition               | Correlation Matrix and antenna | Reference value |         | MBMS UE Category |
|-------------|-----------|-------------------|--------------|-------------------------------------|--------------------------------|-----------------|---------|------------------|
|             |           |                   |              |                                     |                                | BLER (%)        | SNR(dB) |                  |
| 1           | 10 MHz    | R.37 FDD          | OP.4 FDD     | MBSFN channel model (Table B.2.6-1) | 1x2 low                        | 1               | 4.1     | ≥1               |
| 2           | 10 MHz    | R.38 FDD          | OP.4 FDD     |                                     |                                |                 | 11.0    | ≥1               |
| 3           | 10 MHz    | R.39 FDD          | OP.4 FDD     |                                     |                                |                 | 20.1    | ≥2               |
|             | 5.0MHz    | R.39-1 FDD        | OP.4 FDD     |                                     |                                |                 | 20.5    | 1                |
| 4           | 1.4 MHz   | R.40 FDD          | OP.4 FDD     |                                     |                                |                 | 6.6     | ≥1               |

## 10.2 TDD (Fixed Reference Channel)

The parameters specified in Table 10.2-1 are valid for all TDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

Table 10.2-1: Common Test Parameters (TDD)

| Parameter                                                                                                                                        | Unit      | Value       |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------|
| Number of HARQ processes                                                                                                                         | Processes | None        |
| Subcarrier spacing                                                                                                                               | kHz       | 15 kHz      |
| Allocated subframes per Radio Frame (Note 1)                                                                                                     |           | 5 subframes |
| Number of OFDM symbols for PDCCH                                                                                                                 |           | 2           |
| Cyclic Prefix                                                                                                                                    |           | Extended    |
| Note1: For TDD mode, in line with TS 36.331, Uplink-Downlink Configuration 5 is proposed, up to 5 subframes (#3/4/7/8/9) are available for MBMS. |           |             |

### 10.2.1 Minimum requirement

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.2-1 and Table 10.2.1-1 and Annex A.3.8.2, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.2.1-2.

Table 10.2.1-1: Test Parameters for Testing

| Parameter                 |          | Unit      | Test 1-4   |
|---------------------------|----------|-----------|------------|
| Downlink power allocation | $\rho_A$ | dB        | 0          |
|                           | $\rho_B$ | dB        | 0 (Note 1) |
|                           | $\sigma$ | dB        | 0          |
| $N_{oc}$ at antenna port  |          | dBm/15kHz | -98        |
| Note 1: $P_B = 0$ .       |          |           |            |

**Table 10.2.1-2: Minimum performance**

| Test number | Bandwidth | Reference Channel | OCNG Pattern | Propagation condition               | Correlation Matrix and antenna | Reference value |         | MBMS UE Category |
|-------------|-----------|-------------------|--------------|-------------------------------------|--------------------------------|-----------------|---------|------------------|
|             |           |                   |              |                                     |                                | BLER (%)        | SNR(dB) |                  |
| 1           | 10 MHz    | R.37 TDD          | OP.4 TDD     | MBSFN channel model (Table B.2.6-1) | 1x2 low                        | 1               | 3.4     | ≥1               |
| 2           | 10 MHz    | R.38 TDD          | OP.4 TDD     |                                     |                                |                 | 11.1    | ≥1               |
| 3a          | 10 MHz    | R.39 TDD          | OP.4 TDD     |                                     |                                |                 | 20.1    | ≥2               |
| 3b          | 5MHz      | R.39-1 TDD        | OP.4 TDD     |                                     |                                |                 | 20.5    | 1                |
| 4           | 1.4 MHz   | R.40 TDD          | OP.4 TDD     |                                     |                                |                 | 5.8     | ≥1               |

## 10.3 FDD (Fixed Reference Channel) with FeMBMS

For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB for subcarrier spacing as 15kHz, 3dB for for subcarrier spacing as 7.5kHz and 10.8dB for for subcarrier spacing as 1.25kHz because the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

### 10.3.1 Minimum requirement for FeMBMS Unicast-mixed Cell under CA

#### 10.3.1.1 Minimum requirement with 1.25kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell under CA.

For the parameters specified in Table 10.3.1.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.1.1-2.

**Table 10.3.1.1-1: Test Parameters for Testing**

| Parameter                                                                                                             |          | Unit      | Test 1-2                                       |
|-----------------------------------------------------------------------------------------------------------------------|----------|-----------|------------------------------------------------|
| Downlink power allocation                                                                                             | $\rho_A$ | dB        | 0                                              |
|                                                                                                                       | $\rho_B$ | dB        | 0 (Note 1)                                     |
|                                                                                                                       | $\sigma$ | dB        | 0                                              |
| $N_{oc}$ at antenna port                                                                                              |          | dBm/15kHz | -98                                            |
| PDSCH transmission mode in PCell and SCell                                                                            |          |           | 1                                              |
| Subcarrier spacing for SCell                                                                                          |          | kHz       | 1.25 kHz                                       |
| Allocated subframes per Radio Frame for SCell (Note 2)                                                                |          |           | 8 subframes                                    |
| Number of OFDM symbols for PDCCH for SCell                                                                            |          |           | 0 (MBSFN subframes)<br>2 (non-MBSFN subframes) |
| Cyclic Prefix for SCell in non-MBSFN subframes                                                                        |          |           | Extended                                       |
| Note 1: $P_B = 0$ .                                                                                                   |          |           |                                                |
| Note 2: For SCell with FDD mode, up to 8 subframes (#1/2/3/4/6/7/8/9) are available for MBMS, in line with TS 36.331. |          |           |                                                |

**Table 10.3.1.1-2: Minimum performance**

| Test number | Cell  | Bandwidth (MHz) | Reference Channel | OCNG Pattern | Propagation condition                 | Correlation Matrix and antenna | Reference value |         | MBMS UE Category |

### 10.3.1.2 Minimum requirement with 7.5kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell under CA.

For the parameters specified in Table 10.3.1.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.1.2-2.

**Table 10.3.1.2-1: Test Parameters for Testing**

| Parameter                                                                                                             |          | Unit      | Test 1                                         |
|-----------------------------------------------------------------------------------------------------------------------|----------|-----------|------------------------------------------------|
| Downlink power allocation                                                                                             | $\rho_A$ | dB        | 0                                              |
|                                                                                                                       | $\rho_B$ | dB        | 0 (Note 1)                                     |
|                                                                                                                       | $\sigma$ | dB        | 0                                              |

## 10.3.2 Minimum requirement for FeMBMS Unicast-mixed Cell as Non-Serving Cell

### 10.3.2.1 Minimum requirement with 1.25kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell as non-serving cell.

For the parameters specified in Table 10.3.2.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.2.1-2.

**Table 10.3.2.1-1: Test Parameters for Testing**

| Parameter                                                                                                  |          | Unit      | Test 1-4                                       |
|------------------------------------------------------------------------------------------------------------|----------|-----------|------------------------------------------------|
| Downlink power allocation                                                                                  | $\rho_A$ | dB        | 0                                              |
|                                                                                                            | $\rho_B$ | dB        | 0 (Note 1)                                     |
|                                                                                                            | $\sigma$ | dB        | 0                                              |
| $N_{oc}$ at antenna port                                                                                   |          | dBm/15kHz | -98                                            |
| Subcarrier spacing                                                                                         |          | kHz       | 1.25 kHz                                       |
| Allocated subframes per Radio Frame (Note 2)                                                               |          |           | 8 subframes                                    |
| Number of OFDM symbols for PDCCH                                                                           |          |           | 0 (MBSFN subframes)<br>2 (non-MBSFN subframes) |
| Cyclic Prefix in non-MBSFN subframes                                                                       |          |           | Extended                                       |
| Note 1: $P_B = 0$ .                                                                                        |          |           |                                                |

### 10.3.2.2 Minimum requirement with 7.5kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for enhanced FeMBMS Unicast-mixed Cell as non-serving cell.

For the parameters specified in Table 10.3.2.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.2.2-2.

Table 10.3.2.2-1: Test Parameters for Testing

| Parameter                                                                                                  |          | Unit      | Test 1-4                                       |
|------------------------------------------------------------------------------------------------------------|----------|-----------|------------------------------------------------|
| Downlink power allocation                                                                                  | $\rho_A$ | dB        | 0                                              |
|                                                                                                            | $\rho_B$ | dB        | 0 (Note 1)                                     |
|                                                                                                            | $\sigma$ | dB        | 0                                              |
| $N_{oc}$ at antenna port                                                                                   |          | dBm/15kHz | -98                                            |

### 10.3.3 Minimum requirement for MBMS Dedicated cell

#### 10.3.3.1 Minimum requirement with 1.25kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.1-2.

Table 10.3.3.1-1: Test Parameters for Testing MBMS Dedicated Cell

| Parameter                                                            |          | Unit        | Test 1-2                                       |
|----------------------------------------------------------------------|----------|-------------|------------------------------------------------|
| Downlink power allocation                                            | $\rho_A$ | dB          | 0                                              |

### 10.3.3.2 Minimum requirement with 7.5kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.2-2.

**Table 10.3.3.2-1: Test Parameters for Testing MBMS Dedicated Cell**

| Parameter                                                            |          | Unit        | Test 1                                         |
|----------------------------------------------------------------------|----------|-------------|------------------------------------------------|
| Downlink power allocation                                            | $\rho_A$ | dB          | 0                                              |
|                                                                      | $\rho_B$ | dB          | 0 (Note 1)                                     |
|                                                                      | $\sigma$ | dB          | 0                                              |
| $N_{oc}$ at antenna port                                             |          | dBm/1.25kHz | -98                                            |
| PDSCH transmission mode in PCell                                     |          |             | 1                                              |
| Subcarrier spacing for MBMS Dedicated Cell                           |          | kHz         | 7.5 kHz                                        |

|             | MBMS Dedicated Cell | 10              | R.84-1 FDD        | NA           | MBSFN channel model (Table B.2.6.1-1) | 1x2 low                        | 1               | [13.9]  | ≥2               |

### 10.3.3.3 Minimum requirement with 15kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.3-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.3-2.

**Table 10.3.3.3-1: Test Parameters for Testing MBMS Dedicated Cell**

| Parameter                                                            |          | Unit        | Test 1-3                                       |
|----------------------------------------------------------------------|----------|-------------|------------------------------------------------|
| Downlink power allocation                                            | $\rho_A$ | dB          | 0                                              |
|                                                                      | $\rho_B$ | dB          | 0 (Note 1)                                     |
|                                                                      | $\sigma$ | dB          | 0                                              |
| $N_{oc}$ at antenna port                                             |          | dBm/1.25kHz | -98                                            |
| PDSCH transmission mode in PCell                                     |          |             | 1                                              |
| Subcarrier spacing for MBMS Dedicated Cell                           |          | kHz         | 15 kHz                                         |
| Allocated subframes per Radio Frame for MBMS Dedicated Cell (Note 2) |          |             | 10 subframes                                   |
| Number of OFDM symbols for PDCCH for MBMS Dedicated Cell             |          |             | 0 (MBSFN subframes)<br>2 (non-MBSFN subframes) |
| Cyclic Prefix for MBMS Dedicated Cell                                |          |             | Extended                                       |
| Note 1: $P_B = 0$ .                                                  |          |             |                                                |
| Note 2: All subframes are MBSFN subframes                            |          |             |                                                |

**Table 10.3.3.1-2: Minimum performance for MBMS dedicated Cell**

| Test number | Cell                | Bandwidth (MHz) | Reference Channel | OCNG Pattern | Propagation condition                 | Correlation Matrix and antenna | Reference value |         | MBMS UE Category |

## 11 Performance requirement (ProSe Direct Discovery)

This clause contains the performance requirements for the Sidelink physical channels specified for ProSe Direct Discovery.

### 11.1 General

#### 11.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support ProSe Direct Discovery. The test case applicability is in according to table 11.1.1-1 depending on set of supported UE capabilities.

**Table 11.1.1-1: ProSe Direct Discovery test applicability**

| FDD/TDD | Tests / clause | Applicable if UE indicates at least the following capability                                      |
|---------|----------------|---------------------------------------------------------------------------------------------------|
| FDD     | 11.2.1         | ProSe Direct Discovery without support of <i>disc-SLSS-r12</i>                                    |
|         | 11.2.3         | ProSe Direct Discovery with support of <i>discPeriodicSLSS-r13</i> and ProSe Direct Communication |
|         | 11.3.1         | ProSe Direct Discovery                                                                            |
|         | 11.4.1         | ProSe Direct Discovery with support of <i>disc-SLSS-r12</i>                                       |
|         | 11.5.1         | ProSe Direct Discovery                                                                            |
| TDD     | 11.2.2         | ProSe Direct Discovery                                                                            |
|         | 11.3.2         | ProSe Direct Discovery                                                                            |
|         | 11.5.2         | ProSe Direct Discovery                                                                            |

For maximum Sidelink Processes test specified in clause 11.5, the UE is required to only meet the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE. Test case 11.2.3 for 5MHz channel bandwidth is applicable to UEs that support ProSe Direct Communication on Band 31 only.

## 11.1.2 Reference DRX configuration

**Table 11.1.2-1: Reference DRX configuration**

| Parameter                                                      | Value     | Comments |
|----------------------------------------------------------------|-----------|----------|
| onDurationTimer                                                | psf1      |          |
| drx-InactivityTimer                                            | psf1      |          |
| drx-RetransmissionTimer                                        | psf1      |          |
| longDRX-CycleStartOffset                                       | sf2560, 0 |          |
| shortDRX                                                       | disabled  |          |
| NOTE 1: For further information see clause 6.3.2 in TS 36.331. |           |          |

## 11.2 Demodulation of PSDCH (single link performance)

The purpose of the requirements in this subclause is to verify the PSDCH demodulation performance with a single active PSDCH link under different operating scenarios and channel conditions.

The active cell(s), when present, are specified in the test parameters specific to the test.

### 11.2.1 FDD (in-coverage)

The minimum requirements are specified in Table 11.2.1-2 with the test parameters specified in Table 11.2.1-1. The receiver UE under test is associated with Cell 1.

**Table 11.2.1-1: Test Parameters**

| Parameter                                                                                                  |                           |           | Unit      | Test 1                                                                                           |
|------------------------------------------------------------------------------------------------------------|---------------------------|-----------|-----------|--------------------------------------------------------------------------------------------------|
| Discovery resource pool configuration                                                                      |                           |           |           | As specified in Table A.7.1.1-1<br>(Configuration #1-FDD)                                        |
| DRX configuration                                                                                          |                           |           |           | As specified in Table 11.1.2-1                                                                   |

**Table 11.2.3-2: Minimum performance**

| Test number | Sidelink UE | Band-width | Reference channel | Reference value   |          |
|-------------|-------------|------------|-------------------|-------------------|----------|
|             |             |            |                   | BLER of PSDCH (%) | SNR (dB) |
| 1           | 1           | 5 MHz      | D.1 FDD           | 30                | 4.6      |
|             |             | 10 MHz     |                   |                   |          |

## 11.3 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSDCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 11.3.1 FDD

The minimum requirements are specified in Table 11.3.1-2 with the test parameters specified in Table 11.3.1-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

Table 11.3.1-1: Test Parameters

| Parameter                                                                                                  |                                     |           | Unit      | Test 1                                                    |

| NOTE 1: There is no BLER requirement for Sidelink UE 1. |            |             |                   |                   |          |

## 11.3.2 TDD

The minimum requirements are specified in Table 11.3.2-2 with the test parameters specified in Table 11.3.2-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

Table 11.3.2-1: Test Parameters

| Parameter                                                                                                  |                                         |           | Unit      | Test 1                                                    |
|------------------------------------------------------------------------------------------------------------|-----------------------------------------|-----------|-----------|-----------------------------------------------------------|
| Discovery resource pool configuration                                                                      |                                         |           |           | As specified in Table A.7.1.2-1<br>(Configuration #1-TDD) |

## 11.4 Multiple timing reference test

The purpose of this test is to check the demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overlapping in time).

## 11.4.1 FDD

The test parameters are specified in Table 11.4.1-1. Sidelink UE 2 and the receiver UE under test are associated with Cell 1. Sidelink UE 1 and 3 are associated with another cell and use a different timing, and UE 1 acts as a synchronization reference. The minimum requirements are specified in Table 11.4.1-2.

**Table 11.4.1-1: Test Parameters**

| Parameter                             |                                      |           | Unit      | Test 1                                                                                           |
|---------------------------------------|--------------------------------------|-----------|-----------|--------------------------------------------------------------------------------------------------|

| NOTE 1: The BLER is measured after 5 D2D Discovery periods (1600 frames) of lead time during which the test UE detects and synchronizes to Sidelink UE 1 SLSS. |            |             |                   |                                     |          |

## 11.5 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes supported by the UE as reported using UE capability signalling (*discSupportedProc*).

The UE is required to meet only the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE.

### 11.5.1 FDD

The test parameters are specified in Table 11.5.1-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.1-2.

Table 11.5.1-1: Test Parameters

| Parameter                                                                                                                                                                          |                                 |           | Unit          | Test 1-7                                                                                                                                                                                                                                   |

## 11.5.2 TDD

The test parameters are specified in Table 11.5.2-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.2-2.

Table 11.5.2-1: Test Parameters

| Parameter                                                                                                                                                                       |                                         |           | Unit          | Test 1-7                                                                                                                                                                                                                     |

| NOTE 1: $P_B = 0$ .                                                                                                                                                             |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.                                                                                            |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 3: As specified in Table 4.2-2 in TS 36.211 [4].                                                                                                                           |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 4: As specified in Table 4.2-1 in TS 36.211 [4].                                                                                                                           |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 5: $N_{\text{MAX\_SF}}$ represents the maximum number of Sidelink UEs transmitting in one subframe. $N_{\text{MAX\_SF}} = 12$ (5 MHz), 25 (10MHz), 37 (15MHz), 50 (10MHz). |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.                                                                      |                                         |           |               |                                                                                                                                                                                                                              |
| NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.                                                                                                |                                         |           |               |                                                                                                                                                                                                                              |

Table 11.5.2-2: Minimum performance

| Test num. | Bandwidth | discSupportedProc | Number of configured resource pools | $\hat{E}_s$ at antenna port (dBm/15kHz) | Reference value                                                              |
|-----------|-----------|-------------------|-------------------------------------|-----------------------------------------|------------------------------------------------------------------------------|
|           |           |                   |                                     |                                         | Fraction of maximum throughput (%) for Sidelink UE i=0...discSupportedProc-1 |
| 1         | 5 MHz     | 50                | 5                                   | -85                                     | 95                                                                           |
| 2         | 10 MHz    | 50                | 2                                   | -85                                     | 95                                                                           |
| 3         | 15 MHz    | 50                | 2                                   | -85                                     | 95                                                                           |
| 4         | 20 MHz    | 50                | 1                                   | -85                                     | 95                                                                           |
| 5         | 10 MHz    | 400               | 16                                  | -85                                     | 95                                                                           |
| 6         | 15 MHz    | 400               | 11                                  | -85                                     | 95                                                                           |
| 7         | 20 MHz    | 400               | 8                                   | -85                                     | 95                                                                           |

## 12 Performance requirement (ProSe Direct Communication)

This clause contains the performance requirements for the Sidelink physical channels specified for ProSe Direct Communication in TS 36.211 [4].

### 12.1 General

#### 12.1.1 Applicability of requirements

##### 12.1.1.1 Applicability of requirements for different channel bandwidths

The requirements in this clause are applicable to UEs that support ProSe Direct Communication. Test cases defined for 5MHz channel bandwidth are applicable to UEs that support ProSe Direct Communication on only Band 31.

##### 12.1.1.2 Test coverage for different number of component carriers

For FDD tests specified in 12.8, if corresponding CA tests are tested, the test coverage can be considered fulfilled without executing single carrier tests.

##### 12.1.1.3 Applicability and test rules for different CA configurations and bandwidth combination sets

The performance requirement for CA UE demodulation tests with active Sidelink in Clause 12 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.6A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined in Table 12.1.1.3-1. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

Table 12.1.1.3-1: Applicability and test rules for CA UE demodulation tests with active Sidelink

| Tests                             | CA capability where the tests apply                                                       | CA configuration from the selected CA capability where the tests apply                          | CA Bandwidth combination to be tested in priority order |
|-----------------------------------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| CA tests with 2CCs in Clause 12.8 | Any one of the supported CA capabilities with largest aggregated CA bandwidth combination | Any one of the supported FDD CA configurations with largest aggregated CA bandwidth combination | Largest aggregated CA bandwidth combination             |

## 12.1.2 Reference DRX configuration

**Table 12.1.2-1: Reference DRX configuration**

| Parameter                                                      | Value     | Comments |
|----------------------------------------------------------------|-----------|----------|
| onDurationTimer                                                | psf1      |          |
| drx-InactivityTimer                                            | psf1      |          |
| drx-RetransmissionTimer                                        | psf1      |          |
| longDRX-CycleStartOffset                                       | sf2560, 0 |          |
| shortDRX                                                       | disabled  |          |
| NOTE 1: For further information see clause 6.3.2 in TS 36.331. |           |          |

## 12.2 Demodulation of PSSCH

The purpose of the requirements in this subclause is to verify the PSSCH demodulation performance with a single active PSSCH link.

### 12.2.1 FDD

The minimum requirements are specified in Table 12.2.1-2 with the test parameters specified in Table 12.2.1-1. This test specifies an out-of-coverage scenario where Sidelink UE 1 is the synchronization reference only and Sidelink UE 2 transmits PSCCH and PSSCH.

Table 12.2.1-1: Test Parameters

| Parameter                                                                                                                        |                                      | Unit       | Test 1                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Communication resource pool configuration                                                                                        |                                      |            | As specified in Table A.7.2.1-1 (Configuration #1-FDD)                                                                                                                              |
| $N_{oc}$ at antenna port (NOTE 1)                                                                                                |                                      | dBm/15 kHz | -98                                                                                                                                                                                 |

| 1                                                                                                                                         | 2           | 10 MHz     | CD.1 FDD                | 70                                          | -3.4              |
|                                                                                                                                           |             | 5 MHz      |                         | 70                                          | -3.3              |
| NOTE 1: The throughput is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |             |            |                         |                                             |                   |

## 12.3 Demodulation of PSCCH

The purpose of the requirements in this subclause is to verify the PSCCH demodulation performance with a single active PSSCH link.

## 12.3.1 FDD

The minimum requirements are specified in Table 12.3.1-2 with the test parameters specified in Table 12.3.1-1. This test specifies an out-of-coverage scenario where Sidelink UE 1 is the synchronization reference only and Sidelink UE 2 transmits PSCCH and PSSCH.

**Table 12.3.1-1: Test Parameters**

| Parameter                                                                                                                        |                             | Unit       | Test 1                                                                                                                                                                              |

|                                                                                                                                            |             |            |                         | Probability of missed PSCCH (%) (NOTE 1) | SNR (dB) of PSCCH |
| 1                                                                                                                                          | 2           | 10 MHz     | CC.4 FDD                | 1                                        | 4.7               |
|                                                                                                                                            |             | 5 MHz      | CC.3 FDD                | 1                                        | 4.8               |
| NOTE 1: The probability is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |             |            |                         |                                          |                   |

## 12.4 Demodulation of PSBCH

The purpose of the requirements in this subclause is to verify the PSBCH demodulation performance with a single active link.

### 12.4.1 FDD

The minimum requirements are specified in Table 12.4.1-2 with the test parameters specified in Table 12.4.1-1.

**Table 12.4.1-1: Test Parameters**

| Parameter                                 |                         | Unit      | Test 1                                                   |
|-------------------------------------------|-------------------------|-----------|----------------------------------------------------------|
| Communication resource pool configuration |                         |           | As specified in Table A.7.2.1-1 (Configuration #1-FDD)   |
| $N_{oc}$ at antenna port                  |                         | dBm/15kHz | -98                                                      |
| Active cell(s)                            |                         |           | None                                                     |
| Sidelink UE 1                             | Sidelink Transmissions  |           | SLSS + PSBCH (CP.1 FDD)                                  |
|                                           | networkControlledSyncTx |           | ON                                                       |
|                                           | slssid                  |           | 30                                                       |
|                                           | inCoverage (in MIB-SL)  |           | FALSE                                                    |
|                                           | syncOffsetIndicator     |           | Set same as syncOffsetIndicator1 in Configuration #1-FDD |
|                                           | Propagation channel     |           | EPA5                                                     |
|                                           | Antenna configuration   |           | 1x2 Low                                                  |

**Table 12.4.1-2: Minimum performance**

| Test num. | Sidelink UE | Band-width | Reference channel | Reference value                          |          |
|-----------|-------------|------------|-------------------|------------------------------------------|----------|
|           |             |            |                   | Probability of missed PSBCH (%) (NOTE 1) | SNR (dB) |
| 1         | 1           | 10 MHz     | PSBCH (CP.1 FDD)  | 1                                        | 4.4      |
|           |             | 5 MHz      |                   |                                          |          |

NOTE 1: The probability is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1.

## 12.5 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSSCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 12.5.1 FDD

The test parameters in Table 12.5.1-1 specifies an in-coverage scenario where Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSSCH on adjacent RBs. The minimum requirements are specified in Table 12.5.1-2.

Table 12.5.1-1: Test Parameters

| Parameter                                                                                                  |                                      |          | Unit      | Test 1                                                    |
|------------------------------------------------------------------------------------------------------------|--------------------------------------|----------|-----------|-----------------------------------------------------------|
| Communication resource pool configuration                                                                  |                                      |          |           | As specified in Table A.7.2.1-2<br>(Configuration #2-FDD) |
| DRX configuration                                                                                          |                                      |          |           | As specified in Table 12.1.2-1                            |
| $N_{oc}$ at antenna port (Note 3)                                                                          |                                      |          | dBm/15kHz | -98                                                       |
| Active cell(s)                                                                                             |                                      |          |           | Cell 1 (Serving cell)                                     |
| Cell 1                                                                                                     | Cyclic prefix                        |          |           | Normal                                                    |
|                                                                                                            | Cell ID                              |          |           | 0                                                         |
|                                                                                                            | Downlink power allocation            | $\rho_A$ | dB        | 0                                                         |
|                                                                                                            |                                      | $\rho_B$ | dB        | 0 (NOTE 1)                                                |
|                                                                                                            |                                      | $\sigma$ | dB        | 0                                                         |
|                                                                                                            | OCNG Pattern (Note 2)                |          |           | OP.1 FDD                                                  |

Table 12.5.1-2: Minimum performance

| Test num.                                                     | Band-width | Sidelink UE | PSSCH Reference channel | Reference value                    |                   |
|---------------------------------------------------------------|------------|-------------|-------------------------|------------------------------------|-------------------|
|                                                               |            |             |                         | Fraction of maximum throughput (%) | SNR (dB) of PSSCH |
| 1                                                             | 5 / 10 MHz | 1           | CD.5 FDD                | (NOTE 1)                           | 24.35             |
|                                                               |            | 2           | CD.5 FDD                | 70                                 | 2.4               |
| NOTE 1: There is no throughput requirement for Sidelink UE 1. |            |             |                         |                                    |                   |

12.6 Multiple timing reference test

The puporse of this test is to check the PSSCH demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overlapping in time).

12.6.1 FDD

The test parameters are specified in Table 12.6.1-1. Sidelink UE 2 and the receiver UE under test are associated with Cell 1. Sidelink UE 1 and Sidelink UE 3 are associated with another cell and use a different timing, and Sidelink UE 1 acts as a synchronization reference only. The minimum requirements are specified in Table 12.6.1-2.

Table 12.6.1-1: Test Parameters

| Parameter                                 |                                          |           | Unit      | Test 1                                                                                                                                                                              |

| NOTE 1: The throughput is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |            |             |                         |                                                |          |

## 12.7 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the UE.

### 12.7.1 FDD

The test parameters are specified in Table 12.7.1-1. Multiple communication resource pools are interleaved. Each active Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 12.7.1-2.

Table 12.7.1-1: Test Parameters

| Parameter                                                                                                                                                                                                                       |                           |           | Unit    | Test 1                                                                                        |

| NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.                                                                                                                      |                           |           |         |                                                                                               |
| NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.                                                                                                                                                |                           |           |         |                                                                                               |

Table 12.7.1-2: Minimum performance

| Test num. | Bandwidth | PSCCH Reference channel | $\hat{E}_s$ at antenna port (dBm/15kHz) | Reference value for Sidelink UE $i=0...15$ |
|-----------|-----------|-------------------------|-----------------------------------------|--------------------------------------------|
|           |           |                         |                                         | Fraction of maximum throughput (%)         |
| 1         | 10 MHz    | CD.7 FDD                | -85                                     | 95                                         |
|           | 5 MHz     | CD.6 FDD                | -85                                     | 95                                         |

## 12.8 Sustained downlink data rate with active Sidelink

The purpose of this test is to verify the downlink data rate is not impacted when Sidelink resource are also configured. The test parameters are in Table 12.8.1-1. Cell 1 is the serving cell and UE 1 and UE 2 are transmitters of Prose Direct Communication. The test UE is expected to receive all PDSCH transmissions, and prioritize the transmission of ACK/NACK over the reception of UE 2's PSSCH.

The test cases apply to UE categories and bandwidth combinations with maximum aggregated bandwidth as specified in Table 12.8.1-2. The minimum requirements are specified in Table 12.8.1-3. The TB success rate in the cellular link shall be sustained during at least 300 frames.

**Table 12.8.1-1: Test parameters for sustained downlink data rate (FDD 64QAM) with active Sidelink**

| Parameter                                                   |                             | Unit      | Test 1, 2, 3A, 3B, 4A, 6C                                                                  |
|-------------------------------------------------------------|-----------------------------|-----------|--------------------------------------------------------------------------------------------|
| Communication resource pool configuration <sup>Note 5</sup> |                             |           | As specified in Table A.7.2.1-5 (Configuration #5-FDD)                                     |
| Active cell(s)                                              |                             |           | Cell 1 (PCell)<br>Cell 2 (SCell) for Test 3B, 4A, 6C                                       |

## 13 Void

## 14 Performance requirement (V2X Sidelink Communication)

This clause contains the performance requirements for the sidelink physical channels specified for V2X Sidelink Communication.

### 14.1 General

#### 14.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support V2X sidelink communication using Band 47.

When GNSS or GNSS-equivalent synchronization source is used, the reference GNSS signal power is as specified in Table B.6.1-1 in TS 36.133.

The test case applicability is in according to Table 14.1.1-1.

**Table 14.1.1-1: V2X test applicability**

| Tests / clause                      | Applicable if UE supports the following capability                                                                                                                                               |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.2<br>14.3<br>14.4<br>14.8 Test 1 | UE supporting V2X sidelink<br>If the SL-C-RX Category 4 UE passes 14.11 Test 1 or 2, then the test coverage can be considered fulfilled without executing 14.8 Test 1.                           |
| 14.5                                | UE with support of <i>slss-TxRx-r14</i> [7]                                                                                                                                                      |
| 14.6<br>14.9                        | UE supporting concurrent operation band for V2X and E-UTRA                                                                                                                                       |
| 14.7                                | UE not supporting concurrent operation band for V2X and E-UTRA                                                                                                                                   |
| 14.8 Test 2                         | UE with support of <i>v2x-HighReception-r14</i> [7].<br>If the SL-C-RX Category 4 UE passes 14.11 Test 3 or 4, then the test coverage can be considered fulfilled without executing 14.8 Test 2. |
| 14.10 Test 1<br>14.11 Test 1        | UE with support of CA with 2 SL CCs and without support of CA with 3 SL CCs                                                                                                                      |
| 14.10 Test 2<br>14.11 Test 2        | UE with support of CA with 3 SL CCs                                                                                                                                                              |
| 14.11 Test 3                        | UE with support of <i>v2x-EnhancedHighReception-r15</i> [7] and CA with 2 SL CCs and without support of CA with 3 SL CCs                                                                         |
| 14.11 Test 4                        | UE with support of <i>v2x-EnhancedHighReception-r15</i> [7] and CA with 3 SL CCs                                                                                                                 |

## 14.2 Demodulation of PSSCH

The purpose of the requirements in this subclause is to verify the PSSCH for V2X demodulation performance with a single active PSSCH link.

The minimum requirements are specified in Table 14.2-2 with the test parameters specified in Table 14.2-1. In this test scenario, GNSS or GNSS-equivalent synchronization source is used and Sidelink UE 1 transmits PSCCH and PSSCH.

**Table 14.2-1: Test Parameters**

| Parameter                                                                                |                           | Unit       | Test 1, 2                                             | Test 3, 4                    |
|------------------------------------------------------------------------------------------|---------------------------|------------|-------------------------------------------------------|------------------------------|

| 4         | 10 MHz    | CD.14                   | EVA2700               |                 | 2.8               |

## 14.3 Demodulation of PSCCH

The purpose of the requirements in this subclause is to verify the PSCCH for V2X demodulation performance with a single active PSSCH link.

The minimum requirements are specified in Table 14.3-2 with the test parameters specified in Table 14.3-1. In this test scenario, GNSS or GNSS-equivalent synchronization source is used and Sidelink UE 1 transmits PSCCH and PSSCH.

**Table 14.3-1: Test Parameters**

| Parameter                                                                                                  |                           | Unit       | Test 1                                             |
|------------------------------------------------------------------------------------------------------------|---------------------------|------------|----------------------------------------------------|
| Communication resource pool configuration                                                                  |                           |            | As specified in Table A.9-1 (Configuration #1-V2X) |
| $N_{oc}$ at antenna port                                                                                   |                           | dBm/15 kHz | -98                                                |
| Active cell(s)                                                                                             |                           |            | None                                               |
| Sidelink UE 1                                                                                              | Sidelink Transmissions    |            | PSCCH+PSSCH                                        |
|                                                                                                            | Timing offset (Note 1)    |            | CP/2-12Ts                                          |
|                                                                                                            | Frequency offset (Note 2) | Hz         | +600                                               |
|                                                                                                            | Synchronization           |            | GNSS or GNSS-equivalent                            |
|                                                                                                            | Antenna configuration     |            | 1x2 Low                                            |
|                                                                                                            | PSSCH RMC                 |            | CD.9                                               |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing.                   |                           |            |                                                    |
| Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency.                          |                           |            |                                                    |
| Note 3: Cyclic shift for PSCCH DMRS is randomly selected between {0, 3, 6, 9} for each PSCCH transmission. |                           |            |                                                    |

**Table 14.3-2: Minimum performance**

| Test number | Bandwidth | PSCCH Reference channel | Propagation condition | Reference value                 |                   |
|-------------|-----------|-------------------------|-----------------------|---------------------------------|-------------------|
|             |           |                         |                       | Probability of missed PSCCH (%) | SNR (dB) of PSCCH |
| 1           | 10 MHz    | CC.8                    | EVA1500               | 1                               | 2.6               |

## 14.4 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSSCH transmissions from two Sidelink UEs with power imbalance in one subframe.

The minimum requirements are specified in Table 14.4-2 with the test parameters specified in Table 14.4-1. The Sidelink UE 1 and 2 are synchronized to GNSS or GNSS-equivalent synchronization reference.

Table 14.4-1: Test Parameters

| Parameter                                                                                |                           | Unit      | Test 1                                                |
|------------------------------------------------------------------------------------------|---------------------------|-----------|-------------------------------------------------------|
| Communication resource pool configuration                                                |                           |           | As specified in Table A.9-2<br>(Configuration #2-V2X) |
| $N_{oc}$ at antenna port                                                                 |                           | dBm/15kHz | -98                                                   |
| Active cell(s)                                                                           |                           |           | None                                                  |
| Active Sidelink UE(s)                                                                    |                           |           | Sidelink UE 1, Sidelink UE 2                          |
| Sidelink UE 1                                                                            | Sidelink Transmissions    |           | PSCCH + PSSCH                                         |
|                                                                                          | PSCCH RB allocation       |           | PRB pairs {5, 6}                                      |
|                                                                                          | PSSCH RMC                 |           | As specified in Table 14.4-2                          |
|                                                                                          | PSSCH RB allocation       |           | PRB pairs {7, 8, 9}                                   |
|                                                                                          | Time offset (Note 1)      | $\mu$ s   | 0                                                     |
|                                                                                          | Frequency offset (Note 2) | Hz        | 0                                                     |
|                                                                                          | Propagation Channel       |           | AWGN                                                  |
|                                                                                          | Antenna configuration     |           | 1x2                                                   |
| Sidelink UE 2                                                                            | Sidelink Transmissions    |           | PSCCH + PSSCH                                         |
|                                                                                          | PSCCH RB allocation       |           | PRB pairs {20, 21}                                    |
|                                                                                          | PSSCH RMC                 |           | As specified in Table 14.4-2                          |
|                                                                                          | PSSCH RB allocation       |           | PRB pairs {22, 23, 24}                                |
|                                                                                          | Time offset (Note 1)      | $\mu$ s   | 0                                                     |
|                                                                                          | Frequency offset (Note 2) | Hz        | 0                                                     |
|                                                                                          | Propagation Channel       |           | AWGN                                                  |
|                                                                                          | Antenna configuration     |           | 1x2                                                   |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. |                           |           |                                                       |
| Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency.        |                           |           |                                                       |

Table 14.4-2: Minimum performance

| Test number                                                   | Bandwidth | Sidelink UE | PSSCH Reference channel | Reference value |                   |
|---------------------------------------------------------------|-----------|-------------|-------------------------|-----------------|-------------------|
|                                                               |           |             |                         | PSSCH BLER (%)  | SNR (dB) of PSSCH |
| 1                                                             | 20MHz     | 1           | CD.10                   | (Note 1)        | 30.35             |

| Note 1: There is no throughput requirement for Sidelink UE 1. |           |             |                         |                 |                   |

## 14.5 Demodulation of PSBCH

The purpose of the requirements in this subclause is to verify the PSBCH demodulation performance with a single active link.

The minimum requirements are specified in Table 14.5-2 with the test parameters specified in Table 14.5-1. The Sidelink UE 1 is synchronized to SLSS as synchronization reference.

Table 14.5-1: Test Parameters

| Parameter                                                                                |                           | Unit      | Test 1                                                |
|------------------------------------------------------------------------------------------|---------------------------|-----------|-------------------------------------------------------|
| Communication resource pool configuration                                                |                           |           | As specified in Table A.9-1<br>(Configuration #1-V2X) |
| $N_{oc}$ at antenna port                                                                 |                           | dBm/15kHz | -98                                                   |
| Active cell(s)                                                                           |                           |           | None                                                  |
| Sidelink UE 1                                                                            | Sidelink Transmissions    |           | SLSS+PSBCH (Note 3)                                   |

## 14.6 Demodulation of PSSCH with eNB based synchronization

The purpose of the requirements in this subclause is to verify the PSSCH for V2X demodulation performance with a single active PSSCH link under eNB based synchronization.

The minimum requirement is specified in Table 14.6-2 with the test parameters specified in Table 14.6-1. In this test scenario, eNB based synchronization source is used and Sidelink UE 1 transmits PSSCH and PSSCH.

Table 14.6-1: Test Parameters

| Parameter                                                                                 |                           |          | Unit       | Test 1                                                |
|-------------------------------------------------------------------------------------------|---------------------------|----------|------------|-------------------------------------------------------|
| Communication resource pool configuration                                                 |                           |          |            | As specified in Table A.9-3<br>(Configuration #3-V2X) |
| $N_{oc}$ at antenna port                                                                  |                           |          | dBm/15 kHz | -98                                                   |
| Active cell(s)                                                                            |                           |          |            | Cell 1 (Serving cell)                                 |
| Cell 1                                                                                    | Cyclic prefix             |          |            | Normal                                                |
|                                                                                           | Cell ID                   |          |            | 0                                                     |

|           |           |                         |                       | PSSCH BLER (%)  | SNR (dB) of PSSCH |
| 1         | 20 MHz    | CD.12                   | EVA180                | 10              | 4.9               |

## 14.7 Soft buffer test

The purpose of this test is to verify the maximum number of bits per TTI supported by the V2X UE.

The minimum requirement is specified in Table 14.7-2 with the test parameters specified in Table 14.7-1.

**Table 14.7-1: Test Parameters**

## 14.8 PSCCH/PSSCH decoding capability test

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the V2X UE.

The minimum requirements are specified in Table 14.8-3 with the test parameters specified in Table 14.8-1 and Table 14.8-2 according to UE capability.

**Table 14.8-1: Test Parameters**

| Parameter                                                                                                  |                           | Unit    | Test 1                                                                |

## 14.9 Sustained downlink data rate with active sidelink

The purpose of this test is to verify the WAN and V2X operation is not impacted with each other when UE is under concurrent operation. This test case applies to UEs support concurrent operation of V2X communication with E-UTRA uplink/downlink on the operating bands combinations listed in Table 5.5G-2.

The test parameters are in Table 14.9-1, and the test UE is expected to receive all PSSCH and PDSCH transmissions simultaneously.

For PDSCH, the test cases apply to UE categories and bandwidth as specified in Table 14.9-2. The minimum requirements for PSSCH are specified in Table 14.7-2, Table 14.10-3 and Table 14.10-4 with corresponding test applicability and the minimum requirements for PDSCH downlink data rate are specified in Table 14.9-3. Both PDSCH and PSSCH performance will be verified simultaneously. The TB success rate in the cellular link shall be sustained during at least 300 frames.

**Table 14.9-1: Test parameters for sustained downlink data rate (FDD 64QAM) and maximum PSSCH processing capability**

| Parameter                                                                                |                                                          | Unit      | Test 1                                             |

## 14.10 Soft buffer test (CA)

The purpose of this test is to verify the maximum number of bits per TTI supported by the V2X UE with UE SL-C-RX Category 4 for UEs supporting V2X CA.

For CA with 2 SL CCs, the requirements are specified in Table 14.10-3, based on single carrier requirement specified in Table 14.10-2, with the test parameters specified in Table 14.10-1.

For CA with 3 SL CCs, the requirements are specified in Table 14.10-4, based on single carrier requirement specified in Table 14.10-2, with the test parameters specified in Table 14.10-1.

**Table 14.10-1: Test Parameters**

| Parameter                                                                                |                                                          | Unit      | Test 1, 2                                          |

| Test num. | CA Bandwidth combination | Requirement                    | ue-CategorySL-C-RX |
|-----------|--------------------------|--------------------------------|--------------------|
| 2         | 3x10 MHz                 | As specified in 14.10-2 per CC | SL-C-RX Category 4 |

## 14.11 PSCCH/PSSCH decoding capability test (CA)

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the UE with UE SL-C-RX Category 4 for UEs supporting V2X CA.

For CA with 2 SL CCs, the requirements are specified in Table 14.11-4 based on single carrier requirement specified in Table 14.11-3, with the test parameters specified in Table 14.11-1 and Table 14.11-2 according to UE capability.

For CA with 3 SL CCs, the requirements are specified in Table 14.11-5 based on single carrier requirement specified in Table 14.11-3, with test parameters specified in Table 14.11-1 and Table 14.11-2 according to UE capability.

Table 14.11-1: Test Parameters

| Parameter                                                                                                  |                           | Unit          | Test 1                                                                  | Test 2                                             |

## Annex A (normative): Measurement channels

### A.1 General

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per datastream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all datastreams (codewords).

The UE category entry in the definition of the reference measurement channel in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual minimum requirements.

---

### A.2 UL reference measurement channels

#### A.2.1 General

The measurement channels in the following subclauses are defined to derive the requirements in clause 6 (Transmitter Characteristics) and clause 7 (Receiver Characteristics). The measurement channels represent example configurations of physical channels for different data rates.

##### A.2.1.1 Applicability and common parameters

The UL reference measurement channels comprise transmission of PUSCH and Demodulation Reference signals only. The following conditions apply:

- 1 HARQ transmission
- Cyclic Prefix normal
- PUSCH hopping off
- Link adaptation off
- Demodulation Reference signal as per TS 36.211 [4] subclause 5.5.2.1.2.

Where ACK/NACK is transmitted, it is assumed to be multiplexed on PUSCH as per TS 36.212 [5] subclause 5.2.2.6.

- ACK/NACK 1 bit
- ACK/NACK mapping adjacent to Demodulation Reference symbol
- ACK/NACK resources punctured into data
- Max number of resources for ACK/NACK: 4 SC-FDMA symbols per subframe
- No CQI transmitted, no RI transmitted

##### A.2.1.2 Determination of payload size

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $N_{RB}$

1. Calculate the number of channel bits  $N_{ch}$  that can be transmitted during the first transmission of a given sub-frame.
2. Find  $A$  such that the resulting coding rate is as close to  $R$  as possible, that is,

$$\min \left| R - (A + 24 * (N_{CB} + 1)) / N_{ch} \right|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases},$$

subject to

- A is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of  $N_{RB}$  resource blocks.
- C is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
- For RMC-s, which at the nominal target coding rate do not cover all the possible UE categories for the given modulation, reduce the target coding rate gradually (within the same modulation), until the maximal possible number of UE categories is covered.

3. If there is more than one A that minimises the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.

### A.2.1.3 Overview of UL reference measurement channels

In Table A.2.1.3-1 to A.2.1.3-1K are listed the UL reference measurement channels specified in annexes A.2.2 and A.2.3 of this release of TS 36.101. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.2.2 and A.2.3 as appropriate.

**Table A.2.1.3-1: Overview of UL reference measurement channels (FDD, Full RB allocation, QPSK)**

| Duplex       | Table              | Name | BW  | Mod  | TCR  | RB  | RB Off set | UE Cat eg | Notes             |
|--------------|--------------------|------|-----|------|------|-----|------------|-----------|-------------------|
| FDD          | Table A.2.2.1.1-1  |      | 1.4 | QPSK | 1/3  | 6   |            | $\geq 1$  |                   |
| FDD          | Table A.2.2.1.1-1  |      | 3   | QPSK | 1/3  | 15  |            | $\geq 1$  |                   |
| FDD          | Table A.2.2.1.1-1  |      | 5   | QPSK | 1/3  | 25  |            | $\geq 1$  |                   |
| FDD          | Table A.2.2.1.1-1  |      | 10  | QPSK | 1/3  | 50  |            | $\geq 1$  |                   |
| FDD          | Table A.2.2.1.1-1  |      | 15  | QPSK | 1/5  | 75  |            | $\geq 1$  |                   |

## A.2.2 Reference measurement channels for FDD

### A.2.2.1 Full RB allocation

#### A.2.2.1.1 QPSK

Table A.2.2.1.1-1: Reference Channels for QPSK with full RB allocation

| Parameter                                                                                                                                      | Unit | Value    |          |          |          |          |          |
|------------------------------------------------------------------------------------------------------------------------------------------------|------|----------|----------|----------|----------|----------|----------|
| Channel bandwidth                                                                                                                              | MHz  | 1.4      | 3        | 5        | 10       | 15       | 20       |
| Allocated resource blocks                                                                                                                      |      | 6        | 15       | 25       | 50       | 75       | 100      |
| DFT-OFDM Symbols per Sub-Frame                                                                                                                 |      | 12       | 12       | 12       | 12       | 12       | 12       |
| Modulation                                                                                                                                     |      | QPSK     | QPSK     | QPSK     | QPSK     | QPSK     | QPSK     |
| Target Coding rate                                                                                                                             |      | 1/3      | 1/3      | 1/3      | 1/3      | 1/5      | 1/6      |
| Payload size                                                                                                                                   | Bits | 600      | 1544     | 2216     | 5160     | 4392     | 4584     |
| Transport block CRC                                                                                                                            | Bits | 24       | 24       | 24       | 24       | 24       | 24       |
| Number of code blocks per Sub-Frame (Note 1)                                                                                                   |      | 1        | 1        | 1        | 1        | 1        | 1        |
| Total number of bits per Sub-Frame                                                                                                             | Bits | 1728     | 4320     | 7200     | 14400    | 21600    | 28800    |
| Total symbols per Sub-Frame                                                                                                                    |      | 864      | 2160     | 3600     | 7200     | 10800    | 14400    |
| UE Category                                                                                                                                    |      | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ |
| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit) |      |          |          |          |          |          |          |

**Table A.2.2.1.1-1a: Reference Channels for QPSK with full/maximum RB allocation for UE UL category 0**

| Parameter                                    | Unit | Value |      |      |       |       |       |
|----------------------------------------------|------|-------|------|------|-------|-------|-------|
| Channel bandwidth                            | MHz  | 1.4   | 3    | 5    | 10    | 15    | 20    |
| Allocated resource blocks                    |      | 6     | 15   | 25   | 36    | 36    | 36    |
| DFT-OFDM Symbols per Sub-Frame               |      | 12    | 12   | 12   | 12    | 12    | 12    |
| Modulation                                   |      | QPSK  | QPSK | QPSK | QPSK  | QPSK  | QPSK  |
| Target Coding rate                           |      | 1/3   | 1/5  | 1/8  | 1/10  | 1/10  | 1/10  |
| Payload size                                 | Bits | 600   | 872  | 904  | 1000  | 1000  | 1000  |
| Transport block CRC                          | Bits | 24    | 24   | 24   | 24    | 24    | 24    |
| Number of code blocks per Sub-Frame (NOTE 1) |      | 1     | 1    | 1    | 1     | 1     | 1     |
| Total number of bits per Sub-Frame           | Bits | 1728  | 4320 | 7200 | 10368 | 10368 | 10368 |
| Total symbols per Sub-Frame                  |      | 864   | 2160 | 3600 | 5184  | 5184  | 5184  |
| UE UL Category                               |      | 0     | 0    | 0    | 0     | 0     | 0     |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th, 6th, 12th, 13th, 14th, 20th, 21st, 22nd, 28th, 29th, 30th, 36th, 37th, and 38th subframes every 40ms. Information bit payload is available if uplink subframe is scheduled.

**Table A.2.2.1.1-1b: Reference Channels for QPSK with full/maximum RB allocation for UE UL category M1**

| Parameter                                    | Unit | Value |      |      |      |      |      |
|----------------------------------------------|------|-------|------|------|------|------|------|
| Channel bandwidth                            | MHz  | 1.4   | 3    | 5    | 10   | 15   | 20   |
| Allocated resource blocks                    |      | 6     | 6    | 6    | 6    | 6    | 6    |
| DFT-OFDM Symbols per Sub-Frame               |      | 12    | 12   | 12   | 12   | 12   | 12   |
| Modulation                                   |      | QPSK  | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate                           |      | 1/3   | 1/3  | 1/3  | 1/3  | 1/3  | 1/3  |
| Payload size                                 | Bits | 600   | 600  | 600  | 600  | 600  | 600  |
| Transport block CRC                          | Bits | 24    | 24   | 24   | 24   | 24   | 24   |
| Number of code blocks per Sub-Frame (NOTE 1) |      | 1     | 1    | 1    | 1    | 1    | 1    |
| Total number of bits per Sub-Frame           | Bits | 1728  | 1728 | 1728 | 1728 | 1728 | 1728 |
| Total symbols per Sub-Frame                  |      | 864   | 864  | 864  | 864  | 864  | 864  |
| UE UL Category                               |      | M1    | M1   | M1   | M1   | M1   | M1   |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 2: For HD-FDD UE with  $N_{abs}^{PUSCH} = 1$ , the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10ms for the channel bandwidth 5MHz/10MHz/15MHz/20MHz. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10ms for the channel bandwidth 1.4MHz/3MHz. Information bit payload is available if uplink subframe is scheduled.  $N_{abs}^{PUSCH}$  is total number of absolute subframes a PUSCH with repetition spans [4].

NOTE 3: For HD-FDD UE with  $N_{abs}^{PUSCH} > 1$ , MPDCCH are scheduled at 0th DL subframe every  $N_{abs}^{PUSCH} + 5$  subframes (starting from the 0th subframe). The associated PUSCH is scheduled at the 4th to  $(N_{abs}^{PUSCH} + 3)$ -th UL subframes every  $N_{abs}^{PUSCH} + 5$  subframes. Information bit payload is available if uplink subframe is scheduled.

**Table A.2.2.1.1-1c: Reference Channels for QPSK with full/maximum RB allocation for UE UL category M2**

| Parameter                                                                                                                                                                                                                                                                                                                                                            | Unit | Value |      |      |      |      |      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|------|------|------|------|------|
| Channel bandwidth                                                                                                                                                                                                                                                                                                                                                    | MHz  | 1.4   | 3    | 5    | 10   | 15   | 20   |

| UE UL Category                                                                                                                                                                                                                                                                                                                                                       |      | M2    | M2   | M2   | M2   | M2   | M2   |
| NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)                                                                                                                                                                                                                       |      |       |      |      |      |      |      |
| NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10ms for the channel bandwidth 5MHz/10MHz/15MHz/20MHz. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10ms for the channel bandwidth 1.4MHz/3MHz. Information bit payload is available if uplink subframe is scheduled. |      |       |      |      |      |      |      |

| UE Category                                                                                                                                                                                                                                                                                                                                                          |      | M1    | M1    | M1    | M1    | M1    | M1    |
| NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).                                                                                                                                                                                                                      |      |       |       |       |       |       |       |
| NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10ms for the channel bandwidth 5MHz/10MHz/15MHz/20MHz. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10ms for the channel bandwidth 1.4MHz/3MHz. Information bit payload is available if uplink subframe is scheduled. |      |       |       |       |       |       |       |

## A.2.2.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

## A.2.2.2.1 QPSK

Table A.2.2.2.1-1: Reference Channels for QPSK with partial RB allocation

| Parameter                                                                                                                                      | Ch BW    | Allocated RBs | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame | Total symbols per Sub-Frame | UE Category |

| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)                                                                                                         |          |               |                                |       |                    |              |                     |                                              |                                    |                             |                |
| Note 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th, 6th, 12th, 13th, 14th, 20th, 21st, 22nd, 28th, 29th, 30th, 36th, 37th, and 38th subframes every 40ms. Information bit payload is available if uplink subframe is scheduled. |          |               |                                |       |                    |              |                     |                                              |                                    |                             |                |

Table A.2.2.2.1-1b: Reference Channels for QPSK with partial RB allocation for UE UL category M1

| Parameter                                                                                                                                                                                                                                                                                                                                                            | Ch BW    | Allocated RBs | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame | Total symbols per Sub-Frame | UE Category |

| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).                                                                                                                                                                                                                      |          |               |                                |       |                    |              |                     |                                              |                                    |                             |             |
| Note 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10ms for the channel bandwidth 5MHz/10MHz/15MHz/20MHz. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10ms for the channel bandwidth 1.4MHz/3MHz. Information bit payload is available if uplink subframe is scheduled. |          |               |                                |       |                    |              |                     |                                              |                                    |                             |             |

## A.2.2.2.2 16-QAM

Table A.2.2.2.2-1 Reference Channels for 16-QAM with partial RB allocation

| Parameter                                                                                                                                      | Ch BW    | Allocated RBs | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame | Total symbols per Sub-Frame | UE Category |

| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)                                                                                                                                                                                                                     |          |               |                                 |       |                    |              |                     |                                              |                                    |                              |             |
| Note 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10ms for the channel bandwidth 5MHz/10MHz/15MHz/20MHz. For HD-FDD, the uplink subframes are scheduled at the 5th, 6th, and 7th subframes every 10ms for the channel bandwidth 1.4MHz/3MHz. Information bit payload is available if uplink subframe is scheduled. |          |               |                                 |       |                    |              |                     |                                              |                                    |                              |             |

## A.2.2.2.3 64-QAM

Table A.2.2.2.3-1: Reference Channels for 64-QAM with partial RB allocation

| Parameter | Ch BW    | Allocated RBs | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame | Total symbols per Sub-Frame | UE Category (Note 2) | UE UL Category (Note 2) |
|-----------|----------|---------------|--------------------------------|-------|--------------------|--------------|---------------------|----------------------------------------------|------------------------------------|-----------------------------|----------------------|-------------------------|
| Unit      | MHz      |               |                                |       |                    | Bits         | Bits                |                                              | Bits                               |                             |                      |                         |
|           | 1.4 - 20 | 1             | 12                             | 64QAM | 3/4                | 616          | 24                  | 1                                            | 864                                | 144                         | 5,8                  | 5, 8, 13, 14            |

#### A.2.2.3 Void

Table A.2.2.3-1: Void

## A.2.3 Reference measurement channels for TDD

For TDD, the measurement channel is based on DL/UL configuration ratio of 2DL:2UL, or 1DL:4UL. 2DL:2UL is the default and used unless explicitly specified in the test case

### A.2.3.1 Full RB allocation

#### A.2.3.1.1 QPSK

**Table A.2.3.1.1-1: Reference Channels for QPSK with full RB allocation**

| Parameter                                                                                                                                      | Unit | Value |      |      |       |       |       |

## A.2.3.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

### A.2.3.2.1 QPSK

**Table A.2.3.2.1-1: Reference Channels for QPSK with partial RB allocation**

| Parameter                                                                                                                                      | Ch BW    | Allocated RBs | UDL Configuration (Note 2) | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size for Sub-Frame 2, 3, 7, 8 | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame for Sub-Frame 2, 3, 7, 8 | Total symbols per Sub-Frame for Sub-Frame 2, 3, 7, 8 | UE Category |

| Code block CRC size (bits)                                                                                                                                                                                                                                                                                                                                       | 0            | 0            | 0            | 0            | 0     | 0     | 0     |
| Number of code blocks – C                                                                                                                                                                                                                                                                                                                                        | 1            | 1            | 1            | 1            | 1     | 1     | 1     |
| Total number of bits per resource unit                                                                                                                                                                                                                                                                                                                           | 96           | 192          | 96           | 192          | 288   | 288   | 288   |
| Total symbols per resource unit                                                                                                                                                                                                                                                                                                                                  | 96           | 96           | 96           | 96           | 144   | 144   | 144   |
| Tx time (ms)                                                                                                                                                                                                                                                                                                                                                     | 64           | 32           | 16           | 8            | 4     | 2     | 1     |
| NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)                                                                                                                                                                                                                   |              |              |              |              |       |       |       |
| NOTE 2: Parameters related to NPUSCH format 1 scheduling are defined in Table A.2.4-2.                                                                                                                                                                                                                                                                           |              |              |              |              |       |       |       |
| NOTE 3: NPDCCH is not transmitted in the subframes used for transmission of SI messages.                                                                                                                                                                                                                                                                         |              |              |              |              |       |       |       |
| NOTE 4: SI messages transmission should be prioritized over NPDCCH transmission in case of collision. NPDCCH transmission is postponed until the next NB-IoT downlink subframe in case NPDCCH transmission occurs in a non NB-IoT downlink subframe, where an NB-IoT downlink subframe is a subframe that does not contain NPSS/NSSS/NPBCH/SIB1-NB transmission. |              |              |              |              |       |       |       |

**Table A.2.4-2: NPDCCH configuration for NPUSCH format 1 scheduling**

| Parameter                                                | Unit | Value         |
|----------------------------------------------------------|------|---------------|
| DCI format                                               |      | DCI format N0 |
| NPDCCH format                                            |      | 1             |
| Scheduling delay ( $I_{\text{Delay}}$ )                  |      | 0             |
| DCI subframe repetition number                           |      | 00            |
| $R_{\text{max}}$<br>( <i>npdcch-NumRepetitions</i> )     |      | 1             |
| G<br>( <i>NPDCCH-startSF-USS</i> )                       |      | 8             |
| $\alpha_{\text{offset}}$<br>( <i>npdcch-Offset-USS</i> ) |      | 1/4           |

## A.2.5 Reference measurement channels for LAA

### A.2.5.1 Full RB allocation

#### A.2.5.1.1 QPSK

**Table A.2.5.1.1-1: Reference Channels for QPSK with full RB allocation**

| Parameter                                                                                                                                      | Unit | Value    |          |
|------------------------------------------------------------------------------------------------------------------------------------------------|------|----------|----------|
| Channel bandwidth                                                                                                                              | MHz  | 10       | 20       |
| Allocated resource blocks                                                                                                                      |      | 50       | 100      |
| DFT-OFDM Symbols per Sub-Frame                                                                                                                 |      | 12       | 12       |
| Modulation                                                                                                                                     |      | QPSK     | QPSK     |
| Target Coding rate                                                                                                                             |      | 1/3      | 1/6      |
| Payload size                                                                                                                                   | Bits | 5160     | 4584     |
| Transport block CRC                                                                                                                            | Bits | 24       | 24       |
| Number of code blocks per Sub-Frame (Note 1)                                                                                                   |      | 1        | 1        |
| Total number of bits per Sub-Frame                                                                                                             | Bits | 14400    | 28800    |
| Total symbols per Sub-Frame                                                                                                                    |      | 7200     | 14400    |
| UE Category                                                                                                                                    |      | $\geq 1$ | $\geq 1$ |
| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit) |      |          |          |

#### A.2.5.1.2 16QAM

**Table A.2.5.1.2-1: Reference Channels for 16QAM with full RB allocation**

| Parameter                                                                                                                                      | Unit | Value    |          |
|------------------------------------------------------------------------------------------------------------------------------------------------|------|----------|----------|
| Channel bandwidth                                                                                                                              | MHz  | 10       | 20       |
| Allocated resource blocks                                                                                                                      |      | 50       | 100      |
| DFT-OFDM Symbols per Sub-Frame                                                                                                                 |      | 12       | 12       |
| Modulation                                                                                                                                     |      | 16QAM    | 16QAM    |
| Target Coding rate                                                                                                                             |      | 3/4      | 1/3      |
| Payload size                                                                                                                                   | Bits | 21384    | 19848    |
| Transport block CRC                                                                                                                            | Bits | 24       | 24       |
| Number of code blocks per Sub-Frame (Note 1)                                                                                                   |      | 4        | 4        |
| Total number of bits per Sub-Frame                                                                                                             | Bits | 28800    | 57600    |
| Total symbols per Sub-Frame                                                                                                                    |      | 7200     | 14400    |
| UE Category                                                                                                                                    |      | $\geq 2$ | $\geq 2$ |
| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit) |      |          |          |

## A.2.5.1.3 64QAM

Table A.2.5.1.3-1: Reference Channels for 64QAM with full RB allocation

| Parameter                                                                                                                                                                                                                                                                                                                                                                            | Unit | Value     |           |

| UE UL Category (Note 2)                                                                                                                                                                                                                                                                                                                                                              |      | 5,8,13,14 | 5,8,13,14 |
| Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)<br>Note 2: If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category. |      |           |           |

## A.2.5.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements.

## A.2.5.2.1 QPSK

Table A.2.5.2.1-1: Reference Channels for QPSK with partial RB allocation

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Ch BW   | Allocated RBs | DFT-OFDM Symbols per Sub-Frame | Mod'n | Target Coding rate | Payload size | Transport block CRC | Number of code blocks per Sub-Frame (Note 1) | Total number of bits per Sub-Frame | Total symbols per Sub-Frame | UE Category |

If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category<br>Note 3: For the channel bandwidth of 10Mhz, the allocated RBs are distributed over the channel bandwidth at the RB index = {N, N+5, N+10, ..., N+45 for N = 0, ..., N <sub>Interface</sub> -1 } where N <sub>Interface</sub> is 1, ..., 4 for the allocated RBs of 10, ..., 40, respectively.<br>Note 4: For the channel bandwidth of 20Mhz, the allocated RBs are distributed over the channel bandwidth at the RB index = {N, N+10, N+20, ..., N+90 for N = 0, ..., N <sub>Interface</sub> -1 } where N <sub>Interface</sub> is 1, ..., 9 for the allocated RBs of 10, ..., 90, respectively. |         |               |                                |       |                    |              |                     |                                              |                                    |                             |                      |                         |

## A.3 DL reference measurement channels

### A.3.1 General

The number of available channel bits varies across the sub-frames due to PBCH and PSS/SSS overhead. The payload size per sub-frame is varied in order to keep the code rate constant throughout a frame.

Unless otherwise stated, no user data is scheduled on subframes #5 in order to facilitate the transmission of system information blocks (SIB).

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $N_{RB}$

1. Calculate the number of channel bits  $N_{ch}$  that can be transmitted during the first transmission of a given sub-frame.
2. Find  $A$  such that the resulting coding rate is as close to  $R$  as possible, that is,

$$\min |R - (A + 24 * (N_{CB} + 1)) / N_{ch}|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases},$$

subject to

- a)  $A$  is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of  $N_{RB}$  resource blocks.
  - b)  $C$  is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
3. If there is more than one  $A$  that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.
  4. For TDD, the measurement channel is based on DL/UL configuration ratio of 2DL+DwPTS (12 OFDM symbol): 2UL

#### A.3.1.1 Overview of DL reference measurement channels

In Table A.3.1.1-1 to A.3.1.1-1V are listed the DL reference measurement channels specified in annexes A.3.2 to A.3.15 of this release of TS 36.101. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.3.2 to A.3.15 as appropriate.

**Table A.3.1.1-1: Overview of DL reference measurement channels (FDD, Receiver requirements)**

| Duplex       | Table          | Name | BW  | Mod  | TCR | RB  | RB Off set | UE Cat eg | Notes            |
|--------------|----------------|------|-----|------|-----|-----|------------|-----------|------------------|

## A.3.2 Reference measurement channel for receiver characteristics

Unless otherwise stated, Tables A.3.2-1, A.3.2-1a, A.3.2-1b, A.3.2-2, A.3.2-2a and A.3.2-2b are applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

Unless otherwise stated, Tables A.3.2-3, A.3.2-3a, A.3.2-3b, A.3.2-4, A.3.2-4a and A.3.2-4b are applicable for subclause 7.4 (Maximum input level).

Unless otherwise stated, Tables A.3.2-1, A.3.2-1a, A.3.2-1b, A.3.2-2, A.3.2-2a and A.3.2-2b also apply for the modulated interferer used in Clauses 7.5, 7.6 and 7.8 with test specific bandwidths.

For transmissions in TDD Band 46, Table A.3.2-2c is applicable for measurements of Receiver Characteristics (clause 7) except for the Maximum Input Level (clause 7.4A) for which Table A.3.2-4d and Table A.3.2-7 apply. For these measurements, the discovery signals measurement timing configuration (DMTC) periodicity shall be set at *dmTC-Periodicity* = 40 ms with an offset *dmTC-Offset* = 0 for the channel and the DRS shall be transmitted in the first subframe of each DMTC occasion. Furthermore, no PBCH is transmitted and the PDSCH is also scheduled in subframe #5.

**Table A.3.2-1 Fixed Reference Channel for Receiver Requirements (FDD)**

| Parameter                                                                                                                                                                | Unit      | Value |        |        |        |        |       |

| Note 1:                                           | 2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz                                                                                                                                                                                                                                        |       |       |       |       |        |        |
| Note 2:                                           | Reference signal, Synchronization signals and PBCH allocated as per TS 36.211.                                                                                                                                                                                                                                                                                                                          |       |       |       |       |        |        |
| Note 3:                                           | The scheduled wideband other than 1.4MHz/3MHz/5MHz/15MHz channel bandwidth avoids the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.                                                                                                                                                                                                           |       |       |       |       |        |        |
| Note 4:                                           | For HD-FDD UE, PDSCH are scheduled at the 3rd subframe every 1 radio frame for 1.4MHz/3MHz/5MHz/10MHz channel bandwidth. For other channel bandwidth, PDSCH are scheduled at the 0th, 1st and 2nd subframes every 1 radio frame. Information bit payload is available if downlink subframe is scheduled. The corresponding MPDCCH is scheduled 2 subframes before the corresponding PDSCH transmission. |       |       |       |       |        |        |
| Note 5:                                           | 2 resource blocks allocated to MPDCCH.                                                                                                                                                                                                                                                                                                                                                                  |       |       |       |       |        |        |
| Note 6:                                           | 4 resource blocks in each narrowband allocated to PDSCH.                                                                                                                                                                                                                                                                                                                                                |       |       |       |       |        |        |

| Note 1: For normal subframes(0,4,5,9), 2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For special subframe (1&6), only 2 OFDM symbols are allocated to PDCCH for all BWs. |           |       |        |        |       |       |       |
| Note 2: For 1.4MHz, no data shall be scheduled on special subframes(1&6) to avoid problems with insufficient PDCCH performance.                                                                                                                                                               |           |       |        |        |       |       |       |
| Note 3: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [4].                                                                                                                                                                                                    |           |       |        |        |       |       |       |
| Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).                                                                                                                                               |           |       |        |        |       |       |       |
| Note 5: As per Table 4.2-2 in TS 36.211 [4].                                                                                                                                                                                                                                                  |           |       |        |        |       |       |       |

| Note 1: 2 symbols allocated to PDCCH.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].<br>Note 3: The downlink subframes are scheduled at the 0th and 1st subframes every 10ms. Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). The corresponding MPDCCH is scheduled 2 subframes before the corresponding PDSCH transmissions.<br>Note 4: Allocated PRB positions for PDSCH are {3, 4, 5} within the assigned narrowband. Allocated PRB positions for MPDCCH are {0, 1} within the assigned narrowband.<br>Note 5: The downlink subframes are scheduled at the 0th subframes every 11ms. Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). The corresponding MPDCCH is scheduled 5 subframes before the corresponding PDSCH transmissions. |             |            |           |           |

| UE Category                                    |      | ≥ 11     | ≥ 11       | ≥ 11       | ≥ 11       | ≥ 5                                | ≥ 5                                | ≥ 5      | 1bis           | 1bis           |

|         |                                                                                                                                                                    |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | 2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. |
| Note 2: | Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].                                                                                 |
| Note 3: | If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).                            |
| Note 4: | Given per component carrier per codeword.                                                                                                                          |
| Note 5: | 24 resource blocks (RB 0-20 and 30-32) are allocated in sub-frames 0, 1, 2, 3, 4, 6, 7, 8, 9                                                                       |

Table A.3.3.2.2-3: Fixed Reference Channel four antenna ports

| Note 1: 2 symbols allocated to PDCCH.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].<br>Note 3: The downlink subframes are scheduled at the 0th and 1st subframes every 10ms. Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). The corresponding MPDCCH is scheduled 2 subframes before the corresponding PDSCH transmissions.<br>Note 4: Allocated PRB positions for PDSCH are {3, 4, 5} within the assigned narrowband. Allocated PRB positions for MPDCCH are {0, 1} within the assigned narrowband. |             |          |

### A.3.3.3 Reference Measurement Channel for UE-Specific Reference Symbols

#### A.3.3.3.0 Two antenna ports (no CSI-RS)

The reference measurement channels in Table A.3.3.3.0-1 apply with two CRS antenna ports and without CSI-RS.

**Table A.3.3.3.0-1: Fixed Reference Channel without CSI-RS**

| Parameter                                                                                                                                      | Unit | Value    |          |
|------------------------------------------------------------------------------------------------------------------------------------------------|------|----------|----------|

### A.3.3.3.1 Two antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.1-1 apply for verifying demodulation performance for UE-specific reference symbols with two cell-specific antenna ports and two CSI-RS antenna ports.

Table A.3.3.3.1-1: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Unit        | Value       |             |             |             |             |              |             |             |             |             |

### A.3.3.3.2 Four antenna ports (CSI-RS)

The reference measurement channels in Table A.3.3.3.2-1 apply for verifying demodulation performance for UE-specific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

**Table A.3.3.3.2-1: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Note 1: 2 symbols allocated to PDCCH. 1 symbol allocated to PDCCH for reference channel with 1024QAM.

Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].

Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.

Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).

Note 5: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 47 resource blocks (RB0–RB23 and RB27–RB49) are allocated in sub-frame 0. In sub-frame 0, PDSCH is rate matched around RB22, RB23 and RB27.

The reference measurement channels in Table A.3.3.3.2-2 apply for verifying FDD PMI accuracy measurement and CRI accuracy measurement with two CRS antenna ports and four CSI-RS antenna ports.

**Table A.3.3.3.2-2: Fixed Reference Channel for four antenna ports (CSI-RS)**

| Parameter                                    | Unit                                                                                                                                                                                                                                                                                                                                                                                                                     | Value           |                 |               |                 |                  |                 |

| Note 1: 2 symbols allocated to PDCCH.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].<br>Note 3: The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled.<br>Note 4: Allocated PRB positions start from {9, 10, ..., 9+N-1}, where N is the number of allocated resource blocks. |             |             |

The reference measurement channels in Table A.3.3.3.2-4 apply with two CRS antenna ports and four CSI-RS antenna ports.

**Table A.3.3.3.2-4: Fixed Reference Channel for four antenna ports (CSI-RS)**

| Note 1: 2 symbols allocated to PDCCH.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].<br>Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.<br>Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit). |             |             |

**A.3.3.3.2A Eight antenna ports (CSI-RS)**

The reference measurement channels in Table A.3.3.3.2A-1 apply for verifying FDD CRI accuracy measurement with two CRS antenna ports and eight CSI-RS antenna ports.

**Table A.3.3.3.2A-1: Fixed Reference Channel for eight antenna ports (CSI-RS)**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Unit | Value           |                 |

### A.3.3.3.3 Twelve antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.3-1 apply for verifying PMI accuracy performance for UE-specific reference symbols with two cell-specific antenna ports and twelve CSI-RS antenna ports.

**Table A.3.3.3.3-1: Fixed Reference Channel for CDM-multiplexed DM RS with twelve CSI-RS antenna ports**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                             | Unit        | Value       |

| Note 1: 2 symbols allocated to PDCCH.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].<br>Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.<br>Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit). |             |             |

#### A.3.3.3.5 Twenty-four antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.5-1 apply for verifying PMI accuracy performance for UE-specific reference symbols with two cell-specific antenna ports and twenty-four CSI-RS antenna ports.

**Table A.3.3.3.5-1: Fixed Reference Channel for CDM-multiplexed DM RS with twenty-four CSI-RS antenna ports**

| Parameter                                                                                                                                                   | Unit        | Value       |             |

| Note 1: 2 symbols allocated to PDCCH.                                                                                                                       |             |             |             |
| Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].                                                                  |             |             |             |
| Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0. |             |             |             |
| Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).             |             |             |             |

#### A.3.3.3.6 Thirty-two antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.6-1 apply for verifying PMI accuracy performance for UE-specific reference symbols with two cell-specific antenna ports and thirty-two CSI-RS antenna ports.

**Table A.3.3.3.6-1: Fixed Reference Channel for CDM-multiplexed DM RS with thirty-two CSI-RS antenna ports**
