| Total symbols per Sub-Frame |  | 864 | 2160 | 3600 | 7200 | 10800 | 14400 |
| UE Category (Note 2) |  | 5,8 | 5,8 | 5,8 | 5,8 | 5,8 | 5,8 |
| UE UL Cateogry (Note 2) |  | 5,8, | 5,8, | 5,8, | 5,8, | 5,8, | 5,8, |
|  | 13,14 | 13,14 | 13,14 | 13,14 | 13,14 | 13,14 |  |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)
Note2 : If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.

## A.2.2.1.4 256 QAM

Table A.2.2.1.4-1: Reference Channels for 256 QAM with full RB allocation

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 15 | 25 | 50 | 75 | 100 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | 256 QAM | 256 QAM | 256 QAM | 256 QAM | 256 QAM | 256 QAM |
| Target Coding rate |  | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ |
| Payload size | Bits | 5160 | 12960 | 21384 | 42368 | 63776 | 84760 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub- <br> Frame (Note 1) |  | 1 | 3 | 4 | 8 | 11 | 15 |
| Total number of bits per Sub-Frame | Bits | 6912 | 17280 | 28800 | 57600 | 86400 | 115200 |
| Total symbols per Sub-Frame |  | 864 | 2160 | 3600 | 7200 | 10800 | 14400 |
| UE UL Cateogry |  | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)

## A.2.2.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

## A.2.2.2.1 QPSK

Table A.2.2.2.1-1: Reference Channels for QPSK with partial RB allocation

| Parame <br> ter | Ch BW | Allocat <br> ed RBs | DFT- <br> OFDM <br> Symbol <br> sper <br> Sub- <br> Frame |  | Mod'n | Target <br> Coding <br> rate | Payload <br> size | Transp <br> ort <br> block <br> CRC | Number <br> of code <br> blocks <br> per Sub- <br> Frame <br> (Note 1) | Total <br> number <br> of bits <br> per <br> Sub- <br> Frame | Total <br> symbols <br> per Sub- <br> Frame |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Category |  |  |  |  |  |  |  |  |  |  |  |

|  | 3-20 | 9 | 12 | QPSK | 1/3 | 776 | 24 | 1 | 2592 | 1296 | $\geq 1$ |

## A.2.2.3 Void

Table A.2.2.3-1: Void

## A.2.2.4 subPRB allocation

The location of allocated RB for subPRB allocation is chosen according to values specified in the Tx requirements.
Table A.2.2.4-1: Reference Channels for SubPRB allocation

| Parameter | Unit | Value |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | $1.4-20$ | $1.4-20$ | $1.4-20$ |
| Allocated resource blocks |  | 1 | 1 | 1 |
| Number of subcarriers |  | 2 out of 3 | 3 | 6 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 |
| Modulation |  | $\pi / 2 \mathrm{BPSK}$ | QPSK | QPSK |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 32 | 72 | 72 |
| Transport block CRC | Bits | 24 | 24 | 24 |
| Number of code blocks |  | 1 | 1 | 1 |
| Total number of bits per resource unit | Bits | 192 | 288 | 288 |
| Total symbols per resource unit |  | 192 | 144 | 144 |
| Tx time | ms | 8 | 4 | 2 |
| UE UL Category |  | $\mathrm{M} 1 / \mathrm{M} 2$ | $\mathrm{M} 1 / \mathrm{M} 2$ | $\mathrm{M} 1 / \mathrm{M} 2$ |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)

## A.2.3 Reference measurement channels for TDD

For TDD, the measurement channel is based on DL/UL configuration ratio of 2DL:2UL. or 1DL:4UL. 2DL:2UL is the default and used unless explicitly specified in the test case

## A.2.3.1 Full RB allocation

## A.2.3.1.1 QPSK

Table A.2.3.1.1-1: Reference Channels for QPSK with full RB allocation

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 15 | 25 | 50 | 75 | 100 |
| Uplink-Downlink Configuration (Note 2) |  | 1 | 1 | 1 | 1 | 1 | 1 |

| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Modulation |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 5$ | $1 / 6$ |
| Payload size |  |  |  |  |  |  |  |
| For Sub-Frame 2,3,7,8 | Bits | 600 | 1544 | 2216 | 5160 | 4392 | 4584 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (Note 1) |  |  |  |  |  |  |  |
| For Sub-Frame 2,3,7,8 |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per Sub-Frame |  |  |  |  |  |  |  |
| For Sub-Frame 2,3,7,8 | Bits | 1728 | 4320 | 7200 | 14400 | 21600 | 28800 |
| Total symbols per Sub-Frame |  |  |  |  |  |  |  |
| For Sub-Frame 2,3,7,8 |  | 864 | 2160 | 3600 | 7200 | 10800 | 14400 |
| UE Category |  | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ )
Note 2: As per Table 4.2-2 in TS 36.211 [4]

Table A.2.3.1.1-1A: Reference Channels for QPSK with full RB allocation, UL-DL configuration 0

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |

| UE UL Cateogry |  | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ | $\geq 15$ |
| Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit) <br> Note 2: As per Table 4.2-2 in TS 36.211 [4] |  |  |  |  |  |  |  |

## A.2.3.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

## A.2.3.2.1 QPSK

Table A.2.3.2.1-1: Reference Channels for QPSK with partial RB allocation

| $\begin{gathered} \text { Parame } \\ \text { ter } \end{gathered}$ | Ch BW | Allocat ed RBs | UDL Configu ration (Note 2) | DFTOFDM Symbol s per SubFrame | Mod'n | Target Coding rate | Payloa d size for SubFrame 2, 3, 7, 8 | Transp ort block CRC | Number of code blocks per SubFrame (Note 1) | Total number of bits per Sub- <br> Frame for SubFrame 2, 3, 7, 8 | Total symbol s per SubFrame for SubFrame 2, 3, 7, 8 | $\begin{aligned} & \text { UE } \\ & \text { Categor } \end{aligned}$ $\mathbf{y}$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $\mathrm{L}=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ )
Note 2: As per Table 4.2-2 in TS 36.211 [4]

Table A.2.3.3-1: Void

## A.2.3.4 subPRB allocation

The location of allocated RB for subPRB allocation is chosen according to values specified in the Tx requirements.
Table A.2.3.4-1: Reference Channels for SubPRB allocation

| Parameter | Unit | Value |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | $1.4-20$ | $1.4-20$ | $1.4-20$ |
| Allocated resource blocks |  | 1 | 1 | 1 |
| Number of subcarriers |  | 2 out of 3 | 3 | 6 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 |
| Modulation |  | $\pi / 2 \mathrm{BPSK}$ | QPSK | QPSK |
| Target Coding rate | Bits | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 24 | 72 | 72 |
| Transport block CRC |  | 1 | 24 | 24 |
| Number of code blocks | Bits | 192 | 288 | 1 |
| Total number of bits per resource unit |  | 192 | 144 | 144 |
| Total symbols per resource unit | ms | 8 | 4 | 2 |
| Tx time |  | $\mathrm{M} 1 / \mathrm{M} 2$ | $\mathrm{M} 1 / \mathrm{M} 2$ | $\mathrm{M} 1 / \mathrm{M} 2$ |
| UE UL Category |  |  |  |  |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $\mathrm{L}=24$ Bits is attached to each Code Block (otherwise L=0 Bit)

## A.2.4 Reference measurement channels for UE category NB1

Table A.2.4-1 Reference Channels for UE category NB1

| Parameter | Value |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sub-carrier spacing (kHz) | 3.75 | 3.75 | 15 | 15 | 15 | 15 | 15 |
| Number of tone | 1 | 1 | 1 | 1 | 3 | 6 | 12 |
| Modulation | m/2 BPSK | m/4 QPSK | m/2 BPSK | T/4 QPSK | QPSK | QPSK | QPSK |
| Number of NPUSCH repetition (NOTE 5) | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| IMCS / ITBS | $0 / 0$ | $3 / 3$ | $0 / 0$ | $3 / 3$ | $5 / 5$ | $5 / 5$ | $5 / 5$ |
| Payload size (bits) | 32 | 40 | 32 | 40 | 72 | 72 | 72 |
| Allocated resource unit | 2 | 1 | 2 | 1 | 1 | 1 | 1 |
| Code rate (target) | 1/3 | 1/3 | 1/3 | 1/3 | 1/3 | 1/3 | 1/3 |
| Code rate (effective) | 0.29 | 0.33 | 0.29 | 0.33 | 0.33 | 0.33 | 0.33 |
| Transport block CRC (bits) | 24 | 24 | 24 | 24 | 24 | 24 | 24 |
| Code block CRC size (bits) | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Number of code blocks - C | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per resource unit | 96 | 192 | 96 | 192 | 288 | 288 | 288 |
| Total symbols per resource unit | 96 | 96 | 96 | 96 | 144 | 144 | 144 |
| Tx time (ms) | 64 | 32 | 16 | 8 | 4 | 2 | 1 |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L$ $=0 \mathrm{Bit}$ )
NOTE 2: Parameters related to NPUSCH format 1 scheduling are defined in Table A.2.4-2.
NOTE 3: NPDCCH is not transmitted in the subframes used for transmission of SI messages.
NOTE 4: SI messages transmission should be prioritized over NPDCCH transmission in case of collision. NPDCCH transmission is postponed until the next NB-IoT downlink subframe in case NPDCCH transmission occurs in a non NB-loT downlink subframe, where an NB-IoT downlink subframe is a subframe that does not contain NPSS/NSSS/NPBCH/SIB1-NB transmission.
NOTE 5: Number of repetition $N_{\text {Rep }}$ as defined in table 16.5.1.1-3 in TS 36.213 [6].

Table A.2.4-2: NPDCCH configuration for NPUSCH format 1 scheduling

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| DCI format |  | DCI format N0 |
| NPDCCH format |  | 1 |
| Scheduling delay $\left(I_{\text {Delay }}\right)$ |  | 0 |

| DCI subframe repetition <br> number | 00 |  |
| :---: | :---: | :---: |
| $R_{\max }$ <br> (npdcch-NumRepetitions) |  | 1 |
| G <br> (NPDCCH-startSF-USS) | 8 |  |
| $\alpha_{\text {offset }}$ <br> (npdcch-Offset-USS) | $1 / 4$ |  |

## A.2.5 Reference measurement channels for LAA

## A.2.5.1 Full RB allocation

## A.2.5.1.1 QPSK

Table A.2.5.1.1-1: Reference Channels for QPSK with full RB allocation

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Channel bandwidth | MHz | 10 | 20 |
| Allocated resource blocks |  | 50 | 100 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 |
| Modulation |  | QPSK | QPSK |
| Target Coding rate | Bits | $1 / 3$ | $1 / 6$ |
| Payload size | Bits | 24 | 4584 |
| Transport block CRC |  | 1 | 1 |
| Number of code blocks per Sub-Frame <br> (Note 1) | Bits | 14400 | 28800 |
| Total number of bits per Sub-Frame |  | 7200 | 14400 |
| Total symbols per Sub-Frame |  | $\geq 1$ | $\geq 1$ |
| UE Category |  |  |  |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit )

## A.2.5.1.2 16QAM

Table A.2.5.1.2-1: Reference Channels for 16QAM with full RB allocation

| Parameter | Unit |  |  |
| :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 10 | 20 |
| Allocated resource blocks |  | 50 | 100 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 |
| Modulation |  | 16QAM | 16QAM |
| Target Coding rate |  | 3/4 | 1/3 |
| Payload size | Bits | 21384 | 19848 |
| Transport block CRC | Bits | 24 | 24 |
| Number of code blocks per Sub-Frame (Note 1) |  | 4 | 4 |
| Total number of bits per Sub-Frame | Bits | 28800 | 57600 |
| Total symbols per Sub-Frame |  | 7200 | 14400 |
| UE Category |  | $\geq 2$ | $\geq 2$ |
| Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit ) |  |  |  |

## A.2.5.1.3 <br> 64QAM

Table A.2.5.1.3-1: Reference Channels for 64QAM with full RB allocation

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Channel bandwidth | MHz | 10 | 20 |
| Allocated resource blocks |  | 50 | 100 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 |
| Modulation |  | 64 QAM | 64 QAM |
| Target Coding rate | Bits | 31704 | $6 / 4$ |
| Payload size | Bits | 24 | 24 |
| Transport block CRC |  | 8 | 11 |
| Number of code blocks per Sub-Frame <br> (Note 1) | Bits | 43200 | 86400 |
| Total number of bits per Sub-Frame |  | 7200 | 14400 |
| Total symbols per Sub-Frame |  | 5,8 | 5,8 |
| UE Category (Note 2) |  | $5,8,13$, | $5,8,13$, |
| UE UL Category (Note 2) | 14 |  |  |
| Nete 1. more than |  |  |  |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)
Note 2: If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.

## A.2.5.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and $R x$ requirements.

## A.2.5.2.1 QPSK

Table A.2.5.2.1-1: Reference Channels for QPSK with partial RB allocation

| Parame <br> ter | Ch BW | Allocat <br> ed RBs | DFT- <br> OFDM <br> Symbol <br> s per <br> Sub- <br> Frame |  | Mod'n | Target <br> Coding <br> rate | Payload <br> size | Transp <br> ort <br> block <br> CRC | Number <br> of code <br> blocks <br> per Sub- <br> Frame <br> (Note 1) | Total <br> number <br> of bits <br> per <br> Sub- <br> Frame | Total <br> symbols <br> per Sub- <br> Frame |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Category |  |  |  |  |  |  |  |  |  |  |  |

Note 1: If more than one Code Block is present, an additional CRC sequence of $\mathrm{L}=24$ Bits is attached to each Code Block (otherwise L $=0 \mathrm{Bit}$ )
Note 2: For the channel bandwidth of 10 Mhz , the allocated RBs are distributed over the channel bandwidth at the RB index $=\{\mathrm{N}, \mathrm{N}+5$, $N+10, \ldots, N+45$ for $\left.N=0, \ldots, N_{\text {Interlace }}-1\right\}$ where $N_{\text {Interlace }}$ is $1, \ldots, 4$ for the allocated RBs of $10, \ldots, 40$, respectively.
Note 3: For the channel bandwidth of 20 Mhz , the allocated RBs are distributed over the channel bandwidth at the RB index $=\{N, N+10$, $N+20, \ldots, N+90$ for $\left.N=0, \ldots, N_{\text {Interlace }}-1\right\}$ where $N_{\text {Interlace }}$ is $1, . ., 9$ for the allocated RBs of $10, \ldots, 90$, respectively.

## A.2.5.2.2 16QAM

Table A.2.5.2.2-1: Reference Channels for 16QAM with partial RB allocation

| Parame <br> ter | Ch BW | Allocat <br> ed RBs | DFT- <br> OFDM <br> Symbol <br> s per <br> Sub- <br> Frame |  |  | Mod'n | Target <br> Coding <br> rate | Payload <br> size | Transp <br> ort <br> block <br> CRC | Number <br> of code <br> blocks <br> per Sub- <br> Frame <br> (Note 1) | Total <br> number <br> of bits <br> per <br> Sub- <br> Frame |

| Unit | MHz |  |  |  | Total <br> symbols <br> Frame- | UE <br> Category |  |  |  |  |  |
|  | $10-20$ | 10 | 12 | 16QAM | $3 / 4$ | 4264 | 24 | 1 | 5760 | 1440 |  |
|  | $10-20$ | 20 | 12 | 16QAM | $1 / 3$ | 4008 | 24 | 1 | 11520 | 2880 | $\geq 2$ |
|  | $10-20$ | 30 | 12 | 16QAM | $3 / 4$ | 12960 | 24 | 3 | 17280 | 4320 | $\geq 2$ |
|  | $10-20$ | 40 | 12 | 16QAM | $3 / 4$ | 16992 | 24 | 3 | 23040 | 5760 | $\geq 2$ |
|  | 20 | 50 | 12 | 16QAM | $3 / 4$ | 21384 | 24 | 4 | 28800 | 7200 | $\geq 2$ |
|  | 20 | 60 | 12 | 16QAM | $2 / 3$ | 23688 | 24 | 4 | 34560 | 8640 | $\geq 2$ |
|  | 20 | 70 | 12 | 16QAM | $1 / 2$ | 19848 | 24 | 4 | 40320 | 10080 | $\geq 2$ |
|  | 20 | 80 | 12 | 16QAM | $1 / 2$ | 22920 | 24 | 4 | 46080 | 11520 | $\geq 2$ |
|  | 20 | 90 | 12 | 16QAM | $2 / 5$ | 20616 | 24 | 4 | 51840 | 12960 | $\geq 2$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L$ $=0 \mathrm{Bit}$ )
Note 2: For the channel bandwidth of 10 Mhz , the allocated RBs are distributed over the channel bandwidth at the $R B$ index $=\{N, N+5$, $N+10, \ldots, N+45$ for $\left.N=0, \ldots, N_{\text {Interlace }}-1\right\}$ where $N_{\text {Interlace }}$ is $1, \ldots, 4$ for the allocated RBs of $10, \ldots, 40$, respectively.
Note 3: For the channel bandwidth of 20 Mhz , the allocated RBs are distributed over the channel bandwidth at the $R B$ index $=\{N, N+10$, $\mathrm{N}+20, \ldots, \mathrm{~N}+90$ for $\left.\mathrm{N}=0, \ldots, \mathrm{~N}_{\text {Interlace }}-1\right\}$ where $\mathrm{N}_{\text {Interlace }}$ is $1, \ldots, 9$ for the allocated RBs of $10, \ldots, 90$, respectively.

## A.2.5.2.3 64QAM

Table A.2.5.2.3-1: Reference Channels for 64QAM with partial RB allocation

| Parame ter | Ch BW | Allocat ed RBs | DFTOFDM Symbol s per SubFrame | Mod'n | Target Coding rate | Payload size | Transp ort block CRC | Number of code blocks per SubFrame (Note 1) | Total number of bits per SubFrame | Total symbols per SubFrame | UE <br> Category <br> (Note 2) | UE UL Category (Note 2) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit | MHz |  |  |  |  | Bits | Bits |  | Bits |  |  |  |
|  | 10-20 | 10 | 12 | 64QAM | 3/4 | 6200 | 24 | 2 | 8640 | 1440 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \\ \hline \end{gathered}$ |
|  | 10-20 | 20 | 12 | 64QAM | 3/4 | 12576 | 24 | 3 | 17280 | 2880 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \\ \hline \end{gathered}$ |
|  | 10-20 | 30 | 12 | 64QAM | 3/4 | 19080 | 24 | 4 | 25920 | 4320 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \end{gathered}$ |
|  | 10-20 | 40 | 12 | 64QAM | 3/4 | 25456 | 24 | 5 | 34560 | 5760 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \end{gathered}$ |
|  | 20 | 50 | 12 | 64QAM | 3/4 | 31704 | 24 | 6 | 43200 | 7200 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \end{gathered}$ |
|  | 20 | 60 | 12 | 64QAM | 3/4 | 37888 | 24 | 7 | 51840 | 8640 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \end{gathered}$ |
|  | 20 | 70 | 12 | 64QAM | 3/4 | 43816 | 24 | 4 | 60480 | 10080 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \\ \hline \end{gathered}$ |
|  | 20 | 80 | 12 | 64QAM | 3/4 | 51024 | 24 | 9 | 69120 | 11520 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \end{gathered}$ |
|  | 20 | 90 | 12 | 64QAM | 2/3 | 51024 | 24 | 9 | 77760 | 12960 | 5,8 | $\begin{gathered} 5,8,13 \\ 14 \\ \hline \end{gathered}$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit)
Note 2: If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category
Note 3: For the channel bandwidth of 10 Mhz , the allocated RBs are distributed over the channel bandwidth at the RB index $=\{N, N+5, N+10, \ldots$, $N+45$ for $\left.N=0, \ldots, N_{\text {Interlace- }} 1\right\}$ where $N_{\text {Interlace }}$ is $1, \ldots, 4$ for the allocated RBs of $10, \ldots, 40$, respectively.
Note 4: For the channel bandwidth of 20 Mhz , the allocated RBs are distributed over the channel bandwidth at the RB index $=\{N, N+10, N+20, \ldots$, $\mathrm{N}+90$ for $\left.\mathrm{N}=0, \ldots, \mathrm{~N}_{\text {Interlace }}-1\right\}$ where $\mathrm{N}_{\text {Interlace }}$ is $1, . ., 9$ for the allocated RBs of $10, \ldots, 90$, respectively.

## A. 3 DL reference measurement channels

## A.3.1 General

The number of available channel bits varies across the sub-frames due to PBCH and PSS/SSS overhead. The payload size per sub-frame is varied in order to keep the code rate constant throughout a frame.

Unless otherwise stated, no user data is scheduled on subframes \#5 in order to facilitate the transmission of system information blocks (SIB).

The algorithm for determining the payload size $A$ is as follows; given a desired coding rate $R$ and radio block allocation $N_{\text {RB }}$

1. Calculate the number of channel bits $N_{\mathrm{ch}}$ that can be transmitted during the first transmission of a given sub-frame.
2. Find $A$ such that the resulting coding rate is as close to $R$ as possible, that is,

$$
\min \left|R-\left(A+24 *\left(N_{C B}+1\right)\right) / N_{c h}\right|, \text { where } N_{C B}=\left\{\begin{array}{l}
0, \text { if } C=1 \\
C, \text { if } C>1
\end{array},\right.
$$

subject to
a) A is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of $N_{\mathrm{RB}}$ resource blocks.
b) $C$ is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
3. If there is more than one $A$ that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93 .
4. For TDD, the measurement channel is based on DL/UL configuration ratio of 2DL+DwPTS (12 OFDM symbol): 2UL

## A.3.1.1 Overview of DL reference measurement channels

In Table A.3.1.1-1 to A.3.1.1-1V are listed the DL reference measurement channels specified in annexes A.3.2 to A.3.15 of this release of TS 36.101 . This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.3.2 to A.3.15 as appropriate.

## A.3.2 Reference measurement channel for receiver characteristics

Unless otherwise stated, Tables A.3.2-1, A.3.2-1a, A.3.2-1b, A.3.2-2, A.3.2-2a and A.3.2-2b are applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

Unless otherwise stated, Tables A.3.2-3, A.3.2-3a, A.3.2-3b, A.3.2-4, A.3.2-4a and A.3.2-4b are applicable for subclause 7.4 (Maximum input level).

Unless otherwise stated, Tables A.3.2-1, A.3.2-1a, A.3.2-1b, A.3.2-2, A.3.2-2a and A.3.2-2b also apply for the modulated interferer used in Clauses 7.5, 7.6 and 7.8 with test specific bandwidths.

For transmissions in TDD Band 46, Table A.3.2-2c is applicable for measurements of Receiver Characteristics (clause 7) except for the Maximum Input Level (clause 7.4A) for which Table A.3.2-4d and Table A.3.2-7 apply. For these measurements, the discovery signals measurement timing configuration (DMTC) periodicity shall be set at dmtcPeriodicity $=40 \mathrm{~ms}$ with an offset $d m t c$-Offset $=0$ for the channel and the DRS shall be transmitted in the first subframe of each DMTC occasion. Furthermore, no PBCH is transmitted and the PDSCH is also scheduled in subframe \#5.

Table A.3.2-1 Fixed Reference Channel for Receiver Requirements (FDD)

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| For Sub-Frame 5 | Bits | N/A | N/A | N/A | N/A | N/A | N/A |
| For Sub-Frame 0 (Note 3) | Bits | 528 | 2688 | 2688 | 3024 | 3024 | 3024 |
| Max. Throughput averaged over 1 frame | kbps | 341.6 | 884 | 884 | 890.4 | 890.4 | 890.4 |
| UE DL Category |  | 0 | 0 | 0 | 0 | 0 | 0 |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz . 4 symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211.
Note 3: For Sub-Frame 0, it is assumed the 6PRBs are allocated in the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.
Note 4: For HD-FDD UE, the downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40 ms . Information bit payload is available if downlink subframe is scheduled.

Table A.3.2-1b Fixed Reference Channel for Receiver Requirements (FDD and HD-FDD) - for CAT-M1

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Max. Throughput averaged over 1 frames <br> for HD-FDD | kbps | 25.6 | 25.6 | 76.8 | 98.4 | 98.4 | 98.4 |
| UE DL Category |  | M1 | M1 | M1 | M1 | M1 | M1 |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz . 4 symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211.
Note 3: The scheduled narrowband other than 1.4 MHz and 3 MHz channel bandwidth avoids the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.
Note 4: For HD-FDD UE, PDSCH are scheduled at the 3rd subframe every 1 radio frame for 1.4 MHz and 3 MHz channel bandwidth. For other channel bandwidth, PDSCH are scheduled at the 0th, 1st and 2nd subframes every 1 radio frame. Information bit payload is available if downlink subframe is scheduled. The corresponding M-PDCCH is scheduled 2 subframesbefore the corresponding PDSCH transmission.
Note 5: 2 resource blocks allocated to M-PDCCH

Table A.3.2-1c Fixed Reference Channel for Receiver Requirements (HD-FDD) without repetition - for CAT-NB1

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Channel bandwidth | MHz | 0.2 |
| Number of subcarriers |  | 12 |
| Modulation |  | QPSK |
| Target Coding Rate | Processes | $1 / 3$ |
| Number of HARQ Processes | Bits | 1 |
| Maximum number of HARQ transmissions |  | 88 |
| Transport block size | Bits | 1 |
| Number of Sub-Frames per transport <br> block | Bits | 320 |
| Transport block CRC |  | N/A |
| Binary Channel Bits Per Sub-Frame |  | 1 |
| LTE CRS port |  | 0 |
| Number of NRS ports |  | NB1 |
| Number of NPDSCH repetitions (Note 7) |  |  |
| UE DL Category |  |  |
| N |  |  |

Note 1: Category NB1 in stand-alone mode has been considered here.
Note 2: Reference signal, Synchronization signals and NPBCH allocated as per TS 36.211.
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit)
Note 4: Parameters related to NPDSCH scheduling are defined in Table A.3.2-1e to Table A.3.2-1g.

Note 5: NPDCCH and information bit payload are not transmitted in the subframes used for transmission of SI messages.
Note 6: SI messages transmission should be prioritized over NPDCCH transmission in case of collision. NPDCCH transmission is postponed until the next NB-IoT downlink subframe in case NPDCCH transmission occurs in a non NB-IoT downlink subframe, where an NB-IoT downlink subframe is a subframe that does not contain NPSS/NSSS/NPBCH/SIB1-NB transmission.
Note 7: $\quad$ Number of repetition $N_{\text {Rep }}$ as defined in table 16.4.1.3-2 in TS 36.213 [6].

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz . 4 symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211.
Note 3: The scheduled wideband other than $1.4 \mathrm{MHz} / 3 \mathrm{MHz} / 5 \mathrm{MHz} / 15 \mathrm{MHz}$ channel bandwidth avoids the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.
Note 4: For HD-FDD UE, PDSCH are scheduled at the 3rd subframe every 1 radio frame for $1.4 \mathrm{MHz} / 3 \mathrm{MHz} / 5 \mathrm{MHz} / 10 \mathrm{MHz}$ channel bandwidth. For other channel bandwidth, PDSCH are scheduled at the 0th, 1st and 2nd subframes every 1 radio frame. Information bit payload is available if downlink subframe is scheduled. The corresponding MPDCCH is scheduled 2 subframes before the corresponding PDSCH transmission.
Note 5: 2 resource blocks allocated to MPDCCH.
Note 6: 4 resource blocks in each narrowband allocated to PDSCH.

Table A.3.2-2 Fixed Reference Channel for Receiver Requirements (TDD)

| Parameter | Unit | Value |  |  |  |  |  |

Note 7: 2 resource blocks allocated to MPDCCH
Note 8: 4 resource blocks in each narrowband allocated to PDSCH.

Table A.3.2-2e Fixed Reference Channel for Receiver Requirements (TDD) - for CAT-NB1 and CATNB2

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Channel bandwidth | MHz | 0.2 |
| Number of subcarriers |  | 12 |
| Uplink-Downlink Configuration (Note 7) |  | 1 |
| Modulation |  | QPSK |
| Target Coding Rate |  | $1 / 3$ |
| Number of HARQ Processes |  | 1 |
| Maximum number of HARQ <br> transmissions | Bits | 88 |
| Transport block size |  | 1 |
| Number of Sub-Frames per transport <br> block | Bits | 24 |
| Transport block CRC | Bits | 320 |
| Binary Channel Bits Per Sub-Frame |  | N/A |
| LTE CRS port |  | 1 |
| Number of NRS ports |  | 1 |
| Number of NPDSCH repetitions |  | NB1 or |
| UE DL Category | NB2 |  |
| Nid 1 |  | 1 |

Note 1: Category NB1 or NB2 in stand-alone mode has been considered here.
Note 2: Reference signal, Synchronization signals and NPBCH allocated as per TS 36.211.
Note 3: If more than one Code Block is present, an additional CRC sequence of $\mathrm{L}=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ )

Note 4: Parameters related to NPDSCH scheduling are defined in Table A.3.2-1e to Table A.3.2-1g.

Note 5: NPDCCH and information bit payload are not transmitted in the subframes used for transmission of SI messages.
Note 6: SI messages transmission should be prioritized over NPDCCH transmission in case of collision. NPDCCH transmission is postponed until the next NB-loT downlink subframe in case NPDCCH transmission occurs in a non NB-loT downlink subframe, where an NB-loT downlink subframe is a subframe that does not contain NPSS/NSSS/NPBCH/SIB1-NB transmission.
Note 7: As per Table 4.2-2 in TS 36.211 [4]
Note 8: $\quad$ Number of repetition NRep as defined in table 16.4.1.3-2 in TS 36.213 [6].

Table A.3.3.2.1-3: Fixed Reference Channel two antenna ports

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Reference channel |  | R.62 <br> FDD | R.63 <br> FDD |
| Channel bandwidth | MHz | 10 | 10 |
| Allocated resource blocks (Note 4) |  | 3 | 1 |
| Allocated DL subframes per 4 Radio Frames <br> (Note 3) |  | 15 | 15 |
| Modulation |  | 16 QAM | 64 QAM |
| Target Coding Rate |  | $1 / 2$ | $1 / 2$ |
| Information Bit Payload | Bits | 744 | 408 |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Code |  |  |
| Number of Code Blocks | 1 | 1 |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 |  |  |  |
| Binary Channel Bits | Bits | 1584 | 792 |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Mbps | 0.279 | 0.153 |
| Max. Throughput averaged over 4 frames |  | 0 | 0 |
| UE DL Category |  |  |  |

Note 1: 2 symbols allocated to PDCCH
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]
Note 3: The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9 th, 10 th, 16 th, 17 th, 18 th, 24 th, 25 th, 26 th, 32 nd, 33 rd, 34 th subframes every 40 ms . Information bit payload is available if downlink subframe is scheduled.
Note 4: Allocated PRB positions start from $\{9,10, \ldots, 9+\mathrm{N}-1\}$, where N is the number of allocated resource blocks.

Table A.3.3.2.1-4: Fixed Reference Channel two antenna ports

| Parameter | Unit | Values |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Reference channel |  | R.79 FDD | R.103 FDD | R.104 FDD |
| Channel bandwidth | MHz | 10 | 10 | 10 |
| Allocated resource blocks (Note 4) |  | 3 | 3 | 3 |
| Allocated DL subframes per Radio Frame |  | Note 3 | Note 5 | Note 3 |
| Modulation |  | 16 QAM | QPSK | 64 QAM |
| Target Coding Rate |  | $1 / 2$ | $1 / 3$ | 0.4 |
| Information Bit Payload | Bits | 744 | 224 | 968 |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 |  |  |  |  |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and $3 \mathrm{MHz} ; 4$ symbols allocated to PDCCH for 1.4 MHz . 1 symbol allocated to PDCCH for reference channel with 1024QAM.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 4: Given per component carrier per codeword

Table A.3.3.2.2-4: Fixed Reference Channel four antenna ports

| Parameter | Unit | Values |
| :--- | :---: | :---: |
| Reference channel |  | R.95 FDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks (Note 4) |  | 3 |
| Allocated DL subframes per Radio Frame (Note 3) |  | 2 |
| Modulation |  | 16 QAM |
| Target Coding Rate |  | $1 / 2$ |
| Information Bit Payload | Bits | 744 |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Code <br> blocks | 1 |
| Number of Code Blocks |  |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Bits | 1536 |
| Binary Channel Bits | Mbps | 0.149 |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 |  | M 2 |
| Max. Throughput averaged over 1 frame |  |  |
| UE DL Category |  |  |
| Note 1: 2 symbols allocated to PDCCH. |  |  |

Note 1: 2 symbols allocated to PDCCH
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].

Note 3: The downlink subframes are scheduled at the 0th and 1st subframes every 10 ms . Information bit payload is available if downlink subframe is scheduled (starting from Oth subframe). The corresponding MPDCCH is scheduled 2 subframes before the corresponding PDSCH transmissions.
Note 4: Allocated PRB positions for PDSCH are $\{3,4,5\}$ within the assigned narrowband. Allocated PRB positions for MPDCCH are $\{0,1\}$ within the assigned narrowband.

## A.3.3.3 Reference Measurement Channel for UE-Specific Reference Symbols

## A.3.3.3.0 Two antenna ports (no CSI-RS)

The reference measurement channels in Table A.3.3.3.0-1 apply with two CRS antenna ports and without CSI-RS.
Table A.3.3.3.0-1: Fixed Reference Channel without CSI-RS

The reference measurement channels in Table A.3.3.3.0-2 apply for verifying demodulation performance for UEspecific reference symbols without CSI-RS.

Table A.3.3.3.0-2: Fixed Reference Channel without CSI-RS

| Parameter | Unit | Value |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Reference channel |  | R.80 FDD | R.80-1 <br> FDD | R.80-2 <br> FDD |
| Channel bandwidth | MHz | 10 | 10 | 10 |
| Allocated resource blocks (Note 4) |  | 6 | 6 | 6 |
| Allocated PDSCH subframes |  | Note 3 | Note 6 | Note 7 |
| Modulation |  | QPSK | QPSK | QPSK |
| Target Coding Rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Information Bit Payload |  |  |  |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Bits | 504 | 504 | 504 |
| Number of Code Blocks |  |  |  |  |

| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Code <br> blocks | 1 | 1 | 1 |
| :--- | :---: | :---: | :---: | :---: |
| Binary Channel Bits |  |  |  |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Bits | 1440 | 1440 | 1440 |
| Max. Throughput averaged over one period | kbps | 15.75 | 31.5 | 50.4 |
| UE DL Category |  | $\mathrm{M} 1, \geq 0$ | $\geq 1$ | $\geq 1$ |

Note 1: 2 symbols allocated to PDCCH
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]
Note 3: PDSCH subframes are scheduled at the 9th to 16 th subframes every period=32 ms . Information bit payload is availabled from the 9-th to 16th subframes with repetition. (Starting from the 0th subframe)
Note 4: Allocated PRB positions are $\{0,1,2,3,4,5\}$ within the assigned narrowband.
Note 5: MPDCCH are scheduled at the 0th to 7th subframes with repetition. The allocated PRB positions are $\{0,1,2,3,4,5\}$ within the assigned narrowband. (Starting from the 0th subframe)
Note 6: PDSCH subframes are scheduled at the 3th to 6 th subframes every period=16 ms. Information bit payload is availabled from the 3th to 6th subframes with repetition. (Starting from the 0th subframe)
Note 7: PDSCH subframes are scheduled at the 2th to 3th subframes every period=10 ms. Information bit payload is availabled from the 2th to 3th subframes with repetition. (Starting from the 0th subframe)

## A.3.3.3.1 Two antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.1-1 apply for verifying demodulation performance for UEspecific reference symbols with two cell-specific antenna ports and two CSI-RS antenna ports.

Table A.3.3.3.1-1: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports

| Parameter | Unit | Value |  |  |  |  |  |  |  |  |  |

Note 1: $\quad 2$ symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz .
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 .
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit).
Note 5: 25 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 17 resource blocks (RB0-RB9 and RB18-RB24) are allocated in sub-frame 0.
Note 6: 75 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 63 resource blocks (RB0-R31 and RB44-RB74) are allocated in sub-frame 0 .
Note 7: 100 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 88 resource blocks (RB0-RB43 and RB56-RB99) are allocated in sub-frame 0.
Note 8: 24 resource blocks (RB 0-20 and 30-32) are allocated in sub-frames 0, 1, 2, 3, 4, 6, 7, 8, 9

The reference measurement channels in Table A3.3.3.1-2 apply for verifying demudlation performance for UE-specific reference symbols with two cell specific antenna ports and two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS in same subframe.

Table A.3.3.3.1-2: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and $3 \mathrm{MHz} ; 4$ symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]
Note 3: For R.44, R. 45 and R.60, 50 resource blocks are allocated in sub-frames $1,2,3,4,6,7,8,9$ and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0. For R.45-1, 39 resource blocks are allocated in all subframes (RB0RB20 and RB30-RB47). For R.50A-1, 50 resource blocks are allocated in sub-

|  | frames 2, 3, 4, 7, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are |
| :--- | :--- |
| allocated in sub-frame 0. |  |
| Note 4: |  |
| If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is |  |
| attached to each Code Block (otherwise $L=0$ Bit) |  |

The reference measurement channels in Table A.3.3.3.2-3 apply for verifying demodulation performance for UEspecific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

## Table A.3.3.3.2-3: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.64 <br> FDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks (Note 4) |  | 6 |
| Allocated subframes per 4 Radio Frames |  | 15 |
| Modulation |  | QPSK |
| Target Coding Rate | Bits | 504 |
| Information Bit Payload | Bits | 504 |
| For Sub-Frames 0,1,4,5,6,9 (Note 3) | Code <br> blocks | 1 |
| For Sub-Frames 2,3,7,8 (Note 3) | Code <br> blocks | 1 |
| Number of Code Blocks |  |  |
| For Sub-Frames 0,1,4,5,6,9 | Bits | 1440 |
| For Sub-Frames 2,3,7,8 | Bits | 1392 |
| Binary Channel Bits | Mbps | 0.189 |
| For Sub-Frames 0,1,4,5,6,9 |  | 0 |
| For Sub-Frames 2,3,7,8 |  |  |
| Max. Throughput averaged over 4 frames |  |  |
| UE DL Category |  |  |

Note 1: 2 symbols allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40 ms . Information bit payload is avaialbe if downlink subframe is scheduled.
Note 4: Allocated PRB positions start from $\{9,10, \ldots, 9+\mathrm{N}-1\}$, where N is the number of allocated resource blocks.

The reference measurement channels in Table A.3.3.3.2-4 apply with two CRS antenna ports and four CSI-RS antenna ports.

Table A.3.3.3.2-4: Fixed Reference Channel for four antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.69 FDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks |  | 50 |
| Allocated subframes per Radio Frame |  | 8 |
| Modulation |  | QPSK |
| Target Coding Rate |  | 0.74 |
| For Sub-Frames 2,3,4,6,7,8,9 |  | 0.8 |
| For Sub-Frame 1 | Bits |  |
| Information Bit Payload | Bits | 7992 |
| For Sub-Frames 2,3,4,6,7,8,9 | Bits | 7992 |
| For Sub-Frame 1 | Bits | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frame 5 |  | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frame 0 |  |  |
| Number of Code Blocks per Sub-Frame <br> (Note 4) |  | 2 |
| For Sub-Frames 2,3,4,6,7,8,9 |  |  |

| For Sub-Frame 1 |  | 2 |
| :--- | :---: | :---: |
| For Sub-Frame 5 |  | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frame 0 |  | $\mathrm{N} / \mathrm{A}$ |
| Binary Channel Bits Per Sub-Frame |  |  |
| For Sub-Frames 2,3,4,6,7,8,9 | Bits | 10800 |
| For Sub-Frame 1 | Bits | 10000 |
| 2 For Sub-Frame 5 | Bits | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frame 0 | Bits | $\mathrm{N} / \mathrm{A}$ |
| Max. Throughput averaged over 1 frame | Mbps | 6.3936 |
| UE Category |  | $\geq 1$ |

Note 1: 3 symbols allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)

The reference measurement channels in Table A.3.3.3.2-5 apply with two CRS antenna ports and four CSI-RS antenna ports.

Table A.3.3.3.2-5: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
| Reference channel |  | R. 98 FDD | R. 99 FDD |
| Channel bandwidth | MHz | 10 | 10 |
| Allocated resource blocks |  | 50 (Note 3) | 50 (Note 3 |
| Allocated subframes per Radio Frame |  | 9 | 9 |
| Modulation |  | 16QAM | 16QAM |
| Target Coding Rate |  | 1/2 | 1/2 |

## A.3.3.3.2A Eight antenna ports (CSI-RS)

The reference measurement channels in Table A.3.3.3.2A-1 apply for verifying FDD CRI accuracy measurement with two CRS antenna ports and eight CSI-RS antenna ports.

Table A.3.3.3.2A-1: Fixed Reference Channel for eight antenna ports (CSI-RS)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
| Reference channel |  | $\begin{aligned} & \text { R.50A-2 } \\ & \text { FDD } \end{aligned}$ | $\begin{gathered} \text { R.50A-3 } \\ \text { FDD } \end{gathered}$ |
| Channel bandwidth | MHz | 10 | 10 |
| Allocated resource blocks |  | $50^{3}$ | $50^{3}$ |
| Allocated subframes per Radio Frame |  | 7 | 5 |
| Modulation |  | 64QAM | 64QAM |
| Target Coding Rate |  | 1/2 | 1/2 |
| Information Bit Payload |  |  |  |
| For Sub-Frames (Non CSI-RS subframe) | Bits | 18336 | 18336 |
| For Sub-Frames (CSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frames (ZeroPowerCSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frame 5 | Bits | N/A | N/A |
| For Sub-Frame 0 | Bits | 14688 | 14688 |
| Number of Code Blocks per Sub-Frame (Note 4) |  |  |  |
| For Sub-Frames (Non CSI-RS subframe) |  | 3 | 3 |
| For Sub-Frames (CSI-RS subframe) |  | N/A | N/A |
| For Sub-Frames (ZeroPowerCSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frame 5 |  | N/A | N/A |
| For Sub-Frame 0 |  | 3 | 3 |

| Binary Channel Bits Per Sub-Frame |  |  |  |
| :---: | :---: | :---: | :---: |
| For Sub-Frames (Non CSI-RS subframe) | Bits | 36000 | 36000 |
| For Sub-Frames (CSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frames (ZeroPowerCSI-RS <br> subframe) | Bits | N/A | N/A |
| For Sub-Frame 5 | Bits | N/A | N/A |
| For Sub-Frame 0 | Bits | 29520 | 29520 |
| Max. Throughput averaged over 1 frame | Mbps | 12.4704 | 8.8032 |
| UE Category |  | $\geq 2$ | $\geq 2$ |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]

Note 3: For R.50A-2, 50 resource blocks are allocated in sub-frames 2, 3, 4, 7, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in subframe 0. For R.50A-3, 50 resource blocks are allocated in sub-frames 3, 4, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 .
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=$ 24 Bits is attached to each Code Block (otherwise L = 0 Bit)
Table A.3.3.3.2A-2: Fixed Reference Channel for eight antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.108 FDD |
| Channel bandwidth |  | 10 |
| Allocated resource blocks |  | $4^{3}$ |
| Allocated subframes per Radio Frame |  | 8 |
| Modulation |  | QPSK |
| Target Coding Rate | Bits | $4 / 2$ |
| Information Bit Payload | Bits | 472 |
| For Sub-Frames (Non CSI-RS subframe) | N/A |  |
| For Sub-Frames (CSI-RS subframe) |  |  |
| For Sub-Frame 5,7 |  | 1 |
| Number of Code Blocks per Sub-Frame <br> (Note 4) |  | 1 |
| For Sub-Frames (Non CSI-RS subframe) |  | N/A |

| For Sub-Frames (CSI-RS subframe) | Bits | 20800 |
| For Sub-Frames (ZeroPowerCSI-RS subframe) | Bits | N/A |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 19680 |
| Max. Throughput averaged over 1 frame | Mbps | 9.804 |
| UE Category |  | $\geq 2$ |
| Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]. |  |  |
| Note 3: 50 resource blocks are allocat 6, 7, 8, 9 and 41 resource block RB30-RB49) are allocated in | d in sub <br> s (RB0 | $\text { es } 1,2,3,4 \text {, }$ and |
| Note 4: If more than one Code Block is CRC sequence of $L=24$ Bits Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ ). | present, attached | dditional ach Code |

## A.3.3.3.5 Twenty-four antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.5-1 apply for verifying PMI accuracy performance for UEspecific reference symbols with two cell-specific antenna ports and twenty-four CSI-RS antenna ports.

Table A.3.3.3.5-1: Fixed Reference Channel for CDM-multiplexed DM RS with twenty-four CSI-RS antenna ports

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Reference channel |  | R.88 FDD | R.88A FDD |
| Channel bandwidth | MHz | 10 | 10 |
| Allocated resource blocks |  | 50 (Note 3) | 50 (Note 3) |
| Allocated subframes per Radio Frame |  | 9 | 9 |
| Modulation |  | 16 QAM | 16QAM |
| Target Coding Rate | Bits | $11 / 2$ | $1 / 2$ |
| Information Bit Payload | Bits | 9912 | 11448 |
| For Sub-Frames (Non CSI-RS <br> subframe) | Bits | N/A | N/A |
| For Sub-Frames (CSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frames (ZeroPowerCSI-RS <br> subframe) |  | 9528 | 9528 |
| For Sub-Frame 5 | Code blocks |  |  |
| For Sub-Frame 0 |  |  |  |
| Number of Code Blocks per Sub-Frame |  |  |  |

| For Sub-Frames (Non CSI-RS <br> subframe) | Code blocks | 2 | 2 |
| :---: | :---: | :---: | :---: |
| For Sub-Frames (CSI-RS subframe) | Bits | 2 | 2 |
| For Sub-Frames (ZeroPowerCSI-RS <br> subframe) | Bits | N/A | N/A |
| For Sub-Frame 5 |  | N/A | N/A |
| For Sub-Frame 0 | Bits | 2 | 2 |
| Binary Channel Bits Per Sub-Frame |  | 24000 | 24000 |
| For Sub-Frames (Non CSI-RS <br> subframe) | Bits | 19200 | 22400 |
| For Sub-Frames (CSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frames (ZeroPowerCSI-RS <br> subframe) | Bits | N/A | N/A |
| For Sub-Frame 5 | Bits | 19680 | 19680 |
| For Sub-Frame 0 | Mbps | 9.804 | 10.1112 |
| Max. Throughput averaged over 1 frame |  | $\geq 2$ | $\geq 2$ |
| UE Category |  |  |  |

Note 1: 2 symbols allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].

Note 3: 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0.
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=$ 24 Bits is attached to each Code Block (otherwise L = 0 Bit).

## A.3.3.3.6 Thirty-two antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.6-1 apply for verifying PMI accuracy performance for UEspecific reference symbols with two cell-specific antenna ports and thirty-two CSI-RS antenna ports.

Table A.3.3.3.6-1: Fixed Reference Channel for CDM-multiplexed DM RS with thirty-two CSI-RS antenna ports

| Paramter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.89 FDD |
| Channel bandwidth |  | 10 |
| Allocated resource blocks |  | 50 (Note 3) |
| Allocated subframes per Radio Frame |  | 9 |

| Note 1: 2 OFDM symbols are allocated to PDCCH in all subframes <br> Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]. <br> Note 3: As per Table 4.2-2 in TS 36.211 [4]. <br> Note 4: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit). |  |  |  |  |  |  |  |  |

Note 5: Given per component carrier per codeword.

Table A.3.4.2.1-6: Fixed Reference Channel two antenna ports

| Parameter | Unit | Values |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Reference channel |  | R.79 TDD | R.103 TDD | R.104 TDD |
| Channel bandwidth | MHz | 10 | 10 | 10 |
| Allocated resource blocks (Note 4) |  | 3 | 3 | 3 |
| Allocated subframes per Radio Frame (D+S) |  | $4+2$ | (Note 5) | 4 |
| Modulation |  | 16 QAM | QPSK | 64QAM |
| Target Coding Rate |  | $1 / 2$ | $1 / 3$ | 0.4 |
| Information Bit Payload | Bits | 744 | 224 | 968 |
| For Sub-Frames 0,4,5,9 | Bits | 440 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frames 1,6 |  |  |  |  |
| Number of Code Blocks | Code <br> blocks | 1 | 1 | 1 |
| For Sub-Frames 0,4,5,9 | Code <br> blocks | 1 | 1 | 1 |
| For Sub-Frames 0,4,5,9 |  |  |  |  |
| Binary Channel Bits | Bits | 1584 | 792 | 2376 |
| For Sub-Frames 0,4,5,9 | Bits | 1296 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| For Sub-Frames 1,6 | Mbps | 0.3856 | 0.012 | 0.3872 |
| Max. Throughput averaged over 1 frame |  | $\mathrm{M} 1, \mathrm{M} 2 \geq 0$ | $\mathrm{M} 1, \mathrm{M} 2$ | $\mathrm{M} 1, \mathrm{M} 2$ |
| UE DL Category |  |  |  |  |

Note 1: 2 symbols allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: Allocated PRB positions for PDSCH are $\{3,4,5\}$ within the assigned narrowband. Allocated PRB positions for MPDCCH are $\{0,1\}$ within the assigned narrowband.
Note 5: MPDCCH are scheduled at the 0th to 3rd BL/CE DL subframes with repetition every period=20ms. The associated PDSCH is scheduled at the 5th BL/CE DL subframe with repetition every period=20ms (starting from the 0th subframe).

Table A.3.4.2.1-7: Fixed Reference Channel two antenna ports

| Parameter | Unit | Value |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | R. 81 TDD | R.81-1 TDD | R.81-2 TDD |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz . For subframe 1\&6, only 2 OFDM symbols are allocated to PDCCH.
Note 2: For BW=1.4 MHz, the information bit payloads of special subframes are set to zero (no scheduling) to avoid problems with insufficient PDCCH performance at the test point.
Note 3: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 4: As per Table 4.2-2 in TS 36.211 [4]

Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit).
Note 6: Given per component carrier per codeword.

Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: as per Table 4.2-2 in TS 36.211 [4].
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit).
Note 5: 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of subframes 1,6.
Note 6: 25 resource blocks are allocated in sub-frames 4,9 and 17 resource blocks (RB0-RB9 and RB18-RB24) are allocated in sub-frame 0 and the DwPTS portion of subframes 1,6.
Note 7: 75 resource blocks are allocated in sub-frames 4,9 and 63 resource blocks (RB0-R31 and RB44-RB74) are allocated in sub-frame 0 and the DwPTS portion of subframes 1,6.
Note 8: 100 resource blocks are allocated in sub-frames 4,9 and 88 resource blocks (RB0-RB43 and RB56-RB99) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.
Note 9: 24 resource blocks (RB 0-20 and 30-32) are allocated in sub-frames 0, 1, 2, 3, 4, 6, 7, 8, 9

The reference measurement channels in Table A3.4.3.3-2 apply for verifying demudlation performance for UE-specific reference symbols with two cell specific antenna ports and two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS in same subframe.

Table A.3.4.3.3-2: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS

| Parameter | Unit | Value |  |  |  |  |  |

Note 1: 2 symbols allocated to PDCCH. 1 symbol allocated to PDCCH for reference channel with 1024QAM.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: as per Table 4.2-2 in TS 36.211 [4].
Note 4: For R. 44, R. 48 , R. 75 and R.cc, 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6. For R.66, 100 resource blocks are allocated in sub-frames 4, 9 and 88 resources blockes (RB0-RB43 and RB56-RB99) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

The reference measurement channels in Table A.3.4.3.4-2 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and four CSI-RS antenna ports.

Table A.3.4.3.4-2: Fixed Reference Channel for four antenna ports (CSI-RS)

| Parameter | Unit | Value |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | $\begin{aligned} & \hline \text { R. } 60 \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \text { R. } 61 \\ & \text { TDD } \end{aligned}$ | $\begin{gathered} \text { R.61-1 } \\ \text { TDD } \end{gathered}$ |

| UE Category |  | $\geq 2$ | $\geq 1$ | $\geq 2$ | $\geq 2$ |

Note 1: $\quad 2$ symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz . For subframe 1\&6, only 2 OFDM symbols are allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: For R. 45 and R. $45-2,50$ resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of subframes 1,6. For R.45-1, 39 resource blocks are allocated in sub-frames $0,4,9$ and the DwPTS portion of sub-frames 1,6 (RB0-RB20 and RB30-RB47).
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 6: Localized allocation started from RB \#0 is applied.

The reference measurement channels in Table A.3.4.3.5-3 apply for verifying CRI reporting accuracy with two cellspecific antenna ports and four CSI-RS antenna ports.

Table A.3.4.3.5-3: Fixed Reference Channel for eight antenna ports (CSI-RS)

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Reference channel |  | R.44A-2 | R.44A-3 |

| For Sub-Frames 1,6 | Mbps | 9.336 | 7.5024 |
| For Sub-Frame 0 |  | $\geq 2$ | $\geq 2$ |
| Max. Throughput averaged over 1 frame |  | 2 |  |
| UE Category |  |  |  |
| N I |  |  |  |

Note 1: $\quad 2$ symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and $3 \mathrm{MHz} ; 4$ symbols allocated to PDCCH for 1.4 MHz
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]

Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: For R.44A-2, 50 resource blocks are allocated in sub-frames 3, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and and the DwPTS portion of sub-frames 1,6. For R.44A-3, 50 resource blocks are allocated in sub-frames 8,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and and the DwPTS portion of sub-frames 1,6 .
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=$ 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

Table A.3.4.3.5-4: Fixed Reference Channel for eight antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.108 TDD |
| Channel bandwidth | MHz | 10 |
| Uplink-Downlink Configuration (Note 3) |  | 2 |
| Allocated resource blocks |  | $4^{4}$ |

## A.3.4.3.6 Twelve antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.6-1 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and twelve CSI-RS antenna ports.

Table A.3.4.3.6-1: Fixed Reference Channel for twelve antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Reference channel |  | R. 77 TDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks |  | $50^{4}$ |
| Uplink-Downlink Configuration (Note 3) |  | 1 |
| Allocated subframes per Radio Frame (D+S) |  | 3+2 |
| Allocated subframes per Radio Frame |  | 10 |
| Modulation |  | 64QAM |
| Target Coding Rate |  | 1/2 |
| Information Bit Payload |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 16416 |
| For Sub-Frames 1,6 | Bits | 11832 |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 14688 |
| Number of Code Blocks per Sub-Frame (Note 5) |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) |  | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) |  | 3 |
| For Sub-Frames 1,6 |  | 2 |
| For Sub-Frame 5 |  | N/A |
| For Sub-Frame 0 |  | 3 |
| Binary Channel Bits Per Sub-Frame |  |  |

| For Sub-Frames 4 and 9 <br> (Non CSI-RS subframe) | Bits | N/A |
| :--- | :---: | :---: |
| For Sub-Frames 4 and 9 <br> (CSI-RS subframe) | Bits | 32400 |
| For Sub-Frames 1,6 | Bits | 23616 |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 29520 |
| Max. Throughput averaged over 1 frame | Mbps | 7.1184 |
| UE Category |  | $\geq 2$ |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz . For subframe $1 \& 6$, only 2 OFDM symbols are allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 6: Localized allocation started from RB \#0 is applied.

## A.3.4.3.7 Sixteen antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.7-1 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and sixteen CSI-RS antenna ports.

Table A.3.4.3.7-1: Fixed Reference Channel for sixteen antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Reference channel |  | R. 78 TDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks |  | $50^{4}$ |
| Uplink-Downlink Configuration (Note 3) |  | 1 |
| Allocated subframes per Radio Frame ( $\mathrm{D}+\mathrm{S}$ ) |  | 3+2 |
| Allocated subframes per Radio Frame |  | 10 |
| Modulation |  | 16QAM |
| Target Coding Rate |  | 1/2 |
| Information Bit Payload |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 9912 |
| For Sub-Frames 1,6 | Bits | 7736 |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 9528 |
| Number of Code Blocks per Sub-Frame (Note 5) |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) |  | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) |  | 2 |
| For Sub-Frames 1,6 |  | 2 |
| For Sub-Frame 5 |  | N/A |
| For Sub-Frame 0 |  | 2 |
| Binary Channel Bits Per Sub-Frame |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 20800 |
| For Sub-Frames 1,6 | Bits | 15744 |

| For Sub-Frame 5 | Bits | N/A |
| :--- | :---: | :---: |
| For Sub-Frame 0 | Bits | 19680 |
| Max. Throughput averaged over 1 frame | Mbps | 4.4824 |
| UE Category |  | $\geq 2$ |
| N |  |  |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz . For subframe 1\&6, only 2 OFDM symbols are allocated to PDCCH.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 6: Localized allocation started from RB \#0 is applied.

## A.3.4.3.8 Twenty-four antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.8-1 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and twenty-four CSI-RS antenna ports.

## Table A.3.4.3.8-1: Fixed Reference Channel for twenty-four antenna ports (CSI-RS)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
| Reference channel |  | $\begin{aligned} & \hline \text { R. } 88 \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \hline \text { R.88A } \\ & \text { TDD } \end{aligned}$ |
| Channel bandwidth | MHz | 10 | 10 |
| Allocated resource blocks |  | $50^{4}$ | $50^{4}$ |
| Uplink-Downlink Configuration (Note 3) |  | 1 | 1 |
| Allocated subframes per Radio Frame $(\mathrm{D}+\mathrm{S})$ |  | 3+2 | 3+2 |
| Allocated subframes per Radio Frame |  | 10 | 10 |
| Modulation |  | 16QAM | 16QAM |
| Target Coding Rate |  | 1/2 | 1/2 |
| Information Bit Payload |  |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 9912 | 11448 |
| For Sub-Frames 1,6 | Bits | 7736 | 7736 |
| For Sub-Frame 5 | Bits | N/A | N/A |
| For Sub-Frame 0 | Bits | 9528 | 9528 |
| Number of Code Blocks per Sub-Frame (Note 5) |  |  |  |

| Note 6: |  |  |  |

## A.3.4.3.9 Thirty-two antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.9-1 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and thirty-two CSI-RS antenna ports.

Table A.3.4.3.9-1: Fixed Reference Channel for thirty-two antenna ports (CSI-RS)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Reference channel |  | R. 89 TDD |
| Channel bandwidth | MHz | 10 |
| Allocated resource blocks |  | $50^{4}$ |
| Uplink-Downlink Configuration (Note 3) |  | 1 |
| Allocated subframes per Radio Frame $(\mathrm{D}+\mathrm{S})$ |  | 3+2 |
| Allocated subframes per Radio Frame |  | 10 |
| Modulation |  | 64QAM |
| Target Coding Rate |  | 1/2 |
| Information Bit Payload |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 15264 |
| For Sub-Frames 1,6 | Bits | 11832 |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 14688 |
| Number of Code Blocks per Sub-Frame (Note 5) |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) |  | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) |  | 3 |
| For Sub-Frames 1,6 |  | 2 |
| For Sub-Frame 5 |  | N/A |
| For Sub-Frame 0 |  | 3 |
| Binary Channel Bits Per Sub-Frame |  |  |
| For Sub-Frames 4 and 9 (Non CSI-RS subframe) | Bits | N/A |
| For Sub-Frames 4 and 9 (CSI-RS subframe) | Bits | 26400 |
| For Sub-Frames 1,6 | Bits | 23616 |
| For Sub-Frame 5 | Bits | N/A |
| For Sub-Frame 0 | Bits | 29520 |
| Max. Throughput averaged over 1 frame | Mbps | 6.888 |
| UE Category |  | $\geq 2$ |

Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz ; 4 symbols allocated to PDCCH for 1.4 MHz . For subframe 1\&6, only 2 OFDM symbols are allocated to PDCCH.

Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.
Note 5: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 6: Localized allocation started from RB \#0 is applied.

## A.3.5 Reference measurement channels for PDCCH/PCFICH performance requirements

## A.3.5.1 FDD

Table A.3.5.1-1: Reference Channel FDD

| Parameter | Unit | Value |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## A.3.5.3 LAA

Table A.3.5.3-1: Reference Channel for FS3 with FDD primary cell

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.3 FS3 |
| Number of transmitter antennas |  | 2 |
| Channel bandwidth | MHz | 20 |
| Number of OFDM symbols for PDCCH | symbols | 2 |
| Aggregation level | CCE | 4 |
| DCI Format |  | Format 2A |
| Cell ID | Bits | 0 |
| Payload (without CRC) | 48 |  |

Table A.3.5.3-2: Reference Channel for FS3 with TDD primary cell

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | R.4 FS3 |
| Number of transmitter antennas |  | 2 |
| Channel bandwidth | MHz | 20 |
| Number of OFDM symbols for PDCCH | symbols | 2 |
| Aggregation level | CCE | 4 |
| DCI Format |  | Format 2A |
| Cell ID | Bits | 0 |
| Payload (without CRC) | 51 |  |

## A.3.6 Reference measurement channels for PHICH performance requirements

Table A.3.6-1: Reference Channel FDD/TDD

| Parameter | Unit | Value |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | R.18 | R.19 | R.19-1 | R.20 | R.24 |
| Number of transmitter <br> antennas |  | 1 | 2 | 2 | 4 | 1 |
| Channel bandwidth | MHz | 10 | 10 | 5 | 5 | 10 |
| User roles (Note 1) |  | $\mathrm{WITI2}$ | $\mathrm{WITI2}$ | W I1 I2 | W I1 I2 | W I1 |
| Resource allocation (Note 2) |  | $(0,0)(0,1)$ <br> $(0,4)$ | $(0,0)(0,1)$ <br> $(0,4)$ | $(0,0)(0,1)$ <br> $(0,4)$ | $(0,0)(0,1)$ <br> $(0,4)$ | $(0,0)(0,1)$ |
| Power offsets (Note 3) | dB | $-40-3$ | $-40-3$ | $-40-3$ | $-40-3$ | +30 |
| Payload (Note 4) |  | ARR | ARR | ARR | ARR | AR |

Note 1: $\mathrm{W}=$ wanted user, $\mathrm{I}=$ =interfering user $1, \mathrm{I} 2=$ interfering user 2.
Note 2: The resource allocation per user is given as (N_group_PHICH, N_seq_PHICH).

Note 3: The power offsets (per user) represent the difference of the power of BPSK modulated symbol per PHICH relative to the first interfering user.
Note 4: $\quad \mathrm{A}=$ fixed $\mathrm{ACK}, \mathrm{R}=$ random $\mathrm{ACK} / \mathrm{NACK}$.

## A.3.7 Reference measurement channels for PBCH performance requirements

Table A.3.7-1: Reference Channel FDD/TDD

| Parameter | Unit | Value |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | R.21 | R.22 | R.23 | R.23-1 |
| Number of transmitter antennas |  | 1 | 2 | 4 | 1 |
| Channel bandwidth | MHz | 1.4 | 1.4 | 1.4 | 1.4 |
| Modulation |  | QPSK | QPSK | QPSK | QPSK |
| Target coding rate |  | $40 / 1920$ | $40 / 1920$ | $40 / 1920$ | $40 / 4416$ |
| Payload (without CRC) | Bits | 24 | 24 | 24 | 24 |

## A.3.8 Reference measurement channels for MBMS performance requirements

## A.3.8.1 FDD

Table A.3.8.1-1: Fixed Reference Channel QPSK R=1/3

| Parameter | PMCH |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit | Value |  |  |  |  |  |
| Reference channel |  | R. 40 FDD |  |  | R. 37 FDD |  |  |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 |  |  | 50 |  |  |
| Allocated subframes per Radio Frame (Note 1) |  | 6 |  |  | 6 |  |  |
| Modulation |  | QPSK |  |  | QPSK |  |  |
| Target Coding Rate |  | 1/3 |  |  | 1/3 |  |  |
| Information Bit Payload (Note 2) |  |  |  |  |  |  |  |
| For Sub-Frames 1,2,3,6,7,8 | Bits | 408 |  |  | 3624 |  |  |
| For Sub-Frames 0,4,5,9 | Bits | N/A |  |  | N/A |  |  |
| Number of Code Blocks per Subframe (Note 3) |  | 1 |  |  | 1 |  |  |
| Binary Channel Bits Per Subframe |  |  |  |  |  |  |  |
| For Sub-Frames 1,2,3,6,7,8 | Bits | 1224 |  |  | 10200 |  |  |
| For Sub-Frames 0,4,5,9 | Bits | N/A |  |  | N/A |  |  |
| MBMS UE Category |  | $\geq 1$ |  |  | $\geq 1$ |  |  |

Note 1: For FDD mode, up to 6 subframes (\#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331.

Note 2: 2 OFDM symbols are reserved for PDCCH; and reference signal allocated as per TS 36.211.

Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.3.8.1-2: Fixed Reference Channel 16QAM R=1/2

| Parameter | PMCH |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit |  | Value |  |  |  |  |  |
| Reference channel |  |  |  |  | R.38 FDD |  |  |  |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |  |
| Allocated resource blocks |  |  |  |  | 50 |  |  |  |
| Allocated subframes per Radio Frame (Note 1) |  |  |  |  | 6 |  |  |  |

| For Sub-Frames 1,2,3,4,6,7,8,9 | Bits | 24000 | 36000 |  |  |  |
| For Sub-Frames 0,5 |  | N/A | N/A |  |  |  |
| MBMS UE Category |  | $\geq 2$ | $\geq 2$ |  |  |  |
| Note 1: For FDD mode, up to 8 subframes (\#1/2/3/4/6/7/8/9) are available for MBMS, in line with TS 36.331 [7]. <br> Note 2: Zero OFDM symbols are reserved for PDCCH; and no CRS allocated as per TS 36.211 [4]. <br> Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit). |  |  |  |  |  |  |

Table A.3.8.1-5: Fixed Reference Channel for subcarrier spacing 7.5kHz with FeMBMS MBMS/Unicast-
mixed cell

| Parameter | PMCH |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit |  |  |  | Value |  |  |  |
| Reference channel |  |  |  | $\begin{gathered} \text { R.82-1 } \\ \text { FDD } \end{gathered}$ |  |  |  |  |
| Channel bandwidth | MHz |  |  | 10 |  |  |  |  |
| Allocated resource blocks |  |  |  | 50 |  |  |  |  |
| Allocated subframes per Radio Frame(Note1) |  |  |  | 8 |  |  |  |  |
| Modulation |  |  |  | 16QAM |  |  |  |  |
| Target Coding Rate |  |  |  | 1/2 |  |  |  |  |
| Information Bit Payload (Note 2) |  |  |  |  |  |  |  |  |
| For Sub-Frames 1,2,3,4,6,7,8,9 | Bits |  |  | 12960 |  |  |  |  |
| For Sub-Frames 0,5 | Bits |  |  | N/A |  |  |  |  |
| Number of Code Blocks per Sub-Frame (Note 3) |  |  |  | 3 |  |  |  |  |
| Binary Channel Bits Per Subframe |  |  |  |  |  |  |  |  |
| For Sub-Frames 1,2,3,4,6,7,8,9 | Bits |  |  | 25200 |  |  |  |  |
| For Sub-Frames 0,5 | Bits |  |  | N/A |  |  |  |  |
| MBMS UE Category |  |  |  | $\geq 2$ |  |  |  |  |

Note 1: For FDD mode, up to 8 subframes (\#1/2/3/4/6/7/8/9) are available for MBMS, in line with TS 36.331 [7].
Note 2: Zero OFDM symbols are reserved for PDCCH; and no CRS allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.3.8.1-6: Fixed Reference Channel for subcarrier spacing 1.25kHz with MBMS dedicated cell

| Parameter | PMCH |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit | Value |  |  |  |  |  |
| Reference channel |  |  | R.83-1 <br> FDD | R.83-2 <br> FDD |  |  |  |
| Channel bandwidth | MHz |  | 10 | 10 |  |  |  |
| Allocated resource blocks |  |  | 50 | 50 |  |  |  |
| Allocated subframes per Radio <br> Frame(Note1) |  | 10 | 10 |  |  |  |  |
| Modulation |  |  | 16 QAM | 64 QAM |  |  |  |
| Target Coding Rate |  |  | $1 / 2$ | $2 / 3$ |  |  |  |
| Information Bit Payload (Note 2) |  |  |  |  |  |  |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Bits |  | 11448 | 25456 |  |  |  |
| Number of Code Blocks per Sub-Frame <br> (Note 3) |  |  | 3 | 5 |  |  |  |
| Binary Channel Bits Per Subframe |  |  |  |  |  |  |  |
| For Sub-Frames 0,1,2,3,4,5,6,7,8,9 | Bits |  | 24000 | 36000 |  |  |  |
| MBMS UE Category |  |  | $\geq 2$ | $\geq 2$ |  |  |  |

Note 1: For FDD mode, all 10 subframes are available for MBMS, in line with TS 36.331 [7].
Note 2: Zero OFDM symbols are reserved for PDCCH; and no CRS allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.3.8.1-7: Fixed Reference Channel for subcarrier spacing 7.5kHz with with MBMS dedicated cell

Table A.3.8.1-8: Fixed Reference Channel for subcarrier spacing 15kHz with with MBMS dedicated cell

Note 1: For FDD mode, all 10 subframes are available for MBMS, in line with TS 36.331 [7].
Note 2: 2 OFDM symbols are reserved for PDCCH; and no CRS allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L=0 Bit).
Table A.3.8.1-9: Fixed Reference Channel for subcarrier spacing 0.37 kHz with 5 G terrestrial broadcast MBMS dedicated cell

|  | Unit | Value |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | $\begin{gathered} \text { R.106-1 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.106-2 } \\ \text { FDD } \end{gathered}$ |  |  |  |  |
| Channel bandwidth | MHz | 10 | 10 |  |  |  |  |
| Allocated resource blocks |  | 50 | 50 |  |  |  |  |
| Allocated slots per 40ms(Note1) |  | 13 | 13 |  |  |  |  |
| Modulation |  | 64QAM | 64QAM |  |  |  |  |
| Target Coding Rate |  | 0.48 | 0.52 |  |  |  |  |
| Information Bit Payload (Note 2) |  |  |  |  |  |  |  |
| For each slot | Bits | 63776 | 63776 |  |  |  |  |
| Number of Code Blocks per Sub-Frame (Note 3) |  | 11 | 11 |  |  |  |  |
| Binary Channel Bits Per Subframe |  |  |  |  |  |  |  |
| For each slot | Bits | 133650 | 121500 |  |  |  |  |
| MBMS UE Category |  | $\geq 2$ | $\geq 2$ |  |  |  |  |

Note 1: First subframe of every 40 ms is allocated for non-MBMS transmission.
Note 2: Zero OFDM symbols are reserved for PDCCH; and no CRS allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

## Table A.3.8.1-10: Fixed Reference Channel for subcarrier spacing 2.5 kHz with 5 G terrestrial broadcast MBMS dedicated cell

## A.3.8.2 TDD

Table A.3.8.2-1: Fixed Reference Channel QPSK R=1/3

| Parameter | PMCH |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit | Value |  |  |  |  |  |
| Reference channel |  | R.40 TDD |  |  | R.37 TDD |  |  |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 |  |  | 50 |  |  |
| Uplink-Downlink Configuration(Note 1) |  | 5 |  |  | 5 |  |  |
| Allocated subframes per Radio Frame |  | 5 |  |  | 5 |  |  |
| Modulation |  | QPSK |  |  | QPSK |  |  |

Note 1: For TDD mode, in line with TS 36.331, Uplink-Downlink Configuration 5 is proposed, up to 5 subframes (\#3/4/7/8/9) are available for MBMS.
Note 2: 2 OFDM symbols are reserved for PDCCH; reference signal allocated as per TS 36.211.
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0$ Bit).

Table A.3.8.2-2: Fixed Reference Channel 16QAM R=1/2

| Parameter | PMCH |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Unit | Value |  |  |  |  |  |
| Reference channel |  |  |  |  | R. 38 TDD |  |  |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |

Note 1: 1 symbol allocated to PDCCH for all tests.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit})$.
Note 4: Resource blocks nPRB $=0 . .2$ are allocated for SIB transmissions in sub-frame 5 for all bandwidths.
Note 5: Resource blocks $n_{\text {PRB }}=6 . .14,30 . .49$ are allocated for the user data in all sub-frames.
Note 6: Resource blocks $n_{\text {PRB }}=3 . .49$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .49$ in sub-frames 0,1,2,3,4,6,7,8,9.
Note 7: Resource blocks $n_{\text {PRB }}=4 . .99$ are allocated for the user data in sub-frame 5 , and resource blocks $n_{\text {PRB }}=0 . .99$ in sub-frames 0,1,2,3,4,6,7,8,9.
Note 8: Given per component carrier per codeword.
Note 9: Resource blocks nPRB $=4 . .74$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .74$ in subframes $0,1,2,3,4,6,7,8,9$.
Note 10: Resource blocks $n_{\text {PRB }}=4 . .71$ are allocated for the user data in sub-frames $0,1,2,3,4,5,6,7,8,9$.
Note 11: Resource blocks nPRB $=4 . .74$ are allocated for the user data in sub-frame 5, and resource blocks nPRB $=0 . .74$ in sub-frames $0,1,2,3,4,6,7,8,9$.

## Table A.3.9.1-2: Fixed Reference Channel for sustained data-rate test (FDD 64QAM)

Note 1: 1 symbol allocated to PDCCH for all tests.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ ).
Note 4: Resource blocks nPRB $=0 . .24$ in sub-frames $0,1,2,3,4,6,7,8,9$.
Note 5: Given per component carrier per codeword.
Note 6: $\quad \mathrm{Ng}=1 / 6$.
Note 7: Resource blocks nPRB $=3 . .49$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .49$ in sub-frames 0,1,2,3,4,6,7,8,9.
Note 8: Resource blocks nPRB $=4 . .74$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .74$ in sub-frames 0,1,2,3,4,6,7,8,9.
Note 9: Resource blocks nPRB $=4 . .99$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .99$ in sub-frames 0,1,2,3,4,6,7,8,9.
Note 10: Resource blocks $n_{\text {PRB }}=8 . .35$ are allocated for the user data in all sub-frames.

Note 1: 1 symbol allocated to PDCCH for all tests.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ ).
Note 5: Resource blocks nPRB $=0 . .2$ are allocated for SIB transmissions in sub-frame 5 for all bandwidths.
Note 6: Resource blocks nPRB $=6 . .14,30 . .49$ are allocated for the user data in all subframes.
Note 7: Resource blocks $n_{\text {PRB }}=3 . .49$ are allocated for the user data in sub-frame 5, and resource blocks nPRB $=0 . .49$ in the available downlink sub-frames according to uplink downlink configurations used.
Note 8: Resource blocks nPRB $=4 . .99$ are allocated for the user data in sub-frame 5, and resource blocks nPRB $=0 . .99$ in subframes 0,3,4,6,7,8,9.
Note 9: Resource blocks nPRB $=4 . .71$ are allocated for the user data in all sub-frames
Note10: Given per component carrier per codeword.
Note11: Resource blocks nPRB $=4 . .74$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .74$ in other downlink sub-frames.

Note 1: 1 symbol allocated to PDCCH for all tests.
Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
Note 3: As per Table 4.2-2 in TS 36.211 [4].
Note 4: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).
Note 5: Given per component carrier per codeword.
Note 6: Resource blocks $n_{\text {PRB }}=4 . .99$ are allocated for the user data in sub-frame 5 , and resource blocks nPRB $=0 . .99$ in other downlink sub-frames.
Note 7: Resource blocks nPRB $=4 . .74$ are allocated for the user data in sub-frame 5 , and resource blocks $n_{\text {PRB }}=0 . .74$ in other downlink sub-frames.
Note 8: Resource blocks $n_{\text {PRB }}=3 . .49$ are allocated for the user data in sub-frame 5 , and resource blocks $n_{\text {PRB }}=0 . .49$ in the available downlink sub-frames according to uplink downlink configurations used.
Note 9: The first RBG, i.e. resource blocks nPRB $=0 . .2$ for 10 MHz channel bandwidth, $\mathrm{n}_{\text {PRB }}=0 . .3$ for 15 MHz and 20 MHz channel bandwidths are allocated for SIB transmissions in sub-frame 5.

Note 10: 84 resource blocks nPRB $=4 . .43$ and $n_{\text {PRB }}=56$.. 99 are allocated for the user data in sub-frame 5, and 88 resource blocks $n_{\text {PRB }}=0 . .43$ and $n_{\text {PRB }}=56 . .99$ are allocated for the user data in sub-frame 0 , and 100 resource blocks $n_{\text {PRB }}=$ $0 . .99$ in other downlink sub-frames.
Note 11: 59 resource blocks $n_{\text {PRB }}=4 . .31$ and nPRB $=44 \ldots 74$ are allocated for the user data in sub-frame 5 , and 63 resource blocks nPRB $=0 . .31$ and nPRB $=44 . .74$ are allocated for the user data in sub-frame 0 , and 75 resource blocks $n_{\text {PRB }}=$ $0 . .74$ in other downlink sub-frames.
Note 12: 38 resource blocks $n_{\text {PRB }}=3 . .20$ and $n_{\text {PRB }}=30 . .49$ are allocated for the user data in sub-frame 5 , and 41 resource blocks $n_{\text {PRB }}=0 . .20$ and $n_{\text {PRB }}=30 . .49$ are allocated for the user data in sub-frame 0 , and 50 resource blocks $n_{\text {PRB }}=$ $0 . .49$ in other available downlink sub-frames according to uplink downlink configurations used.

## A.3.15.2 Reference Measurement Channel for UE-Specific Reference Symbols

## A.3.15.2.1 Two antenna ports (CSI-RS)

The reference measurement channels in Table A.3.15.2.1-1 apply for verifying demodulation performance for UEspecific reference symbols with two cell-specific antenna ports and two CSI-RS antenna ports for LAA SCell.

Table A.3.15.2.1-1: Reference Channel with two CRS ports

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Reference channel |  | R. 2 FS3 |
| Channel bandwidth | MHz | 20 |
| Allocated resource blocks (Note 4) |  | 100 |
| Allocated subframes per Radio Frame |  | 10 |
| Modulation |  | 16QAM |
| Target Coding Rate |  | 1/2 |
| Information Bit Payload (Note 4) |  |  |
| For Sub-Frames 1,4,6,9 | Bits | \{22920,7480,12960,19080,10296\} |
| For Sub-Frames 2, 7 |  | \{22920,7480,12960,19080,10296\} |
| For Sub-Frames 3, 8 |  | \{22920,7480,12960,19080,10296\} |
| For Sub-Frame 5 | Bits | \{19848, 6712, 11448, 16992, 9144\} |
| For Sub-Frame 0 | Bits | \{19848, 6712, 11448, 16992, 9144\} |
| Number of Code Blocks |  |  |
| (Notes 3 and 4) |  |  |
| For Sub-Frames 1,4,6,9 |  | \{4,2,3,4,2\} |
| For Sub-Frames 2,7 |  | \{4,2,3,4,2\} |
| For Sub-Frames 3, 8 |  | $\{4,2,3,4,2\}$ |
| For Sub-Frame 5 |  | $\{4,2,2,3,2\}$ |
| For Sub-Frame 0 |  | $\{4,2,2,3,2\}$ |
| Binary Channel Bits (Note 4) |  |  |
| For Sub-Frames 1,4,6,9 | Bits | \{48000,15200,25600,38400,20000\} |
| For Sub-Frames 2, 7 |  | \{47200,15200,25600,38400,20000\} |
| For Sub-Frames 3, 8 |  | \{46400,15200,25600,38400,20000\} |
| For Sub-Frame 5 | Bits | \{42240,13376,22528,33792,17600\} |
| For Sub-Frame 0 (Note 5) (Note 6) | Bits | \{42240,13376,22528,33792,17600\} |
| UE Category |  | $\geq 5$ |
| Note 1: 2 symbols allocated to PDCCH for $20 \mathrm{MHz}, 15 \mathrm{MHz}$ and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and $3 \mathrm{MHz} ; 4$ symbols allocated to PDCCH for 1.4 MHz . |  |  |
| Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]. |  |  |
| If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $\mathrm{L}=0 \mathrm{Bit}$ ). |  |  |
| Note 4: Given per component carrie | code |  |
| For TM9, 100 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 88 resource blocks (RB0-RB43,RB56-RB99) are allocated in subframe 0 and subframe 5 |  |  |
| For $\{a 1, a 2, a 3, a 4, a 5\}, a 1, a 2, a 3, a 4$ and $a 5$ stand for the setup when the number of OFDM sybmols is $14,6,9,12,7$, respectively |  |  |

## A.3.17 Reference measurement channels for SPDCCH performance requirements

## A.3.17.1 FDD

Table A.3.17.1-1: Reference Channel FDD

| Parameter | Unit |  |  |
| :--- | :---: | :---: | :---: |
| Reference channel |  | R.sTTI.10 FDD | R.sTTI.11 FDD |
| Number of transmitter antennas |  | 4 | 2 |
| Channel bandwidth | MHz | 10 | 10 |
| Aggregation level | SCCE | 2 | 8 |
| DCI Format |  | $7-1 \mathrm{C}$ | $7-1 \mathrm{~F}$ |
| Cell ID |  | 0 | 0 |
| Payload (without CRC) | Bits | 32 | 28 |

## A.3.17.2 TDD

Table A.3.17.2-1: Reference Channel TDD

| Parameter | Unit |  |  |
| :--- | :---: | :---: | :---: |
| Reference channel |  | R.sTTI.10 TDD | R.sTTI.11 TDD |
| Number of transmitter antennas |  | 4 | 2 |
| Channel bandwidth | MHz | 10 | 10 |
| Aggregation level | SCCE | 2 | 8 |
| DCI Format |  | $7-1 \mathrm{C}$ | $7-1 \mathrm{~F}$ |
| Cell ID |  | 0 | 0 |
| Payload (without CRC) | Bits | 34 | 30 |

## A. 4 CSI reference measurement channels

This section defines the DL signal applicable to the reporting of channel status information (Clause 9.2, 9.3 and 9.5).
In Table A.4-1 are specified the reference channels. Table A.4-13 specifies the mapping of CQI index to modulation coding scheme, which complies with the CQI definition specified in Section 7.2.3 of [6].

Table A.4-0: Void

| Note 1: 3 symbols allocated to PDCCH. <br> Note 2: For FDD only subframes 1, 2, 3, 4, 6, 7, 8 and 9 are allocated to avoid PBCH and synchronization signal overhead. |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
| Note 3: <br> Note 4: | For TDD when UL-DL configuration 1 is used only subframes 4 and 9 are allocated to avoide PBCH and synchronizaiton signal overhead. |  |  |  |  |  |  |  |  |
| Note 5: | For TDD when UL-DL configuration 2 is used only subframes $3,4,8$, and 9 are allocated to avoid PBCH and synchronization signal overhead. |  |  |  |  |  |  |  |  |
| Note 6: <br> Note 7: | Only subframes 2, 3, 4, 7, 8 and 9 are allocated to avoid PBCH and synchronization signal overhead. |  |  |  |  |  |  |  |  |
| Note 8: <br> Note 9: | The number of HARQ processes is 10 for TDD UL/DL configuration 2 and 7 for TDD UL/DL configuration 1. |  |  |  |  |  |  |  |  |

Note 10: The downlink subframes are scheduled at the 1st, 2nd, 8th, 9th, 16th, 17th, 18th, 24th, 26th, 32nd, 33rd, 34 th subframes every 40 ms . Information bit payload is available if downlink subframe is scheduled.(starting from 0th subframe)
Note 11: 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in subframe 0 and 5 in RC. 19 TDD.
Note 12: Allocate PDSCH on 3th, 4th and 5th PRBs within a narrowband. Allocate MPDCCH on the 0th and 1st PRBs within a narrowband.
Note 13: The PDSCH subframes are scheduled at the 0th and 1st subframes every 10 ms . Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). MPDCCH subframes are scheduled at the 8th and 9th subframes every 10 ms .
Note 14: The downlink subframes are scheduled at the 0th to 4th subframes every 20 ms . Information bit payload is scheduled at the 4th subframe (starting from 0th subframe). MPDCCH and Information bit payload are not scheduled in the radio frames where systemInformation1-BR is scheduled and $N_{\text {PDSCH }}^{\text {SIB1-BR }}=4$ with the set of frames and subframes for SIB1-BR defined in TS 36.211 [16] Table 6.4.1-2.

Note 15: Information bit payload is scheduled at the 8th subframe every 20 ms (starting from 0th subframe).
Note 16: 2 symbols allocated for PDCCH.
Note 17: No PDSCH is scheduled in subslot index 0.
Note 18: Subslot-PDSCH is scheduled in subslots 2, 3, and 4.
Note 19: Subslot-PDSCH is scheduled in subslots 1 and 5.
Note 20: Allocate PDSCH on 3th, 4th and 5th PRBs within a narrowband. Allocate MPDCCH on the 0th, 1st, 2nd and 3rd PRBs within a narrowband.

## A. 5 OFDMA Channel Noise Generator (OCNG)

## A.5.1 OCNG Patterns for FDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test) and/or allocations used for MBSFN. The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG_RA and OCNG_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols with and without reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$
\gamma_{i}=P D S C H_{i-} R A / O C N G_{-} R A=P D S C H_{i_{-}} R B / O C N G_{-} R B,
$$

where $\gamma_{i}$ denotes the relative power level of the $i$ :th virtual UE. The parameter settings of OCNG_RA, OCNG_RB, and the set of relative power levels $\gamma$ are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a constant transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given respectively by PDCCH_RA/RB and PHICH_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

For the performance requirements of UE with the CA capability, the OCNG patterns apply for each CC.

## A.5.1.1 OCNG FDD pattern 1: One sided dynamic OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided).

Table A.5.1.1-1: OP. 1 FDD: One sided dynamic OCNG FDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |
| Allocation |  |  |  |
| First unallocated PRB <br> Last unallocated PRB | First unallocated PRB <br> Last unallocated PRB | First unallocated PRB <br> Last unallocated PRB |  |
| 0 | 0 | 0 | Note 1 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.5.1.2 OCNG FDD pattern 2: Two sided dynamic OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in two parts by the allocated area two sided), starts with PRB 0 and ends with PRB $N_{R B}-1$.

Table A.5.1.2-1: OP. 2 FDD: Two sided dynamic OCNG FDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |
| Allocation |  |  |  |
| $\begin{gathered} \hline 0-\text { (First allocated PRB-1) } \\ \text { and } \\ \text { (Last allocated PRB }+1)-( \\ \left.N_{R B}-1\right) \end{gathered}$ | $\begin{gathered} \hline 0-\text { (First allocated PRB-1) } \\ \text { and } \\ \text { (Last allocated PRB }+1)-( \\ \left.N_{R B}-1\right) \end{gathered}$ | $\begin{gathered} \hline 0-\text { (First allocated PRB-1) } \\ \text { and } \\ \text { (Last allocated PRB }+1)-( \\ \left.N_{R B}-1\right) \end{gathered}$ |  |
| 0 | 0 | 0 | Note 1 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.5.1.3 OCNG FDD pattern 3: 49 RB OCNG allocation with MBSFN in 10 MHz

Table A.5.1.3-1: OP. 3 FDD: OCNG FDD Pattern 3

| Allocatio$n_{P R B}$ | Relative power level $\gamma_{\text {PRB }}$ [dB] |  |  |  | $\begin{aligned} & \text { PDSCH } \\ & \text { Data } \end{aligned}$ | PMCH <br> Data |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Subframe |  |  |  |  |  |
|  | 0 | 5 | 4,9 | 1-3, 6-8 |  |  |
| 1-49 | 0 | 0 <br> (Allocation: all empty PRB-s) | 0 | N/A | Note 1 | N/A |
| 0-49 | N/A | N/A | N/A | 0 | N/A | Note 2 |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH. |  |  |  |  |  |  |
| Note 2: | Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{P R B}$ is used to scale the power of PMCH. |  |  |  |  |  |
| Note 3: If | If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |  |  |  |  |  |

## A.5.1.4A OCNG FDD pattern 4A: One sided dynamic OCNG FDD pattern for enhanced MBMS transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided) and MBMS performance is tested.

Table A.5.1.4A-1: OP.4A FDD: One sided dynamic OCNG FDD Pattern for MBMS transmission

| Allocation$n_{P R B}$ | Relative power level $\gamma_{P R B}$ [dB] |  |  | $\begin{aligned} & \text { PDSCH } \\ & \text { Data } \end{aligned}$ | PMCH Data |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Subframe |  |  |  |  |
|  | 0 | 5 | 1-4, 6-9 |  |  |
| First unallocated PRB - <br> Last unallocated PRB | 0 | 0 <br> (Allocation: all empty PRB-s) | N/A | Note 1 | N/A |
| First unallocated PRB - <br> Last unallocated PRB | N/A | N/A | N/A | N/A | Note 2 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall not contain any cell-specific Reference Signals. The parameter $\gamma_{P R B}$ is used to scale the power of PMCH.
Note 3: If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

N/A: Not Applicable

## A.5.1.5 OCNG FDD pattern 5: One sided dynamic 16QAM modulated OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of DL sub-frames, when the unallocated area is continuous in the frequency domain (one sided).

Table A.5.1.5-1: OP. 5 FDD: One sided dynamic 16QAM modulated OCNG FDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] | PDSCH |
| :---: | :---: |
| Subframe |  |

| 0 | 5 | $1-4,6-9$ |  |
| :---: | :---: | :---: | :---: |
| Allocation |  |  |  |
|  |  |  |  |
| First unallocated PRB |  |  |  |
| - |  |  |  |
| Last unallocated PRB | First unallocated PRB |  |  |
| - | First unallocated PRB |  |  |
| 0 | 0 | - |  |
| Last unallocated PRB |  |  |  |
| 0 | 0 | 0 | Note 1 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 3 (Large Delay CDD). The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.5.1.6 OCNG FDD pattern 6: dynamic OCNG FDD pattern when user data is in 2 non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in two parts by the first allocated block). The second allocated block ends with PRB $N_{R B}-1$.

Table A.5.1.6-1: OP. 6 FDD: OCNG FDD Pattern when user data is in 2 non-contiguous blocks

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |
| Allocation |  |  |  |
| 0 - (First allocated PRB of first block -1) and | 0 - (First allocated PRB of first block -1) and | 0 - (First allocated PRB of first block -1) and |  |
| (Last allocated PRB of first | (Last allocated PRB of first | (Last allocated PRB of first |  |
| block +1 ) - (First allocated PRB of second block -1) | block +1 ) - (First allocated PRB of second block -1) | block +1 ) - (First allocated PRB of second block -1) |  |
| 0 | 0 | 0 | Note 1 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.5.1.7 OCNG FDD pattern 7: dynamic OCNG FDD pattern when user data is in multiple non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data, EPDCCH or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in multiple parts by the $M$ allocated blocks for data transmission). The $m$-th allocated block starts with RPB $N_{S t a r t, m}$ and ends with PRB $N_{E n d, m}-1$, where $m=1, \ldots, M$. The system bandwidth starts with RPB 0 and ends with $N_{R B}-1$.

Table A.5.1.7-1: OP. 7 FDD: OCNG FDD Pattern when user data is in multiple non-contiguous blocks

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |
| Allocation |  |  |  |
| $0-\left(\right.$ PRB $\left.N_{\text {Start, } 1}-1\right)$ | 0 - (PRB $\left.N_{\text {Start,1 }}-1\right)$ | $0-\left(\mathrm{PRB} N_{\text {Start,1}}-1\right)$ |  |
| $\left(\text { PRB } N_{\text {End. }(m-1)}\right)-(\mathrm{PRB}$ | $\left(\text { PRB } N_{\text {End. }(m-1)}\right)-(\mathrm{PRB}$ | $\left(\mathrm{PRB} N_{\text {End.(m-1) }}\right)-(\mathrm{PRB}$ |  |
| $\left.N_{\text {Start }, m}-1\right)$ | $\left.N_{\text {Start }, m}-1\right)$ | $\left.N_{\text {Start }, m}-1\right)$ |  |
| $\left(\mathrm{PRB} N_{E n d, M}\right)-(\mathrm{PRB}$ | $\left(\mathrm{PRB} N_{E n d, M}\right)-(\mathrm{PRB}$ | $\left(\mathrm{PRB} N_{E n d, M}\right)-(\mathrm{PRB}$ |  |
| $\left.N_{R B}-1\right)$ | $\left.N_{R B}-1\right)$ | $\left.N_{R B}-1\right)$ |  |
| 0 | 0 | 0 |  |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.5.1.8 OCNG FDD pattern 8: Dynamic OCNG FDD pattern for TM10 transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain where there are $M$ unallocated PRB blocks labled from 1 -st block to $M$-th block ( $M>1$ ) and the $m$-th block starts with PRB $N_{\text {Start }, m}$ and end with PRB $N_{\text {End }, m}$, or when the unallocated area is continuous in frequency domain where $M=1$ (one sided). The system bandwidth starts with RPB 0 and ends with $N_{R B}-1 . N_{E n d, M}$ should be equal to or less than $N_{R B}-1$.

Table A.5.1.8-1: OP. 8 FDD: Dynamic OCNG FDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |

| 1-st unallocated PRB (PRB $N_{\text {Start }, 1} \sim$ PRB $\left.N_{\text {End,1 }}\right)$ <br> m-th unallocated PRB (PRB $\left.N_{\text {Start }, m} \sim \text { PRB } N_{E n d, m}\right)$ <br> $M$-th unallocated PRB (PRB $\left.N_{\text {Start }, M} \sim \operatorname{PRB} N_{E n d, M}\right)$ | 1-st unallocated PRB (PRB $N_{\text {Start,1 }} \sim$ PRB $\left.N_{\text {End,1 }}\right)$ <br> $m$-th unallocated PRB (PRB $\left.N_{S t a r t, m} \sim \text { PRB } N_{E n d, m}\right)$ <br> $M$-th unallocated PRB (PRB <br> $N_{\text {Start }, M} \sim$ PRB $\left.N_{E n d, M}\right)$ | 1-st unallocated PRB (PRB $N_{\text {Start , } 1} \sim$ PRB $\left.N_{\text {End,1 }}\right)$ <br> m-th unallocated PRB (PRB $\left.N_{\text {Start }, m} \sim \text { PRB } N_{\text {End }, m}\right)$ <br> $M$-th unallocated PRB (PRB $\left.N_{S t a r t, M} \sim \operatorname{PRB} N_{E n d, M}\right)$ |  |
| 0 | 0 | 0 | Note 1,2,3 |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH. |  |  |  |
| Note 2: The OCNG shall be | nsmitted to the virtual users b mit power is equal between all specified in section 7.1 in 3G | he transmit antennas accordin ransmit antennas used in the S 36.213. | transmission The antenna |

Note 3: $\quad$ The detailed test set-up for TM10 transmission i.e PMI configuration is specified to each test case.

## A.5.2 OCNG Patterns for TDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG_RA and OCNG_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols with and without reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$
\gamma_{i}=P D S C H_{i} \quad R A / O C N G_{-} R A=P D S C H_{i_{-}} R B / O C N G_{-} R B,
$$

where $\gamma_{i}$ denotes the relative power level of the $i:$ th virtual UE. The parameter settings of OCNG_RA, OCNG_RB, and the set of relative power levels $\gamma$ are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given respectively by PDCCH_RA/RB and PHICH_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

## A.5.2.1 OCNG TDD pattern 1: One sided dynamic OCNG TDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the subframes available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is continuous in frequency domain (one sided).

Table A.5.2.1-1: OP. 1 TDD: One sided dynamic OCNG TDD Pattern

## A.5.2.2 OCNG TDD pattern 2: Two sided dynamic OCNG TDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the subframes available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is discontinuous in frequency domain (divided in two parts by the allocated area - two sided), starts with PRB 0 and ends with PRB $N_{R B}-1$.

Table A.5.2.2-1: OP. 2 TDD: Two sided dynamic OCNG TDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  |  | $\begin{gathered} \text { PDSCH } \\ \text { Data } \end{gathered}$ |

## A.5.2.7 OCNG TDD pattern 7: dynamic OCNG TDD pattern when user data is in multiple non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data, EPDCCH or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in multiple parts by the $M$ allocated blocks for data transmission). The $m$-th allocated block starts with RPB $N_{S t a r t, m}$ and ends with PRB $N_{E n d, m}-1$, where $m=1, \ldots, M$. The system bandwidth starts with RPB 0 and ends with $N_{R B}-1$.

Table A.5.2.7-1: OP. 7 TDD: OCNG TDD Pattern when user data is in multiple non-contiguous blocks

| Relative power level $\gamma_{P R B}$ [dB] |  |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: | :---: |

The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH. |  |  |  |  |
| Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211 |  |  |  |  |
| Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |  |  |  |  |

## A.5.2.8 OCNG TDD pattern 8: Dynamic OCNG TDD pattern for TM10 transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain where there are $M$ unallocated PRB blocks labled from 1 -st block to $M$-th block (M>1) and the $m$-th block starts with PRB $N_{\text {Start }, m}$ and end with PRB $N_{\text {End }, m}$, or when the unallocated area is continuous in frequency domain where $M=1$ (one sided). The system bandwidth starts with RPB 0 and ends with $N_{R B}-1 . N_{E n d, M}$ should be equal to or less than $N_{R B}-1$.

Table A.5.2.8-1: OP. 8 TDD: Dynamic OCNG TDD Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  | PDSCH Data |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4,6-9 |  |
| Allocation |  |  |  |

\text { per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random } \\
\text { data, which is 16QAM modulated. The parameter } \gamma_{P R B} \text { is used to scale the power of PDSCH. }
\end{array}
$$

Note 2: The OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode10. The the transmit power is equal between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.
Note 3: The detailed test set-up for TM10 transmission i.e PMI configuration is specified to each test case.

## A.5.3 OCNG Patterns for Narrowband IoT

The following OCNG patterns are used for modelling allocations to virtual narrowband IoT UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG_RA and OCNG_RB which together with a relative power level $(\gamma)$ specifies the NPDSCH EPRE-to-NRS EPRE ratios in OFDM symbols with and without Narrowband reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$
\gamma_{i}=N P D S C H_{i_{-}} R A / O C N G_{-} R A=N P D S C H_{i_{-}} R B / O C N G_{-} R B,
$$

where $\gamma_{i}$ denotes the relative power level of the $i$ :th virtual UE. The parameter settings of OCNG_RA, OCNG_RB, and the set of relative power levels $\gamma$ are chosen such that when also taking allocations to the UE under test into account, as given by a NPDSCH or NPDCCH reference channel, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

## A.5.3.1 Narrowband IoT OCNG pattern 1

Table A.5.3.1-1: NB.OP. 1 FDD: OCNG FDD Pattern 1

| Bandwidth |  | Relative power level $\gamma$ | NPDCCH and corresponding NPDSCH Data |
| :---: | :---: | :---: | :---: |
|  |  | Subframe |  |
|  |  | Unused subframes |  |
| 200 KHz |  | 0 | Note 2 |
| Note 1: These subframes are assigned to an arbitrary number of virtual UEs with one NPDSCH per virtual UE with corresponding NPDCCH; the data transmitted over the OCNG NPDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma$ is used to scale the power of NPDSCH and NPDCCH. |  |  |  |
| Note 2: Subframes and/or REs available for narrowband IOT DL transmission depend on the in-band, guard band or standalone mode indicated in MIB, and scheduling delay between NPDCCH, NPDSCH, NPUSCH format 2 and NPDCCH specified in test cases. <br> Note 3: If two or more transmit antennas with NRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with NRS according to transmit diversity scheme. The parameter $\gamma$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with NRS used in the test. |  |  |  |

## A.5.4 OCNG Patterns for frame structure type 3

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG_RA and OCNG_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols with and without reference
symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$
\gamma_{i}=P D S C H_{i_{-}} R A / O C N G_{-} R A=P D S C H_{i_{-}} R B / O C N G_{-} R B,
$$

where $\gamma_{i}$ denotes the relative power level of the $i: t h$ virtual UE. The parameter settings of OCNG_RA, OCNG_RB, and the set of relative power levels $\gamma$ are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a constant transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PDCCH reference channel which specifies the control region. For any aggregationthe PDCCH are padded with resource element groups with a power level given respectively by PDCCH_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

For the performance requirements of UE with the CA capability, the OCNG patterns apply for eachLAA Scell.

## A.5.4.1 OCNG FS3 pattern 1: One sided dynamic OCNG frame structure type 3 pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided).

Table A.5.4.1-1: OP. 1 FS3: One sided dynamic OCNG frame structure type 3 Pattern

| Relative power level $\gamma_{P R B}$ [dB] |  |  | $\underset{\text { Data }}{\text { PDSCH }}$ |
| :---: | :---: | :---: | :---: |
| Subframe |  |  |  |
| 0 | 5 | 1-4, 6-9 |  |
| Allocation |  |  |  |
| First unallocated PRB Last unallocated PRB | First unallocated PRB Last unallocated PRB | First unallocated PRB Last unallocated PRB |  |
| 0 | 0 | 0 | Note 1 |

Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{P R B}$ is used to scale the power of PDSCH.
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{P R B}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.
Note 3: Subframes available for DL transmission and Occupied OFDM symbols in each subframe depend on the downlink burst transmission pattern and its corresponding configuration

## A.5.4.2 OCNG FS3 pattern 2: Two sided dynamic OCNG frame structure 3 pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in two parts by the allocated area two sided), starts with PRB 0 and ends with PRB $N_{R B}-1$.

Table A.5.4.2-1: OP. 2 FS3: Two sided dynamic OCNG frame structure type 3 Pattern

## A. 6 Sidelink reference measurement channels

## A.6.1 General

The algorithm for determining the payload size $A$ is as follows; given a desired coding rate $R$ and radio block allocation $N_{\text {RB }}$

1. Calculate the number of channel bits $N_{\text {ch }}$ that can be transmitted during the first transmission of a given subframe.
2. Find $A$ such that the resulting coding rate is as close to $R$ as possible, that is,

$$
\min \left|R-\left(A+24^{*}\left(N_{C B}+1\right)\right) / N_{c h}\right|, \text { where } N_{C B}=\left\{\begin{array}{l}
0, \text { if } C=1 \\
C, \text { if } C>1
\end{array},\right.
$$

subject to
a) A is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of $N_{\mathrm{RB}}$ resource blocks.
b) $C$ is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
3. If there is more than one $A$ that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93 .

## A.6.1.1 Overview of ProSe reference measurement channels

In Table A.6.1.1-1 are listed the ProSe reference measurement channels specified in annexes A.6.2 to A. 6.6 of this release of TS 36.101. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.6.2 to A.6.6 as appropriate.

Table A.6.1.1-1: Overview of ProSe reference measurement channels

| Table | Name | BW | Mod | RB | UE Categ | Notes |

## A.6.2 Reference measurement channel for receiver characteristics

For ProSe Direct Discovery, Table A.6.2-1 is applicable for measurements on the Receiver Characteristics (clause 7) including the requirements of subclause 7.4D (Maximum input level).

For ProSe Direct Communication, Table A.6.2-2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4D (Maximum input level). Tables A.6.2-3, A.6.2-4, are applicable for subclause 7.4D (Maximum input level).

Table A.6.2-1: Fixed Reference measurement channel for ProSe Direct Discovery receiver requirements and maximum input level

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  |  |  | 2 | 2 | 2 | 2 |
| Subcarriers per resource block |  |  |  | 12 | 12 | 12 | 12 |
| Allocated subframes per Discovery period |  |  |  | 1 | 1 | 1 | 1 |
| DFT-OFDM Symbols per subframe (see <br> note) |  |  |  | 11 | 11 | 11 | 11 |

| Binary Channel Bits (NOTE 1) |  |  | 528 | 528 | 528 | 528 |  |
| Max. Throughput averaged over 1 Discovery <br> period of 320ms | kbps |  |  | 0.725 | 0.725 | 0.725 | 0.725 |
| UE Category |  |  |  | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ |

NOTE1: PSDCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.

## A.6.4 Reference measurement channels for PSCCH performance requirements

Table A.6.4-1: Fixed reference measurement channel for PSCCH performance requirement

|  | Parameter | Unit | Value |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  |  | CC. 1 FDD | CC. 2 FDD | CC. 3 FDD | CC. 4 FDD | CC. 5 FDD | CC. 6 FDD |
| Channel bandwidth |  | MHz | 5 | 10 | 5 | 10 | 5 | 10 |
| Allocated resource blocks |  |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Subcarriers per resource block |  |  | 12 | 12 | 12 | 12 | 12 | 12 |
| DFT-OFDM Symbols per subframe (see Note 1) |  |  | 11 | 11 | 11 | 11 | 11 | 11 |
| Modulation |  |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Transport Block Size |  | Bits | 41 | 43 | 41 | 43 | 41 | 43 |
| Information bits | Frequency hopping flag |  | 0 | 0 | 1 | 1 | 1 | 1 |
|  | RB assignment |  | Set as per PSSCH RB allocation specific in the test |  |  |  |  |  |
|  | Hopping bits |  | N/A | N/A | Type 2 <br> Hopping | $(1,1)$ Type 2 Hopping <br> Hopping | Type 1 <br> Hopping | $(1,0)$ Type 1 Hopping <br> Hopping |
|  | Time resource pattern (lTRP) |  | 8 (unless specified otherwise in the test) (Note 3) |  |  |  |  |  |
|  | Modulation and coding scheme |  | Set as the PSSCH MCS specified in the test |  |  |  |  |  |
|  | Timing advance indication |  | 0 (unless specified otherwise in the test) |  |  |  |  |  |
|  | Group destination ID |  | As set by higher layers |  |  |  |  |  |
| Transport block CRC |  | Bits | 16 | 16 | 16 | 16 | 16 | 16 |
| Maximum number of HARQ transmissions |  |  | 2 | 2 | 2 | 2 | 2 | 2 |
| Binary Channel Bits (see Note 1,2) |  | Bits | 264 | 264 | 264 | 264 | 264 | 264 |
| Max. Throughput averaged over one scperiod (bits/sc-period) |  |  | 41 | 43 | 41 | 43 | 41 | 43 |
| NOTE 1: PSCCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211. <br> NOTE 2: Binary channel bits per HARQ transmission. <br> NOTE 3: For NTRP $=8$ (FDD) and trpt-Subset $=010$, ITRP $=8$ corresponds to a time repetition pattern of ( $1,1,0,0,0,0,0,0$ ) as per TS 36.213. |  |  |  |  |  |  |  |  |

## A.6.5 Reference measurement channels for PSSCH performance requirements

Table A.6.5-1: Fixed reference measurement channel for PSSCH performance requirement

| Parameter | Unit | Value |  |  |  |  |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | CD. 1 FDD | CD. 2 FDD | CD.3 FDD | CD. 4 FDD | CD. 5 FDD |
| Channel bandwidth | MHz | $5 / 10$ | $5 / 10$ | 5 | 10 | $5 / 10$ |
| Allocated resource blocks |  | 10 | 10 | 25 | 50 | 2 |
| Subcarriers per resource block |  | 12 | 12 | 12 | 12 | 12 |
| DFT-OFDM Symbols per subframe <br> (see Note 1) |  | 11 | 11 | 11 | 11 | 11 |
| Modulation |  | QPSK | 16 QAM | 16 QAM | 16 QAM | QPSK |
| Transport Block Size | Bits | 872 | 2536 | 6456 | 12960 | 328 |
| Transport block CRC |  | 4 | 24 | 24 | 24 | 24 |
| Maximum number of HARQ <br> transmissions | 4 | 4 | 4 | 4 |  |  |
| Binary Channel Bits (see Note 1,2) | Bits | 2640 | 5280 | 13200 | 26400 | 528 |
| Max. Throughput averaged over <br> one sc-period (bits/sc-period) |  | 872 | 2536 | 6456 | 12960 | 328 |

NOTE 1: PSSCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.
NOTE 2: Binary channel bits per HARQ transmission.
NOTE 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.6.5-2: Fixed reference measurement channel for PSSCH for maximum Sidelink processes test

| Parameter | Unit | Value |  |
| :--- | :--- | :---: | :---: |
| Reference channel |  | CD.6 FDD | CD.7 FDD |
| Channel bandwidth | MHz | 5 | 10 |
| Allocated resource blocks |  | 25 | 50 |
| Subcarriers per resource block |  | 12 | 12 |
| DFT-OFDM Symbols per subframe <br> (see Note 1) |  | 11 | 11 |
| Modulation |  | 16QAM | 16QAM |
| Transport Block Size | Bits | 15840 | 25456 |
| Transport block CRC |  | 4 | 24 |
| Maximum number of HARQ <br> transmissions | Bits | 13200 | 26400 |
| Binary Channel Bits (see Note 1,2) | 15840 | 25456 |  |
| Max. Throughput averaged over <br> one sc-period (bits/sc-period) |  | 4 |  |
| NOTE 1: PSSCH transmissions are rate-matched for 12 DFT-OFDM |  |  |  |
| symbols per subframe, and the last symbol shall be punctured <br> as per TS 36.211. |  |  |  |
| NOTE 2: <br> NOTE 3: <br> NOTE channel bits per HARQ transmission. <br> If more than one Code Block is present, an additional CRC <br> sequence of L 24 Bits is attached to each Code Block <br> (otherwise L = 0 Bit). |  |  |  |

## A.6.6 Reference measurement channels for PSBCH performance requirements

Table A.6.6-1: Fixed reference measurement channel for PSBCH performance requirement

| Parameter | Unit | Value |
| :--- | :--- | :---: |
| Reference channel |  | CP.1 FDD |
| Channel bandwidth | MHz | $5 / 10$ |
| Allocated resource blocks |  | 6 |
| Subcarriers per resource block |  | 12 |
| DFT-OFDM Symbols per subframe <br> (see Note 1) |  | 7 |
| Modulation | Bits | QPSK |
| Transport Block Size |  | 40 |
| Transport block CRC | Bits | 16 |
| Maximum number of HARQ transmissions | kbps | 1 |
| Binary Channel Bits (see Note 1,2) | 1008 |  |
| Max. Throughput averaged over 40ms | 1 |  |
| NOTE 1: PSBCH transmissions are rate-matched for 8 DFT-OFDM symbols per |  |  |
| subframe, and the last symbol shall be punctured as per TS 36.211. |  |  |
| NOTE 2: Binary channel bits per HARQ transmission. |  |  |

## A. 7 Sidelink reference resource pool configurations

## A.7.1 Reference resource pool configurations for ProSe Direct Discovery demodulation tests

## A. 8 V2X reference measurement channels

## A.8.1 General

The algorithm for determining the payload size $A$ is as follows; given a desired coding rate $R$ and radio block allocation $N_{\text {RB }}$

1. Calculate the number of channel bits $N_{\text {ch }}$ that can be transmitted during the first transmission of a given subframe.
2. Find $A$ such that the resulting coding rate is as close to $R$ as possible, that is,

$$
\min \left|R-\left(A+24 *\left(N_{C B}+1\right)\right) / N_{c h}\right|, \text { where } N_{C B}=\left\{\begin{array}{l}
0, \text { if } C=1 \\
C, \text { if } C>1
\end{array},\right.
$$

subject to
a) A is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of $N_{\mathrm{RB}}$ resource blocks.
b) $C$ is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
3. If there is more than one $A$ that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93 .

## A.8.1.1 Overview of V2X reference measurement channels

In Table A.8.1.1-1 are listed the Sidelink reference measurement channels specified in annexes A.8.2 to A.8.6 of this release of TS 36.101. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.8.2 to A.8.6 as appropriate.

Table A.8.1.1-1: Overview of Sidelink reference measurement channels

| Table | Name | BW | Mod | TCR | RB | UE Categ | Notes |

## A.8.2 Reference measurement channel for receiver characteristics

For V2X side link transmission over PC5, Table A.8.2-1 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of Maximum input level (subclause 7.4G). Table A.8.2-2 and Table A.8.2-3, are applicable for Maximum input level (subclause 7.4G).

Table A.8.2-1 Fixed Reference measurement channel for V2X receiver requirements

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  |  |  |  | 48 |  | 96 |
| Subcarriers per resource block |  |  |  |  | 12 |  | 12 |
| Packets per period |  |  |  |  | 1 |  |  |
| Modulation |  |  |  |  | QPSK |  | QPSK |
| Target Coding Rate |  |  |  | $1 / 3$ |  | $1 / 3$ |  |
| Transport Block Size | Bits |  |  |  | 3496 |  | 6968 |
| Transport block CRC |  |  |  |  | 24 |  | 24 |
| Number of Code Blocks per Sub-Frame |  |  |  |  | 1 |  | 2 |
| Maximum number of HARQ transmissions |  |  |  | 1 |  | 1 |  |
| Binary Channel Bits per subframe | Bits |  |  |  | 11520 |  | 23040 |
| Max. Throughput averaged over 1 period of <br> 100ms | kbps |  |  |  | 34.96 |  | 69.68 |
| UE Category |  |  |  |  | $\geq 1$ |  | $\geq 1$ |

Note 1: $\quad 2 R B s$ allocated to SA transmission and 4 symbols allocated to RS.
Note 2: Throughput (in kbps) will depend on SA period configuration.
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.8.2-2 Fixed Reference measurement channel for V2X maximum input level requirements for 16QAM

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  |  |  |  | 48 |  | 96 |
| Subcarriers per resource block |  |  |  |  | 12 |  | 12 |
| Packets per period |  |  |  |  | 1 |  | 1 |
| Modulation |  |  |  |  | 16 QAM | 16 QAM |  |
| Target Coding Rate |  |  |  |  | $2 / 3$ | $2 / 3$ |  |
| Transport Block Size | Bits |  |  |  | 15840 | 29296 |  |
| Transport block CRC |  |  |  |  | 24 |  | 24 |
| Number of Code Blocks per Sub-Frame |  |  |  |  | 3 |  | 5 |
| Maximum number of HARQ transmissions |  |  |  |  | 23040 |  | 46080 |
| Binary Channel Bits per subframe | Bits |  |  |  | 158.4 | 292.96 |  |
| Max. Throughput averaged over 1 period of <br> 100ms | kbps |  |  |  |  |  |  |

Note 1: $\quad$ 2RBs allocated to SA transmission and 4 symbols allocated to RS.
Note 2: Throughput (in kbps) will depend on SA period configuration.
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

Table A.8.2-3 (Void)

Table A.8.2-4 Fixed Reference measurement channel for V2X maximum input level for 64QAM

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  |  |  |  | 48 |  | 96 |
| Subcarriers per resource block |  |  |  |  | 12 |  | 12 |
| Packets per period |  |  |  |  | 1 | 1 |  |
| Modulation |  |  |  |  | 64 QAM | 64 QAM |  |
| Target Coding Rate |  |  |  | $3 / 4$ |  | $3 / 4$ |  |
| Transport Block Size | Bits |  |  |  | 22920 | 46888 |  |
| Transport block CRC |  |  |  |  | 24 |  | 24 |
| Number of Code Blocks per Sub-Frame |  |  |  |  | 1 |  | 8 |
| Maximum number of HARQ transmissions |  |  |  |  | 31104 |  | 62208 |
| Binary Channel Bits per subframe | Bits |  |  | 229.2 |  | 468.88 |  |
| Max. Throughput averaged over 1 period of <br> 100ms | kbps |  |  |  |  |  |  |

Note 1: $\quad$ 2RBs allocated to SA transmission, 4 symbols allocated to RS and the last symbol within a subframe is not considered in the mapping process
Note 2: Throughput (in kbps) will depend on SA period configuration.
Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit).

## A.8.3 Reference measurement channel for transmitter characteristics

For V2X side link transmission over PC5, Table A.8.3-1 and Table A.8.3-2 are applicable for measurements on the Transmitter Characteristics (clause 6).

Table A.8.3-1 Fixed Reference measurement channel for V2X Transmitter requirements for QPSK

| Parame ter | Ch BW | Allocat ed RBs | DFTOFDM Symbol s per SubFrame | Mod'n | Target Coding rate | $\begin{aligned} & \text { Payload } \\ & \text { size } \end{aligned}$ | Transp ort block CRC | Number of code blocks per SubFrame (Note 1) | Total number of bits per SubFrame | Total symbols per SubFrame |

## A.8.4 Reference measurement for PSCCH performance requirements

Table A.8.4-1: Fixed reference measurement channel for PSCCH performance requirement

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | CC. 8 |
| Allocated resource blocks |  | 2 |
| DFT-OFDM Symbols per subframe (see Note 1) |  | 9 |
| Modulation |  | QPSK |
| Payload (without CRC) | Bits | 32 |
| CRC | Bits | 16 |
| SCI Format |  | 1 |
| Number of PSCCH transmissions |  | 1 |
| Binary Channel Bits (see Note 2) | Bits | 432 |

Note 1: PSCCH transmissions are rate-matched for 10 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.
Note 2: Binary Channel Bits are calculated under assumption of 9 symbols.
Note 3: Un-used or redundant bits/code-points in SCI format 1 are randomized.

## A.8.5 Reference measurement for PSSCH performance requirements

Table A.8.5-1: Fixed reference measurement channel for PSSCH performance requirement

| Parameter | Unit | Value |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | CD. 8 | CD. 9 | CD. 10 | CD. 11 | CD. 12 |
| Channel bandwidth | MHz | 20 | 10 | 20 | 20 | 20 |
| Allocated resource blocks |  | 8 | 3 | 3 | 96 | 8 |
| DFT-OFDM Symbols per subframe (see Note 1) |  | 9 | 9 | 9 | 9 | 9 |
| Modulation |  | 16QAM | QPSK | QPSK | 16QAM | QPSK |
| Transport Block Size | Bits | 1800 | 208 | 504 | 31704 | 552 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 |
| Number of PSSCH transmissions |  | 1 | 2 | 1 | 2 | 1 |
| Binary Channel Bits (see Note 2) | Bits | 3456 | 648 | 648 | 41472 | 1728 |
| Note 1: PSSCH transmissions are rate-matched for 10 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211. <br> Note 2: Binary Channel Bits are calculated under assumption of 9 symbols. <br> Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit). |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

Table A.8.5-2: Fixed reference measurement channel for PSSCH performance requirement

| Parameter | Unit | Value |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reference channel |  | CD. 13 | CD. 14 | CD. 15 | CD. 16 | CD. 17 | CD. 18 | CD. 19 | CD. 20 |
| Channel bandwidth | MHz | 20 | 10 | 20 | 10 | 20 | 10 | 20 | 10 |
| Allocated resource blocks |  | 8 | 3 | 96 | 48 | 8 | 8 | 3 | 3 |
| DFT-OFDM Symbols per subframe (see Note 1) |  | 9 | 9 | 9 | 9 | 9 | 9 | 9 | 9 |
| Modulation |  | 64QAM | QPSK | 64QAM | 64QAM | QPSK | QPSK | QPSK | QPSK |
| Transport Block Size | Bits | 2600 | 120 | 48936 | 24496 | 408 | 408 | 120 | 120 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of PSSCH transmissions |  | 2 | 2 | 2 | 2 | 1 | 1 | 1 | 1 |
| Binary Channel Bits (see Note 2) | Bits | 5184 | 648 | 62208 | 31104 | 1728 | 1728 | 648 | 648 |
| Note 1: PSSCH transmissions are rate-matched for 9 DFT-OFDM symbols per subframe. <br> Note 2: Binary Channel Bits are calculated under assumption of 9 symbols. <br> Note 3: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit). |  |  |  |  |  |  |  |  |  |

## A.8.6 Reference measurement for PSBCH performance requirements

Table A.8.6-1: Fixed reference measurement channel for PSBCH performance requirement

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Reference channel |  | CP.2 |
| Channel bandwidth | MHz | 20 |
| Allocated resource blocks |  | 6 |
| DFT-OFDM Symbols per subframe (see Note 1) |  | 6 |
| Modulation |  | QPSK |
| Transport Block Size | Bits | 48 |
| Transport block CRC | Bits | 16 |
| Binary Channel Bits (see Note 2) | Bits | 864 |

Note 1: PSBCH transmissions are rate-matched for 7 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.
Note 2: Binary Channel Bits are calculated under assumption of 6 symbols.

## A. 9 V2X reference resource pool configurations

Table A.9-1: V2X sidelink communication pre-configuration for PSSCH/PSCCH tests (Configuration \#1-V2X)

## Annex B (normative): Propagation conditions

## B. 1 Static propagation condition

## B.1.1 UE Receiver with 2Rx

For 1 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\binom{1}{1}
$$

For 2 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left(\begin{array}{cc}
1 & j \\
1 & -j
\end{array}\right)
$$

For 4 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{ccc}
1 & 1 & j \\
1 & j & j \\
1 & 1 & -j
\end{array}\right]
$$

For 8 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{ccccccc}
1 & 1 & 1 & 1 & j & j & j \\
1 & 1 & 1 & 1 & -j & -j & -j \\
- & -j
\end{array}\right]
$$

## B.1.2 UE Receiver with 4Rx

For 1 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{l}
1 \\
1 \\
1 \\
1
\end{array}\right]
$$

For 2 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{cc}
1 & j \\
1 & -j \\
1 & j \\
1 & -j
\end{array}\right]
$$

For 4 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{cccc}
1 & 1 & j & j \\
1 & 1 & -j & -j \\
1 & -1 & j & -j \\
1 & -1 & -j & j
\end{array}\right]
$$

For 8 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{cccccccc}
1 & 1 & 1 & 1 & j & j & j & j \\
1 & 1 & 1 & 1 & -j & -j & -j & -j \\
1 & 1 & -1 & -1 & j & j & -j & -j \\
1 & 1 & -1 & -1 & -j & -j & j & j
\end{array}\right]
$$

## B.1.3 UE Receiver with 8Rx

For 1 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{l}
1 \\
1 \\
1 \\
1 \\
1 \\
1 \\
1 \\
1
\end{array}\right] .
$$

For 2 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{rr}
1 & j \\
1 & -j \\
1 & j \\
1 & -j \\
-1 & j \\
-1 & -j \\
-1 & j \\
-1 & -j
\end{array}\right] .
$$

For 4 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{cccc}
1 & 1 & j & j \\
1 & 1 & -j & -j \\
1 & 1 & j & -j \\
1 & 1 & -j & j \\
1 & -1 & j & j \\
1 & -1 & -j & -j \\
1 & -1 & j & -j \\
1 & -1 & -j & j
\end{array}\right] .
$$

For 8 port transmission the channel matrix is defined in the frequency domain by

$$
\mathbf{H}=\left[\begin{array}{cccccccc}
1 & 1 & 1 & 1 & j & j & j & j \\
1 & 1 & 1 & 1 & -j & -j & -j & -j \\
1 & 1 & -1 & -1 & j & j & -j & -j \\
1 & 1 & -1 & -1 & -j & -j & j & j \\
1 & -1 & 1 & -1 & j & -j & j & -j \\
1 & -1 & 1 & -1 & -j & j & -j & j \\
1 & -1 & -1 & 1 & j & -j & -j & j \\
1 & -1 & -1 & 1 & -j & j & j & -j
\end{array}\right]
$$

## B. 2 Multi-path fading propagation conditions

The multipath propagation conditions consist of several parts:

- A delay profile in the form of a "tapped delay-line", characterized by a number of taps at fixed positions on a sampling grid. The profile can be further characterized by the r.m.s. delay spread and the maximum delay spanned by the taps.
- A combination of channel model parameters that include the Delay profile and the Doppler spectrum, that is characterized by a classical spectrum shape and a maximum Doppler frequency
- A set of correlation matrices defining the correlation between the UE and eNodeB antennas in case of multi-antenna systems.
- Additional multi-path models used for CQI (Channel Quality Indication) tests

## B.2.1 Delay profiles

The delay profiles are selected to be representative of low, medium and high delay spread environments. The resulting model parameters are defined in Table B.2.1-1 and the tapped delay line models are defined in Tables B.2.1-2, B.2.1-3 and B.2.1-4.

Table B.2.1-1 Delay profiles for E-UTRA channel models

| Model | Number of <br> channel taps | Delay spread <br> (r.m.s.) | Maximum excess <br> tap delay (span) |
| :--- | :---: | :---: | :---: |
| Extended Pedestrian A (EPA) | 7 | 43 ns | 410 ns |
| Extended Vehicular A model (EVA) | 9 | 357 ns | 2510 ns |
| Extended Typical Urban model (ETU) | 9 | 991 ns | 5000 ns |

Table B.2.1-2 Extended Pedestrian A model (EPA)

| Excess tap delay <br> [ns] | Relative power <br> [dB] |
| :---: | :---: |
| 0 | 0.0 |
| 30 | -1.0 |
| 70 | -2.0 |
| 90 | -3.0 |
| 110 | -8.0 |
| 190 | -17.2 |
| 410 | -20.8 |

Table B.2.1-3 Extended Vehicular A model (EVA)

| Excess tap delay <br> [ns] | Relative power <br> [dB] |
| :---: | :---: |
| 0 | 0.0 |
| 30 | -1.5 |
| 150 | -1.4 |
| 310 | -3.6 |
| 370 | -0.6 |
| 710 | -9.1 |
| 1090 | -7.0 |
| 1730 | -12.0 |
| 2510 | -16.9 |

Table B.2.1-4 Extended Typical Urban model (ETU)

| Excess tap delay <br> [ns] | Relative power <br> [dB] |
| :---: | :---: |
| 0 | -1.0 |
| 50 | -1.0 |
| 120 | -1.0 |
| 200 | 0.0 |

## B.2.2 Combinations of channel model parameters

The propagation conditions used for the performance measurements in multi-path fading environment are indicated as EVA[number], EPA[number] or ETU[number] where 'number' indicates the maximum Doppler frequency (Hz).

Table B.2.2-1 Void

## B.2.3 MIMO Channel Correlation Matrices

The MIMO channel correlation matrices defined in B.2.3 apply for the antenna configuration using uniform linear arrays at both eNodeB and UE.

## B.2.3.1 Definition of MIMO Correlation Matrices

Table B.2.3.1-1 defines the correlation matrix for the eNodeB

## Table B.2.3.1-1 eNodeB correlation matrix

Table B.2.3.1-2 defines the correlation matrix for the UE:
Table B.2.3.1-2 UE correlation matrix

|  |  | $\alpha^{*}$ | $\alpha^{36 / 49^{*}}$ | $\alpha^{25 / 49^{*}}$ | $\alpha^{16 / 49^{*}}$ | $\alpha^{9 / 49^{*}}$ | $\alpha^{4 / 49^{*}}$ | $\alpha^{1 / 49^{*}}$ | 1 |  | $\beta^{*}$ | $\beta^{36 / 49^{*}}$ | $\beta^{25 / 49^{*}}$ | $\beta^{16 / 49^{*}}$ | $\beta^{9 / 49^{*}}$ | $\beta^{4 / 49^{*}}$ | $\beta^{1 / 49^{*}}$ |

For cases with more antennas at either eNodeB or UE or both, the channel spatial correlation matrix can still be expressed as the Kronecker product of $R_{e N B}$ and $R_{U E}$ according to $R_{\text {spat }}=R_{e N B} \otimes R_{U E}$.

## B.2.3.2 MIMO Correlation Matrices at High, Medium and Low Level

The $\alpha$ and $\beta$ for different correlation types are given in Table B.2.3.2-1.
Table B.2.3.2-1: The $\alpha$ and $\beta$ parameters for ULA MIMO correlation matrices

| Correlation Model | $\alpha$ | $\beta$ |
| :---: | :---: | :---: |
| Low correlation | 0 | 0 |
| Medium <br> Correlation | 0.3 | 0.9 |
| Medium <br> Correlation A | 0.3 | 0.3874 |
| Medium <br> Correlation B | 0.3 | 0.005154 |
| High Correlation | 0.9 | 0.9 |

The correlation matrices for high, medium, low and medium A correlation are defined in Table B.2.3.1-2, B.2.3.2-3, B.2.3.2-4 and B.2.3.2-5 as below.

The values in Table B.2.3.2-2 have been adjusted for the $4 \times 2$ and $4 x 4$ high correlation cases to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision. This is done using the equation:

$$
\mathbf{R}_{\text {high }}=\left[\mathbf{R}_{\text {spatial }}+a I_{n}\right] /(1+a)
$$

Where the value "a" is a scaling factor such that the smallest value is used to obtain a positive semi-definite result. For the $4 \times 2$ high correlation case, $a=0.00010$. For the $4 x 4$ high correlation case, $a=0.00012$.

The same method is used to adjust the 2 x 4 and 4 x 4 medium correlation matrix in Table B.2.3.2-3 to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision with $\mathrm{a}=0.00010$ and $\mathrm{a}=0.00012$.

## B.2.3A MIMO Channel Correlation Matrices using cross polarized antennas

The MIMO channel correlation matrices defined in B.2.3A apply for the antenna configuration using cross polarized (XP/X-pol) antennas at both eNodeB and UE. The cross-polarized antenna elements with $+/-45$ degrees polarization slant angles are deployed at eNB and cross-polarized antenna elements with $+90 / 0$ degrees polarization slant angles are deployed at UE.

For the cross-polarized antennas, the N antennas are labelled such that antennas for one polarization are listed from 1 to $\mathrm{N} / 2$ and antennas for the other polarization are listed from $\mathrm{N} / 2+1$ to N , where N is the number of transmit or receive antennas.

## B.2.3A. 1 Definition of MIMO Correlation Matrices using cross polarized antennas

For the channel spatial correlation matrix, the following is used:

$$
R_{\text {spat }}=P\left(R_{e N B} \otimes \Gamma \otimes R_{U E}\right) P^{T}
$$

where

- $\quad R_{U E}$ is the spatial correlation matrix at the UE with same polarization,
- $R_{e N B}$ is the spatial correlation matrix at the eNB with same polarization,
- $\quad \Gamma$ is a polarization correlation matrix, and
- $(\bullet)^{T}$ denotes transpose.

The matrix $\Gamma$ is defined as

$$
\Gamma=\left[\begin{array}{cccc}
1 & 0 & -\gamma & 0 \\
0 & 1 & 0 & \gamma \\
-\gamma & 0 & 1 & 0 \\
0 & \gamma & 0 & 1
\end{array}\right]
$$

A permutation matrix $P$ elements are defined as

$$
P(a, b)=\left\{\begin{array}{lccc}
1 & \text { for } \quad a=(j-1) N r+i & \text { and } \quad b=2(j-1) N r+i, & i=1, \cdots, N r, j=1, \cdots N t / 2 \\
1 & \text { for } & a=(j-1) N r+i & \text { and } \quad b=2(j-N t / 2) N r-N r+i, \\
0 & & \text { otherwise }
\end{array}\right.
$$

where $N_{t}$ and $N_{r}$ is the number of transmitter and receiver respectively. This is used to map the spatial correlation coefficients in accordance with the antenna element labelling system described in B.2.3A.

## B.2.3A. 2 Spatial Correlation Matrices using cross polarized antennas at eNB and UE sides

## B.2.3A.2.1 Spatial Correlation Matrices at eNB side

For 2-antenna transmitter using one pair of cross-polarized antenna elements, $R_{e N B}=1$.
For 4-antenna transmitter using two pairs of cross-polarized antenna elements, $R_{e N B}=\left(\begin{array}{ll}1 & \alpha \\ \alpha^{*} & 1\end{array}\right)$.

## B.2.3A.2.2 Spatial Correlation Matrices at UE side

For 2-antenna receiver using one pair of cross-polarized antenna elements, $R_{U E}=1$.
For 4-antenna receiver using two pairs of cross-polarized antenna elements, $R_{U E}=\left(\begin{array}{ll}1 & \beta \\ \beta^{*} & \mathbf{1}\end{array}\right)$.

## B.2.3A. 3 MIMO Correlation Matrices using cross polarized antennas

The values for parameters $\alpha, \beta$ and $\gamma$ for the cross polarized antenna models are given in Table B.2.3A.3-1.
Table B.2.3A.3-1: : The $\alpha$ and $\beta$ parameters for cross-polarized MIMO correlation matrices

| Correlation Model | $\alpha$ | $\beta$ | $\gamma$ |
| :---: | :---: | :---: | :---: |
| Medium <br> Correlation A | 0.3 | 0.6 | 0.2 |
| High Correlation | 0.9 | 0.9 | 0.3 |
| Note 1: | Value of $\alpha$ applies when more than one <br> pair of cross-polarized antenna elements <br> at eNB side. |  |  |
| Note 2: | Value of $\beta$ applies when more than one <br> pair of cross-polarized antenna elements <br> at UE side. |  |  |

The correlation matrices for high spatial correlation and medium correlation A are defined in Table B.2.3A.3-2 and Table B.2.3A.3-3 as below.

The values in Table B.2.3A.3-2 have been adjusted to insure the correlation matrix is positive semi-definite after roundoff to 4 digit precision. This is done using the equation:

$$
\mathbf{R}_{\text {high }}=\left[\mathbf{R}_{\text {spat }}+a I_{n}\right] /(1+a)
$$

Where the value "a" is a scaling factor such that the smallest value is used to obtain a positive semi-definite result. For the $8 \times 2$ high spatial correlation case, $a=0.00010$.

## B.2.3A. 4 Beam steering approach

Given the channel spatial correlation matrix in B.2.3A.1, the corresponding random channel matrix $\boldsymbol{H}$ can be calculated. The signal model for the k -th subframe is denoted as

$$
y=H D_{\theta_{k}} W x+n
$$

Where

- H is the $\mathrm{Nr} x \mathrm{Nt}$ channel matrix per subcarrier.
- $D_{\theta_{k}}$ is the steering matrix,

For 8 transmission antennas, $D_{\theta_{k}}=\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right] \otimes\left[\begin{array}{cccc}1 & 0 & 0 & 0 \\ 0 & e^{j \theta_{k}} & 0 & 0 \\ 0 & 0 & e^{j 2 \theta_{k}} & 0 \\ 0 & 0 & 0 & e^{j 3 \theta_{k}}\end{array}\right]$;
For 4 transmission antennas, $D_{\theta_{k}}=\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right] \otimes\left[\begin{array}{cc}1 & 0 \\ 0 & e^{j 3 \theta_{k}}\end{array}\right]$.

- $\quad \theta_{k}$ controls the phase variation, and the phase for k-th subframe is denoted by $\theta_{k}=\theta_{0}+\Delta \theta \cdot k$, where $\theta_{0}$ is the random start value with the uniform distribution, i.e., $\theta_{0} \in[0,2 \pi], \Delta \theta$ is the step of phase variation, which is defined in Table B.2.3A.4-1, and $k$ is the linear increment of 1 for every subframe throughout the simulation,
- $W$ is the precoding matrix for Nt transmission antennas,
- $y$ is the received signal, $x$ is the transmitted signal, and $n$ is AWGN.

Table B.2.3A.4-1: The step of phase variation

| Variation Step | Value (rad/subframe) |
| :---: | :---: |
| $\Delta \theta$ | $1.2566 \times 10^{-3}$ |

## B.2.3B MIMO Channel Correlation Matrices using two-dimension cross polarized antennas at eNB and cross polarized antennas at UE

The MIMO channel correlation matrices defined in B.2.3B apply for the antenna configuration using two-dimension (2D) cross polarized antennas at eNodeB and the antenna configuration using cross polarized antennas at UE. The cross-polarized antenna elements with $+/-45$ degrees polarization slant angles are deployed at eNB and cross-polarized antenna elements with $+90 / 0$ degrees polarization slant angles are deployed at UE.

For 2D cross-polarized antenna array at eNodeB, the N antennas are indexed by $\left(N_{1}, N_{2}, P\right)$, and total number of antennas is $N=P \cdot N_{1} \cdot N_{2}$, where

- $\quad N_{1}$ is the number of antenna elements in first dimension (i.e. vertical direction) with same polarization,
- $\quad N_{2}$ is the number of antenna elements in second dimension (i.e. horizontal direction) with same polarization, and
- $\quad P$ is the number of polarization groups.

For the 2 D cross-polarized antennas at eNB , the N antennas are labelled such that antennas shall be in increasing order of the second dimension firstly, then the first dimension, and finally the polarization group. For a specific antenna
element at $p$-th polarization, $n_{1}$-th row, and $n_{2}$-th column within the 2 D antenna array, the following index number is used for antenna labelling:

$$
\operatorname{Index}\left(p, n_{1}, n_{2}\right)=p \cdot N_{1} \cdot N_{2}+n_{1} \cdot N_{2}+n_{2}+1, \quad p=0,1, n_{1}=0, \cdots, N_{1}-1, \quad n_{2}=0, \cdots, N_{2}-1
$$

where N is the number of transmit antennas, $p$ is the polarization group index, $n_{l}$ is the row index, and $n_{2}$ is the column index of the antenna element.

For the cross-polarized antennas at UE, the N antennas are labelled such that antennas for one polarization are listed from 1 to $\mathrm{N} / 2$ and antennas for the other polarization are listed from $\mathrm{N} / 2+1$ to N , where N is the number of receive antennas.

## B.2.3B. 1 Definition of MIMO Correlation Matrices using two-dimension cross polarized antennas at eNB and cross polarized antennas at UE

For the channel spatial correlation matrix, the following is used:

$$
R_{\text {spat }}=P\left(R_{e N B} \otimes \Gamma \otimes R_{U E}\right) P^{T}
$$

where

- $R_{U E}$ is the spatial correlation matrix at the UE with same polarization,
- $R_{e N B}$ is the spatial correlation matrix at the eNB with same polarization,
- $\quad \Gamma$ is a polarization correlation matrix, and
- $\quad(\bullet)^{T}$ denotes transpose.

The spatial correlation matrix at the eNB is further expressed as following:

$$
R_{e N B}=R_{e N B_{-} D i m, 1} \otimes R_{e N B_{-} D i m, 2}
$$

where

- $R_{e N B_{-} \text {Dim, } 1}$ is the correlation matrix of antenna elements in first dimension with same polarization, and
- $R_{e N B_{-} D i m, 2}$ is the correlation matrix of antenna elements in second dimension with same polarization.

The matrix $\Gamma$ is defined as

$$
\Gamma=\left[\begin{array}{cccc}
1 & 0 & -\gamma & 0 \\
0 & 1 & 0 & \gamma \\
-\gamma & 0 & 1 & 0 \\
0 & \gamma & 0 & 1
\end{array}\right]
$$

A permutation matrix $P$ elements are defined as

$$
P(a, b)=\left\{\begin{array}{lcc}
1 & \text { for } a=(j-1) N r+i \quad \text { and } \quad b=2(j-1) N r+i, & i=1, \cdots, N r, j=1, \cdots N t / 2 \\
1 & \text { for } \quad a=(j-1) N r+i & \text { and } b=2(j-N t / 2) N r-N r+i, \quad i=1, \cdots, N r, j=N t / 2+1, \cdots, N t . \\
0 & \text { otherwise }
\end{array}\right.
$$

where $N_{t}$ and $N_{r}$ is the number of transmitter and receiver respectively. This is used to map the spatial correlation coefficients in accordance with the antenna element labelling system described in B.2.3B.

## B.2.3B. 2 Spatial Correlation Matrices using two-dimension cross polarized antennas at eNB and cross polarized antennas at UE

## B.2.3B.2.1 Spatial Correlation Matrices at eNB side

For one direction of the 2 D antenna array at the eNB side, the followings are used to construct the spatial correlation matrix:

For 1 antenna element of the same polarization in one direction, $R_{e N B}{ }_{-D i m, i}=1$.
For 2 antenna elements of the same polarization in one direction, $R_{e N B_{-} \text {Dim, }, ~}=\left(\begin{array}{ll}1 & \alpha_{i} \\ \alpha_{i}^{*} & 1\end{array}\right)$.
For 3 antenna elements of the same polarization in one direction, $R_{e N B_{-} D i m, i}=\left(\begin{array}{ccc}1 & \alpha_{i}^{1 / 4} & \alpha_{i} \\ \alpha_{i}^{1 / 4} & 1 & \alpha_{i}^{1 / 4} \\ \alpha_{i}^{*} & \alpha_{i}^{1 / 4} & 1\end{array}\right)$.
For 4 antenna elements of the same polarization in one direction, $R_{e N B_{-} D i m, i}=\left(\begin{array}{cccc}1 & \alpha_{i}^{1 / 9} & \alpha_{i}{ }^{4 / 9} & \alpha_{i} \\ \alpha_{i} 1^{*} 9^{*} & 1 & \alpha_{i}{ }^{1 / 9} & \alpha_{i}^{4 / 9} \\ \alpha_{i}^{4 / 9} & \alpha_{i}{ }^{1 / 9}{ }^{*} & 1 & \alpha_{i}{ }^{1 / 9} \\ \alpha_{i}^{*} & \alpha_{i}^{4 / 9} & \alpha_{i}{ }^{1 / 9^{*}} & 1\end{array}\right)$.
where the index $i=1,2$ stands for first dimension and second dimension respectively.

## B.2.3B.2.2 Spatial Correlation Matrices at UE side

For 2-antenna receiver using one pair of cross-polarized antenna elements, $R_{U E}=1$.
For 4-antenna receiver using two pairs of cross-polarized antenna elements, $R_{U E}=\left(\begin{array}{ll}1 & \beta \\ \beta^{*} & 1\end{array}\right)$.

## B.2.3B.3 MIMO Correlation Matrices using two-dimension cross polarized antennas at eNB and cross polarized antennas at UE

The values for parameters $\alpha_{1}, \alpha_{2}, \beta$ and $\gamma$ for high and medium spatial correlation are given in Table B.2.3B.3-1.
Table B.2.3B.3-1

| Correlation type | $\alpha_{1}$ | $\alpha_{2}$ | $\beta$ | $\gamma$ |
| :---: | :---: | :---: | :---: | :---: |
| High | 0.9 | 0.9 | 0.9 | 0.3 |
| Medium | 0.3 | 0.3 | 0.6 | 0.2 |

Note 1: Value of $\alpha_{1}$ applies when more than one pair of cross-polarized antenna elements in first dimension at eNB side.
Note 2: Value of $\alpha_{2}$ applies when more than one pair of cross-polarized antenna elements in second dimension at eNB side.
Note 3: Value of $\beta$ applies when more than one pair of cross-polarized antenna elements at UE side.

The correlation matrices for high spatial correlation with12(2,3,2)x2 case and $16(2,4,2) \times 2$ case are defined in Table B.2.3B.3-2 as below.

The values in Table B.2.3B.3-2 have been adjusted to insure the correlation matrix is positive semi-definite after roundoff to 4 digit precision. This is done using the equation:

$$
\mathbf{R}_{\text {high }}=\left[\mathbf{R}_{\text {spat }}+a I_{n}\right] /(1+a)
$$

where the value " a " is a scaling factor such that the smallest value is used to obtain a positive semi-definite result. For the $16(2,4,2) \times 2$ high spatial correlation case, $\mathrm{a}=0.00012$.

The same method is used to adjust the the $24(3,4,2) \times 2$ and $32(4,4,2) \times 2$ high correlation matrix to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision with $\mathrm{a}=0.00012$ and $\mathrm{a}=0.00022$.

Table B.2.3B.3-2: MIMO correlation matrices for high spatial correlation

## B.2.3B. 4 Beam steering approach

Given the channel spatial correlation matrix in B.2.3B.1, the corresponding random channel matrix $\boldsymbol{H}$ can be calculated. The signal model for the k -th subframe is denoted as

$$
y=H D_{\theta_{k, 1}, \theta_{k, 2}} W x+n
$$

And the steering matrix is further expressed as following:

$$
D_{\theta_{k, 1}, \theta_{k, 2}}=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] \otimes\left(D_{\theta_{k, 1}}\left(N_{1}\right) \otimes D_{\theta_{k, 2}}\left(N_{2}\right)\right)
$$

where

- $\quad \mathrm{H}$ is the Nr xNt channel matrix per subcarrier.
- $D_{\theta_{k, 1}, \theta_{k, 2}}$ is the steering matrix,
- $D_{\theta_{k, 1}}\left(N_{1}\right)$ is the steering matrix in first dimension with same polarization,
- $D_{\theta_{k, 2}}\left(N_{2}\right)$ is the steering matrix in second dimension with same polarization,
- $\quad N_{1}$ is the number of antenna elements infirst dimension with same polarization,
- $\quad N_{2}$ is the number of antenna elements in second dimension with same polarization,

For 1 antenna element of the same polarization in one direction, $D_{\theta_{k, i}}(1)=1$.
For 2 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(2)=\left[\begin{array}{cc}1 & 0 \\ 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.
For 3 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(3)=\left[\begin{array}{ccc}1 & 0 & 0 \\ 0 & e^{j 1.5 \theta_{k, i}} & 0 \\ 0 & 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.
For 4 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(4)=\left[\begin{array}{cccc}1 & 0 & 0 & 0 \\ 0 & e^{j \theta_{k, i}} & 0 & 0 \\ 0 & 0 & e^{j 2 \theta_{k, i}} & 0 \\ 0 & 0 & 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.
where the index $i=1,2$ stands for first dimension and second dimension respectively.

- $\theta_{k, i}$ controls the phase variation in first dimension and second dimension respectively, and the phase for k-th subframe is denoted by $\theta_{k, i}=\theta_{0, i}+\Delta \theta \cdot k$, where $\theta_{0, i}$ is the random start value with the uniform distribution, i.e., $\theta_{0, i} \in[0,2 \pi], \Delta \theta$ is the step of phase variation, which is defined in Table B.2.3B.4-1, and $k$ is the linear increment of 1 for every subframe throughout the simulation, the index $i=1,2$ stands for first dimension and second dimension respectively.
- $W$ is the precoding matrix for Nt transmission antennas,
- $y$ is the received signal, $x$ is the transmitted signal, and $n$ is AWGN.

Table B.2.3B.4-1: The step of phase variation

| Variation Step | Value (rad/subframe) |
| :---: | :---: |
| $\Delta \theta$ | $1.2566 \times 10^{-3}$ |

## B.2.3B.4A Beam steering approach with dual cluster beams

Given the channel spatial correlation matrix in B.2.3B.1, the corresponding random channel matrix $\boldsymbol{H}$ can be calculated. The signal model for the k -th subframe is denoted as

$$
y=\left[\sqrt{\frac{1}{1+p^{2}}} H_{m} D_{\theta_{k, 1}, \theta_{k, 2}}^{(m)}+\sqrt{\frac{p^{2}}{1+p^{2}}} H_{s} D_{\theta_{k, 1}, \theta_{k, 2}}^{(s)}\right] W_{X}+n
$$

And the steering matrix is further expressed as following:

$$
D_{\theta_{k, 1}, \theta_{k, 2}}=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] \otimes\left(D_{\theta_{k, 1}}\left(N_{1}\right) \otimes D_{\theta_{k, 2}}\left(N_{2}\right)\right)
$$

where

- $\quad H_{m}, H_{s}$ are independent channels for the first beam and second beam with the Nr xNt channel matrix per subcarrier.
- $\quad D_{\theta_{k, 1}, \theta_{k, 2}}^{(m)}, D_{\theta_{k, 1}, \theta_{k, 2}}^{(s)}$ are the steering matrix for first beam and second beam
- $D_{\theta_{k, 1}}\left(N_{1}\right)$ is the steering matrix in first dimension with same polarization,
- $D_{\theta_{k, 2}}\left(N_{2}\right)$ is the steering matrix in second dimension with same polarization,
- $\quad N_{1}$ is the number of antenna elements infirst dimension with same polarization,
- $\quad N_{2}$ is the number of antenna elements in second dimension with same polarization,
- $\quad p$ is the relative power ratio of the second beam to the first beam, the value of $p$ is specific to a test case,

For 1 antenna element of the same polarization in one direction, $D_{\theta_{k, i}}(1)=1$.
For 2 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(2)=\left[\begin{array}{cc}1 & 0 \\ 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.

For 3 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(3)=\left[\begin{array}{ccc}1 & 0 & 0 \\ 0 & e^{j 1.5 \theta_{k, i}} & 0 \\ 0 & 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.
For 4 antenna elements of the same polarization in one direction, $D_{\theta_{k, i}}(4)=\left[\begin{array}{cccc}1 & 0 & 0 & 0 \\ 0 & e^{j \theta_{k, i}} & 0 & 0 \\ 0 & 0 & e^{j 2 \theta_{k, i}} & 0 \\ 0 & 0 & 0 & e^{j 3 \theta_{k, i}}\end{array}\right]$.
where the index $i=1,2$ stands for first dimension and second dimension respectively.

- $\theta_{k, i}$ controls the phase variation in first dimension and second dimension respectively, and the phase for k-th subframe is denoted by $\theta_{k, i}=\theta_{0, i}+\Delta \theta \cdot k$, where $\theta_{0, i}$ is the random start value with the uniform distribution, i.e., $\theta_{0, i} \in[0,2 \pi], \Delta \theta$ is the step of phase variation, which is defined in Table B.2.3B.4-1, and $k$ is the linear increment of 1 for every subframe throughout the simulation, the index $i=1,2$ stands for first dimension and second dimension respectively.
- $W$ is the precoding matrix for Nt transmission antennas,
- $\quad y$ is the received signal, $x$ is the transmitted signal, and $n$ is AWGN.

Table B.2.3B.4A-1: The step of phase variation

| Variation Step | Value (rad/subframe) |
| :---: | :---: |
| $\Delta \theta^{(m)}$ | $1.2566 \times 10^{-3}$ |
| $\Delta \theta^{(s)}$ | $2.5132 \times 10^{-3}$ |

## B.2.4 Propagation conditions for CQI tests

For Channel Quality Indication (CQI) tests, the following additional multi-path profile is used:

$$
h(t, \tau)=\delta(\tau)+a \exp \left(-i 2 \pi f_{D} t\right) \delta\left(\tau-\tau_{d}\right)
$$

in continuous time $(t, \tau)$ representation, with $\tau_{d}$ the delay, $a$ a constant and $f_{D}$ the Doppler frequency. The same $h(t, \tau)$ is used to describe the fading channel between every pair of Tx and Rx.

## B.2.4.1 Propagation conditions for CQI tests with multiple CSI processes

For CQI tests with multiple CSI processes, the following additional multi-path profile is used for 2 port transmission:

$$
H=\left[\begin{array}{cc}
1 & j \\
1 & -j
\end{array}\right] \circ H_{M P}
$$

Where $\circ$ represents Hadamard product, $H_{M P}$ indicates the $2 \times 2$ propagation channel generated in the manner defined in Clause B.2.4.

## B.2.5 Void

## B.2.6 MBSFN Propagation Channel Profile

## B.2.6.1 Subcarrier spacing 15 kHz or 7.5 kHz

Table B.2.6.1-1 shows propagation conditions that are used for the MBSFN performance requirements in multi-path fading environment in an extended delay spread environment.

Table B.2.6.1-1: Propagation Conditions for Multi-Path Fading Environments for MBSFN Performance Requirements in an extended delay spread environment with subcarrier spacing 15 kHz or 7.5 kHz

| Maximum Doppler frequency [5Hz] |  |
| :---: | :---: |
| Relative Mean Power [dB] |  |

## B. 3 High speed train scenario

The high speed train condition for the test of the baseband performance is a non fading propagation channel with one tap. Doppler shift is given by

$$
\begin{equation*}
f_{s}(t)=f_{d} \cos \theta(t) \tag{B.3.1}
\end{equation*}
$$

where $f_{s}(t)$ is the Doppler shift and $f_{d}$ is the maximum Doppler frequency. The cosine of angle $\theta(t)$ is given by

$$
\begin{gather*}
\cos \theta(t)=\frac{D_{s} / 2-v t}{\sqrt{D_{\min }^{2}+\left(D_{s} / 2-v t\right)^{2}}}, 0 \leq t \leq D_{s} / v  \tag{B.3.2}\\
\cos \theta(t)=\frac{-1.5 D_{s}+v t}{\sqrt{D_{\min }^{2}+\left(-1.5 D_{s}+v t\right)^{2}}}, D_{s} / v<t \leq 2 D_{s} / v  \tag{B.3.3}\\
\cos \theta(t)=\cos \theta\left(t \bmod \left(2 D_{s} / v\right)\right), t>2 D_{s} / v \tag{B.3.4}
\end{gather*}
$$

where $D_{s} / 2$ is the initial distance of the train from eNodeB, and $D_{\text {min }}$ is eNodeB Railway track distance, both in meters; $v$ is the velocity of the train in $\mathrm{m} / \mathrm{s}, t$ is time in seconds.

Doppler shift and cosine angle are given by equation B.3.1 and B.3.2-B.3.4 respectively, where the required input parameters listed in table B.3-1 and the resulting Doppler shift shown in Figure B.3-1 are applied for all frequency bands.

Table B.3-1: High speed train scenario

| Parameter | Value |
| :---: | :--- |
| $D_{s}$ | 300 m |

| $D_{\min }$ | 2 m |
| :---: | :---: |
| $v$ | $300 \mathrm{~km} / \mathrm{h}$ |
| $f_{d}$ | 750 Hz |

NOTE 1: Parameters for HST conditions in table B.3-1 including $f_{d}$ and Doppler shift trajectories presented on figure B.3-1 were derived from Band 7 and are applied for performance verification in all frequency bands.

Figure B.3-1: Doppler shift trajectory
For 1 x 2 antenna configuration, the same $h(t, \tau)$ is used to describe the channel between every pair of Tx and Rx .
For $2 \times 2$ antenna configuration, the same $h(t, \tau)$ is used to describe the channel between every pair of Tx and Rx with phase shift according to $\mathbf{H}=\left(\begin{array}{cc}1 & j \\ 1 & -j\end{array}\right)$.

## B.3A HST-SFN scenario

There is an infinite number of RRHs distributed equidistantly along the track with the same Cell ID as depicted in figure B.3A-1.

Figure B.3A-1: Deployment of HST-SFN

The location of RRH $k$ is given as:

$$
\begin{equation*}
x_{k}=k^{*} D_{s}+j^{*} D_{\min } \tag{B.3A.1}
\end{equation*}
$$

where: $k \in[-\infty, \infty], j=\operatorname{sqrt}(-1)$ and $D_{\text {min }}$ is the distance between the RRHs and railway track, while $D_{s}$ is the distance of two RRHs, both in meters.

The train location is denoted as:

$$
\begin{equation*}
y=a+j * 0 \tag{B.3A.2}
\end{equation*}
$$

where: $a \in[0, \infty]$ and $a$ means distance in meters, which means the train is right on the track.
The HST-SFN scenario for the test of the baseband performance is a non fading propagation channel with four taps, namely the four nearest RRHs. Thus RRH $k$ is visible for the train only in the range:

$$
\begin{equation*}
k * D_{s}-2 * D_{s} \leq a<k * D_{s}+2 * D_{s} \tag{B.3A.3}
\end{equation*}
$$

Power level $P_{k}(\mathrm{~dB})$ for the signal from $k$ th RRH, normalized to the total power received from all visible RRHs, is given by:
$P_{k}=-20 \lg \left(\left|y-x_{k}\right|\right)-10 \lg \left(\sum_{i \in\left\{i i^{*} D_{s}-2^{*} D_{s} \leq a<i^{*} D_{s}+2^{*} D_{s}\right\}\left|y-x_{i}\right|^{2}}\right.$ (B.3A.4) $\frac{1}{}$ for $k * D_{s}-2 * D_{s} \leq a<k * D_{s}+2 * D_{s}$
Doppler shift $F_{D, k}(\mathrm{~Hz})$ from $k$ th RRH is given by:

$$
\begin{equation*}
F_{D, k}=f_{C} \times \operatorname{real}\left[-v \times \frac{y-x_{k}}{\left|y-x_{k}\right| \times C}\right] \text { for } k * D_{s}-2 * D_{s} \leq a<k * D_{s}+2 * D_{s} \tag{B.3A.5}
\end{equation*}
$$

The relative delay $T_{k}$ (s) for the signal from $k$ th RRH can be derived as:

$$
\begin{equation*}
T_{k}=\frac{\left|y-x_{k}\right|}{C} \text { for } k * D_{s}-2 * D_{s} \leq a<k * D_{s}+2 * D_{s} \tag{B.3A.6}
\end{equation*}
$$

In the above $v(\mathrm{~m} / \mathrm{s})$ is the moving speed of the train, $f_{\mathrm{C}}(\mathrm{Hz})$ is the center frequency, and $C(\mathrm{~m} / \mathrm{s})$ is the velocity of light.
Power level, Doppler shift and relative delay are given by equations B. 3 A. $4 \sim$ B.3A. 6 respectively, where the required input parameters listed in table B.3A-1 and the resulting Doppler shift shown in Figure B.3A-3 are applied for all frequency bands.

Table B.3A-1: HST-SFN scenario

| Parameter | Value |
| :---: | :---: |
| $D_{s}$ | 1000 m |
| $D_{\min }$ | 50 m |
| $v$ | $350 \mathrm{~km} / \mathrm{h}$ |
| $f_{d}$ | 872 Hz |

NOTE 1: Parameters for HST-SFN scenario in Table B.3A-1 including $f_{d}$ and Doppler shift trajectories presented in Figure B.3A-2 were derived from Band 7 and are applied for performance verification in all frequency bands. And the trajectories of ralative power, Doppler shifts and relative delay presented in Figures B.3A$2 \sim$ B.3A-4 are derived from the equations B.3A. $4 \sim$ B. 3 A. 6 respectively.

Figure B.3A-2 Ralative power level trajectories

Figure B.3A-3 Doppler shifts trajectories

Figure B.3A-4 Relative delay trajectories
For 2 x 2 antenna configuration, the same $h(t, \tau)$ is used to describe the channel between every pair of Tx and Rx with phase shift according to $\mathbf{H}=\left(\begin{array}{cc}1 & j \\ 1 & -j\end{array}\right)$.

For 2 x 4 antenna configuration, the same $h(t, \tau)$ is used to describe the channel between every pair of Tx and Rx with
phase shift according to

$$
\mathbf{H}=\left[\begin{array}{cc}
1 & j \\
1 & -j \\
1 & j \\
1 & -j
\end{array}\right]
$$

## B.3B HST-SFN scenario for $500 \mathrm{~km} / \mathrm{h}$ speed

The channel model for this scenario is the same as B. 3 A , with the following parameters replacing Table B.3A-1:
Table B.3B-1-500: HST-SFN scenario for higher speed

| Parameter | Value |
| :---: | :---: |
| $D_{s}$ | 1000 m |
| $D_{\min }$ | 50 m |
| $v$ | $500 \mathrm{~km} / \mathrm{h}$ |
| $f_{d}$ | 972 Hz |

## B.3C HST scenario for $500 \mathrm{~km} / \mathrm{h}$ speed

The channel model for this scenario is the same as B.3, with the following parameters replacing Table B.3-1:

Table B.3C-1: HST-500 scenario for higher speed

| Parameter | Value |
| :---: | :---: |
| $D_{s}$ | 300 m |
| $D_{\min }$ | 2 m |
| $v$ | $500 \mathrm{~km} / \mathrm{h}$ |
| $f_{d}$ | 972 Hz |

## B. 4 Beamforming Model

## B.4.1 Single-layer random beamforming (Antenna port 5, 7, or 8)

Single-layer transmission on antenna port 5 or on antenna port 7 or 8 without a simultaneous transmission on the other antenna port, is defined by using a precoder vector $W(i)$ of size $2 \times 1$ or $4 \times 1$ randomly selected with the number of layers $v=1$ from Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 in [4] as beamforming weights. This precoder takes as an input the signal $y^{(p)}(i), i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, for antenna port $p \in\{5,7,8\}$, with $M_{\text {symb }}^{\text {ap }}$ the number of modulation symbols including the user-specific reference symbols (DRS), and generates a block of signals $\quad y_{b f}(i)=\left[\begin{array}{lll}y_{b f}(i) & \tilde{y}_{b f}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$
\left[\begin{array}{l}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=W(i) y^{(p)}(i)
$$

Single-layer transmission on antenna port 7 or 8 with a simultaneous transmission on the other antenna port, is defined by using a pair of precoder vectors $W_{1}(i)$ and $W_{2}(i)$ each of size $2 \times 1$ or $4 \times 1$, which are not identical and randomly selected with the number of layers $v=1$ from Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 in [4], as beamforming weights, and normalizing the transmit power as follows:

$$
\left[\begin{array}{l}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=\frac{1}{\sqrt{2}}\left(W_{1}(i) y^{(7)}(i)+W_{2}(i) y^{(8)}(i)\right)
$$

The precoder update granularity is specific to a test case.
The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p \bmod 2=1, p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $y_{b f}(i)$. The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p$ mod $2=0$, $p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $\tilde{y}_{b f}(i)$.

## B.4.1A Single-layer random beamforming (Antenna port 7, 8, 11 or 13 with enhanced DMRS table configured)

Single-layer transmission on antenna port 11 with a simultaneous transmission on one antenna port from antenna port 7,8 or 13 , is defined by using a pair of precoder vectors $W_{1}(i)$ and $W_{2}(i)$ each of size $2 \times 1$, which are not identical and randomly selected with the number of layers $v=1$ from Table 6.3.4.2.3-1 in [4], as beamforming weights, and normalizing the transmit power as follows:

$$
\left[\begin{array}{l}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=\frac{1}{\sqrt{2}}\left(W_{1}(i) y^{(11)}(i)+W_{2}(i) y^{\left(p_{1}\right)}(i)\right)
$$

The precoders takes $y^{(11)}(i)$ and $y^{\left(p_{1}\right)}(i)$ as the input the signals, $i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, with $M_{\text {symb }}^{\text {ap }}$ the number of modulation symbols including the user-specific reference symbols (DM-RS), and generates a block of signals $y_{b f}(i)=\left[\begin{array}{lll}y_{b f}(i) & \tilde{y}_{b f}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements.

The antenna port $p_{1} \in\{7,8,13\}$ update granularity is specific to a test case.
The precoder update granularity is specific to a test case.
The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p \bmod 2=1, p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $y_{b f}(i)$. The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p \bmod 2=0$, $p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $\tilde{y}_{b f}(i)$.

## B.4.2 Dual-layer random beamforming (antenna ports 7 and 8)

Dual-layer transmission on antenna ports 7 and 8 is defined by using a precoder matrix $W(i)$ of size $2 \times 2$ randomly selected with the number of layers $v=2$ from Table 6.3.4.2.3-1 in [4] as beamforming weights. This precoder takes as an input a block of signals for antenna ports 7 and $8, y(i)=\left[\begin{array}{ll}y^{(7)}(i) & y^{(8)}(i)\end{array}\right]^{T}, i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, with $M_{\text {symb }}^{\text {ap }}$ being the number of modulation symbols per antenna port including the user-specific reference symbols, and generates a block of signals $y_{b f}(i)=\left[\begin{array}{ll}y_{b f}(i) & \tilde{y}_{b f}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$
\left[\begin{array}{l}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=W(i)\left[\begin{array}{l}
y^{(7)}(i) \\
y^{(8)}(i)
\end{array}\right],
$$

The precoder update granularity is specific to a test case.
The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p \bmod 2=1, p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $y_{b f}(i)$. The CSI reference symbols $a_{k, l}^{(p)}$ satisfying $p \bmod 2=0$, $p \in\{15,16, . ., 22\}$, are transmitted on the same physical antenna element as the modulation symbols $\tilde{y}_{b f}(i)$.

## B.4.3 Generic beamforming model (antenna ports 7-14)

The transmission on antenna port(s) $p=7,8, \ldots, v+6$ is defined by using a precoder matrix $W(i)$ of size $N_{C S I} \times v$, where $N_{C S I}$ is the number of CSI reference signals configured per test and $v$ is the number of spatial layers. This precoder takes as an input a block of signals for antenna port(s) $p=7,8, \ldots, v+6$, $y^{(p)}(i)=\left[\begin{array}{llll}y^{(7)}(i) & y^{(8)}(i) & \cdots & y^{(6+v)}(i)\end{array}\right], i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, with $M_{\text {symb }}^{\text {ap }}$ being the number of modulation symbols per antenna port including the user-specific reference symbols (DM-RS), and generates a block of signals $y_{b f}^{(q)}(i)=\left[\begin{array}{llll}y_{b f}^{(0)}(i) & y_{b f}^{(1)}(i) & \ldots & y_{b f}^{\left(N_{C S I}-1\right)}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same timefrequency index pair $(k, l)$ but transmitted on different physical antenna elements:

$$
\left[\begin{array}{c}
y_{b f}^{(0)}(i) \\
y_{b f}^{(1)}(i) \\
\vdots \\
y_{b f}^{\left(N_{C S I}-1\right)}(i)
\end{array}\right]=W(i)\left[\begin{array}{c}
y^{(7)}(i) \\
y^{(8)}(i) \\
\vdots \\
y^{(6+v)}(i)
\end{array}\right]
$$

The precoder matrix $W(i)$ is specific to a test case.

The physical antenna elements are identified by indices $j=0,1, \ldots, N_{A N T}-1$, where $N_{A N T}=N_{C S I}$ is the number of physical antenna elements configured per test.

Modulation symbols $y_{b f}^{(q)}(i)$ with $q \in\left\{0,1, \ldots, N_{C S I}-1\right\}$ (i.e. beamformed PDSCH and DM-RS) are mapped to the physical antenna index $j=q$.

Modulation symbols $y^{(p)}(i)$ with $p \in\{0,1, \ldots, P-1\}$ (i.e. PBCH, PDCCH, PHICH, PCFICH) are mapped to the physical antenna index $j=p$, where $P$ is the number of cell-specific reference signals configured per test.

Modulation symbols $a_{k, l}^{(p)}$ with $p \in\{0,1, \ldots, P-1\}$ (i.e. CRS) are mapped to the physical antenna index $j=p$, where $P$ is the number of cell-specific reference signals configured per test.

Modulation symbols $a_{k, l}^{(p)}$ with $p \in\left\{15,16, \ldots, 14+N_{C S I}\right\}$ (i.e. CSI-RS) are mapped to the physical antenna index $j=p-15$, where $N_{C S I}$ is the number of CSI reference signals configured per test.

## B.4.4 Random beamforming for EPDCCH distributed transmission (Antenna port 107 and 109)

EPDCCH distributed transmission on antenna port 107 and antenna port 109 is defined by using a pair of precoder vectors $W_{1}(i)$ and $W_{2}(i)$ each of size $2 \times 1$, which are not identical and randomly selected per EPDCCH PRB pair with the number of layers $v=1$ from Table 6.3.4.2.3-1 in [4], as beamforming weights. This precoder takes as an input the signal $y^{(p)}(i), i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, for antenna port $p \in\{107,109\}$, with $M_{\text {symb }}^{\text {ap }}$ the number of modulation symbols including the user-specific reference symbols (DMRS), and generates a block of signals $y_{b f}(i)=\left[\begin{array}{ll}y_{b f}(i) & \tilde{y}_{b f}(i)\end{array}\right]^{T}$. When EPDCCH is associated with port 107, the transmitted block of signals is deonted as

$$
\left[\begin{array}{c}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=W_{1}(i) y^{(107)}(i)
$$

When EPDCCH is associated with port 109, the transmitted block of signals is denoted as

$$
\left[\begin{array}{c}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=W_{2}(i) y^{(109)}(i)
$$

## B.4.5 Random beamforming for EPDCCH localized transmission (Antenna port 107, 108, 109 or 110)

EPDCCH localized transmission on antenna port 107, 108, 109 or 110 is defined by using a precoder vector $W(i)$ of size $2 \times 1$ randomly selected with the number of layers $v=1$ from Table 6.3.4.2.3-1 in [4] as beamforming weights. This precoder takes as an input the signal $y^{(p)}(i), i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, for antenna port $p \in\{107,108,109,110\}$, with $M_{\text {symb }}^{\text {ap }}$ the number of modulation symbols including the user-specific reference symbols (DMRS), and generates a block of signals $\quad y_{b f}(i)=\left[\begin{array}{lll}y_{b f}(i) & \tilde{y}_{b f}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$
\left[\begin{array}{l}
y_{b f}(i) \\
\tilde{y}_{b f}(i)
\end{array}\right]=W(i) y^{(p)}(i) .
$$

## B.4.6 Beamforming model for CRI test

The transmission on antenna port(s) $p=7,8, \ldots, v+6$ is defined by using a precoder matrix $W(i)$ of size $N_{C S I} \times v$, where $N_{C S I}$ is the number of CSI reference signals configured per test and $v$ is the number of spatial layers. This precoder takes as an input a block of signals for antenna port(s) $p=7,8, \ldots, v+6$,
$y^{(p)}(i)=\left[\begin{array}{llll}y^{(7)}(i) & y^{(8)}(i) & \cdots & y^{(6+v)}(i)\end{array}\right], i=0,1, \ldots, M_{\text {symb }}^{\text {ap }}-1$, with $M_{\text {symb }}^{\text {ap }}$ being the number of modulation symbols per antenna port including the user-specific reference symbols (DM-RS), and generates a block of signals $y_{b f}^{(q)}(i)=\left[\begin{array}{llll}y_{b f}^{(0)}(i) & y_{b f}^{(1)}(i) & \ldots & y_{b f}^{\left(N_{C S I}-1\right)}(i)\end{array}\right]^{T}$ the elements of which are to be mapped onto the same timefrequency index pair $(k, l)$ but transmitted on different physical antenna elements:

$$
\left[\begin{array}{c}
y_{b f}^{(0)}(i) \\
y_{b f}^{(1)}(i) \\
\vdots \\
y_{b f}^{\left(N_{C S I}-1\right)}(i)
\end{array}\right]=\alpha(n) W(i)\left[\begin{array}{c}
y^{(7)}(i) \\
y^{(8)}(i) \\
\vdots \\
y^{(6+v)}(i)
\end{array}\right]
$$

- $\quad W(i)$ is precoder matrix
- $\quad \alpha(n)$ is amplitude scaling factor for CRI test, $\alpha(n)=10^{P_{\theta_{m}}(n) / 20}$
- $\quad P_{\theta_{m}}(n)$ is power scaling factor as following definition:
- $P_{\theta_{m}}(n)=A \cos \left(\theta_{\mathrm{m}}+\frac{2 \pi n}{K}\right)+B, \mathrm{~A}=5 \mathrm{~dB}, \mathrm{~B}=-1.3351 \mathrm{~dB}$.
- $\theta_{m}$ controls the phase variation, and the phase for m-th subframe is denoted by $\theta_{m}=\theta_{0}+\Delta \theta \cdot m$, where $\theta_{0}$ is the random start value with the uniform distribution, i.e., $\theta_{0} \in[0,2 \pi], \Delta \theta$ is the step of phase variation which is defined in Table B.4.6-1, and $m$ is the linear increment of 1 for every sub-frame throughout the simulation.
- K is the number of configured CSI-RS resources
- $n \in\{0,1, \ldots, K-1\}$
- For following CRI with multiple CSI-RS resources configured, $n$ equals to CRI value reported by UE
- For fixed CRI with single CSI-RS resource configure, $n$ equals to 0 .

Table B.4.6-1: The step of phase variation

| Variation Step | Value (rad/subframe) |
| :---: | :---: |
| $\Delta \theta$ | $1.2566 \times 10^{-3}$ |

The physical antenna elements are identified by indices $j=0,1, \ldots, N_{A N T}-1$, where $N_{A N T}=N_{C S I}$ is the number of physical antenna elements configured per test.

Modulation symbols $y_{b f}^{(q)}(i)$ with $q \in\left\{0,1, \ldots, N_{C S I}-1\right\}$ (i.e. beamformed PDSCH and DM-RS) are mapped to the physical antenna index $j=q$.

For the k-th configured CSI-RS resource, modulation symbols $a_{k, l}^{(p)}$ with $p \in\left\{15,16, \ldots, 14+N_{C S I}\right\}$ (i.e. CSI-RS) are firstly multipled by amplitude scaling factor $\alpha(n)$ to generate power scaled symols $y_{k, l}^{(p)}$ :

$$
y_{k, l}^{(p)}=\alpha(n) a_{k, l}^{(p)}
$$

- $n$ equals to CSI-RS resource index (k-th)

And power scaled symols $y_{k, l}^{(p)}$ with $p \in\left\{15,16, \ldots, 14+N_{C S I}\right\}$ (i.e. power scaled CSI-RS) are mapped to the physical antenna index $j=p-15$, where $N_{C S I}$ is the number of CSI reference signals configured per test.

Modulation symbols $y^{(p)}(i)$ with $p \in\{0,1, \ldots, P-1\}$ (i.e. PBCH, PDCCH, PHICH, PCFICH) are mapped to the physical antenna index $j=p$, where $P$ is the number of cell-specific reference signals configured per test.

Modulation symbols $a_{k, l}^{(p)}$ with $p \in\{0,1, \ldots, P-1\}$ (i.e. CRS) are mapped to the physical antenna index $j=p$, where $P$ is the number of cell-specific reference signals configured per test.

## B. 5 Interference models for enhanced performance requirements Type-A

This clause provides a description for the modelling of interfering cell transmissions for enhanced performance requirements Type-A including: definition of dominant interferer proportion, transmission mode 3, 4 and 9 type of interference modelling.

## B.5.1 Dominant interferer proportion

Each interfering cell involved in enhanced performance requirements Type-A is characterized by its associated dominant interferer proportion (DIP) value:

$$
D I P_{i}=\frac{\hat{I}_{o r(i+1)}}{N_{o c}{ }^{\prime}}
$$

where is $\hat{I}_{o r(i+1)}$ is the average received power spectral density from the i-th strongest interfering cell involved in the requirement scenario ( $\hat{I}_{o r(1)}$ is assumed to be the power spectral density associated with the serving cell) and $N_{o c}{ }^{\prime}=\sum_{j=2}^{N} \hat{I}_{o r(j)}+N_{o c}$ where $N_{o c}$ is the average power spectral density of a white noise source consistent with the definition provided in subclause 3.2 and $N$ is the total number of cells involved in a given requirement scenario.

## B.5.2 Transmission mode 3 interference model

This subclause provides transmission mode 3 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth. Transmitted physical channels shall include PSS, SSS and PBCH.

For each subframe and each CQI subband as defined in subclause 7.2 of [6], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For rank-1 transmission over a subband, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4].

For rank-2 transmission over a subband, precoding for spatial multiplexing with large delay CDD over two layers for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.2.2 of [4].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.5.3 Transmission mode 4 interference model

This subclause provides transmission mode 4 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth according to the probabilities of occurrence. Transmitted physical channels shall include PSS, SSS and PBCH. Probabilites of occurrence in each subframe are as specified in the requirement scenario. If the probabilities of occurrence in each subframe are not specified in the requirement scenario, as default, they are equal to 1 .

For each subframe and each CQI subband as defined in subclause 7.2 of [6], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For each subframe and CQI subband, a precoding matrix for the number of layers $v$ associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [4]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is $v=2$.

Precoding for spatial multiplexing with cell-specific reference signals for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.2.1 of [4] with the selected precoding matrices for each subframe and each CQI subband.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.5.4 Transmission mode 9 interference model

This subclause provides transmission mode 9 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth according to the probabilities of occurrence. Transmitted physical channels shall include PSS, SSS and PBCH. Probabilites of occurrence in each subframe are as specified in the requirement scenario. If the probabilities of occurrence in each subframe are not specified in the requirement scenario, as default, they are equal to 1 .

For each subframe and each CQI subband as defined in subclause 7.2 of [6], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For each subframe and each CQI subband, a precoding matrix for the number of layers $v$ associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-2 of [4].

The generic beamforming model in subclause B. 4.3 shall be applied assuming cell-specific reference signals and CSI reference signals as specified in the requirement scenario. Random precoding with selected rank and precoding matrices for each subframe and each CQI subband shall be applied to 16QAM randomly modulated layer symbols including the user-specific reference symbols over antenna port 7 when the rank is one and antenna ports 7,8 when the rank is two.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B. 6 Interference models for enhanced performance requirements Type-B

This clause provides a description for the modelling of interfering cell transmissions for enhanced performance requirements Type-B including: transmission mode 2, 3, 4 and 9 type of interference modelling and a definition of the random interference model.

## B.6.1 Transmission mode 2 interference model

This subclause provides transmission mode 2 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

Precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.2 Transmission mode 3 interference model

This subclause provides transmission mode 3 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined for each user defined in section B. 6.6 with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For rank-1 transmission, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4].

For rank-2 transmission, precoding for spatial multiplexing with large delay CDD over two layers for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.2.2 of [4].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.3 Transmission mode 4 interference model

This subclause provides transmission mode 4 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For each TTI, for each user defined in B.6.6, a single precoding matrix for the number of layers $v$ associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [4]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is $v=2$.

Precoding for spatial multiplexing with cell-specific reference signals for the number of antenna ports in the requirement scenario shall be applied to randomly modulated layer symbols, as specified in subclause 6.3.4.2.1 of [4] with the selected precoding matrices as specified in subclause B.6.6.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.4 Transmission mode 9 interference model

This subclause provides transmission mode 9 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For each TTI, for each user defined in B.6.6, a single precoding matrix for the number of layers $v$ associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [4]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is $v=2$.

The generic beamforming model in subclause B. 4.3 shall be applied assuming cell-specific reference signals and CSI reference signals as specified in the requirement scenario. Random precoding with selected rank and precoding matrices for each subframe shall be applied to randomly modulated layer symbols including the user-specific reference symbols over antenna port 7 when the rank is one and antenna ports 7,8 when the rank is two.

For each TTI, for each user defined in B.6.6, the scrambling ID value nSCID is randomly assigned from the set of $\{0,1\}$.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.5 CRS interference model

This subclause provides for the CRS interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe there is no PDSCH transmitted. Transmitted physical channels shall include PSS, SSS and PBCH.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.6 Random interference model

This subclause presents the interference model which defines the resource allocation, MCS and rank for the two interference cells. The model includes approximately $10 \%$ DTX on these interference cells. Table B.6.6-1 shows the resource allocation for four users in two different configurations for each of the two interferers. Table B.6.6-2 shows the resource allocation to be used for special subframes with TM9 interference. Table B.6.6-3 shows the probabilities for the MSC and rank for these users.

Table B.6.6-1: Resource allocation for the random interference model
Resource allocation for random interference model
Probability

| Resource allocation configurations Indexes | User Index | Resource allocation type | Bitmap for resource allocation (Note 1) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 1st field bitmap | 2nd field bitmap | 3rd field bitmap |  |
| Configuration 1 | User 0 | 1 | 00 | 0 | 10101000101010 | 50\% |
|  | User 1 | 1 | 00 | 0 | 01010101010101 |  |
|  | User 2 | 0 | 01001001001001001 |  |  |  |
|  | User 3 | 0 | 00100100100100100 |  |  |  |
| Configuration 2 | User 0 | 1 | 00 | 0 | 10101010101010 | 50\% |
|  | User 1 | 1 | 00 | 1 | 01010100010101 |  |
|  | User 2 | 0 | 01001001001001001 |  |  |  |
|  | User 3 | 0 | 00100100100100100 |  |  |  |
| Note 1: The $1^{\text {st }}, 2^{\text {nd }}$, and $3^{\text {rd }}$ field bitmaps are only valid for resource allocation type 1 which was defined in [6]. <br> Note 2: The resource allocation model is used for both $1^{\text {st }}$ and $2^{\text {nd }}$ interfering cells and the resource allocation is independent for each interfering cell. |  |  |  |  |  |  |

Table B.6.6-2: Resource allocation for the random interference model for TM9 special subframes

| Resource allocation configurations Indexes | User Index | Resource allocation for random interference model |  |  |  | Probability |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Resource allocation type | Bitmap for resource allocation (Note 1) |  |  |  |
|  |  |  | 1st field bitmap | 2nd field bitmap | 3rd field bitmap |  |
| Configuration 1 | User 0 | 1 | 00 | 0 | 10101000101010 | 50\% |
|  | User 1 | 1 | 00 | 0 | 01010101000001 |  |
|  | User 2 | 0 | 01001000001001001 |  |  |  |
|  | User 3 | 0 | 00100100000100100 |  |  |  |
| Configuration 2 | User 0 | 1 | 00 | 0 | 10101000101010 | 50\% |
|  | User 1 | 1 | 00 | 1 | 01010000010101 |  |
|  | User 2 | 0 | 01001000001001001 |  |  |  |
|  | User 3 | 0 | 00100100000100100 |  |  |  |

Note 1: The $1^{\text {st }}, 2^{\text {nd }}$, and $3^{\text {rd }}$ field bitmaps are only valid for resource allocation type 1 which was defined in [6].
Note 2: The resource allocation model is used for both $1^{\text {st }}$ and $2^{\text {nd }}$ interfering cells and the resource allocation is independent for each interfering cell.

Table B.6.6-3 MCS and rank configuration for the random interference model

| MCS probability |  |  | Rank probability |  |
| :---: | :---: | :---: | :---: | :---: |
| MCS5 | MCS14 | MCS25 | Rank 1 | Rank 2 |
| $50 \%$ | $25 \%$ | $25 \%$ | $80 \%$ | $20 \%$ |

Note 1: The MCS and rank should follow the probability indicated in the table randomly per UE per TTI.
Note 2: The probabilities for MCS and rank configuration are used for both $1^{\text {st }}$ and $2^{\text {nd }}$ interfering cells.
The MCS and rank configurations are independent for each interfering cell.

## B. 7 Interference models for enhanced downlink control channel performance requirements Type $A$ and $B$

This clause provides a description for the modelling of interfering cell transmissions for the enhanced downlink control channel performance requirements Type A and B.

## B.7.1 PDCCH, PCFICH and PHICH interference model

This subclause provides a description of the interfering cell transmissions model for the enhanced PDCCH/PCFICH and PHICH downlink control channel performance requirements Type A and B under synchronous network scenarios.

The transmitted physical signals and channels shall include CRS, PSS, SSS, PBCH and PCFICH. The PDCCH and PHICH transmit signals are emulated as virtual PDCCH signals described further in the clause.

The PDCCH signals are modelled with a per control channel element (CCE) level granularity and have guaranteed $50 \%$ CCE resource loading in each subframe. For each subframe the set of active and inactive CCEs is derived in accordance to the following procedure:

1) All available CCEs for the PDCCH and PHICH are marked as $\mathrm{CCE}_{0}, \mathrm{CCE}_{1}, \ldots, \mathrm{CCE}_{\mathrm{N}-1}$.
2) For the given partial loading ratio $X=50 \%$ the numbers of active CCEs $M_{\text {Active }}$ and inactive CCEs $M_{\text {Inactive }}$ are derived

$$
\begin{aligned}
& M_{\text {Inactive }}=\lfloor N *(100-X \%)\rfloor \\
& M_{\text {Active }}=N-M_{\text {Inactive }}
\end{aligned}
$$

3) The indexes of $M_{\text {Inactive }}$ inactive CCEs are randomly selected out of the full set of CCEs.
4) The remaining $M_{\text {Active }}$ CCEs are assigned to be active.

No signals are transmitted in the REs corresponding to the inactive CCEs. The PDCCH signals are transmitted in the REs corresponding to the active CCEs. For PDCCH REs, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [4]. The EPRE ratio of the PDCCH REs in the active CCEs shall be derived in accordance to the following procedure:

1) For each generated active i-th CCE the PDCCH power boosting level $P(i)$ shall be randomly generated using the uniform distribution in the [Pmin, Pmax] range. The Pmin is equal to -6 dB , the Pmax is equal to 6 dB . The random values should be derived in the dB scale.
2) Additional power normalization is applied for each generated i-th PDCCH power boosting level:

$$
P_{\text {norm }}(i)=P(i)-\alpha
$$

where $P(i)$ and $P_{\text {norm }}(i)$ are the PDCCH power boosting coefficients before and after normalization in the dB scale; the power normalization factor $\alpha$ is equal to 1.3 dB .
3) The normalized PDCCH power boosting coefficients $P_{\text {norm }}(i)$ are further applied to the $\mathrm{PDCCH} \_$RA and PDCCH_RB values to derive the EPRE ratio of the PDCCH signals transmitted in the REs corresponding the ith CCE in each subframe.

## B. 8 Burst transmission models for Frame structure type 3

This clause provides a description for burst transmission models for Frame structure type 3.

## B.8.1 Burst transmission model for one LAA SCell

One burst is defined as downlink transmissions which occupy one or more consecutive subframes. The burst transmission format is determined according to the steps below:

1) Select the number of subframes $N$ randomly from a given set of the number of subframes $S_{1}$ with equal probability as the total length of burst transmission format. The length includes both occupied OFDM symbols and non-occupied OFDM symbols within the burst format. $S_{1}$ is given per test case.
2) If $N$ is equal to 1 , the subframe is set as fully occupied, otherwise:

- For demodulation test, the starting position for the first subframe is randomly selected from OFDM symbol 0 and OFDM symbol 7 with equal probability. For CSI test, the starting position for the first subframe is OFDM symbol 0 .
- The configuration of occupied OFDM symbols in the last subframe is randomly selected from configuration set $S_{2} . S_{2}$ is given per test case.

A uniform random variable from $[0,1]$ is generated. If the random variable is less than $p$ which is given per test case,

- If both the last subframe of previous burst and first subframe of new burst format are fully occupied, start burst transmission after deferring one subframe from the last subframe of previous burst. Otherwise, start burst transmission at the end of last subframe of previous burst.

Otherwise, the burst transmission is muted and the muting duration is the same as the number of subframes for determined burst format.

## B.8.2 Burst transmission model for multiple LAA SCell(s)

This clause provides a description for burst transmission models for Frame structure type 3 when there are multiple LAA Scell(s) in the test.

One burst is defined as downlink transmissions which occupy one or more consecutive subframes. Assuming M carriers are configured, the burst transmission format is determined according to the steps below:

1) For each carrier $c_{m}(m=0, \cdots, \mathrm{M}-1)$, select the number of subframes $N_{m}$ randomly from a given set of the number of subframes $S_{l}$ with equal probability as the total length of burst transmission format used for carrier $c_{m}$. The length includes both occupied OFDM symbols and non-occupied OFDM symbols within the burst format. $S_{l}$ is given per test case.
2) If any $N_{m}$ is equal to 1 , the first subframe is set as fully occupied for all carriers, otherwise:

- For demodulation test, the starting position for the first subframe is randomly selected from OFDM symbol 0 and OFDM symbol 7 with equal probability. For CSI test, the starting position for the first subframe is OFDM symbol 0 . The starting position is common for all carriers.
- The configuration of occupied OFDM symbols in the last subframe is randomly selected from configuration set $S_{2}$ for each carrier $c_{m} . S_{2}$ is given per test case.

A uniform random variable $p_{m}$ from $[0,1]$ is generated for each carrier $c_{m}$ to determine whether the burst is transmitted or not on each carrier.

For each carrier $c_{m}$, if $p_{m}$ is less than $p$ which is given per test case,

- If both the last subframe of previous longest transmitted burst over M carriers and first subframe of new burst format are fully occupied, start burst transmission according to the determined burst transmission format for this carrier after deferring one subframe from the last subframe of previous longest transmitted burst. Otherwise, start burst transmission for this carrier at the end of last subframe of previous longest transmitted burst.

Otherwise, the burst transmission is muted and the muting duration is $N_{\max }$ and $N_{\max }$ is the maximum of $N_{j}$ wherein $j \in\{0,1, \cdots, \mathrm{M}-1\}$ and $p_{j}$ is less than $p$.

## Annex C (normative): Downlink Physical Channels

## C. 1 General

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

## C. 2 Set-up

Table C.2-1 describes the downlink Physical Channels that are required for connection set up.
Table C.2-1: Downlink Physical Channels required for connection set-up

| Physical Channel |
| :---: |
| PBCH |
| SSS |
| PSS |
| PCFICH |
| PDCCH |
| EPDCCH |
| PHICH |
| PDSCH |

## C. 3 Connection

The following clauses, describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done.

## C.3.1 Measurement of Receiver Characteristics

Unless otherwise stated, Table C.3.1-1 is applicable for measurements on the Receiver Characteristics (clause 7).
Table C.3.1-1: Downlink Physical Channels transmitted during a connection (FDD and TDD)

| Physical Channel | EPRE Ratio |
| :--- | :---: |
| PBCH | PBCH_RA $=0 \mathrm{~dB}$ |
|  | PBCH_RB $=0 \mathrm{~dB}$ |
| PSS | PSS_RA $=0 \mathrm{~dB}$ |
| SSS | SSS_RA $=0 \mathrm{~dB}$ |
| PCFICH | PCFICH_RB $=0 \mathrm{~dB}$ |
| PDCCH | PDCCH_RA $=0 \mathrm{~dB}$ |
|  | PDCCH_RB $=0 \mathrm{~dB}$ |
|  | PDSCH_RA $=0 \mathrm{~dB}$ |
|  | ODSCH_RB $=0 \mathrm{~dB}$ |
|  | OCNG_RA $=0 \mathrm{~dB}$ |
|  | OCNG_RB $=0 \mathrm{~dB}$ |

NOTE 1: No boosting is applied.
For measurements on cells in TDD Band 46, Table C.3.1-1a is applicable for measurements of Receiver Characteristics (clause 7).

Table C.3.1-1a: Downlink Physical Channels transmitted during a connection (TDD Band 46)

| Physical Channel | EPRE Ratio |
| :--- | :---: |
| DRS | NOTE 1 |
| PSS | PSS_RA $=0 \mathrm{~dB}$ |
| SSS | SSS_RA $=0 \mathrm{~dB}$ |
| PCFICH | PCFICH_RB $=0 \mathrm{~dB}$ |
| PDCCH | PDCCH_RA $=0 \mathrm{~dB}$ |
|  | PDCCH_RB $=0 \mathrm{~dB}$ |
| PDSCH | PDSCH_RA $=0 \mathrm{~dB}$ |
|  | PDSCH_RB $=0 \mathrm{~dB}$ |
| OCNG | OCNG_RA $=0 \mathrm{~dB}$ |
|  | OCNG_RB $=0 \mathrm{~dB}$ |
|  | NOTE 1: No boosting is applied. |

Table C.3.1-2: Power allocation for OFDM symbols and reference signals

| Parameter | Unit | Value | Note |
| :--- | :---: | :---: | :---: |
| Transmitted power spectral <br> density $I_{\text {or }}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | Test specific | $1 . I_{\text {or }}$ shall be kept <br> constant throughout <br> all OFDM symbols |
| Cell-specific reference <br> signal power ratio $E_{R S} / I_{\text {or }}$ |  | 0 dB |  |

## C.3.2 Measurement of Performance requirements

Table C.3.2-1 is applicable for measurements in which uniform RS-to-EPRE boosting for all downlink physical channels, unless otherwise stated.

## Table C.3.2-1: Downlink Physical Channels transmitted during a connection (FDD and TDD and Frame structure Type 3)

| Physical Channel | EPRE Ratio |
| :---: | :---: |
| PBCH | PBCH_RA $=\rho_{\text {A }}+\sigma$ |
|  | PBCH_RB $=\rho_{\text {B }}+\sigma$ |
| PSS | PSS_RA = 0 (Note 3) |
| SSS | SSS_RA = 0 (Note 3) |
| PCFICH | PCFICH_RB $=\rho_{B}+\sigma$ |
| PDCCH | PDCCH_RA $=\rho_{A}+\sigma$ |
|  | $\mathrm{PDCCH} \mathrm{RB}=\rho_{\mathrm{B}}+\sigma$ |
| EPDCCH | EPDCCH_RA $=\rho_{A}+\bar{\delta}$ |
|  | EPDCCH_RB $=\rho_{B}+\delta$ |
| MPDCCH | MPDCCH_RA $=\rho_{A}+\bar{\delta}$ |
|  | $\mathrm{MPDCCH}=R B=\rho_{B}+\delta$ |
| SPDCCH (CRS-based) | SPDCCH_RA $=\rho_{\text {A }}+\sigma$ |
|  | SPDCCH_RB $=\rho_{B}+\sigma$ |
| SPDCCH (DMRS-based) | SPDCCH_RA $=\rho_{A}+\bar{\delta}$ |
|  | SPDCCH_RB $=\rho_{B}+\bar{\delta}$ |
| PDSCH | PDSCH_RA $=\rho_{A}$ |
|  | PDSCH_RB $=\rho_{B}$ |
| PMCH | PMCH_RA $=\rho_{A}$ |
|  | PMCH_RB $=\rho_{B}$ |
| MBSFN RS | MBSFN RS_RA $=\rho_{A}$ |
|  | MBSFN RS_RB $=\rho_{B}$ |
| OCNG | OCNG_RA $=\rho_{A}+\sigma$ |
|  | OCNG_RB $=\rho_{B}+\sigma$ |

NOTE 1: $\rho_{A}=\rho_{B}=0 \mathrm{~dB}$ means no RS boosting.

NOTE 2: MBSFN RS and OCNG are not defined downlink physical channels in [4].
NOTE 3: Assuming PSS and SSS transmitted on a single antenna port.
NOTE 4: $\rho_{A}, \rho_{B}, \sigma$, and $\delta$ are test specific.
NOTE 5: Void.
NOTE 6: For Frame Structure Type 3, PBCH are not defined.
Table C.3.2-2: Power allocation for OFDM symbols and reference signals

| Parameter | Unit | Value | Note |
| :--- | :--- | :--- | :--- |
| Total transmitted power <br> spectral density $I_{o r}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | Test specific | 1. $I_{o r}$ shall be kept <br> constant throughout all <br> OFDM symbols |
| Cell-specific reference <br> signal power ratio $E_{R S} / I_{\text {or }}$ |  | Test specific | 1. Applies for antenna <br> port $p$ |
| Energy per resource <br> element EPRE |  | Test specific | 1. The complex-valued <br> symbols $y^{(p)}(i)$ and |

## C.3.3 Aggressor cell power allocation for Measurement of Performance Requirements when ABS is Configured

For the performance requirements and channel state information reporting when ABS is configured, the power allocation for the physical channels of the aggressor cell in non-ABS and ABS is listed in Table C.3.3-1.

Table C.3.3-1: Downlink physical channels transmitted in aggressor cell when ABS is configured in this cell

| Physical Channel | Parameters | Unit | EPRE Ratio |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Non-ABS | ABS |
| PBCH | PBCH_RA | dB | $\rho_{\text {A }}$ | Note 1 |
|  | PBCH_RB | dB | $\rho_{B}$ | Note 1 |
| PSS | PSS_RA | dB | $\rho_{A}$ | Note 1 |
| SSS | SSS_RA | dB | $\rho_{\text {A }}$ | Note 1 |
| PCFICH | PCFICH_RB | dB | $\rho_{B}$ | Note 1 |
| PHICH | PHICH_RA | dB | $\rho_{\text {A }}$ | Note 1 |
|  | PHICH_RB | dB | $\rho_{B}$ | Note 1 |
| PDCCH | PDCCH_RA | dB | $\rho_{\text {A }}$ | Note 1 |
|  | PDCCH_RB | dB | $\rho_{B}$ | Note 1 |
| PDSCH | PDSCH_RA | dB | N/A | Note 1 |
|  | PDSCH_RB | dB | N/A | Note 1 |
| OCNG | OCNG_RA | dB | pA | Note 1 |

## C.3.4 Power Allocation for Measurement of Performance Requirements when Quasi Co-location Type B: same Cell ID

For the performance requirements related to quasi-colocation type B behaviour when transmission points share the same Cell ID, the power allocation for the physical channels of the serving cell is listed in Table C.3.4-1 and the power allocation for the physical channels of the cell transmitting PDSCH is listed in Table C.3.4-2

Table C.3.4-1: Downlink physical channels transmitted in the serving cell (TP1)

| Physical Channel | EPRE Ratio |
| :--- | :---: |
| PBCH | PBCH_RA $=\rho_{A}+\sigma$ |
|  | PBCH_RB $=\rho_{B}+\sigma$ |
| PSS | PSS_RA $=0($ Note 2$)$ |
| SSS | SSS_RA $=0($ Note 2$)$ |
| PDSCH | PDSCH_RA $=\rho_{A}$ |
|  | PDSCH_RB $=\rho B$ |
| PCFICH | PCFICH_RB $=\rho B+\sigma$ |
| PDCCH | PDCCH_RA $=\rho A+\sigma$ |
|  | PDCCH_RB $=\rho B+\sigma$ |

NOTE 1: $\rho_{A}=\rho_{B}=0 \mathrm{~dB}$ means no RS boosting.
NOTE 2: Assuming PSS and SSS transmitted on a single antenna port.
NOTE 3: $\rho_{A}, \rho_{B}$ and $\sigma$ are test specific.

Table C.3.4-2: Downlink physical channels for the transmission point transmitting PDSCH (TP2)

| Physical Channel | Value |
| :---: | :---: |
| PDSCH | Test Specific |

## C.3.5 Simplified CA testing method

For CA tests which require more than 16 independent faders, if a test system cannot support a throughput measurement with fading on all carriers simultaneously, the simplified CA testing method shall be used.

In the simplified CA testing method, the resulting propagation channel(s) shall be generated by considering a number of independent faders needed for one carrier and connecting them to the signal of randomly chosen carrier(s). The maximum number of channel faders on the test will be less than or equal to 16 . The remaining carrier(s) shall be connected without a channel fader but with AWGN. The throughput is then collected only for the carrier(s) connected to channel faders.

In the simplified CA testing method, the test shall be repeated by choosing carrier(s) excluding already chosen carrier(s) until all the carrier(s) are tested under fading conditions. All the collected throughtputs from each carrier shall be compared against the reference value of the requirements.

All supported carriers shall be configured and activated during the test.

## C.3.6 Measurement of Receiver Characteristics for Narrowband IoT

For the performance requiremens for Narrowband IoT, the power allocation for the physical channels is listed in Table C.3.6-1

Table C.3.6-1: Downlink Physical Channels transmitted during a connection

| Physical Channel | EPRE Ratio for <br> one NRS antenna <br> port | EPRE Ratio for <br> two NRS antenna <br> ports |
| :--- | :---: | :---: |
| NPBCH | 0 dB | -3 dB |
| NPDCCH | 0 dB | -3 dB |
| NPDSCH | 0 dB | -3 dB |
| NPSS | 0 dB | 0 dB |
| NSSS | 0 dB | 0 dB |

NOTE 1: Assuming NPSS and NSSS transmitted on one NRS antenna port.

Table C.3.6-2: Power allocation for OFDM symbols and reference signals

| Parameter | Unit | Value | Note |
| :--- | :---: | :---: | :--- |
| Transmitted power spectral <br> density $I_{o r}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | Test specific | $I_{o r}$ shall be kept <br> constant throughout <br> all OFDM symbols |
| Cell-specific reference <br> signal power ratio <br> $E_{C R S} / I_{\text {or }}$ |  | 0 dB | Applicble for In- <br> band operation |
| Narrowband reference <br> signal power ratio <br> $E_{\text {NRS }} / I_{\text {or }}$ |  | 0 dB | Applicble for Stand- <br> alone and Guard- <br> band operation |
| Narrowband refefence <br> signal power over cell- <br> specific reference signal <br> power $E_{\text {NRS }} / E_{R S}$ |  | 0 dB | Applicable for In- <br> band operation |

## Annex D (normative): Characteristics of the interfering signal

## D. 1 General

Unless otherwise stated, when the channel bandwidth is wider or equal to 5 MHz , a modulated 5 MHz full bandwidth EUTRA downlink signal and CW signal are used as interfering signals when RF performance requirements for E-UTRA UE receiver are defined. For channel bandwidths below 5 MHz , the bandwidth of modulated interferer should be equal to bandwidth of the received signal.

For Band 46, the bandwidth of interfering signal is 20 MHz when RF performance requirements for E-UTRA UE receiver are defined.

## D. 2 Interference signals

Table D.2-1 describes the modulated interferer for different channel bandwidth options.
Table D.2-1: Description of modulated E-UTRA interferer

|  | Channel bandwidth |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1 . 4} \mathbf{M H z}$ | $\mathbf{3} \mathbf{M H z}$ | $\mathbf{5} \mathbf{M H z}$ | $\mathbf{1 0} \mathbf{M H z}$ | $\mathbf{1 5} \mathbf{M H z}$ | $\mathbf{2 0} \mathbf{M H z}$ |

|  | $\mathbf{1 . 4} \mathbf{~ M H z}$ | $\mathbf{3 M H z}$ | $\mathbf{5 M H z}$ | $\mathbf{1 0} \mathbf{~ M H z}$ | $\mathbf{1 5 ~ M H z}$ | $\mathbf{2 0} \mathbf{~ M H z}$ |
| $\mathrm{BW}_{\text {Interferer }}$ |  |  |  |  |  | 20 MHz |
| RB |  |  |  |  |  | 100 |

## Annex E (normative): Environmental conditions

## E. 1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

## E. 2 Environmental

The requirements in this clause apply to all types of UE(s).

## E.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:
Table E.2.1-1

| $+15^{\circ} \mathrm{C}$ to $+35^{\circ} \mathrm{C}$ | for normal conditions (with relative humidity of $25 \%$ to $75 \%$ ) |
| :---: | :--- |
| $-10^{\circ} \mathrm{C}$ to $+55^{\circ} \mathrm{C}$ | for extreme conditions (see IEC publications $68-2-1$ and $68-2-2$ ) |

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in clause 6.2 for extreme operation.

## E.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.
The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Table E.2.2-1

| Power source | Lower extreme <br> voltage | Higher extreme <br> voltage | Normal conditions <br> voltage |
| :--- | :---: | :---: | :---: |
| AC mains | $0,9^{*}$ nominal | $1,1^{*}$ nominal | nominal |
| Regulated lead acid battery | $0,9^{*}$ nominal | $1,3^{*}$ nominal | $1,1^{*}$ nominal |
| Non regulated batteries: | $0,85^{*}$ nominal | Nominal | Nominal <br> Leclanché |
| Lithium | $0,95^{*}$ nominal | $1,1^{*}$ Nominal | $1,1^{*}$ Nominal |
| Mercury/nickel \& cadmium | $0,90^{*}$ nominal | Nominal |  |

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in clause 6.2 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

## E.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes.
Table E.2.3-1

| Frequency | ASD (Acceleration Spectral Density) random vibration |
| :--- | :--- |
| 5 Hz to 20 Hz | $0,96 \mathrm{~m}^{2} / \mathrm{s}^{3}$ |
| 20 Hz to 500 Hz | $0,96 \mathrm{~m}^{2} / \mathrm{s}^{3}$ at 20 Hz , thereafter $-3 \mathrm{~dB} /$ Octave |

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 36.101 for extreme operation.

## Annex F (normative): Transmit modulation

## F. 1 Measurement Point

Figure F.1-1 shows the measurement point for the unwanted emission falling into non-allocated RB(s) and the EVM for the allocated RB(s).

Figure F.1-1: EVM measurement points

## F. 2 Basic Error Vector Magnitude measurement

The EVM is the difference between the ideal waveform and the measured waveform for the allocated RB(s)

$$
E V M=\sqrt{\frac{\sum_{v \in T_{m}}\left|z^{\prime}(v)-i(v)\right|^{2}}{\left|T_{m}\right| \cdot P_{0}}},
$$

where
$T_{m}$ is a set of $\left|T_{m}\right|$ modulation symbols with the considered modulation scheme being active within the measurement period,
$z^{\prime}(v)$ are the samples of the signal evaluated for the EVM,
$i(v)$ is the ideal signal reconstructed by the measurement equipment, and
$P_{0}$ is the average power of the ideal signal. For normalized modulation symbols $P_{0}$ is equal to 1 .
The basic EVM measurement interval is defined over one slot in the time domain for PUCCH and PUSCH and over one preamble sequence for the PRACH.

## F. 3 Basic in-band emissions measurement

The in-band emissions are a measure of the interference falling into the non-allocated resources blocks. The in-band emission requirement is evaluated for PUCCH and PUSCH transmissions. The in-band emission requirement is not evaluated for PRACH transmissions.

The in-band emissions are measured as follows
where
$T_{s}$ is a set of $\left|T_{s}\right|$ SC-FDMA symbols with the considered modulation scheme being active within the measurement period,
$\Delta_{R B}$ is the starting frequency offset between the allocated RB and the measured non-allocated RB (e.g. $\Delta_{R B}=1$ or $\Delta_{R B}=-1$ for the first adjacent RB),
$f_{\min }\left(\right.$ resp. $\left.f_{\max }\right)$ is the lower (resp. upper) edge of the UL system BW,
$f_{l}$ and $f_{h}$ are the lower and upper edge of the allocated BW, and
$Y(t, f)$ is the frequency domain signal evaluated for in-band emissions as defined in the subsection (ii)
The relative in-band emissions are, given by

$$
\text { Emissions }_{\text {relative }}\left(\Delta_{R B}\right)=\frac{\text { Emissions }_{\text {absolutet }}\left(\Delta_{R B}\right)}{\frac{1}{\left|T_{s}\right| \cdot N_{R B}} \sum_{t \in T_{s}} \sum_{f_{i}}^{f_{i}\left(12 \cdot N_{R E}-1\right) A f}}|Y(t, f)|^{2}
$$

where
$N_{R B}$ is the number of allocated RBs
The basic in-band emissions measurement interval is defined over one slot in the time domain. When the PUSCH or PUCCH transmission slot is shortened due to multiplexing with SRS, the in-band emissions measurement interval is reduced by one SC-FDMA symbol, accordingly.

In the evaluation of in-band emissions, the timing is set according to $\Delta \tilde{t}=\Delta \tilde{c}$, where sample time offsets $\Delta \tilde{t}$ and $\Delta \tilde{c}$ are defined in subclause F.4.

## F. 4 Modified signal under test

Implicit in the definition of EVM is an assumption that the receiver is able to compensate a number of transmitter impairments.

The PUSCH data or PRACH or Physical Sidelink Channel signal under test is modified and, in the case of PUSCH or Physical Sidelink Channel data signal, decoded according to:

$$
\left.\left.Z^{\prime}(t, f)=I D F T\left\{\frac{F F T\left\{z(v-\Delta \tilde{t}) \cdot e^{-j 2 \pi \Delta \tilde{u}}\right]}{\tilde{a}(t, f) \cdot e^{j \tilde{\varphi}(t, f)}}\right\} e^{j 2 \pi \Delta \tilde{t}}\right)\right\}
$$

where
$z(v)$ is the time domain samples of the signal under test.
The PUCCH or PUSCH or Physical Sidelink Channel demodulation reference signal or PUCCH data signal under test is equalised and, in the case of PUCCH data signal decoded according to:

$$
Z^{\prime}(t, f)=\frac{F F T\left\{z(v-\Delta \tilde{t}) \cdot e^{-j 2 \pi \tilde{f_{v}}}\right\} e^{j 2 \pi \tilde{t} \tilde{t}}}{\tilde{a}(t, f) \cdot e^{j \tilde{\varphi}(t, f)}}
$$

where
$z(v)$ is the time domain samples of the signal under test.
To minimize the error, the signal under test should be modified with respect to a set of parameters following the procedure explained below.

Notation:
$\Delta \tilde{t}$ is the sample timing difference between the FFT processing window in relation to nominal timing of the ideal signal.
$\Delta \tilde{f}$ is the RF frequency offset.
$\tilde{\varphi}(t, f)$ is the phase response of the TX chain.
$\tilde{a}(t, f)$ is the amplitude response of the TX chain.
In the following $\Delta \tilde{c}$ represents the middle sample of the EVM window of length $W$ (defined in the next subsections) or the last sample of the first window half if $W$ is even.

The EVM analyser shall
$>$ detect the start of each slot and estimate $\Delta \tilde{t}$ and $\Delta \tilde{f}$,
$>$ determine $\Delta \tilde{c}$ so that the EVM window of length $W$ is centred

- on the time interval determined by the measured cyclic prefix minus 16 samples of the considered OFDM symbol for symbol 0 for normal CP, i.e. the first 16 samples of the CP should not be taken into account for this step. In the determination of the number of excluded samples, a sampling rate of 30.72 MHz was assumed. If a different sampling rate is used, the number of excluded samples is scaled linearly.
- on the measured cyclic prefix of the considered OFDM symbol symbol for symbol 1 to 6 for normal CP and for symbol 0 to 5 for extended CP.
- on the measured preamble cyclic prefix for the PRACH

To determine the other parameters a sample timing offset equal to $\Delta \tilde{c}$ is corrected from the signal under test. The EVM analyser shall then
$>$ correct the RF frequency offset $\Delta \tilde{f}$ for each time slot, and
$>$ apply an FFT of appropriate size. The chosen FFT size shall ensure that in the case of an ideal signal under test, there is no measured inter-subcarrier interference.

The carrier leakage shall be removed from the evaluated signal before calculating the EVM and the in-band emissions; however, the removed relative carrier leakage power also has to satisfy the applicable requirement.

At this stage the allocated RBs shall be separated from the non-allocated RBs. In the case of PUCCH and PUSCH EVM, the signal on the non-allocated $\mathrm{RB}(\mathrm{s}), Y(t, f)$, is used to evaluate the in-band emissions.

Moreover, the following procedure applies only to the signal on the allocated $\mathrm{RB}(\mathrm{s})$.

- In the case of PUCCH and PUSCH and Physical Sidelink Channel, the UL EVM analyzer shall estimate the TX chain equalizer coefficients $\tilde{a}(t, f)$ and $\tilde{\varphi}(t, f)$ used by the ZF equalizer for all subcarriers by time averaging at each signal subcarrier of the amplitude and phase of the reference and data symbols. The time-averaging length is 1 slot. This process creates an average amplitude and phase for each signal subcarrier used by the ZF equalizer. The knowledge of data modulation symbols may be required in this step because the determination of symbols by demodulation is not reliable before signal equalization.
- In the case of PRACH, the UL EVM analyzer shall estimate the TX chain coefficients $\tilde{a}(t)$ and $\tilde{\varphi}(t)$ used for phase and amplitude correction and are seleted so as to minimize the resulting EVM. The TX chain coefficients are not dependent on frequency, i.e. $\tilde{a}(t, f)=\tilde{a}(t)$ and $\tilde{\varphi}(t, f)=\tilde{\varphi}(t)$. The TX chain coefficient are chosen independently for each preamble transmission and for each $\Delta \tilde{t}$.

At this stage estimates of $\Delta \tilde{f}, \tilde{a}(t, f), \tilde{\varphi}(t, f)$ and $\Delta \tilde{c}$ are available. $\Delta \tilde{t}$ is one of the extremities of the window $W$, i.e. $\Delta \tilde{t}$ can be $\Delta \tilde{c}+\alpha-\left\lfloor\frac{W}{2}\right\rfloor$ or $\Delta \tilde{c}+\left\lfloor\frac{W}{2}\right\rfloor$, where $\alpha=0$ if $W$ is odd and $\alpha=1$ if $W$ is even. The EVM analyser shall then
$>$ calculate $\mathrm{EVM}_{1}$ with $\Delta \tilde{t}$ set to $\Delta \tilde{c}+\alpha-\left\lfloor\frac{W}{2}\right\rfloor$,
$>$ calculate $\mathrm{EVM}_{\mathrm{h}}$ with $\Delta \tilde{t}$ set to $\Delta \tilde{c}+\left\lfloor\frac{W}{2}\right\rfloor$.

## F. 5 Window length

## F.5.1 Timing offset

As a result of using a cyclic prefix, there is a range of $\Delta \tilde{t}$, which, at least in the case of perfect $T x$ signal quality, would give close to minimum error vector magnitude. As a first order approximation, that range should be equal to the length of the cyclic prefix. Any time domain windowing or FIR pulse shaping applied by the transmitter reduces the $\Delta \tilde{t}$ range within which the error vector is close to its minimum.

## F.5.2 Window length

The window length $W$ affects the measured EVM, and is expressed as a function of the configured cyclic prefix length. In the case where equalization is present, as with frequency domain EVM computation, the effect of FIR is reduced. This is because the equalization can correct most of the linear distortion introduced by the FIR. However, the time domain windowing effect can't be removed.

## F.5.3 Window length for normal CP

The table below specifies the EVM window length at channel bandwidths $1.4,3,5,10,15,20 \mathrm{MHz}$, for normal CP . The nominal window length for 3 MHz is rounded down one sample to allow the window to be centered on the symbol.

Table F.5.3-1 EVM window length for normal CP

| Channel Bandwidth MHz | Cyclic prefix length ${ }^{1} N_{c p}$ for symbol 0 | Cyclic prefix length ${ }^{1} N_{c p}$ for symbols 1 to 6 | Nominal FFT size | Cyclic prefix for symbols 1 to 6 in FFT samples | EVM window length $W$ in FFT samples | Ratio of $W$ to CP for symbols 1 to $6^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1.4 | 160 | 144 | 128 | 9 | 5 | 55.6 |

| 1 | 21024 | 24576 | 20928 | $99.5 \%$ |
| 2 | 6240 | 49152 | 6144 | $98.5 \%$ |
| 3 | 21024 | 49152 | 20928 | $99.5 \%$ |
| 4 | 448 | 4096 | 432 | $96.4 \%$ |
| Note 1: | The unit is number of samples, sampling rate of 30.72MHz is <br> assumed |  |  |  |
| Note 2:The use of other FFT sizes is possible as long as appropriate <br> scaling of the window length is applied |  |  |  |  |
| Note 3: These percentages are informative |  |  |  |  |

## F.5.F Window length for category NB1

The EVM window length, W, for NPUSCH is set to 1 (in FFT samples where the nominal FFT size is 128 for 15 kHz sub-carrier spacing and 512 for 3.75 kHz sub-carrier spacing).

The EVM window length, W , for NPRACH is set to 110 for preamble format 0 and to 494 for preamble format 1 (both in FFT samples where the nominal FFT size is 512).

## F. 6 Averaged EVM

The general EVM is averaged over basic EVM measurements for n slots in the time domain.

$$
\overline{E V M}=\sqrt{\frac{1}{n} \sum_{i=1}^{n} E V M_{i}^{2}},
$$

where n is
$\mathrm{n}=20$ for $\mathrm{PUCCH}, \mathrm{PUSCH}, \mathrm{PSDCH}, \mathrm{PSCCH}$, and PSSCH,
$\mathrm{n}=48$ for PBSCH.
The EVM requirements shall be tested against the maximum of the RMS average at the window W extremities of the EVM measurements:

Thus $\overline{\mathrm{EVM}}_{1}$ is calculated using $\Delta \tilde{t}=\Delta \tilde{t}_{l}$ in the expressions above and $\overline{\mathrm{EVM}}_{\mathrm{h}}$ is calculated using $\Delta \tilde{t}=\Delta \tilde{t}_{h}$.
Thus we get:

$$
E V M=\max \left(\overline{\mathrm{EVM}}_{1}, \overline{\mathrm{EVM}}_{h}\right)
$$

The calculation of the EVM for the demodulation reference signal, $E V M_{D M R S}$, follows the same procedure as calculating the general EVM, with the exception that the modulation symbol set $T_{m}$ defined in clause F. 2 is restricted to symbols containing uplink demodulation reference signals.

The basic $E V M_{\text {DMRS }}$ measurements are first averaged over 20 slots in the time domain to obtain an intermediate average $\overline{E V M}_{\text {DMRS }}$.

$$
\overline{E V M}_{D M R S}=\sqrt{\frac{1}{20} \sum_{i=1}^{20} E V M_{D M R S, i}^{2}}
$$

In the determination of each $E V M_{D M R S, i}$, the timing is set to $\Delta \tilde{t}=\Delta \tilde{t}_{l}$ if $\overline{\mathrm{EVM}}_{1}>\overline{\mathrm{EVM}}_{\mathrm{h}}$, and it is set to $\Delta \tilde{t}=\Delta \tilde{t}_{h}$ otherwise, where $\overline{\mathrm{EVM}}_{1}$ and $\overline{\mathrm{EVM}}_{\mathrm{h}}$ are the general average EVM values calculated in the same 20 slots over which the intermediate average $\overline{E V M}_{D M R S}$ is calculated. Note that in some cases, the general average EVM may be calculated only for the purpose of timing selection for the demodulation reference signal EVM.

Then the results are further averaged to get the EVM for the demodulation reference signal, $E V M_{D M R S}$,

$$
E V M_{D M R S}=\sqrt{\frac{1}{6} \sum_{j=1}^{6} \overline{E V M}_{D M R S, j}^{2}}
$$

The PRACH EVM, $E V M_{P R A C H}$, is averaged over two preamble sequence measurements for preamble formats $0,1,2$, 3 , and it is averaged over 10 preamble sequence measurements for preamble format 4.

The EVM requirements shall be tested against the maximum of the RMS average at the window $W$ extremities of the EVM measurements:

Thus $\overline{\mathrm{EVM}}_{\mathrm{PRACH}, 1}$ is calculated using $\Delta \tilde{t}=\Delta \tilde{t}_{l}$ and $\overline{\mathrm{EVM}}_{\mathrm{PRACH}, \mathrm{h}}$ is calculated using $\Delta \tilde{t}=\Delta \tilde{t}_{h}$.
Thus we get:
$E V M_{\text {PRACH }}=\max \left(\overline{\mathrm{EVM}}_{\mathrm{PRACH}, \mathrm{l}}, \overline{\mathrm{EVM}}_{\mathrm{PRACH}, \mathrm{h}}\right)$

## F.6.F Averaged EVM for category NB1

The general EVM for category NB1 is calculated using the procedure defined in Annex F. 6 with the exception that the general EVM is averaged over basic EVM measurements for $240 / L_{\text {Ctone }}$ slots in the time domain, where $L_{\text {Cotone }}=\{1,3,6$, $12\}$ is the number of subcarriers for the transmission.

The calculation of the EVM for the demodulation reference symbols for category NB1 follows the procedure defined for DMRS in Annex F. 6 with the exception that the basic $E V M_{\text {DMRS }}$ measurements are first averaged over 240/ $L_{C \text { tone }}$ slots to obtain the intermediate average EVM.

The calculation of the NPRACH EVM for both formats follows the procedure defined for PRACH in Annex F. 6 with the exception that $E V M_{\text {PRACH }}$ is averaged over 64 preamble measurements.

## F. 7 Spectrum Flatness

The data shall be taken from FFT coded data symbols and the demodulation reference symbols of the allocated resource block.

## Annex G (informative): <br> Reference sensitivity level in lower SNR

This annex contains information on typical receiver sensitivity when HARQ transmission is enabled allowing operation in lower SNR regions (HARQ is disabled in conformance testing), thus representing the configuration normally used in live network operation under noise-limited conditions.

## G. 1 General

The reference sensitivity power level $\mathrm{P}_{\text {SENS }}$ with HARQ retransmission enabled (operation in lower SNR) is the minimum mean power applied to both the UE antenna ports at which the residual BLER after HARQ shall meet the requirements for the specified reference measurement channel. The residual BLER after HARQ transmission is defined as follows:
$B L E R_{\text {residual }}=1-\frac{A}{B}$
$A$ : Number of correctly decoded MAC PDUs
$B$ : Number of transmitted MAC PDUs (Retransmitted MAC PDUs are not counted)

## G. 2 Typical receiver sensitivity performance (QPSK)

The residual BLER after HARQ shall be lower than $1 \%$ for the reference measurement channels as specified in Annexes G. 3 (with one sided dynamic OCNG Pattern OP. 1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table G.2-1 and Table G.2-2

Table G.2-1: Reference sensitivity QPSK Psens

| Channel bandwidth |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E-UTRA Band | 1.4 MHz (dBm) | $\begin{aligned} & 3 \mathrm{MHz} \\ & \text { (dBm) } \\ & \hline \end{aligned}$ | $5 \mathrm{MHz}$ $(\mathrm{dBm})$ | 10 MHz (dBm) | $15 \mathrm{MHz}$ <br> (dBm) | 20 MHz <br> (dBm) | Duplex Mode |
| 1 |  |  |  | [-102] |  |  | FDD |
| 2 |  |  |  | TBD |  |  | FDD |
| 3 |  |  |  | TBD |  |  | FDD |
| 4 |  |  |  | TBD |  |  | FDD |
| 5 |  |  |  | TBD |  |  | FDD |
| 6 |  |  |  | TBD |  |  | FDD |
| 7 |  |  |  | TBD |  |  | FDD |
| 8 |  |  |  | TBD |  |  | FDD |
| 9 |  |  |  | TBD |  |  | FDD |
| 10 |  |  |  | TBD |  |  | FDD |
| 11 |  |  |  | TBD |  |  | FDD |
| 12 |  |  |  | TBD |  |  | FDD |
| 13 |  |  |  | TBD |  |  | FDD |
| 14 |  |  |  | TBD |  |  | FDD |
| ... |  |  |  |  |  |  |  |
| 17 |  |  |  | TBD |  |  | FDD |
| 18 |  |  |  | TBD |  |  | FDD |
| 19 |  |  |  | TBD |  |  | FDD |
| 20 |  |  |  | TBD |  |  | FDD |
| 21 |  |  |  | TBD |  |  | FDD |
| 22 |  |  |  | TBD |  |  | FDD |

Table G.2-2 specifies the minimum number of allocated uplink resource blocks for which the reference receive sensitivity requirement in lower SNR must be met.

Table G.2-2: Minimum uplink configuration for reference sensitivity

| E-UTRA Band / Channel bandwidth / NRB / Duplex mode |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E-UTRA <br> Band | $\mathbf{1 . 4} \mathbf{~ M H z}$ | $\mathbf{3} \mathbf{~ M H z}$ | $\mathbf{5} \mathbf{~ M H z}$ | $\mathbf{1 0} \mathbf{~ M H z}$ | $\mathbf{1 5} \mathbf{~ M H z}$ | $\mathbf{2 0} \mathbf{M H z}$ | Duplex <br> Mode |
| 1 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 2 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 3 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 4 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 5 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 6 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 7 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 8 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 9 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 10 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 11 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 12 |  |  |  | $[6]^{1}$ |  |  | FDD |
| 13 |  |  |  | $[6]^{1}$ |  |  | FDD |

Unless given by Table G.2-3, the minimum requirements specified in Tables G.2-1 and G.2-2 shall be verified with the network signalling value NS_01 (Table 6.2.4-1) configured.

Table G.2-3: Network Signalling Value for reference sensitivity

| Network Signalling <br> value | E-UTRA Band |
| :---: | :--- |
| NS_03 | $2,4,10,23,35,36,70$ |
| NS_06 | $12,13,14,17$ |
| NS_08 | 19 |

| NS_09 | 21 |
| :--- | :--- |
| NS_21 | 30 |
| NS_35 | 71 |
| NS_56 | 24 |

## G. 3 Reference measurement channel for REFSENSE in lower SNR

Tables G.3-1 and G.3-2 are applicable for Annex G. 2 (Reference sensitivity level in lower SNR).
Table G.3-1 Fixed Reference Channel for Receiver Requirements (FDD)

Table G.3-2 Fixed Reference Channel for Receiver Requirements (TDD)

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| Channel Bandwidth | MHz |  |  |  | 10 |  |  |
| Allocated resource blocks |  |  |  |  | 50 |  |  |
| Uplink-Downlink Configuration (Note 5) |  |  |  |  | 1 |  |  |
| Allocated subframes per Radio Frame <br> (D+S) |  |  |  |  | $4+2$ |  |  |
| Number of HARQ Processes | Processes |  |  |  | 7 |  |  |
| Maximum number of HARQ transmission |  |  |  |  | $[4]$ |  |  |
| Modulation |  |  |  |  | QPSK |  |  |
| Target coding rate |  |  |  |  | $1 / 3$ |  |  |
| Information Bit Payload per Sub-Frame | Bits |  |  |  |  |  |  |
| For Sub-Frame 4, 9 |  |  |  |  | 4392 |  |  |
| For Sub-Frame 1,6 |  |  |  |  | 3240 |  |  |

## Annex H (normative): <br> Modified MPR behavior

## H. 1 Indication of modified MPR behavior

This annex contains the definitions of the bits in the field modifiedMPRbehavior indicated in the IE UE Radio Access Capability [7] by a UE supporting an MPR or A-MPR modified in a later release of this specification.

Table H.1-1: Definitions of the bits in the field modifiedMPRbehavior

| Index of field <br> (bit number) | Nefinition <br> (description of the supported functionality if indicator <br> set to one) | Notes |
| :--- | :--- | :--- |
| 0 (leftmost bit) | - The MPR for intra-band contiguous carrier <br> aggregation bandwidth class C with non-contiguous <br> resource allocation specified in Clause 6.2.3A in <br> version 12.5.0 of this specification | - This bit shall be set to 1 by <br> a UE supporting intra-band <br> contiguous CA bandwidth <br> class C |
| 1 | - The A-MPR associated with NS_05 for Band 1 in <br> Clause 6.2.4 in version 12.10.0 of this specification. | - This bit shall be set to 1 by <br> a UE supporting A-MPR <br> associated to NS_05 for <br> Band 1. |
| 2 | The A-MPR associated with NS_04 for Band 41 in <br> Table 6.2.4-4 in version 14.1.0 of this specification. | - This bit shall be set to 1 by <br> a power class 3 UE <br> supporting A-MPR <br> associated to NS_04 for <br> Band 41. |
| 3 | The A-MPR associated with NS_31 for Band 46 in <br> Table 6.2.4-26 in version 15.3.0 of this specification. | - This bit shall be set to 1 by <br> a UE supporting A-MPR <br> associated to NS_31 for <br> Band 46. |

## Annex I (normative): Supported Post Antenna Gain

## I. 1 Declared Supported Post Antenna Gain for UE

For V2X service at band 47, some regional requirements (region 1) are defined per effective isotropic radiated power (EIRP), which is a combination of the transmitted power (or in some cases spectral density) and the effective antenna gain.

Due to large form factor, V2X UE can have external antenna placed far away from the chipset unit. In this case, the effective antenna gain is a UE specific condition. This effective antenna gain includes the feeding loss of all components after the chipset unit antenna connector and the peak directional gain of the external antenna and hence will be call the post connector gain $\mathrm{G}_{\text {post connector }}$.

The 3GPP specifications mandate UE manufacturer declarations of at least one supported value of the post connector gain $\mathrm{G}_{\text {post connector }}$ as a way to accommodate the refered regional requirement without putting requirements on the UE specific condtion.

The possible values of declared supported post connector gains are: $0,1,2,3,4,5,6,7 \mathrm{dBi}$. If no value is declared, or if external antenna is not used, the default value of 0 dBi will be used.

The regional requirements in $\mathrm{P}_{\text {EIRP }}$ in Subclauses 6.2.2G, 6.2.5G, 6.6.2.2.4, 6.6.3.2 and 7.9.1 will be converted to conducted requirements by subtracting $\mathrm{G}_{\text {post connector }}$ as.

$$
\mathrm{P}_{\text {Conducted }}=\mathrm{P}_{\text {EIRP }}-\mathrm{G}_{\text {post connector. }}
$$

| V16.16.0 | May 2023 | Publication |

[^0]:    NOTE 1: NB ${ }_{\text {index }}$ is the narrowband index that is defined in 6.2.7 in [4]. The resource block assignment is defined within the narrowband as defined in 5.3.3.1.12 and 5.3.3.1.13 in [5].
    NOTE 2: Lcsc is the length of the continuous subcarrier, SCstart is the subcarrier offset relative to the first subcarrier of the first PRB of NB indicated with NBindex.

[^1]:    <reserved for future use>

[^2]:    transport blocks are calculated as the sum of the numbers of DL transport blockes across all the CGs used for DC transmission or reception.
    Note 3: For the configuration of DRB type of SCG bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*} N_{D L \_ \text {correct_rx/ }}\left(N_{D L \_ \text {newtx }}+N_{D L \_ \text {retx }}\right)$, where $N_{D L \_ \text {newtx }}$ is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NDL_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes per CG used for DC transmission or reception, separately.
    Note 4: 71112 bits for sub-frame 5.

[^3]:    Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
    Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.

[^4]:    - $t_{u e, \text { followCRI }}{ }^{(1)}$, followPMI ${ }^{(2)}$ is [70\%] of the maximum throughput obtained at $S N R_{\text {ue, followCRI }}{ }^{(1)}$, followPMI ${ }^{(2)}$ using following precoder according to UE reported $\mathrm{PMI}^{(2)}$ for eMIMO-Type2 and power scaling factor according to UE reported CRI ${ }^{(1)}$ for eMIMO-Type

[^5]:    Note 1: 2 symbols allocated to PDCCH. 1 symbol allocated to PDCCH for reference channel with 1024QAM.
    Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].
