### 8.2.4 LAA

### 8.2.4.1 Closed-loop spatial multiplexing performance 4Tx Antenna Port

### 8.2.4.1.1 FDD PCell (FDD single carrier)

The parameters specified in Table 8.2.4.1.1-1 are valid for FDD CC and LAA SCell(s) unless otherwise stated. And the additional parameters specified in Table 8.2.4.1.1-2 are valid for LAA SCell(s).

Table 8.2.4.1.1-1: Common Test Parameters

| Parameter | Unit | Value |  |
| :--- | :---: | :---: | :---: |
| Inter-TTI Distance |  | 1 |  |
| Number of HARQ <br> processes per <br> component carrier | Processes | 8 |  |
| Maximum number of <br> HARQ transmission <br> (Note 1) |  | 4 |  |
| Redundancy version <br> coding sequence |  | $\{0,1,2,3\}$ for QPSK and 16QAM <br> $\{0,0,1,2\}$ for 64QAM and 256QAM |  |
| Cyclic Prefix | Normal |  |  |
| Cell_ID | 0 |  |  |
| Cross carrier scheduling | Not configured |  |  |
| Note 1: For retransmission in partial subframes, the TB size should be kept the same as |  |  |  |
| the initial transmission regardless of the initial transmission is performed in full |  |  |  |
| subframes or partial subframes. |  |  |  |

Table 8.2.4.1.1-2: Addtional Test Parameters for LAA SCell(s)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| DMTC Periodicity | ms | 80 |
| dmtc-PeriodOffset-r12 <br> ms80-r12 |  | 0 |
| Discovery signal <br> occasion duration | subframe | 1 |
| Power allocation of <br> discovery signal |  | Same as power allocation of CRS within a <br> transmission burst in the test |

For CA with LAA SCell(s), the requirements are specified in Table 8.2.4.1.1-4, with the addition of the parameters in Table 8.2.4.1.1-1, Table 8.2.4.1.1-2, Table 8.2.4.1.1-3 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rank-two performance with frequency selective precoding for CA with LAA SCell(s).

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.2.4.1.1-3: Test Parameters for Dual-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |

| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| :---: | :---: | :---: |
| Precoding granularity | PRB | 4 for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) | ms | 8 |
| Reporting interval | ms | 1 |
| Reporting mode |  | PUSCH 1-2 |
| CodeBookSubsetRestriction bitmap |  | 000000000000000000000000000000 001111111111111111000000000000 0000 |
| CSI request field (Note 3) |  | '10' |
| PDSCH transmission mode |  | TM4 |
| DL Burst transmission pattern for LAA SCell |  | As specified in B. 8 |
| The number of subframes set $\left(S_{1}\right)$ in a burst |  | \{1,3,5,8\} |
| Occupied OFDM symbols set in the last subframe |  | \{6,9,12,14\} |
| Random variable $p$ defined in B. 8 |  | 0.5 |
| timing error relative of LAA SCell to PCell | $\mu \mathrm{s}$ | 0 |
| Frequency offset of th $i$-th LAA SCell relative to PCell | Hz | 200 |
| Note 1: $\quad P_{B}=1$. |  |  |
| Note 2: If the UE reports in an based on PMI estima PMI cannot be applied | ailable uplink at a downlink the eNB dow | orting instance at subrame SF\#n not later than SF\#(n-4), this reported $k$ before SF\#( $\mathrm{n}+4$ ). |
| Note 3: Multiple CC-s under layers. | are configured | the $1^{\text {st }}$ set of serving cells by higher |
| Note 4: ACK/NACK bits are tr <br> Note 5: The same PDSCH tr | smitted using mission mode | SCH with PUCCH format 3. applied to each component carrier. |

Table 8.2.4.1.1-4: Single carrier performance for PCell for multiple CA configurations

| Bandwidth | Reference channel | OCNG pattern | Propagation condi-tion | Correlation matrix and antenna config. | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Fraction of maximum throughput (\%) | $\begin{aligned} & \text { SNR } \\ & \text { (dB) } \end{aligned}$ |
| 1.4 MHz | R.14-4 FDD | OP. 1 FDD | EVA5 | 4x2 Low | 70 | 10.4 |
| 3 MHz | R.14-5 FDD | OP. 1 FDD | EVA5 | $4 \times 2$ Low | 70 | 9.5 |
| 5 MHz | R.14-6 FDD | OP. 1 FDD | EVA5 | $4 \times 2$ Low | 70 | 9.5 |
| 10 MHz | R. 14 FDD | OP. 1 FDD | EVA5 | $4 \times 2$ Low | 70 | 10.1 |
| 15MHz | R.14-7 FDD | OP. 1 FDD | EVA5 | $4 \times 2$ Low | 70 | 10.1 |
| 20 MHz | R.14-3 FDD | OP. 1 FDD | EVA5 | 4x2 Low | 70 | 10.3 |

Table 8.2.4.1.1-5: Single carrier performance for LAA SCell(s) for multiple CA configurations

| Bandwidth | Sub-test <br> (Note 2) | Reference channel | OCNG pattern | Propagation condition | Correlation matrix and antenna config. | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Fraction of norminal maximum throughput (\%) (Note 1) | SNR <br> (dB) |
| 20MHz | 1 | R. 1 FS3 | OP. 1 FS3 | EVA5 | 4x2 Low | 70 | 18.7 |
|  | 2 | R. 1 FS3 | OP. 1 FS3 | EVA5 | 4x2 Low | 70 | 18.6 |
|  | 3 | R. 1 FS3 | OP. 1 FS3 | EVA5 | 4x2 Low | 70 | 18.9 |
|  | 4 | R. 1 FS3 | OP. 1 FS3 | EVA5 | 4x2 Low | 70 | 19 |
| Note 1: | Fraction of nominal maximum throughput is calculated based on random transmission occasions of PDSCH. |  |  |  |  |  |  |
| Note 2: | An UE is required to fulfill only one test of Sub-test 1-4 depending on UE capabilities of endingDwPTS and secondSlotStartingPosition. For an UE not supporting both endingDwPTS and secondSlotStartingPosition, it is required to fulfill Sub-test 1; For an UE not supporting endingDwPTS but |  |  |  |  |  |  |

supporting secondSlotStartingPosition, it is required to fulfill Sub-test 2; For an UE supporting endingDwPTS but not supporting secondSlotStartingPosition, it is required to fulfil Sub-test 3; and For an UE supporting both endingDwPTS and secondSlotStartingPosition, it is required to fulfill Sub-test 4.

| 1 | $7 \times 20$ | 20 | $6 \times 20$ | As defined in Table 8.2.4.1.1-4 and Table 8.2.4.1.1-5 | $\geq 5$ |
| 2 | $15+6 \times 20$ | 15 | $6 \times 20$ | As defined in Table 8.2.4.1.1-4 and Table 8.2.4.1.1-5 | $\geq 5$ |
| 3 | $10+6 \times 20$ | 10 | $6 \times 20$ | As defined in Table 8.2.4.1.1-4 and Table 8.2.4.1.1-5 | $\geq 5$ |

Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3D.
Note 2: Apply a per-CC requirement defined in Table 8.2.4.1.1-4 for PCell and apply a per-CC requirement defined in Table 8.2.4.1.1-5 for LAA SCell.

### 8.2.4.1.2 TDD PCell (TDD single carrier)

The parameters specified in Table 8.2.4.1.2-1 are valid for TDD CC and LAA SCell(s) unless otherwise stated. And the additional parameters specified in Table 8.2.4.1.2-2 are valid for LAA SCell(s).

Table 8.2.4.1.2-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Uplink downlink configuration (Note 1) |  | 1 |
| Special subframe configuration (Note 2) |  | 4 |
| Cyclic prefix |  | Normal |
| Cell ID |  | 0 |
| Inter-TTI Distance |  | 1 |
| Number of HARQ processes per component carrier | Processes | 7 |
| Maximum number of HARQ transmission (Note 3) |  | 4 |
| Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM and 256QAM |
| Cross carrier scheduling |  | Not configured |
| Note 1: as specified in Table 4.2-2 in TS 36.211 [4]. <br> Note 2: as specified in Table 4.2-1 in TS 36.211 [4]. <br> Note 3: For retransmission in partial subframes, the TB size should be kept the same as the initial transmission regardless of the initial transmission is performed in full subframes or partial subframes. |  |  |

Table 8.2.4.1.2-2: Addtional Test Parameters for LAA SCell(s)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| DMTC Periodicity | ms | 80 |
| dmtc-PeriodOffset-r12 <br> ms80-r12 |  | 0 |
| Discovery signal <br> occasion duration | subframe | 1 |
| Power allocation of <br> discovery signal |  | Same as power allocation of CRS within a <br> transmission burst in the test |

For CA with LAA SCell(s), the requirements are specified in Table 8.2.4.1.2-4, with the addition of the parameters in Table 8.2.4.1.2-1, Table 8.2.4.1.2-2, Table 8.2.4.1.2-3 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rank-two performance with frequency selective precoding for CA with LAA SCell(s).

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.2.4.1.2-3: Test Parameters for Dual-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 4 for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) |  | ms | 10 or 11 |
| Reporting interval |  | ms | 1 or 4 (Note 3) |
| Reporting mode |  |  | PUSCH 1-2 |

### 8.3.1.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format 2 C , the requirements are specified in Table 8.3.1.1-1 and 8.3.1.1-2, with the addition of the parameters in Table 8.3.1.1-3 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 with and without a simultaneous transmission on the other antenna port, and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.3.1.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSIRS configurations

| parameter |  | Unit | Test 1, Test 1a | Test 2 | Test 3 | Test 4 | Test 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 | 0 | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) |
|  | $\sigma$ | dB | -3 | -3 | -3 | -3 | -3 |
| Beamforming model |  |  | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 |

| Simultaneous transmission |  |  | No | Yes (Note 3, 5) | No | No | No |

| PDSCH <br> transmission <br> mode | 9 | 9 | 9 | 9 | 9 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of <br> MBSFN <br> subframes | Subframes | 6 (Note 6) | NA | NA | 6 (Note 6) | NA |

## Note 1: $\quad P_{B}=1$.

Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8.
Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test.
Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Note 5: The two UEs' scrambling identities $n_{\text {SCID }}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.
Note 6: For FDD mode, 6 subframes ( $\# 1 / 2 / 3 / 6 / 7 / 8$ ) are allocated as MBSFN subframes.
Note 7: Through DCI signalling, indicating aperiodic ZP-CSI-RS in sub-frames \#3 and \#8 per frame, the indicated aperiodic ZP-CSI-RS is random selected from RRC-configured AP ZP CSIRS list.

Table 8.3.1.1-2: Minimum performance for CDM-multiplexed DM RS without simultaneous transmission (FRC) with multiple CSI-RS configurations

### 8.3.1.1A Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing with TM9 interference model

The requirements are specified in Table 8.3.1.1A-2, with the addition of the parameters in Table 8.3.1.1A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.3.1.1A-1, Cell 1 is the serving cell, and

Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

Table 8.3.1.1A-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model

| parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| CSI reference signals |  |  | Antenna ports 15,...,18 | N/A |
| CSI-RS periodicity and subframe offset $T_{\text {CSI-RS }} / \Delta_{\text {CSI-RS }}$ |  | Subframes | 5 / 2 | N/A |
| CSI reference signal configuration |  |  | 0 | N/A |
| $N_{o c}$ at antenna port |  | $\begin{gathered} \mathrm{dBm} / 15 \mathrm{kH} \\ \mathrm{z} \end{gathered}$ | -98 | N/A |
| DIP (Note 2) |  | dB | N/A | -1.73 |
| BWChannel |  | MHz | 10 | 10 |
| Cyclic Prefix |  |  | Normal | Normal |
| Cell Id |  |  | 0 | 126 |
| Number of control OFDM symbols |  |  | 2 | 2 |
| PDSCH transmission mode |  |  | 9 | N/A |
| Beamforming model |  |  | As specified in clause B.4.3 (Note 4, 5) | N/A |
| Interference model |  |  | N/A | As specified in clause B.5.4 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 |  | N/A | 70 |
|  | Rank 2 |  | N/A | 30 |
| Precoder update granularity |  | PRB | 50 | 6 |
| PMI delay (Note 5) |  | Ms | 8 | N/A |
| Reporting interval |  | Ms | 5 | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A |
| CodeBookSubsetRestriction bitmap |  |  | $\begin{aligned} & \hline 0000000000000000 \\ & 0000000000000000 \\ & 0000000000000000 \\ & 111111111111111 \\ & \hline \end{aligned}$ | N/A |
| Symbols for unused PRBs |  |  | OCNG (Note 6) | N/A |
| Simultaneous transmission |  |  | No simultaneous transmission on the other antenna port in (7 or 8) not used for the input signal under test | N/A |
| Physical channel for CQIreporting |  |  | PUSCH(Note 8) | N/A |
| cqi-pmi-ConfigurationIndex |  |  | 5 | N/A |
| Note 1: $\quad P_{B}=1$ |  |  |  |  |

Note 2: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1.
Note 3: The modulation symbols of the signal under test in Cell 1 are mapped onto antenna port 7 or 8 .
Note 4: The precoder in clause B. 4.3 follows UE recommended PMI.
Note 5: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ ).
Note 6: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 7: All cells are time-synchronous.
Note 8: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.

### 8.3.1.1B Single-layer Spatial Multiplexing (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured)

The requirements are specified in Table 8.3.1.1B-2, with the addition of parameters in Table 8.3.1.1B-1. The purpose is to verify the performance of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [9] of the aggressor cell with CRS assistance information. In Table 8.3.1.1B-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] includes Cell 2 and Cell 3.

| Cyclic prefix |  |  | Normal | Normal | Normal |

Note 1: $\quad P_{B}=1$.
Note 2: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10, \#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 3: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 4: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor nonABS
Note 5: ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 6: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 7: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 8: The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.
Note 10: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 11: The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 12: SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.
Note 13: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8.

### 8.3.1.1C Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM9 interference model

The requirements are specified in Table 8.3.1.1C-2, with the addition of the parameters in Table 8.3.1.1C-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7,8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of two interfering cells applying transmission mode 9 interference model defined in clause B.6.4. In 8.3.1.1C-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.1.1C-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with TM9 interference model

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.

### 8.3.1.1D Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with CRS interference model

The requirements are specified in Table 8.3.1.1D-2, with the addition of the parameters in Table 8.3.1.1D-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by the CRS of the interfering cell, applying the CRS interference model defined in clause B.6.5. In 8.3.1.1D-1, Cell 1 is the serving cell, and Cell 2,3 are
interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.1.1D-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with CRS interference model

| Parameter |  |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.3.1.1E Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM3 interference model

The requirements are specified in Table 8.3.1.1E-2, with the addition of the parameters in Table 8.3.1.1E-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of two interfering cells applying transmission mode 3 interference model defined in clause B.6.2. In 8.3.1.1E-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.1.1E-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with TM3 interference model

| Parameter |  |  | Unit | Cell 1 | Cell 2 | Cell 3 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: $\quad$ SNR corresponds to $\hat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.

### 8.3.1.1F Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM10 serving cell configuration and TM9 interference model

The requirements are specified in Table 8.3.1.1F-2, with the addition of the parameters in Table 8.3.1.1F-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission configured with TM10 in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.6.3. The NAICS network assistance is provided when the serving cell TM10 is configured with QCL-type A and PCID based DM-RS scrambling. The neighbouring cell has transmission mode TM9 and NeighCellsInfo-r12 for interfering cell indicates presence of TM9. In 8.3.1.1F-1, Cell 1 is the serving cell, and Cell 2,3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.1.1F-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM10 serving cell configuration and TM9 interference model

| Parameter |  |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 8.3.1.1G Single-layer Spatial Multiplexing (CRS assistance information is configured)

The requirements are specified in Table 8.3.1.1G-2, with the addition of parameters in Table 8.3.1.1G-1. The purpose is to verify the performance of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell with CRS assistance information. In Table 8.3.1.1G-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1, Cell2 and Cell 3 is according to Annex C.3.2. The CRS assistance information [7] includes Cell 2 and Cell 3.

Table 8.3.1.1G-1: Test parameters of TM9-Single-Layer (2 CSI-RS ports)

| Parameter | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{\mathrm{E}}_{\mathrm{s}} / \mathrm{N}_{\mathrm{oc}}$ of cell 1.

### 8.3.1.1H Single-layer Spatial Multiplexing (With Enhanced DMRS table configured)

For single-layer transmission on antenna port $7,8,11$ or 13 upon detection of a PDCCH with DCI format 2C, the requirement is specified in Table 8.3.1.1H-2, with the addition of the parameters in Table 8.3.1.1H-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of the test is to verify rank-1 performance on antenna port 11 with a simultaneous transmission on the antenna port 7,8 or 13 with DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

Table 8.3.1.1H-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations with Enhanced DMRS table

### 8.3.1.1 $\quad$ Single-layer Spatial Multiplexing (with assistance information for simultaneous transmition interfering PDSCH)

For single-layer transmission on a DMRS antenna port upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.3.1.1I-1, with the addition of the parameters in Table 8.3.1.1I-2 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one DMRS antenna port with a simultaneous transmission on on of the other DMRS antenna port with or without DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

Table 8.3.1.11-1: Test Parameters for Minimun Performance Requirement - Single-layer Spatial Multiplexing with assistance information for simultaneous transmition interfering PDSCH (FRC)

| parameter |  | Unit | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.3.1.2 Dual-Layer Spatial Multiplexing

For dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.3.1.2-2, with the addition of the parameters in Table 8.3.1.2-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation, to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

Table 8.3.1.2-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSIRS configurations

| Parameter |  | Unit | Test 1 |  |

### 8.3.1.3 Performance requirements for DCI format 2D and non Quasi Co-located Antenna Ports

### 8.3.1.3.1 Minimum requirement with Same Cell ID (with single NZP CSI-RS resource)

The requirements are specified in Table 8.3.1.3.1-3, with the additional parameters in Table 8.3.1.3.1-1 and Table 8.3.1.3.1-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission point share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6], configured according to Table 8.3.1.3.1-2. In Tables 8.3.1.3.1-1 and 8.3.1.3.1-2, transmission point 1 (TP 1 ) is the serving cell and transmission point 2 (TP 2) transmits PDSCH. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.1.3.1-1: Test Parameters for quasi co-location type B: same Cell ID

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |

Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for TP 1 and TP 2.
Note 3: $\quad$ SNR corresponds to $\hat{E}_{s} / N_{o c}$ of TP 2 as defined in clause 8.1.1.

### 8.3.1.3.2 Minimum requirements with Same Cell ID (with multiple NZP CSI-RS resources)

The requirements are specified in Table 8.3.1.3.2-3, with the additional parameters in Tables 8.3.1.3.2-1 and 8.3.1.3.2-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission point share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6]. In Tables 8.3.1.3.2-1 and 8.3.1.3.2-2, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) has same Cell ID as TP 1. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between 2 TPs with multiple PDSCH RE Mapping and Quasi-Co-Location Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.1.3.2-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.1.3.2-1: Test Parameters for timing offset compensation with DPS transmission

### 8.3.1.3.3 Minimum requirement with Different Cell ID and Colliding CRS (with single NZP CSIRS resource)

The requirements are specified in Table 8.3.1.3.3-2, with the additional parameters in Table 8.3.1.3.3-1. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points have different Cell ID and colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.3.1.3.3-1, transmission point 1 (TP 1) is serving cell transmitting PDCCH, synchronization signals and PBCH , and transmission point 2 (TP 2) transmits PDSCH with different Cell ID. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.1.3.3-1: Test Parameters for quasi co-location type B with different Cell ID and Colliding CRS

| parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Beamforming model |  |  | N/A | As specified in clause B.4.2 |

Note 1: The propagation conditions for TP. 1 and TP. 2 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP. 1 and TP.2.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of TP. 2 as defined in clause 8.1.1.

### 8.3.1.3.4 Minimum requirement with Different Cell ID and non-colliding CRS (with single NZP CSI-RS resource and CRS assistance information is configured)

The requirements are specified in Table 8.3.1.3.4-3, with the additional parameters in Table 8.3.1.3.4-1 and Table 8.3.1.3.4-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where three transmission points have different Cell ID and non-colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference and time difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. Further, the test verifies that the UE, configured with the CRS assistance information [7], can mitigate interference from CRS for demodulation. The CRS assistance information [7] includes TP 3. In Table 8.3.1.3.4-1, transmission point 1 (TP 1) is serving cell transmitting PDCCH, synchronization signals and PBCH, transmission point 2 (TP 2) transmits PDSCH with different Cell ID, and Transmission point 3 (TP 3) is the aggressor transmission point. The downlink physical channel setup for TP 1 is according to Table C.3.4-1, for TP 2 is according to Table C.3.4-2, and for TP 3 is according to Annex C.3.2.

Table 8.3.1.3.4-1: Test Parameters for quasi co-location type B with different Cell ID and nonColliding CRS when CRS assistance information is configured

| parameter |  | Unit | TP 1 | TP 2 | TP 3 |

Note 1: The propagation conditions for TP.1, TP. 2 and TP. 3 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP.1, TP. 2 and TP.3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of TP. 2 as defined in clause 8.1.1.
8.3.1.3.5 Minimum requirements with different Cell ID and non-colliding CRS (with multiple NZP CSI-RS resources and CRS assistance information is configured)

The requirements are specified in Table 8.3.1.3.5-3, with the additional parameters in Tables 8.3.1.3.5-1 and 8.3.1.3.5-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where three transmission points have different Cell ID and non-colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type $B$, performs correct tracking and compensation of the frequency difference and timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6]. Further, the test verifies that the UE, configured with the CRS assistance information [7], can mitigate interference from CRS for demodulation. The CRS assistance information [7] includes TP 3. In Tables 8.3.1.3.5-1 and 8.3.1.3.5-2, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, Transmission point 2 (TP 2) has different Cell ID as TP 1, and Transmission point 3 (TP 3) is the aggressor transmission point. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between TP 1 and TP 2 with multiple PDSCH RE Mapping and Quasi-Co-Location Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.1.3.5-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1, for TP 2 is according to Table C.3.4-2, and for TP 3 is according to Annex C.3.2.

Table 8.3.1.3.5-1: Test Parameters DPS transmission with CRS assistance information

| parameter | Unit | TP 1 | TP 2 | TP 3 |

### 8.3.1.3.6 Minimum requirements for QCL Type C and 2 Layers Spatial Multiplexing

The requirements are specified in Table 8.3.1.3.6-3, with the additional parameters in Table 8.3.1.3.6-1 and Table 8.3.1.3.6-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.3.1.3.6-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP1 and TP2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.3.1.3.6-1: Test Parameters

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |

### 8.3.1.4 Performance Requirements for semiOpenLoop transmission

The requirements are specified in Table 8.3.1.4-2, with the addition of the parameters in Table 8.3.1.4-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank one and rank two performances for full RB allocation upon antenna ports 7 and 8 with higher layer parameter semiOpenLoop is configured.

Table 8.3.1.4-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) when high layer parameter semiOpenLoop is configured

| parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |

### 8.3.2 TDD

The parameters specified in Table 8.3.2-1 are valid for TDD unless otherwise stated.
Table 8.3.2-1: Common Test Parameters for User-specific Reference Symbols

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | Uplink downlink <br> configuration (Note 1) |  | 1 |
|  | Special subframe <br> configuration (Note 2) |  | 4 |
|  | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |
|  | Inter-TTI Distance |  | 1 |
|  | Number of HARQ <br> processes | Processes | 7 |
|  | Maximum number of <br> HARQ transmission |  | 4 |

| Redundancy version <br> coding sequence | $\{0,1,2,3\}$ for QPSK and 16QAM <br> $\{0,0,1,2\}$ for 64QAM, 256QAM and <br> 1024QAM |  |
| :---: | :---: | :---: |
| Number of OFDM <br> symbols for PDCCH | OFDM symbols | 2 |

### 8.3.2.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna port 5, the requirements are specified in Table 8.3.2.1-2, with the addition of the parameters in Table 8.3.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the demodulation performance using user-specific reference signals with full RB or single RB allocation.

Table 8.3.2.1-1: Test Parameters for Testing DRS

| Parameter |  | Unit | Test 1 | Test 2 | Test 3 | Test 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) |
|  | $\sigma$ | dB | 0 | 0 | 0 | 0 |
| Cell-specific reference signals |  |  | Antenna port 0 |  |  |  |
| Beamforming model |  |  | Annex B.4.1 |  |  |  |
| $N_{o c}$ at antenna port |  | $\mathrm{dB} / 15 \mathrm{kHz}$ | -98 | -98 | -98 | -98 |
| Symbols for unused PRBs |  |  | $\begin{aligned} & \text { OCNG } \\ & \text { (Note 2) } \end{aligned}$ | $\begin{aligned} & \text { OCNG } \\ & \text { (Note 2) } \end{aligned}$ | $\begin{aligned} & \text { OCNG } \\ & \text { (Note 2) } \end{aligned}$ | $\begin{aligned} & \text { OCNG } \\ & \text { (Note 2) } \end{aligned}$ |
| PDSCH transmissionmode |  |  | 7 | 7 | 7 | 7 |
| Note 1: $\quad P_{B}=0$. <br> Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. |  |  |  |  |  |  |

Table 8.3.2.1-2: Minimum performance DRS (FRC)

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth and MCS | Reference Channel | OCNG Pattern | Propagation Condition | Correlation Matrix and Antenna Configuration | Reference value |  | UE Category |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) |  |

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format 2 B , the requirements are specified in Table 8.3.2.1-4 and 8.3.2.1-5, with the addition of the parameters in Table 8.3.2.1-3 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 with and without a simultaneous transmission on the other antenna port.

### 8.3.2.1A Single-layer Spatial Multiplexing (with multiple CSI-RS configurations)

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format 2 C , the requirements are specified in Table 8.3.2.1A-2 and 8.3.2.1A-3, with the addition of the parameters in Table 8.3.2.1A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 with and without a simultaneous transmission on the other antenna port, and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.3.2.1A-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations

| Parameter |  | Unit | Test 1, Test 1a | Test 2 | Test 3 | Test 4 a | Test 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 | 0 | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) |
|  | $\sigma$ | dB | -3 | -3 | -3 | -3 | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 |  |  |  |  |
| CSI referencesignals |  |  | Antenna ports $15, \ldots, 22$ | Antenna ports $15, \ldots, 18$ | Antenna ports $15, \ldots, 18$ | Antenna ports $15, \ldots, 22$ | Antenna ports $15, \ldots, 18$ |
| Beamforming model |  |  | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 | Annex B.4.1 |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta \mathrm{CSI}$-RS |  | Subframes | $5 / 4$ | $5 / 4$ | $5 / 4$ | $5 / 4$ | $5 / 4$ |
| CSI reference signal configuration |  |  | 1 | 3 | 3 | 1 | 3 |
| csi-RS-ConfigZPApList |  |  | N/A | NA | NA | \{0,1\} | NA |
| Zero-power CSI-RS configuration Icsi-rs / <br> ZeroPowerCSIRS bitmap |  | Subframes / bitmap | $\begin{gathered} 4 / \\ 0010000100000000 \end{gathered}$ | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ | 0010000100000000 or 0001000100000000 (Note 7) | N/A |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 | -98 | -98 | -98 |
| Symbols for unused PRBs |  |  | OCNG (Note 4) | OCNG (Note 4) | OCNG (Note 4) | OCNG (Note 4) | OCNG (Note 4) |
| Number of allocated resource blocks (Note 2) |  | PRB | 50 | 50 | 100 | 50 | 50 |
| Simultaneous transmission |  |  | No | Yes (Note 3, 5) | No | No | No |
| PDSCHtransmissionmode |  |  | 9 | 9 | 9 | 9 | 9 |
| Number of MBSFN subframes |  | Subframes | 2 (Note 6) | NA | NA | 2 (Note 7) | NA |

Note 1: $\quad P_{B}=1$.
Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8.
Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test.
Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Note 5: The two UEs' scrambling identities $n_{\text {SCID }}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.
Note 6: For TDD mode, 2 subframes (\#4/9) are allocated as MBSFN subframes.
Note 7: $\quad$ Through DCI signalling, indicating aperiodic ZP-CSI-RS in sub-frames \#4 and \#9 per frame, the indicated aperiodic ZP-CSI-RS is random selected from RRC-configured AP ZP CSIRS list.

Table 8.3.2.1 A-2: Minimum performance for CDM-multiplexed DM RS without simultaneous transmission (FRC) with multiple CSI-RS configurations

### 8.3.2.1B Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing with TM9 interference model

The requirements are specified in Table 8.3.2.1B-2, with the addition of the parameters in Table 8.3.2.1B-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed-loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.3.2.1B-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1and Cell 2, respectively.

Table 8.3.2.1B-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model

| parameter |  | Unit | Cell 1 | Cell 2 |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: $\quad$ SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1.
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.

### 8.3.2.1C Single-layer Spatial Multiplexing (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured)

The requirements are specified in Table 8.3.2.1C-2, with the addition of parameters in Table 8.3.2.1C-1. The purpose is to verify the performance of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [9] of the aggressor cell with CRS assistance information. In Table 8.3.2.1C-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] includes Cell 2 and Cell 3.

Table 8.3.2.1C-1: Test parameters of TM9-Single-Layer (2 CSI-RS ports) - Non-MBSFN ABS

Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of cell 1.

### 8.3.2.1D Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM9 interference

The requirements are specified in Table 8.3.2.1D-2, with the addition of the parameters in Table 8.3.2.1D-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of two interfering cells applying transmission mode 9 interference model defined in clause B.6.4. In 8.3.2.1D-1, Cell 1 is the serving cell, and Cell 2,3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.2.1D-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with TM9 interference model

| Parameter |  |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.3.2.1E Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with CRS interference model

The requirements are specified in Table 8.3.2.1E-2, with the addition of the parameters in Table 8.3.2.1E-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by the CRS of the interfering cell, applying the CRS interference model defined in clause B.6.5. In 8.3.2.1E-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3,
respectively.
Table 8.3.2.1E-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with CRS interference model

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 , Cell 2 and Cell 3.

### 8.3.2.1F Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM3 interference

The requirements are specified in Table 8.3.2.1F-2, with the addition of the parameters in Table 8.3.2.1F-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of two interfering cells applying transmission mode 3 interference model defined in clause B.6.2. In 8.3.2.1F-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.3.2.1F-1: Test Parameters for Testing CDM-multiplexed DM RS (Single-layer) with TM3 interference model

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.3.2.1G Enhanced Performance Requirement Type B - Single-layer Spatial Multiplexing with TM10 serving cell configuration and TM9 interference model

The requirements are specified in Table 8.3.2.1G-2, with the addition of the parameters in Table 8.3.2.1G-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission configured with TM10 in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.6.3. The NAICS network assistance is provided when the serving cell TM10 is configured with QCL-type A and PCID based DM-RS scrambling. The neighbouring cell has transmission mode TM9 and NeighCellsInfo-r12 for interfering cell indicates presence of TM9. In 8.3.2.1G-1, Cell 1 is the serving cell, and Cell 2,3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

### 8.3.2.1H Single-layer Spatial Multiplexing (CRS assistance information is configured)

The requirements are specified in Table 8.3.2.1H-2, with the addition of parameters in Table 8.3.2.1H-1. The purpose is to verify the performance of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell with CRS assistance information. In Table 8.3.2.1H-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1, Cell 2 and Cell 3 is according to Annex C.3.2. The CRS assistance information [7] includes Cell 2 and Cell 3.

Table 8.3.2.1H-1: Test parameters of TM9-Single-Layer (2 CSI-RS ports)

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{\mathrm{E}}_{\mathrm{s}} / N_{o c}$ of cell 1.

### 8.3.2.1 Single-layer Spatial Multiplexing (With Enhanced DMRS table configured)

For single-layer transmission on antenna port $7,8,11$ or 13 upon detection of a PDCCH with DCI format 2C, the requirement is specified in Table 8.3.2.1I-2, with the addition of the parameters in Table 8.3.2.1I-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of the test is to verify rank-1 performance on antenna port 11 with a simultaneous transmission on the antenna port 7,8 or 13 with DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

Table 8.3.2.11-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations with Enhanced DMRS table

| parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |

### 8.3.2.1 $\quad$ Single-layer Spatial Multiplexing (with assistance information for simultaneous transmition interfering PDSCH)

For single-layer transmission on a DMRS antenna port upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.3.2.1 $\mathrm{J}-1$, with the addition of the parameters in Table 8.3.2.1J-2 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one DMRS antenna port with a simultaneous transmission on one of the other DMRS antenna port with or without DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

| $P_{B}=1$. |  |  |  |  |
| These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. |  |  |  |  |
| In Test 1, the modulation symbols of the signal under test are mapped randomly onto antenna port 7 or 8 . Modulation symbols of an interference signal are mapped randomly onto one of the |  |  |  |  |
| remaining DMRS antenna port. The two UEs' scrambling identities $n_{\text {SCID }}$ are set to 0 with OCC $=2$. |  |  |  |  |
| In Test 2 and Test 3, the modulation symbols of the signal under test are mapped randomly onto antenna port $7,8,11$ or 13. Modulation symbols of an interference signal are mapped randomly |  |  |  |  |
| onto one of the remaining DMRS antenna port. The two UEs' scrambling identities $n_{\text {SCID }}$ are se to 0 with $O C C=4$. |  |  |  |  |
| k-max-r14 is decribed in subclause 6.3 .2 of [7]. |  |  |  |  |
| The upadate granularity for randomized mapping antenna port is 50 PRGs in frequency domain and 1 ms in time domain. |  |  |  |  |

### 8.3.2.2 Dual-Layer Spatial Multiplexing

For dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2B, the requirements are specified in Table 8.3.2.2-2, with the addition of the parameters in Table 8.3.2.2-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation.

Table 8.3.2.2-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer)

### 8.3.2.3 Dual-Layer Spatial Multiplexing (with multiple CSI-RS configurations)

For dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.3.2.3-2, with the addition of the parameters in Table 8.3.2.3-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation, to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

Table 8.3.2.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSIRS configurations

| Parameter |  | Unit | Test 1 |  |
| :---: | :---: | :---: | :---: | :---: |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1.

### 8.3.2.4 Performance requirements for DCI format 2D and non Quasi Co-located Antenna Ports

### 8.3.2.4.1 Minimum requirement with Same Cell ID (with single NZP CSI-RS resource)

The requirements are specified in Table 8.3.2.4.1-3, with the additional parameters in Table 8.3.2.4.1-1 and Table 8.3.2.4.1-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission point share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6], configured according to Table 8.3.2.4.1-2. In Tables 8.3.2.4.1-1 and 8.3.2.4.1-2, transmission point 1 (TP 1 ) is the serving cell and transmission point 2 (TP 2) transmits PDSCH. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.2.4.1-1: Test Parameters for quasi co-location type B: same Cell ID

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |

### 8.3.2.4.2 Minimum requirements with Same Cell ID (with multiple NZP CSI-RS resources)

The requirements are specified in Table 8.3.2.4.2-3, with the additional parameters in Tables 8.3.2.4.2-1 and 8.3.2.4.2-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission point share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6]. In Tables 8.3.2.4.2-1 and 8.3.2.4.2-2, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) has same Cell ID as TP 1. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between 2 TPs with multiple PDSCH RE Mapping and Quasi-Co-Location Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.2.4.2-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.2.4.2-1: Test Parameters for timing offset compensation with DPS transmission

| parameter |  | Unit | TP 1 | TP 2 |

### 8.3.2.4.3 Minimum requirement with Different Cell ID and Colliding CRS (with single NZP CSI-RS resource)

The requirements are specified in Table 8.3.2.4.3-2, with the additional parameters in Table 8.3.2.4.3-1. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points have different Cell ID and colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.3.2.4.3-1, transmission point 1 (TP 1) is serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) transmits PDSCH with different Cell ID. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Table 8.3.2.4.3-1: Test Parameters for quasi co-location type B with different Cell ID and Colliding CRS

### 8.3.2.4.4 Minimum requirement with Different Cell ID and non-Colliding CRS (with single NZP CSI-RS resource and CRS assistance information is configured)

The requirements are specified in Table 8.3.2.4.4-3, with the additional parameters in Table 8.3.2.4.4-1 and Table 8.3.2.4.4-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where three transmission points have different Cell ID and non-colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference and time difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. Further, the test verifies that the UE, configured with the CRS assistance information [7], can mitigate interference from CRS for demodulation. The CRS assistance information [7] includes TP 3. In Table 8.3.2.4.4-1, transmission point 1 (TP 1) is serving cell transmitting PDCCH, synchronization signals and PBCH, transmission point 2 (TP 2) transmits PDSCH with different Cell ID, and Transmission point 3 (TP 3) is the aggressor transmission point. The downlink physical channel setup for TP 1 is according to Table C.3.4-1, for TP 2 is according to Table C.3.4-2, and for TP 3 is according to Annex C.3.2.

Table 8.3.2.4.4-1: Test Parameters for quasi co-location type B with different Cell ID and non-colliding CRS when CRS assistance information is configured

Note 1: The propagation conditions for TP.1, TP. 2 and TP. 3 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP.1, TP. 2 and TP.3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of TP. 2 as defined in clause 8.1.1.

### 8.3.2.4.5 Minimum requirements with different Cell ID and non-colliding CRS (with multiple NZP CSI-RS resources and CRS assistance information is configured)

The requirements are specified in Table 8.3.2.4.5-3, with the additional parameters in Tables 8.3.2.4.5-1 and 8.3.2.4.5-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario where three transmission point have the different Cell ID and non-colliding CRS. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference and timing difference between two transmission points, channel parameters estimation and rate matching according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling defined in [6]. Further, the test verifies that the UE, configured with the CRS assistance information [7], can mitigate interference from CRS for demodulation. The CRS assistance information [7] includes TP 3. In Tables 8.3.2.4.5-1 and 8.3.2.4.5-2, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, Transmission point 2 (TP 2) has different Cell ID as TP 1, and Transmission point 3 (TP3) is the aggressor transmission point. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between TP 1 and TP 2 with multiple PDSCH RE Mapping and Quasi-CoLocation Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.2.4.5-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1, for TP 2 is according to Table C.3.4-2, and for TP 3 is according to Annex C.3.2

Table 8.3.2.4.5-1: Test Parameters for DPS transmission with CRS assistance information

Note 1: $\quad P_{B}=1$
Note 2: $\quad \hat{E}_{s} / N_{o c}$ of TP 1 is set the same as that of TP 2.
Note 3: PDSCH transmission from TP 1 and TP 2 shall be randomly determined independently for each subframe. Probabilities of occurrence of PDSCH transmission from TPs are specified.
Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Table 8.3.2.4.5-2: Configurations of PQI and DL transmission hypothesis for each PQI set

| PQI set <br> index | Parameters in each PQI set |  |  | DL transmission <br> hypothesis for <br> each PQI Set |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | NZP CSI-RS Index (For quasi <br> co-location) | ZP CSI-RS configuration | TP 1 | TP 2 |  |
| PQI set 0 | CSI-RS 0 | ZP CSI-RS 0 | PDSCH | Blanked |  |
| PQI set 1 | CSI-RS 1 | ZP CSI-RS 1 | Blanked | PDSCH |  |

Table 8.3.2.4.5-3: Performance Requirements for DPS transmission with CRS assistance information

| Test Number | Refere nce Chann el | OCNG Pattern |  |  | PropagationConditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE <br> Cate gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | TP 1 | TP 2 | TP3 | TP 1 | TP 2 | TP3 |  | Fraction of Maximum Throughput (\%) | $\begin{gathered} \hline \text { SNR } \\ \text { (dB) } \\ \text { (Note } \\ \text { 3) } \\ \hline \end{gathered}$ |  |
| 1 | $\begin{gathered} \text { R.52-1 } \\ \text { TDD } \\ \hline \end{gathered}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | N/A | EVA5 | EVA5 | EVA5 | 2x2 Low | 70 | 11.2 | $\geq 2$ |

Note 1: The propagation conditions for TP.1, TP. 2 and TP. 3 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP.1, TP. 2 and TP.3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of both TP. 1 and TP. 2 as defined in clause 8.1.1.

### 8.3.2.4.6 Minimum requirements for QCL Type C and 2 Layers Spatial Multiplexing

The requirements are specified in Table 8.3.2.4.6-3, with the additional parameters in Table 8.3.2.4.6-1 and Table 8.3.2.4.6-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.3.2.4.6-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP 1 and TP 2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.3.2.4.6-1: Test Parameters

| Parameter | Unit | TP 1 | TP 2 |  |
| :--- | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  | 1 | 1 |  |
| Special subframe configuration |  |  | 4 | 4 |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Beamforming model |  |  | Random beamforming <br> (rank 1) | Random beamforming <br> (rank 1) |

| Cell-specific reference signals |  | Antenna ports 0,1 | Antenna ports 0,1 |

Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of TP 1 and TP 2 as defined in clause 8.1.1.

### 8.3.2.5 Performance Requirements for semiOpenLoop transmission

The requirements are specified in Table 8.3.2.5-2, with the addition of the parameters in Table 8.3.2.5-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank one and rank two performances for full RB allocation upon antenna ports 7 and 8 with higher layer parameter semiOpenLoop is configured.

Table 8.3.2.5-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) when high layer parameter semiOpenLoop is configured

| parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 (Note 1) |
|  | $\sigma$ | dB | -3 | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 | Antenna ports 0 and 1 |
| CSI reference signals |  |  | Antenna ports $15,16$ | Antenna ports $15,16,17,18$ |
| Beamforming model |  |  | B.4.3 (Note 3) | B.4.3 (Note 3) |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta$ CsI-RS |  | Subframes | $5 / 4$ | $5 / 4$ |
| CSI reference signal configuration |  |  | 0 | 0 |

### 8.3.3 LAA

### 8.3.3.1 Dual-Layer Spatial Multiplexing with DM-RS

### 8.3.3.1.1 FDD PCell (FDD single carrier)

The parameters specified in Table 8.3.3.1.1-1 are valid for FDD CC and LAA SCell(s) unless otherwise stated. And the additional parameters specified in Table 8.3.3.1.1-2 are valid for LAA SCell(s).

Table 8.3.3.1.1-1: Common Test Parameters

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |
|  | Inter-TTI Distance |  | 1 |
|  | Number of HARQ processes | Processes | 8 |
|  | Maximum number of HARQ transmission (Note 1) |  | 4 |
|  | Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM and 256QAM |
|  | Precoder update granularity |  | Frequency domain: 1 PRG Time domain: 1 ms |
|  | Note 1: For retransmission in partial subframes, the TB size should be kept the same as the initial transmission regardless of the initial transmission is performed in full subframes or partial subframes. <br> Note 2: Void. |  |  |

Table 8.3.3.1.1-2: Addtional Test Parameters for LAA SCell(s)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | DMTC Periodicity | ms | 80 |
|  | dmtc-PeriodOffset-r12 <br> ms80-r12 |  | 0 |
|  | Discovery signal <br> occasion duration | subframe | 1 |
|  | Power allocation of <br> discovery signal |  | Same as power allocation of CRS within a <br> transmission burst in the test |

For CA with LAA SCell(s), the requirements for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C are specified in Table 8.3.3.1.1-7, with the addition of the parameters in Table 8.3.3.1.1-3, Table 8.3.3.1.1-4 and Table 8.3.3.1.1-5. The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation for CA with LAA SCell(s).

Table 8.3.3.1.1-3: Test Parameters for Large Delay CDD (FRC) for PCell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink powerallocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 (NOTE 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 |
| PDSCH transmission mode Subframe configuration |  |  | TM3 |
|  |  |  | Non-MBSFN |
| NOTE 1: $P_{B}=1$. <br> NOTE 2: PUCCH format 3 is used to feedback ACK/NACK. <br> NOTE 3: Void. |  |  |  |
|  |  |  |  |

Table 8.3.3.1.1-4: Test Parameters for CDM-multiplexed DM RS (dual layer) for CA with LAA SCell(s)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| DMRS ports (dual layer transmission) |  |  | port 7 and port 8 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta$ CSI-RS |  | Subframes | 5/2 |

### 8.3.3.1.2 TDD Pcell (TDD single carrier)

The parameters specified in Table 8.3.3.1.2-1 are valid for TDD CC and LAA SCell(s) unless otherwise stated. And the additional parameters specified in Table 8.3.3.1.2-2 are valid for LAA SCell(s).

Table 8.3.3.1.2-1: Common Test Parameters

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | Uplink downlink configuration (Note 1) |  | 1 |
|  | Special subframe configuration (Note 2) |  | 4 |
|  | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |
|  | Inter-TTI Distance |  | 1 |
|  | Number of HARQ processes | Processes | 7 |
|  | Maximum number of HARQ transmission (Note 3) |  | 4 |
|  | Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM and 256QAM |
|  | Precoder update granularity |  | Frequency domain: 1 PRG for Transmission modes 9 Time domain: 1 ms |
|  | ACK/NACK feedback mode |  | Multiplexing |
|  | Note 1: As specified i <br> Note 2: As specified i <br> Note 3: For retransmi <br>  the initial tran <br>  subframes or | 4.2-2 in TS 4.2-1 in T in partial sub ion regardle subframes | 4] <br> 4] <br> TB size should be kept the same as nitial transmission is performed in full |

Table 8.3.3.1.2-2: Addtional Test Parameters for LAA SCell(s)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | DMTC Periodicity | ms | 80 |
|  | dmtc-PeriodOffset-r12 <br> ms80-r12 |  | 0 |
|  | Discovery signal <br> occasion duration | subframe | 1 |
|  | Power allocation of <br> discovery signal |  | Same as power allocation of CRS within a <br> transmission burst in the test |

For CA with LAA SCell(s), the requirements for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C are specified in Table 8.3.3.1.2-7, with the addition of the parameters in Table 8.3.3.1.2-3, Table 8.3.3.1.2-4 and Table 8.3.3.1.2-5, The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation for CA with LAA SCell(s).

Table 8.3.3.1.2-3: Test Parameters for Large Delay CDD (FRC) for PCell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | $-3($ NOTE 1) |

|  | $\sigma$ | dB |
| :---: | :---: | :---: |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode |  | TM3 |
| Subframe configuration |  | Non-MBSFN |
| NOTE 1: $P_{B}=1$. |  |  |
| NOTE 2: PUCCH format 3 is used to feedback ACK/NACK. |  |  |
| NOTE 3: Void. |  |  |

Table 8.3.3.1.2-4: Test Parameters for CDM-multiplexed DM RS (dual layer) for LAA SCell(s)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| DMRS ports (dual layer transmission) |  |  | port 7 and port 8 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframe offset <br> TCSI-RS / $\Delta$ CSI-RS |  | Subframes | 5/4 |
| CSI reference signal configuration |  |  | 8 |
| Zero-power CSI-RS configuration lcsi-Rs / ZeroPowerCSI-RS bitmap |  | Subframes / bitmap | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ |
| $\begin{gathered} N_{o c} \text { at antenna } \\ \text { port } \end{gathered}$ |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Symbols for unused PRBs |  |  | OCNG (Note 2) |
| PDSCHtransmission mode |  |  | 9 |
| DL Burst transmission pattern for LAA SCell |  |  | As specified in B. 8 |
| The number of subframes set ( $S_{1}$ ) in a burst |  |  | \{1,3,5,8\} |
| Occupied OFDM symbols set in the last subframe |  |  | \{6,9,12,14\} |
| Random variable $p$ defined in B. 8 |  |  | 0.5 |
| Timing error relative of LAA SCell to PCell |  | $\mu \mathrm{s}$ | 0 |
| Frequency offset of th $i$-th LAA SCell relative to PCell |  | Hz | 200 |
| Note 1: $\quad P_{B}=1$ <br> Note 2: These physical resource blocks are assigned only within burst transmissions to a LAA UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. |  |  |  |

### 8.4 Demodulation of PDCCH/PCFICH

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

### 8.4.1 FDD

The parameters specified in Table 8.4.1-1 are valid for all FDD tests unless otherwise stated.

Table 8.4.1-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Single antenna port | Transmit diversity |
| :---: | :---: | :---: | :---: | :---: |
| Number of PDCCH symbols |  | symbols | 2 | 2 |
| PHICH Ng (Note 1) |  |  | 1 | 1 |
| PHICH duration |  |  | Normal | Normal |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG |
| Cell ID |  |  | 0 | 0 |
| Downlink power allocation | PDCCH RA PHICH ${ }^{-}$RA OCNG RA | dB | 0 | -3 |
|  | PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB | dB | 0 | -3 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | -98 |
| Note 1: $\quad$ Cyccording to Clause 6.9 in TS 36.211 [4] |  |  | Normal | Normal |
|  |  |  |  |  |

### 8.4.1.1 Single-antenna port performance

For the parameters specified in Table 8.4.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.1.1-1: Minimum performance PDCCH/PCFICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Aggregation level | Reference Channel | OCNG Pattern | Propagation Condition | AntennaconfigurationandcorrelationMatrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 1 | 10 MHz | 8 CCE | R. 15 FDD | OP. 1 FD | ETU70 | 1x2 Low | 1 | -1.7 |

### 8.4.1.2 Transmit diversity performance

### 8.4.1.2.1 Minimum Requirement 2 Tx Antenna Port

For the parameters specified in Table 8.4.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.1.2.1-1: Minimum performance PDCCH/PCFICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Aggregation level | Reference Channel | OCNG <br> Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Pm-dsg (\%) | SNR (dB) |
| 1 | 10 MHz | 4 CCE | R. 16 FDD | OP |  | $2 \times 2$ Low | 1 | -0.6 |

### 8.4.1.2.2 Minimum Requirement 4 Tx Antenna Port

For the parameters specified in Table 8.4.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.1.2.2-1: Minimum performance PDCCH/PCFICH

| $\begin{array}{c\|} \hline \text { Test } \\ \text { number } \end{array}$ | Bandwidth | Aggregation level | Reference Channel | OCNG <br> Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Pm-dsg (\%) | $\begin{aligned} & \hline \text { SNR } \\ & \text { (dB) } \end{aligned}$ |

| 1 | 5 MHz | 2 CCE | R.17 FDD | OP.1 FDD | EPA5 | $4 \times 2$ Medium | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

### 8.4.1.2.3 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS)

For the parameters for non-MBSFN ABS specified in Table 8.4.1-1 and Table 8.4.1.2.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.3-2. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.4.1.2.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

For the parameters for MBSFN ABS specified in Table 8.4.1-1 and Table 8.4.1.2.3-3, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.3-4. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Table 8.4.1.2.3-1: Test Parameters for PDCCH/PCFICH - Non-MBSFN ABS

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |

| RLM/RRM Measurement Subframe Pattern (Note 5) |  |  | $\begin{aligned} & \hline 00000100 \\ & 00000100 \\ & 00000100 \\ & 00000100 \\ & 00000100 \\ & \hline \end{aligned}$ | N/A |
| CSI Subframe Sets (Note 6) | Ccsi,0 |  | $\begin{aligned} & 00000100 \\ & 00000100 \\ & 00000100 \\ & 01000100 \\ & 00000100 \\ & \hline \end{aligned}$ | N/A |
|  | Ccsi,1 |  | $\begin{aligned} & 11111011 \\ & 11111011 \\ & 11111011 \\ & 10111011 \\ & 11111011 \end{aligned}$ | N/A |
| Number of control OFDM symbols |  |  | 3 | 3 |
| PHICH Ng (Note 9) |  |  | 1 | N/A |
| PHICH duration |  |  | Extended | N/A |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG |
| Cyclic prefix |  |  | Normal | Normal |

Note 1: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10, \#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 2: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 3: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 4: ABS pattern as defined in [9]. PDCCH/PCFICH other than that associated with SIB1/Paging are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell.
Note 5: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7];
Note 6: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7];
Note 7: Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell1 and Cell2 is the same.
Note 8: SIB-1 will not be transmitted in Cell2 in the test.
Note 9: According to Clause 6.9 in TS 36.211 [4]

Table 8.4.1.2.3-2: Minimum performance PDCCH/PCFICH - Non-MBSFN ABS

| Test Numb er | Aggregati on Level | Referen ce Channel | OCNG Pattern |  | Propagation Conditions (Note 1) |  | Correlation Matrix and Antenna Configuration | Reference Value |  |

Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.

### 8.4.1.2.4 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured)

For the parameters for non-MBSFN ABS specified in Table 8.4.1-1 and Table 8.4.1.2.4-1, the average probability of a missed downlink scheduling grant ( Pm -dsg) shall be below the specified value in Table 8.4.1.2.4-2.

For the parameters for MBSFN ABS specified in Table 8.4.1-1 and Table 8.4.1.2.4-3, the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.4.1.2.4-4.

In Tables 8.4.1.2.4-1 and 8.4.1.2.4-3, Cell 1 is the serving cell, and Cell 2 and Cell3are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 8.4.1.2.4-1: Test Parameters for PDCCH/PCFICH - Non-MBSFN ABS

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.4.1.2.5 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port under Asynchronous Network

The test purpose is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with interference model defined in clause B.5.2. For the parameters specified in Table 8.4.1-1 and Table 8.4.1.2.5-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.5-2 for the Enhanced Downlink Control

Channel Performance Requirement Type A. In Table 8.4.1.2.5-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is not provided.

Table 8.4.1.2.5-1: Test Parameters for PDCCH/PCFICH

Note 1: The OCNG pattern applies for Cell 1, Cell 2 and Cell 3.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 4: SNR corresponds to $\hat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.

### 8.4.1.2.6 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and
applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.1-1 and Table 8.4.1.2.61, the average probability of a missed downlink scheduling grant ( Pm - dsg ) shall be below the specified value in Table 8.4.1.2.6-2. In Table 8.4.1.2.6-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.1.2.6-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.4.1.2.7 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Port with Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type B for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.1-1 and Table 8.4.1.2.71, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.7-2. In Table 8.4.1.2.7-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink
physical channel setup is according to Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.1.2.7-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

| 1 | 2 CCE | $\begin{gathered} \text { R.16-3 } \\ \text { FDD } \end{gathered}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | EPA5 | EPA5 | EPA5 | 2x2 Low | 1 | 12.7 |

Note 1: The OCNG pattern applies for Cell 1, Cell 2 and Cell 3.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 4: $\quad$ SNR corresponds to $\bar{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.

### 8.4.1.2.8 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type B for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.1-1 and Table 8.4.1.2.81 , the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.4.1.2.8-2. In Table 8.4.1.2.8-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.1.2.8-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |

| 1 | 4 CCE | $\begin{gathered} \text { R.16-4 } \\ \text { FDD } \end{gathered}$ | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | EPA5 | EPA5 | EPA5 | 2x2 Low | 1 | 10.3 |

Note 1: The OCNG pattern applies for Cell 1, Cell 2 and Cell 3.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 4: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.

### 8.4.1.2.9 Enhanced Downlink Control Channel Performance Requirement Type A-4 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 4 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1.

For the parameters specified in Table 8.4.1-1 and Table 8.4.1.2.9-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.9-2. In Table 8.4.1.2.9-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes information on Cell 2 and Cell 3.

Table 8.4.1.2.8-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | -98 |
| Cyclic prefix |  |  | Normal | Normal |
| ACK/NACK feedback mode |  |  | Multiplexing | Multiplexing |

Note 1: as specified in Table 4.2-2 in TS 36.211 [4].
Note 2: as specified in Table 4.2-1 in TS 36.211 [4].
Note 3: According to Clause 6.9 in TS 36.211 [4]

### 8.4.2.1 Single-antenna port performance

For the parameters specified in Table 8.4.2-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.2.1-1: Minimum performance PDCCH/PCFICH

| Test <br> number | Bandwidth | Aggregation <br> level | Reference <br> Channel | OCNG <br> Pattern | Propagation <br> Condition | Antenna <br> configuration <br> and <br> correlation <br> Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pm-dsg (\%) | SNR (dB) |  |  |  |  |  |  |  |
| 1 | 10 MHz | 8 CCE | R.15 TDD | OP.1 TDD | ETU70 | $1 \times 2$ Low | 1 | -1.6 |

### 8.4.2.2 Transmit diversity performance

### 8.4.2.2.1 Minimum Requirement 2 Tx Antenna Port

For the parameters specified in Table 8.4.2-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.2.2.1-1: Minimum performance PDCCH/PCFICH

| $\begin{aligned} & \hline \text { Test } \\ & \text { number } \end{aligned}$ | Bandwidth | Aggregation level | Reference Channel | OCNG Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Pm-dsg (\%) | SNR (dB) |
| 1 | 10 MHz | 4 CCE | R. 16 TDD | OP. 1 TDD | EVA70 | $2 \times 2$ Low | 1 | 0.1 |

### 8.4.2.2.2 Minimum Requirement 4 Tx Antenna Port

For the parameters specified in Table 8.4.2-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.4.2.2.2-1: Minimum performance PDCCH/PCFICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Aggregation level | Reference Channel | $\begin{aligned} & \text { OCNG } \\ & \text { Pattern } \end{aligned}$ | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Pm-dsg (\%) | $\begin{aligned} & \text { SNR } \\ & \text { (dB) } \end{aligned}$ |
| 1 | 5 MHz | 2 CCE | R. 17 TDD | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | EPA5 | $4 \times 2$ Medium | 1 | 6.5 |

### 8.4.2.2.3 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS)

For the parameters for non-MBSFN ABS specified in Table 8.4.2-1 and Table 8.4.2.2.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.3-2. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3.. In Table 8.4.2.2.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

For the parameters for MBSFN ABS specified in Table 8.4.2-1 and Table 8.4.2.2.3-3, the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.4.2.2.3-4. The downlink physical channel setup for Cell 1 is according to Annex C3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Table 8.4.2.2.3-1: Test Parameters for PDCCH/PCFICH - Non-MBSFN ABS

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 |

Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.

### 8.4.2.2.4 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured)

For the parameters for non-MBSFN ABS specified in Table 8.4.2-1 and Table 8.4.2.2.4-1, the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.4.2.2.4-2.

For the parameters for MBSFN ABS specified in Table 8.4.2-1 and Table 8.4.2.2.4-3, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.4-4.

In Tables 8.4.2.2.4-1 and 8.4.2.2.4-3, Cell 1 is the serving cell, and Cell 2 and Cell 3are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 8.4.2.2.4-1: Test Parameters for PDCCH/PCFICH - Non-MBSFN ABS

| Parameter | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: |

### 8.4.2.2.5 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port with Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.2-1 and Table 8.4.2.2.51, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.5-2. In Table 8.4.2.2.5-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

### 8.4.2.2.6 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.2-1 and Table 8.4.2.2.61, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.6-2. In Table 8.4.2.2.6-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.2.2.6-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.4.2.2.7 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Port with Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type B for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.2-1 and Table 8.4.2.2.71, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.7-2. In Table 8.4.2.2.7-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.2.2.7-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Note 1: <br> Note 2: <br> Note 3: | The OCNG pattern applies for Cell 1, Cell 2 and Cell 3. <br> The propagation conditions for Cell 1 , Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. |  |  |  |  |  |  |  |  |
| Note 4: | SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |

### 8.4.2.2.8 Enhanced Downlink Control Channel Performance Requirement Type B - 2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.2-1 and Table 8.4.2.2.81, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.8-2. In Table 8.4.2.2.8-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.4.2.2.8-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{gathered} \text { PDCCH_RA } \\ \text { OCNG_RA } \end{gathered}$ | dB | -3 | -3 | -3 |

| Note 1: <br> Note 2: <br> Note 3: | The OCNG pattern applies for Cell 1, Cell 2 and Cell 3. <br> The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. |  |  |  |  |  |  |  |  |
| Note 4: | SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |

### 8.4.2.2.9 Enhanced Downlink Control Channel Performance Requirement Type A-4 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 4 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1.

For the parameters specified in Table 8.4.1-1 and Table 8.4.2.2.9-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.9-2. In Table 8.4.2.2.9-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes information on Cell 2 and Cell 3.

Table 8.4.2.2.9-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

| Note1: UE is required to fulfill only one test among test 1-4 depending on it's capability for endingDwPTS and |  |  |  |  |  |  |  |  |
| secondSlotStartingPosition. For UE don't support endingDwPTS and secondSlotStartingPosition, it is required to |  |  |  |  |  |  |  |  |
| fulfill test 1; For UE don't support endingDwPTS and support secondSlotStartingPosition, it is required to fulfill |  |  |  |  |  |  |  |  |
| test 2; For UE support endingDwPTS and don't support secondSlotStartingPosition, it is required to fulfil test 3; |  |  |  |  |  |  |  |  |
| and For UE support both endingDwPTS and secondSlotStartingPosition, it is required to fulfill test 4. |  |  |  |  |  |  |  |  |

### 8.5 Demodulation of PHICH

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold delection).

### 8.5.1 FDD

The parameters specified in Table 8.5.1-1 are valid for all FDD tests unless otherwise stated.

Table 8.5.1-1: Test Parameters for PHICH

| Parameter |  | Unit | Single antenna port | Transmit diversity |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { PHICH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | 0 | -3 |
|  | $\begin{aligned} & \text { PCFICH_RB } \\ & \text { PDCCH_RB } \\ & \text { PHICH_RB } \\ & \text { OCNG_RB } \end{aligned}$ | dB | 0 | -3 |
| PHICH duration |  |  | Normal | Normal |
| PHICH Ng (Note 1) |  |  | $\mathrm{Ng}=1$ | $\mathrm{Ng}=1$ |
| PDCCH Content |  |  | UL Grant should proper informatio | cluded with the ned with A.3.6. |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG |
| Cell ID |  |  | 0 | 0 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | -98 |
| Cyclic prefix |  |  | Normal | Normal |
| Note 1: according to Clause 6.9 in TS 36.211 [4] |  |  |  |  |

### 8.5.1.1 Single-antenna port performance

For the parameters specified in Table 8.5.1-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.1.1-1: Minimum performance PHICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | OCNG Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Pm-an (\%) | SNR (dB) |
| 1 | 10 MHz | R. 18 | OP. 1 FDD | ETU70 | $1 \times 2$ Low | 0.1 | 5.5 |
| 2 | 10 MHz | R. 24 | OP. 1 FDD | ETU70 | $1 \times 2$ Low | 0.1 | 0.6 |

### 8.5.1.2 Transmit diversity performance

### 8.5.1.2.1 Minimum Requirement 2 Tx Antenna Port

For the parameters specified in Table 8.5.1-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.1.2.1-1: Minimum performance PHICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | OCNG Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Pm-an (\%) | SNR (dB) |
| 1 | 10 MHz | R. 19 | OP. 1 FDD | EVA70 | $2 \times 2$ Low | 0.1 | 4.4 |
| 1A | 5 MHz (Note 1) | R.19-1 | OP. 1 FDD | EVA 70 | 2x2 Low | 0.1 | 4 |

### 8.5.1.2.2 Minimum Requirement 4 Tx Antenna Port

For the parameters specified in Table 8.5.1-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.1.2.2-1: Minimum performance PHICH

| Test | Bandwidth | Reference <br> Channel | OCNG <br> Pattern | Propagation <br> Condition | Antenna <br> configuration <br> and <br> correlation <br> Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Pm-an (\%) | SNR (dB) |  |  |  |  |
| 1 | 5 MHz | R.20 | OP.1 FDD | EPA5 | $4 \times 2$ Medium | 0.1 | 6.1 |

### 8.5.1.2.3 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS)

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.3-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.3-2. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.5.1.2.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Table 8.5.1.2.3-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | PDCCH RA PHICH RA OCNG RA | dB | -3 | -3 |
|  | $\begin{aligned} & \text { PCFICH_RB } \\ & \text { PDCCH_RB } \\ & \text { PHICH_RB } \\ & \text { OCNG_RB } \end{aligned}$ | dB | -3 | -3 |
| $N_{o c}$ at antenna port | $N_{o c 1}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -100.5 (Note 1) | N/A |
|  | $N_{o c 2}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 (Note 2) | N/A |

| Note 1: <br> Note 2: <br> Note 3: | The propagation conditions for Cell 1 and Cell 2 are statistically independent. SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of cell 1. <br> The correlation matrix and antenna configuration apply for Cell 1 and Cell 2. |  |  |  |  |  |  |  |

### 8.5.1.2.4 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured)

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.4-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.4-2. In Table 8.5.1.2.4-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 8.5.1.2.4-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | PDCCH RA PHICH RA OCNG RA | dB | -3 | -3 | -3 |
|  | $\begin{aligned} & \text { PCFICH_RB } \\ & \text { PDCCH_RB } \\ & \text { PHICH_RB } \\ & \text { OCNG_RB } \end{aligned}$ | dB | -3 | -3 | -3 |

Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1.

### 8.5.1.2.5 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Ports under Asynchronous Network

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.5-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.5-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells and applying interference model defined in clause B.5.2. In Table 8.5.1.2.5-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is not provided.

Table 8.5.1.2.5-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { PHICH_RA } \\ & \text { PDSCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | PCFICH RB PHICH_RB PDCCH_RB PDSCH_RB OCNG_RB | dB | -3 | -3 | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 | Antenna ports 0,1 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |  |
| $\hat{E}_{s} / N_{o c}$ |  | dB | N/A | 13.91 | 3.34 |
| BWChannel |  | MHz | 10 | 10 | 10 |
| Cyclic Prefix |  |  | Normal | Normal | Normal |
| Cell ID |  |  | 0 | 1 | 6 |
| Subframe Configuration |  |  | Non-MBSFN | Non-MBSFN | Non-MBSFN |
| Number of control OFDM symbols |  |  | 1 | 1 | 1 |
| PHICH Ng (Note 1) |  |  | 1 | N/A | N/A |
| PHICH duration |  |  | Normal | N/A | N/A |
| Interference model |  |  | N/A | As specified in clause B.5.2 | As specified in clause B.5.2 |
| Probability of occurrence of PDSCH transmission rank in interfering cells | Rank 1 | \% | N/A | 80 | 80 |
|  | Rank 2 | \% | N/A | 20 | 20 |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG | OCNG |
| Time offset relative to Cell 1 |  | ms | N/A | 0.33 | 0.67 |
| Frequency offset relative to Cell 1 |  | Hz | N/A | 0 | 0 |
| Note 1: According to Clause 6.9 in TS 36.211 [4]. |  |  |  |  |  |

Table 8.5.1.2.5-2: Minimum performance PHICH for Enhanced Downlink Control Channel Performance Requirement Type A

| Test Number | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note 1) |  |  | Antenna Configuration and Correlation Matrix (Note 2) | Reference Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | $\begin{gathered} \text { Pm-an } \\ (\%) \end{gathered}$ | SNR (dB) (Note 3) |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1 as defined in clause 8.1.1.

### 8.5.1.2.6 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Ports with Non-Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.6-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.6-2. The purpose of this test is to verify the PHICH
performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the non-colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.1.2.6-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.1.2.6-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | PDCCH_RA OCNG_VA | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

| Note 1: Note 2: Note 3: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. |  |  |  |  |  |  |  |  |  |

### 8.5.1.2.7 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Ports with Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.7-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.7-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.1.2.7-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.1.2.7-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | PDCCH_RA OCNG RA | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |
|  | PCFICH RB PDCCH RB OCNG RB | dB | -3 | -3 | -3 |
|  | PHICH_RB | dB | -3 | N/A | N/A |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 | Antenna ports 0,1 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |  |
| $\hat{E}_{s} / N_{o c}$ |  | dB | N/A | 13.91 | 3.34 |
| BWChannel |  | MHz | 10 | 10 | 10 |
| Cyclic Prefix |  |  | Normal | Normal | Normal |
| Cell ID |  |  | 0 | 6 | 1 |
| Subframe Configuration |  |  | Non-MBSFN | Non-MBSFN | Non-MBSFN |
| Number of control OFDM symbols |  |  | 1 | 1 | 1 |
| PHICH Ng (Note 1) |  |  | 1 | N/A | N/A |
| PHICH duration |  |  | Normal | N/A | N/A |
| Interference model |  |  | N/A | As specified in clause B.7.1 | As specified in clause B.7.1 |
| Unused RE-s and PRB-s (Note 2) |  |  | OCNG | OCNG | OCNG |
| Time offset to cell 1 |  | us | N/A | 2 | 3 |
| Frequency offset to cell 1 |  | Hz | N/A | 200 | 300 |
| Note 1: According to Clause 6.9 in TS 36.211 [4]. <br> Note 2: For Cell 2 and Cell 3 unused RE-s and PRB-s do not include control region REs. |  |  |  |  |  |

Table 8.5.1.2.7-2: Minimum performance PHICH for Enhanced Downlink Control Channel Performance Requirement Type B

| Test Number | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note 1) |  |  | Antenna Configuration and Correlation Matrix (Note 2) | Reference Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | $\begin{gathered} \text { Pm-an } \\ (\%) \end{gathered}$ | SNR (dB) (Note 3) |
| 1 | R. 19 | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | EPA5 | EPA5 | EPA5 | 2x2 Low | 0.1 | 13.4 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1 as defined in clause 8.1.1.

### 8.5.1.2.8 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Ports with Non-Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.1-1 and Table 8.5.1.2.8-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.8-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the non-colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.1.2.8-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.1.2.8-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | PDCCH RA OCNG RA | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

|  | PCFICH RB PDCCH RB OCNG RB | dB | -3 | -3 | -3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Note 1: <br> Note 2: <br> Note 3: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |  |

### 8.5.2 TDD

The parameters specified in Table 8.5.2-1 are valid for all TDD tests unless otherwise stated.
Table 8.5.2-1: Test Parameters for PHICH

| Parameter |  | Unit | $\begin{gathered} \text { Single } \\ \text { antenna port } \end{gathered}$ | Transmit diversity |
| :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration (Note 1) |  |  | 1 | 1 |
| Special subframe configuration (Note 2) |  |  | 4 | 4 |
| Downlink power allocation | PDCCH_RA PHICH RA OCNG_RA | dB | 0 | -3 |
|  | PCFICH_RB PDCCH_RB PHICH RB OCNG_RB | dB | 0 | -3 |
| PHICH duration |  |  | Normal | Normal |
| PHICH Ng (Note 3) |  |  | $\mathrm{Ng}=1$ | $\mathrm{Ng}=1$ |

| PDCCH Content |  | UL Grant should be included with the <br> proper information aligned with A.3.6. |  |
| :---: | :---: | :---: | :---: |
| Unused RE-s and PRB-s |  | OCNG | OCNG |
| Cell ID |  | 0 | 0 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cyclic prefix |  | Normal | Normal |
| ACK/NACK feedback mode |  | Multiplexing | Multiplexing |
| Note 1: as specified in Table 4.2-2 in TS 36.211 [4] |  |  |  |
| Note 2: as specified in Table 4.2-1 in TS 36.211 [4] |  |  |  |
| Note 3: according to Clause 6.9 in TS 36.211 [4] |  |  |  |

### 8.5.2.1 Single-antenna port performance

For the parameters specified in Table 8.5.2-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.2.1-1: Minimum performance PHICH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | OCNG Pattern | Propagation Condition | AntennaconfigurationandcorrelationMatrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Pm-an (\%) | SNR (dB) |
| 1 | 10 MHz | R. 18 | OP. 1 TDD | ETU70 | $1 \times 2$ Low | 0.1 | 5.8 |
| 2 | 10 MHz | R. 24 | OP. 1 TDD | ETU70 | $1 \times 2$ Low | 0.1 | 1.3 |

### 8.5.2.2 Transmit diversity performance

### 8.5.2.2.1 Minimum Requirement 2 Tx Antenna Port

For the parameters specified in Table 8.5.2-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.2.2.1-1: Minimum performance PHICH

| Test | Bandwidth | Reference <br> Channel | OCNG <br> Pattern | Propagation <br> Condition | Antenna <br> configuration <br> and <br> correlation <br> Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Pm-an (\%) | SNR (dB) |  |  |  |
| 1 | 10 MHz | R.19 | OP.1 TDD | EVA70 | $2 \times 2$ Low | 0.1 | 4.2 |

### 8.5.2.2.2 Minimum Requirement 4 Tx Antenna Port

For the parameters specified in Table 8.5.2-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.5.2.2.2-1: Minimum performance PHICH

| Test | Bandwidth | Reference <br> Chambel | OCNG <br> Pattern | Propagation <br> Condition | Antenna <br> configuration <br> and <br> correlation <br> Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Pm-an (\%) | SNR (dB) |  |  |  |  |
| 1 | 5 MHz | R.20 | OP.1 TDD | EPA5 | $4 \times 2$ Medium | 0.1 | 6.2 |

### 8.5.2.2.3 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with aggressor cell ABS)

For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.3-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.3-2. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3, In Table 8.5.2.2.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Table 8.5.2.2.3-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 |

### 8.5.2.2.4 Minimum Requirement 2 Tx Antenna Port (demodulation subframe overlaps with

 aggressor cell ABS and CRS assistance information are configured)For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.4-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.4-2. In Table 8.5.2.2.4-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 8.5.2.2.4-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1.

### 8.5.2.2.5 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Ports with Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.5-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.5-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.2.2.5-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.2.2.5-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 | 1 |

| Note 1: Note 2: <br> Note 3: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. SNR corresponds to $\widehat{E}_{s} / N_{c 2}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |  |

### 8.5.2.2.6 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Ports with Non-Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.6-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.6-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the non-colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.2.2.6-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.2.2.6-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 | 1 |
| Special subframe configuration |  |  | 4 | 4 | 4 |
| Downlink power allocation | PDCCH_RA OCNG RA | dB | -3 | -3 | -3 |

| Unused RE-s and PRB-s (Note 2) |  | OCNG | OCNG | OCNG |
| Time offset to cell 1 | us | N/A | 2 | 3 |
| Frequency offset to cell 1 | Hz | N/A | 200 | 300 |
| Note 1: According to Clause 6.9 in TS 36.211 [4]. <br> Note 2: For Cell 2 and Cell 3 unused RE-s and PRB-s do not include control region REs. |  |  |  |  |

Table 8.5.2.2.6-2: Minimum performance PHICH for Enhanced Downlink Control Channel Performance Requirement Type A

| $\begin{gathered} \text { Test } \\ \text { Number } \end{gathered}$ | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note 1) |  |  | Antenna Configuration and Correlation Matrix (Note 2) | Reference Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | $\begin{gathered} \text { Pm-an } \\ (\%) \\ \hline \end{gathered}$ | SNR (dB) <br> (Note 3) |
| 1 | R. 19 | $\begin{aligned} & \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | EPA5 | EPA5 | EPA5 | 2x2 Low | 0.1 | 16.1 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1 as defined in clause 8.1.1.

### 8.5.2.2.7 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Ports with Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.7-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.7-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.2.2.7-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.2.2.7-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 | 1 |
| Special subframe configuration |  |  | 4 | 4 | 4 |

| Note 1: Note 2: <br> Note 3: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. R corresponds to $E / N$ of Cell 1 as defined in clause 8.1.1 |  |  |  |  |  |  |  |  |  |

### 8.5.2.2.8 Enhanced Downlink Control Channel Performance Requirement Type B-2 Tx Antenna Ports with Non-Colliding CRS Dominant Interferer

For the parameters specified in Table 8.5.2-1 and Table 8.5.2.2.8-1, the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.8-2. The purpose of this test is to verify the PHICH performance with 2 transmit antennas when the serving cell PHICH transmission is interfered by two interfering cells with the dominant interferer having the non-colliding CRS pattern and applying interference model defined in clause B.7.1. In Table 8.5.2.2.8-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.5.2.2.8-1: Test Parameters for PHICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 | 1 |
| Special subframe configuration |  |  | 4 | 4 | 4 |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |

| Note 1: Note 2: Note 3: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. SNR corresponds to $\widehat{E}_{s} / N_{o c 2}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |  |

### 8.6 Demodulation of PBCH

The receiver characteristics of the PBCH are determined by the probability of miss-detection of the PBCH (Pm-bch), which is defined as

$$
\mathrm{Pm}-\mathrm{bch}=1-\frac{A}{B}
$$

Where A is the number of correctly decoded MIB PDUs and B is the Number of transmitted MIB PDUs (Redundancy versions for the same MIB are not counted separately).

### 8.6.1 FDD

Table 8.6.1-1: Test Parameters for PBCH

| Parameter |  |  | Unit | $\begin{array}{c}\text { Single antenna } \\ \text { port }\end{array}$ |
| :---: | :---: | :---: | :---: | :---: |

|  |  |  |  |  | Pm-bch (\%) | SNR (dB) |
| 1 | 1.4 MHz | R. 22 | EPA5 | $2 \times 2$ Low | 1 | -4.8 |

### 8.6.2.2.2 Minimum Requirement 4 Tx Antenna Port

For the parameters specified in Table 8.6.2-1 the average probability of a miss-detected PBCH (Pm-bch) shall be below the specified value in Table 8.6.2.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.6.2.2.2-1: Minimum performance PBCH

| Test number | Bandwidth | Reference Channel | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Pm-bch (\%) | SNR (dB) |
| 1 | 1.4 MHz | R. 23 | EVA5 | $4 \times 2$ Medium | 1 | -4.1 |

### 8.6.2.2.3 Minimum Requirement 2 Tx Antenna Port under Time Domain Measurement Resource Restriction with CRS Assistance Information

For the parameters specified in Table 8.6.2.2.3-1 and Table 8.6.2.2.3-2, the averaged probability of a miss-detected PBCH (Pm-bch) shall be below the specified value in Table 8.6.2.2.3-2. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 8.6.2.2.3-1: Test Parameters for PBCH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PBCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | $\begin{aligned} & \text { PBCH_RB } \\ & \text { OCNG_RB } \end{aligned}$ | dB | -3 | -3 | -3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | N/A | N/A |
| $\hat{E}_{S} / N_{o c}$ |  | dB | $\begin{gathered} \text { Reference } \\ \text { Value in Table } \\ \text { 8.6.2.2.3-2 } \end{gathered}$ | 4 | 2 |
| BW Channel |  | MHz | 1.4 | 1.4 | 1.4 |
| Time Offset between Cells |  | $\mu \mathrm{S}$ | N/A | 3 | -1 |
| Frequency shift between Cells |  | Hz | N/A | 300 | -100 |
| Cell Id |  |  | 0 | 126 | 1 |
| ABS Pattern (Note 4) |  |  | N/A | $\begin{aligned} & 0000000001 \\ & 0000000001 \end{aligned}$ | $\begin{aligned} & 0000000001 \\ & 0000000001 \end{aligned}$ |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG | OCNG |
| Cyclic prefix |  |  | Normal | Normal | Normal |

| Note 1: | The number of the CRS ports in Cell1, Cell2 and Cell 3is the same. |
| :--- | :--- |
| Note 2: | SIB-1 will not be transmitted in Cell2 and Cell 3 in the test. |
| Note 3: | The PBCH transmission from Cell 1, Cell 2 and Cell 3 overlap. The same PBCH transmission |
| redundancy version is used for Cell 1, Cell 2 and Cell 3. |  |
| Note 4: | ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated <br>  <br>  <br> PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped <br> with the ABS subframe of aggressor cell and the subframe is available in the definition of the <br> reference channel. |

Table 8.6.2.2.3-2: Minimum performance PBCH

| Test Number | Reference Channel | Propagation Conditions (Note 1) |  |  | Antenna Configuration and Correlation Matrix (Note 2) | Reference Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 |  | $\begin{aligned} & \text { Pm-bch } \\ & \text { (\%) } \end{aligned}$ | $\begin{aligned} & \text { SNR (dB) (Note } \\ & \text { 3) } \end{aligned}$ |
| 1 | R. 22 | ETU30 | ETU30 | ETU30 | 2x2 Low | 1 | -3.0 |
| Note 1: | The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. SNR corresponds to $\hat{E}_{s} / N_{o c}$ of cell 1 . |  |  |  |  |  |  |

### 8.7 Sustained downlink data rate provided by lower layers

The purpose of the test is to verify that the Layer 1 and Layer 2 correctly process in a sustained manner the received packets corresponding to the maximum number of DL-SCH transport block bits received within a TTI for the UE category indicated. The sustained downlink data rate shall be verified in terms of the success rate of delivered PDCP SDU(s) by Layer 2. The test case below specifies the RF conditions and the required success rate of delivered TB by Layer 1 to meet the sustained data rate requirement. The size of the TB per TTI corresponds to the largest possible DLSCH transport block for each UE category using the maximum number of layers for spatial multiplexing. Transmission modes 1 and 3 are used with radio conditions resembling a scenario where sustained maximum data rates are available.

Test case is selected according to table 8.7-1 depending on UE capability for CA and EPDCCH.
Table 8.7-1: SDR test applicability

|  | Single carrier UE <br> not supporting <br> EPDCCH | CA UE not <br> supporting <br> EPDCCH | Single carrier UE <br> supporting <br> EPDCCH | CA UE <br> supporting <br> EPDCCH |
| :---: | :---: | :---: | :---: | :---: |
| FDD | 8.7 .1 | 8.7 .1 | 8.7 .3 | $8.7 .1,8.7 .3$ |
| TDD | 8.7 .2 | 8.7 .2 | 8.7 .4 | $8.7 .2,8.7 .4$ |

### 8.7.1 FDD (single carrier and CA)

The parameters specified in Table 8.7.1-1 are valid for all FDD tests unless otherwise stated.
Table 8.7.1-1: Common Test Parameters (FDD)

| Parameter |  | Unit | Value |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Cyclic prefix |  | Normal |  |
|  | Cell ID |  | 0 |  |
|  | Inter-TTI Distance |  | 1 |  |
|  | Number of HARQ <br> processes per <br> component carrier | Processes | 8 |  |

| Maximum number of <br> HARQ transmission |  | 4 |
| :---: | :---: | :---: |
| Redundancy version <br> coding sequence |  | $\{0,0,1,2\}$ for 64QAM and 256QAM |
| Number of OFDM <br> symbols for PDCCH per <br> component carrier | OFDM symbols | 1 |
| Cross carrier scheduling |  | Not configured |
| Propagation condition |  | Static propagation condition <br> No external noise sources are applied |

For UE not supporting 256QAM, the requirements are specified in Table 8.7.1-3, with the addition of the parameters in Table 8.7.1-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.1-4. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements are specified in Table 8.7.1-6, with the addition of the parameters in Table 8.7.1-5 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.1-7, the TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirement in Table 8.7.13 is not applicable.

For UE supporting 256QAM and category $9 / 10$ and category 13, the requirements are specified in both Table 8.7.1-3 and Table 8.7.1-6, with the addition of the parameters in Table 8.7.1-2 and in Table 8.7.1-5 respectivly. The downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.1-4 and in Table 8.7.1-7 for the category $9 / 10$ and category 13, the TB success rate shall be sustained during at least 300 frames.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.7.1-2: test parameters for sustained downlink data rate (FDD 64QAM)

| Test | Bandwidth (MHz) | Transmission mode | Antenna configuration | Codebook subset restriction | Downlinkpowerallocation (dB) |  |  | $\begin{gathered} \hat{E}_{s} \text { at } \\ \text { antenna port } \\ (\mathrm{dBm} / 15 \mathrm{kHz}) \end{gathered}$ | Symbols for unused PRBs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | $\rho_{A}$ | $\rho_{B}$ | $\sigma$ |  |  |

Note 1: Void.
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.
Note 3: Void.
Note 4: If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, the single carrier test is selecte, i.e., Test 3 for UE category 3 and Test 4 for UE category 4. Otherwise, Test 3B applies for category 3 UE and Test 4A applies for category 4 UE.
Note 5: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.
Note 6: If DL category is signalled by the UE under test, then select the test point according to UE DL Category. Otherwise, select the test point according to the UE category signalled.

Table 8.7.1-5: test parameters for sustained downlink data rate (FDD 256QAM)

| Test | Bandwidth (MHz) | Transmission mode | Antenna configuration | Codebook subset restriction | Downlink power allocation (dB) |  |  | $\hat{E}_{s}$ atantenna port <br> $(\mathrm{dBm} / 15 \mathrm{kHz})$ | $\begin{gathered} \hline \text { Symbols } \\ \text { for } \\ \text { unused } \\ \text { PRBs } \\ \hline \end{gathered}$ |

Table 8.7.1-7: Test points for sustained data rate (FRC 256QAM)

### 8.7.2 TDD (single carrier and CA)

The parameters specified in Table 8.7.2-1 are valid for all TDD tests unless otherwise stated.
Table 8.7.2-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | Special subframe configuration (Note 1) |  | 4 |
|  | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |
|  | Inter-TTI Distance |  | 1 |
|  | Maximum number of HARQ transmission |  | 4 |
|  | Redundancy version coding sequence |  | \{0,0,1,2\} for 64QAM and 256QAM |
|  | Number of OFDM symbols for PDCCH per component carrier | OFDM symbols | 1 |
|  | Cross carrier scheduling |  | Not configured |
| Propagation condition |  | Static propagation conditionNo external noise sources are applied |  |

Note 1: as specified in Table 4.2-1 in TS 36.211 [4].

For UE not supporting 256QAM, the requirements are specified in Table 8.7.2-3, with the addition of the parameters in Table 8.7.2-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE
category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.2-4. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements are specified in Table 8.7.2-6, with the addition of the parameters in Table 8.7.2-5 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.2-7. The TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirement in Table 8.7.23 is not applicable.

For UE supporting 256QAM and category $9 / 10$ and category 13, the requirements are specified in both Table 8.7.2-3 and Table 8.7.2-6, with the addition of the parameters in Table 8.7.2-2 and in Table 8.7.2-5 respectivly. The downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.2-4 and in Table 8.7.2-7 for the category $9 / 10$ and category 13 , the TB success rate shall be sustained during at least 300 frames.

The test coverage for different number of component carriers is defined in 8.1.2.4.

### 8.7.3 FDD (EPDCCH scheduling)

The parameters specified in Table 8.7.3-1 are valid for all FDD tests unless otherwise stated.
Table 8.7.3-1: Common test parameters (FDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Cyclic prefix |  | Normal |

| Cell ID |  | 0 |
| :---: | :---: | :---: |
| Inter-TTI Distance |  | 1 |
| Number of HARQ processes per component carrier | Processes | 8 |
| Maximum number of HARQ transmission |  | 4 |
| Redundancy version coding sequence |  | \{0,0,1,2\} for 64QAM |
| Number of OFDM symbols for PDCCH per component carrier | OFDM symbols | 1 |
| Cross carrier scheduling |  | Not configured |
| Number of EPDCCH sets |  | 1 |
| EPDCCH transmission type |  | Localized |
| Number of PRB per EPDCCH set and EPDCCH PRB pair allocation |  | 2 PRB pairs <br> 10 MHz BW : Resource blocks nPRB $=48,49$ <br> 15 MHz BW: Resource blocks nPRB $=70,71$ <br> 20 MHz BW: Resource blocks $\mathrm{n}_{\text {PRB }}=98,99$ |
| $\begin{aligned} & \text { EPDCCH Starting } \\ & \text { Svmbol } \end{aligned}$ |  | Derived from CFI (i.e. default behaviour) |
| ECCE Aggregation Level |  | 2 ECCEs |
| Number of EREGs per ECCE |  | 4 |
| EPDCCH scheduling |  | EPDCCH candidate is randomly assigned in each subframe |
| EPDCCH precoder (Note 1) |  | Fixed PMI 0 |
| EPDCCH monitoring SF pattern |  | 11111111110000000000 11111111110000000000 |
| Timing advance | $\mu \mathrm{s}$ | 100 |
| Propagation condition |  | Static propagation condition No external noise sources are applied |
| Note 1: $\begin{aligned} & \text { EPDCCH precoder parameters are defined for tests with } 2 \times 2 \text { antenna } \\ & \text { configuration }\end{aligned}$ |  |  |

The requirements are specified in Table 8.7.3-3, with the addition of the parameters in Table 8.7.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category, CA capability and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.3-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.3-2: Test parameters for SDR test for PDSCH scheduled by EPDCCH (FDD)

| Test | Bandwidth (MHz) | Transmission mode | Antenna configuration | Codebook subset restriction | Downlink power allocation (dB) |  |  |  | $\hat{E}_{s}$ at antenna port (dBm/15kHz) | Symbols for unused PRBs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | $\rho_{A}$ | $\rho_{B}$ | $\sigma$ | б |  |  |
| 1 | 10 | 1 | $1 \times 2$ | N/A | 0 | 0 | 0 | 0 | -85 | $\begin{aligned} & \text { OP. } 6 \\ & \text { FDD } \end{aligned}$ |
| 2 | 10 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ |
| 3,4,6 | 20 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ |
| 3A | 10 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ |
| $\begin{aligned} & 3 C, \\ & 4 B \end{aligned}$ | 15 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ |

Table 8.7.3-3: Minimum requirement (FDD)

| Test | Measurement channel | Reference value |
| :--- | :--- | :--- | :--- |

|  | Number of bits of a DL-SCH <br> transport block received within a TTI | TB success rate [\%] |  |
| :---: | :---: | :---: | :---: |
| 1 | 10296 | R.31E-1 FDD | 95 |
| 2 | 25456 | R.31E-2 FDD | 95 |
| 3 | 51024 | R.31E-3 FDD | 95 |
| $3 A$ | $36696($ Note 2$)$ | R.31E-3A FDD | 85 |
| $3 C$ | 51024 | R.31E-3C FDD | 85 |
| 4 | $75376($ Note 3) | R.31E-4 FDD | 85 |
| $4 B$ | $55056($ Note 5) | R.31E-4B FDD | 85 |
| 6 | $75376($ Note 3) | R.31E-4 FDD | 85 |

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.
Note 2: 35160 bits for sub-frame 5.
Note 3: 71112 bits for sub-frame 5.
Note 4: The TB success rate is defined as TB success rate $=100 \% *{ }^{*}$ NDL_correct_rx/ (NDL_newtx + NDL_retx) , where NDL_newtx is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NDL_correct_rx is the number of correctly received DL transport blocks.
Note 5: 52752 bits for sub-frame 5.

Table 8.7.3-4: Test points for sustained data rate (FRC)

| CA <br> config | Bandwidth (MHz) | Category <br> $\mathbf{1}$ | Category <br> $\mathbf{2}$ | Category 3 | Category 4 | Category 6 | Category 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Single <br> carrier | 10 | 1 | 2 | $3 A$ | $3 A$ | - | - |
|  | 15 | - | - | $3 C$ | $4 B$ | - | - |
| Note 1: The test is selected for maximum supported bandwidth. |  |  |  |  |  |  |  |

### 8.7.4 TDD (EPDCCH scheduling)

The parameters specified in Table 8.7.4-1 are valid for all TDD tests unless otherwise stated.
Table 8.7.4-1: Common test parameters (TDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Special subframe configuration (Note 1) |  | 4 |
| Cyclic prefix |  | Normal |
| Cell ID |  | 0 |
| Inter-TTI Distance |  | 1 |
| Maximum number of HARQ transmission |  | 4 |
| Redundancy version coding sequence |  | \{0,0,1,2\} for 64QAM |
| Number of OFDM symbols for PDCCH per component carrier | OFDM symbols | 1 |
| Cross carrier scheduling |  | Not configured |
| Number of EPDCCH sets |  | 1 |
| EPDCCH transmission type |  | Localized |
| Number of PRB per EPDCCH set and EPDCCH PRB pair allocation |  | 2 PRB pairs$10 \mathrm{MHz} \mathrm{BW}:$ Resource blocks nPRB $=48$,49$15 \mathrm{MHz} \mathrm{BW}:$ Resource blocks7 PRB$=70$,71$20 \mathrm{MHz} \mathrm{BW}:$ Resource blocks nPRB $=98$, |
| $\begin{aligned} & \text { EPDCCH Starting } \\ & \text { Svmbol } \end{aligned}$ |  | Derived from CFI (i.e. default behaviour) |
| ECCE Aggregation Level |  | 2 ECCEs |

| Number of EREGs per <br> ECCE |  | 4 for normal subframe and for special <br> subframe |
| :--- | :---: | :---: |
| EPDCCH scheduling |  | EPDCCH candidate is randomly assigned <br> in each subframe |
| EPDCCH precoder <br> (Note 2) |  | Fixed PMI 0 |

The requirements are specified in Table 8.7.4-3, with the addition of the parameters in Table 8.7.4-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category, CA capability and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.4-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.4-2: Test parameters for SDR test for PDSCH scheduled by EPDCCH (TDD)

| Test | Bandwidth (MHz) | Transmission mode | Antenna configuration | Codebook subset restriction | Downlink power allocation (dB) |  |  |  | $\begin{gathered} \hat{E}_{s} \text { at } \\ \text { antenna port } \\ (\mathrm{dBm} / 15 \mathrm{kHz}) \end{gathered}$ | ```Symbols for unused PRBs``` | ACK/NACK feedback mode |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | $\rho_{A}$ | $\rho_{B}$ | $\sigma$ | б |  |  |  |
| 1 | 10 | 1 | $1 \times 2$ | N/A | 0 | 0 | 0 | 0 | -85 | $\begin{aligned} & \hline \text { OP. } 6 \\ & \text { TDD } \\ & \hline \end{aligned}$ | Bundling |
| 2 | 10 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | Bundling |
| 3 | 20 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | Bundling |
| 3A | 15 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \text { OP. } 2 \\ & \text { TDD } \end{aligned}$ | Multiplexing |
| 4,6 | 20 | 3 | $2 \times 2$ | 10 | -3 | -3 | 0 | 3 | -85 | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | Multiplexing |

Table 8.7.4-3: Minimum requirement (TDD)

| Test | Number of bits of a DL-SCH transport block received within a TTI for normal/special subframe | Measurement channel | Reference value |
| :---: | :---: | :---: | :---: |
|  |  |  | TB success rate [\%] |
| 1 | 10296/0 | R.31E-1 TDD | 95 |
| 2 | 25456/0 | R.31E-2 TDD | 95 |
| 3 | 51024/0 | R.31E-3 TDD | 95 |
| 3A | 51024/0 | R.31E-3A TDD | 85 |
| 4 | 75376/0 (Note 2) | R.31E-4 TDD | 85 |
| 6 | 75376/0 (Note 2) | R.31E-4 TDD | 85 |

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.
Note 2: 71112 bits for sub-frame 5.
Note 3: The TB success rate is defined as TB success rate $=100 \% * N_{D L \_ \text {correct_rx/ ( }}$ (NDL_newtx + NDL_retx), where NDL_newtx is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NoL_correct_rx is the number of correctly received DL transport blocks.

| Note 1: The test is selected for maximum supported bandwidth. |  |  |  |  |  |  |  |

### 8.7.5 TDD FDD CA

The parameters specified in Table 8.7.5-1 are valid for all TDD FDD CA tests unless otherwise stated.
Table 8.7.5-1: Common Test Parameters (TDD FDD CA)

| Parameter |  | Value |  |
| :---: | :---: | :---: | :---: |
| Uplink downlink configuration (Note 1) for |  |  | 1 |
| Special subframe configuration (Note 2) for TDD CC |  |  | 4 |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 |
|  | $\sigma$ | dB | 0 |
| Cyclic prefix |  |  | Normal |
| Cell ID |  |  | 0 |
| Inter-TTI Distance |  |  | 1 |
| Maximum number of HARQ processes per component carrier | FDD PCell | Processes | 8 for FDD and TDD CCs |
|  | TDD PCell | Processes | 11 for FDD CC; 7 for TDD CC |
| Maximum number of HARQ transmission |  |  | 4 |
| Redundancy version coding sequence |  |  | \{0,0,1,2\} for 64QAM, 256QAM |
| Number of OFDM symbols for PDCCH per component carrier |  | OFDM symbols | 1 |
| Cross carrier scheduling |  |  | Not configured |
| Propagation condition |  |  | Static propagation condition <br> No external noise sources are applied |
| Transmission mode |  |  | TM3 |
| Codebook subset restriction |  |  | 10 |
| Antenna configuration |  |  | $2 \times 2$ |
| $\hat{E}_{s}$ at antenna port (dBm/15kHz) |  |  | -85 |
| Symbols for unused PRBs |  |  | OP. 1 FDD for FDD CC, OP. 1 TDD for TDD CC |
| ACK/NACK feedback mode |  |  | PUCCH format 3 |
| Downlink HARQ-ACK timing | FDD PCell |  | As specified in Clause 7.3.3 in TS36.213 [6] |
|  | TDD PCell |  | $\begin{gathered} \text { As specified in Clause 7.3.4 in } \\ \text { TS36.213 [6] } \\ \hline \end{gathered}$ |
| Note 1: as specified in Table 4.2-2 in TS 36.211 [4]. <br> Note 2: as specified in Table 4.2-1 in TS 36.211 [4]. |  |  |  |

### 8.7.5.1 Minimum Requirement FDD PCell

For UE not supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.1-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.5.1-2. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.1-3 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category or UE DL category, and bandwidth combination with the maximum aggregated bandwidth as specified in Table 8.7.5.1-4. The TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirement in Table 8.7.5.1-1 is not applicable.

The applicability of the requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.7.5.1-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)

| Test num ber | Bandwidth (MHz) |  |  | Number of bits of a DLSCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe \#5) |  | Measurement channel |  | Reference value <br> TB success rate [\%] |

Table 8.7.5.1-4: Test points for sustained data rate (FRC 256QAM)

### 8.7.5.2 Minimum Requirement TDD PCell

For UE not supporting 256QAM, the requirements for TDD FDD CA with TDD PCell are specified in Table 8.7.5.2-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.5.2-2. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.2-3 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category or UE DL category, and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.5.2-4. The TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirements in Table 8.7.5.2-1 is not applicable.

The applicability of ther requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.7.5.2-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)

| Test num ber | Bandwidth (MHz) |  |  | Number of bits of a DLSCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe \#5) |  | Measurement channel |  | Referen ce value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | FDD CC | TDD CC | FDD CC | TDD CC | FDD CC | TDD CC | TB success rate [\%] |
| 1 | 2x20 | 20 | 20 | 75376 | 75376/0 | R.31-4 FDD | R.31-4 TDD | 85 |

Table 8.7.5.2-4: Test points for sustained data rate (FRC 256QAM)

### 8.7.6 FDD (DC)

The parameters specified in Table 8.7.6-1 are valid for all FDD DC tests unless otherwise stated.
Table 8.7.6-1: Common Test Parameters (FDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |

| Cyclic prefix |  | Normal |
| :---: | :---: | :---: |
| Cell ID |  | 0 |
| Inter-TTI Distance | Processes | 1 |
| Number of HARQ processes per <br> component carrier |  | 8 |
| Maximum number of HARQ <br> transmission |  | 4 |
| Redundancy version coding sequence |  | OFDM |
| Number of OFDM symbols for PDCCH <br> per component carrier | Symbols | Not configured |
| Cross carrier scheduling |  | Static propagation condition <br> Propagation condition |
| Transmission mode |  | No external noise sources are applied |

For UE not supporting 256QAM, the requirements are specified in Table 8.7.6-2, with the addition of the parameters in Table 8.7.6-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.6-3. The TB success rate across CGs shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements are specified in Table 8.7.6-4, with the addition of the parameters in Table 8.7.6-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.6-5. The TB success rate across CGs shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirements in Table 8.7.6-2 are not applicable.

The applicability of ther requirements are specified in Clause 8.1.2.3A.

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.
Note 2: For the configuration of DRB type of Split bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*} N_{D L \_c o r r e c t \_r x / ~(N D L n e w t x ~}+$ NDL_retx ), where NDL_newtx is the number of newly transmitted DL transport blocks, NoL_retx is the number of retransmitted DL transport blocks, and NoL_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes across all the CGs used for DC transmission or reception.
Note 3: For the configuration of DRB type of SCG bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*}$ NDL_correct_rx/ (NDL_newtx + NDL_retx), where NDL_newtx is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NdL_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes per CG used for DC transmission or reception, separately.
Note 4: 35160 bits for sub-frame 5.
Note 5: 71112 bits for sub-frame 5.
Note 6: 52752 bits for sub-frame 5.

Table 8.7.6-3: Test points for sustained data rate (FRC DC 64QAM)

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.
Note 2: For the configuration of DRB type of Split bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*} N_{\text {DL_correct_rx/ }}\left(N_{D L \_}\right.$newtx + NDL_retx $)$, where NDL_newtx is the number of newly transmitted DL transport blocks, NoL_retx is the number of retransmitted DL transport blocks, and NoL_correctrix is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes across all the CGs used for DC transmission or reception.
Note 3: For the configuration of DRB type of SCG bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*}$ NDL_correct_rx/ (NDL_newtx + NDL_retx), where NdL_newtx is the number of newly transmitted DL transport blocks, NdL_retx is the number of retransmitted DL transport blocks, and NDL_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes per CG used for DC transmission or reception, separately.

Table 8.7.6-5: Test points for sustained data rate (FRC DC 256QAM)

### 8.7.7 TDD (DC)

The parameters specified in Table 8.7.7-1 are valid for all TDD DC tests unless otherwise stated.
Table 8.7.7-1: Common Test Parameters (TDD)

| Parameter |  | Unit | Value |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Uplink downlink configuration |  | 2 (Note 2) |  |
|  | Special subframe configuration |  | 4 |  |
|  | Cyclic prefix |  | Normal |  |
|  | Cell ID |  | 0 |  |
| Inter-TTI Distance | Processes | 1 |  |  |

| Maximum number of HARQ transmission |  |  | 4 |
| :---: | :---: | :---: | :---: |
| Redundancy version coding sequence |  |  | \{0,0,1,2\} for 64QAM and 256QAM |
| Number of OFDM symbols for PDCCH per component carrier |  | OFDM symbols | 1 |
| Cross carrier scheduling |  |  | Not configured |
| Propagation condition |  |  | Static propagation condition <br> No external noise sources are applied |
| Transmission mode |  |  | TM3 |
| Codebook subset restriction |  |  | 10 |
| Antenna configuration |  |  | 2x2 |
| $\hat{E}_{s}$ at antenna port (dBm/15kHz) |  |  | -85 |
| Symbols for unused PRBs |  |  | OP. 1 TDD |
| ACK/NACK feedback mode |  |  | Separate ACK/NACK feedbacks with PUCCH format 3 on the MCG and SCG |
| Time offset between MCG CC and SCG CC |  | $\mu \mathrm{s}$ | 0 for UE under test supporting synchronous dual connectivity; 500 for UE under test supporting both asynchronous and synchrounous dual connectivity (Note 1) |
| Downlink power allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 |
|  | $\sigma$ | dB | 0 |
| Note 1: Asynchronous and synchrous dual connectivity are defined in TS36.300 [11]. <br> Note 2: If the UE supports both SCG bearer and Split bearer, the Split bearer is configured. |  |  |  |

For UE not supporting 256QAM, the requirements are specified in Table 8.7.7-2, with the addition of the parameters in Table 8.7.7-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.7-3. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements are specified in Table 8.7.7-4, with the addition of the parameters in Table 8.7.7-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.7-5. The TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirements in Table 8.7.72 are not applicable.

The applicability of ther requirements are specified in Clause 8.1.2.3A.

### 8.7.8 TDD FDD (DC)

The parameters specified in Table 8.7.8-1 are valid for all TDD FDD DC tests unless otherwise stated.
Table 8.7.8-1: Common Test Parameters (TDD FDD DC)

For UE not supporting 256QAM, the requirements are specified in Table 8.7.8-2, with the addition of the parameters in Table 8.7.8-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.8-3. The TB success rate shall be sustained during at least 300 frames.

For UE supporting 256QAM, the requirements are specified in Table 8.7.8-4, with the addition of the parameters in Table 8.7.7-1 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified inTable 8.7.8-5. The TB success rate shall be sustained during at least 300 frames. For UE supporting 256QAM, the requirements in Table 8.7.82 are not applicable.

The applicability of ther requirements are specified in Clause 8.1.2.3A.

Table 8.7.8-2: Minimum requirement (TDD FDD DC 64QAM)

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.
Note 2: For the configuration of DRB type of Split bearer,the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*} N_{D L \_c o r r e c t \_r x / ~(~}^{\text {DL_newtx }}+$ NDL_retx ), where NDL_newtx is the number of newly transmitted DL transport blocks, NoL_rexx is the number of retransmitted DL transport blocks, and Nol_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes across all the CGs used for DC transmission or reception.
Note 3: For the configuration of DRB type of SCG bearer, the TB success rate across CGs is defined as TB success rate $=100 \%{ }^{*} N_{D L \_\_c o r r e c t \_r x / ~}^{c}\left(N_{D L \_n e w t x ~}+\right.$ NDL_retx) , where NDL_newtx is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NoL_correct_rx is the number of correctly received DL transport blocks. All the above numbers of transmitted, retransmitted or correctly received DL transport blocks are calculated as the sum of the numbers of DL transport blockes per CG used for DC transmission or reception, separately.
Note 4: 71112 bits for sub-frame 5.

|  | Downlin power | 2 layer CC | $\rho_{A}=-3 \mathrm{~dB}, \rho_{B}=-3 \mathrm{~dB}, \sigma=0 \mathrm{~dB}$ |
|  | allocation | 4 layer CC | $\rho_{A}=-6 \mathrm{~dB}, \rho_{B}=-6 \mathrm{~dB}, \sigma=3 \mathrm{~dB}$ |
|  | Symbols for unused PRBs |  | OP. 1 FDD |

For UE not supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.9-2 with the downlink physical channel setup according to Annex C.3.2.

For UE supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.9-3 with the downlink physical channel setup according to Annex C.3.2. For UE supporting 256QAM, the requirement with 64QAM is not applicable.

The TB success rate is defined as $100 \% * \mathrm{~N}_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\text {DL_newtx }}+\mathrm{N}_{\text {DL_retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\text {DL_retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

|  | 20 | R.68-6 FDD |

CA configuration, bandwidth combination and MIMO layer on each CC is determined by following procedure.

- Select one CA bandwidth combination among all supported CA configurations with bandwidth combination and MIMO layer on each CC that leads to largest equivalent aggregated bandwidth among all CA bandwidth combinations supported by UE. Equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} R_{i} B_{i}
$$

where $N$ is number of CCs, $R_{i} \in\{2,4\}$ and $B_{i} \in\{5,10,15,20\}$ is MIMO layer and bandwidth of CC $i$.

- When there are multiple sets of \{CA configuration, bandwidth combination, MIMO layer\} with same largest aggregated bandwidth, select one among sets with largest number of 4 layer CCs.
- The procedure applies also for single carrier using operating band instead of CA configuration, and bandwidth instead of bandwidth combination.

Table 8.7.9-4: Void
Table 8.7.9-5: Void

### 8.7.10 TDD (4 Rx)

The parameters specified in Table 8.7.10-1 are valid for all TDD tests for 4Rx capable UEs unless otherwise stated.

Table 8.7.10-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
| - ${ }^{\text {a }}$ Transmission mode |  |  | 3 |
|  | Special subframe configuration (Note 1) |  | 4 |
|  | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |

CA configuration, bandwidth combination and MIMO layer on each CC is determined by following procedure.

- Select one CA bandwidth combination among all supported CA configurations with bandwidth combination and MIMO layer on each CC that leads to largest equivalent aggregated bandwidth among all CA bandwidth combinations supported by UE. Equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} R_{i} B_{i}
$$

where $N$ is number of CCs, $R_{i} \in\{2,4\}$ and $B_{i} \in\{5,10,15,20\}$ is MIMO layer and bandwidth of CC $i$.

- When there are multiple sets of \{CA configuration, bandwidth combination, MIMO layer\} with same largest aggregated bandwidth, select one among sets with largest number of 4 layer CCs.

For UE not supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.12.1-2 with the downlink physical channel setup according to Annex C.3.2.

For UE supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.12.1-3 with the downlink physical channel setup according to Annex C.3.2. For UE supporting 256QAM, the requirement with 64QAM is not applicable.

For LAA SCell, per-CC separate FRCs are defined for different UE capability for endingDwPTS and secondSlotStartingPosition.

The TB success rate is defined as $100 \% * N_{\text {DL_correct_rx }} /\left(N_{D L \_n e w t x ~}+N_{\text {DL_retx }}\right)$, where $N_{D L \_n e w t x ~}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\text {DL_retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\mathrm{DL}}$ correct_rx is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

|  | 4 layer CC | $\rho_{A}=-6 \mathrm{~dB}, \rho_{B}=-6 \mathrm{~dB}, \sigma=3 \mathrm{~dB}$ |

| Symbols for unused <br> PRBs |  | OP. 1 TDD |
| :---: | :---: | :---: |
| ACK/NACK feedback <br> mode |  | Separate ACK/NACK feedbacks with <br> PUCCH format 3 on the MCG and SCG |
| Time offset between <br> MCG CC and SCG CC | $\mu$ s | 0 for UE under test supporting <br> synchronous dual connectivity; <br> 500 for UE under test supporting both <br> asynchronous and synchrounous dual <br> connectivity (Note 1) |

Note 1: Asynchronous and synchrous dual connectivity are defined in TS36.300 [11].
Note 2: If the UE supports both SCG bearer and Split bearer, the Split bearer is configured.

For UE not supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.14-2 with the downlink physical channel setup according to Annex C.3.2.

For UE supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.14-3 with the downlink physical channel setup according to Annex C.3.2. For UE supporting 256QAM, the requirement with 64QAM is not applicable.

The TB success rate is defined as $100 \% * \mathrm{~N}_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\mathrm{DL} \_ \text {newtx }}+\mathrm{N}_{\text {DL_retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\text {DL_retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate across CGs shall be sustained during at least 300 frames.

|  |  | R.68-5 TDD |
|  | 15 | R.68-6 TDD |
|  | 20 | R.68-7 TDD |

DC configuration, bandwidth combination and MIMO layer on each CC is determined by following procedure.

- Select one DC bandwidth combination among all supported DC configurations with bandwidth combination and MIMO layer on each CC that leads to largest equivalent aggregated bandwidth among all DC bandwidth combinations supported by UE. Equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} R_{i} B_{i}
$$

where $N$ is number of CCs, $R_{i} \in\{2,4\}$ and $B_{i} \in\{5,10,15,20\}$ is MIMO layer and bandwidth of CC $i$.

- When there are multiple sets of \{DC configuration, bandwidth combination, MIMO layer\} with same largest aggregated bandwidth, select one among sets with largest number of 4 layer CCs.

### 8.7.15 TDD FDD DC (4 Rx)

The parameters specified in Table 8.7.15-1 are valid for all TDD FDD tests for 4Rx capable UEs unless otherwise stated.

Table 8.7.15-1: Common Test Parameters (TDD FDD)

| Parameter | Unit | FDD CC | TDD CC |

DC configuration, bandwidth combination and MIMO layer on each CC is determined by following procedure.

- Select one DC bandwidth combination among all supported DC configurations with bandwidth combination and MIMO layer on each CC that leads to largest equivalent aggregated bandwidth among all DC bandwidth combinations supported by UE. Equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} R_{i} B_{i}
$$

where $N$ is number of $\mathrm{CCs}, R_{i} \in\{2,4\}$ and $B_{i} \in\{5,10,15,20\}$ is MIMO layer and bandwidth of CC $i$.

- When there are multiple sets of \{DC configuration, bandwidth combination, MIMO layer \} with same largest aggregated bandwidth, select one among sets with largest number of 4 layer CCs.

### 8.7.16 FDD (1024QAM and up to 4Rx supported)

The common parameters are specified in Table 8.7.16-1 for UE which is capable of supporting 1024QAM.
Table 8.7.16-1: Common Test Parameters (FDD)

| Parameter | Unit | Value |
| :--- | :--- | :--- |
| Transmission mode |  | 3 |
| Cyclic prefix |  | Normal |
| Cell ID |  | 0 |

| Codebook subset <br> restriction | 2 layer CC | 10 |
|  | 4 layer CC | 1000 |
| Downlin power <br> allocation | 2 layer CC | $\rho_{A}=-3 \mathrm{~dB}, \rho_{B}=-3 \mathrm{~dB}, \sigma=0 \mathrm{~dB}$ |
|  | 4 layer CC | $\rho_{A}=-6 \mathrm{~dB}, \rho_{B}=-6 \mathrm{~dB}, \sigma=3 \mathrm{~dB}$ |
| Symbols for unused <br> PRBs |  | OP.1 FDD |

The UE capability for 1024QAM is signalled per band or per band combination, hence the SDR tests with the mixed modulation orders and the mixed receiver antenna numbers across CC-s are specified.

For UE not supporting CA and supporting 1024QAM, the TB success rate shall be higher than $85 \%$ when PDSCH is scheduled with FRC in Table 8.7.16-4 according the UE capability. The maximum supported channel bandwidth and MIMO layer are configured during the test.

For UE supporting CA and supporting 1024QAM at least on one CC for a supported CA configuration, the SDR requirements are specified as follows:

- If UE is capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.16-3 for the transmission with 256QAM and Table 8.7.16-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.
- If UE is not capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.16-2 for the transmission with 64QAM and Table 8.7.16-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.

For UE supporting 1024 QAM, the SDR requirement with 64QAM and 256QAM only is not applicable.
The CA configuration or band for single carrier, bandwidth combination or bandwidth for single carrier, modulation order on each CC and MIMO layer on each CC are determined by the following procedure.

- Among all the supported CA configurations which support 1024QAM at least on one CC, select one set of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\}, which leads to the largest equivalent aggregated bandwidth. The equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} M_{i} R_{i} B_{i}
$$

Where $N$ is the number of CCs, $R_{i} \in\{2,4\}$ represents the MIMO layer, $B_{i} \in\{5,10,15,20\}$ represents the bandwidths on each CC, $\left[M_{i} \in\{0.75,1,1.25\}\right.$ is the scaling factor according to the supported modulation order on each CC, where $M_{i}=0.75$ is used if the maximum modulation order of CC $i$ is 64QAM, $M_{i}=1$ is used if the
maximum modulation order of CC $i$ is 256QAM, and $M_{i}=1.25$ is used if the maximum modulation order of CC $i$ is 1024QAM.]

- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\} which can reach the same equivalent aggregated bandwidth, select one among the sets with the largest number of CCs supporting 1024QAM.
- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\} which can reach the same equivalent aggregated bandwidth with the same number of CCs supporting 1024QAM, select one among the sets with the largest number of CCs supporting 4 layer.
- The procedure applies also for the single carrier operating band instead of CA configuration, and bandwidth instead of bandwidth combination.

The TB success rate for single carrier or on each CC for CA is defined as $100 \% * \mathrm{~N}_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\text {DL_newtx }}+\mathrm{N}_{\text {DL_retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\mathrm{DL} \text { _retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

|  | 4 layer CC | 1000 |
| Downlin power allocation | 2 layer CC | $\rho_{A}=-3 \mathrm{~dB}, \rho_{B}=-3 \mathrm{~dB}, \sigma=0 \mathrm{~dB}$ |
|  | 4 layer CC | $\rho_{A}=-6 \mathrm{~dB}, \rho_{B}=-6 \mathrm{~dB}, \sigma=3 \mathrm{~dB}$ |
| Symbols for unused PRBs |  | OP. 1 TDD |

The UE capability for 1024QAM is signalled per band or per band combination, hence the SDR tests with the mixed modulation orders and the mixed receiver antenna numbers across CC -s are specified.

For UE not supporting CA and supporting 1024QAM, the TB success rate shall be higher than $85 \%$ when PDSCH is scheduled with FRC in Table 8.7.17-4 according the UE capability. The maximum supported channel bandwidth and MIMO layer are configured during the test.

For UE supporting CA and supporting 1024QAM at least on one CC for a supported CA configuration, the SDR requirements are specified as follows:

- If UE is capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.17-3 for the transmission with 256QAM and Table 8.7.17-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.
- If UE is not capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.17-2 for the transmission with 64QAM and Table 8.7.17-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.

For UE supporting 1024 QAM, the SDR requirement with 64QAM and 256QAM only is not applicable.
The CA configuration or band for single carrier, bandwidth combination or bandwidth for single carrier, modulation order on each CC and MIMO layer on each CC are determined by the following procedure.

- Among all the supported CA configurations which support 1024QAM at least on one CC, select one set of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on
each CC$\}$, which leads to the largest equivalent aggregated bandwidth. The equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} M_{i} R_{i} B_{i}
$$

Where $N$ is the number of CCs, $R_{i} \in\{2,4\}$ represents the MIMO layer, $B_{i} \in\{10,15,20\}$ represents the bandwidths on each CC, $\left[M_{i} \in\{0.75,1,1.25\}\right.$ is the scaling factor according to the supported modulation order on each CC, where $M_{i}=0.75$ is used if the maximum modulation order of CC $i$ is 64QAM, $M_{i}=1$ is used if the maximum modulation order of CC $i$ is 256QAM, and $M_{i}=1.25$ is used if the maximum modulation order of CC $i$ is 1024QAM.]

- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC$\}$ which can reach the same equivalent aggregated bandwidth, select one among the sets with the largest number of CCs supporting 1024QAM.
- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\} which can reach the same equivalent aggregated bandwidth with the same number of CCs supporting 1024QAM, select one among the sets with the largest number of CCs supporting 4 layer.
- The procedure applies also for the single carrier operating band instead of CA configuration, and bandwidth instead of bandwidth combination.

The TB success rate for single carrier or on each CC for CA is defined as $100 \% * \mathrm{~N}_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\mathrm{DL} \_ \text {newtx }}+\mathrm{N}_{\mathrm{DL} \_ \text {retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\mathrm{DL} \_ \text {retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

The UE capability for 1024QAM is signalled per band or per band combination, hence the SDR tests with the mixed modulation orders and the mixed receiver antenna numbers across CC-s are specified.

For UE not supporting CA and supporting 1024QAM, the TB success rate shall be higher than $85 \%$ when PDSCH is scheduled with FRC in Table 8.7.18-4 according the UE capability. The maximum supported channel bandwidth and MIMO layer are configured during the test.

For UE supporting CA and supporting 1024QAM at least on one CC for a supported CA configuration, the SDR requirements are specified as follows:

- If UE is capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.18-3 for the transmission with 256QAM and Table 8.7.18-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.
- If UE is not capable of supporting 256QAM, the TB success rate shall be higher than $85 \%$ on each CC when PDSCH-s are scheduled with FRC-s in Table 8.7.18-2 for the transmission with 64QAM and Table 8.7.18-4 for the transmission with 1024QAM according to the reported capability of supported modulation order for the determined CA configuration.

For UE supporting 1024 QAM, the SDR requirement with 64QAM and 256QAM only is not applicable.
The CA configuration or band for single carrier, bandwidth combination or bandwidth for single carrier, modulation order on each CC and MIMO layer on each CC are determined by the following procedure.

- Among all the supported CA configurations which support 1024QAM at least on one CC, select one set of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC$\}$, which leads to the largest equivalent aggregated bandwidth. The equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} M_{i} R_{i} B_{i}
$$

Where $N$ is the number of CCs, $R_{i} \in\{2,4\}$ represents the MIMO layer, $B_{i} \in\{5,10,15,20\}$ represents the bandwidths on each FDD CC and $B_{i} \in\{10,15,20\}$ represents the bandwidths on each FDD CC, [ $M_{i} \in\{0.75,1,1.25\}$ is the scaling factor according to the supported modulation order on each CC, where $M_{i}=$ 0.75 is used if the maximum modulation order of CC $i$ is 64QAM, $M_{i}=1$ is used if the maximum modulation order of CC $i$ is 256QAM, and $M_{i}=1.25$ is used if the maximum modulation order of CC $i$ is 1024QAM.]

- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\} which can reach the same equivalent aggregated bandwidth, select one among the sets with the largest number of CCs supporting 1024QAM.
- When there are multiple sets of \{CA configuration or a band, bandwidth combination or bandwidth, modulation order on each CC, MIMO layer on each CC\} which can reach the same equivalent aggregated bandwidth with the same number of CCs supporting 1024QAM, select one among the sets with the largest number of CCs supporting 4 layer.
- The procedure applies also for the single carrier operating band instead of CA configuration, and bandwidth instead of bandwidth combination.

The TB success rate for single carrier or on each CC for CA is defined as $100 \% * \mathrm{~N}_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\text {DL_newtx }}+\mathrm{N}_{\text {DL_retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\mathrm{DL}}$ retx is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

| Note 1: | $P_{B}=1$ |
| Note 2: | 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks <br> (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS <br> portion of sub-frames 1,6. |
| Note 3:The precoder in clause B.4.3 follows UE recommended PMI. <br> Note 4: <br> If the UE reports in an available uplink reporting instance at subrame SF\#n <br> based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported <br> PMI cannot be applied at the eNB downlink before SF\#(n+4). |  |

For UE not supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.19-2 with the downlink physical channel setup according to Annex C.3.2.

For UE supporting 256QAM, the TB success rate shall be higher than $85 \%$ when PDSCH are scheduled with FRC in Table 8.7.19-3 with the downlink physical channel setup according to Annex C.3.2. For UE supporting 256QAM, the requirement with 64QAM is not applicable.

The TB success rate is defined as $100 \% * N_{\text {DL_correct_rx }} /\left(\mathrm{N}_{\text {DL_newtx }}+\mathrm{N}_{\text {DL_retx }}\right)$, where $\mathrm{N}_{\text {DL_newtx }}$ is the number of newly transmitted DL transport blocks, $\mathrm{N}_{\text {DL_retx }}$ is the number of retransmitted DL transport blocks, and $\mathrm{N}_{\text {DL_correct_rx }}$ is the number of correctly received DL transport blocks. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.19-2: Per-CC FRC for SDR test (TDD 64QAM)

| 8 layer | 10 | R.68-8 TDD |
|  | 15 | R.68-9 TDD |
|  | 20 | R.68-10 TDD |

CA configuration, bandwidth combination and MIMO layer on each CC is determined by following procedure.

- Select the set(s) of \{CA configuration, bandwidth combination, MIMO layer\} among all the supported CA configurations that leads to the largest equivalent aggregated bandwidth which does not cause the transport block bits within a TTI to exceed the capability of the category of UE under test when the defined reference channel applies on each CC. The equivalent aggregated bandwidth is defined as

$$
B_{a g g}=\sum_{i=0}^{N-1} a\left(R_{i}\right) R_{i} B_{i}
$$

Where $N$ is the number of CCs, $R_{i} \in\{2,4,8\}$ and $B_{i} \in\{5,10,15,20\}$ are MIMO layer and bandwidth of CC

$$
i \text {. And } a\left(R_{i}\right)=1 \text { for } R_{i}=2,4 \text { and } a\left(R_{i}\right)=0.75 \text { for } R_{i}=8
$$

- The procedure applies also for single carrier using operating band instead of CA configuration, and bandwidth instead of bandwidth combination.

### 8.8 Demodulation of EPDCCH

The receiver characteristics of the EPDCCH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). For the distributed transmission tests in 8.8.1, EPDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of EPDCCH. For other tests, EPDCCH and PCFICH are not tested jointly.

### 8.8.1 Distributed Transmission

### 8.8.1.1 FDD

The parameters specified in Table 8.8.1.1-1 are valid for all FDD distributed EPDCCH tests unless otherwise stated.
Table 8.8.1.1-1: Test Parameters for Distributed EPDCCH

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Number of PDCCH symbols |  | symbols | 2 (Note 1) |
| PHICH duration |  |  | Normal |
| Unused RE-s and PRB-s |  |  | OCNG |
| Cell ID |  |  | 0 |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 |
|  | $\sigma$ | dB | 0 |
|  | б | dB | 3 |
| $N_{o c}$ at antenna port |  | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -98 |
| Cyclic prefix |  |  | Normal |

| TDD Special Subframe |  | 1 (Note 4) |
| Note 1: The starting symbol for EPDCCH is signalled with epdcch-StartSymbol-r11. However, CFI is set to 1. |  |  |
| Note 2: The first set is distributed tran transmission with $\mathrm{PRB}=\{0$, for all tests. |  | $=\{0,49\}$ and the second set is localized 49\}. ePDCCH is scheduled in the second set |
| Note 3: EPDCCH is scheduled in ever space only in SFs configured |  | d to monitor ePDCCH for UE-specific search Config-r11. Legacy PDCCH is not scheduled mal and special subframe. |

For the parameters specified in Table 8.8.2.2-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.2.2.2-2. EPDCCH subframe monitoring is configured and the subframe monitoring requirement in EPDCCH restricted subframes is statDTX of $99.9 \%$.

The downlink physical setup is in accordance with Annex C.3.2.

### 8.8.4 Enhanced Downlink Control Channel Performance Requirements Type A - Localized Transmission with CRS Interference Model

### 8.8.4.1 FDD

For the parameters specified in Table 8.8.4.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.4.1-2. The purpose of this test is to verify the localized EPDCCH performance, when the EPDCCH transmission in the serving cell is interfered by the CRS of the interfering cells, applying the CRS interference model defined in clause B.6.5. In Table 8.8.4.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical setup is in accordance with Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.8.4.1-1: Test Parameters for EPDCCH

### 8.8.4.2 TDD

For the parameters specified in Table 8.8.4.2-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.4.2-2. The purpose of this test is to verify the localized EPDCCH performance, when the EPDCCH transmission in the serving cell is interfered by the CRS of the interfering cells, applying the CRS interference model defined in clause B.6.5. In Table 8.8.4.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical setup is in accordance with Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.8.4.2-1: Test Parameters for EPDCCH

### 8.8.5 Enhanced Downlink Control Channel Performance Requirements Type A - Distributed Transmission with TM9 Interference Model

### 8.8.5.1 TDD

For the parameters specified in Table 8.8.5.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.5.1-2. The purpose of this test is to verify the distributed EPDCCH performance when the EPDCCH transmission in the serving cell is interfered by two interfering cells and applying TM9 interference model. In Table 8.8.5.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical setup is in accordance with Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.8.5.1-1: Test Parameters for EPDCCH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.8.6 Enhanced Downlink Control Channel Performance Requirements Type A - Distributed Transmission with TM3 Interference Model

### 8.8.6.1 FDD

For the parameters specified in Table 8.8.6.1-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.6.1-2. The purpose of this test is to verify the distributed EPDCCH performance when the serving cell EPDCCH transmission is interfered by two interfering cells applying asynchronous TM3 interference model. In Table 8.8.6.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical setup is in accordance with Annex C. 3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is not provided.

Table 8.8.6.1-1: Test Parameters for EPDCCH

| Parameter | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.9.1.1.2 Closed-loop spatial multiplexing performance (Cell-Specific Reference Symbols)

### 8.9.1.1.2.1 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port

The requirements are specified in Table 8.9.1.1.2.1-2, with the addition of the parameters in Table 8.9.1.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rankone performance with frequency selective precoding.

Table 8.9.1.1.2.1-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 6 |
| PMI delay (Note 2) |  | ms | 8 |
| Reporting interval |  | ms | 8 |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestricti on bitmap |  |  | 001111 |
| PDSCH transmission mode |  |  | 4 |
| Note 1: $\quad P_{B}=1$. <br> Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |  |  |  |

Table 8.9.1.1.2.1-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)
$\left.\begin{array}{|c|c|c|c|c|c|c|c|c|}\hline \begin{array}{c}\text { Test } \\ \text { number }\end{array} & \begin{array}{c}\text { Band- } \\ \text { width } \\ \text { and } \\ \text { MCS }\end{array} & \begin{array}{c}\text { Reference } \\ \text { Channel }\end{array} & \begin{array}{c}\text { OCNG } \\ \text { Pattern }\end{array} & \begin{array}{c}\text { Propagation } \\ \text { Condition }\end{array} & \begin{array}{c}\text { Correlation } \\ \text { Matrix and } \\ \text { Antenna } \\ \text { Configuration }\end{array} & \begin{array}{c}\text { Reference value }\end{array} & \begin{array}{c}\text { Fraction of } \\ \text { Maximum } \\ \text { Throughput } \\ (\%)\end{array} & \begin{array}{c}\text { UNR } \\ \text { (dB) }\end{array} \\ \hline \text { categor } \\ \mathbf{y}\end{array}\right]$

### 8.9.1.1.2.2 Minimum Requirement Single-Layer Spatial Multiplexing 4 Tx Antenna Port

The requirements are specified in Table 8.9.1.1.2.2-2, with the addition of the parameters in Table 8.9.1.1.2.2-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rankone performance with frequency selective precoding.

Table 8.9.1.1.2.2-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 6 |
| PMI delay (Note 2) |  | ms | 8 |
| Reporting interval |  | ms | 8 |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestricti on bitmap |  |  | 000000000000FFFF |
| PDSCH transmissionmode |  |  | 4 |
| Note 1: $\quad P_{B}=1$. <br> Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4). |  |  |  |

Table 8.9.1.1.2.2-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)
$\left.\begin{array}{|c|c|c|c|c|c|c|c|c|}\hline \text { Test } & \text { Band- } & \text { Reference } & \begin{array}{c}\text { OCNG } \\ \text { number } \\ \text { width } \\ \text { and } \\ \text { MCS }\end{array} & \text { Channel } & \begin{array}{c}\text { Propagation } \\ \text { Condition }\end{array} & \begin{array}{c}\text { Correlation } \\ \text { Matrix and } \\ \text { Antenna } \\ \text { Configuration }\end{array} & \begin{array}{c}\text { Reference value }\end{array} & \begin{array}{c}\text { Fraction of } \\ \text { Maximum } \\ \text { Throughput } \\ (\%)\end{array}\end{array} \begin{array}{c}\text { SNR } \\ \text { (dB) }\end{array} \begin{array}{c}\text { categor } \\ \mathbf{y}\end{array}\right]$

### 8.9.1.1.2.3 Minimum Requirement Single-Layer Spatial Multiplexing 4 Tx Antenna Ports with CRS assistance information

The requirements are specified in Table 8.9.1.1.2.3-2, with the addition of parameters in Table 8.9.1.1.2.3-1. In Table 8.9.1.1.2.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cells.

Table 8.9.1.1.2.3-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 | -6 | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) | -6 (Note 1) | -6 (Note 1) |
|  | $\sigma$ | dB | 3 | 3 | 3 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | N/A | N/A |
| $\hat{E}_{s} / N_{o c}$ |  | dB | N/A | 10.45 | 4.6 |
| BW Channel |  | MHz | 10 | 10 | 10 |
| Cyclic prefix |  |  | Normal | Normal | Normal |
| Subframe Configuration |  |  | Non-MBSFN | Non-MBSFN | Non-MBSFN |
| Cell ID |  |  | 0 | 1 | 6 |
| Cell-specific reference signals |  |  | Antenna ports 0,1,2,3 |  |  |
| Number of control OFDM symbols (CFI) |  |  | 2 | 2 | 2 |
| PDSCH transmission mode |  |  | 4 | N/A | N/A |
| Precoding granularity |  | PRB | 50 | N/A | N/A |

| Time offset relative to Cell 1 |  | $\mu \mathrm{S}$ | N/A | 3 | -1 |
| Frequency shift relative to Cell 1 |  | Hz | N/A | 300 | -100 |
| Interference model |  |  | N/A | As specified in clause B.5.3 | As specified in clause B.5.3 |
| Probability of occurrence of transmission in interference cells |  | \% | N/A | 20 | 20 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 | 80 |
|  | Rank 2 | \% | N/A | 20 | 20 |
| Note 1: $\quad P_{B}=1$. <br> Note 2: If the UE reports in an available uplink reporting instance at subframe SF \#n based on PMI estimation at a downlink SF not later than SF \#(n-4), this reported PMI cannot be applied at the eNB downlink before SF \#( $\mathrm{n}+4$ ). <br> Note 3: SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test. |  |  |  |  |  |

Table 8.9.1.1.2.3-2: Minimum performance for PDSCH

| $\begin{gathered} \text { Test } \\ \text { Number } \end{gathered}$ | Reference Channel | OCNG Pattern |  |  | PropagationConditions (Note1) |  |  | Correlation <br> Matrix and Antenna Configurati on (Note 2) | Reference Value |  | $\begin{aligned} & \text { UE } \\ & \text { Cate } \\ & \text { gory } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R. 93 FDD | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { FDD } \\ & \hline \end{aligned}$ | N/A | N/A | EPA5 |  |  | 4x1 Low | 70 | 16.7 | 1bis |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.9.1.1.3 Closed-loop spatial multiplexing performance (User-Specific Reference Symbols)

### 8.9.1.1.3.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.9.1.1.3.1-2 with the addition of the parameters in Table 8.9.1.1.3.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 , and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.9.1.1.3.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations

| parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | dB | 0 |  |
|  | dB | 0 (Note 1) |  |
|  | dB | -3 |  |
| Beamforming model |  | Annex B.4.1 | Annex B.4.3 |
| Cell-specific reference signals |  | Antenna ports 0,1 | Antenna ports 0,1 |
| CSI reference signals |  | Antenna ports 15,...,18 | Antenna ports 15,16 |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta$ CsI-RS | Subframes | $5 / 2$ | $5 / 2$ |
| CSI reference signal configuration |  | 0 | 0 |
| Zero-power CSI-RS configuration lcsI-RS / ZeroPowerCSI-RS bitmap | Subframes / bitmap | $\begin{gathered} 3 / \\ 0001000000000000 \end{gathered}$ | $\begin{gathered} 3 / \\ 0001000000000000 \end{gathered}$ |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Symbols for unused PRBs |  | OCNG (Note 4) | OCNG (Note 3) |
| Reporting mode |  | N/A | PUSCH 3-1 |
| Reporting interval |  | N/A | 5 |
| PMI delay (Note 4) |  | N/A | 8 |
| $\begin{array}{\|c\|} \hline \begin{array}{c} \text { CodeBookSubsetRestriction } \\ \text { bitmap } \end{array} \\ \hline \end{array}$ |  | N/A | 001111 |
| Number of allocated resource blocks (Note 2) | PRB | 6 | 50 |
| PDSCH transmission mode |  | 9 |  |
| Note 1: $\quad P_{B}=1$. <br> Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8. |  |  |  |

Note 3: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 4: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4).

Table 8.9.1.1.3.1-2: Minimum performance for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidt $h$ and MCS | Reference Channel | OCNG Pattern | Propagation Condition | Correlation Matrix and Antenna Configuration | Reference value |  | UE DL category |

### 8.9.1.1.3.2 Single-layer Spatial Multiplexing with CRS assistance information

The requirements are specified in Table 8.9.1.1.3.2-2, with the addition of parameters in Table 8.9.1.1.3.2-1. In Table 8.9.1.1.3.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the single-layer spatial multiplexing TM9 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.9.1.1.3.2-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) |
|  | $\sigma$ | dB | -3 | -3 | -3 |

### 8.9.1.2.2.3 Minimum Requirement Single-Layer Spatial Multiplexing 4 Tx Antenna Ports with CRS assistance information

The requirements are specified in Table 8.9.1.2.2.3-2, with the addition of parameters in Table 8.9.1.2.2.3-1. In Table 8.9.1.2.2.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cells.

Table 8.9.1.2.2.3-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.9.1.2.3 Closed-loop spatial multiplexing performance (User-Specific Reference Symbols)

### 8.9.1.2.3.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format 2 C , the requirements are specified in Table 8.9.1.2.3.1-2 with the addition of the parameters in Table 8.9.1.2.3.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 , and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.9.1.2.3.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |

### 8.9.1.2.3.2 Single-layer Spatial Multiplexing with CRS assistance information

The requirements are specified in Table 8.9.1.2.3.2-2, with the addition of parameters in Table 8.9.1.2.3.2-1. In Table 8.9.1.2.3.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the single-layer spatial multiplexing TM9 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.9.1.2.3.2-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.9.4 PDCCH/PCFICH

### 8.9.4.1 FDD and half-duplex FDD

### 8.9.4.1.1 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.1-1 and Table 8.9.4.1.11 , the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.9.4.1.1-2. In Table 8.9.4.1.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.9.4.1.1-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |

### 8.9.4.1.2 Enhanced Downlink Control Channel Performance Requirement Type A-4 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 4 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1.

For the parameters specified in Table 8.4.1-1 and Table 8.9.4.1.2-1, the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.9.4.1.2-2. In Table 8.9.4.1.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes information on Cell 2 and Cell 3.

Table 8.9.4.1.2-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 | -3 |
|  | PHICH_RA | dB | -3 | N/A | N/A |

Note 1: The OCNG pattern applies for Cell 1, Cell 2 and Cell 3.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 4: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1.

### 8.9.4.2 TDD

### 8.9.4.2.1 Enhanced Downlink Control Channel Performance Requirement Type A-2 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 2 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1. For the parameters specified in Table 8.4.2-1 and Table 8.9.4.2.11 , the average probability of a missed downlink scheduling grant ( $\mathrm{Pm}-\mathrm{dsg}$ ) shall be below the specified value in Table 8.9.4.2.1-2. In Table 8.9.4.2.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the agressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided and includes Cell 2 and Cell 3.

Table 8.9.4.2.1-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Note 4: | SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |

### 8.10 Demodulation (4 receiver antenna ports)

The performance requirements specified in this clause are valid for 4Rx capable UEs.

### 8.10.1 PDSCH

### 8.10.1.1 FDD (Fixed Reference Channel)

The parameters specified in Table 8.10.1.1-1 are valid for all FDD tests unless otherwise stated.

Table 8.10.1.1-1: Common Test Parameters (FDD)

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
|  | Inter-TTI Distance |  | 1 |
|  | Number of HARQ processes per component carrier | Processes | 8 |
|  | Maximum number of HARQ transmission |  | 4 |
|  | Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM, 256QAM and 1024QAM |
|  | Number of OFDM symbols for PDCCH | OFDM symbols | 4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, <br> 2 for $10 \mathrm{MHz}, 15 \mathrm{MHz}$ and 20 MHz bandwidths unless otherwise stated |
|  | Precoder update granularity |  | Frequency domain: 1 PRG for Transmission modes 9 and 10 Time domain: 1 ms |
|  | Cyclic Prefix |  | Normal |
|  | Cell_ID |  | 0 |
|  | Cross carrier scheduling |  | Not configured |

### 8.10.1.1.1 Transmit diversity performance with 2Tx Antenna Ports (Cell-Specific Reference

 Symbols)The requirements are specified in Table 8.10.1.1.1-2, with the addition of the parameters in Table 8.10.1.1.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmitter antennas.

Table 8.10.1.1.1-1: Test Parameters for Transmit diversity Performance (FRC) with 4 RX Antenna Ports

| Parameter | Unit | Test 1 |  |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 (NOTE 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode |  |  | 2 |
| NOTE 1: $P_{B}=1$. |  |  |  |

### 8.10.1.1.1A Transmit diversity performance wit Enhanced Performance Requirement Type A 2 Tx Antenna Ports with TM3 interference model

The requirements are specified in Table 8.10.1.1.1A-2, with the addition of parameters in Table 8.10.1.1.1A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cells applying transmission mode 3 interference model defined in clause B.5.2. In Table 8.10.1.1.1A-1, Cell 1 is the serving cell, and Cell 2 is an interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

Table 8.10.1.1.1A-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model

Table 8.10.1.1.1A-2: Enhanced Performance Requirement Type A, Transmit Diversity (FRC) with TM3 interference model

NOTE 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
NOTE 2: SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1.
NOTE 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.

### 8.10.1.1.2 Open-loop spatial multiplexing performance with 2Tx Antenna Ports (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.2-2, with the addition of the parameters in Table 8.10.1.1.2-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.10.1.1.2-1: Test Parameters for Large Delay CDD (FRC) with 4 RX Antenna Ports

| Parameter |  | Unit | Test 1 |
| :--- | :--- | :---: | :---: |

8.10.1.1.3 Closed-loop spatial multiplexing Enhanced Performance Requirements Type A -Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.3-2, with the addition of the parameters in Table 8.10.1.1.3-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rankone performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.10.1.1.3-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

Table 8.10.1.1.3-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model and 4 RX Antenna Ports

| Parameter |  | Cell 1 | Cell 2 |  |
| :---: | :---: | :---: | :---: | :---: |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: $\quad$ SINR corresponds to $\widehat{E}_{s} / N_{o c}^{\prime}$ of Cell 1 as defined in clause 8.1.1.
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.

### 8.10.1.1.4 Closed-loop spatial multiplexing performance, Dual-Layer Spatial Multiplexing 4 Tx Antenna Port (Cell-Specific Reference Symbols)

For single carrier, the requirements are specified in Table 8.10.1.1.4-2, with the addition of the parameters in Table 8.10.1.1.4-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.10.1.1.4-1: Test Parameters for Dual-Layer Spatial Multiplexing (FRC) with 4 RX Antenna Ports

| Parameter |  | Unit | Test 1-2 | Test 3 |
| :--- | :--- | :---: | :---: | :---: |

8.10.1.1.4A Enhanced Performance Requirement Type C - Dual-Layer Spatial Multiplexing with 2Tx Antenna Ports

The requirements are specified in Table 8.10.1.1.4A-2, with the addition of the parameters in Table 8.10.1.1.4A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rank-two performance with wideband precoding.

Table 8.10.1.1.4A-1: Test Parameters for Dual-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |

### 8.10.1.1.5 Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.5-2, with the addition of the parameters in Table 8.10.1.1.5-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.10.1.1.5-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

Table 8.10.1.1.5-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model and 4 RX Antenna Ports

| parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| CSI reference signals |  |  | Antenna ports 15,16 | N/A |
| CSI-RS periodicity and subframe offset $T_{\text {CSI-RS }} / \Delta$ csI-RS |  | Subframes | $5 / 2$ | N/A |
| CSI reference signal configuration |  |  | 0 | N/A |
| $N_{o c}$ at antenna port |  | $\begin{gathered} \mathrm{dBm} / 15 \mathrm{kH} \\ \mathrm{z} \end{gathered}$ | -98 | N/A |
| DIP (Note 2) |  | dB | N/A | -1.73 |
| BWChannel |  | MHz | 10 | 10 |
| Cell Id |  |  | 0 | 126 |
| PDSCH transmission mode |  |  | 9 | 9 |
| Beamforming model |  |  | As specified in clause B.4.3 (Note 4, 5) | N/A |
| Interference model |  |  | N/A | As specified in clause B.5.4 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 |  | N/A | 70 |
|  | Rank 2 |  | N/A | 30 |
| Precoder update granularity |  | PRB | 50 | 6 |
| PMI delay (Note 5) |  | Ms | 8 | N/A |
| Reporting interval |  | Ms | 5 | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A |
| CodeBookSubsetRestriction bitmap |  |  | 001111 | N/A |
| Symbols for unused PRBs |  |  | OCNG (Note 6) | N/A |
| Simultaneous transmission |  |  | No simultaneous transmission on the other antenna port in (7 or 8) used for the input signal under test | N/A |
| Physical channel for CQI reporting |  |  | PUSCH(Note 8) | N/A |
| cqi-pmi-ConfigurationIndex |  |  | 5 | N/A |

Note 1: $\quad P_{B}=1$
Note 2: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1.
Note 3: The modulation symbols of the signal under test in Cell 1 are mapped onto antenna port 7 or 8 .
Note 4: The precoder in clause B.4.3 follows UE recommended PMI.
Note 5: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4).
Note 6: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 7: All cells are time-synchronous.
Note 8: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.

Table 8.10.1.1.5-2: Enhanced Performance Requirement Type A, CDM-multiplexed DM RS with TM9 interference model and 4 RX Antenna Ports

| Test Number | Reference Channel and MCS | OCNG Pattern |  | Propagation Conditions |  | Correlation Matrix and Antenna Configurati on (Note 3) | Reference Value |  | $\begin{gathered} \text { UE } \\ \text { Categor } \end{gathered}$$y$ |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: $\quad$ SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1.
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.

### 8.10.1.1.5A Single-layer Spatial Multiplexing (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.5A-2, with the addition of the parameters in Table 8.10.1.1.5A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 with a simultaneous transmission on the other antenna port in the serving cell, and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.10.1.1.5A-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations

### 8.10.1.1.5B Single-layer Spatial Multiplexing (With Enhanced DMRS table configured)

For single-layer transmission on antenna port $7,8,11$ or 13 upon detection of a PDCCH with DCI format 2C, the requirement is specified in Table 8.10.1.1.5B-2, with the addition of the parameters in Table 8.10.1.1.5B-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of the test is to verify rank-1 performance on antenna port 11 with a simultaneous transmission on the antenna port 7,8 or 13 with DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

Table 8.10.1.1.5B-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations with Enhanced DMRS table

| Parameter |  | Unit | Test 1 |

### 8.10.1.1.6 Dual-Layer Spatial Multiplexing (User-Specific Reference Symbols)

For dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.10.1.1.6-2, with the addition of the parameters in Table 8.10.1.1.6-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation, to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

Table 8.10.1.1.6-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations with 4 RX Antenna Ports

$\begin{array}{ll}\text { 8.10.1.1.10 } & \text { Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing } \\ & \text { 2 Tx Antenna Port with CRS assistance information (Cell-Specific Reference } \\ & \text { Symbols) }\end{array}$
The requirements are specified in Table 8.10.1.1.10-2, with the addition of parameters in Table 8.10.1.1.10-1. In Table 8.10.1.1.10-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.10.1.1.10-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :--- | :--- | :---: | :---: | :---: | :---: |

| CodeBookSubsetRestriction <br> bitmap |  | 001111 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| Time Offset relative to Cell 1 | $\mu \mathrm{s}$ | $\mathrm{N} / \mathrm{A}$ | 3 | -1 |
| Frequency shift relative to Cell 1 | Hz | $\mathrm{N} / \mathrm{A}$ | 300 | -100 |
| Interference model |  | $\mathrm{N} / \mathrm{A}$ | As specified in <br> clause B.5.3 | As specified in <br> clause B.5.3 |
| Probability of occurrence of <br> transmission in interference cells | $\%$ | $\mathrm{~N} / \mathrm{A}$ | 20 | 20 |
| Probability of <br> occurrence of <br> transmission rank in <br> interfering cells | Rank 1 | Rank 2 | \% | $\mathrm{N} / \mathrm{A}$ |
| Note 1: <br> $P_{B}=1$. <br> Note 2: If the UE reports in an available uplink reporting instance at subrame SF \#n based on PMI <br> estimation at a downlink SF not later than SF \#(n-4), this reported PMI cannot be applied at <br> the eNB downlink before SF\#(n+4). |  |  |  |  |

Table 8.10.1.1.10-2: Minimum Performance for PDSCH

| $\begin{array}{c\|} \hline \text { Test } \\ \text { Number } \end{array}$ | Reference Channel | OCNG Pattern |  |  | PropagationConditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | $\begin{aligned} & \text { UE } \\ & \text { Cate } \end{aligned}$gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R. 35 FDD | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | N/A | N/A | EVA5 | EVA5 | EVA5 | 2x4 low | 70 | 11.1 | $\geq 2$ |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.1.11 Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing 4 Tx Antenna Port with CRS assistance information (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.11-2, with the addition of parameters in Table 8.10.1.1.11-1. In Table 8.10.1.1.11-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cell.

Table 8.10.1.1.11-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :--- | :--- | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -6 | -6 |

Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.1.12 Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing with CRS assistance information (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.1.12-2, with the addition of parameters in Table 8.10.1.1.12-1. In Table 8.10.1.1.12-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM9 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.10.1.1.12-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :--- | :--- | :---: | :---: | :---: | :---: |

Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.1.13 Performance requirements for DCI format 2D and non Quasi Co-located Antenna Ports

### 8.10.1.1.13.1 Minimum requirements for QCL Type C and 3 Layers Spatial Multiplexing

The requirements are specified in Table 8.10.1.1.13.1-3, with the additional parameters in Table 8.10.1.1.13.1-1 and Table 8.10.1.1.13.1-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission
points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.10.1.1.13.1-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP 1 and TP 2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.10.1.1.13.1-1: Test Parameters

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Beamforming model |  |  | Random beamforming (rank 2) | Random beamforming (rank 1) |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| CSI reference signals 0 |  |  | Antenna ports $\{15,16,17,18\}$ | N/A |
| CSI-RS 0 periodicity and subframe offset Tcsi-Rs / $\Delta$ csi-Rs |  | Subframes | $5 / 2$ |  |
| CSI reference signal 0 configuration |  |  | 0 |  |

### 8.10.1.1.13.2 Minimum requirements for QCL Type C and 4 Layers Spatial Multiplexing

The requirements are specified in Table 8.10.1.1.13.2-3, with the additional parameters in Table 8.10.1.1.13.2-1 and Table 8.10.1.1.13.2-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.10.1.1.13.2-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP 1 and TP 2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.10.1.1.13.2-1: Test Parameters

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |

### 8.10.1.1.14 HST-SFN performance

8.10.1.1.14.1 Minimum Requirement for Rel-16 further enhanced HST

The requirements are specified in Table 8.10.1.1.14.1-2, with the addition of the parameters in Table 8.10.1.1.14.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of this test is to verify UE performance
in the HST-SFN-500 scenario. The test for HST-SFN-500 scenario defined in B.3B is applied when highSpeedEnhDemodFlag2-r16 [7] is received.

Table 8.10.1.1.14.1-1: Test Parameters for UE performance in HST-SFN-500 scenario (FRC)

| Parameter | nit | Test 1 |  |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 (NOTE 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode |  |  | 3 |
| NOTE 1: $\quad P_{B}=1$. |  |  |  |

### 8.10.1.2 TDD (Fixed Reference Channel)

The parameters specified in Table 8.10.1.2-1 are valid for all TDD tests unless otherwise stated.
Table 8.10.1.2-1: Common Test Parameters (TDD)

### 8.10.1.2.1 Transmit diversity performance with 2Tx Antenna Ports (Cell-Specific Reference Symbols)

The requirements are specified in Table 8. 10.1.2.1-2, with the addition of the parameters in Table 8. 10.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmitter antennas.

Table 8.10.1.2.1-1: Test Parameters for Transmit diversity Performance (FRC) with 4Rx Antenna Ports

Table 8.10.1.2.1-2: Minimum performance Transmit Diversity (FRC) with 4Rx Antenna Ports

### 8.10.1.2.1A Transmit diversity performance with Enhanced Performance Requirement Type A - 2 Tx Antenna Ports with TM3 interference model

The requirements are specified in Table 8.10.1.2.1A-2, with the addition of parameters in Table 8.10.1.2.1A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cells applying transmission mode 3 interference model defined in clause B.5.2. In Table 8.10.1.2.1A-1, Cell 1 is the serving cell, and Cell 2,3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

Table 8.10.1.2.1A-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) | -3 |
|  | $\sigma$ | dB | 0 | 0 |
| Cell-specific reference signals |  |  | Antenna ports <br> 0,1 | Antenna ports <br> 0,1 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | $\mathrm{~N} / \mathrm{A}$ |
| DIP (Note 2) |  | dB | $\mathrm{N} / \mathrm{A}$ | -1.73 |

| BWChannel |  | MHz | 10 | 10 |

8.10.1.2.3 Closed-loop spatial multiplexing Enhanced Performance Requirements Type A-Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.3-2, with the addition of the parameters in Table 8.10.1.2.3-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rankone performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.10.1.2.3-1, Cell 1 is the serving cell, and Cell 2 is the interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

Table 8.10.1.2.3-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model and 4Rx Antenna Ports

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |

### 8.10.1.2.4A Enhanced Performance Requirement Type C - Dual-Layer Spatial Multiplexing with 2Tx Antenna Ports

The requirements are specified in Table 8.10.1.2.4A-2, with the addition of the parameters in Table 8.10.1.2.4A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rank-two performance with wideband precoding.

Table 8.10.1.2.4A-1: Test Parameters for Dual-Layer Spatial Multiplexing (FRC)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| Precoding granularity |  | PRB | 50 |
| PMI delay (Note 2) | ms | 10 or 11 |  |
| Reporting interval | ms | 1 or 4 (Note 3) |  |
| Reporting mode |  | PUSCH 3-1 |  |
| ACK/NACK feedback mode |  | Bundling |  |
| CodeBookSubsetRestriction <br> bitmap |  | 110000 |  |
| PDSCH transmission mode |  | 4 |  |

Note 1: $\quad P_{B}=1$.
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ ).
Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1 ms and 4 ms .

| Category |  |  |  |  |  |  |  |  |  |

### 8.10.1.2.5 Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.5-2, with the addition of the parameters in Table 8.10.1.2.5-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed-loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.10.1.2.5-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1and Cell 2, respectively.

Table 8.10.1.2.5-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model and 4Rx Antenna Ports

| parameter |  | Unit | Cell 1 | Cell 2 |
| :--- | :--- | :---: | :---: | :---: |

### 8.10.1.2.5A Single-layer Spatial Multiplexing (with multiple CSI-RS configurations)

The requirements are specified in Table 8.10.1.2.5A-2, with the addition of the parameters in Table 8.10.1.2.5A-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 with a simultaneous transmission on the other antenna port in the serving cell, and to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power.

Table 8.10.1.2.5A-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |

| Symbols for unused PRBs |  |  | OCNG (Note 4) |
| Number of allocated resource blocks (Note 2) |  | PRB | 50 |
| Simultaneous transmission |  |  | Yes (Note 3, 5) |
| PDSCH transmission |  |  | 9 |
| Number of MBSFN subframes |  | Subframes | NA |
| Note 1: $\quad P_{B}=1$. <br> Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8. <br> Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test. |  |  |  |

| Note 4: | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one |
| :--- | :--- |
|  | PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated |
|  | pseudo random data, which is QPSK modulated. |

Note 5: The two UEs' scrambling identities $n_{\text {SCID }}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.

Table 8.10.1.2.5A-2: Minimum performance for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations
$\left.\begin{array}{|c|c|c|c|c|c|c|c|c|}\hline \begin{array}{c}\text { Test } \\ \text { number }\end{array} & \begin{array}{c}\text { Bandwidth } \\ \text { and MCS }\end{array} & \begin{array}{c}\text { Reference } \\ \text { Channel }\end{array} & \begin{array}{c}\text { OCNG } \\ \text { Pattern }\end{array} & \begin{array}{c}\text { Propagation } \\ \text { Condition }\end{array} & \begin{array}{c}\text { Correlation } \\ \text { Matrix and } \\ \text { Antenna } \\ \text { Configuration }\end{array} & \begin{array}{c}\text { Reference value }\end{array} & \begin{array}{c}\text { Fraction of } \\ \text { Maximum } \\ \text { Throughput } \\ (\%)\end{array} & \begin{array}{c}\text { UNR } \\ \text { (dB) }\end{array} \\ \hline \text { Category }\end{array}\right]$

Table 8.10.1.2.5A-3: Void

### 8.10.1.2.5B Single-layer Spatial Multiplexing (With Enhanced DMRS table configured)

For single-layer transmission on antenna port $7,8,11$ or 13 upon detection of a PDCCH with DCI format 2C, the requirement is specified in Table 8.10.1.2.5B -2, with the addition of the parameters in Table 8.10.1.2.5B-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of the test is to verify rank-1 performance on antenna port 11 with a simultaneous transmission on the antenna port 7,8 or 13 with DMRS enhancement table and 4 orthogonal DMRS ports (dmrs-Enhancements-r13 UE-EUTRA-Capability [7]).

Table 8.10.1.2.5B-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations with Enhanced DMRS table

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |
| Downlink power $\quad \rho_{A}$ | dB | 0 |
| allocation $\rho_{B}$ <br>   | dB | 0 (Note 1) |
| $\sigma$ | dB | -3 |
| Beamforming model |  | Annex B.4.1A |
| Cell-specific reference signals |  | Antenna ports 0,1 |
| CSI reference signals |  | Antenna ports 15, ... 18 |
| CSI-RS periodicity and subframe offset <br> TCSI-RS / $\Delta$ CSI-RS | Subframes | $5 / 4$ |
| CSI reference signal configuration |  | 3 |
| Zero-power CSI-RS configuration IcsI-RS / ZeroPowerCSI-RS bitmap | Subframes / bitmap | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Symbols for unused PRBs |  | OCNG (Note 4) |
| Number of allocated resource blocks (Note 2) | PRB | 50 |
| Simultaneous transmission |  | Yes (Note 3, 5) |
| dmrs-Enhancements-r13 |  | Enable |
| PDSCH transmission mode |  | 9 |

Note 1: $\quad P_{B}=1$.
Note 2: The modulation symbols of the signal under test are mapped onto antenna port 11.
Note 3: Modulation symbols of an interference signal are random mapped onto one antenna port among antenna port 7, 8 and 13. The upadate granularity for randomized mapping antenna port is 1 PRG in frequency domain and 1 ms in time domain.
Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Note 5: $\quad$ The two UEs' scrambling identities $n_{\text {SCID }}$ are set to 0 with OCC $=4$.

Table 8.10.1.2.5B-2: Minimum performance for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations with Enhanced DMRS table

| Test <br> number | Bandwidth <br> and MCS | Reference <br> Channel | OCNG <br> Pattern | Propagation <br> Condition | Correlation <br> Matrix and <br> Antenna <br> Configuration | Reference value | Fraction of <br> Maximum <br> Throughput <br> $(\%)$ | UNR <br> (dB) |

| Note 1: The reference channel applies to both the input signal under test and the interfering signal. |  |  |  |  |  |  |  |  |

### 8.10.1.2.6 Dual-Layer Spatial Multiplexing (User-Specific Reference Symbols)

For dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.10.1.2.6-2, with the addition of the parameters in Table 8.10.1.2.6-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Annex C.3.2. The purpose of these tests is to verify the rank-2 performance for full RB allocation, to verify rate matching with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

Table 8.10.1.2.6-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations and 4Rx Antenna Ports

|  |  |  |  |  | Category |  |  |  |  |

NOTE: For a UE supporting TM9 rank3/4 transmission based on DMRS OCC length 4, Test 1a will be run and Test 1 will be skipped. Otherwise, Test 1 a is not applicable and only Test 1 will be run.
8.10.1.2.9A Enhanced Performance Requirement Type C-4 Layer Spatial Multiplexing (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.9A-2, with the addition of the parameters in Table 8.10.1.2.9A-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.10.1.2.9A-1: Minimum performance for 4 Layer Spatial Multiplexing (User-Specific Reference Symbols)

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |
| Downlink power allocation | dB | 0 |
|  | dB | 0 (Note 1) |
|  | dB | -3 |
| Cell-specific reference signals |  | Antenna ports 0,1 |
| CSI reference signals |  | Antenna ports 15,..., 18 |
| Beamforming model |  | Annex B.4.3 (Note 4, 5) |
| CSI-RS periodicity and subframe offset Tcsi-RS / $\Delta$ csI-RS | Subframes | $5 / 4$ |
| CSI reference signal configuration |  | 3 |
| Zero-power CSI-RS configuration lcsi-RS / ZeroPowerCSI-RS bitmap | Subframes / bitmap | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Symbols for unused PRBs |  | OCNG (Note 3) |
| Number of allocated resource blocks (Note 2) | PRB | 50 |
| Simultaneous transmission |  | No |
| PDSCH transmission mode |  | 9 |
| Precoding granularity |  | 50 |
| PMI delay |  | 10 or 11 |
| Reporting interval |  | 1 or 4 |
| Reporting mode |  | PUSCH 3-1 |
| alternativeCodeBookEnabledFor4TX-r12 |  | False |
| CodeBookSubsetRestriction bitmap |  | 0xFFFFF000000000000 |

## Note 1: $\quad P_{B}=1$.

Note 2: 50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0,1 and 6.
Note 3: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

$$
\begin{array}{|ll|}
\hline \text { Note 4: } & \text { The precoder in clause B.4.3 follows UE recommended PMI. } \\
\text { Note 5: } & \text { If the UE reports in an available uplink reporting instance at subrame SF\#n } \\
& \text { based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported } \\
& \text { PMI cannot be applied at the eNB downlink before SF\#(n+4). } \\
\hline
\end{array}
$$

### 8.10.1.2.10 Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing 2 Tx Antenna Port with CRS assistance information (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.10-2, with the addition of parameters in Table 8.10.1.2.10-1. In Table 8.10.1.2.10-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.10.1.2.10-1: Test Parameters

| Parameter | Unit | Cell 1 | Cell 2 | Cell 3 |
| :--- | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  | 1 | 1 | 1 |
| Dpecial subframe configuration <br> allocation power |  |  |  | 4 |

| Probability of occurrence of <br> transmission in interference cells | $\%$ | N/A | 20 | 20 |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Probability of <br> occurrence of <br> transmission rank in <br> interfering cells | Rank 1 | Rank 2 | $\%$ | N/A | 80 |
|  | \% | N/A | 20 | 80 |  |

Note 1: $\quad P_{B}=1$.
Note 2: If the UE reports in an available uplink reporting instance at subrame SF \#n based on PMI estimation at a downlink SF not later than SF \#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1 ms and 4 ms .

Table 8.10.1.2.10-2: Minimum Performance for PDSCH

| $\begin{gathered} \text { Test } \\ \text { Number } \end{gathered}$ | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE Cate gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R. 35 TDD | $\begin{aligned} & \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | N/A | N/A | EVA5 | EVA5 | EVA5 | 2x4 low | 70 | 11.2 | $\geq 2$ |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\hat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.2.11 Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing 4 Tx Antenna Port with CRS assistance information (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.11-2, with the addition of parameters in Table 8.10.1.2.11-1. In Table 8.10.1.2.11-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2.

The purpose of the test is to verify the closed loop single layer TM4 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cell.

Table 8.10.1.2.11-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 |
| Special subframe configuration |  |  | 4 | 4 |
| Downlink power allocation | $\rho_{A}$ | dB | -6 | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) | -6 (Note 1) |
|  | $\sigma$ | dB | 3 | 3 |
| $N_{o c}$ at antenna port |  | $\begin{gathered} \mathrm{dBm} / 15 \mathrm{k} \\ \mathrm{~Hz} \end{gathered}$ | -98 | N/A |
| $\hat{E}_{s} / N_{o c}$ |  | dB | Reference Value in Table 8.10.1.2.11-2 | 10.45 |
| BW Channel |  | MHz | 10 | 10 |
| Cyclic prefix |  |  | Normal | Normal |
| Subframe Configuration |  |  | Non-MBSFN | Non-MBSFN |
| Cell ID |  |  | 0 | 1 |
| Cell-specific reference signals |  |  | Antenna ports 0,1,2,3 |  |
| Number of control OFDM symbols (CFI) |  |  | 2 | 2 |
| PDSCH transmission mode |  |  | 4 | N/A |
| Precoding granularity |  | PRB | 50 | N/A |

| PMI delay (Note 2) |  | ms | 8 | N/A |
| :---: | :---: | :---: | :---: | :---: |
| Reporting interval |  | ms | 1 or 4 (Note 3) | N/A |
| Reporting mode |  |  | PUSCH 3-1 | N/A |
| CodeBookSubsetRestriction bitmap |  |  | 000000000000FFFF | N/A |
| ACK/NACK feedback mode |  |  | Multiplexing | N/A |
| Time Offset relative to Cell 1 |  | $\mu \mathrm{S}$ | N/A | 3 |
| Frequency shift relative to Cell 1 |  | Hz | N/A | 300 |
| Interference model |  |  | N/A | As specified in clause B.5.3 |
| Probability of occurrence of transmission in interference cells |  | \% | N/A | 20 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 |
|  | Rank 2 | \% | N/A | 20 |

Note 1: $\quad P_{B}=1$.
Note 2: If the UE reports in an available uplink reporting instance at subrame SF \#n based on PMI estimation at a downlink SF not later than SF \#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ ).
Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1 ms and 4 ms .

Table 8.10.1.2.11-2: Minimum Performance for PDSCH

| TestNumber | Reference Channel | OCNG Pattern |  | Propagation Conditions (Note1) |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE Cate gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 1 | Cell 2 |  | Fraction of Maximum Throughput (\%) | $\begin{gathered} \text { SNR } \\ \text { (dB) } \\ \text { (Note 3) } \end{gathered}$ |  |
| 1 | $\begin{aligned} & \text { R.36-1 } \\ & \text { TDD } \\ & \hline \end{aligned}$ | OP. 1 TDD | N/A | EVA5 | EVA5 | 4x4 low | 70 | 9.8 | $\geq 2$ |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.2.12 Closed loop spatial multiplexing performance - Single-Layer Spatial Multiplexing with CRS assistance information (User-Specific Reference Symbols)

The requirements are specified in Table 8.10.1.2.12-2, with the addition of parameters in Table 8.10.1.2.12-1. In Table 8.10.1.2.12-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single layer TM9 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.10.1.2.12-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 | 1 |

Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.10.1.2.13 Performance requirements for DCI format 2D and non Quasi Co-located Antenna Ports

### 8.10.1.2.13.1 Minimum requirements for QCL Type C and 3 Layers Spatial Multiplexing

The requirements are specified in Table 8.10.1.2.13.1-3, with the additional parameters in Table 8.10.1.2.13.1-1 and Table 8.10.1.2.13.1-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location

Indicator' signalling defined in [6]. In Table 8.10.1.2.13.1-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP 1 and TP 2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.10.1.2.13.1-1: Test Parameters

| Parameter |  | Unit | TP 1 | TP 2 |
| :---: | :---: | :---: | :---: | :---: |
| Uplink downlink configuration |  |  | 1 | 1 |
| Special subframe configuration |  |  | 4 | 4 |
| Downlink power allocation | $\rho_{A}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) | 0 |
|  | $\sigma$ | dB | -3 | -3 |
| Beamforming model |  |  | Random beamforming (rank 2) | Random beamforming (rank 1) |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |

| Note 1: <br> Note 2: <br> Note 3: | The propagation conditions for TP 1 and TP 2 are statistically independent. Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2. SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of TP 1 and TP 2 as defined in clause 8.1.1. |  |  |  |  |  |  |  |  |  |

### 8.10.1.2.13.2 Minimum requirements for QCL Type C and 4 Layers Spatial Multiplexing

The requirements are specified in Table 8.10.1.2.13.2-3, with the additional parameters in Table 8.10.1.2.13.2-1 and Table 8.10.1.2.13.2-2. The purpose of this test is to verify the UE capability of supporting non quasi-colocated antenna ports when the UE receives DCI format 2D in a scenario with non-coherent joint transmission from two transmission points. The test verifies that the UE configured with quasi co-location type C performs correct tracking and compensation of the frequency and time difference between two transmission points, channel parameters estimation, channel estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' signalling defined in [6]. In Table 8.10.1.2.13.2-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and PDSCH, and transmission point 2 (TP 2) has different Cell ID and transmits PDSCH. In the test the PDSCH is transmitted from TP 1 and TP 2. The downlink physical channel setup for TP 1 is according to Annex C.3.2 and for TP 2 according to Annex C.3.2.

Table 8.10.1.2.13.2-1: Test Parameters

| Parameter | Unit | TP 1 | TP 2 |
| :--- | :--- | :---: | :---: |
| Uplink downlink configuration |  | 1 | 1 |

### 8.10.1.2.14 HST-SFN performance

### 8.10.1.2.14.1 Minimum Requirement for Rel-16 further enhanced HST

The requirements are specified in Table 8.10.1.2.14-2, with the addition of the parameters in Table 8.10.1.2.14-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of this test is to verify UE performance in the HST-SFN-500 scenario. The test for HST-SFN-500 scenario defined in B.3B is applied when highSpeedEnhDemodFlag2-r16 [7] is received.

Table 8.10.1.2.14-1: Void
Table 8.10.1.2.14-2: Void
NOTE: Table 8.10.1.2.14-1 and Table 8.10.1.2.14-2 are moved to subclause 8.10.1.2.14.1 as Table 8.10.1.2.14.11 and Table 8.10.1.2.14.1-2.

Table 8.10.1.2.14.1-1: Test Parameters for UE performance in HST-SFN-500 scenario (FRC)

| Parameter |  | Unit |  | Test 1 |  |
| :--- | :--- | :--- | :--- | :--- | :---: |

Table 8.10.1.2.14.1-2: Minimum performance UE in HST-SFN-500 scenario (FRC)
$\left.\begin{array}{|c|c|c|c|c|c|c|c|c|}\hline \text { Test } & \begin{array}{c}\text { Band- } \\ \text { width }\end{array} & \begin{array}{c}\text { Reference } \\ \text { Channel }\end{array} & \begin{array}{c}\text { OCNG } \\ \text { Pattern }\end{array} & \begin{array}{c}\text { Propagation } \\ \text { Condition }\end{array} & \begin{array}{c}\text { Correlation } \\ \text { Matrix and } \\ \text { Antenna } \\ \text { Configuration }\end{array} & \begin{array}{c}\text { Reference value }\end{array} & \begin{array}{c}\text { URaction } \\ \text { of } \\ \text { Maximum } \\ \text { Throughp }\end{array} & \begin{array}{c}\text { SNR } \\ \text { (dB) }\end{array} \\ \text { Category }\end{array}\right]$

NOTE 1: Test case applicability is defined in 8.1.2.1 and 8.1.2.6.
NOTE 2: The requirement defined is based on the normarliazed channel model, i.e.the power of each tap is normalized to the instantaneous total received power from four taps.

### 8.10.2 PDCCH/PCFICH

### 8.10.2.1 FDD

The parameters specified in Table 8.10.2.1-1 are valid for all FDD tests unless otherwise stated.
Table 8.10.2.1-1: Test Parameters for PDCCH/PCFICH with 4 Rx Antenna Ports

| Parameter | Unit | Single antenna <br> port | Transmit <br> diversity |
| :--- | :---: | :---: | :---: |
| Number of PDCCH symbols | symbols | 2 | 2 |

| 1 | 5 MHz | 2 CCE | R. 17 FDD | OP. 1 FDD | EPA5 | $4 \times 4$ Medium A Xpol | 1 | -0.4 |

### 8.10.2.1.4 Enhanced Downlink Control Channel Performance Requirement Type A-4 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 4 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1.

For the parameters specified in Table 8.10.2.1.4-1, the average probability of a missed downlink scheduling grant (Pmdsg ) shall be below the specified value in Table 8.10.2.1.4-2. In Table 8.10.2.1.4-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell, respectively.

Table 8.10.2.1.4-1: Test Parameters for PDCCH/PCFICH

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\begin{aligned} & \text { PDCCH_RA } \\ & \text { OCNG_RA } \end{aligned}$ | dB | -3 | -3 |

### 8.10.2.2.4 Enhanced Downlink Control Channel Performance Requirement Type A-4 Tx Antenna Port with Non-Colliding CRS Dominant Interferer

The purpose of this test is to verify the Enhanced Downlink Control Channel Performance Requirement Type A for PDCCH/PCFICH with 4 transmit antennas for the case of dominant interferer with the non-colliding CRS pattern and applying interference model defined in clause B.7.1.

For the parameters specified in Table 8.10.2.2.4-1, the average probability of a missed downlink scheduling grant (Pmdsg) shall be below the specified value in Table 8.10.2.2.4-2. In Table 8.10.2.2.4-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell, respectively.

Table 8.10.2.2.4-1: Test Parameters for PDCCH/PCFICH

Table 8.10.2.1.4-2: Minimum Performance for PDCCH/PCFICH for Enhanced Downlink Control Channel Performance Requirement Type A

| Test Number | Aggregation level | Reference Channel | OCNG Pattern (Note 1) | Propagation Conditions (Note 2) |  | Antenna Configuration and Correlation Matrix (Note 3) | Reference Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Cell 1 | Cell 2 |  | Pm-dsg (\%) | SNR (dB) <br> (Note 4) |
| 1 | 1 CCE | $\begin{aligned} & \text { R.17-2 } \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | EPA5 | EPA5 | 4x4 Low | 1 | 17.9 |
| Note 1: <br> Note 2: <br> Note 3: <br> Note 4: | SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1 as defined in clause 8.1.1. |  |  |  |  |  |  |  |

### 8.10.3 PHICH

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold delection).

### 8.10.3.1 FDD

The parameters specified in Table 8.10.3.1-1 are valid for all FDD tests with 4Rx unless otherwise stated.
Table 8.10.3.1-1: Test Parameters for PHICH with 4 Rx Antenna Ports

| Parameter |  | Unit | Single antenna port | Transmit diversity |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 | -3 |
|  | $\rho_{B}$ | dB | 0 | -3 |
|  | $\sigma$ | dB | 0 | 0 |
| PHICH duration |  |  | Normal | Normal |
| PHICH Ng (Note 1) |  |  | $\mathrm{Ng}=1$ | $\mathrm{Ng}=1$ |

| 1 | 10 MHz | R.18 | OP.1 TDD | ETU70 | $1 \times 4$ Low | 0.1 | 1.7 |

### 8.10.3.2.2 Transmit diversity performance with 2 Tx Antenna Ports

For the parameters specified in Table 8.10.3.2-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.10.3.2.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.10.3.2.2-1: Minimum performance PHICH with 4 Rx Antenna Ports

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | OCNG Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Pm-an (\%) | SNR (dB) |
| 1 | 10 MHz | R. 19 | OP. 1 TDD | EVA70 | $2 \times 4$ Low | 0.1 | 0.9 |

### 8.10.3.2.3 Transmit diversity performance with 4 Tx Antenna Ports

For the parameters specified in Table 8.10.3.2-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.10.3.2.3-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.10.3.2.3-1: Minimum performance PHICH with 4 Rx Antenna Ports

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | OCNG Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Pm-an (\%) | SNR (dB) |
| 1 | 5 MHz | R. 20 | OP. 1 TDD | EPA5 | $4 \times 4$ Medium cotrelation A, Cross polarized | 0.1 | 0.3 |

### 8.10.4 ePDCCH

The receiver characteristics of the EPDCCH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). For the distributed transmission tests in 8.10.4.1, EPDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of EPDCCH. For other tests, EPDCCH and PCFICH are not tested jointly.

### 8.10.4.1 Distributed Transmission with 4Rx

### 8.10.4.1.1 <br> FDD

The parameters specified in Table 8.10.4.1.1-1 are valid for all FDD distributed EPDCCH test with 4Rx unless otherwise stated.

Table 8.10.4.1.1-1: Test Parameters for Distributed EPDCCH with 4Rx

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Number of PDCCH symbols |  | symbols | 2 (Note 1) |
| PHICH duration |  |  | Normal |
| Unused RE-s and PRB-s |  |  | OCNG |
| Cell ID |  |  | 0 |
| Downlink power allocation | $\rho_{A}$ | dB | -3 |

### 8.10.4.1.2 TDD

The parameters specified in Table 8.10.4.1.2-1 are valid for all TDD distributed EPDCCH tests with 4Rx unless otherwise stated.

Table 8.10.4.1.2-1: Test Parameters for Distributed EPDCCH with 4Rx

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Number of PDCCH symbols |  | symbols | 2 (Note 1) |
| PHICH duration |  |  | Normal |
| Unused RE-s and PRB-s |  |  | OCNG |
| Cell ID |  |  | 0 |
| Downlink power allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 |
|  | $\sigma$ | dB | 0 |
|  | б | dB | 3 |
| $N_{o c}$ at antenna port |  | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -98 |
| Cyclic prefix |  |  | Normal |
| Subframe Configuration |  |  | Non-MBSFN |
| Precoder Update Granularity |  | PRB | 1 |
|  |  | ms | 1 |
| Beamforming Pre-Coder |  |  | Annex B.4.4 |
| Cell Specific Reference Signal |  |  | Port 0 and 1 |
| Number of EPDCCH Sets Configured |  |  | 2 (Note 2) |
| Number of PRB per EPDCCH Set |  |  | $\begin{aligned} & 4\left(1^{\text {st }} \text { Set }\right) \\ & 8\left(2^{\text {nd }}\right. \text { Set) } \end{aligned}$ |
| EPDCCH Subframe Monitoring |  |  | NA |
| PDSCH TM |  |  | TM3 |
| DCI Format |  |  | 2A |
| TDD UL/DL Configuration |  |  | 0 |
| TDD Special Subframe |  |  | 1 (Note 3) |

Note 1: The starting symbol for EPDCCH is derived from the PCFICH. RRC signalling epdcch-StartSymbol-r11 is not configured.
Note 2: The two sets are distributed EPDCCH sets and nonoverlapping with $\mathrm{PRB}=\{3,17,31,45\}$ for the first set and $\operatorname{PRB}=\{0,7,14,21,28,35,42,49\}$ for the second set. EPDCCH is scheduled in the first set for Test 1 and second set for Test 2, respectively. Both sets are always configured.
Note 3: Demodulation performance is averaged over normal and special subframe.

For the parameters specified in Table 8.10.4.1.2-1 the average probability of a missed downlink scheduling grant (Pmdsg ) shall be below the specified value in Table 8.10.4.1.2-2. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.10.4.1.2-2: Minimum performance Distributed EPDCCH with 4Rx Antenna ports

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Aggregation level | Reference Channel | OCNG <br> Pattern | Propagation Condition | Antenna configuration and correlation Matrix | Reference value |  |

### 8.11 Demodulation (UE supporting coverage enhancement)

The requirements for UE DL Category M1 in this sub-clause are defined based on the simulation results with UE DL Category M1 unless otherwise stated.

The requirements for UE DL Category M2 in this sub-clause are defined based on the simulation results with UE DL Category M2 unless otherwise stated.

The requirements of UE DL Category M1 in this sub-clause are applicable for UE DL Category M2, UE DL Category 1 bis and Category 0 , as specified in the applicability rule in the sub-clause 8.1.2.8A.

The requirements of UE DL Category M2 in this sub-clause are applicable for UE DL Category 1bis and Category 0, as specified in the applicability rule in the sub-clause 8.1.2.8A.

### 8.11.1 PDSCH

### 8.11.1.1 FDD and half-duplex FDD (Fixed Reference Channel)

The parameters specified in Table 8.11.1.1-1 are valid for FDD and half-duplex FDD tests unless otherwise stated.
Table 8.11.1.1-1: Common Test Parameters (FDD and half-duplex FDD)

| Parameter | Unit | CE Mode A | CE Mode B |
| :---: | :---: | :---: | :---: |
| Inter-TTI Distance |  | 1 | 1 |
| Number of HARQ processes per component carrier | Processes | $\begin{aligned} & 8 \text { or } 10 \\ & \text { (Note } 2) \end{aligned}$ | 2 |
| Maximum number of HARQ transmission |  | 4 | 4 |

### 8.11.1.1.1.2 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with CRS assistance information

The requirements are specified in Table 8.11.1.1.1.2-2, with the addition of parameters in Table 8.11.1.1.1.2-1. In Table 8.11.1.1.1.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single-layer spatial multiplexing TM6 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.1.1.1.2-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 | -3 | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) | -3 (Note 1) | -3 (Note 1) |
|  | $\sigma$ | dB | 0 | 0 | 0 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | N/A | N/A |
| $\hat{E}_{s} / N_{o c}$ |  | dB | N/A | 11.75 | 5.69 |
| BW Channel |  | MHz | 10 | 10 | 10 |
| Cyclic prefix |  |  | Normal | Normal | Normal |
| Subframe Configuration |  |  | Non-MBSFN | Non-MBSFN | Non-MBSFN |
| Cell ID |  |  | 0 | 1 | 6 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 |  |  |
| Number of control OFDM symbols (CFI) |  |  | 2 | 2 | 2 |
| PDSCH transmission mode |  |  | 6 | N/A | N/A |
| Coverage enhancement mode |  |  | CE Mode A | N/A | N/A |
| OFDM starting symbol (startSymbolBR) |  |  | 2 | N/A | N/A |
| Maximum number of repetitions (mpdcch-NumRepetition) |  |  | 1 | N/A | N/A |
| Frequency hopping (mpdcch-pdsch-HoppingConfig) |  |  | Disabled | N/A | N/A |
| MPDCCH transmission duration |  | ms | 1 | N/A | N/A |
| Starting subframe configuration for MPDCCH (mpdcch_startSF_UESS) |  |  | 1 | N/A | N/A |
| Precoding granularity |  | PRB | 6 | N/A | N/A |
| PMI delay (Note 2) |  | ms | 10 | N/A | N/A |
| Reporting interval |  | ms | 10 | N/A | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A | N/A |
| Physical channel for CQI reporting |  |  | PUSCH(Note4) |  |  |
| CodeBookSubsetRestriction bitmap |  |  | 001111 | N/A | N/A |
| Time offset relative to Cell 1 |  | $\mu \mathrm{S}$ | N/A | 3 | -1 |
| Frequency shift relative to Cell 1 |  | Hz | N/A | 300 | -100 |
| Interference model |  |  | N/A | As specified in clause B.5.3 | As specified in clause B.5.3 |
| Probability of occurrence of transmission in interference cells |  | \% | N/A | 10 | 10 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 | 80 |
|  | Rank 2 | \% | N/A | 20 | 20 |

```
Note 1: }\quad\mp@subsup{P}{B}{}=
Note 2: If the UE reports in an available uplink reporting instance at subframe SF #n based on PMI
        estimation at a downlink SF not later than SF#(n-4). This reported PMI cannot be applied at
        the eNB downlink before SF#(n+4).
Note 3: For each test, DC subcarrier puncturing shall be considered.
Note 4: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 6-0A shall be transmitted in downlink SF\#1 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#5.
```

Table 8.11.1.1.1.2-2: Minimum performance for PDSCH

| Test Number | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE Cate gory <br> gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R.79 FDD | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | N/A | N/A | EPA5 | EPA5 | EPA5 | 2x1 Low | 70 | 12.5 | M2 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.11.1.1.1.3 Minimum Requirement Single-Layer Spatial Multiplexing 4 Tx Antenna Port with CRS assistance information

The requirements are specified in Table 8.11.1.1.1.3-2, with the addition of parameters in Table 8.11.1.1.1.3-1. In Table 8.11.1.1.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single-layer spatial multiplexing TM6 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cells.

Table 8.11.1.1.1.3-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.11.1.1.2 Closed-loop spatial multiplexing performance (User-Specific Reference Symbols)

### 8.11.1.1.2.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna ports 7 or 8 upon detection of a MPDCCH with DCI format $6-1 \mathrm{~A}$, the requirements are specified in Table 8.11.1.1.2.1-2 with the addition of the parameters in Table 8.11.1.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 .

Table 8.11.1.1.2.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer)

| parameter |  | Unit | Test 1 | Test 2 | Test 3 |

### 8.11.1.2.1.2 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with CRS assistance information

The requirements are specified in Table 8.11.1.2.1.2-2, with the addition of parameters in Table 8.11.1.2.1.2-1. In Table 8.11.1.2.1.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single-layer spatial multiplexing TM6 performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.1.2.1.2-1: Test Parameters

| Parameter |  | Unit | Cell 1 (Option <br> 1) | Cell 2 | Cell 3 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Uplink downlink Configuration |  | 1 | 1 | 1 |  |
| Special subframe configuration |  |  | 4 | 4 | 4 |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 | -3 | -3 |
|  | $\rho_{B}$ | dB | $-3($ Note 1) | $-3($ Note 1) | $-3($ Note 1) |
|  | $\sigma$ | dB | 0 | 0 | 0 |
| $N_{o c \mid}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |

| $\hat{E}_{s} / N_{o c}$ |  | dB | N/A | 11.75 | 5.69 |

| OFDM starting symbol (startSymbolBR) |  |  | 2 | N/A | N/A |
| Maximum number of repetitions (mpdcch-NumRepetition) |  |  | 1 | N/A | N/A |
| Frequency hopping (mpdcch-pdsch-HoppingConfig) |  |  | Disabled | N/A | N/A |
| Frequency hopping offset (mpdcch-pdsch-HoppingOffset) |  |  | N/A | N/A | N/A |
| Frequency hopping interval (interval-TDD) |  | ms | N/A | N/A | N/A |
| MPDCCH transmission duration |  | ms | 1 | N/A | N/A |
| Starting subframe configuration for MPDCCH (mpdcch_startSF_UESS) |  |  | 1 | N/A | N/A |
| Precoding granularity |  | PRB | 6 | N/A | N/A |
| PMI delay (Note 2) |  | ms | 10 or 11 | N/A | N/A |
| Reporting interval |  | ms | 5 | N/A | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A | N/A |
| Physical channel for CQI reporting |  |  | PUSCH(Note4) |  |  |
| CodeBookSubsetRestriction bitmap |  |  | 001111 | N/A | N/A |
| Time Offset relative to Cell 1 |  | $\mu \mathrm{s}$ | N/A | 3 | -1 |
| Frequency shift relative to Cell 1 |  | Hz | N/A | 300 | -100 |
| Interference model |  |  | N/A | As specified in clause B.5.3 | As specified in clause B.5.3 |
| Probability of occurrence of transmission in interference cells |  | \% | N/A | 10 | 10 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 | 80 |
|  | Rank 2 | \% | N/A | 20 | 20 |

Note 1: $\quad P_{B}=1$.
Note 2: If the UE reports in an available uplink reporting instance at subframe SF \#n based on PMI estimation at a downlink SF not later than SF \#(n-4). This reported PMI cannot be applied at the eNB downlink before SF \#(n+4).
Note 3: For each test, DC subcarrier puncturing shall be considered.
Note 4: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. MPDCCH DCI format 6-0A shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQACK on PUSCH in uplink subframe SF\#8 and \#3.

Table 8.11.1.2.1.2-2: Minimum performance for PDSCH

| Test Number | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE Cate gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R.79 TDD | $\begin{aligned} & \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | N/A | N/A | EPA5 | EPA5 | EPA5 | 2x1 Low | 70 | 11.5 | M2 |

[^3]Note 3: $\quad$ SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.

### 8.11.1.2.1.3 Minimum Requirement Single-Layer Spatial Multiplexing 4 Tx Antenna Port with CRS assistance information

The requirements are specified in Table 8.11.1.2.1.3-2, with the addition of parameters in Table 8.11.1.2.1.3-1. In Table 8.11.1.2.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the closed loop single-layer spatial multiplexing TM6 performance under assumption that UE applies CRS interference mitigation in the scenario with 4 CRS antenna ports in the serving and aggressor cells.

Table 8.11.1.2.1.3-1: Test Parameters

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| :--- | :--- | :--- | :--- | :--- |
| Note 1: | $P_{B}=1$. |  |  |  |
| Note 2: | If the UE reports in an available uplink reporting instance at subframe SF \#n based on PMI |  |  |  |
| estimation at a downlink SF not later than SF\#(n-4). This reported PMI cannot be applied at |  |  |  |  |
| the eNB downlink before SF\#(n+4). |  |  |  |  |

Table 8.11.1.2.1.3-2: Minimum performance for PDSCH

| Test Number | Reference Channel | OCNG Pattern |  |  | Propagation Conditions (Note1) |  |  | Correlation Matrix and Antenna Configurati on (Note 2) | Reference Value |  | UE Cate <br> gory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cell 1 | Cell 2 | Cell 3 | Cell 1 | Cell 2 | Cell 3 |  | Fraction of Maximum Throughput (\%) | SNR <br> (dB) <br> (Note <br> 3) |  |
| 1 | R. 95 TDD | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { TDD } \end{aligned}$ | N/A | N/A | EPA5 | EPA5 | EPA5 | 4x1 Low | 70 | 11.1 | M2 |

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.
Note 3: SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of cell 1.
8.11.1.2.2 Closed-loop spatial multiplexing performance (User-Specific Reference Symbols)

### 8.11.1.2.2.1 Single-layer Spatial Multiplexing

For single-layer transmission on antenna ports 7 or 8 upon detection of a PDCCH with DCI format $6-1 \mathrm{~A}$, the requirements are specified in Table 8.11.1.2.2.1-2 with the addition of the parameters in Table 8.11.1.2.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify rank-1 performance on one of the antenna ports 7 or 8 .

Table 8.11.1.2.2.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer)

| Parameter | Unit | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | dB | 0 | 0 | 0 |
|  | dB | 0 (Note 1) | 0 (Note 1) | 0 (Note 1) |
|  | dB | -3 | -3 | -3 |

### 8.11.2.1.2 CE Mode B

For the parameters specified in Table 8.11.2.1-1 and 8.11.2.1-2 the average probability of a missed downlink scheduling grant ( Pm -dsg) shall be below the specified value in Table 8.11.2.1.2-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.11.2.1.2-1: Minimum performance CE Mode B MPDCCH
$\left.\begin{array}{|c|c|c|c|c|c|c|c|c|c|}\hline \begin{array}{c}\text { Test } \\ \text { number }\end{array} & \text { Bandwidth } & \begin{array}{c}\text { Aggregation } \\ \text { level }\end{array} & \begin{array}{c}\text { Reference } \\ \text { Channel }\end{array} & \begin{array}{c}\text { OCNG } \\ \text { Pattern }\end{array} & \begin{array}{c}\text { Propagation } \\ \text { Condition }\end{array} & \begin{array}{c}\text { Antenna } \\ \text { configuration } \\ \text { and }\end{array} & \begin{array}{c}\text { Reference } \\ \text { value }\end{array} & \begin{array}{c}\text { UE } \\ \text { Category } \\ \text { Correlation } \\ \text { Matrix }\end{array} & \begin{array}{c}\text { Pm- } \\ \text { dsg } \\ (\%)\end{array} \\ \hline \text { (dB) }\end{array}\right]$

### 8.11.2.1.3 CE Mode A with TM9 interference model

The requirements are specified in Table 8.11.2.1.3-2, with the addition of parameters in Table 8.11.2.1.3-1. In Table 8.11.2.1.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the MPDCCH performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.2.1.3-1: Test Parameters for MPDCCH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.11.2.1.4 CE Mode A with CRS interference model

The requirements are specified in Table 8.11.2.1.4-2, with the addition of parameters in Table 8.11.2.1.4-1. In Table 8.11.2.1.4-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the MPDCCH performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.2.1.4-1: Test Parameters for MPDCCH

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.11.2.2.3 CE Mode A with TM9 interference model

The requirements are specified in Table 8.11.2.2.3-2, with the addition of parameters in Table 8.11.2.2.3-1. In Table 8.11.2.2.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the MPDCCH performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.2.2.3-1: Test Parameters for MPDCCH (TM9 interference model)

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.11.2.2.4 CE Mode A with CRS interference model

The requirements are specified in Table 8.11.2.2.4-2, with the addition of parameters in Table 8.11.2.2.4-1. In Table 8.11.2.2.4-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively. The CRS assistance information [7] is provided to the UE and includes information on Cell 2 and Cell 3.

The purpose of the test is to verify the MPDCCH performance under assumption that UE applies CRS interference mitigation in the scenario with 2 CRS antenna ports in the serving and aggressor cells.

Table 8.11.2.2.4-1: Test Parameters for MPDCCH (CRS interference model)

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :--- | :--- | :---: | :---: | :---: | :---: |
| OFDM starting symbol (startSymbolLC) |  | symbols | 2 | 2 | 2 |
| Unused RE-s and PRB-s |  |  |  |  |  |
| Downlink power allocation |  |  | OCNG | N/A | N/A |

| Note 4: | SNR corresponds to $\widehat{E}_{s} / N_{o c}$ of Cell 1. |  |  |  |  |  |  |  |  |

### 8.11.3 PBCH

The receiver characteristics of the PBCH are determined by the probability of miss-detection of the PBCH for single decoding interval (Pm-bch-s) and the probability of miss-detection of the PBCH for multiple decoding intervals (Pm-bch-m), which are defined as

$$
\begin{aligned}
& \operatorname{Pm}-\mathrm{bch}-\mathrm{s}=1-\frac{A_{s}}{B_{s}} \\
& \mathrm{Pm}-\mathrm{bch}-\mathrm{m}=1-\frac{A_{m}}{B_{m}}
\end{aligned}
$$

The probability of miss-detection of the PBCH for single decoding interval (Pm-bch-s) is calculated under assumption of single PBCH TTI interval decoding. $A_{s}$ is the number of correctly decoded MIB PDUs and $B_{s}$ is the number of transmitted MIB PDUs (redundancy versions for the same MIB are not counted separately).

The probability of miss-detection of the PBCH for multiple decoding intervals (Pm-bch-m) is calculated over multiple PBCH TTI intervals under assumption of independent PBCH decoding over these intervals. $A_{m}$ is the number of PBCH decoding intervals with at least one correctly decoded MIB PDU and $B_{m}$ is the total number of PBCH decoding intervals. A multiple PBCH decoding interval has 1120 ms duration consisting of continuous PBCH TTIs during the test.
8.11.3.1 FDD and half-duplex FDD

Table 8.11.3.1-1: Test Parameters for PBCH

| Parameter |  | Unit | Transmit diversity |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | PBCH_RA | dB | -3 |
|  | $N_{o c}$ at antenna port_RB |  | dB | -3 |
| Cyclic prefix |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Cell ID |  | Normal |  |
| Repetition of the physical broadcast <br> channel (Note 1) |  | 0 |  |
| Cyclic prefix |  |  |  |
| Note 1: as specified in Table 6.6.4-1 in TS 36.211 [4]. |  |  |  |

### 8.11.3.1.1 Transmit diversity performance

For the parameters specified in Table 8.11.3.1-1 and Table 8.11.3.1.1-1, the averaged probability of a miss-detected PBCH (Pm-bchs and Pm-bch-m) shall be below the specified value in Table 8.11.3.1.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.11.3.1.1-1: Minimum performance PBCH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | Propagation Condition | Antenna configuration and correlation Matrix | Reference value for single PBCH TTI |  | Reference value for multiple PBCH TTI |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | $\begin{aligned} & \text { Pm-bch- } \\ & \text { s (\%) } \end{aligned}$ | SNR (dB) | $\begin{aligned} & \text { Pm-bch- } \\ & \text { m (\%) } \end{aligned}$ | SNR (dB) |
| 1 | 10 MHz | R. 22 | EPA1 | $2 \times 1$ Low | 1 | -1.9 | 1 | -12.6 |

### 8.11.3.2 TDD

Table 8.11.3.2-1: Test Parameters for PBCH

| Parameter |  | Unit | Transmit diversity |

| Test number |  |  |  |  |  |  | Fraction of Maximum Throughp ut (\%) | SNR <br> (dB) |  |
| 1 | 200kHz | Anchor | R.NB. 5 FDD | 1 | EPA5 | 2x1 Low | 70\% | 6.9 | $\begin{aligned} & \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 2 | 200kHz | Anchor | R.NB. 5 FDD | 32 | EPA5 | 2x1 Low | 70\% | -4.8 | $\begin{aligned} & \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 3 | 200kHz | Nonanchor | R.NB.5-1 FDD | 256 | ETU1 | 2x1 Low | 70\% | -9.8 | $\begin{aligned} & \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |

### 8.12.1.1.2 Minimum Requirements for Standalone/Guard-band

The requirements are specified in Table 8.12.1.1.2-2, with the addition of the parameters in Table 8.12.1.1.2-1 and the downlink physical channel setup according to Annex C.3.6. The purpose of these tests is to verify the performance.

Table 8.12.1.1.2-1: Test Parameters for NPDSCH under Standalone/Guard-band

|  | Parameter |  |  | Test 1, 2 |
| :---: | :---: | :---: | :---: | :---: |
| $N_{o c}$ at antenna port |  | $N_{o c 1}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -93 (Note 1) |
|  |  | $N_{o c 2}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -99 (Note 2) |
| NPDCCH repetition number |  |  | subframe | 32 for Test 1; 256 for Test 2. |
| $R_{\max }$ (npdcch-NumRepetitions-r13) |  |  | subframe | 64 for Test 1; 512 for Test 2. |
| $G(n P D C C H-s t a r t S F-U S S-r 13)$ |  |  |  | 1.5 |
| Note 1: This noise is applied to all subframes from the end of the NPDCCH to the end of the following NPDSCH transmission; <br> Note 2: This noise is applied to all subframes from the end of the NPDSCH to the end of the following NPDCCH transmission. |  |  |  |  |

Table 8.12.1.1.2-2: Minimum performance for NPDSCH under Standalone/Guard-band with 1 NRS port

| Test numb er | $\begin{aligned} & \text { Bandwi } \\ & \text { dth } \end{aligned}$ | Carri er Type | Referen ce Channe I | Repetiti on number | Propagati on condition | Numb er of NRS ports | Antenna Configurat ion | Reference value |  | $\begin{gathered} \text { UE } \\ \text { Catego } \\ \text { ry } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | Fraction of <br> Maximu m <br> Through put (\%) | $\begin{gathered} \text { SN } \\ R \\ \text { (dB } \\ \text { ) } \end{gathered}$ |  |
| 1 | 200kHz | Anch or | $\begin{gathered} \hline \text { R.NB. } 6 \\ \text { FDD } \end{gathered}$ | 32 | EPA5 | 1 | 1x1 | 70\% | $3.4$ | $\begin{aligned} & \hline \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 2 | 200kHz | Nonanch or | R.NB.6- <br> 1 FDD | 256 | ETU1 | 1 | 1x1 | 70\% | - 10 2 | NB1, NB2 |

### 8.12.1.1.3 Minimum Requirements for Standalone for UE Category NB2

The requirements are specified in Table 8.12.1.1.3-2, with the addition of the parameters in Table 8.12.1.1.3-1 and the downlink physical channel setup according to Annex C.3.6. The purpose of these tests is to verify the NPDSCH performance.

Table 8.12.1.1.3-1: Test Parameters for NPDSCH under Standalone

| Parameter | Unit |  | Test 1 |
| :---: | :---: | :---: | :---: |
| $N_{o c \mid}$ at antenna port | $N_{o c 1}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -93 (Note 1) |
|  | $N_{o c 2}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -96 (Note 2) |
| NPDCCH repetition number |  | subframe | 4 for Test 1 |
| $R_{\text {max }}$ (npdcch-NumRepetitions-r13) |  | subframe | 8 for Test 1 |
| Note 1: <br> Note 2:This noise is applied to all subframes from the end of the NPDCCH to the end of the <br> following NPDSCH transmission; <br> This noise is applied to all subframes from the end of the NPDSCH to the end of the <br> following NPDCCH transmission. |  |  |  |

Table 8.12.1.1.3-2: Minimum performance for NPDSCH under Standalone with 1 NRS port

|  | $\begin{aligned} & \text { Bandwi } \\ & \text { dth } \end{aligned}$ | $\begin{aligned} & \text { Carr } \\ & \text { er } \\ & \text { Type } \end{aligned}$ | Referen ce Channe | Repetiti on number | Propagati on condition | Numb er of NRS | Antenna Configurat ion | Reference value |  | $\begin{gathered} \text { UE } \\ \text { Catego } \\ \text { ry } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| er |  |  |  |  |  |  |  | Fraction of | $\begin{gathered} \hline \text { SN } \\ \text { R } \end{gathered}$ |  |

|  |  |  |  |  |  |  | Maximu <br> $\mathbf{m}$ <br> Through <br> put (\%) | (dB <br> ) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 200 kHz | Non- <br> anch <br> or | R.NB.7 <br> FDD | 1 | EPA5 | 1 | $1 \times 1$ | $70 \%$ | 9.4 | NB2 |

### 8.12.1.1.4 Minimum Requirements for Standalone for UE with multiple TBs interleaved transmission

The requirements are specified in Table 8.12.1.1.4-2, with the addition of the parameters in Table 8.12.1.1.4-1 and the downlink physical channel setup according to Annex C.3.6. The purpose of these tests is to verify NPDSCH performance when multiple TBs with interleaved transmission are scheduled by one DCI as specified in TS 36.213[6].

These requirements are applicable for UE of UE-Category-NB NB2 supporting multiple TBs scheduling with interleaved transmission when multiple TBs are scheduled.

Table 8.12.1.1.4-1: Test Parameters for NPDSCH under Standalone

| Parameter | Unit |  | Test 1 |
| :---: | :---: | :---: | :---: |
| $N_{o c}$ at antenna port | $N_{o c 1}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -93 (Note 1) |
|  | $N_{o c 2}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -99 (Note 2) |
| NPDCCH repetition number |  | subframe | 128 for Test 1 |
| $R_{\text {max }}$ (npdcch-NumRepetitions-r13) |  | subframe | 128 for Test 1 |
| $G$ (nPDCCH-startSF-USS-r13) |  |  | 1.5 |
| Two HARQ processes (twoHARQ-ProcessesConfigr14) |  |  | true |
| Multiple TBs scheduling (multiTB-Config-r16) |  |  | interleaved |
| Note 1: This noise is applied to all subframes from the end of the NPDCCH to the end of the following NPDSCH transmission; <br> Note 2: This noise is applied to all subframes from the end of the NPDSCH to the end of the following NPDCCH transmission. |  |  |  |

Table 8.12.1.1.4-2: Minimum performance for NPDSCH under Standalone with 1 NRS port

| Test numb er | $\begin{aligned} & \text { Bandwi } \\ & \text { dth } \end{aligned}$ | $\begin{aligned} & \text { Carr } \\ & \text { er } \\ & \text { Type } \end{aligned}$ | Referen ce Channe I | Repetiti on number | Propagati on condition | Numb er of NRS ports | Antenna Configurat ion | Reference value |  | $\begin{aligned} & \text { UE } \\ & \text { Catego } \\ & \text { rv } \end{aligned}$ry |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | Fraction of Maximu m <br> Through put (\%) | $\begin{gathered} S N \\ R \\ \text { (dB } \\ \text { ) } \end{gathered}$ |  |
| 1 | 200 kHz | Nonanch or | $\begin{gathered} \text { R.NB. } 8 \\ \text { FDD } \end{gathered}$ | 32 | ETU1 | 1 | 1x1 | 70\% | $6.0$ | NB2 |

### 8.12.1.2 TDD

Table 8.12.1.2-1: Common Test Parameters

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Uplink downlink <br> configuration (Note 1) |  | 4 |
| Special subframe <br> configuration (Note 2) |  | 4 |

| Number of HARQ <br> processes per component <br> carrier (Note 4) | Processes | 1 or 2 |
| :---: | :---: | :---: |
| Maximum number of HARQ <br> transmission |  | 4 |
| Cyclic Prefix |  | Normal |
| eutraControlRegionSize- <br> r13 |  | 2 for In-band, N/A for <br> Standalone/Guard-band <br> unless otherwise stated |
| downlinkBitmap-r13 and dl- <br> Gap-r13 | Not configured |  |
| dl-GapNonAnchor-r13 and <br> downlinkBitmapNonAnchor <br> -r13 | Not configured |  |
| Unused REs or RB (Note |  |  |
| 3) |  |  |

Table 8.12.1.2-2: Test Parameters of related NPDCCH and NPUSCH format 2 configurations

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| DCI format | DCI format N1 |  |
| scheduling delay field <br> $\left(I_{\text {Delay }}\right)$ |  | 1 for the first HARQ process; <br> 2 for the second HARQ <br> process if configured |
| $N_{\text {Rep }}^{\text {(ack-NACK- }}$ <br> NumRepetitions-r13) |  | 1 |
| ACK/NACK resource <br> field |  | 0 |
| Reference channel for <br> NPDCCH |  | R.NB.3 TDD for one NRS <br> antenna port; R.NB.4 TDD for <br> two NRS antenna ports |
| $\alpha_{\text {offset }}$(npdcch-Offset- <br> USS-r13) | 0 |  |

### 8.12.1.2.1 Minimum Requirements for In-band

The requirements are specified in Table 8.12.1.2.1-2, with the addition of the parameters in Table 8.12.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2 and C.3.6. The purpose of these tests is to verify the performance.

Table 8.12.1.2.1-1: Test Parameters for NPDSCH under In-band

| Parameter |  | Unit | Test 1, 2 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation of LTE <br> signal | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | $-3($ Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port | $N_{o c 1}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -93 (Note 2) |
|  | $N_{o c 2}$ | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -99 (Note 3) |
| LTE CRS port number (eutra-NumCRS-Ports-r13) |  |  | 4 |
| NPDCCH repetition number |  | subframe | 8 for Test 1; 16 for <br> Test 2; 128 for Test <br> 3. |

|  | $R_{\max }$ (npdcch-NumRepetitions-r13) | subframe | 8 for Test 1; 16 for <br> Test 2; 128 for Test <br> 3. |
| :--- | :--- | :---: | :---: |
| $G$ (nPDCCH-startSF-USS-r13) |  | 4 |  |
| Note 1: | $P_{B}=1$. <br> Note 2:This noise is applied to all subframes from the end of the NPDCCH to the end of the <br> following NPDSCH transmission; <br> Note 3: <br> This noise is applied to all subframes from the end of the NPDSCH to the end of the <br> following NPDCCH transmission. |  |  |

Table 8.12.1.2.1-2: Minimum performance under In-band with 2 NRS ports

| $\begin{gathered} \text { Test } \\ \text { numbe } \\ \mathbf{r} \end{gathered}$ | Bandwidt h | Carrie r Type | Referenc e Channel |  | Propagatio n Condition | Correlation Matrix and Antenna Configurati on | Reference value |  | $\underset{\text { Categor }}{\text { UE }}$ y |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Repetitio n number |  |  | Fraction of Maximum Throughp ut (\%) | $\begin{gathered} S N \\ R \\ (\mathrm{~dB} \\ \text { ) } \end{gathered}$ |  |
| 1 | 200kHz | Ancho r | $\begin{gathered} \text { R.NB. } 5 \\ \text { TDD } \end{gathered}$ | 1 | EPA5 | 2x1 Low | 70\% | 6.9 | $\begin{aligned} & \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 2 | 200kHz | Ancho $r$ | $\begin{aligned} & \text { R.NB. } 5 \\ & \text { TDD } \end{aligned}$ | 32 | EPA5 | 2x1 Low | 70\% | -4.8 | $\begin{aligned} & \hline \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 3 | 200kHz | Nonancho r | $\begin{aligned} & \text { R.NB.5-1 } \\ & \text { TDD } \end{aligned}$ | 256 | ETU1 | 2x1 Low | 70\% | -9.8 | NB1, NB2 |

### 8.12.1.2.2 Minimum Requirements for Standalone/Guard-band

The requirements are specified in Table 8.12.1.2.2-2, with the addition of the parameters in Table 8.12.1.2.2-1 and the downlink physical channel setup according to Annex C.3.6. The purpose of these tests is to verify the performance.

Table 8.12.1.2.2-1: Test Parameters for NPDSCH under Standalone/Guard-band

Table 8.12.1.2.2-2: Minimum performance for NPDSCH under Standalone/Guard-band with 1 NRS port

|  |  |  |  |  |  |  |  | Reference value |  | $\begin{aligned} & \text { UE } \\ & \text { Cate } \\ & \text { gory } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Test numb er | $\begin{aligned} & \text { Bandwi } \\ & \text { dth } \end{aligned}$ | Carri er Type | Referen ce Channe I |  | Propagati on condition | Numb er of NRS ports | Antenna Configurat ion | Fraction of Maximu $m$ Through put (\%) | SNR <br> (dB) |  |
| 1 | 200 kHz | Anch or | $\begin{aligned} & \text { R.NB. } 6 \\ & \text { TDD } \end{aligned}$ | 32 | EPA5 | 1 | 1x1 | 70\% | -3.4 | NB1, NB2 |
| 2 | 200 kHz | Nonanch or | $\begin{aligned} & \text { R.NB.6- } \\ & 1 \text { TDD } \end{aligned}$ | 256 | ETU1 | 1 | 1x1 | 70\% | -10.2 | NB1, NB2 |

### 8.12.1.2.3 Minimum Requirements for Standalone for UE Category NB2

The requirements are specified in Table 8.12.1.2.3-2, with the addition of the parameters in Table 8.12.1.2.3-1 and the downlink physical channel setup according to Annex C.3.6. The purpose of these tests is to verify the NPDSCH performance.

Table 8.12.1.2.3-1: Test Parameters for NPDSCH under Standalone

Table 8.12.1.2.3-2: Minimum performance for NPDSCH under Standalone with 1 NRS port

| Test numb er | $\begin{aligned} & \text { Bandwi } \\ & \text { dth } \end{aligned}$ | Carr er Type | Referen ce Channe I | $\begin{aligned} & \text { Repetiti } \\ & \text { on } \\ & \text { number } \end{aligned}$ | Propagati on condition | Numb er of NRS ports | Antenna Configurat ion | Reference value |  | UECatego ry |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | Fraction of <br> Maximu m <br> Through put (\%) | $\begin{gathered} S N \\ R \\ (\mathrm{~dB} \\ \text { ) } \end{gathered}$ |  |
| 1 | 200kHz | Nonanch or | $\begin{aligned} & \text { R.NB. } 7 \\ & \text { TDD } \end{aligned}$ | 1 | EPA5 | 1 | 1x1 | 70\% | 9.4 | NB2 |

### 8.12.2 NPDCCH

The receiver characteristics of the NPDCCH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg).

### 8.12.2.1 Half-duplex FDD

The parameters specified in Table 8.12.2.1-1 and Table 8.12.2.1-2 are valid for all half-duplex FDD tests unless otherwise stated.

Table 8.12.2.1-1: Test Parameters for NPDCCH

| Parameter | Unit | Single antenna <br> port | Transmit <br> diversity |
| :---: | :---: | :---: | :---: |
| Narrowband physical layer Cell ID |  | 0 | 0 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cyclic prefix |  | Normal | Normal |
| Number of CRS ports for in-band <br> deployment mode | 4 | 4 |  |
| NPDCCH starting position <br> (eutraControlRegionSize-r13) <br> (Note 1) |  | 3 | 3 |

| Maximum number of repetitions |  | 128 for Test 1; <br> 1024 for Test 2. | 64 for Test 1; <br> 512 for Test 2. |
| :---: | :---: | :---: | :---: |
| max <br> NPDCCCH start subframe $G$ <br> (npdcch-startSF-USS-r13) |  | 2 for test 1, <br> 1.5 for test 2 | 2 for test 1, <br> 1.5 for test 2 |
| NPDCCH fractional period offset of <br> starting subframe $\alpha_{\text {offset }}$ <br> (npdcch-Offset-USS-r13) |  | 0 | 0 |
| NB-IoT downlink subframe bitmap <br> for anchor carrier <br> (downlinkBitmap-r13) | Not configured | Not configured |  |
| NB-loT downlink subframe bitmap <br> for non-anchor carrier <br> (downlinkBitmapNonAnchor-r13) | Not configured | Not configured |  |
| Downlink gap configuration for <br> anchor carrier (dl-Gap-r13) | Not configured | Not configured |  |
| Downlink gap configuration for <br> non-anchor carrier <br> (dl-GapNonAnchor-r13) | Not configured | Not configured |  |
| Unused REs or RBs (Note 1) | OCNG | OCNG |  |
| OCNG pattern | NB.OP.1 | NB.OP.1 |  |
| NOTE 1: Applicable only for in-band deployment mode. |  |  |  |

Table 8.12.2.1-2: Test Parameters of related NPDSCH and NPUSCH format 2 configurations

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Scheduling delay field $\left(I_{\text {Delay }}\right)$ |  | 0 |
| NPDSCH Repetition |  | 1 |
| $N_{o c}$ at antenna port for NPDSCH | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| $N_{\text {Rep }}^{A N}$ (ack-NACK- <br> NumRepetitions-r13) |  | 1 |
| ACK/NACK resource field |  | 0 |
| Reference channel for NPDSCH |  | R.NB. 6 FDD and R.NB.6-1 FDD for one NRS antenna port; R.NB. 5 FDD and R.NB.51 FDD for two NRS antenna ports |

### 8.12.2.1.1 Single-antenna performance

For the parameters specified in Table 8.12.2.1.1-1 the average probability of a missed downlink scheduling grant (Pmdsg ) shall be below the specified value in Table 8.12.2.1.1-1. The downlink physical channel setup is in accordance with Annex C.3.6.

Table 8.12.2.1.1-1: Minimum performance NPDCCH

| Test numb er | Deployme nt mode | Repetiti on number (R) | $\begin{aligned} & \text { Carri } \\ & \text { er } \\ & \text { Type } \end{aligned}$ | Referen ce Channel | Propagati on Condition | Numb er of NRS ports | Antenna Configurati on | Referenc e value |  | UECatego ry |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | $\begin{gathered} \hline \text { Pm } \\ - \\ \text { ds } \\ \mathrm{g} \\ (\%) \end{gathered}$ | $\begin{gathered} \hline \text { SN } \\ R \\ \text { (dB } \\ \text { ) } \end{gathered}$ |  |
| 1 | Standalone/Guar d-band | 128 | Anch or | $\begin{aligned} & \text { R.NB. } 3 \\ & \text { FDD } \end{aligned}$ | EPA5 | 1 | 1x1 | 1 | -4.9 | NB1, NB2 |

| 2 | Stand- <br> alone/Guar <br> d-band | 1024 | Non- <br> ancho <br> $r$ | R.NB.3 <br> FDD | ETU1 | 1 | $1 \times 1$ | 1 | - <br> 11. <br> 4 | NB1, <br> NB2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 8.12.2.1.2 Transmit diversity performance

For the parameters specified in Table 8.12.2.1.2-1 the average probability of a missed downlink scheduling grant (Pmdsg ) shall be below the specified value in Table 8.12.2.1.2-1. The downlink physical channel setup is in accordance with Annex C.3.6.

Table 8.12.2.1.2-1: Minimum performance NPDCCH

| Test numb er | Deployme nt mode | Repetiti on number (R) | $\begin{aligned} & \text { Carri } \\ & \text { er } \\ & \text { Type } \end{aligned}$ | Referen ce Channel | Propagati on Condition | Numb er of NRS ports | Antenna Configurati on and correlation matrix | Referenc e value |  | UECategory |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | $\begin{gathered} \mathrm{Pm} \\ - \\ \mathrm{ds} \\ \mathrm{~g} \\ (\%) \end{gathered}$ | $\begin{gathered} \text { SN } \\ R \\ \text { (dB } \\ \text { ) } \end{gathered}$ |  |
| 1 | In-band | 64 | Anch or | $\begin{gathered} \hline \text { R.NB. } 4 \\ \text { FDD } \end{gathered}$ | EPA5 | 2 | 2x1 Low | 1 | -3.9 | $\begin{aligned} & \hline \text { NB1, } \\ & \text { NB2 } \end{aligned}$ |
| 2 | In-band | 512 | Nonancho r | $\begin{gathered} \text { R.NB. } 4 \\ \text { FDD } \end{gathered}$ | ETU1 | 2 | 2x1 Low | 1 | - 10 0 | NB1, NB2 |

### 8.12.2.2 TDD

The parameters specified in Table 8.12.2.2-1 and Table 8.12.2.2-2 are valid for all TDD tests unless otherwise stated.
Table 8.12.2.2-1: Test Parameters for NPDCCH

| Parameter | Unit | Single antenna <br> port | Transmit <br> diversity |
| :---: | :---: | :---: | :---: |
| Uplink downlink configuration <br> (Note 1) |  | 4 | 4 |
| Special subframe configuration <br> (Note 2) |  | 4 | 4 |
| Narrowband physical layer Cell ID |  | 0 | 0 |
| $N_{\text {oc }}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cyclic prefix |  | Normal | Normal |
| Number of CRS ports for in-band <br> deployment mode |  | 4 | 4 |
| NPDCCH starting position <br> (eutraControlRegionSize-r13) <br> (Note 1) |  | 2 | 2 |
| Maximum number of repetitions <br> $R_{\text {max }}$ (npdcch-NumRepetitions-r13) | 128 for Test 1; | 64 for Test 1; |  |
| NPDCCH start subframe $G$ <br> (npdcch-startSF-USS-r13) | 1024 for Test 2. | 512 for Test 2. |  |
| NPDCCH fractional period offset of <br> starting subframe $\alpha_{\text {offset }}$ <br> (npdcch-Offset-USS-r13) | Not configured | Not configured |  |
| NB-IoT downlink subframe bitmap <br> for anchor carrier <br> (downlinkBitmap-r13) | Not configured | Not configured |  |
| NB-IoT downlink subframe bitmap <br> for non-anchor carrier <br> (downlinkBitmapNonAnchor-r13) | Not configured | Not configured |  |
| Downlink gap configuration for <br> anchor carrier (dl-Gap-r13) |  | 0 |  |

### 8.12.3 Demodulation of NPBCH

The receiver characteristics of the NPBCH are determined by the probability of miss-detection of the NPBCH (Pmbch), which is defined as

$$
\operatorname{Pm}-\mathrm{bch}=1-\frac{A}{B}
$$

For the performance with single a NPBCH TTI decoding, A is the number of correctly decoded MIB-NB PDUs and B is the number of transmitted MIB-NB PDUs.

For the performance with multiple NPBCH TTIs decoding, A is the number of 5120 ms durations consisting of contiguous NPBCH TTIs where there is at least one correctly decoded MIB-NB PDU, and B is the number of 5120 ms durations consisting of contiguous NPBCH TTIs during the test.

### 8.12.3.1 HD-FDD

Table 8.12.3.1-1: Test Parameters for NPBCH

| Parameter |  | Unit | Single antenna <br> port | Transmit <br> diversity |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | NPBCH_RA | dB | 0 | -3 |
|  | $N_{o c \mid}$ at antenna port_RB |  | dB | 0 | -3 |
| Cyclic prefix |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cell ID |  |  | Normal | Normal |

### 8.12.3.1.1 Single-antenna port performance with single NPBCH TTI

For the parameters specified in Table 8.12.3.1-1 the average probability of a miss-detecting NPBCH (Pm-bch) shall be below the specified value in Table 8.12.3.1.1-1. The downlink physical setup is in accordance with Annex C.3.6.

Table 8.12.3.1.1-1: Minimum performance NPBCH
$\begin{array}{|c|c|c|c|c|c|c|c|}\hline \text { Test } & \text { Bandwidth } & \text { Reference } & \text { Propagation } & \text { Antenna } \\ \text { number }\end{array}$ Channel $\left.\begin{array}{c}\text { Condition }\end{array}\right)$
8.12.3.1.2 Transmit diversity performance
8.12.3.1.2.1 Minimum Requirement 2 Tx Antenna Port with multiple NPBCH TTIs

For the parameters specified in Table 8.12.3.1-1 the average probability of a miss-detected NPBCH (Pm-bch) shall be below the specified value in Table 8.12.3.1.2.1-1. The downlink physical setup is in accordance with Annex C.3.6.

Table 8.12.3.1.2.1-1: Minimum performance NPBCH

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | Propagation Condition | Antenna configuration and | Reference value |  | UE Category |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Pm-bch (\%) | SNR (dB) |  |

|  |  |  | correlation <br> Matrix |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 200 KHz | R.NB1.2 | EPA1 | $2 \times 1$ Low | 1 | -11.5 | NB1, NB2 |

### 8.12.3.2 TDD

Table 8.12.3.2-1: Test Parameters for NPBCH TDD

| Parameter |  | Unit | Single antenna port | Transmit diversity |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | NPBCH_RA | dB | 0 | -3 |
|  | NPBCH_RB | dB | 0 | -3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cyclic prefix |  |  | Normal | Normal |
| Cell ID |  |  | 0 | 0 |

### 8.12.3.2.1 Single-antenna port performance with single NPBCH TTI

For the parameters specified in Table 8.12.3.2-1 the average probability of a miss-detecting NPBCH (Pm-bch) shall be below the specified value in Table 8.12.3.2.1-1. The downlink physical setup is in accordance with Annex C.3.6.

Table 8.12.3.2.1-1: Minimum performance NPBCH
$\begin{array}{|c|c|c|c|c|c|c|c|}\hline \text { Test } & \text { Bandwidth } & \text { Reference } & \text { Propagation } & \text { Antenna } \\ \text { number }\end{array}$ Channel $\left.\begin{array}{c}\text { Condition }\end{array}\right)$
8.12.3.2.2 Transmit diversity performance
8.12.3.2.2.1 Minimum Requirement 2 Tx Antenna Port with multiple NPBCH TTIs

For the parameters specified in Table 8.12.3.2-1 the average probability of a miss-detected NPBCH (Pm-bch) shall be below the specified value in Table 8.12.3.2.2.1-1. The downlink physical setup is in accordance with Annex C.3.6.

Table 8.12.3.2.2.1-1: Minimum performance NPBCH

| Test | Bandwidth | Reference | Propagation | Antenna | Reference value <br> number |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel | Condition | UE <br> and <br> and <br> correlation <br> Matrix | Pm-bch (\%) | SNR (dB) |  |  |  |
| 1 | 200 KHz | R.NB1.2 | EPA1 | $2 \times 1$ Low | 1 | -11.5 | NB1, NB2 |

### 8.13 Demodulation of PDSCH CA and DC(4 receiver antenna ports)

### 8.13.1 FDD (CA and DC)

The parameters specified in Table 8.13.1-1 are valid for all FDD CA and DC tests unless otherwise stated.

Table 8.13.1-1: Common Test Parameters (FDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Inter-TTI Distance |  | 1 |
| Number of HARQ <br> processes per component <br> carrier | Processes | 8 |
| Maximum number of HARQ <br> transmission |  | 4 |
| Redundancy version coding <br> sequence |  | $\{0,1,2,3\}$ for QPSK and 16QAM <br> $\{0,0,1,2\}$ for 64QAM and 256QAM |
| Number of OFDM symbols <br> for PDCCH per component <br> carrier | OFDM symbols <br> Cyclic Prefix | 4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 <br> 2 for $10 \mathrm{MHz}, 15 \mathrm{MHz}$ and 20 MHz bandwidths <br> unless otherwise stated |
| Cell_ID |  | Normal |

### 8.13.1.1 Closed-loop spatial multiplexing performance

### 8.13.1.1.1 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port

The purpose of these tests is to verify the closed loop rank-two performance with frequency selective precoding.
For CA with 2 DL CCs, the requirements are specified in Table 8.13.1.1.1-3, based on single carrier requirement specified in Table 8.13.1.1.1-2, with the addition of the parameters in Table 8.13.1.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 3 DL CCs, the requirements are specified in Table 8.13.1.1.1-4, based on single carrier requirement specified in Table 8.13.1.1.1-2, with the addition of the parameters in Table 8.13.1.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 4 DL CCs, the requirements are specified in Table 8.13.1.1.1-5, based on single carrier requirement specified in Table 8.13.1.1.1-2, with the addition of the parameters in Table 8.13.1.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 5 DL CCs, the requirements are specified in Table 8.13.1.1.1-6, based on single carrier requirement specified in Table 8.13.1.1.1-2, with the addition of the parameters in Table 8.13.1.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.1.1.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 4 for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) |  | ms | 8 |
| Reporting interval |  | ms | 1 |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestriction bitmap |  |  | $\begin{gathered} 000000000000000000000000000000 \\ 00111111111111111000000000000 \\ 0000 \end{gathered}$ |
| CSI request field (Note 3) |  |  | '10' |
| PDSCH transmission mode |  |  | 4 |

| Note 1: | $P$ |
| :---: | :---: |
| Note 2: | If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |
| Note 3: | Multiple CC-s under test are configured as the $1^{\text {st }}$ set of serving cells by higher layers. |
| Note 4: | ACK/NACK bits are transmitted using PUSCH with PUCCH format 1b with channel selection configured for Tests in Table 8.13.1.1.1-3, and with PUCCH format 3 for Tests in Table 8.13.1.1.1-4, Table 8.13.1.1.1-5 and Table 8.13.1.1. 6. |
| Note 5: | The same PDSCH transmission mode is applied to each component carrier. |

Table 8.13.1.1.1-2: Single carrier performance for multiple CA configurations

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |

### 8.13.1.1.2 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port for dual connectivity

For dual connectivity the requirements are specified in Table 8.13.1.1.2-3 for 2DL CCs and Table 8.13.1.1.2-4 for 3DL CCs, based on single carrier requirement specified in Table 8.13.1.1.2-2, with the addition of the parameters in Table 8.13.1.1.2-1 and the downlink physical channel setup according to Annex C.3.2. The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding by using dual connectivity transmission.

Table 8.13.1.1.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for dual connectivity

| Parameter |  | Unit | Values |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 6 for $1.4 \mathrm{MHz}, 4$ for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, and 8 for 15 MHz CCs and 20 MHz CCs |
| PMI delay (Note 2) |  | ms | 8 |
| Reporting interval |  | ms | 1 |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestriction bitmap |  |  | 0000000000000000000000000000 0000111111111111111100000000 00000000 |
| PDSCH transmission mode |  |  | 4 |
| ACK/NACK transmission |  |  | Separate ACK/NACK feedbacks with PUCCH format 1b on the MCG and SCG |
| CSI feedback |  |  | Separate PUSCH feedbacks on the MCG and SCG |
| Time offset between MCG CC and SCG CC |  | $\mu \mathrm{S}$ | 0 for UE under test supporting synchronous dual connectivity; 334 for UE under test supporting both asynchronous and synchrounous dual connectivity (Note 4) |
| Note 1: $\quad P_{B}=1$. |  |  |  |
| Note 2: If the based reported | orts in estim canno | vailable uplink at a downlink applied at the | porting instance at subrame SF\#n not later than SF\#(n-4), this $B$ downlink before $S F \#(n+4)$. |

### 8.13.1.1.3 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port with 256QAM

The purpose of these tests is to verify the closed loop rank-two performance with frequency selective precoding with 256QAM under CA.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.1.1.3-3, based on single carrier requirement specified in Table 8.13.1.1.3-2, with the addition of the parameters in Table 8.13.1.1.3-1 and the downlink physical channel setup according to Annex C.3.2. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.13.1.1.3-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |

### 8.13.1.1.4 Minimum Requirement Four-Layer Spatial Multiplexing 4 Tx Antenna Port

The purpose of these tests is to verify the closed loop rank-four performance with wideband precoding with 4Tx and $4 R x$ under $C A$.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.1.1.4-3, based on single carrier requirement specified in Table 8.13.1.1.4-2, with the addition of the parameters in Table 8.13.1.1.4-1 and the downlink physical channel setup according to Annex C.3.2. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.13.1.1.4-1: Test Parameters for Four-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Cell-specific reference signals |  |  | Antenna Ports 0,1,2,3 |
| Precoding granularity |  | PRB | 25 for 5 MHz CCs, 50 for 10 MHz CCs, 75 for 15 MHz and 100 for 20 MHz CCs |

| Note 1: | The applicability of requirements for different CA configurations and bandwidth combination <br> sets is defined in 8.1.2.6. |  |  |

### 8.13.1.2 Dual-Layer Spatial Multiplexing (User-Specific Reference Symbols)

### 8.13.1.2.1 Minimum Requirement Dual-Layer Spatial Multiplexing 2 Tx Antenna Port

For CA with 2 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.1.2.1-3, based on single carrier requirement specified in Table 8.13.1.2.1-2, with the addition of the parameters in Table 8.13.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 3 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.1.2.1-4, based on single carrier requirement specified in Table 8.13.1.2.1-2, with the addition of the parameters in Table 8.13.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 4 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.1.2.1-5, based on single carrier requirement specified in Table 8.13.1.2.1-2, with the addition of the parameters in Table 8.13.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 5 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.1.2.1-6, based on single carrier requirement specified in Table 8.13.1.2.1-2, with the addition of the parameters in Table 8.13.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.1.2.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Values |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| Cell ID |  |  | 0 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta$ CSI-RS |  | Subframes | $5 / 2$ |
| CSI reference signal configuration |  |  | 8 |
| Zero-power CSI-RS configuration Icsi-Rs / ZeroPowerCSI-RS bitmap |  | $\begin{gathered} \hline \text { Subframes / } \\ \text { bitmap } \end{gathered}$ | $\begin{gathered} 3 / \\ 0010000000000000 \\ \hline \end{gathered}$ |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |

| $\widehat{E}_{s} / N_{o c}$ |  | Reference Value in Table <br> $8.13 .1 .2 .1-2$ |
| :---: | :---: | :---: |
| Symbols for unused PRBs | OCNG (Note 2) |  |
| Number of allocated resource blocks <br> (Note 2) | PRB | 50 |
| Simultaneous transmission |  | No |
| PDSCH transmission mode |  | 9 |

Note 1: $\quad P_{B}=1$
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Table 8.13.1.2.1-2: Single carrier performance for multiple CA configurations

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |
|  | 2Rx CC | 4Rx CC |  |  | 2Rx CC | 4Rx CC | 2Rx CC | 4Rx CC |
| 5 MHz | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.2 | 9.0 |

8.13.1.3 Enhanced Performance Requirements Type A Closed-loop spatial multiplexing

### 8.13.1.3.1 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols)

The purpose of these tests is to verify the closed loop rank-one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.13.1.3.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.1.3.1-3, based on single carrier requirement specified in Table 8.13.1.3.1-2, with the addition of the parameters in Table 8.13.1.3.1-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.1.3.1-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model for CA

| Parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) | -3 |
|  | $\sigma$ | dB | 0 | 0 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| $N_{o c}$ at antenna port |  | $\underset{\mathrm{z}}{\mathrm{dBm} / 15 \mathrm{kH}}$ | -98 | N/A |
| DIP (Note 2) |  | dB | N/A | -1.73 |
| Cell Id |  |  | 0 | 1 |
| PDSCH transmission mode |  |  | 6 | 4 |
| Interference model |  |  | N/A | As specified in clause B.5.3 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 |
|  | Rank 2 | \% | N/A | 20 |
| Precoding granularity |  | PRB | $\begin{gathered} 25 \text { for } 5 \mathrm{MHz} \text { CCs, } 50 \\ \text { for } 10 \mathrm{MHz} \text { CCs, } 75 \text { for } \\ 15 \mathrm{MHz} \text { and } 100 \text { for } \\ 20 \mathrm{MHz} \text { CCs } \\ \hline \end{gathered}$ | 4 for 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 4) |  | ms | 8 | N/A |
| Reporting interval |  | ms | 5 | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A |
| CodeBookSubsetRestriction bitmap |  |  | 1111 | N/A |
| Physical channel for CQI reporting |  |  | PUSCH (Note 7) | N/A |
| cqi-pmiConfigurationIndex | FDD PCC |  | 2 | N/A |
|  | FDD SCC |  | 3 | N/A |
| Note 1: $\quad P_{B}=1$ <br> Note 2: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1. |  |  |  |  |

Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell.
Note 4: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 5: All cells are time-synchronous.
Note 6: ACK/NACK bits are transmitted using PUSCH with PUCCH format 1 b with channel selection configured for tests with 2 CCs .
Note 7: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1, SF\#2, SF\#6 and \#7 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#5 SF\#6 SF\#0 and SF\#1.

Table 8.13.1.3.1-2: Single carrier performance for multiple CA configurations Enhanced Performance Requirement Type A

| Bandwidth | Reference Channel |  | OCNG Pattern |  | Propagation Conditions |  | Correlation Matrix and Antenna Configuration (Note 3) |  | Reference Value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2Rx CC | 4Rx CC | Cell 1 | Cell 2 | Cell 1 | Cell 2 |  |  | Fraction of Maximu m <br> Through put (\%) | SINR (dB) (Note 2) |  |

### 8.13.1.4 Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing (User-Specific Reference Symbols)

8.13.1.4.1 Minimum Requirement Enhanced Performance Requirement Type A - Singlelayer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols)

The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.13.1.4.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.1.4.1-3, based on single carrier requirement specified in Table 8.13.1.4.1-2, with the addition of the parameters in Table 8.13.1.4.1-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.1.4.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model for CA

| parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |

| Note 1: | The applicability of requirements for different CA configurations and bandwidth combination <br> sets is defined in 8.1.2.6. |  |  |

### 8.13.2 TDD (CA and DC)

The parameters specified in Table 8.13.2-1 are valid for all TDD CA and DC tests unless otherwise stated.
Table 8.13.2-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Uplink downlink configuration (Note 1) |  | 1 |
| Special subframe configuration (Note 2) |  | 4 |
| Cyclic prefix |  | Normal |
| Cell ID |  | 0 |
| Inter-TTI Distance |  | 1 |
| Number of HARQ processes per component carrier | Processes | 7 |
| Maximum number of HARQ transmission |  | 4 |
| Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM and 256QAM |
| Number of OFDM symbols for PDCCH per component carrier | OFDM symbols | 4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, <br> 2 for $10 \mathrm{MHz}, 15 \mathrm{MHz}$ and 20 MHz bandwidths unless otherwise stated |
| Cross carrier scheduling |  | Not configured |
| $\begin{array}{ll}\text { Note 1: } & \text { as specified in Table 4.2-2 in TS } 36.211 \text { [4]. } \\ \text { Note 2: } & \text { as specified in Table 4.2-1 in TS 36.211 [4]. }\end{array}$ |  |  |

### 8.13.2.1 Closed-loop spatial multiplexing performance

### 8.13.2.1.1 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port

For CA with 2 DL CCs, the requirements are specified in Table 8.13.2.1.1-2A, based on single carrier requirement specified in Table 8.13.2.1.1-2, with the addition of the parameters in Table 8.13.2.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 3 DL CCs, the requirements are specified in Table 8.13.2.1.1-3, based on single carrier requirement specified in Table 8.13.2.1.1-2, with the addition of the parameters in Table 8.13.2.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 4 DL CCs, the requirements are specified in Table 8.13.2.1.1-4, based on single carrier requirement specified in Table 8.13.2.1.1-2, with the addition of the parameters in Table 8.13.2.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 5 DL CCs, the requirements are specified in Table 8.13.2.1.1-5, based on single carrier requirement specified in Table 8.13.2.1.1-2, with the addition of the parameters in Table 8.13.2.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.2.1.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 8 |
| PMI delay (Note 2) |  | ms | 10 or 11 |
| Reporting interval |  | ms | 1 or 4 (Note 3) |
| Reporting mode |  |  | PUSCH 1-2 |
| ACK/NACK feedback mode |  |  | PUCCH format 1b with channel selection for Tests with 2CCs; PUCCH format 3 for Tests with more than 2 CCs |
| CodeBookSubsetRestrictionbitmap |  |  | 0000000000000000000000000000 0000111111111111111100000000 00000000 |
| CSI request field (Note 4) |  |  | '10' |
| PDSCH transmission mode |  |  | 4 |
| Note 1: $\quad P_{B}=1$. |  |  |  |
| Note 2: If the UE based on reported | rts in estim canno | vailable uplink at a downlin applied at the | orting instance at subrame SF\#n not later than SF\#(n-4), this downlink before SF\#(n+4) |

### 8.13.2.1.2 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port for dual connectivity

For dual connectivity the requirements are specified in Table 8.13.2.1.2-3, for 2DL CCs, in Table 8.13.2.1.2-4 for 3DL CCs, and Table 8.13.2.1.2-5 for 4DL CCs, based on single carrier requirement specified in Table 8.13.2.1.2-2, with the addition of the parameters in Table 8.13.2.1.2-1 and the downlink physical channel setup according to Annex C.3.2.The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding by using dual connectivity.

Table 8.13.2.1.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for dual connectivity

| Parameter |  | Unit | Value |
| :--- | :--- | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| Precoding granularity | PRB | 6 for $1.4 \mathrm{MHz}, 4$ for 3MHz and 5MHz <br> $\mathrm{CCs}, 6$ for 10MHz CCs, and 8 for <br> $15 \mathrm{MHz} \mathrm{CCs} \mathrm{and} \mathrm{20MHz} \mathrm{CCs}$ |  |
|  | ms | 10 or 11 |  |
| Reporting interval | ms | 1 or 4 (Note 3) |  |
| Reporting mode |  | PUSCH 1-2 |  |

| CodeBookSubsetRestriction bitmap |  | 0000000000000000000000000000 0000111111111111111100000000 00000000 |
| :---: | :---: | :---: |
| PDSCH transmission mode |  | 4 |
| ACK/NACK transmission |  | Separate ACK/NACK feedbacks with PUCCH format 1b on the MCG and SCG |
| CSI feedback |  | Separate PUSCH feedbacks on the MCG and SCG |
| Time offset between MCG CC and SCG CC | $\mu \mathrm{S}$ | 0 for UE under test supporting synchronous dual connectivity; 334 for UE under test supporting both asynchronous and synchrounous dual connectivity (Note 5) |
| Note 1: $\quad P_{B}=1$. |  |  |
| Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$ |  |  |
| Note 3: For Uplink - downlink between 1 ms and 4 |  | eporting interval will alternate |
| Note 4: The same PDSCH tr | on | pplied to each component carrier. |
| Note 5: As defined in TS36.3 |  |  |
| Note 6: If the UE supports both configured. |  | plit bearer, the SCG bearer is |

Table 8.13.2.1.1-2: Single carrier performance for multiple DC configurations

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |

### 8.13.2.1.3 Minimum Requirement Multi-Layer Spatial Multiplexing 4 Tx Antenna Port with 256QAM

The purpose of these tests is to verify the closed loop rank-two performance with frequency selective precoding with 256QAM under CA.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.2.1.3-3, based on single carrier requirement specified in Table 8.13.2.1.3-2, with the addition of the parameters in Table 8.13.2.1.3-1 and the downlink physical channel setup according to Annex C.3.2. The test coverage for different number of component carriers is defined in 8.1.2.4

Table 8.13.2.1.3-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | 4 for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |

### 8.13.2.1.4 Minimum Requirement Four-Layer Spatial Multiplexing 4 Tx Antenna Port

The purpose of these tests is to verify the closed loop rank-four performance with wideband precoding with 4 Tx and $4 R x$ under CA.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.2.1.4-3, based on single carrier requirement specified in Table 8.13.2.1.4-2, with the addition of the parameters in Table 8.13.2.1.4-1 and the downlink physical channel setup according to Annex C.3.2. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.13.2.1.4-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c \mid}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| Cell-specific reference signals |  | Antenna ports 0,1,2,3 |  |
| PDSCH transmission mode |  | 4 |  |
| PDSCH rank |  |  | 4 |
| Precoding granularity <br> PMI delay |  | PRB | 25 for 5MHz CCs, 50 for 10MHz <br> CCs, 75 for 15MHz and 100 for <br> 20 MHz CCs |
| Reporting interval |  | ms | 10 or 11 |

```
Note 1: }\quad\mp@subsup{P}{B}{}=1
Note 2: If the UE reports in an available uplink reporting instance at subrame SF#n
    based on PMI estimation at a downlink SF not later than SF#(n-4), this
    reported PMI cannot be applied at the eNB downlink before SF#(n+4)
Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate
    between 1ms and 4ms.
Note 4: Multiple CC-s under test are configured as the 1st set of serving cells by high
    layers.
Note 5: The same PDSCH transmission mode is applied to each component carrier.
```

### 8.13.2.2 Dual-Layer Spatial Multiplexing (User-Specific Reference Symbols)

### 8.13.2.2.1 Minimum Requirement Dual-Layer Spatial Multiplexing 2 Tx Antenna Port

For CA with 2 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.2.2.1-2A, based on single carrier requirement specified in Table 8.13.2.2.1-2, with the addition of the parameters in Table 8.13.2.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 3 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.2.2.1-3, based on single carrier requirement specified in Table 8.13.2.2.1-2, with the addition of the parameters in Table 8.13.2.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 4 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.2.2.1-4, based on single carrier requirement specified in Table 8.13.2.2.1-2, with the addition of the parameters in Table 8.13.2.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For CA with 5 DL CCs, for dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C, the requirements are specified in Table 8.13.2.2.1-5, based on single carrier requirement specified in Table 8.13.2.2.1-2, with the addition of the parameters in Table 8.13.2.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.13.2.2.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Values |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| Cell ID |  |  | 0 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframeoffset $\quad$ TcsI-RS / $\Delta$ csI-RS |  | Subframes | $5 / 4$ |
| CSI reference signal configuration |  |  | 8 |
| Zero-power CSI-RS configuration ICsI-RS / ZeroPowerCSI-RS bitmap |  | $\begin{gathered} \hline \text { Subframes / } \\ \text { bitmap } \end{gathered}$ | $\begin{gathered} 4 / \\ 0010000000000000 \end{gathered}$ |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| $\widehat{E}_{s} / N_{o c}$ |  |  | Reference Value in Table 8.13.2.2.1-2 |
| Symbols for unused PRBs |  |  | OCNG (Note 2) |
| Number of allocated resource blocks (Note 2) |  | PRB | 50 |
| Simultaneous transmission |  |  | No |
| PDSCH transmission mode |  |  | 9 |
| Note 1: $\quad P_{B}=1$ <br> Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. |  |  |  |

Table 8.13.2.2.1-2: Single carrier performance for multiple CA configurations

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |
|  | 2Rx CC | 4Rx CC |  |  | 2Rx CC | 4Rx CC | 2Rx CC | 4Rx CC |
| 5 MHz | $\begin{gathered} \text { R.51-2 } \\ \text { TDD } \end{gathered}$ | $\begin{aligned} & \text { R.51-2 } \\ & \text { TDD } \end{aligned}$ | OP. 1 TDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.0 | 9.0 |

### 8.13.2.3 Enhanced Performance Requirements Type A Closed-loop spatial multiplexing

### 8.13.2.3.1 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols)

The purpose of these tests is to verify the closed loop rank-one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.13.2.3.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.2.3.1-3, based on single carrier requirement specified in Table 8.13.2.3.1-2, with the addition of the parameters in Table 8.13.2.3.1-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.2.3.1-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model for CA

| Parameter |  |  |  | Unit |
| :---: | :--- | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -3 | Cell 1 |
|  | $\rho_{B}$ | dB | $-3($ Note 1) | -3 |
|  | $\sigma$ | dB | 0 | -3 |

| Cell-specific reference signals |  |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 8.13.2.4 Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing (User-Specific Reference Symbols)

8.13.2.4.1 Minimum Requirement Enhanced Performance Requirement Type A - Singlelayer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols)

The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.13.2.4.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For CA with 2 DL CCs, the requirements are specified in Table 8.13.2.4.1-3, based on single carrier requirement specified in Table 8.13.2.4.1-2, with the addition of the parameters in Table 8.13.2.4.1-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.2.4.1-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model for CA

| parameter |  | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: | :---: |

### 8.13.3 TDD-FDD (CA and DC)

The parameters specified in Table 8.13.3-1 are valid for all the TDD FDD CA tests unless otherwise stated.
Table 8.13.3-1: Common Test Parameters

| Parameter | Unit | Value |
| :--- | :---: | :---: |
| Uplink downlink configuration (Note 1) <br> for TDD CC only |  | 1 |
| Special subframe configuration (Note <br> 2) for TDD CC only |  | 4 |
| Inter-TTI Distance |  | 1 |
| Maximum number of <br> HARQ processes per <br> component carrier | FDD PCell | Processes |

The applicability of ther requirements are specified in Clause 8.1.2.6. The single carrier performance with different bandwidths for multiple CA configurations specified in Clause 8.13.3 cannot be applied for UE single carrier test.

### 8.13.3.1 Closed-loop spatial multiplexing performance 4Tx Antenna Port

### 8.13.3.1.1 Minimum Requirement for FDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD CA with FDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.1.1-4 based on single carrier requirement specified in Table 8.13.3.1.1-2 and Table 8.13.3.1.1-3, with the addition of the parameters in Table 8.13.3.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with FDD PCell and 3DL CCs, the requirements are specified in Table 8.13.3.1.1-5 based on single carrier requirement specified in Table 8.13.3.1.1-2 and Table 8.13.3.1.1-3, with the addition of the parameters in Table 8.13.3.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with FDD PCell and 4DL CCs, the requirements are specified in Table 8.13.3.1.1-6 based on single carrier requirement specified in Table 8.13.3.1.1-2 and Table 8.13.3.1.1-3, with the addition of the parameters in Table 8.13.3.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with FDD PCell and 5DL CCs, the requirements are specified in Table 8.13.3.1.1-7 based on single carrier requirement specified in Table 8.13.3.1.1-2 and Table 8.13.3.1.1-3, with the addition of the parameters in Table 8.13.3.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.1.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | Wideband precoding for $1.4 \mathrm{MHz}, 4$ for 3 MHz and 5 MHz CCs , 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) | FDD CC | ms | 8 |
|  | TDD CC | ms | 10 or 11 |
| Reporting interval | FDD CC | ms | 1 |
|  | TDD CC | ms | 1 or 4 (Note 3) |
| Reporting mode |  |  | PUSCH 1-2 |

### 8.13.3.1.2 Minimum Requirement for TDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD CA with TDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.1.2-4 based on single carrier requirement specified in Table 8.13.3.1.2-2 and Table 8.13.3.1.2-3, with the addition of the parameters in Table 8.13.3.1.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 3DL CCs, the requirements are specified in Table 8.13.3.1.2-5 based on single carrier requirement specified in Table 8.13.3.1.2-2 and Table 8.13.3.1.2-3, with the addition of the parameters in Table 8.13.3.1.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 4DL CCs, the requirements are specified in Table 8.13.3.1.2-6 based on single carrier requirement specified in Table 8.13.3.1.2-2 and Table 8.13.3.1.2-3, with the addition of the parameters in Table 8.13.3.1.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 5DL CCs, the requirements are specified in Table 8.13.3.1.2-7 based on single carrier requirement specified in Table 8.13.3.1.2-2 and Table 8.13.3.1.2-3, with the addition of the parameters in Table 8.13.3.1.2-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.1.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |

### 8.13.3.2 Dual-Layer Spatial Multiplexing (User-Specific Reference Symbols)

### 8.13.3.2.1 Minimum Requirement Dual-Layer Spatial Multiplexing 2 Tx Antenna Port for FDD PCell

The purpose of these tests is to verify dual-layer transmission on antenna ports 7 and 8 upon detection of a PDCCH with DCI format 2C.

For TDD FDD CA with FDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.2.1-4 based on single carrier requirement specified in Table 8.13.3.2.1-2 and Table 8.13.3.2.1-3, with the addition of the parameters in Table 8.13.3.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with FDD PCell and 3DL CCs, the requirements are specified in Table 8.13.3.2.1-5 based on single carrier requirement specified in Table 8.13.3.2.1-2 and Table 8.13.3.2.1-3, with the addition of the parameters in Table 8.13.3.2.1-1 and the downlink physical channel setup according to Annex C.3.2

For TDD FDD CA with FDD PCell and 4DL CCs, the requirements are specified in Table 8.13.3.2.1-6 based on single carrier requirement specified in Table 8.13.3.2.1-2 and Table 8.13.3.2.1-3, with the addition of the parameters in Table 8.13.3.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with FDD PCell and 5DL CCs, the requirements are specified in Table 8.13.3.2.1-7 based on single carrier requirement specified in Table 8.13.3.2.1-2 and Table 8.13.3.2.1-3, with the addition of the parameters in Table 8.13.3.2.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.2.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Values |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| Cell ID |  |  | 0 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframe offset $T_{\text {csI-RS }} / \Delta$ csi-Rs | FDD CC | Subframes | 5/2 |
|  | TDD CC |  | $5 / 4$ |
| CSI reference signal configuration |  |  | 8 |
| Zero-power CSI-RS configuration Icsi-Rs / ZeroPowerCSI-RS bitmap | FDD CC | Subframes / bitmap | $3 / 0010000000000000$ |
|  | TDD CC |  | $4 / 0010000000000000$ |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 |
| $\widehat{E}_{s} / N_{o c}$ | FDD CC |  | Reference Value in Table 8.13.3.2.1-2 |
|  | TDD CC |  | Reference Value in Table 8.13.3.2.1-3 |
| Symbols for unused PRBs |  |  | OCNG (Note 2) |
| Number of allocated resource blocks (Note 2) |  | PRB | 50 |
| Simultaneous transmission |  |  | No |
| PDSCH transmission mode |  |  | 9 |
| Note 1: $\quad P_{B}=1$ <br> Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. <br> Note 3: ACK/NACK bits are transmitted using PUSCH with PUCCH format 3. |  |  |  |
|  |  |  |  |  |

Table 8.13.3.2.1-2: Single carrier performance with different bandwidths for multiple CA configurations for FDD PCell and SCell (FRC)

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |
|  | 2Rx CC | 4Rx CC |  |  | 2Rx CC | 4Rx CC | 2Rx CC | 4Rx CC |
| 5 MHz | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.2 | 9.0 |

### 8.13.3.2.2 Minimum Requirement Dual-Layer Spatial Multiplexing 2 Tx Antenna Port for TDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD CA with TDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.2.2-4 based on single carrier requirement specified in Table 8.13.3.2.2-2 and Table 8.13.3.2.2-3, with the addition of the parameters in Table 8.13.3.2.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 3DL CCs, the requirements are specified in Table 8.13.3.2.2-5 based on single carrier requirement specified in Table 8.13.3.2.2-2 and Table 8.13.3.2.2-3, with the addition of the parameters in Table 8.13.3.2.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 4DL CCs, the requirements are specified in Table 8.13.3.2.2-6 based on single carrier requirement specified in Table 8.13.3.2.2-2 and Table 8.13.3.2.2-3, with the addition of the parameters in Table 8.13.3.2.2-1 and the downlink physical channel setup according to Annex C.3.2.

For TDD FDD CA with TDD PCell and 5DL CCs, the requirements are specified in Table 8.13.3.2.2-7 based on single carrier requirement specified in Table 8.13.3.2.2-2 and Table 8.13.3.2.2-3, with the addition of the parameters in Table 8.13.3.2.2-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.2.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Values |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | -3 |
| Cell-specific reference signals |  |  | Antenna ports 0 and 1 |
| Cell ID |  |  | 0 |
| CSI reference signals |  |  | Antenna ports 15,16 |
| Beamforming model |  |  | Annex B.4.2 |
| CSI-RS periodicity and subframe offset $T_{\text {csI-RS }} / \Delta$ csi-RS | FDD CC | Subframes | 5/2 |
|  | TDD CC |  | 5/4 |
| CSI reference signal configuration |  |  | 8 |
| Zero-power CSI-RS configuration Icst-Rs / ZeroPowerCSI-RS bitmap | FDD CC | $\begin{gathered} \hline \text { Subframes / } \\ \text { bitmap } \end{gathered}$ | $3 / 0010000000000000$ |
|  | TDD CC |  | $4 / 0010000000000000$ |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| $\hat{E}_{s} / N_{o c}$ | FDD CC |  | Reference Value in Table 8.13.3.2.2-2 |
|  | TDD CC |  | Reference Value in Table 8.13.3.2.2-3 |
| Symbols for unused PRBs |  |  | OCNG (Note 2) |

| Number of allocated resource blocks (Note 2) |  |  |  |  | PRB | 50 |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
|  | Simultaneous transmission |  | No |  |  |  |
| PDSCH transmission mode |  | 9 |  |  |  |  |
| Note 1: | $P_{B}=1$ |  |  |  |  |  |
| Note 2: | These physical resource blocks are assigned to an arbitrary number of virtual UEs <br> with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall <br> be uncorrelated pseudo random data, which is QPSK modulated. |  |  |  |  |  |
| Note 3: | ACK/NACK bits are transmitted using PUSCH with PUCCH format 3. |  |  |  |  |  |

Table 8.13.3.2.2-2: Single carrier performance with different bandwidths for multiple CA configurations for FDD SCell (FRC)

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |
|  | 2Rx CC | 4Rx CC |  |  | 2Rx CC | 4Rx CC | 2Rx CC | 4Rx CC |
| 5MHz | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.51-2 } \\ \text { FDD } \end{gathered}$ | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.2 | 9.0 |
| $\begin{gathered} \hline 10 \\ \mathrm{MHz} \end{gathered}$ | R. 51 FDD | R. 51 FDD | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 13.7 | 8.8 |
| $\begin{gathered} 15 \mathrm{M} \\ \mathrm{~Hz} \end{gathered}$ | $\begin{gathered} \text { R.51-3 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.51-3 } \\ \text { FDD } \end{gathered}$ | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 13.6 | 8.7 |
| $\begin{gathered} 20 \mathrm{M} \\ \mathrm{~Hz} \end{gathered}$ | $\begin{gathered} \text { R.51-4 } \\ \text { FDD } \end{gathered}$ | $\begin{gathered} \text { R.51-4 } \\ \text { FDD } \end{gathered}$ | OP. 1 FDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.3 | 8.8 |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.
Note 3: $\quad$ SNR corresponds to $\widehat{E}_{S} / N_{o c}$ of Cell 1.

Table 8.13.3.2.2-3: Single carrier performance with different bandwidths for multiple CA configurations for TDD PCell and SCell (FRC)

| Band width | Reference channel |  | OCNG pattern | Propagation condition | Correlation matrix and antenna config. |  | Reference value |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Fraction of maximum throughpu t (\%) |  |  |  | SNR (dB) |  |
|  | 2Rx CC | 4Rx CC |  |  | 2Rx CC | 4Rx CC | 2Rx CC | 4Rx CC |
| 5MHz | $\begin{aligned} & \text { R.51-2 } \\ & \text { TDD } \end{aligned}$ | $\begin{aligned} & \text { R.51-2 } \\ & \text { TDD } \end{aligned}$ | OP. 1 TDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.0 | 9.0 |
| $\begin{gathered} 10 \\ \mathrm{MHz} \\ \hline \end{gathered}$ | R. 51 TDD | R. 51 TDD | OP. 1 TDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 13.9 | 9.1 |
| $\begin{gathered} 15 \mathrm{M} \\ \mathrm{~Hz} \end{gathered}$ | $\begin{aligned} & \text { R.51-3 } \\ & \text { TDD } \end{aligned}$ | $\begin{gathered} \text { R.51-3 } \\ \text { TDD } \end{gathered}$ | OP. 1 TDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 13.9 | 9.2 |
| $\begin{gathered} \text { 20M } \\ \mathrm{Hz} \end{gathered}$ | $\begin{aligned} & \text { R.51-4 } \\ & \text { TDD } \end{aligned}$ | $\begin{gathered} \text { R.51-4 } \\ \text { TDD } \end{gathered}$ | OP. 1 TDD | ETU5 | 2x2 Low | 2x4 Low | 70 | 14.1 | 9.3 |

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.
Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.
Note 3: SNR corresponds to $\widehat{E}_{S} / N_{o c}$ of Cell 1.

Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.6.

### 8.13.3.3 Enhanced Performance Requirements Type A Closed-loop spatial multiplexing

8.13.3.3.1 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols) for FDD PCell

The purpose of these tests is to verify the closed loop rank-one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.13.3.3.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For TDD FDD CA with FDD PCell and with 2 DL CCs, the requirements are specified in Table 8.13.3.3.1-4, based on single carrier requirement specified in Table 8.13.3.3.1-2 and Table 8.13.3.3.1-3, with the addition of the parameters in Table 8.13.3.3.1-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.3.3.1-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model for CA

| Parameter | Unit | Cell 1 | Cell 2 |  |
| :---: | :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 | -3 |
|  | $\rho_{B}$ | dB | -3 (Note 1) | -3 |
|  | $\sigma$ | dB | 0 | 0 |
| Cell-specific reference signals |  |  | Antenna ports 0,1 | Antenna ports 0,1 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kH}$ | -98 | N/A |
| DIP (Note 2) |  | dB | N/A | -1.73 |
| Cell Id |  |  | 0 | 1 |
| PDSCH transmission mode |  |  | 6 | 4 |
| Interference model |  |  | N/A | As specified in clause B.5.3 |
| Probability of occurrence of transmission rank in interfering cells | Rank 1 | \% | N/A | 80 |
|  | Rank 2 | \% | N/A | 20 |
| Precoding granularity |  | PRB | 25 for 5 MHz CCs, 50 for 10 MHz CCs, 75 for 15 MHz and 100 for 20 MHz CCs | 4 for 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 4) | FDD CC | ms | 8 | N/A |
|  | TDD CC | ms | 10 or 11 | N/A |
| Reporting interval |  | ms | 5 | N/A |
| Reporting mode |  |  | PUCCH 1-1 | N/A |
| CodeBookSubsetRestriction bitmap |  |  | 1111 | N/A |
| Physical channel for CQI reporting |  |  | PUSCH (Note 7) | N/A |
| cai-pmi- <br> ConfigurationIndex | FDD PCC |  | 4 | N/A |
|  | TDD SCC |  | 5 | N/A |
| Note 1: $\quad P_{B}=1$ <br> Note 2: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1. |  |  |  |  |

Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell.
Note 4: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4).
Note 5: All cells are time-synchronous.
Note 6: ACK/NACK bits are transmitted using PUSCH with PUCCH format 1b with channel selection configured for tests with 2 CCs .
Note 7: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3 for TDD CCs, and PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2 for FDD CCs.

### 8.13.3.3.2 Minimum Requirement Single-Layer Spatial Multiplexing 2 Tx Antenna Port with TM4 interference model (Cell-Specific Reference Symbols) for TDD PCell

The purpose of these tests is to verify the closed loop rank-one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 4 interference model defined in clause B.5.3. In Table 8.13.3.3.2-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2 , respectively.

For TDD FDD CA with TDD PCell with 2 DL CCs, the requirements are specified in Table 8.13.3.3.2-4, based on single carrier requirement specified in Table 8.13.3.3.2-2 and Table 8.13.3.3.2-3, with the addition of the parameters in Table 8.13.3.3.2-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.3.3.2-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model for CA

| Parameter | Unit | Cell 1 | Cell 2 |  |
| :---: | :---: | :---: | :---: | :---: |

### 8.13.3.4 Enhanced Performance Requirement Type A - Single-layer Spatial Multiplexing (User-Specific Reference Symbols)

### 8.13.3.4.1 Minimum Requirement Enhanced Performance Requirement Type A - Singlelayer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols) for FDD PCell

The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.13.3.4.1-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For TDD FDD CA with FDD PCell with 2 DL CCs, the requirements are specified in Table 8.13.3.4.1-4, based on single carrier requirement specified in Table 8.13.3.4.1-2 and Table 8.13.3.4.1-3, with the addition of the parameters in Table 8.13.3.4.1-1 and the downlink physical channel setup according to Annex C.3.2.

### 8.13.3.4.2 Minimum Requirement Enhanced Performance Requirement Type A Singlelayer Spatial Multiplexing with TM9 interference model (User-Specific Reference Symbols) for TDD PCell

The purpose of these tests is to verify closed loop rank one performance on one of the antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4. In 8.13.3.4.2-1, Cell 1 is the serving cell, and Cell 2 is the interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2, respectively.

For TDD FDD CA with TDD PCell with 2 DL CCs, the requirements are specified in Table 8.13.3.4.2-4, based on single carrier requirement specified in Table 8.13.3.4.2-2 and Table 8.13.3.4.2-3, with the addition of the parameters in Table 8.13.3.4.2-1 and the downlink physical channel setup according to Annex C.3.2.

Table 8.13.3.4.2-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model for CA

| CodeBookSubsetRestriction bitmap |  |  | 001111 | N/A |
| Symbols for unused PRBs |  |  | OCNG (Note 6) | N/A |
| Simultaneous transmission |  |  | No simultaneous transmission on the other antenna port in (7 or 8 ) used for the input signal under test | N/A |
| Physical channel for CQIreporting |  |  | PUSCH(Note 8) | N/A |
| cqi-pmi- <br> ConfigurationInde <br> x | FDD CC |  | 3 | N/A |
|  | TDD CC |  | 4 | N/A |
| Note 1: $\quad P_{B}=1$ <br> Note 2: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1. <br> Note 3: The modulation symbols of the signal under test in Cell 1 are mapped onto antenna port 7 or 8 . <br> Note 4: The precoder in clause B.4.3 follows UE recommended PMI. <br> Note 5: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$. |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

Note 6: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 7: All cells are time-synchronous.
Note 8: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3 for TDD CCs, and PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2 for FDD CCs.
Note 9: ACK/NACK bits are transmitted using PUSCH with PUCCH format 1b with channel selection configured for tests with 2 CCs.

### 8.13.3.5 Closed-loop spatial multiplexing performance 4Tx Antenna Port for DC

### 8.13.3.5.1 Minimum Requirement for FDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD DC with FDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.5.1-4 based on single carrier requirement specified in Table 8.13.3.5.1-2 and Table 8.13.3.5.1-3, with the addition of the parameters in Table 8.13.3.5.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.5.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for DC

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| $\begin{array}{c}\text { Downlink power } \\ \text { allocation }\end{array}$ | $\rho_{A}$ | dB | -6 |$]-6$ (Note 1)

Note 1: $\quad P_{B}=1$.
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4).
Note 3: Multiple CC-s under test are configured as the $1^{\text {st }}$ set of serving cells by higher layers.
Note 4: ACK/NACK bits are transmitted using PUSCH with PUCCH format 3.
Note 5: The same PDSCH transmission mode is applied to each component carrier.
Note 6: As defined in TS36.300 [11].
Note 7: If the UE supports both SCG bearer and Split bearer, the SCG bearer is configured.

### 8.13.3.5.2 Minimum Requirement for TDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD DC with TDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.5.2-4 based on single carrier requirement specified in Table 8.13.3.5.2-2 and Table 8.13.3.5.2-3, with the addition of the parameters in Table 8.13.3.5.2-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.5.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for DC

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Precoding granularity |  | PRB | Wideband precoding for $1.4 \mathrm{MHz}, 4$ for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) | FDD CC | ms | 8 |
|  | TDD CC | ms | 10 or 11 |
| Reporting interval | FDD CC | ms | 1 |
|  | TDD CC | ms | 1 or 4 (Note 3) |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestriction bitmap |  |  | $\begin{gathered} 000000000000000000000000000000001111 \\ 1111111111110000000000000000 \end{gathered}$ |
| CSI request field (Note 3) |  |  | '10' |
| PDSCH transmission mode |  |  | 4 |
| ACK/NACK transmission |  |  | Separate ACK/NACK feedbacks with PUCCH format 1b on the MCG and SCG |
| CSI feedback |  |  | Separate PUSCH feedbacks on the MCG and SCG |
| Time offset between MCG CC and SCG CC |  | $\mu \mathrm{S}$ | 0 for UE under test supporting synchronous dual connectivity; 334 for UE under test supporting both asynchronous and synchrounous dual connectivity (Note 6) |
| Note 1: $\quad P_{B}=1$. |  |  |  |
| Note 2: If the UE re at a downli before SF\# | an available later than | k reporting ins -4), this repor | ee at subrame SF\#n based on PMI estimation PMI cannot be applied at the eNB downlink |
| Note 3: Multiple CC-s under test are con |  | d as the $1^{\text {st }}$ s | serving cells by higher layers. |
| Note 4: ACK/NACK bits are transmitted |  | PUSCH with | CCH format 3 . |
| Note 5: The same PDSCH transmission |  | is applied to | h component carrier. |
| Note 6: As defined in | 300 [11]. |  |  |
| Note 7: If the UE sup | oth SCG be | and Split bear | e SCG bearer is configured. |

Table 8.13.3.5.2-2: Single carrier performance with different bandwidths for multiple DC configurations for FDD SCell (FRC)

| 1 | 2x20 | 20 | 20 | As defined in Table 8.13.3.6.1-2 and Table 8.13.3.6.1-3 per CC | $\geq 5$ |
| 2 | 20+10 | 10 | 20 | As defined in Table 8.13.3.6.1-2 and Table 8.13.3.6.1-3 per CC | $\geq 5$ |
| 3 | 20+15 | 15 | 20 | As defined in Table 8.13.3.6.1-2 and Table 8.13.3.6.1-3 per CC | $\geq 5$ |
| Note 1: | The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.6. |  |  |  |  |

### 8.13.3.6.2 Minimum Requirement for TDD PCell

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

For TDD FDD CA with TDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.6.2-4 based on single carrier requirement specified in Table 8.13.3.6.2-2 and Table 8.13.3.6.2-3, with the addition of the parameters in Table 8.13.3.6.2-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.6.2-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -6 |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 3 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 |
| Precoding granularity |  | PRB | Widelband pre-coding for $1.4 \mathrm{MHz}, 4$ for 3 MHz and 5 MHz CCs, 6 for 10 MHz CCs, 8 for 15 MHz and 20 MHz CCs |
| PMI delay (Note 2) | FDD CC | ms | 8 |
|  | TDD CC | ms | 10 or 11 |
| Reporting interval | FDD CC | ms | 1 |
|  | TDD CC | ms | 1 or 4 (Note 3) |
| Reporting mode |  |  | PUSCH 1-2 |
| CodeBookSubsetRestriction bitmap |  |  | 0000000000000000000000000000 0000111111111111111100000000 00000000 |
| CSI request field (Note 3) |  |  | '10' |
| PDSCH transmission mode |  |  | 4 |
| Note 1: $\quad P_{B}=1$. <br> Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |  |  |  |
|  |  |  |  |
| Note 3: Multiple layers. | under tes | re configured | s the $1^{\text {st }}$ set of serving cells by higher |
| $\begin{array}{ll}\text { Note 4: } & \text { ACK/NAC } \\ \text { Note 5: }\end{array}$ | bits are tra | itted using P | SCH with PUCCH format 3. |
|  | DSCH tran | ission mode is | applied to each component carrier. |

8.13.3.7 Closed-loop spatial multiplexing performance 4Tx Antenna Port with Four layers

### 8.13.3.7.1 Minimum Requirement for FDD PCell

The purpose of these tests is to verify the closed loop rank-four performance with wideband precoding with 4Tx and 4 Rx under CA.

For TDD FDD CA with FDD PCell and 2DL CCs, the requirements are specified in Table 8.13.3.7.1-4 based on single carrier requirement specified in Table 8.13.3.7.1-2 and Table 8.13.3.7.1-3, with the addition of the parameters in Table 8.13.3.7.1-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.
Table 8.13.3.7.1-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA

| Downlink power allocation | $\rho_{\text {A }}$ | dB | -6 |
| :---: | :---: | :---: | :---: |
|  | $\rho_{B}$ | dB | -6 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Cell-specific reference signals |  |  | Antenna Ports 0,1,2,3 |
| Precoding granularity |  | PRB | 25 for 5 MHz CCs, 50 for 10 MHz CCs, 75 for 15 MHz and 100 for 20 MHz CCs |
| PMI delay (Note 2) | FDD CC | ms | 8 |
|  | TDD CC | ms | 10 or 11 |
| Reporting interval | FDD CC | ms | 1 |

### 8.14 Demodulation (UE supporting Short TTI)

The performance requirements specified in this clause are valid for UEs capable of short TTI.

### 8.14.1 Slot-PDSCH and Subslot-PDSCH

### 8.14.1.1 FDD (Fixed Reference Channel)

The parameters specified in Table 8.14.1.1-1 are valid for FDD unless otherwise stated.
Table 8.14.1.1-1: Common Test Parameters

| Parameter | Unit | Value |  |
| :---: | :---: | :---: | :---: |
| Cyclic prefix |  | Normal |  |
|  | Cell ID |  | 0 |

| Number of HARQ processes | Processes | 8 for Slot-PDSCH <br> 8 for subslot-PDSCH with proc- <br> Timeline=set1 (Note 1) <br> 12 for subslot-PDSCH with proc- <br> Timeline=set2 (Note 1) |
| :---: | :---: | :---: |
| Minimum Processing Time (Note 2) |  | $\begin{aligned} & X_{\mathrm{p}}=4(\text { proc-Timeline }=\text { set } 1) \\ & X_{\mathrm{p}}=6(\text { proc- } \text { Timeline }=\text { set } 2) \end{aligned}$ |
| Maximum number of HARQ transmission |  | 4 |
| Redundancy version coding sequence |  | \{0,1,2,3\} |
| Number of OFDM symbols for PDCCH | OFDM symbols | 2 |
| Note 1: As specified in TS36.211 Table 8.1-2. <br> Note 2: Subslot-PDSCH only. As specified in TS36.213 7.3. |  |  |

### 8.14.1.1.1 Open-loop spatial multiplexing performance

The requirements are specified in Table 8.14.1.1.1-3, with the addition of the parameters in Table 8.14.1.1.1-1 and Table 8.14.1.1.1-2, and the downlink physical channel setup according to Annex C.3.2.

Table 8.14.1.1.1-1: Test Parameters for PDSCH

| Parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |
| Unused RE-s and PRB-s |  | OCNG | OCNG |
| Cell ID |  | 0 | 0 |

### 8.14.2 SPDCCH

The receiver characteristics of the SPDCCH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg).

### 8.14.2.1 FDD

The parameters specified in Table 8.14.2.1-1 and Table 8.14.2.1-2 are valid for all FDD tests unless otherwise stated.
Table 8.14.2.1-1: Test Parameters for SPDCCH

| Parameter |  | Unit | Test 1 Test 3 | Test 2 Test 4 |
| :---: | :---: | :---: | :---: | :---: |
| Number of PDCCH symbols |  | symbols | 2 | 2 |
| Unused RE-s and PRB-s |  |  | OCNG | OCNG |
| Cell ID |  |  | 0 | 0 |
| Downlink power allocation | $\rho_{A}$ | dB | -6 | -3 |
|  | $\rho_{B}$ | dB | -6 | -3 |
|  | $\sigma$ | dB | 0 | 0 |
|  | б | dB | N/A | 3 |
| $N_{o c}$ at antenna port |  | dBm/15kHz | -98 | -98 |
| Cyclic prefix |  |  | Normal | Normal |
| Subframe configuration |  |  | Non-MBSFN | Non-MBSFN |
| Precoder update granularity |  | SREG | N/A | 2 |
|  |  | ms | N/A | 1 |
| Beamforming precoder |  |  | N/A | Annex B.4.4 |
| Cell specific reference signal |  |  | Antenna ports $0,1,2,3$ | $\begin{gathered} \text { Antenna ports } \\ 0,1 \end{gathered}$ |
| Configured SPDCCH-PRB sets |  |  | \{Set 1\} | \{Set 2\} |
| SPDCCH-PRB set used for DCI transmission |  |  | Set 1 | Set 2 |
| PDSCH transmission mode |  |  | TM4 | TM9 |
| DCI format |  |  | 7-1C | 7-1F |

> | Note 1: | For slot-based transmission, $\mathrm{DCI} 7-1 \mathrm{C}$ and $7-1 \mathrm{~F}$ are transmitted only on |
| :--- | :--- |
| SPDCCH in slot 1. For subslot-based transmission, DCI $7-1 \mathrm{C}$ and $7-1 \mathrm{~F}$ are |  |
| transmitted on SPDCCH in all the subslots. |  |

Table 8.14.2.1-2: SPDCCH-PRB set parameters

| Parameter | Unit | Set 1 | Set 2 |
| :---: | :---: | :---: | :---: |
| Refence symbol |  | CRS | DMRS |
| Transmission type |  | Localized | Distributed |
| Number of OFDM symbols |  | 1 | Note 2 |
| Number of PRBs per SPDCCHPRB set (Note 1) |  | 16 | 16 |
| Note 1: The two SPDCCH-PRB sets are non-overlapping with PRB $=\{0,1, \ldots, 15\}$ for Set 1 and PRB $=\{0,1,6,7,12,13,18,19,28,29,34,35,40,41,46,47\}$ for Set 2. <br> Note 2: 2 OFDM symbols for slot-based SPDCCH. 2 OFDM symbols for subslot indices 2 , 3, and 4, and 3 OFDM symbols for subslot indices 1 and 5 for subslot-based SPDCCH. |  |  |  |
|  |  |  |  |

### 8.14.2.1.1 Mimimum requirement

For the parameters specified in Table 8.14.2.1-1 and Table 8.14.2.1-2 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.14.2.1.1-1. The metric Pm-dsg is calculated across all the slots for slot-based SPDCCH and across all the subslots for subslot-based SPDCCH. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.14.2.1.1-1: Minimum performance SPDCCH

| Test <br> number | Bandwidth | DL TTI <br> length | Aggregati <br> on Level | Reference <br> Channel | OCNG <br> Pattern | Propagation <br> Condition | Antenna <br> configuration <br> and correlation <br> Matrix | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 10 MHz | Slot | 2 SCCE | R.sTTI.10 <br> (\%) | SND <br> (dB) |  |  |  |  |
| 2 | 10 MHz | Slot | 8 OPCE 7 | R.sTTI.11 <br> FDD | OP.7 FDD | EPA5 | $2 \times 2$ Low | 1 | 1.3 |
| 3 | 10 MHz | Subslot | 2 SCCE | R.sTTI.10 <br> FDD | OP.7 FDD | EVA30 | $4 \times 2$ Low | 1 | 2.3 |
| 4 | 10 MHz | Subslot | 8 SCCE | R.sTTI.11 <br> FDD | OP.7 FDD | EPA5 | $2 \times 2$ Low | 1 | 0.9 |

### 8.14.2.2 TDD

The parameters specified in Table 8.14.2.2-1 and Table 8.14.2.2-2 are valid for all TDD tests unless otherwise stated.
Table 8.14.2.2-1: Test Parameters for SPDCCH

| Parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |
| Number of PDCCH symbols | symbols | 2 | 2 |
| Unused RE-s and PRB-s |  | OCNG | OCNG |
| Cell ID |  | 0 | 0 |
| Downlink power allocation | dB | -6 | -3 |
|  | dB | -6 | -3 |
|  | dB | 0 | 0 |
|  | dB | N/A | 3 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 | -98 |
| Cyclic prefix |  | Normal | Normal |
| Subframe configuration |  | Non-MBSFN | Non-MBSFN |
| Precoder update granularity | SREG | N/A | 2 |
|  | ms | N/A | 1 |

Table 8.14.2.2-2: SPDCCH-PRB set parameters

| Parameter | Unit | Set 1 | Set 2 |

### 8.15 Demodulation (8 receiver antenna ports)

### 8.15.1 PDSCH

### 8.15.1.1 Void

### 8.15.1.2 TDD (Fixed Reference Channel)

The parameters specified in Table 8.15.1.2-1 are valid for all TDD tests unless otherwise stated.

Table 8.15.1.2-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Uplink downlink configuration (Note 1) |  | 1 |
| Special subframe configuration (Note 2) |  | 4 |
| Cyclic prefix |  | Normal |
| Cell ID |  | 0 |
| Inter-TTI Distance |  | 1 |
| Number of HARQ processes per component carrier | Processes | 7 |
| Maximum number of HARQ transmission |  | 4 |
| Redundancy version coding sequence |  | \{0,1,2,3\} for QPSK and 16QAM $\{0,0,1,2\}$ for 64QAM and 256QAM |
| Number of OFDM symbols for PDCCH | OFDM symbols | 4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, <br> 2 for $10 \mathrm{MHz}, 15 \mathrm{MHz}$ and 20 MHz bandwidths unless otherwise stated |
| Cross carrier scheduling |  | Not configured |
| Precoder update granularity |  | Frequency domain: 1 PRG for Transmission modes 9 and 10 unless stated otherwise Time domain: 1 ms |
| ACK/NACK feedback mode |  | Multiplexing |
| Note 1: $\quad$ as specified in Table 4.2-2 in TS 36.211 [4]. <br> Note 2: as specified in Table 4.2-1 in TS 36.211 [4]. |  |  |

8.15.1.2.1 Transmit diversity performance with 2Tx Antenna Ports (Cell-Specific Reference Symbols)

The requirements are specified in Table 8.15.1.2.1-2, with the addition of the parameters in Table 8.15.1.2.1-1 and the downlink physical channel setup according to Annex C.3.2. The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmitter antennas.

Table 8.15.1.2.1-1: Test Parameters for Transmit diversity Performance (FRC) with 8Rx Antenna Ports

| Parameter |  | Unit | Test 1 |
| :--- | :--- | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | $-3($ Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| PDSCH transmission mode |  | 2 |  |
| Note 1: $\quad P_{B}=1$ |  |  |  |

### 8.15.2.2.1 Eight Layer Spatial Multiplexing (User-Specific Reference Symbols)

### 8.15.2.2.1.1 Minimum Requirement Eight-Layer Spatial Multiplexing 8 Tx Antenna Port

The purpose of these tests is to verify the closed loop rank-eight performance with frequency selective precoding with 8 Tx and 8 Rx under CA.

For CA with 2 DL CCs, the requirements are specified in Table 8.15.2.2.1.1-3, based on single carrier requirement specified in Table 8.15.2.2.1.1-2, with the addition of the parameters in Table 8.15.2.2.1.1-1 and the downlink physical channel setup according to Annex C.3.2.

## 9 Reporting of Channel State Information

### 9.1 General

This section includes requirements for the reporting of channel state information (CSI). For all test cases in this section, the definition of SNR and SINR are in accordance with the one given in clause 8.1.1.

For the performance requirements specified in this clause, it is assumed that $N_{R X}=2$ unless otherwise stated.
Unless otherwise stated, 4-bit CQI Table in Table 7.2.3-1 in TS 36.213 [6], and Modulation and TBS index table in Table 7.1.7.1-1 for PDSCH in TS 36.213 [6] are applied in all the CSI requirements.

### 9.1.1 Applicability of requirements

### 9.1.1.1 Applicability of requirements for different channel bandwidths

In Clause 9 the test cases may be defined with different channel bandwidth to verify the same CSI requirement.
Test cases defined for 5 MHz channel bandwidth that reference this clause are applicable to UEs that support only Band 31, 72, 73, 87 and/or 88.

### 9.1.1.2 Applicability and test rules for different CA configurations and bandwidth combination sets

The performance requirement for CA CQI tests in Clause 9 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.6A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL CCs in Table 9.1.1.2-1 and 3 or more DL CCs in Table 9.1.1.2-2. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

Table 9.1.1.2-1: Applicability and test rules for CA UE CQI tests with 2 DL CCs

| Tests | CA capability where the tests apply | CA configuration from the selected CA capbility where the tests apply | CA Bandwidth combination to be tested in priority order |

### 9.1.1.2A Applicability and test rules for different TDD-FDD CA configurations and bandwidth combination sets

The performance requirement for TDD-FDD CA CQI tests in Clause 9 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.6A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL TDD-FDD CA in Table 9.1.1.2A-1 and for 3 or more DL TDD-FDD CA in Table 9.1.1.2A-2. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

Table 9.1.1.2A-1: Applicability and test rules for CA UE CQI tests for TDD-FDD CA with 2 DL CCs

| Tests | CA capability <br> where the tests <br> apply | CA configuration from the <br> selected CA capbility where the <br> tests apply | CA Bandwidth <br> combination to be <br> tested in priority order |

| Note 2: | Number of the supported bandwidth combinations to be tested from each selected CA |
|  | configuration is 1. |
| Note 3: | A single Uplink CC is configured for all tests |

### 9.1.1.3 Test coverage for different number of componenet carriers

For FDD CA tests specified in 9.6.1.1, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD CA tests specified in 9.6.1.2, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD FDD CA tests specified in 9.6.1.3 and 9.6.1.4, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the TDD FDD CA tests with less than the largest number of CCs supported by the UE.

### 9.1.1.4 Applicability of performance requirements for 4Rx capable UEs

### 9.1.1.4.1 Applicability rule and antenna connection for single carrier tests with $2 R x$

For 4 Rx capable UEs all single carrier tests specified in 9.2 to 9.5 with 2 Rx are tested on any of the 2 Rx supported RF bands by connecting 2 out of the 4 Rx with data source from system simulator, and the other 2 Rx are connected with zero input, depending on UE's declaration and AP configuration. Same requirements specified with $2 R x$ should be applied.

For 4Rx capable UEs without any 2 Rx supported RF bands, all single carrier tests specified in 9.2 to 9.5 with 2 Rx are tested on any of the 4 Rx supported RF bands by duplicating the fading channel from each Tx antenna and add independent noise for each Rx antenna where applicable. Figure 9.1.1.4.1-1 shows an example of antenna connection for 4 Rx UE in any one 4 Rx supported RF band to perform a 2 Rx performance test with antenna configuration as 2 x 2 without interference for information. The SNR requirements should be applied with 3 dB less than the number specified with $2 R x$, unless there is no $S N R$ requirements specified.

For 4Rx capable UEs without any 2Rx supported RF bands, all single carrier tests specified in 9.3 .3 with $2 R x$ are tested on any of the $4 R x$ supported RF bands by duplicating the fading channel from each Tx antenna and add independent interference for each $R x$ antenna.

Figure 9.1.1.4.1-1 Antenna connection example for 2Rx tests with antenna configuration as $2 \times 2$ without interference (informative)

For 4Rx capable UEs without any 2Rx supported RF bands, for all single carrier tests listed in Table 9.1.1.4.1-1 specified from 9.2 to 9.5 with 2 Rx can be skipped.

Table 9.1.1.4.1-1 Requirement lists for 4Rx capable UEs

| Requirement lists |
| :---: |
| Enhanced performance requirements type B |
| Requirements with demodulation subframe overlaps with aggressor cell ABS |
| Requirements with demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are |
| configured |

For 4Rx capable UEs, if corresponding tests listed from the 4Rx test lists from Table 9.1.1.4.1-2 are tested, the test coverage can be considered fulfilled without executing the corresponding tests listed from the 2Rx test lists from Table 9.1.1.4.1-2.

Table 9.1.1.4.1-2: Applicability rules for single carrier tests with $2 R x$

| 9.9.4.2.2 Test 1 | 9.5 .2 .2 Test 1 |
| 9.9.4.2.2 Test 2 | 9.5 .2 .2 Test 2 |
| 9.9.4.2.2 Test 3 | 9.5 .2 .2 Test 3 |

### 9.1.1.4.2 Applicability rule and antenna connection for CA tests with $2 R x$

All tests specified in 9.6 with 2Rx with CA and TDD-FDD CA are tested with 4 Rx capable UEs by connecting all 4Rx with data source from system simulator with the following change on the power level in the test configurations listed in Table 9.1.1.4.2-1 and by scheduling the PDSCH for user data based on the Reference measurement channel RC. 1 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1 for FDD cells and Reference measurement channel RC. 1 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1 for TDD cells.

Table 9.1.1.4.2-1: Power level for 4Rx capable UE to verify CA tests with 2Rx

| Number of CCs |  | $\hat{I}_{\text {or }}^{(j)} \mathbf{d B}[\mathbf{m W} / \mathbf{1 5 k H z}]$ |
| :---: | :---: | :---: |
| 2 | PCell | -88 |
|  | SCell | -95 |
| 3,4 | PCell | -85 |
|  | SCell1 | -92 |
|  | SCell2, SCell3 | -99 |
| 5 | PCell | -85 |
|  | SCell1 | -92 |
|  | SCell2, SCell3, SCell4 | -99 |

Within the CA configuration if any of the PCell and/or the SCells is a 2Rx supported RF band, keep the same power level listed in Table 9.1.1.4.2-1. Within the CA configuration if any of the PCell and/or the SCells is a 4Rx supported RF band, configure the power level 3 dB smaller than the number listed in Table 9.1.1.4.2-1. Same requirements specified with 2 Rx should be applied.

Same applicability rules defined in 9.1.1.2, 9.1.1.2A for CA and TDD-FDD CA applied for different CA configurations and bandwidth combination sets should be applied for 4 Rx capable UEs.

### 9.1.1.4.3 Applicability rule and antenna connection for single carrier tests with 4Rx

For 4Rx capable UEs all single carrier tests specified in 9.9 with $4 R x$ are tested on any of the 4 Rx supported RF bands by connecting all 4 Rx with data source from system simulator.

### 9.1.1.5 Applicability of requirements for UEs supporting coverage enhancement

For 2Rx capable UEs supporting coverage enhancement mode A (ce-ModeA in UE-EUTRA-Capability [7]), all the tests for CE Mode A specified in 9.8.1 and 9.8.2 are tested on any of the 2 Rx supported RF bands by connecting all 2Rx with data source from system simulator. The SNR requirements should be applied with 3 dB less than the number specified with UE DL Category M1.

For 4Rx capable UEs supporting coverage enhancement mode A (ce-ModeA in UE-EUTRA-Capability [7]), all the tests for CE Mode A specified in 9.8.1 and 9.8.2 are tested on any of the 4Rx supported RF bands by connecting all 4Rx
with data source from system simulator. The SNR requirements should be applied with 6 dB less than the number specified with UE DL Category M1.

### 9.2 CQI reporting definition under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [6]. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.2.1 Minimum requirement PUCCH 1-0 (Cell-Specific Reference Symbols)

### 9.2.1.1 FDD

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.1.1-1 and Table 9.2.1.1-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 1 FDD / RC. 14 FDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

The applicability of the requirement with 5 MHz bandwidth as specificed in Table 9.2.1.1-2 is defined in 9.1.1.1.
Table 9.2.1.1-1: PUCCH 1-0 static test (FDD)

| Parameter |  | Unit |  |  |  |  |

| Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |  |  |  |

### 9.2.1.2 TDD

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.1.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 1 TDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1 , the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1.

Table 9.2.1.2-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 9.2.1.3 FDD (CSI measurements in case two CSI subframe sets are configured)

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-1 for Cell 2 and C.3.2-2, the reported CQI value according to RC. 2 FDD / RC. 6 FDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER in nonABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets C C $\mathrm{CSI}, 1^{1}$ is less than or equal to 0.1 , the BLER in non-ABS subframes using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1 . The value of the median CQI obtained by reports in CSI subframe sets C CSI, 0 minus the median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ shall be larger than or equal to 2 and less than or equal to 5 in Test 1 and shall be larger than or equal to 0 and less than or equal to 1 in Test 2.

### 9.2.1.4 TDD (CSI measurements in case two CSI subframe sets are configured)

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.1.4-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C3.3-1 for Cell 2 and C.3.2-2, the reported CQI value according to RC. 2 TDD / RC. 6 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER in nonABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ is less than or equal to 0.1 , the BLER in non-ABS subframes using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 . The value of the median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 0}$ minus the median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ shall be larger than or equal to 2 and less than or equal to 5 in Test 1 and shall be larger than or equal to 0 and less than or equal to 1 in Test 2.

| ACK/NACK feedback mode |  |  | Multiplexing |  | Multiplexing |  |

Note 1: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2: ABS pattern as defined in [9].
Note 3: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 4: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 5: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 6: Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell 1 and Cell2 is the same.
Note 7: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10, \#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 8: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS
Note 9: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.2.5
Note 11: Reference measurement channel in Cell 1 RC. 2 TDD according to Table A.4-1 for UE Category $\geq 2$ with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1, and RC. 6 TDD according to Table A.4-1 for Category 1 with one/two sided dynami OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1 and Annex A.5.2.2.
Note 12: To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.
Note 13: cqi-pmi-ConfigurationIndex is applied for Ccsı,0.
Note 14: cai-pmi-ConfigurationIndex2 is applied for Ccsl,1.

### 9.2.1.5 FDD (CSI measurements in case two CSI subframe sets are configured and with CRS assistance information)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in Table 9.2.1.5-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC. 2 FDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and nonABS subframes shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time.

For test 1 and test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 0}$ is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ is less than or equal to 0.1 , the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.2.1.5-1: PUCCH 1-0 static test (FDD)

### 9.2.1.6 TDD (CSI measurements in case two CSI subframe sets are configured and with CRS assistance information)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in Table 9.2.1.6-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC. 2 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time.

For test 1 and test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 0}$ is less than or equal to 0.1 , the BLER in ABS subframes using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets C $_{\text {CSI, } 1}$ is less than or equal to 0.1 , the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Note 1: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2: ABS pattern as defined in [9].
Note 3: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 4: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 5: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 6: Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell1, Cell2, and Cell3 is the same.
Note 7: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10,\#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 8: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS
Note 9: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.2.5
Note 11: Reference measurement channel in Cell 1 RC. 2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 12: To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.
Note 13: cqi-pmi-ConfigurationIndex is applied for Ccsi,0.
Note 14: cai-pmi-ConfigurationIndex2 is applied for $\mathrm{C}_{\mathrm{cs}, 1,1}$.

### 9.2.1.7 FDD (Modulation and TBS index Table 2 and 4-bit CQI Table 2 are used)

The following requirements apply to UE Category 11-12 and DL Category $\geq 11$. For the parameters specified in Table 9.2.1.7-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1A FDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 , or the BLER using the transport format indicated by the (median CQI +1 ) shall be less than or equal to 0.1 when the highest MCS value of the test case has reached. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [6], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [6] are applied.

Table 9.2.1.7-1: PUCCH 1-0 static test (FDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |  |  |

Note 1: Reference measurement channel RC.1A FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

### 9.2.1.8 TDD (Modulation and TBS index Table 2 and 4-bit CQI Table 2 are used)

The following requirements apply to UE Category 11-12 and UE DL Category $\geq 11$. For the parameters specified in Table 9.2.1.8-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1A TDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 , or the BLER using the transport format indicated by the (median CQI +1) shall be less than or equal to 0.1 when the highest MCS value of the test case has reached. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [6], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [6] are applied.

Table 9.2.1.8-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 20 |  |  |  |
| PDSCH transmission mode |  |  | 1 |  |  |  |

| Physical channel for CQI reporting |  |  | PUSCH (Note 3) |  |  |  |
| PUCCH Report Type |  |  | 4 |  |  |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=5$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 3 |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: Reference measurement channel RC.1A TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2.

### 9.2.1.9 FDD (Modulation and TBS index Table 3 and 4-bit CQI Table 4 are used)

The following requirements apply to UE DL Category 20 and DL Category $\geq 22$. For the parameters specified in Table 9.2.1.9-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.X FDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

In this test, 4-bit CQI Table 4 in Table 7.2.3-4 in TS 36.213 [6], and Modulation and TBS index table 3 in Table 7.1.7.1-1B for PDSCH in TS 36.213 [6] are applied.

Table 9.2.1.9-1: PUCCH 1-0 static test (FDD)

### 9.2.1.10 TDD (Modulation and TBS index Table 3 and 4-bit CQI Table 4 are used)

The following requirements apply to UE DL Category 20 and DL Category $\geq 22$. For the parameters specified in Table 9.2.1.10-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.X TDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1 .

In this test, 4-bit CQI Table 3 in Table 7.2.3-4 in TS 36.213 [6], and Modulation and TBS index table 3 in Table 7.1.7.1-1B for PDSCH in TS 36.213 [6] are applied.

Table 9.2.1.10-1: PUCCH 1-0 static test (TDD)

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |
| Bandwidth | MHz | 20 |
| PDSCH transmission mode |  | 1 |
| Uplink downlink configuration |  | 2 |
| Special subframe <br> configuration |  | 4 |
|  | $\rho_{A}$ | dB |

Note 1: Reference measurement channel RC. 30 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2.

### 9.2.2 Minimum requirement PUCCH 1-1 (Cell-Specific Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.2.2.1 FDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.2.2.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords $\# 0$ and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1.

Table 9.2.2.1-1: PUCCH 1-1 static test (FDD)

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |
| PDSCH transmission mode |  |  | 4 |  |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 |  |
|  | $\rho_{B}$ | dB | -3 |  |
|  | $\sigma$ | dB | 0 |  |
| Propagation condition and <br> antenna configuration |  |  | Clause B.1 $(2 \times 2)$ |  |

| CodeBookSubsetRestriction bitmap |  | 010000 |  |  |  |

| SNR (Note 2) | dB | 10 | 11 | 16 | 17 |
| $\hat{I}_{o r}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -88 | -87 | -82 | -81 |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Max number of HARQ transmissions |  | 1 |  |  |  |
| Physical channel for CQI/PMI reporting |  | PUCCH Format 2 |  |  |  |
| PUCCH Report Type for CQI/PMI |  | 2 |  |  |  |
| PUCCH Report Type for RI |  | 3 |  |  |  |
| Reporting periodicity | ms | $N_{\text {pd }}=5$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  | 6 |  |  |  |
| ri-Configlndex |  | 1 (Note 3) |  |  |  |

Note 1: Reference measurement channel RC. 2 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: It is intended to have UL collisions between RI reports and HARQ-ACK, since the RI reports shall not be used by the eNB in this test.

### 9.2.2.2 TDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.2.2.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1.

Table 9.2.2.2-1: PUCCH 1-1 static test (TDD)

### 9.2.3 Minimum requirement PUCCH 1-1 (CSI Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.2.3.1 FDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.2.3.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords $\# 0$ and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.2.3.1-1: PUCCH 1-1 static test (FDD)

| Note 1: Reference measurement channel RC. 7 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1. |  |  |  |  |  |
| For each test, the minimum requirements shall be fulfilled for at least one of the two $\operatorname{SNR}$ (s) and the respective wanted signal input level. |  |  |  |  |  |
| To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1 and \#6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#0 and \#5. |  |  |  |  |  |

### 9.2.3.1A FDD (With channelMeasRestriction configured)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table $9.2 .3 .1 \mathrm{~A}-1$, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

### 9.2.3.2 TDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.2.3.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

| For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |  |  |
| To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#7 and \#2. |  |  |  |  |  |
| RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report |  |  |  |  |  |

### 9.2.3.2A TDD (With channelMeasRestriction configured)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table $9.2 .3 .2 \mathrm{~A}-1$, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

### 9.2.4 Minimum requirement PUCCH 1-1 (With Single CSI Process)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

If UE supporting interferenceMeasRestriction, test cases specified in 9.2.4.1A and 9.2.4.2A are applicable for such UE otherwise test cases specified in 9.2.4.1 and 9.2.4.2 are applied.

### 9.2.4.1 FDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.2.4.1-1, and using the downlink physical channels specified in Tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords $\# 0$ and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.2.4.1-1: PUCCH 1-1 static test (FDD)

### 9.2.4.1A FDD (With interferenceMeasRestriction configured)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table $9.2 .4 .1 \mathrm{~A}-1$, and using the downlink physical channels specified in Tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

### 9.2.4.2 TDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table $9.2 \cdot 4.2-1$, and using the downlink physical channels specified in Tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.2.4.2-1: PUCCH 1-1 static test (TDD)

### 9.2.4.2A TDD (With interferenceMeasRestriction configured)

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table $9.2 .4 .2 \mathrm{~A}-1$, and using the downlink physical channels specified in Tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

NOTE 1: Reference measurement channel RC. 10 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
NOTE 2: REs for antenna ports 0 and 1 CRS have zero transmission power.
NOTE 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
NOTE 4: N/A.
NOTE 5: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#7.
NOTE 6: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, $\mathrm{CQI} / \mathrm{PMI}$ and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification.

### 9.2.5 Minimum requirement PUCCH 1-1 (when csi-SubframeSet -r12 and EIMTA-MainConfigServCell-r12 are configured)

The following requirements apply to UE Category $\geq 2$ which supports eIMTA TDD UL-DL reconfiguration for TDD serving cell(s) via monitoring PDCCH with eIMTA-RNTI and Rel-12 CSI subframe sets. For the parameters specified in table 9.2.5-1, and using the downlink physical channels specified in Tables C.3.2-1 and C.3.2-2, for each CSI subframe set, the reported CQI value shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. For each CSI subframe set, if the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 . The difference of the median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CII}, 0}$ and the median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ shall be larger than or equal to 3 .

Table 9.2.5-1: PUCCH 1-1 static test (TDD)

| Parameter | Unit | Test |
| :--- | :---: | :---: |
| Bandwidth | MHz | 10 |
| PDSCH transmission mode |  | 9 |
| Uplink downlink configuration in SIB1 |  | 0 |
| Downlink HARQ reference <br> configuration (eimta- | 2 |  |
| HarqReferenceConfig-r12) (Note 4) <br> configurations (Notes 4,DL | ms | $\{0,2\}$ |
| Periodicity of monitoring the L1 <br> reconfiguration DCI (eimta- <br> CommandPeriodicity-r12) |  | 10 |

Note 1: Reference measurement channel RC. 19 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD and dynamic OCNG Pattern with multiple non-contiguous blocks OP. 7 TDD as described in Annex A.5.2.1/7 for CSI subframe set 0 .
Note 2: Reference measurement channel RC. 20 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1 for CSI subframe set 1.
Note 3: In the test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level for each CSI subframe set separately.
Note 4: As specified in Table 4.2-2 in TS 36.211.
Note 5: UL/DL configuration in PDCCH with eIMTA-RNTI is cyclically selected from the given set on a perDCI basis.
Note 6: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1 and \#6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#7 and \#2. CQI/PMI reports for CSI subframe set 0 is transmitted in SF\#2 and CQI/PMI reports for CSI subframe set 1 is transmitted in SF\#7.
Note 7: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification.

### 9.2.6 Minimum requirement PUSCH 3-0 (Cell-Specific Reference Symbols)

### 9.2.6.1 Frame structure type 3 with FDD Pcell

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.6.1-1, Table 9.2.6.1-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, two sets of CQI reports are obtained for LAA Scell. The first one is obtained by reports whose reference resource is in the downlink subframes with 6 dB transmission power boost, i.e., high power subframes. The second one is obtained by reports whose reference resource is in the downlink subframe with 0 dB transmission power boost, i.e., low power subframe. In the test, PDSCH transport format in high power subframe is determined by first set of CQI reports and PDSCH transport format in low power subframe is determined by second set of CQI reports.

The reported CQI value in the first set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the first set of reports. The reported CQI value in the second set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the second set of reports.

If the PDSCH BLER in the high power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1 , the BLER in high power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the high power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in high power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

If the PDSCH BLER in the low power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1 , the BLER in low power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the low power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in low power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

The value of the wideband CQI median for first set of CQI reports minus the wideband CQI median for second set of CQI reports shall be larger than or equal to 2 in Test 1 and Test 2.

Table 9.2.6.1-1: Parameters for PUSCH 3-0 static test on FDD Pcell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 20 |
| PDSCH transmission mode |  |  | 3 |
| Downlink power <br> allocation | $\rho_{A}$ | dB | -3 |
|  | $\rho_{B}$ | dB | -3 |
|  | dB | 0 |  |

| SNR | dB | 20 |
| :---: | :---: | :---: |
| $\hat{I}_{o r}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -78 |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |
| Max number of HARQ <br> transmissions |  | 1 |
| Reporting mode |  | $\mathrm{PUSCH} 3-0$ |
| CSI request field |  | $10 '$ |
| trigger1 (Note 2) |  | 0100000 |
| trigger2 (Note 2) |  | 00000000 |

Note 1: PCell is used for HARQ ACK/NACK feedback and aperiodic CSI triggering/reporting. One sided dynamic OCNG Pattern OP. 1 FDD as described in A.5.1.1 is transmitted on PCell on all RBs, but PDSCH for user data is not transmitted on PCell.
Note 2: trigger1 and trigger2 are defined as TS 36.331 for aperiodicCSI-Trigger. They Indicate for which serving cell(s) the aperiodic CSI report is triggered when one or more SCells are configured. PDCCH DCI format 0 with a trigger for aperiodic CQI is transmitted periodically in subframe 1 and subframe 6 with 5 ms periodicity.

Table 9.2.6.1-2: PUSCH 3-0 static test on LAA Scell

### 9.2.6.2 Frame structure type 3 with TDD Pcell

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.6.2-1, Table 9.2.6.2-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, two sets of CQI reports are obtained for LAA Scell. The first one is obtained by reports whose reference resource is in the downlink subframes with 6 dB transmission power boost, i.e., high power subframes. The second one is obtained by reports whose reference resource is in the downlink subframe with 0 dB transmission power boost, i.e., low power subframe. In the test, PDSCH transport format in high power subframe is determined by first set of CQI reports and PDSCH transport format in low power subframe is determined by second set of CQI reports.

The reported CQI value in the first set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the first set of reports. The reported CQI value in the second set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the second set of reports.

If the PDSCH BLER in the high power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1, the BLER in high power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the high power subframes using the transport format indicated by the wideband CQI median is greater than 0.1 , the BLER in high power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

If the PDSCH BLER in the low power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1, the BLER in low power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the low power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in low power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

The value of the wideband CQI median for first set of CQI reports minus the wideband CQI median for second set of CQI reports shall be larger than or equal to 2 in Test 1 and Test 2.

Table 9.2.6.2-1: Parameters for PUSCH 3-0 static test on TDD Pcell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 20 |

Note 1: PCell is used for HARQ ACK/NACK feedback and aperiodic CSI triggering/reporting. One sided dynamic OCNG Pattern OP. 1 TDD as described in A.5.2.1 is transmitted on PCell on all RBs, but PDSCH for user data is not transmitted on PCell.
Note 2: trigger1 and trigger2 are defined as TS 36.331 for aperiodicCSI-Trigger. They Indicate for which serving cell(s) the aperiodic CSI report is triggered when one or more SCells are configured. PDCCH DCI format 0 with a trigger for aperiodic CQI is transmitted periodically in subframe 3 and subframe 8 with 5 ms periodicity.

Note 1: Reference measurement channel RC.2A FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FS3 as described in Annex A.5.4.1, except for category 1 UE use RC.4A FDD with two sided dynamic OCNG Pattern OP. 2 FS3 as described in Annex A.5.4.2.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

### 9.2.7 Minimum requirement PUSCH 3-1 (CSI Reference Symbol)

### 9.2.7.1 Frame structure type 3 wth FDD Pcell

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.7.1-1, Table 9.2.7.1-2and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, two sets of CQI reports are obtained for LAA Scell, The first one is obtained by reports whose reference resource is in the downlink subframes with 6 dB transmission power boost, i.e., high power subframes. The second one is obtained by reports whose reference resource is in the downlink subframe with 0 dB transmission power boost, i.e., low power subframe. In the test, PDSCH transport format in high power subframe is determined by first set of CQI reports and PDSCH transport format in low power subframe is determined by second set of CQI reports.

The reported CQI value in the first set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the first set of reports. The reported CQI value in the second set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the second set of reports.

If the PDSCH BLER in the high power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1, the BLER in high power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in high power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in high power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

If the PDSCH BLER in the low power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1 , the BLER in low power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the low power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in low power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

The value of the wideband CQI for the first set of CQI report minus the wideband CQI median for second set of CQI shall be larger than or equal to 2 in Test 1 and Test 2.

Table 9.2.7.1-1: Parameters for PUSCH 3-1 static test on FDD Pcell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |

|  | Power configuration for each burst |  |  | $\hat{I}_{o r}^{(j)}$ is randomly selected from 6 dB power boosting or 0 dB power boosting with equal probability |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\#(n+4)
Note 2: Reference measurement channel RC.9A FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FS3 as described in Annex A.5.4.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two $\mathrm{SNR}(\mathrm{s})$ and the respective wanted signal input level.

### 9.2.7.2 Frame structure type 3 wth TDD Pcell

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.2.7.2-1, Table 9.2.7.2-2and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, two sets of CQI reports are obtained for LAA Scell, The first one is obtained by reports whose reference resource is in the downlink subframes with 6 dB transmission power boost, i.e., high power subframes. The second one is obtained by reports whose reference resource is in the downlink subframe with 0 dB transmission power boost, i.e., low power subframe. In the test, PDSCH transport format in high power subframe is determined by first set of CQI reports and PDSCH transport format in low power subframe is determined by second set of CQI reports.

The reported CQI value in the first set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the first set of reports. The reported CQI value in the second set of reports shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the second set of reports.

If the PDSCH BLER in the high power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1, the BLER in high power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in high power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in high power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

If the PDSCH BLER in the low power subframes using the transport format indicated by wideband CQI median is less than or equal to 0.1 , the BLER in low power subframes using the transport format indicated by the (wideband CQI median +1 ) shall be greater than 0.1. If the PDSCH BLER in the low power subframes using the transport format indicated by the wideband CQI median is greater than 0.1, the BLER in low power subframes using transport format indicated by (wideband CQI median -1 ) shall be less than or equal to 0.1 .

The value of the wideband CQI for the first set of CQI report minus the wideband CQI median for second set of CQI shall be larger than or equal to 2 in Test 1 and Test 2.

Table 9.2.7.2-1: Parameters for PUSCH 3-1 static test on TDD Pcell

| Parameter |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 20 |
| PDSCH transmission mode |  |  | 9 |

| Note 3: | For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |

### 9.3 CQI reporting under fading conditions

### 9.3.1 Frequency-selective scheduling mode

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective fading conditions is determined by a double-sided percentile of the reported differential CQI offset level 0 per sub-band, and the relative increase of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any sub-band in set $S$ of TS 36.213 [6]. The purpose is to verify that preferred sub-bands can be used for frequently-selective scheduling. To account for sensitivity of the input SNR the sub-band CQI reporting under frequency selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.3.1.1 Minimum requirement PUSCH 3-0 (Cell-Specific Reference Symbols)

### 9.3.1.1.1 FDD

For the parameters specified in Table 9.3.1.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.1.1-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each subband;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.

Table 9.3.1.1.1-1 Sub-band test for single antenna transmission (FDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Propagation channel |  | $\begin{gathered} \hline \text { Clause B.2.4 with } \tau_{d}=0.45 \mu \mathrm{~s}, \\ a=1, f_{D}=5 \mathrm{~Hz} \\ \hline \end{gathered}$ |  |  |  |
| Antenna configuration |  | $1 \times 2$ |  |  |  |
| Reporting interval | ms | 5 |  |  |  |
| CQI delay | ms | 8 |  |  |  |
| Reporting mode |  | PUSCH 3-0 |  |  |  |
| Sub-band size | RB | 6 (full size) |  |  |  |
| Max number of HARQ transmissions |  | 1 |  |  |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe
SF\#n based on CQI estimation at a downlink subframe not later than
SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\# $(n+4)$
Note 2: Reference measurement channel RC. 3 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

Table 9.3.1.1.1-2 Minimum requirement (FDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |
| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.1.1.2 <br> TDD

For the parameters specified in Table 9.3.1.1.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.1.2-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each subband;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.

Table 9.3.1.1.2-1 Sub-band test for single antenna transmission (TDD)

| Parameter | Unit | Test 1 | Test 2 |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before $\operatorname{SF} \#(n+4)$
Note 2: Reference measurement channel RC. 3 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two $\operatorname{SNR}(\mathrm{s})$ and the respective wanted signal input level.

Table 9.3.1.1.2-2 Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |
| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.1.1.3 FDD (CSI measurements in case two CSI subframe sets are configured and with CRS assistance information)

For the parameters specified in Table 9.3.1.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.1.3-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput in ABS subframes obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER in ABS subframes for the indicated transport formats shall be greater than or equal to $\varepsilon$.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.

Table 9.3.1.1.3-1 Sub-band test for single antenna transmission (FDD)

| Parameter | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | RB | 6 (full size) |  |  |  |

Note 1: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2: ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 3: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 4: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7]
Note 5: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 6: Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell1, Cell2, and Cell3 are the same.
Note 7: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10, \#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 8: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 9: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.1.5
Note 11: Reference measurement channel in Cell 1 RC. 3 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 12: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$.
Note 13: The CSI reporting is such that reference subframes belong to $\mathrm{C}_{\text {csi }, 0}$.

Table 9.3.1.1.3-2 Minimum requirement (FDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |
| $\varepsilon$ | 0.01 | 0.01 |
| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.1.1.4 TDD (CSI measurements in case two CSI subframe sets are configured and with CRS assistance information)

For the parameters specified in Table 9.3.1.1.4-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.1.4-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput in ABS subframes obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER in ABS subframes for the indicated transport formats shall be greater than or equal to $\varepsilon$.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.

Table 9.3.1.1.4-1: Sub-band test for single antenna transmission (TDD)

| Parameter | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| CQI delay |  | ms | 10 |  |  |  |
| Reporting interval (Note 13) |  | ms | 10 |  |  |  |
| Reporting mode |  |  | PUSCH 3-0 |  |  |  |
| Sub-band size |  | RB | 6 (full size) |  |  |  |

Note 1: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2: ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 3: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 4: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 5: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 6: Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell1, Cell2, and Cell3 is the same.
Note 7: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10,\#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 8: $\quad$ This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS
Note 9: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.2.5
Note 11: Reference measurement channel in Cell 1 RC. 3 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 12: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\#(n+4).
Note 13: The CSI reporting is such that reference subframes belong to $\mathrm{C}_{\text {csi, }}$.

Table 9.3.1.1.4-2 Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |

| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.1.1.5 TDD (when csi-SubframeSet -r12 is configured)

The following requirements apply to UE Category $\geq 1$ which supports Rel- 12 CSI subframe sets. For the parameters specified in Table 9.3.1.1.5-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.1.5-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band for each CSI subframe set;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$ for each CSI subframe set;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 and less than 0.60 for each CSI subframe set.
d) the difference of the wide-band median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 0}$ and the wide-band median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 1}$ shall be larger than or equal to 3 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.1.1.5-1: Sub-band test for TDD

| Parameter |  | Unit | Test |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |

| IcsI-RS / ZeroPowerCSI-RS bitmap |  | 0100000000000000 |
| :---: | :---: | :---: |
| PDSCH scheduled subframes for CSI subframe set 0 |  | 8,9 |
| PDSCH scheduled subframes for CSI subframe set 1 |  | 3,4 |
| Reporting interval (Note 4) | ms | 10 per subframe set |
| CQI delay | ms | 15 for CSI subframe set 0 15 for CSI subframe set 1 |
| Reporting mode |  | PUSCH 3-0 |
| Sub-band size | RB | 6 (full size) |
| Max number of HARQ transmissions |  | 1 |
| ACK/NACK feedback mode |  | Multiplexing |
| Number of EPDCCH Sets Configured |  | 2 (Note 5,6) |
| Number of PRB per EPDCCH Set |  | 4 |
| EPDCCH Subframe Monitoring |  | NA |
| EPDCCH Aggregation level |  | 8ECCE |
| EPDCCH beamforming model |  | Annex B.4.4 |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\#(n+4)
Note 2: Reference measurement channel RC. 17 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 3: In the test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level for each subframe set separately..
Note 4: For CSI subframe set 0, PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#3 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF \#7. For CSI subframe set 1, PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#8 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF\#2.
Note 5: In case UE supports EPDCCH, the PDSCH scheduling grants are transmitted via EPDCCH, otherwise PDCCH is used.
Note 6: $\quad$ The two sets are distributed EPDCCH sets and non-overlapping with $\operatorname{PRB}=\{0,3,6,9\}$ for the first set and $\mathrm{PRB}=\{40,43,46,49\}$ for the second set. EPDCCH set is selected after scheduling decision for PDSCH to avoid collision between PDSCH and EPDCCH PRBs, respectively. EPDCCH is only transmitted from one set. The starting symbol for EPDCCH is derived from the PCFICH. RRC signalling epdcch-StartSymbol-r11is not configured

Table 9.3.1.1.5-2: Minimum requirement (TDD)

|  | Test |
| :---: | :---: |
| $\alpha[\%]$ | 2 |
| $\beta[\%]$ | 55 |
| $\gamma$ | 1.1 |
| UE Category | $\geq 1$ |

### 9.3.1.2 Minimum requirement PUSCH 3-1 (CSI Reference Symbol)

### 9.3.1.2.1 FDD

For the parameters specified in Table 9.3.1.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.1-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

### 9.3.1.2.2 TDD

For the parameters specified in Table 9.3.1.2.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.2-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.1.2.2-1 Sub-band test for TDD

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 9 |  |  |  |

| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\#(n+4)
Note 2: Reference measurement channel RC. 8 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two $\mathrm{SNR}(\mathrm{s})$ and the respective wanted signal input level.
Note 4: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#3 and \#8 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF\#2 and \#7.

Table 9.3.1.2.2-2 Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 40 | 40 |
| $\gamma$ | 1.1 | 1.1 |
| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.1.2.3 FDD (Modulation and TBS index Table 2 and 4-bit CQI Table 2 are used)

For the parameters specified in Table 9.3.1.2.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.3-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [6], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [6] are applied.

Table 9.3.1.2.3-1 Sub-band test for FDD

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |
| Transmission mode |  |  | 9 |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 |
|  | $P_{c}$ | dB | 0 |
|  | $\sigma$ | dB | 0 |
| SNR (Note 3) |  | dB | 16 17 |
| $\hat{I}_{\text {or }}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -82 -81 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 -98 |
| Propagation channel |  |  | Clause B.2.4 with $\tau_{d}=0.45 \mu \mathrm{~s}$, $a=1, f_{D}=5 \mathrm{~Hz}$ |
| Antenna configuration |  |  | 2x2 |
| Beamforming Model |  |  | As specified in Section B.4.3 |
| CRS reference signals |  |  | Antenna ports 0 |
| CSI reference signals |  |  | Antenna ports 15, 16 |
| CSI-RS periodicity and subframe offset TCSI-RS / $\Delta$ CSI-RS |  |  | 5/1 |
| CSI-RS reference signal configuration |  |  | 4 |
| CodeBookSubsetRestriction bitmap |  |  | 000001 |
| Reporting interval (Note 4) |  | ms | 5 |
| CQI delay |  | ms | 8 |
| Reporting mode |  |  | PUSCH 3-1 |
| Sub-band size |  | RB | 6 (full size) |
| Max number of HARQ transmissions |  |  | 1 |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ )
Note 2: Reference measurement channel RC.8A FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 4: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#1 and \#6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF\#0 and \#5.

Table 9.3.1.2.3-2 Minimum requirement (FDD)

|  | Test 1 |
| :---: | :---: |
| $\alpha[\%]$ | 2 |
| $\beta[\%]$ | 40 |
| $\gamma$ | 1.1 |
| UE Category | $11-12$ |
| UE DL Category | $\geq 11$ |

### 9.3.1.2.4 TDD (Modulation and TBS index Table 2 and 4-bit CQI Table 2 are used)

For the parameters specified in Table 9.3.1.2.4-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.4-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [6], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [6] are applied.

Table 9.3.1.2.4-1 Sub-band test for TDD

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 20 MHz |
| Transmission mode |  |  | 9 |
| Uplink downlink configuration |  |  | 2 |

### 9.3.1.2.5 Void

Table 9.3.1.2.5-1: Void

Table 9.3.1.2.5-2: Void

### 9.3.1.2.6 TDD (when csi-SubframeSet -r12 is configured with one CSI process)

The following requirements apply to UE Category $\geq 1$ which supports Rel- 12 CSI subframe sets and TM10. For the parameters specified in Table 9.3.1.2.6-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.6-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band for each CSI subframe set;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$ for each CSI subframe set;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.01 for each CSI subframe set.
d) The difference of the wide-band median CQI obtained by reports in CSI subframe sets $\mathrm{C}_{\mathrm{CSI}, 0}$ and the wide-band median CQI obtained by reports in CSI subframe sets C $_{\text {CSI, } 1}$ shall be larger than or equal to 3 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.1.2.6-1: Sub-band test for TDD

| Parameter | Unit | Test |
| :---: | :---: | :---: |
| Bandwidth | MHz | 10 |
| Transmission mode |  | 10 |
| Uplink downlink configuration |  | 2 |

Table 9.3.1.2.6-2: Minimum requirement (TDD)

|  | Test |
| :---: | :---: |
| $\alpha[\%]$ | 2 |
| $\beta[\%]$ | 55 |
| $\gamma$ | 1.02 |
| UE Category | $\geq 1$ |

### 9.3.2 Frequency non-selective scheduling mode

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective fading conditions is determined by the reporting variance, and the relative increase of the throughput obtained when the transport format transmitted is that indicated by the reported CQI compared to the case for which a fixed transport format configured according to the reported median CQI is transmitted. In addition, the reporting accuracy is determined by a minimum BLER using the transport formats indicated by the reported CQI. The purpose is to verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling. To account for sensitivity of the input SNR the CQI reporting under frequency non-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.3.2.1 Minimum requirement PUCCH 1-0 (Cell-Specific Reference Symbol)

### 9.3.2.1.1 FDD

For the parameters specified in Table 9.3.2.1.1-1 and Table 9.3.2.1.1-3, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.2.1.1-2 and Table 9.3.2.1.1-4 and by the following
a) a CQI index not in the set $\{$ median CQI -1 , median CQI, median CQI +1$\}$ shall be reported at least $\alpha \%$ of the time;
b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be $\geq \gamma$;
c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02

The applicability of the requirement with 5 MHz bandwidth as specificed in Table 9.3.2.1.1-3 and Table 9.3.2.1.1-4 is defined in 9.1.1.1.

Table 9.3.2.1.1-1 Fading test for single antenna (FDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| SNR (Note 3) |  | dB | 6 | 7 | 12 | 13 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -92 | -91 | -86 | -85 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ |  |  |  |  |
| Propagation channel |  |  | EPA5 |  |  |  |
| Correlation and antenna configuration |  |  | High ( $1 \times 2$ ) |  |  |  |
| Reporting mode |  |  | PUCCH 1-0 |  |  |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=2$ |  |  |  |
| CQI delay |  | ms | 8 |  |  |  |

### 9.3.2.1.2 TDD

For the parameters specified in Table 9.3.2.1.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.2.1.2-2 and by the following
a) a CQI index not in the set $\{$ median CQI -1 , median CQI, median $\mathrm{CQI}+1\}$ shall be reported at least $\alpha \%$ of the time;
b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be $\geq \gamma$;
c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02 .

Table 9.3.2.1.2-1 Fading test for single antenna (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |

### 9.3.2.2.1 FDD

For the parameters specified in Table 9.3.2.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.2.2.1-2 and by the following
a) a CQI index not in the set $\{$ median CQI -1 , median CQI, median CQI +1$\}$ shall be reported at least $\alpha \%$ of the time;
b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be $\geq \gamma$;
c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02 .

| $\gamma$ | 1.05 | 1.05 |
| UE Category | $\geq 2$ | $\geq 2$ |

### 9.3.3 Frequency-selective interference

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective interference conditions is determined by a percentile of the reported differential CQI offset level +2 for a preferred sub-band, and the relative increase of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any sub-band in set $S$ of TS 36.213 [6]. The purpose is to verify that preferred sub-bands are used for frequently-selective scheduling under frequency-selective interference conditions.

### 9.3.3.1 Minimum requirement PUSCH 3-0 (Cell-Specific Reference Symbol)

### 9.3.3.1.1 FDD

For the parameters specified in Table 9.3.3.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.3.1.1-2 and by the following
a) a sub-band differential CQI offset level of +2 shall be reported at least $\alpha \%$ for at least one of the sub-bands of full size at the channel edges;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.3.1.1-1 Sub-band test for single antenna transmission (FDD)

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz | 10 MHz |
| Transmission mode |  |  | 1 (port 0) | 1 (port 0) |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 | 0 |
|  | $\rho_{B}$ | dB | 0 | 0 |
|  | $\sigma$ | dB | 0 | 0 |

### 9.3.3.2 Void

### 9.3.3.2.1 Void

### 9.3.3.2.2 Void

### 9.3.4 UE-selected subband CQI

The accuracy of UE-selected subband channel quality indicator (CQI) reporting under frequency-selective fading conditions is determined by the relative increase of the throughput obtained when transmitting on the UE-selected subbands with the corresponding transport format compared to the case for which a fixed format is transmitted on any subband in set $S$ of TS 36.213 [6]. The purpose is to verify that correct subbands are accurately reported for frequencyselective scheduling. To account for sensitivity of the input SNR the subband CQI reporting under frequency-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.3.4.1 Minimum requirement PUSCH 2-0 (Cell-Specific Reference Symbols)

### 9.3.4.1.1 FDD

For the parameters specified in Table 9.3.4.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.4.1.1-2 and by the following
a) the ratio of the throughput obtained when transmitting on a randomly selected subband among the best M subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set $S$ shall be $\geq \gamma$;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each TTI for FDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the $N_{\text {PRB }}$ entry in Table 7.1.7.2.1-1 of TS 36.213 [6] that corresponds to the subband size.

Table 9.3.4.1.1-1 Subband test for single antenna transmission (FDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.4.2 Minimum requirement PUCCH 2-0 (Cell-Specific Reference Symbols)

### 9.3.4.2.1 FDD

For the parameters specified in Table 9.3.4.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.4.2.1-2 and by the following
a) the ratio of the throughput obtained when transmitting on subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set $S$ shall be $\geq \gamma$;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each TTI for FDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the $N_{\text {PRB }}$ entry in Table 7.1.7.2.1-1 of TS 36.213 [6] that corresponds to the subband size.

### 9.3.4.2.2 TDD

For the parameters specified in Table 9.3.4.2.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.4.2.2-2 and by the following
a) the ratio of the throughput obtained when transmitting on subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set $S$ shall be $\geq \gamma$;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each available downlink transmission instance for TDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the $N_{\text {PRB }}$ entry in Table 7.1.7.2.1-1 of TS 36.213 [6] that corresponds to the subband size.

Table 9.3.4.2.2-1 Sub-band test for single antenna transmission (TDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Uplink downlink configuration |  |  | 2 |  |  |  |
| Special subframe configuration |  |  | 4 |  |  |  |
| SNR (Note 3) |  | dB | 8 | 9 | 13 | 14 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -90 | -89 | -85 | -84 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Propagation channel |  |  | $\begin{gathered} \text { Clause B.2.4 with } \tau_{d}=0.45 \mu \mathrm{~s}, \\ \qquad a=1, f_{D}=5 \mathrm{~Hz} \end{gathered}$ |  |  |  |

| Reporting periodicity | ms | $N_{P}=5$ |
| :---: | :---: | :---: |
| CQI delay | ms | 10 or 11 |
| Physical channel for CQI reporting |  | PUSCH (Note 4) |
| PUCCH Report Type for wideband CQI |  | 4 |
| PUCCH Report Type for subband CQI |  | 1 |
| Max number of HARQ transmissions |  | 1 |

| $\gamma$ | 1.15 | 1.15 |
| UE Category | $\geq 1$ | $\geq 1$ |

### 9.3.5 Additional requirements for enhanced receiver Type A

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

### 9.3.5.1 Minimum requirement PUCCH 1-0 (Cell-Specific Reference Symbol)

### 9.3.5.1.1 FDD

For the parameters specified in Table 9.3.5.1.1-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.1.1-2 and by the following
a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be $\geq \gamma$;
b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to $2 \%$.

Table 9.3.5.1.1-1 Fading test for single antenna (FDD)

| Parameter | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: |
| Bandwidth | MHz | 10 MHz |  |
| Transmission mode |  | 1 (port 0) |  |
| Cyclic Prefix |  | Normal | Normal |
| Cell ID |  | 0 | 1 |
| SINR (Note 8) | dB | -2 | N/A |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | N/A |
| Propagation channel |  | EPA5 | Static (Note 7) |
| Correlation and antenna configuration |  | Low (1 x 2) | (1 x 2 ) |
| DIP (Note 4) | dB | N/A | -0.41 |
| Reference measurement channel |  | Note 2 | R. 2 FDD |
| Reporting mode |  | PUCCH 1-0 | N/A |
| Reporting periodicity | ms | $N_{\text {pd }}=2$ | N/A |
| CQI delay | ms | 8 | N/A |
| Physical channel for CQI reporting |  | PUSCH (Note 3) | N/A |
| PUCCH Report Type |  | 4 | N/A |
| cqi-pmi- <br> ConfigurationIndex |  | 1 | N/A |
| Max number of HARQ transmissions |  | 1 | N/A |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ )
Note 2: Reference measurement channel RC. 1 FDD according to Table A.4-1 for Category 2-8 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1 and RC. 4 FDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1, \#3, \#7 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#5, \#7, \#1 and \#3.
Note 4: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1.
Note 5: Two cells are considered in which Cell 1 is the serving cell and Cell 2 is the interfering cell. The number of the CRS ports in both cells is the same. Intefering cell is fully loaded.
Note 6: Both cells are time-synchronous.
Note 7: Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present.
Note 8: SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1.

| ri-ConfigIndex |  | 805 (Note 9) | N/A |
| Max number of HARQ transmissions |  | 1 | N/A |
| ACK/NACK feedback mode |  | Multiplexing | N/A |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ )
Note 2: Reference measurement channel RC. 11 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 3: To avoid collisions between CQI/ PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#2 and \#7.
Note 4: The respective received power spectral density of each interfering cell relative to $N_{o c}$ ' is defined by its associated DIP value as specified in clause B.5.1.

| Note 5: | Two cells are considered in which Cell 1 is the serving cell and Cell 2 is the interfering cell. Intefering cell is fully loaded. |
| :---: | :---: |
| Note 6: | Both cells are time-synchronous. |
| Note 7: | Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present. |
| Not | SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1. |
| Note 9: | RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification and the reported CQI in subframe SF\#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available. |
| Note 10: | N/A. |
| Note 11: | The precoder in clause B.4.3 follows UE recommended PMI. |
| Note 12: | If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |

Table 9.3.5.2.2-2 Minimum requirement (TDD)

| $\gamma$ | 1.8 |
| :---: | :---: |
| UE Category | $\geq 2$ |

### 9.3.6 Minimum requirement (With multiple CSI processes)

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for multiple CSI processes. Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.3.6-1. For UE supports one CSI process, CSI process 2 is configured and the corresponding requirements shall be fulfilled. For UE supports three CSI processes, CSI processes 0,1 and 2 are configured and the corresponding requirements shall be fulfilled. For UE supports four CSI processes, CSI processes $0,1,2$ and 3 are configured and the corresponding requirements shall be fulfilled.

Table 9.3.6-1: Configuration of CSI processes

|  | CSI process 0 | CSI process 1 | CSI process 2 | CSI process 3 |
| :--- | :---: | :---: | :---: | :---: |
| CSI-RS resource | CSI-RS signal 0 | CSI-RS signal 1 | CSI-RS signal 0 | CSI-RS signal 1 |
| CSI-IM resource | CSI-IM resource 0 | CSI-IM resource 0 | CSI-IM resource 1 | CSI-IM resource 2 |

### 9.3.6.1 FDD

For the parameters specified in Table 9.3.6.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.1-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band for CSI process 1,2 , or 3 ;
b) a CQI index not in the set $\{$ median CQI -1 , median CQI, median CQI +1$\}$ shall be reported at least $\delta \%$ of the time for CSI process 0;
c) the difference of the median CQIs of the reported wideband CQI for configurated CSI processes shall be greater or equal to the values as in Table 9.3.6.1-3;
d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.6.1-1: Fading test for FDD

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | TP1 | TP2 | TP1 | TP2 |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ )
Note 2: 3 symbols allocated to PDCCH
Note 3: Reference measurement channel RC. 12 FDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 2, 3, 4, 7, 8 and 9 from TP1.
Note 4: TM10 OCNG OP. 8 FDD as specified in A.5.1.8 is transmitted on subframe 1 and 6 from TP1.
Note 5: TM10 OCNG OP. 8 FDD as specified in A.5.1.8 is transmitted on subframe 1, 2, 3, 4, 6, 7, 8 and 9 from TP2
Note 6: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#2 and \#7.
Note 7: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 8: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#1 and \#6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF\#0 and \#5.
Note 9: For these sub-bands which are not selected for PDSCH transmission, TM10 OCNG should be transmitted.

Note 10: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#2 and \#7 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF\#1 and \#6.

### 9.3.6.2 TDD

For the parameters specified in Table 9.3.6.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.2-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band for CSI process 1,2 , or 3 ;
b) a CQI index not in the set $\{$ median CQI -1 , median CQI, median CQI +1$\}$ shall be reported at least $\delta \%$ of the time for CSI process 0 ;
c) the difference of the median CQIs of the reported wideband CQI for configurated CSI processes shall be greater or equal to the values as in Table 9.3.6.2-3;
d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

| Max number of | Q transmissions |  | 1 | N/A | 1 | N/A |
| ACK/NACK fee | mode |  | Multiplexing | N/A | Multiplexing | N/A |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#( $n-4$ ), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ )
Note 2: 3 symbols allocated to PDCCH
Note 3: Reference measurement channel RC. 12 TDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 4 and 9 from TP1.
Note 4: TM10 OCNG OP. 8 TDD is transmitted as specified in A.5.2.8 on subframe 3 and 8 from TP1.
Note 5: TM10 OCNG OP. 8 TDD is transmitted as specified in A.5.2.8 on subframe 3, 4, 8 and 9 from TP2
Note 6: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/PMI to multiplex with the HARQACK on PUSCH in uplink SF\#7 and \#2.
Note 7: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 8: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#3 and \#8 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF\#7 and \#2.
Note 9: For these sub-bands which are not selected for PDSCH transmission, TM10 OCNG should be transmitted.
Note 10: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification and the reported CQI in subframe SF\#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.

Table 9.3.6.2-2: Minimum requirement (TDD)

### 9.3.7 Minimum requirement PUSCH 3-2

### 9.3.7.1 FDD

For the parameters specified in Table 9.3.7.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.1-2 and by the following.
a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be $\geq \alpha$,
b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be $\geq \beta$;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC. 17 FDD for test 1 and according to RC. 18 FDD for test 2.

### 9.3.7.2 TDD

For the parameters specified in Table 9.3.7.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.2-2 and by the following.
a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be $\geq \alpha$,
b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be $\geq \beta$;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC. 17 TDD for test 1 and RC. 18 TDD for test 2.

### 9.3.8 Additional requirements for enhanced receiver Type B

The purpose of the test is to verify that the reporting of the channel quality based on the receiver of the enhanced Type B meets a minimum performance. Performance requirements are specified in terms of the relative throughput obtained when the transport format is that indicated by the reported CQI with NeighCellsInfo-r 12 configured compared to the case without NeighCellsInfo-r12 configured. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the interference cells.

### 9.3.8.1 Minimum requirement PUCCH 1-1 (Cell-Specific Reference Symbols)

### 9.3.8.1.1 FDD

For the parameters specified in Table 9.3.8.1.1-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.8.1.1-2 and by the following
a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources with NeighCellsInfo-r12 configured and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources without NeighCellsInfo-r12 configured shall be $\geq \gamma$;

| Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$ <br> Note 2: Reference measurement channel RC. 11 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1. |  |  |  |  |  |  |

Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#2 and \#7.
Note 4: All cells are time-synchronous.
Note 5: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification and the reported CQI in subframe SF\#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.
Note 6: $\quad$ NeighCellsInfo-r12 is described in subclause 6.3.2 of [7].

### 9.4 Reporting of Precoding Matrix Indicator (PMI)

The minimum performance requirements of PMI reporting are defined based on the precoding gain, expressed as the relative increase in throughput when the transmitter is configured according to the UE reports compared to the case when the transmitter is using random precoding, respectively. When the transmitter uses random precoding, for each PDSCH allocation a precoder is randomly generated and applied to the PDSCH. A fixed transport format (FRC) is configured for all requirements.

The requirements for transmission mode 6 , transmission mode 9 with 4 TX and transmission mode 9 with 8 TX alternativeCodebookEnabledCLASSB_K1=TRUE configured are specified in terms of the ratio

$$
\gamma=\frac{t_{u e}}{t_{r n d}}
$$

In the definition of $\gamma$, for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements, $t_{r n d}$ is $60 \%$ of the maximum throughput obtained at $S N R_{r n d}$ using random precoding, and $t_{u e}$ the throughput measured at $S N R_{r n d}$ with precoders configured according to the UE reports;

For the PUCCH 2-1 single PMI requirement, $t_{r n d}$ is $60 \%$ of the maximum throughput obtained at $S N R_{r n d}$ using random precoding on a randomly selected full-size subband in set S subbands, and $t_{u e}$ the throughput measured at $S N R_{r n d}$ with both the precoder and the preferred full-size subband applied according to the UE reports;

For PUSCH 2-2 multiple PMI requirements, $t_{r n d}$ is $60 \%$ of the maximum throughput obtained at $S N R_{r n d}$ using random precoding on a randomly selected full-size subband in set S subbands, and $t_{u e}$ the throughput measured at $S N R_{r n d}$ with both the subband precoder and a randomly selected full-size subband (within the preferred subbands) applied according to the UE reports.

For PUCCH 1-1 single PMI requirement under transmission mode 9 with 4Tx and 8 TX when
alternativeCodebookEnabledCLASSB_K1=TRUE configured, $t_{\text {ue }}$ is $70 \%$ of the maximum throughput obtained at SNR follow using the precoders configured according to the UE reports, and $t_{r r d}$ is the throughput measured at

SNR follow with random precoding.

The requirements for transmission mode 9 with 8 TX and transmission mode 9 with 4TX enhanced codebook are specified in terms of the ratio

$$
\gamma=\frac{t_{u e, \text { follow } 1, \text { follow } 2}}{t_{\text {rnd } 1, \text { rnd } 2}}
$$

In the definition of $\gamma$, for PUSCH 3-1 single PMI, PUCCH 1-1 single PMI and PUSCH 1-2 multiple PMI requirements, $t_{\text {follow } 1 \text {,follow } 2}$ is $70 \%$ of the maximum throughput obtained at $S N R$ $\qquad$ using the precoders configured according to the UE reports, and $t_{r n d 1, m d 2}$ is the throughput measured at $S N R_{\text {follow } 1, \text { follow } 2}$ with random precoding.

The requirements for transmission mode 9 with $12 \mathrm{TX}, 16 \mathrm{TX}, 24 \mathrm{TX}$ and 32 TX Class A codebook are specified in terms of the ratio

$$
\gamma=\frac{t_{\text {ue, follow } 1,1, \text { follow } 1,2, \text { follow } 2}}{t_{\text {rnd } 1,1, \text { rnd } 1,2, \text { rnd } 2}}
$$

In the definition of $\gamma$, for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements, $t_{\text {ue, follow, } 1,1 \text {, follow, } 2, \text { follow } 2}$ is $90 \%$ of the maximum throughput obtained at $S N R_{\text {follow } 1,1, \text { follow } 1,2 \text {,follow } 2}$ using the precoders configured according to the UE reports, and $t_{\text {rndl } 1,1, \text { rndl }, 2, \text { rnd } 2}$ is the throughput measured at $S N R_{\text {follow } 1,1, \text { follow } 1,2 \text { follow } 2}$ with random precoding.

The requirements for transmission mode 9 with 16 TX Class A advancedCodebookEnabled $=$ TRUE configured are specified in terms of the ratio

$$
\gamma=\frac{t_{u e, \text { follow } 1,1, \text { follow } 1,2, \text { follow } 1,3, \text { follow } 2, \text { follow_ }} \text { RPI }}{t_{\text {follow } 1,1, \text { follow } 1,2, \text { follow } 1,3, \text { follow } 2, \text { fixed }}^{-} \text {RPI }}
$$

In the definition of $\gamma, t_{\text {ue,follow, }, 1, \text { follow }, 2, \text {,follow }, 3, \text { follow } 2, \text { follow_ }}$ RPI is [70\%] of the maximum throughput obtained at $S N R_{\text {follow1, } 1, \text {,follow }, 2, \text { follow } 1,3, \text { follow, }, \text { follow_ } R P I}$ using the precoders configured according to both the PMI and relative power indicator (RPI) reported by the UE, and $t_{\text {follow, } 1, \text {,follow, }, 2, \text { follow, }, 3, \text { follow } 2, \text { fixed_RPI }}$ is the throughput measured at $S N R_{\text {follow } 1,1, \text { follow }, 2, \text {,follow } 1,3, \text { _follone,_follow_ } R P I}$ using the precoders configured according to the UE reports PMI and fixed RPI equal to 0 .

### 9.4.1 Single PMI

### 9.4.1.1 Minimum requirement PUSCH 3-1 (Cell-Specific Reference Symbols)

### 9.4.1.1.1 FDD

For the parameters specified in Table 9.4.1.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.1.1-2.

Table 9.4.1.1.1-1: PMI test for single-layer (FDD)

| Parameter | Unit | Test 1 |

|  | $\sigma$ | dB | -3 | -3 |  |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 | -98 |
| Reporting mode |  |  | PUSCH 3-1 | PUSCH 3-1 | PUSCH 3-1 |
| Reporting interval |  | ms | 5 | 5 | 5 |
| PMI delay (Note 2) |  | ms | 8 | 8 | 8 |
| Measurement channel |  |  | R. 44 FDD | R. 44 FDD | R. 44 FDD |
| OCNG Pattern |  |  | OP. 1 FDD | OP. 1 FDD | OP. 1 FDD |
| Max number of HARQ transmissions |  |  | 4 | 4 | 4 |
| Redundancy version coding sequence |  |  | \{0,1,2,3\} | \{0,1,2,3\} | \{0,1,2,3\} |

Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity).
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 3: PDSCH _RA $=0 \mathrm{~dB}$, PDSCH_RB= 0 dB in order to have the same PDSCH and OCNG power per subcarrier at the receiver.
Note 4: Only one of these two aperiodic NZP CSI-RS resources will be randomly seleted and activated during test. The selected aperiodic NZP CSI-RS is transmitted in every subframe \#1 and \#6.
Note 5: Through MAC CE, one of these two periodic NZP CSI-RS resources will be activated and the other one will be deactivated in an alternative way. The activation and deactivation command will be transmitted in sub-frame \#0 per [10000] ms.
Note 6: When activation and/or deactivation command through MAC CE is transmitted at subframe n , the scheduled PDSCH transmission will be skiped for the subsequent 25 subframes.

Table 9.4.1.3.1-2: Minimum requirement (FDD)

| Parameter | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: |
| $\gamma$ | 1.2 | 1.2 | 1.2 |
| UE Category | $\geq 1$ | $\geq 2$ | $\geq 2$ |

Note 1: For UE that indicates support of csi-RS-NZP-mode 'aperiodic' and/or 'multiShot', test 2 and/or test 3 will be run and test 1 will be skipped. Otherwise, test 1 will be run and test 2 and test 3 will be skipped.

### 9.4.1.3.2 TDD

For the parameters specified in Table 9.4.1.3.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.3.2-2.

Table 9.4.1.3.2-1: PMI test for single-layer (TDD)

| Parameter |  | Unit | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| OCNG Pattern |  |  | OP. 7 TDD for UE Category 1, and OP. 1 TDD for UE Category $\geq 2$ | OP. 1 TDD | OP. 1 TDD |
| Max number of HARQ transmissions |  |  | 4 | 4 | 4 |

| Redundancy version <br> coding sequence |  | $\{0,1,2,3\}$ | $\{0,1,2,3\}$ | $\{0,1,2,3\}$ |
| :---: | :---: | :---: | :---: | :---: |
| ACK/NACK feedback <br> mode |  | Multiplexing | Multiplexing | Multiplexing |

Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity).
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$.
Note 3: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#4 and \#9 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF\#3 and \#8.
Note 4: Randomization of the principle beam direction shall be used as specified in B.2.3A.4
Note 5: Only one of these two aperiodic NZP CSI-RS resources will be randomly seleted and activated during test. The selected aperiodic NZP CSI-RS is transmitted in every subframe \#4 and \#9.
Note 6: Through MAC CE, one of these two periodic NZP CSI-RS resources will be activated and the other one will be deactivated in an alternative way. The activation and deactivation command will be transmitted in sub-frame \#0 per [10000] ms.
Note 7: When activation and/or deactivation command through MAC CE is transmitted at subframe n , the scheduled PDSCH transmission will be skiped for the subsequent 25 subframes.

Table 9.4.1.3.2-2: Minimum requirement (TDD)

| Parameter | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: |
| $\gamma$ | 3 | 3 | 3 |
| UE Category | $\geq 1$ | $\geq 2$ | $\geq 2$ |

Note 1: For UE that indicates support of csi-RS-NZP-mode 'aperiodic' and/or 'multiShot', test 2 and/or test 3 will be run and test 1 will be skipped. Otherwise, test 1 will be run and test 2 and test 3 will be skipped.

### 9.4.1.3.3 FDD (with Class A 12Tx codebook)

For the parameters specified in Table 9.4.1.3.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.3.3-2.

Table 9.4.1.3.3-1: PMI test for single-layer (FDD)

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |
| Bandwidth | MHz | 10 |
| Transmission mode |  | 9 |
| Propagation channel |  | EPA5 |

| Rank Number of PDSCH |  |  | 2 | 2 |
| OCNG Pattern |  |  | OP. 1 FDD | OP. 1 FDD |
| Max number of HARQ transmissions |  |  | 4 | 4 |
| Redundancy version coding sequence |  |  | \{0,1,2,3\} | \{0,1,2,3\} |
| Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity). <br> Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |  |  |  |  |

## Note 3: PDSCH _RA=0 dB, PDSCH_RB= 0 dB in order to have the same PDSCH and OCNG power per subcarrier at the receiver.

Note 4: Randomization of the principle beam direction shall be used as specified in B.2.3B.4.
Note 5: Value of parameter codebookConfig shall be random selected one value from UE supported codebook configurations.

Table 9.4.1.3.5-2: Minimum requirement (FDD)

| Parameter | Test 1a | Test 1b |
| :---: | :---: | :---: |
| $\gamma$ | 3.5 | 3.5 |
| UE Category | $\geq 2$ | $\geq 2$ |

Note1: For UE that indicates support of density reduction for Class A, test 1 b will be run and test 1 a will be skipped. Otherwise, test 1 a will be run and test 1 b will be skipped.

### 9.4.1.3.6 TDD (with Class A 24Tx codebook)

For the parameters specified in Table 9.4.1.3.6-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.3.6-2.

Table 9.4.1.3.6-1: PMI test for dual-layer (TDD)

| Cell-specific reference signals |  | High 2D XP <br> CsI reference signals |
| An,4,2) x 2 |  |  |

| Rank Number of PDSCH |  | 2 |
| :---: | :---: | :---: |
| OCNG Pattern | OP.1 FDD |  |
| Max number of HARQ <br> transmissions | 4 |  |
| Redundancy version coding <br> sequence | $\{0,1,2,3\}$ |  |

Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity).
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 3: $\operatorname{PDSCH} \_R A=0 \mathrm{~dB}$, PDSCH_RB $=0 \mathrm{~dB}$ in order to have the same PDSCH and OCNG power per subcarrier at the receiver.
Note 4: Randomization of the principle beam direction shall be used as specified in B.2.3B.4.

Note 5: Value of parameter codebookConfig shall be random selected one value from UE supported codebook configurations.

Table 9.4.2.3.5-2: Minimum requirement (FDD)

| Parameter | Test 1 |
| :---: | :---: |
| $\gamma$ | 2.5 |
| UE Category | $\geq 2$ |

### 9.4.2.3.6 TDD (with Class A 16Tx codebook)

For the parameters specified in Table 9.4.2.3.6-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.2.3.6-2.

Table 9.4.2.3.6-1: PMI test for dual-layer (TDD)

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |
| Bandwidth | MHz | 10 |

| Reporting interval |  | ms | 5 |
| PMI delay (Note 2) |  | ms | 8 |
| Measurement channel |  |  | R. 78 FDD |
| Rank Number of PDSCH |  |  | 2 |
| OCNG Pattern |  |  | OP. 1 FDD |
| Max number of HARQ transmissions |  |  | 4 |
| Redundancy version coding sequence |  |  | \{0,1,2,3\} |

Note 1: For random precoder selection, the precoder shall be updated in each TTI ( 1 ms granularity).
Note 2: If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\#(n+4).
Note 3: $\quad$ PDSCH _RA $=0 \mathrm{~dB}$, PDSCH_RB $=0 \mathrm{~dB}$ in order to have the same PDSCH and OCNG power per subcarrier at the receiver.
Note 4: Randomization of the dual-cluster beam directions shall be used as specified in B.2.3B.4A. The value of relative power ratio (p) shall be fixed as 1 during the test.
Note 5: Value of parameter codebookConfig shall be random selected one value from UE supported codebook configurations.

Table 9.4.2.3.9-2: Minimum requirement (FDD)

| Parameter | Test 1 |
| :---: | :---: |
| $\gamma$ | 1.03 |
| UE Category | $\geq 2$ |

### 9.4.2.3.10 TDD (with Class A 16Tx advanced codebook)

For the parameters specified in Table 9.4.2.3.10-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.2.3.10-2.

Table 9.4.2.3.10-1: PMI test for dual-layer (TDD)

| Parameter | Unit | Test 1 |
| :---: | :---: | :---: |

| :---: | :---: |
| $\gamma$ | 1.03 |
| UE Category | $\geq 2$ |

### 9.4.3 Void

### 9.5 Reporting of Rank Indicator (RI)

The purpose of this test is to verify that the reported rank indicator accurately represents the channel rank. The accuracy of RI (CQI) reporting is determined by the relative increase of the throughput obtained when transmitting based on the reported rank compared to the case for which a fixed rank is used for transmission. Transmission mode 4 is used with the specified CodebookSubSetRestriction in section 9.5.1, transmission mode 9 is used with the specified CodebookSubSetRestriction in section 9.5.2 and transmission mode 3 is used with the specified CodebookSubSetRestriction in section 9.5.3, and transmission mode 10 is used with the specified CodebookSubSetRestriction in section 9.5.5.

For fixed rank 1 transmission in sections 9.5.1, 9.5.2 and 9.5.5, the RI and PMI reporting is restricted to two singlelayer precoders, For fixed rank 2 transmission in sections 9.5.1, 9.5.2 and 9.5.5, the RI and PMI reporting is restricted to one two-layer precoder, For follow RI transmission in sections 9.5 .1 and 9.5.2, the RI and PMI reporting is restricted to select the union of these precoders. Channels with low and high correlation are used to ensure that RI reporting reflects the channel condition.

For fixed rank 1 transmission in section 9.5.3, the RI reporting is restricted to single-layer, for fixed rank 2 transmission in section 9.5.3, the RI reporting is restricted to two-layers. For follow RI transmission in section 9.5.3, the RI reporting is either one or two layers.

### 9.5.1 Minimum requirement (Cell-Specific Reference Symbols)

### 9.5.1.1 FDD

The minimum performance requirement in Table 9.5.1.1-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

For the parameters specified in Table 9.5.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.1.1-2.

Table 9.5.1.1-1: RI Test (FDD)

| Parameter |  | Unit | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |  |
| PDSCH transmission mode |  |  | 4 |  |  |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 |  |  |
|  | $\rho_{B}$ | dB | -3 |  |  |
|  | $\sigma$ | dB | 0 |  |  |
| Propagation condition and antenna configuration |  |  | $2 \times 2$ EPA5 |  |  |
| CodeBookSubsetRestriction bitmap |  |  | $\begin{gathered} 000011 \text { for fixed RI }=1 \\ 010000 \text { for fixed } \mathrm{RI}=2 \\ 010011 \text { for UE reported RI } \end{gathered}$ |  |  |
| Antenna corr |  |  | Low | Low | High |

| RI configuration |  | Fixed RI=2 and follow RI | Fixed RI=1 and follow RI | Fixed RI=1 and follow RI |
| :---: | :---: | :---: | :---: | :---: |
| SNR | dB | 0 | 20 | 20 |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 | -98 |
| $\hat{I}_{o r}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -78 | -78 |
| Maximum number of HARQ transmissions |  | 1 |  |  |
| Reporting mode |  | PUCCH 1-1 (Note 4) |  |  |
| Physical channel for CQI/PMI reporting |  | PUCCH Format 2 |  |  |
| PUCCH Report Type for CQI/PMI |  | 2 |  |  |
| Physical channel for RI reporting |  | PUSCH (Note 3) |  |  |
| PUCCH Report Type for RI |  | 3 |  |  |
| Reporting periodicity | ms | $N_{\text {pd }}=5$ |  |  |
| PMI and CQI delay | ms | 8 |  |  |
| cqi-pmi-ConfigurationIndex |  | 6 |  |  |
| ri-ConfigurationInd |  | 1 (Note 5) |  |  |
| Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on PMI and CQI estimation at a downlink subframe not later than SF\#(n-4), this reported PMI and wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ ). |  |  |  |  |
| Note 2: Reference measurement channel RC. 2 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1. |  |  |  |  |
| To avoid collisions between RI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic RI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3. |  |  |  |  |
| The bit field for precoding information in DCI format 2 shall be mapped as: <br> - For reported $\mathrm{RI}=1$ and $\mathrm{PMI}=0 \gg$ precoding information bit field index $=1$ <br> - For reported $\mathrm{RI}=1$ and $\mathrm{PMI}=1 \gg$ precoding information bit field index $=2$ <br> - For reported $\mathrm{RI}=2$ and $\mathrm{PMI}=0 \gg$ precoding information bit field index $=0$ |  |  |  |  |
| To avoid the ambiguity of TE behaviour when applying CQI and PMI during rank switching, RI reports are to be applied at the TE with one subframe delay in addition to Note 1 to align with CQI and PMI reports. |  |  |  |  |

Table 9.5.1.1-2: Minimum requirement (FDD)

|  | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: |

### 9.5.1.2 TDD

The minimum performance requirement in Table 9.5.1.2-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

For the parameters specified in Table 9.5.1.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.1.2-2.

Table 9.5.1.2-1: RI Test (TDD)

### 9.5.2 Minimum requirement (CSI Reference Symbols)

### 9.5.2.1 FDD

The minimum performance requirement in Table 9.5.2.1-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

For the parameters specified in Table 9.5.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.2.1-2.

Table 9.5.2.1-1: RI Test (FDD)

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |

| UE Category | $\geq 2$ | $\geq 2$ | $\geq 2$ |

### 9.5.2.2 TDD

The minimum performance requirement in Table 9.5.2.2-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

For the parameters specified in Table 9.5.2.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.2.2-2.

Table 9.5.2.2-1: RI Test (TDD)

| Parameter |  | Unit | Test 1 | Test 2 | Test 3 |

### 9.5.3.2 TDD

The minimum performance requirement in Table 9.5.3.2-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$.

For the parameters specified in Table 9.5.3.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.3.2-2.

Table 9.5.3.2-1: RI Test (TDD)

| Parameter |  | Unit | Test1 |  | Test2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Cyclic prefix |  | Normal | Normal |
| 1 | Normal | Normal |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 2: Reference measurement channel in Cell 1 RC. 2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 3: To avoid collisions between RI/CQI reports and HARQ-ACK it is necessary to report them on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic RI/CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.
Note 4: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10,\#12, \#13 of a subframe overlapping with the aggressor ABS
Note 5: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 6: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 7: ABS pattern as defined in [9].
Note 8: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7].
Note 9: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 10: Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell 1 and Cell 2 is the same.
Note 11: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.2.5.

Table 9.5.3.2-2: Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| ユ4 | 0.9 | 1.05 |
| UE Category | $\geq 2$ | $\geq 2$ |

### 9.5.4 Minimum requirement (CSI measurements in case two CSI subframe sets are configured and CRS assistance information are configured)

### 9.5.4.1 FDD

For the parameters specified in Table 9.5.4.1-1, the minimum performance requirement in Table 9.5.4.1-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

In Table 9.5.4.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggresso cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 9.5.4.1-1: RI Test (FDD)

| Parameter |  | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| :---: | :---: | :---: | :---: | :---: |
| ri-ConfigurationInd |  | 5 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| cqi-pmi-ConfigurationIndex2 |  | 10 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| ri-ConfigurationInd2 |  | 2 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| Cyclic prefix |  | Normal | Normal | Normal |

Note 1: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern OP. 5 FDD as defined in Annex A.5.1.5.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10,\#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 4: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 5: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 6: ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 7: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 8: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 9: The number of control OFDM symbols is not available for ABS and is 3 for the subframe indicated by "0" of ABS pattern.
Note 10: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $n+4$ ).
Note 11: Reference measurement channel in Cell 1 RC. 2 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1.
Note 12: The number of the CRS ports in Cell1, Cell2 and Cell 3 is the same.
Note 13: SIB-1 will not be transmitted in Cell2 and Cell 3 in this test.

Table 9.5.4.1-2: Minimum requirement (FDD)

|  | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: |
| $\hat{E}_{s} / N_{o c}$ for Cell $1(\mathrm{~dB})$ | 4 | 20 | 20 |
| $\hat{I}_{o r}^{(j)}$ for Cell 1 $(\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}])$ | -94 | -78 | -78 |
| Antenna correlation | High for Cell 1, low for <br> Cell 2 and Cell 3 | Low for Cell 1, Cell 2 <br> and Cell 3 | High for Cell 1, low for <br> Cell 2 and Cell 3 |
| $\eta_{1}$ | $\mathrm{~N} / \mathrm{A}$ | 1.05 | 0.9 |
| $h_{2}$ | 1.05 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| UE Category | $\geq 2$ | $\geq 2$ | $\geq 2$ |

### 9.5.4.2 TDD

For the parameters specified in Table 9.5.4.2-1, the minimum performance requirement in Table 9.5.4.2-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

In Table 9.5.4.2-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggresso cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [7] including Cell 2 and Cell 3 is provided.

Table 9.5.4.2-1: RI Test (TDD)

| Parameter | Unit | Cell 1 | Cell 2 | Cell 3 |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth | MHz | 10 | 10 | 10 |
| PDSCH transmission mode |  | 3 | As defined in <br> Note 1 | As defined in <br> Note 1 |
| Uplink downlink configuration |  | 1 | 1 | 1 |

| ri-ConfigurationInd2 |  |  | 0 | N/A | N/A |
| Cyclic prefix |  |  | Normal | Normal | Normal |

Note 1: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCNG pattern OP. 5 TDD as defined in Annex A.5.2.5.
Note 2: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.
Note 3: This noise is applied in OFDM symbols \#1, \#2, \#3, \#5, \#6, \#8, \#9, \#10,\#12, \#13 of a subframe overlapping with the aggressor ABS.
Note 4: This noise is applied in OFDM symbols \#0, \#4, \#7, \#11 of a subframe overlapping with the aggressor ABS.
Note 5: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 6: ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 7: Time-domain measurement resource restriction pattern for PCell measurements as defined in [7]
Note 8: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].
Note 9: The number of control OFDM symbols is not available for ABS and is 3 for the subframe indicated by " 0 " of ABS pattern.
Note 10: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before $\operatorname{SF} \#(n+4)$.
Note 11: Reference measurement channel in Cell 1 RC. 2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 12: The number of the CRS ports in Cell1, Cell2 and Cell 3 is the same.
Note 13: SIB-1 will not be transmitted in Cell2 and Cell 3 in this test.
Note 14: To avoid collisions between RI/CQI reports and HARQ-ACK it is necessary to report them on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#4 and \#9 to allow periodic RI/CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#8 and \#3.

Table 9.5.4.2-2: Minimum requirement (TDD)

|  | Test 1 | Test 2 | Test 3 |
| :---: | :---: | :---: | :---: |
| $\hat{E}_{s} / N_{o c 2}$ for Cell 1 $(\mathrm{dB})$ | 4 | 20 | 20 |
| $\hat{I}_{o r}^{(j)}$ for Cell 1 $(\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz})$ | -94 | -78 | -78 |
| Antenna correlation | High for Cell 1, low for <br> Cell 2 and Cell 3 | Low for Cell 1, Cell 2 <br> and Cell 3 | High for Cell 1, low for <br> Cell 2 and Cell 3 |
| $n$ | $\mathrm{~N} / \mathrm{A}$ | 1.05 | 0.9 |
|  | 1.05 | $\mathrm{~N} / \mathrm{A}$ | $\mathrm{N} / \mathrm{A}$ |
| UE Category | $\geq 2$ | $\geq 2$ | $\geq 2$ |

### 9.5.5 Minimum requirement (with CSI process)

Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.5.5-1.
For UE supports one CSI process, CSI process 0 is configured for Test 1 and Test 2, but CSI process 1 is not configured for Test 2. The corresponding $\gamma$ requirements for Test 1 and Test 2 shall be fulfilled. The requirement on reported RI for CSI process 1 in Test 2 is not applicable.

For UE supports multiple CSI processes, CSI process 0 is configured for Test 1 and CSI processes 0 and 1 are configured for Test 2 . The corresponding $\gamma$ requirements for Test 1 and Test 2 shall be fulfilled, and also the requirement on reported RI for CSI process 1 in Test 2.

Table 9.5.5-1: Configuration of CSI processes

|  | CSI process 0 | CSI process 1 |
| :---: | :---: | :---: |
| CSI-RS resource | CSI-RS signal 0 | CSI-RS signal 1 |
| CSI-IM resource | CSI-IM resource 0 | CSI-IM resource 1 |

### 9.5.5.1 FDD

The minimum performance requirement in Table 9.5.5.1-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;
c) For Test 2, the RI reported for CSI process 1 shall be the same as the most recent RI reported for CSI process 0 if UE is configured with multiple CSI processes.

For the parameters specified in Table 9.5.5.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.5.1-2.

Table 9.5.5.1-1: RI Test (FDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | TP1 | TP2 | TP1 | TP2 |
| Bandwidth |  |  | MHz | 10 MHz |  | 10 MHz |  |
| Transmission mode |  | 10 |  | 10 | 10 | 10 |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  | 0 |  |
|  | $\rho_{B}$ | dB | 0 |  | 0 |  |

| Quasi-co-located CRS |  |  | Same Cell ID as Cell 1 | Same Cell ID as Cell 2 | Same Cell ID as Cell 1 | Same Cell ID as Cell 2 |
| PMI for subframe 2, 3, 4, 7, 8 and 9 |  |  | 010000 for fixed $\mathrm{RI}=2$ 010011 for UE reported RI | 100000 | $\begin{gathered} 000011 \text { for } \\ \text { fixed } \mathrm{RI}=1 \\ 010011 \text { for UE } \\ \text { reported RI } \end{gathered}$ | N/A |
| PMI for subframe 1 and 6 |  |  | 100000 | 100000 | 10000 | N/A |
| Max number of HARQ transmissions |  |  | 1 | N/A | 1 | N/A |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#(n+4)
Note 2: 3 symbols allocated to PDCCH
Note 3: Reference measurement channel RC. 13 FDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 2, 3, 4, 7, 8 and 9 from TP1.
Note 4: TM10 OCNG as specified in A.5.1.8 is transmitted on subframe 1 and 6 from TP1.
Note 5: TM10 OCNG as specified in A.5.1.8 is transmitted on subframe 1, 2, 3, 4, 6, 7, 8 and 9 from TP2 for Test 1; TP2 is blanked for Test 2.
Note 6: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1 and \#6 to allow periodic CQI/PMI to multiplex with the HARQACK on PUSCH in uplink SF\#0 and \#5.
Note 7: If UE supports multiple CSI processes, CSI process 0 is configured as 'RI-reference CSI process' for CSI process 1.
Note 8: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF\#1 and \#6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF\#0 and \#5.
Note 9: If UE supports one CSI process, CSI process 1 is not configured in Test 2.

Table 9.5.5.1-2: Minimum requirement (FDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $n$ | N/A | 1.0 |
| $\mu$ | 1.0 | N/A |
| UE Category | $\geq 2$ | $\geq 2$ |

### 9.5.5.2 TDD

The minimum performance requirement in Table 9.5.5.2-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;
c) For Test 2, the RI reported for CSI process 1 shall be the same as the most recent RI reported for CSI process 0 if UE is configured with multiple CSI processes.

For the parameters specified in Table 9.5.5.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.5.2-2.

Table 9.5.5.2-1: RI Test (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |

| $n$ | N/A | 1.0 |
| $\mu$ | 1.0 | N/A |
| UE Category | $\geq 2$ | $\geq 2$ |

### 9.6 Additional requirements for carrier aggregation

This clause includes requirements for the reporting of channel state information (CSI) with the UE configured for carrier aggregation. The purpose is to verify that the channel state for each cell is correctly reported with multiple cells configured for periodic reporting.

### 9.6.1 Periodic reporting on multiple cells (Cell-Specific Reference Symbols)

### 9.6.1.1 FDD

The following requirements apply to UE Category $\geq 3$. For CA with 2 DL CC, for the parameters specified in Table 9.6.1.1-1 and Table 9.6.1.1-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell reported shall be such that

$$
\text { wideband }^{\mathrm{CQI}_{\text {Pcell }}} \text { - wideband } \mathrm{CQI}_{\text {scell }} \geq 2
$$

for more than $90 \%$ of the time.
Table 9.6.1.1-1: Parameters for PUCCH 1-0 static test on multiple cells (FDD, 2 DL CA)

| Parameter |  | Unit | Pcell | Scell |
| :---: | :---: | :---: | :---: | :---: |
| PDSCH transmission mode |  |  | 1 |  |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |  |
|  | $\rho_{B}$ | dB | 0 |  |

| Propagation condition and antenna configuration |  | AWGN ( $1 \times 2$ ) |  |
| :---: | :---: | :---: | :---: |
| SNR | dB | 10 | 4 |
| $\hat{I}_{o r}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -88 | -94 |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 |
| Physical channel for CQI reporting |  | PUCCH Format 2 |  |
| PUCCH Report Type |  | 4 |  |
| Reporting periodicity | ms | $N_{\text {pd }}=10$ |  |
| cqi-pmi-ConfigurationIndex |  | 11 | 16 (shift of 5 ms relative to Pcell) |
| 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1. Void |  |  |  |

Table 9.6.1.1-2: PUCCH 1-0 static test (FDD, 2 DL CA)

| Test number | Bandwidth combination |
| :---: | :---: |
| 1 | 10 MHz for both cells |
| 2 | 20 MHz for both cells |
| 3 | 5 MHz for both cells |
| 4 | 5 MHz for PCell and 10MHz for SCell |
| 5 | 5 MHz for PCell and 15MHz for SCell |
| Note 1: | The applicability of requirements for different CA configurations and <br> bandwidth combination sets is defined in 9.1.1.2. The test coverage for <br> different number of component carriers is defined in 9.1.1.3. |
| Note 2:Mapping of PCell and Scell to the CCs shall be constant for all the <br> iterations during the test. Each execution of the test shall use the same <br> mapping. |  |

The following requirements for 3DL CA apply to UE Category $\geq 5$. For CA with 3 DL CC , for the parameters specified in Table 9.6.1.1-3 and Table 9.6.1.1-4, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell 1 and SCell2 reported shall be such that

$$
\begin{gathered}
\text { wideband } \mathrm{CQI}_{\text {PCell }} \text { - wideband } \mathrm{CQI}_{\text {SCell1 }} \geq 2 \\
\text { wideband } C Q I_{\text {SCell1 }} \text { - wideband } \mathrm{CQI}_{\text {SCell2 }} \geq 2
\end{gathered}
$$

for more than $90 \%$ of the time.
The following requirements for 4DL CA apply to UE Category $\geq 8$. For CA with 4 DL CC, for the parameters specified in Table 9.6.1.1-3 and Table 9.6.1.1-5, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell 1 and SCell2, and SCell 1 and SCell 3 reported shall be such that

$$
\begin{aligned}
& \text { wideband } \mathrm{CQI}_{\text {PCell }} \text { - wideband } \mathrm{CQI}_{\text {SCell1 }} \geq 2 \\
& \text { wideband } \mathrm{CQI}_{\text {SCell1 }} \text { - wideband } \mathrm{CQI}_{\text {SCell2 }} \geq 2 \\
& \text { wideband } \mathrm{CQI}_{\text {SCell1 }} \text { - wideband } \mathrm{CQI}_{\text {SCell3 }} \geq 2
\end{aligned}
$$

for more than $90 \%$ of the time.
Table 9.6.1.1-3: Parameters for PUCCH 1-0 static test on multiple cells (FDD, 3 and 4 DL CA)

| Parameter |  | Unit | Pcell | Scell1 | Scell2, 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 9.6.1.3 TDD-FDD CA with FDD PCell

The following requirements apply to UE Category $\geq 5$. For TDD-FDD CA with FDD PCell with 2 DL CC, for the parameters specified in Table 9.6.1.3-1 and Table 9.6.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell reported shall be such that

$$
\text { wideband } \mathrm{CQI}_{\text {PCell }}-\text { wideband } \mathrm{CQI}_{\text {SCell }} \geq 2
$$

for more than $90 \%$ of the time.
Table 9.6.1.3-1: Parameters for PUCCH 1-0 static test on multiple cells (TDD-FDD CA with FDD PCell, 2 DL CA)

| Parameter |  | Unit | PCell | SCell |
| :---: | :---: | :---: | :---: | :---: |
| PDSCH transmission mode |  |  | 1 |  |
| Uplink downlink configuration |  |  | N/A | 2 |
| Special subframe configuration |  |  | N/A | 4 |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |
|  | $\rho_{B}$ | dB | 0 |  |
| Propagation condition and antenna configuration |  |  | AWGN (1 x 2 ) |  |
| SNR |  | dB | 10 | 4 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -88 | -94 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 |
| Physical channel for CQIreporting |  |  | PUCCH Format 2 |  |
| PUCCH Report Type |  |  | 4 |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=10$ |  |
| cqi-pmi-ConfigurationIndex |  |  | 9 | 14 (shift of 5 ms relative to Pcell) |

Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP. 1 FDD and OP. 1 TDD as described in Annex A.5.1.1 and A.5.2.1.

Note 2: Void
Note 3: Void

Table 9.6.1.3-2: PUCCH 1-0 static test (TDD-FDD CA with FDD PCell, 2 DL CA)

| Test number | Bandwidth combination |
| :---: | :---: |
| 1 | 20 MHz for FDD cell and 20MHz for TDD cell |
| 2 | 10 MHz for FDD cell and 20MHz for TDD cell |
| 3 | 15 MHz for FDD cell and 20MHz for TDD cell |
| Note 1: | The applicability of requirements for different CA configurations and <br> bandwidth combination sets is defined in 9.1.1.2A. The test coverage <br> for different number of component carriers is defined in 9.1.1.3. |

The following requirements for 3DL CA apply to UE Category $\geq 5$. For TDD-FDD CA with FDD PCell with 3 DL CC, for the parameters specified in Table 9.6.1.3-3 and Table 9.6.1.3-4, and using the downlink physical channels specified
in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$
\begin{aligned}
& \text { wideband } \mathrm{CQI}_{\text {PCell }} \text { - wideband } \mathrm{CQI}_{\text {SCell1 }} \geq 2 \\

| Note 1: | The applicability of requirements for different CA configurations and bandwidth <br> combination sets is defined in 9.1.1.2A. The test coverage for different number of <br> component carriers is defined in 9.1.1.3. |  |
| Note 2: | If more than one cell can be configured as PCell, choose one of the cells with the <br> smallest bandwidth as PCell. Mapping of PCell and Scells to the CCs shall be <br> constant for all the iterations during the test. Each execution of the test shall use the <br> same mapping. |  |

### 9.6.1.4 TDD-FDD CA with TDD PCell

The following requirements apply to UE Category $\geq 5$. For TDD-FDD CA with TDD PCell with 2 DL CC, for the parameters specified in Table 9.6.1.4-1 and Table 9.6.1.4-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell reported shall be such that

$$
\text { wideband }^{C Q I} I_{\text {PCell }}-\text { wideband } C Q I_{S C e l l} \geq 2
$$

for more than $90 \%$ of the time.
Table 9.6.1.4-1: Parameters for PUCCH 1-0 static test on multiple cells (TDD-FDD CA with TDD PCell, 2 DL CA)

| Parameter | Unit | PCell | SCell |
| :---: | :---: | :---: | :---: |
| PDSCH transmission mode |  | 2 | 1 |
| Uplink downlink configuration |  | 4 | N/A |
| Special subframe <br> configuration |  |  | N/A |
|  | $\rho_{A}$ | dB |  |

| Downlink power allocation | $\rho_{B}$ | dB | 0 |  |
| :---: | :---: | :---: | :---: | :---: |
| Propagation condition and antenna configuration |  |  | AWGN (1 x 2) |  |
| SNR |  | dB | 10 | 4 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -88 | -94 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 |
| Physical channel for CQI reporting |  |  | PUCCH Format 2 |  |
| PUCCH Report Type |  |  | 4 |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=10$ |  |
| cqi-pmi-ConfigurationIndex |  |  | 8 | 13 (shift of 5 ms relative to Pcell) |
| Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP. 1 FDD and OP. 1 TDD as described in Annex A.5.1.1 and A.5.2.1. |  |  |  |  |
| Note 2: Void <br> Note 3: Void |  |  |  |  |

Table 9.6.1.4-2: PUCCH 1-0 static test (TDD-FDD CA with TDD PCell, 2 DL CA)

| Test number | Bandwidth combination |
| :---: | :---: |
| 1 | 20 MHz for TDD cell and 20 MHz for FDD cell |
| 2 | 20 MHz for TDD cell and 10MHz for FDD cell |
| 3 | 20 MHz for TDD cell and 15MHz for FDD cell |
| Note 1: | The applicability of requirements for different CA configurations and <br> bandwidth combination sets is defined in 9.1.1.2A. The test coverage <br> for different number of component carriers is defined in 9.1.1.3. |

The following requirements for 3DL CA apply to UE Category $\geq 5$. For TDD-FDD CA with TDD PCell with 3 DL CC, for the parameters specified in Table 9.6.1.4-3 and Table 9.6.1.4-4, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$
\begin{aligned}
& \text { wideband } \mathrm{CQI}_{\text {PCell }} \text { - wideband } \mathrm{CQI}_{\text {SCell1 }} \geq 2 \\
& \text { wideband } \mathrm{CQI}_{\text {SCell1 }} \text { - wideband } \mathrm{CQI}_{\text {SCell2 }} \geq 2
\end{aligned}
$$

for more than $90 \%$ of the time.
The following requirements for 4DL CA apply to UE Cateogry $\geq 8$. For TDD-FDD CA with TDD PCell with 4 DL CC, for the parameters specified in Table 9.6.1.4-3 and Table 9.6.1.4-5, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2, and SCell1 and SCell3 reported shall be such that

$$
\begin{gathered}
\text { wideband } \mathrm{CQI}_{\text {PCell }}-\text { wideband } \mathrm{CQI}_{\text {SCell1 }} \geq 2 \\
\text { wideband } \mathrm{CQI}_{\text {SCell1 }}-\text { wideband } \mathrm{CQI}_{\text {SCell2 }} \geq 2 \\
\text { wideband } \mathrm{CQI}_{\text {SCell1 }} \text { - wideband } \mathrm{CQI}_{\text {SCell3 }} \geq 2
\end{gathered}
$$

for more than $90 \%$ of the time.

### 9.7 CSI reporting (Single receiver antenna)

The number of receiver antennas $\mathrm{N}_{\mathrm{RX}}$ assumed for the minimum performance requirement in this clause is 1.

### 9.7.1 CQI reporting definition under AWGN conditions

### 9.7.1.1 FDD and half-duplex FDD

The following requirements apply to UE DL Category 0 . For the parameters specified in Table 9.7.1.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 16 FDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1 , the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |  |  |
| PDSCH transmission mode |  |  | 1 |  |  |  |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Propagation condition and antenna configuration |  |  | AWGN (1 x 1) |  |  |  |
| SNR (Note 2) |  | dB | 0 | 1 | 6 | 7 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -97 | -92 | -91 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Physical channel for CQI reporting |  |  | PUCCH Format 2 |  |  |  |
| PUCCH Report Type |  |  | 4 |  |  |  |
| Reporting periodicity |  | ms | $N_{p d}=40$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 41 |  |  |  |
| Note 1: Reference measurement channel RC. 16 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/OP. 2 FDD as described in Annex A.5.1.1/A.5.1.2. <br> Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |  |  |  |

### 9.7.1.2 TDD

The following requirements apply to UE DL Category 0. For the parameters specified in Table 9.7.1.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 16 TDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1 , the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.7.1.2-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  |  |  |  |  |  |

### 9.7.1.3 FDD (Category 1bis UE)

The following requirements apply to UE DL Category 1 bis. For the parameters specified in Table 9.7.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 4 FDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1 , the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.7.1.3-1: PUCCH 1-0 static test (FDD)

| Parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |
| Bandwidth | MHz |  | 10 |
| PDSCH transmission mode |  |  | 1 |

| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Propagation condition and antenna configuration |  |  | AWGN ( $1 \times 1$ ) |  |  |  |
| SNR (Note 2) |  | dB | 0 | 1 | 6 | 7 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -97 | -92 | -91 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Physical channel for CQI reporting |  |  | PUCCH Format 2 |  |  |  |
| PUCCH Report Type |  |  | 4 |  |  |  |
| Reporting periodicity |  | ms | $N_{p d}=5$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 6 |  |  |  |
| Note 1: Reference measurement channel RC. 4 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP. 2 FDD as described in Annex A.5.1.2. <br> Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |  |  |  |

### 9.7.1.4 TDD (Category 1bis UE)

The following requirements apply to UE DL Category 1 bis. For the parameters specified in Table 9.7.1.4-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 4 TDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1 , the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.7.1.4-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |  |  |
| PDSCH transmission mode |  |  | 1 |  |  |  |
| Uplink downlink configuration |  |  |  |  |  |  |
| Special subframe configuration |  |  | 4 |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Propagation condition and antenna configuration |  |  | AWGN (1 x 1 ) |  |  |  |
| SNR (Note 2) |  | dB | 0 | 1 | 6 | 7 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -97 | -92 | -91 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Physical channel for CQI reporting |  |  | PUSCH (Note 3) |  |  |  |
| PUCCH Report Type |  |  | 4 |  |  |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=5$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 3 |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: Reference measurement channel RC. 4 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/OP. 2 TDD as described in Annex A.5.2.1/A.5.2.2.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2.

### 9.7.2 CQI reporting under fading conditions

### 9.7.2.1 FDD and half-duplex FDD

For the parameters specified in Table 9.7.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.1-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD and in each available downlink transmission instance for half-duplex FDD.

Table 9.7.2.1-1 Sub-band test for single antenna transmission (FDD and half-duplex FDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| SNR (Note 3) |  | dB | 8 | 9 | 13 | 14 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -90 | -89 | -85 | -84 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Propagation channel |  |  | $\begin{gathered} \text { Clause B.2.4 with } \tau_{d}=0.45 \mu \mathrm{~s}, \\ a=1, f_{D}=5 \mathrm{~Hz} \end{gathered}$ |  |  |  |
| Antenna configuration |  |  | $1 \times 1$ |  |  |  |
| Reporting interval |  | ms | 8 |  |  |  |
| CQI delay |  | ms | 8 |  |  |  |
| Reporting mode |  |  | PUSCH 3-0 |  |  |  |
| Sub-band size |  | RB | 6 (full size) |  |  |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\# $(n+4)$ |  |  |  |  |  |  |
| Note 2: | Reference measurement channel RC. 16 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2. |  |  |  |  |  |
| Note 3: | For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |  |  |

Table 9.7.2.1-2 Minimum requirement (FDD and half-duplex FDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |
| UE DL Category | 0 | 0 |

### 9.7.2.2 TDD

For the parameters specified in Table 9.7.2.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.2-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance for TDD.

Table 9.7.2.2-1 Sub-band test for single antenna transmission (TDD)

| Parameter |  | Unit |  | t 1 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink <br> power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Uplink downlink configuration |  |  | 2 |  |  |  |
| Special subframe configuration |  |  | 4 |  |  |  |
| SNR (Note 3) |  | dB | 8 | 9 | 13 | 14 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -90 | -89 | -85 | -84 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Propagation channel |  |  | $\begin{gathered} \text { Clause B.2.4 with } \tau_{d}=0.45 \\ \mu \mathrm{~s}, a=1, f_{D}=5 \mathrm{~Hz} \end{gathered}$ |  |  |  |
| Antenna configuration |  |  | $1 \times 1$ |  |  |  |
| Reporting interval |  | ms | 5 |  |  |  |
| CQI delay |  | ms | 10 or 11 |  |  |  |
| Reporting mode |  |  | PUSCH 3-0 |  |  |  |
| Sub-band size |  | RB | 6 (full size) |  |  |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$

Note 2: Reference measurement channel RC. 16 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

Table 9.7.2.2-2 Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.1 | 1.1 |
| UE DL Category | 0 | 0 |

### 9.7.2.3 FDD (Category 1bis UE)

The following requirements apply to UE DL Category 1 bis. For the parameters specified in Table 9.7.2.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.3-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI.

Table 9.7.2.3-1 Sub-band test for single antenna transmission (FDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| SNR (Note 3) |  | dB | 8 | 9 | 13 | 14 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -90 | -89 | -85 | -84 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Propagation channel |  |  | $\begin{gathered} \text { Clause B.2.4 with } \tau_{d}=0.45 \mu \mathrm{~s}, \\ a=1, f_{D}=5 \mathrm{~Hz} \end{gathered}$ |  |  |  |
| Antenna configuration |  |  | $1 \times 1$ |  |  |  |
| Reporting interval |  | ms | 5 |  |  |  |
| CQI delay |  | ms | 8 |  |  |  |
| Reporting mode |  |  | PUSCH 3-0 |  |  |  |
| Sub-band size |  | RB | 6 (full size) |  |  |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before $\operatorname{SF} \#(n+4)$ |  |  |  |  |  |  |

Note 2: Reference measurement channel RC. 3 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP. 2 FDD as described in Annex A.5.1.2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

Table 9.7.2.3-2 Minimum requirement (FDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.15 | 1.15 |
| UE DL Category | 1bis | 1 bis |

### 9.7.2.4 TDD (Category 1 bis UE)

The following requirements apply to UE DL Category 1 bis. For the parameters specified in Table 9.7.2.4-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.4-2 and by the following
a) a sub-band differential CQI offset level of 0 shall be reported at least $\alpha \%$ of the time but less than $\beta \%$ for each sub-band;
b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set $S$ shall be $\geq \gamma$;
c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05 .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance for TDD.

Table 9.7.2.4-1 Sub-band test for single antenna transmission (TDD)

| Parameter |  | Unit |  | st 1 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 MHz |  |  |  |
| Transmission mode |  |  | 1 (port 0) |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |  |  |  |
|  | $\rho_{B}$ | dB | 0 |  |  |  |
|  | $\sigma$ | dB | 0 |  |  |  |
| Uplink downlink configuration |  |  | 2 |  |  |  |
| Special subframe configuration |  |  | 4 |  |  |  |
| SNR (Note 3) |  | dB | 8 | 9 | 13 | 14 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -90 | -89 | -85 | -84 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Propagation channel |  |  | Clause B.2.4 with $\tau_{d}=0.45$ $\mu \mathrm{s}, a=1, f_{D}=5 \mathrm{~Hz}$ |  |  |  |
| Antenna configuration |  |  | $1 \times 1$ |  |  |  |
| Reporting interval |  | ms | 5 |  |  |  |
| CQI delay |  | ms | 10 or 11 |  |  |  |
| Reporting mode |  |  | PUSCH 3-0 |  |  |  |
| Sub-band size |  | RB | 6 (full size) |  |  |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink subframe not later than SF\#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before $S F \#(n+4)$
Note 2: Reference measurement channel RC. 3 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.

Table 9.7.2.4-2 Minimum requirement (TDD)

|  | Test 1 | Test 2 |
| :---: | :---: | :---: |
| $\alpha[\%]$ | 2 | 2 |
| $\beta[\%]$ | 55 | 55 |
| $\gamma$ | 1.15 | 1.15 |
| UE DL Category | 1bis | 1bis |

### 9.8 CSI reporting (UE supporting coverage enhancement)

The requirements in this sub-clause are defined based on the simulation results with UE DL Category M1 unless otherwise stated.

The requirements of UE DL Category M1 in 9.8.1 and 9.8.2 are applicable for UE DL Category M2 and UE DL Category 0.

The requirements of UE DL Category M1 in 9.8.3 and 9.8.4 are applicable for UE DL Category M2.
The requirements in 9.8 .5 are defined based on the simulation results with Non-BL UEs, and they are applicable for non-BL UEs supporting coverage enhancement.

### 9.8.1 CQI reporting definition under AWGN conditions

### 9.8.1.1 FDD and half-duplex FDD

The following requirements apply to UE supporting coverage enhancement. For the parameters specified in Table 9.8.1.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 23 FDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median $\mathrm{CQI}-1$ ) shall be less than or equal to 0.1 .

Table 9.8.1.1-1: PUCCH 1-0 static test (FDD and half-duplex FDD)

| Parameter |  | Unit |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz |  |  |
| PDSCH transmission mode |  |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB |  |  |
|  | $\rho_{B}$ | dB |  |  |
|  | $\sigma$ | dB |  |  |
|  | $\bar{\delta}$ | dB |  |  |
| Propagation condition and antenna configuration |  |  | AWGN ( $1 \times 1$ ) |  |
| SNR (Note 2) |  | dB | 5 | 6 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -93 | -92 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 |

### 9.8.1.2 TDD

The following requirements apply to UE supporting coverage enhancement. For the parameters specified in Table 9.7.3.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 23 TDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median $\mathrm{CQI}-1$ ) shall be less than or equal to 0.1 .

Table 9.8.1.2-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz |  |  |
| PDSCH transmission mode |  |  |  |  |

Note 1: Reference measurement channel RC. 23 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD and two sided dynamic OCNG pattern OP. 2 TDD as described in Annex A.5.2.1 and A.5.2.2.
Note 2: The minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. MPDCCH DCI format 6-0A shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2.
Note 4: DC subcarrier puncturing shall be considered.

### 9.8.2 UE-selected subband CQI

### 9.8.2.1 FDD and half-duplex FDD

The following requirements apply to UE supporting coverage enhancement. For the parameters specified in Table 9.8.2.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.8.2.1-2 and by the following
a) the ratio of the throughput obtained when transmitting on the best narrowband reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected narrowband within the set of narrowbands in which MPDCCH is monitored shall be $\geq \gamma$;

The requirements only apply for narrowbands of full size and the random scheduling across the narrowbands is done by selecting a new narrowband in each TTI for FDD and half-duplex FDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the $N_{\text {PRB }}$ entry in Table 7.1.7.2.1-1 of TS 36.213 [6] that corresponds to the narrowband size.

Table 9.8.2.1-1 Sub-band test for single antenna transmission (FDD and half-duplex FDD)

| Parameter |  | Unit |  |  |

### 9.8.2.2 TDD

The following requirements apply to UE supporting coverage enhancement. For the parameters specified in Table 9.8.2.2-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.8.2.2-2 and by the following
a) the ratio of the throughput obtained when transmitting on the best narrowband reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected narrowband within the set of narrowbands in which MPDCCH is monitored shall be $\geq \gamma$;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new narrowband in each available downlink transmission instance for TDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the $N_{\text {PRB }}$ entry in Table 7.1.7.2.1-1 of TS 36.213 [6] that corresponds to the narrowband size.

### 9.8.3 CQI reporting definition for UE supporting 64QAM under AWGN

### 9.8.3.1 FDD and half-duplex FDD

The following requirements apply to UE supporting ce-ModeA-r13 and ce-PDSCH-64QAM-r15. For the parameters specified in Table 9.8.3.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 31 FDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.8.3.1-1: PUCCH 1-0 static test (FDD and half-duplex FDD)

| Parameter |  | Unit |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz |  |  |
| PDSCH transmission mode |  |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB |  |  |
|  | $\rho_{B}$ | dB |  |  |

| Reference measurement channel RC. 31 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 FDD and two sided dynamic OCNG pattern OP. 2 FDD as described in Annex A.5.1.1 and A.5.1.2. |  |  |  |
| The minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |  |
| DC subcarrier puncturing shall be considered. |  |  |  |
| To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. MPDCCH DCI format 6-0A shall be transmitted in downlink SF\#1 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#5. |  |  |  |

### 9.8.3.2 TDD

The following requirements apply to UE supporting supporting ce-ModeA-r13 and ce-PDSCH-64QAM-r15. For the parameters specified in Table 9.8.3.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.22 , the reported CQI value according to RC. 31 TDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

### 9.8.4 CQI reporting definition for UE supporting alternative table under AWGN

### 9.8.4.1 FDD and half-duplex FDD

The following requirements apply to UE supporting ce-ModeA-r13 and ce-CQI-AlternativeTable-r15. For the parameters specified in Table 9.8.4.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.22, the reported CQI value according to RC. 32 FDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.8.4.1-1: PUCCH 1-0 static test (FDD and half-duplex FDD)

| Parameter |  | Unit |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz |  |  |
| PDSCH transmission mode |  |  |  |  |
| Downlink power allocation | $\rho_{A}$ | dB |  |  |
|  | $\rho_{B}$ | dB |  |  |
|  | $\sigma$ | dB |  |  |
|  | $\delta$ | dB |  |  |
| Propagation condition and antenna configuration |  |  | AWGN ( $1 \times 1$ ) |  |
| SNR (Note 2) |  | dB | 5 | 6 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -93 | -92 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | -98 |

### 9.8.4.2 TDD

The following requirements apply to UE supporting ce-ModeA-r13 and ce-CQI-AlternativeTable-r15. For the parameters specified in Table 9.8.4.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.22, the reported CQI value according to RC. 32 TDD in Table A.4-1 shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

Table 9.8.4.2-1: PUCCH 1-0 static test (TDD)

| Parameter |  | Unit | Test 1 |  |

| MPDCCH repetition level |  | 1 |
| Beamforming Precoder for MPDCCH |  | No precoding |
| Precoder update granularity for MPDCCH |  | N/A |
| BL/CE DL Subframe comiguration (fdd- DownlinkOrTddSubframeBitm apBR) |  | 1011110111 |
| Reference measurement channel RC. 32 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD and two sided dynamic OCNG pattern OP. 2 TDD as described in Annex A.5.2.1 and A.5.2.2. |  |  |
| The minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. |  |  |
| To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. MPDCCH DCI format 6-0A shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2. |  |  |
| DC subcarrier puncturing shall be considered. |  |  |

### 9.8.5 PMI reporting with PUCCH 1-1 (CSI Reference Symbol)

The minimum performance requirements of PMI reporting are defined based on the precoding gain, expressed as the relative increase in throughput when the transmitter is configured according to the UE reports compared to the case when the transmitter is using random precoding, respectively. When the transmitter uses random precoding, for each PDSCH allocation a precoder is randomly generated and applied to the PDSCH. A fixed transport format (FRC) is configured for all requirements.

The requirements are specified in terms of the ratio

$$
\gamma=\frac{t_{u e}}{t_{r n d}}
$$

In the definition of $\gamma, \mathrm{t}_{\mathrm{ue}}$ is $70 \%$ of the maximum throughput obtained at $\mathrm{SNR}_{\text {follow }}$ using the precoders configured according to the UE reports, and $\mathrm{t}_{\mathrm{rnd}}$ is the throughput measured at $\mathrm{SNR}_{\text {follow }}$ with random precoding.

### 9.8.5.1 FDD

For the parameters specified in Table 9.8.5.1-1 and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.8.5.1-2.

Table 9.8.5.1-1 PMI test for single-layer (FDD)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |

### 9.9 CSI reporting for 4Rx UE

### 9.9.1 CQI reporting definition under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [6]. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.9.1.1 Minimum requirement PUCCH 1-0 with Rank 1 (Cell-Specific Reference Symbols)

### 9.9.1.1.1 FDD

The following requirements apply to UE Category $\geq 1$. For the parameters specified in Table 9.9.1.1.1-1, using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC. 1 FDD / RC. 4 FDD in Table A. $4-1$ shall be in the range of $\pm 1$ of the reported median more than $90 \%$ of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1 , the BLER using the transport format indicated by the (median CQI +1 ) shall be greater than 0.1 . If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1 ) shall be less than or equal to 0.1 .

### 9.9.1.2 Minimum requirement PUCCH 1-1 with Rank 2 (CSI Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.9.1.2.1 FDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.9.1.2.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords $\# 0$ and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.9.1.2.1-1: PUCCH 1-1 static test (FDD)

| Parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |

### 9.9.1.2.2 TDD

The following requirements apply to UE Category $\geq 2$. For the parameters specified in table 9.9.1.2.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

### 9.9.1.3 Minimum requirement PUCCH 1-1 with Rank 4 (Cell-Specific Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.9.1.3.1 FDD

The following requirements apply to UE Category $\geq 5$. For the parameters specified in table 9.9.1.3.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1.

|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

### 9.9.1.3.2 TDD

The following requirements apply to UE Category $\geq 5$. For the parameters specified in table 9.9.1.3.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords $\# 0$ and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.9.1.3.2-1: PUCCH 1-1 static test (TDD)

| Parameter | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: |
| Bandwidth | MHz |  | 10 |
| PDSCH transmission mode |  | 4 |  |
| Uplink downlink configuration |  | 2 |  |

| PUCCH Report Type |  |  | 2 |  |  |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=5$ |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 3 |  |  |  |
| ri-ConfigIndex |  |  | 805 (Note 4) |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

Note 1: Reference measurement channel RC. 21 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#7 and \#2.
Note 4: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification.

### 9.9.1.4 Minimum requirement PUCCH 1-1 with Rank 3 (CSI Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.9.1.4.1 FDD

The following requirements apply to UE Category $\geq 5$. For the parameters specified in table 9.9.1.4.1-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.9.1.4.1-1: PUCCH 1-1 static test (FDD)

### 9.9.1.4.2 TDD

The following requirements apply to UE Category $\geq 5$. For the parameters specified in table 9.9.1.4.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

### 9.9.2 CQI reporting definition under fading conditions

### 9.9.2.1 Minimum requirement PUCCH 1-0 (Cell-Specific Reference Symbol) for enhanced receiver Type A

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

### 9.9.2.1.1 FDD

For the parameters specified in Table 9.9.2.1.1-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.9.2.1.1-2 and by the following
a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be $\geq \gamma$;
b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to $2 \%$.

Table 9.9.2.1.1-1 Fading test for single antenna (FDD)

| Parameter | Unit | Cell 1 | Cell 2 |
| :---: | :---: | :---: | :---: |
| Bandwidth | MHz | 10 MHz |  |
| Transmission mode |  | 1 (port 0) |  |
| Cyclic Prefix |  | Normal | Normal |
| Cell ID |  | 0 | 1 |
| SINR (Note 8) | dB | -4 | N/A |
| $N_{o c}^{(j)}$ | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 | N/A |
| Propagation channel |  | EPA5 | Static (Note 7) |
| Correlation and antenna configuration |  | Low (1 x 4) | $(1 \times 4)$ |
| DIP (Note 4) | dB | N/A | -0.41 |
| Reference measurement channel |  | Note 2 | R. 2 FDD |
| Reporting mode |  | PUCCH 1-0 | N/A |
| Reporting periodicity | ms | $N_{\text {pd }}=2$ | N/A |
| CQI delay | ms | 8 | N/A |
| Physical channel for CQI reporting |  | $\begin{aligned} & \text { PUSCH (Note } \\ & 3 \text { ) } \end{aligned}$ | N/A |
| PUCCH Report Type |  | 4 | N/A |
| cqi-pmi- <br> ConfigurationIndex |  | 1 | N/A |
| Max number of HARQ transmissions |  | 1 | N/A |

Note 1: If the UE reports in an available uplink reporting instance at subframe SF\#n based on CQI estimation at a downlink SF not later than SF\#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF\#( $\mathrm{n}+4$ )
Note 2: Reference measurement channel RC. 1 FDD according to Table A.4-1 for Category 2-8 with one sided dynamic OCNG Pattern OP. 1 FDD as described in Annex A.5.1.1 and RC. 4 FDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#1, \#3, \#7 and \#9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF\#5, \#7, \#1 and \#3.
Note 4: The respective received power spectral density of each interfering cell relative to $N_{o c}{ }^{\prime}$ is defined by its associated DIP value as specified in clause B.5.1.
Note 5: Two cells are considered in which Cell 1 is the serving cell and Cell 2 is the interfering cell. The number of the CRS ports in both cells is the same. Intefering cell is fully loaded.
Note 6: Both cells are time-synchronous.
Note 7: Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present.
Note 8: SINR corresponds to $\widehat{E}_{s} / N_{o c}{ }^{\prime}$ of Cell 1 as defined in clause 8.1.1.

8.1.1.

Table 9.3.5.1.2-2 Minimum requirement (TDD)

| $\gamma$ | 1.8 |
| :---: | :---: |
| UE Category | $\geq 1$ |

### 9.9.2.2 Minimum requirement PUCCH 1-1 (CSI Reference Symbol) for enhanced receiver Type A

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

### 9.9.2.2.1 FDD

For the parameters specified in Table 9.9.2.2.1-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.9.2.2.1-2 and by the following
a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be $\geq \gamma$;
b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to $2 \%$.

|  | 8.1.1. |
| Note 9: | RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification and the reported CQI in subframe SF\#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available. |
| Note 10: <br> Note 11: | The precoder in clause B.4.3 follows UE recommended PMI. If the UE reports in an available uplink reporting instance at subrame SF\#n based on PMI estimation at a downlink SF not later than SF\#(n-4), this reported PMI cannot be applied at the eNB downlink before SF\# $(\mathrm{n}+4)$. |

Table 9.9.2.2.2-2 Minimum requirement (TDD)

| $\gamma$ | 1.8 |
| :---: | :---: |
| UE Category | $\geq 2$ |

### 9.9.3 Reporting of Precoding Matrix Indicator (PMI) for 4Rx UE

The minimum performance requirements of PMI reporting are defined based on the precoding gain, expressed as the relative increase in throughput when the transmitter is configured according to the UE reports compared to the case when the transmitter is using random precoding, respectively. When the transmitter uses random precoding, for each PDSCH allocation a precoder is randomly generated and applied to the PDSCH. A fixed transport format (FRC) is configured for all requirements.

The requirements for transmission mode 9 with 8 TX are specified in terms of the ratio

$$
\gamma=\frac{t_{u e, \text { follow } 1, \text { follow } 2}}{t_{\text {rnd } 1, \text { rnd } 2}}
$$

In the definition of $\gamma$, for PUSCH 3-1 single PMI $t_{\text {follow } 1 \text {, follow } 2}$ is $70 \%$ of the maximum throughput obtained at $S N R_{\text {follow } 1, \text { follow } 2}$ using the precoders configured according to the UE reports, and $t_{m d 1, m d 2}$ is the throughput measured at $S N R_{\text {follow } 1 \text {, follow } 2}$ with random precoding .

### 9.9.3.1 Minimum requirement PUSCH 3-1 (CSI Reference Symbol)

### 9.9.3.1.1 <br> TDD

For the parameters specified in Table 9.9.3.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.9.3.1.1-2.

Table 9.9.3.1.1-1: PMI test for single-layer (TDD)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |
| Transmission mode |  |  | 9 |
| Uplink downlink configuration |  |  | 1 |
| Special subframe configuration |  |  | 4 |
| Propagation channel |  |  | EVA5 |

Table 9.9.3.1.1-2: Minimum requirement (TDD)

| Parameter | Test 1 |
| :---: | :---: |
| $\gamma$ | 2.5 |
| UE Category | $\geq 2$ |

### 9.9.4 Reporting of Rank Indicator (RI)

The purpose of this test for 4Rx UEs is to verify that the reported rank indicator accurately represents the channel rank. The accuracy of RI (CQI) reporting is determined by the relative increase of the throughput obtained when transmitting based on the reported rank compared to the case for which a fixed rank is used for transmission. Transmission mode 4 is used with the specified CodebookSubSetRestriction in section 9.9.4.1, transmission mode 9 is used with the specified CodebookSubSetRestriction in section 9.9.4.2.

For the fixed rank 1 transmission with 2 Tx ports the RI and PMI reporting is restricted to two single-layer precoders, For fixed rank 2 transmission with 2 Tx ports the RI and PMI reporting is restricted to one two-layer precoder. For the follow RI transmission for rank 1 and 2 and 2 Tx ports the RI and PMI reporting is restricted to select the union of these precoders.

For the fixed rank 2 transmission with 4 Tx ports the RI and PMI reporting is restricted to any 2 Layer precoder, for the follow RI transmission the RI and PMI reporting is not restricted at all.

Channels with low and high correlation are used to ensure that RI reporting reflects the channel condition.

### 9.9.4.1 Minimum requirement (Cell-Specific Reference Symbols)

### 9.9.4.1.1 FDD

The minimum performance requirement in Table 9.9.4.1.1-2 is defined as
a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be $\geq \gamma_{1}$;
b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be $\geq \gamma_{2}$;

For the parameters specified in Table 9.9.4.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.9.4.1.1-2.

Table 9.9.4.1.1-1: RI Test (FDD)

| Parameter |  | Unit | Test 1 | Test 2 | Test 3 | Test 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |  |  |  |
| PDSCH transmission mode |  |  | 4 |  |  |  |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | -3 |  |  | -6 |
|  | $\rho_{B}$ | dB | -3 |  |  | -6 |
|  | $\sigma$ | dB | 0 |  |  | 3 |
| Propagation condition and antenna configuration |  |  | $2 \times 4$ EPA5 |  |  | $4 \times 4$ EPA5 |
| Cell-specific reference signals |  |  | Antenna ports 0, 1 |  |  | Antenna ports 0-3 |
| CodeBookSubsetRestrictionbitmap |  |  | 000011 for fixed $\mathrm{RI}=1$ 010000 for fixed $\mathrm{RI}=2$ 010011 for UE reported RI |  |  | Note 6 |
| Antenna correlation |  |  | Low | Low | High | Low |
| RI configuration |  |  | Fixed RI=2 and follow RI | $\begin{gathered} \text { Fixed RI=1 } \\ \text { and follow } \mathrm{RI} \end{gathered}$ | $\begin{aligned} & \text { Fixed RI=1 } \\ & \text { and follow RI } \end{aligned}$ | Fixed RI=2 and follow RI |
| SNR |  | dB | -4 | 16 | 16 | 25 |

### 9.10 Reporting of CSI-RS Resource Indicator (CRI)

The purpose of this test is to verify that the reported CSI-RS Resource Indicator is accurate. The accuracy of CRI reporting for Tests in Section 9.10.1 is determined by:
a) The ratio of the throughput obtained when transmitting based on the reported CRI and fixed precoder with multiple CSI-RS resources configured compared to that obtained when transmitting based on the fixed precoder

- $t_{u e, \text { follow_CRI,_fixed_PMI }}$ is [70\%] of the maximum throughput obtained at $S N R_{\text {ue,follow_CRI,_fixed_PMI }}$ using fixed precoder and power scaling factor according to UE reported CRI value with multiple CSI-RS resources configured
- $t_{\text {fixed_CRI,fixed_PMI }}$ is throughput obtained at $S N R_{\text {ue,follow_CRI,_fixed_PMI }}$ using fixed precoder and power scaling factor according to the one configured CSI-RS resource
- $S N R_{\text {ue,follow_CRI,_fixed_PMI }}$ is specified based on CRS RE power
b) Each candidate CRI value among $0,1, \ldots, \mathrm{~K}-1$ shall be reported at least $\alpha \%$ of the time at
$S N R_{\text {ue,follow_CRI,_fixed_PMI }}$ with multiple CSI-RS resources configured
- The number of configured CSI-RS resources K is specific to a test.

The accuracy of CRI reporting for Tests in Section 9.10.2 is determined by:
a) The ratio of the throughput obtained when transmitting based on the reported CRI and fixed precoder with multiple CSI-RS resources configured compared to that obtained when transmitting based on the fixed precoder with one CSI-RS resource configured: $\gamma=\frac{t_{\text {uefolow_ } C R I}}{t_{\text {fived_TP1 }}}$

- $t_{\text {ue,follow_CRI }}$ is [70\%] of the maximum throughput obtained at $S N R_{\text {ue,follow_CRI }}$ using the CRI configured according to the CSI UE report
- $t_{\text {fixed_TP1 }}$ is throughput obtained at $S N R_{u e, f o l l o w_{-} C R I}$ under assumption of single TP1 transmission
b) CRI 2 value among 0,1 and 2 shall be reported at least $\alpha \%$ of the time at $S N R_{\text {ue,follow_CRI }}$ with 2 CSI-RS resources configured
c) CRI 0 value among 0,1 and 2 shall be reported at least $\beta \%$ of the time at $S N R_{\text {fixed_TP1 }}$ with 2 CSI-RS resources configured
- $S_{\text {fixed_TP1 }}$ corresponds to [70\%] of the maximum throughput under assumption of single TP1 transmission

### 9.10.1 Minimum requirement (PUSCH 3-1)

### 9.10.1.1 FDD

For the parameters specified in Table 9.10.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.10.1.1-2.

Table 9.10.1.1-1: CRI Test (FDD)

| Parameter |  | Unit | $\begin{gathered} \text { Test 1-1 } \\ (\mathrm{K}, \mathrm{~N})=(2,8) \end{gathered}$ | $\begin{gathered} \text { Test 1-2 } \\ (\mathrm{K}, \mathrm{~N})=(2,16) \end{gathered}$ | $\begin{gathered} \text { Test 1-3 } \\ (K, N)=(4,32) \end{gathered}$ | $\begin{gathered} \text { Test 1-4 } \\ (K, N)=(8,64) \end{gathered}$ |

### 9.10.2 Minimum requirement (PUSCH 3-1, QCL Type C)

### 9.10.2.1 FDD

The requirements are specified in Table 9.10.2.1-4, with the additional parameters in Table 9.10.2.1-1, Table 9.10.2.1-2 and Table 9.10.2.1-3. In Table 9.10.2.1-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and can transmit PDSCH, and transmission point 2 (TP 2) has different Cell ID and can transmit PDSCH. The downlink physical channel setup for TP 1 is according to Table C.3.2 and for TP 2 according to Table C.3.2.

Table 9.10.2.1-1: Test Parameters

| Parameter | Unit | Fixed TP1 case |  | Follow CRI case |  |

### 9.10.2.2 TDD

The requirements are specified in Table 9.10.2.2-4, with the additional parameters in Table 9.10.2.2-1, Table 9.10.2.2-2 and Table 9.10.2.2-3. In Table 9.10.2.2-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals, PBCH and can transmit PDSCH, and transmission point 2 (TP 2) has different Cell ID and can transmit PDSCH. The downlink physical channel setup for TP 1 is according to Table C.3.2 and for TP 2 according to Table C.3.2.

Table 9.10.2.2-1: Test Parameters

| $\beta$ | 60 |
| UE Category | $\geq 2$ |

### 9.11 Reporting of Hybrid Channel state information

### 9.11.1 Minimum requirement (with eMIMO-Type configured as Class B with more than one CSI-RS resource configured and eMIMO-Type2 as Class B with one CSI-RS resource configured)

The purpose of this test is to verify that the reported CRI ${ }^{(1)}$ from eMIMO-Type and PMI $^{(2)}$ from eMIMO-Type 2 are accurate.

The accuracy of CRI and PMI reporting are determined by the ratio of the throughput obtained when transmitting based on UE reported $\mathrm{CRI}^{(1)}$ and $\mathrm{PMI}^{(2)}$ compared to that obtained when transmitting based on the random precoding and fixed CRI:

$$
\gamma=\frac{t_{u e, \text { followCRI }}{ }^{(1)}, \text { followPMI } I^{(2)}}{t_{\text {fixedCRI }} I^{(1)}, \text { rndPMI }^{(2)}}
$$

[^4]- $t_{\text {fixedCRI }^{(1)}, \text { rndPMI }^{(2)}}$ is throughput obtained at $S N R_{\text {ue, followCRI }}{ }^{(1)}$,followPMI ${ }^{(2)}$ using random precoder and power scaling factor according to the one configured CSI-RS resource
- $\quad S N R_{u e, \text { followCRI }{ }^{(1)}, \text { followPMI }{ }^{(2)}}$ is specified based on CRS RE power

### 9.11.1.1 FDD

For the parameters specified in Table 9.11.1.1-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.11.1.1-2.

Table 9.11.1.1-1: CRI/PMI test for single layer (FDD)

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Bandwidth |  | MHz | 10 |
| Transmission mode |  |  | 9 |

Table 9.11.2.2-2: Minimum requirement (TDD)

| Parameter | Test 1 |
| :---: | :---: |
| $\gamma$ | 1.3 |
| UE Category | $\geq 2$ |

### 9.12 CSI reporting (UE supporting Short TTI)

The requirements in this sub-clause are valid for UEs capable of short TTI.

### 9.12.1 CQI reporting under fading conditions (Cell-Specific Reference Symbol)

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective fading conditions is determined by the reporting variance, and the relative increase of the throughput obtained when the transport format transmitted is that indicated by the reported CQI compared to the case for which a fixed transport format configured according to the reported median CQI is transmitted. In addition, the reporting accuracy is determined by a minimum BLER using the transport formats indicated by the reported CQI. The purpose is to verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling. To account for sensitivity of the input SNR the CQI reporting under frequency non-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.12.1.1 FDD

For the parameters specified in Table 9.12.1.1-1, Table 9.12.1.1-2 and Table 9.12.1.1-3 using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.12.1.1-4 by the following
a) a CQI index not in the set $\{$ median CQI -1 , median CQI, median $\mathrm{CQI}+1\}$ shall be reported at least $\alpha \%$ of the time;
b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be $\geq \gamma$;
c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02 .

Table 9.12.1.1-1: Fading test for slot-PDSCH (FDD)

| Parameter |  | Unit | Test 1 |  | Test 2 |  |

### 9.12.2.2 TDD

For the parameters specified in Table 9.12.2.2-1and Table 9.12.2.2-2 using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.12.2.2-3 by the following
a) a CQI index not in the set $\{$ median CQI -1 , median CQI, median CQI +1$\}$ shall be reported at least $\alpha \%$ of the time;
b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be $\geq \gamma$;
c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to [0.02].

### 9.13 CSI reporting for 8Rx UE

### 9.13.1 CQI reporting definition under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [6]. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB .

### 9.13.1.1 Minimum requirement PUCCH 1-1 with Rank 4 (CSI Reference Symbols)

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword \#1, and their BLER performance using the transport format indicated by the reported CQI median of codeword \#0 and codeword \#1. The precoding used at the transmitter is a fixed precoding matrix specified by
the bitmap parameter codebookSubsetRestriction. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

### 9.13.1.2.1 Void

### 9.13.1.2.2 TDD

The following requirements apply to UE Category 8 and DL Category 14, 17~20, $\geq 22$. For the parameters specified in table 9.13.1.2.2-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword \#1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword \#1 as

$$
\text { wideband } \mathrm{CQI}_{1}=\text { wideband } \mathrm{CQI}_{0}-\text { Codeword } 1 \text { offset level }
$$

The wideband $\mathrm{CQI}_{1}$ shall be within the set $\left\{\right.$ median $\mathrm{CQI}_{1}-1$, median $\mathrm{CQI}_{1}$, median $\left.\mathrm{CQI}_{1}+1\right\}$ for more than $90 \%$ of the time, where the resulting wideband values $\mathrm{CQI}_{1}$ shall be used to determine the median CQI values for codeword \#1. For both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}-1$ and median $\mathrm{CQI}_{1}-1$ shall be less than or equal to 0.1 . Furthermore, for both codewords \#0 and \#1, the PDSCH BLER using the transport format indicated by the respective median $\mathrm{CQI}_{0}+1$ and median $\mathrm{CQI}_{1}+1$ shall be greater than or equal to 0.1 .

Table 9.13.1.2.2-1: PUCCH 1-1 static test $4 \times 8$ (TDD)

| Parameter |  | Unit |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| CSI reference signal configuration |  |  | 0 |  |  |  |
| Propagation condition and antenna configuration |  |  | Clause B. 1 (4×8 for Rank4) |  |  |  |
| Beamforming Model |  |  | As specified in Section B.4.3 |  |  |  |
| CodeBookSubsetRestriction bitmap |  |  | 0x0001 000000000000 |  |  |  |
| SNR (Note 2) |  | dB | 4 | 5 | 11 | 12 |
| $\hat{I}_{o r}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -94 | -93 | -87 | -86 |
| $N_{o c}^{(j)}$ |  | $\mathrm{dB}[\mathrm{mW} / 15 \mathrm{kHz}]$ | -98 |  | -98 |  |
| Max number of HARQ transmissions |  |  | 1 |  |  |  |
| Physical channel for CQI/PMI reporting |  |  | PUSCH (Note 3) |  |  |  |
| PUCCH Report Type for CQI/PMI |  |  | 2 |  |  |  |
| Physical channel for RI reporting |  |  | PUSCH |  |  |  |
| PUCCH Report Type for RI |  |  | 3 |  |  |  |
| Reporting periodicity |  | ms | $N_{\text {pd }}=5$ |  |  |  |
| CQI delay |  | ms | 10 or 11 |  |  |  |
| cqi-pmi-ConfigurationIndex |  |  | 3 |  |  |  |
| ri-Configlndex |  |  | 805 (Note 4) |  |  |  |
| ACK/NACK feedback mode |  |  | Multiplexing |  |  |  |

## Note 1: Reference measurement channel RC. 23 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP. 1 TDD as described in Annex A.5.2.1.

Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF\#3 and \#8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF\#7 and \#2.
Note 4: RI reporting interval is set to the maximum allowable length of 160 ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160 ms during performance verification.

## 10 Performance requirement (MBMS)

### 10.1 FDD (Fixed Reference Channel)

The parameters specified in Table 10.1-1 are valid for all FDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

Table 10.1-1: Common Test Parameters (FDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Number of HARQ <br> processes | Processes | None |
| Subcarrier spacing | kHz | 15 kHz |
| Allocated subframes per <br> Radio Frame (Note 1) |  | 6 subframes |
| Number of OFDM <br> symbols for PDCCH | 2 |  |
| Cyclic Prefix |  | Extended |
| Note1:For FDD mode, up to 6 subframes (\#1/2/3/6/7/8) are available for MBMS, <br> in line with TS 36.331. |  |  |

All tests specified in 10.1 and 10.3 the applicability rules are defined as the following. The requirements in clause 10.3 are applicable to UEs that support FeMBMS. The test case applicability is in according to Table 10.1-2 depending on set of supported UE capabilities.

Table 10.1-2: FeMBMS PMCH tests applicability

| Tests / clause | Applicable if UE indicates at least the following capability |
| :---: | :---: |
| 10.3 .1 | FeMBMS support of fembmsMixedCell and unicast-fembmsMixedSCell with <br> corresponding subcarrier spacing |
| 10.3 .2 | FeMBMS support of fembmsMixedCell with corresponding subcarrier spacing |
| 10.3 .3 | FeMBMS support of fembmsDedicatedCell with corresponding subcarrier |
| spacing |  |

For FeMBMS capable UEs, if corresponding tests listed in clause 10.1 or 10.3 .1 or 10.3.2 are tested, the test coverage can be considered fulfilled without executing the corresponding tests listed in clause 10.3.3.

### 10.1.1 Minimum requirement

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.1-1 and Table 10.1.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.1.1-2.

Table 10.1.1-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1-4 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ |
| Note 1: $\quad P_{B}=0$. |  |  |  |

Table 10.1.1-2: Minimum performance

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | $\begin{aligned} & \text { OCNG } \\ & \text { Pattern } \end{aligned}$ | Propagation condition | Correlation Matrix and antenna | Reference value |  | $\begin{gathered} \text { MBMS } \\ \text { UE } \\ \text { Category } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | BLER <br> (\%) | SNR(dB) |  |
| 1 | 10 MHz | R. 37 FDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { FDD } \end{aligned}$ | MBSFN channel model (Table B.2.6-1) | 1x2 low | 1 | 4.1 | $\geq 1$ |
| 2 | 10 MHz | R. 38 FDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { FDD } \end{aligned}$ |  |  |  | 11.0 | $\geq 1$ |
| 3 | 10 MHz | R. 39 FDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { FDD } \\ & \hline \end{aligned}$ |  |  |  | 20.1 | $\geq 2$ |
|  | 5.0 MHz | R.39-1 FDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { FDD } \end{aligned}$ |  |  |  | 20.5 | 1 |
| 4 | 1.4 MHz | R. 40 FDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { FDD } \end{aligned}$ |  |  |  | 6.6 | $\geq 1$ |

### 10.2 TDD (Fixed Reference Channel)

The parameters specified in Table 10.2-1 are valid for all TDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

Table 10.2-1: Common Test Parameters (TDD)

| Parameter | Unit | Value |
| :---: | :---: | :---: |
| Number of HARQ <br> processes | Processes | None |
| Subcarrier spacing | kHz | 15 kHz |
| Allocated subframes per <br> Radio Frame (Note 1) |  | 5 subframes |
| Number of OFDM <br> symbols for PDCCH |  | 2 |
| Cyclic Prefix |  |  |
| Note1:For TDD mode, in line with TS 36.331, Uplink-Downlink Configuration 5 is <br> proposed, up to 5 subframes (\#3/4/7/8/9) are available for MBMS. |  |  |

### 10.2.1 Minimum requirement

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.2-1 and Table 10.2.1-1 and Annex A.3.8.2, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.2.1-2.

Table 10.2.1-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1-4 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  |  |  |
| Note 1: $\quad P_{B}=0$. |  |  |  |

Table 10.2.1-2: Minimum performance

| $\begin{gathered} \text { Test } \\ \text { number } \end{gathered}$ | Bandwidth | Reference Channel | $\begin{aligned} & \hline \text { OCNG } \\ & \text { Pattern } \end{aligned}$ | Propagation condition | Correlation Matrix and antenna | Reference value |  | MBMS UE Category |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | $\begin{gathered} \text { BLER } \\ (\%) \\ \hline \end{gathered}$ | SNR(dB) |  |
| 1 | 10 MHz | R. 37 TDD | $\begin{aligned} & \hline \text { OP. } 4 \\ & \text { TDD } \end{aligned}$ | MBSFN channel model (Table B.2.6-1) | 1x2 low | 1 | 3.4 | $\geq 1$ |
| 2 | 10 MHz | R. 38 TDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { TDD } \end{aligned}$ |  |  |  | 11.1 | $\geq 1$ |
| 3 a | 10 MHz | R. 39 TDD | $\begin{aligned} & \hline \text { OP. } 4 \\ & \text { TDD } \\ & \hline \end{aligned}$ |  |  |  | 20.1 | $\geq 2$ |
| 3b | 5 MHz | R.39-1 TDD | $\begin{aligned} & \text { OP. } 4 \\ & \text { TDD } \end{aligned}$ |  |  |  | 20.5 | 1 |
| 4 | 1.4 MHz | R. 40 TDD | $\begin{aligned} & \hline \text { OP. } 4 \\ & \text { TDD } \end{aligned}$ |  |  |  | 5.8 | $\geq 1$ |

### 10.3 FDD (Fixed Reference Channel) with FeMBMS

For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB for subcarrier spacing as $15 \mathrm{kHz}, 3 \mathrm{~dB}$ for for subcarrier spacing as 7.5 kHz and 10.8 dB for for subcarrier spacing as 1.25 kHz because the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

### 10.3.1 Minimum requirement for FeMBMS Unicast-mixed Cell under CA

### 10.3.1.1 Minimum requirement with 1.25 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell under CA.

For the parameters specified in Table 10.3.1.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.1.1-2.

Table 10.3.1.1-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1-2 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |

|  | SCel I | 10 | $\begin{gathered} \text { R.81-2 } \\ \text { FDD } \end{gathered}$ | $\begin{aligned} & \text { OP.4A } \\ & \text { FDD } \end{aligned}$ | MBSFN channel model (Table B.2.6.2-1) | 1x2 low | 1 | 26.0 | $\geq 2$ |

### 10.3.1.2 Minimum requirement with 7.5 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell under CA.

For the parameters specified in Table 10.3.1.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.1.2-2.

Table 10.3.1.2-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| PDSCH transmission mode in <br> PCell and SCell |  | 1 |  |
| Subcarrier spacing for SCell | kHz | 7.5 kHz |  |
| Allocated subframes per Radio <br> Frame for SCell (Note 2) |  | 8 subframes |  |

### 10.3.2 Minimum requirement for FeMBMS Unicast-mixed Cell as Non-Serving Cell

### 10.3.2.1 Minimum requirement with 1.25 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for FeMBMS Unicast-mixed Cell as non-serving cell.

For the parameters specified in Table 10.3.2.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.2.1-2.

Table 10.3.2.1-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1-4 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Subcarrier spacing |  | kHz | 1.25 kHz |
| Allocated subframes per Radio Frame (Note 2) |  |  | 8 subframes |
| Number of OFDM symbols for PDCCH |  |  | 0 (MBSFN subframes) 2 (non-MBSFN subframes) |
| Cyclic Prefix in non-MBSFN subframes |  |  | Extended |
| Note 1: $\quad P_{B}=0$. <br> Note 2: $\quad$ For FDD mode, up to 8 subframes (\#1/2/3/4/6/7/8/9) are available for MBMS, in line with TS 36.331. |  |  |  |

### 10.3.2.2 Minimum requirement with 7.5 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for enhanced FeMBMS Unicast-mixed Cell as non-serving cell.

For the parameters specified in Table 10.3.2.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.2.2-2.

Table 10.3.2.2-1: Test Parameters for Testing

| Parameter |  | Unit | Test 1-4 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Subcarrier spacing |  | kHz | 7.5 kHz |
| Allocated subframes per Radio Frame (Note 2) |  |  | 8 subframes |
| Number of OFDM symbols for PDCCH |  |  | 0 (MBSFN subframes) 2 (non-MBSFN subframes) |
| Cyclic Prefix in non-MBSFNsubframes |  |  | Extended |
| Note 1: $\quad P_{B}=0$. <br> Note 2: $\quad$ For FDD mode, up to 8 subframes (\#1/2/3/4/6/7/8/9) are available for MBMS, in line with TS 36.331. |  |  |  |

### 10.3.3 Minimum requirement for MBMS Dedicated cell

### 10.3.3.1 Minimum requirement with 1.25 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.1-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.1-2.

Table 10.3.3.1-1: Test Parameters for Testing MBMS Dedicated Cell

| Parameter |  | Unit | Test 1-2 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 1.25 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode inPCell |  |  | 1 |
| Subcarrier spacing for MBMS Dedicated Cell |  | kHz | 1.25 kHz |
| Allocated subframes per Radio Frame for MBMS Dedicated Cell (Note 2) |  |  | 10 subframes |
| Number of OFDM symbols for PDCCH for MBMS Dedicated Cell |  |  | 0 (MBSFN subframes) 2 (non-MBSFN subframes) |
| Cyclic Prefix for CAS in MBMS Dedicated Cell |  |  | Extended |
| Note 1: $\quad P_{B}=0$. <br> Note 2: All subframes are MBSFN subframes except CAS |  |  |  |

Table 10.3.3.1-2: Minimum performance for MBMS dedicated Cell

### 10.3.3.2 Minimum requirement with 7.5 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.2-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.2-2.

Table 10.3.3.2-1: Test Parameters for Testing MBMS Dedicated Cell

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 1.25 \mathrm{kHz}$ | -98 |  |
| PDSCH transmission mode in <br> PCell |  | 0 |  |
| Subcarrier spacing for MBMS <br> Dedicated Cell | kHz | 7.5 kHz |  |
| Allocated subframes per Radio <br> Frame for MBMS Dedicated Cell <br> (Note 2) |  | 10 subframes |  |
| Number of OFDM symbols for <br> PDCCH for MBMS Dedicated <br> Cell | 0 (MBSFN <br> subframes) |  |  |
| Cyclic Prefix for CAS in MBMS <br> Dedicated Cell |  | Extended <br> subframes) |  |
| Note 1: $\quad P_{B}=0$. <br> Note 2: All subframes are MBSFN subframes except CAS |  |  |  |

Table 10.3.3.2-2: Minimum performance for MBMS dedicated Cell

| Test numbe$\qquad$ | Cell | Bandwidt h (MHz) | Referenc e Channel | OCNG Patter n | Propagatio n condition | Correlatio n Matrix and antenna | Reference value |  | MBMSUECategor$y$ |

| 1 | PCell | 10 | NA | $\begin{aligned} & \hline \text { OP. } 1 \\ & \text { FDD } \end{aligned}$ | AWGN | 1x2 low | NA | NA | NA |
|  | MBMS Dedicate d Cell | 10 | $\begin{aligned} & \text { R.84-1 } \\ & \text { FDD } \end{aligned}$ | NA | MBSFN channel model (Table B.2.6.1-1) | 1x2 low | 1 | 13.9 | $\geq 2$ |

### 10.3.3.3 Minimum requirement with 15 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS Dedicated Cell.

For the parameters specified in Table 10.3.3.3-1 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.3.3.3-2.

Table 10.3.3.3-1: Test Parameters for Testing MBMS Dedicated Cell

| Parameter |  | Unit | Test 1-3 |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 1.25 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode in PCell |  |  | 1 |
| Subcarrier spacing for MBMS Dedicated Cell |  | kHz | 15 kHz |
| Allocated subframes per Radio Frame for MBMS Dedicated Cell (Note 2) |  |  | 10 subframes |
| Number of OFDM symbols for PDCCH for MBMS Dedicated Cell |  |  | 0 (MBSFN subframes) <br> 2 (non-MBSFN subframes) |
| Cyclic Prefix for MBMS Dedicated Cell |  |  | Extended |
| Note 1: $\quad P_{B}=0$. <br> Note 2: All subframes are MBSFN subframes |  |  |  |

Table 10.3.3.3-2: Minimum performance for MBMS dedicated Cell

### 10.4 FDD with 5G terrestrial broadcast

For all tests in section 10.4 the applicability rules are defined in Table 10.4-1 depending on the capabilities of the UE. The requirements in clause 10.4 are applicable to UEs that support 5G terrestrial broadcast.

Table 10.4-1: 5G terrestrial broadcast tests applicability

| Tests | Applicable if UE supports at least the following capability |
| :---: | :---: |
| Table 10.4.1.1-2 test 1 | 5G terrestrial broadcast support of mbms-ScalingFactorOdot37-r16 and |
| timeSeparationSlot4-r16 |  |

| Table 10.4.1.1-2 test 2 | 5G terrestrial broadcast support of mbms-ScalingFactorOdot37-r16 and <br> timeSeparationSlot2-r16 |
| :--- | :---: |
| Table 10.4.1.2-2 test 1 | 5G terrestrial broadcast support of $m b m s$-ScalingFactor2dot5-r16 |
| Table 10.4.2.1-1 test 1 | 5G terrestrial broadcast support of $m b m s-S c a l i n g F a c t o r 0 d o t 37-r 16 ~$ <br> and 5G terrestrial broadcast support of PBCH repetition in CAS |
| Table 10.4.2.1-1 test 2 | 5G terrestrial broadcast support of $m b m s-S c a l i n g F a c t o r 2 d o t 5-r 16 ~$ <br> and 5G terrestrial broadcast support of PBCH repetition in CAS |

For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 16 dB for subcarrier spacing as $0.37 \mathrm{kHz}, 7.8 \mathrm{~dB}$ for subcarrier spacing as 2.5 kHz because the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

### 10.4.1 Minimum requirement for PMCH decoding

### 10.4.1.1 Minimum requirement with 0.37 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER.
For the parameters specified in Table 10.4.1.1-1 and Table A.3.8.1-9, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.4.1.1-2.

Table 10.4.1.1-1: Test Parameters for Testing

| Parameter |  | Unit |  |
| :---: | :---: | :---: | :---: |
| Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |
|  | $\sigma$ | dB | 0 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| PDSCH transmission mode inPCell |  |  | 1 |
| Subcarrier spacing for MBSFN cell |  | kHz | 0.37 kHz |
| Bandwidth |  | MHz | 10(Note 2) |
| Note 1: $P_{B}=0$. <br> Note 2: For both Pcell and Scell. |  |  |  |

### 10.4.1.2 Minimum requirement with 2.5 kHz subcarrier spacing

The receive characteristic of MBMS is determined by the BLER.
For the parameters specified in Table 10.4.1.2-1 and Table A.3.8.1-10, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.4.1.2-2.

Table 10.4.1.2-1: Test Parameters for Testing

| Parameter |  | Unit |  |
| :---: | :---: | :---: | :---: |
| Downlink power <br> allocation | $\rho_{A}$ | dB | 0 |
|  | $\rho_{B}$ | dB | 0 (Note 1) |

### 10.4.2 Minimum requirement for CAS detection

### 10.4.2.1 Minimum requirement for PBCH detection

For the parameters specified in Table 8.6.1-1, the average probability of a miss-detected PBCH (Pm-bch) shall be below the specified value in Table 10.4.2.1-1. The downlink physical setup is in accordance with Annex C.3.2.

Table 10.4.2.1-1: Minimum performance

## 11 Performance requirement (ProSe Direct Discovery)

This clause contains the performance requirements for the Sidelink physical channels specified for ProSe Direct Discovery.

### 11.1 General

### 11.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support ProSe Direct Discovery. The test case applicability is in according to table 11.1.1-1 depending on set of supported UE capabilities.

Table 11.1.1-1: ProSe Direct Discovery test applicability

| FDD/TDD | Tests / clause | Applicable if UE indicates at least the following capability |
| :---: | :---: | :---: |
| FDD | 11.2 .1 | ProSe Direct Discovery without support of disc-SLSS-r12 |
|  | 11.2 .3 | ProSe Direct Discovery with support of discPeriodicSLSS-r13 and |
|  | ProSe Direct Communication |  |
|  | 11.3 .1 | ProSe Direct Discovery |
|  | 11.4 .1 | ProSe Direct Discovery with support of disc-SLSS-r12 |
| TDD | 11.5 .1 | ProSe Direct Discovery |
|  | 11.2 .2 | ProSe Direct Discovery |
|  | 11.3 .2 | ProSe Direct Discovery |
|  | 11.5 .2 | ProSe Direct Discovery |

For maximum Sidelink Processes test specified in clause 11.5, the UE is required to only meet the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE. Test case 11.2.3 for 5 MHz channel bandwidth is applicable to UEs that support ProSe Direct Communication on Band 31 only.

### 11.1.2 Reference DRX configuration

Table 11.1.2-1: Reference DRX configuration

| Parameter | Value | Comments |
| :--- | :---: | :---: |
| onDurationTimer | psf1 |  |
| drx-InactivityTimer | psf1 |  |
| drx-RetransmissionTimer | psf1 |  |
| IongDRX-CycleStartOffset | sf2560,0 |  |
| shortDRX | disabled |  |
| NOTE 1: For further information see clause 6.3.2 in TS 36.331. |  |  |

### 11.2 Demodulation of PSDCH (single link performance)

The purpose of the requirements in this subclause is to verify the PSDCH demodulation performance with a single active PSDCH link under different operating scenarios and channel conditions.

The active cell(s), when present, are specified in the test parameters specific to the test.

### 11.2.1 FDD (in-coverage)

The minimum requirements are specified in Table 11.2.1-2 with the test parameters specified in Table 11.2.1-1. The receiver UE under test is associated with Cell 1.

Table 11.2.1-1: Test Parameters

Table 11.2.1-2: Minimum performance

| Test num. | Sidelink UE | Band-width | Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | BLER of PSDCH (\%) | SNR (dB) |
| 1 | 1 | 5 MHz | D.1 FDD | 30 | 4.6 |

### 11.2.2 TDD (in-coverage)

The minimum requirements are specified in Table 11.2.2-2 with the test parameters specified in Table 11.2.2-1. The receiver UE under test is associated with Cell 1.

Table 11.2.2-1: Test Parameters

| Parameter | Unit | Test 1 |
| :--- | :---: | :---: |
| Discovery resource pool configuration |  | As specified in Table A.7.1.2-1 <br> (Configuration \#1-TDD) |
| DRX configuration |  | dBm/15kHz |
| $N_{o c}$ at antenna port (NOTE 5) |  | As specified in Table 11.1.2-1 |
| Active cell(s) | Cyclic prefix | Cell 1 (Serving cell) |
| Cell 1 | Uplink downlink <br> Configuration (NOTE 3) |  |

|  | Special subframe configuration (NOTE 4) |  |  | 4 |
| :---: | :---: | :---: | :---: | :---: |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern ${ }^{\text {NOTE } 2}$ |  |  | OP. 1 TDD |
|  | Propagation channel |  |  | AWGN |
|  | Antenna configuration |  |  | $1 \times 2$ |
|  | RSRP |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -92 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE 1 |
| Sidelink UE 1 | Sidelink Transmissions |  |  | PSDCH |
|  | RB allocation |  |  | PRB pairs $\{2 \mathrm{i} . .2 \mathrm{i}+1\}$, where i is chosen randomly uniformly from $[0,11]$ in each discovery period. |
|  | Time offset (NOTE 6) |  | $\mu \mathrm{s}$ | +1 |
|  | Frequency offset (NOTE 7) |  | Hz | +200 |
|  | Propagation Channel |  |  | EPA5 |
|  | Antenna configuration |  |  | 1x2 Low |
| NOTE 1: $P_{B}=0$. |  |  |  |  |
| NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs. |  |  |  |  |
| NOTE 3: As specified in Table 4.2-2 in TS 36.211 [4]. |  |  |  |  |
| NOTE 4: As specified in Table 4.2-1 in TS 36.211 [4]. |  |  |  |  |
| NOTE 5: Applicable to both DL subframes and UL subframes configured for ProSe Direct Discovery. |  |  |  |  |
| NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE. |  |  |  |  |
| NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency. |  |  |  |  |

Table 11.2.2-2: Minimum performance

| Test num. | Sidelink UE | Band-width | Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | BLER of PSDCH (\%) | SNR (dB) |
| 1 | 1 | 5 MHz | D.1 TDD | 30 | 4.6 |

### 11.2.3 FDD (out-of-coverage)

The minimum requirements are specified in Table 11.2.3-2 with the test parameters specified in Table 11.2.3-1. The receiver UE under test is out of network coverage.

Table 11.2.3-1: Test Parameters

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Resource pool configuration |  |  | As specified in Table A.7.1.1-4 (Configuration \#4-FDD) |
| DRX configuration |  |  | As specified in Table 11.1.2-1 |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  | None |
| Active Sidelink UE(s) |  |  | Sidelink UEs 1, 2 |
| Sidelink UE 1 | Sidelink Transmissions |  | SLSS + PSBCH |
|  | networkControlledSyncTx |  | ON |
|  | slssid |  | 30 |
|  | inCoverage (in MIB-SL) |  | TRUE |
|  | syncOffsetIndicator |  | Set same as syncOffsetIndicator1 in Configuration \#4-FDD |
|  | Propagation channel |  | EPA5 |
|  | Antenna configuration |  | 1x2 Low |
|  | $\widehat{E}_{s}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -82 |
| Sidelink UE 2 | Sidelink Transmissions |  | PSDCH |

|  | PSDCH RB allocation |  | PRB pairs $\{2 \mathrm{i} . .2 \mathrm{i}+1\}$, where i is chosen randomly uniformly from $[0,11]$ (for 5 MHz ) or $[0,24]$ (for 10 MHz ) in each discovery period. |
| :---: | :---: | :---: | :---: |
|  | Time offset (Note 1) | $\mu \mathrm{S}$ | +1 |
|  | Frequency offset (Note 2) | Hz | +200 |
|  | Propagation Channel |  | EPA5 |
|  | Antenna configuration |  | 1x2 Low |
| NOTE 1: Time offset of Sidelink UE 2 receive signal timing with respect to Sidelink UE 1 receive signal timing at the tested UE. <br> NOTE 2: Frequency offset of Sidelink UE 2 with respect to Sidelink UE 1 transmit frequency. | Time offset of Sidelink UE 2 receive signal timing with respect to Sidelink UE 1 receive signal timing at the tested UE. <br> Frequency offset of Sidelink UE 2 with respect to Sidelink UE 1 transmit frequency. |  |  |

Table 11.2.3-2: Minimum performance

| Test number | Sidelink UE | Band-width | Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | BLER of PSDCH (\%) | SNR (dB) |
| 1 | 1 | 5 MHz | 30 | 4.6 |  |
|  |  | 10 MHz |  |  |  |

### 11.3 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSDCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 11.3.1 FDD

The minimum requirements are specified in Table 11.3.1-2 with the test parameters specified in Table 11.3.1-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

Table 11.3.1-1: Test Parameters

| Parameter |  |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: | :---: |
| Discovery resource pool configuration |  |  |  | As specified in Table A.7.1.1-1 (Configuration \#1-FDD) |
| DRX configuration |  |  |  | As specified in Table 11.1.2-1 |
| $N_{o c}$ at antenna port (NOTE 3) |  |  | dBm/15kHz | -98 |
| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern (NOTE 2) |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | AWGN |
|  | Antenna configuration |  |  | 1x2 |
|  | RSRP |  | dBm/15kHz | -92 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE 1, Sidelink UE 2 |
| Sidelink UE 1 | Sidelink Transmissions |  |  | PSDCH |
|  | PSDCH RB allocation |  |  | PRB pairs $\{4 . .5\}$ |
|  | Time offset (NOTE 3) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 4) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |
|  | Antenna configuration |  |  | 1x2 Low |
| Sidelink UE 2 | Sidelink Transmissions |  |  | PSDCH |
|  | PSDCH RB allocation |  |  | PRB pairs $\{6 . .7\}$ |
|  | Time offset (w.r.t. Cell 1 DL) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (w.r.t. Cell 1 UL ) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |

|  |  | Antenna configuration |  |
| :--- | :--- | :--- | :--- |
| NOTE 1: | $P_{B}=0$. |  |  |
| NOTE 2: | OCNG is used to fully allocate the available resource blocks to virtual UEs. |  |  |
| NOTE 3: | Applicable to both DL channel and ProSe Direct Discovery Subframes on UL. |  |  |
| NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE. |  |  |  |
| NOTE 5: | Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency. |  |  |

Table 11.3.1-2: Minimum performance

| Test <br> num. | Band- <br> width | Sidelink <br> UE | Reference <br> channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |
| 1 | 5 | 1 | D.1 FDD | (NOTE 1) | 24.3 |
|  | MHz | 2 | D.1 FDD | 30 | 6.9 |
| NOTE 1: There is no BLER requirement for Sidelink UE 1. |  |  |  |  |  |

### 11.3.2 TDD

The minimum requirements are specified in Table 11.3.2-2 with the test parameters specified in Table 11.3.2-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

Table 11.3.2-1: Test Parameters

| Parameter |  |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: | :---: |
| Discovery resource pool configuration |  |  |  | As specified in Table A.7.1.2-1 (Configuration \#1-TDD) |
| DRX configuration |  |  |  | As specified in Table 11.1.2-1 |
| $N_{o c}$ at antenna port (NOTE 5) |  |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Uplink downlink configuration (NOTE 3) |  |  | 0 |
|  | Special subframe configuration (NOTE 4) |  |  | 4 |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern ${ }^{\text {NOTE } 2}$ |  |  | OP. 1 TDD |
|  | Propagation channel |  |  | AWGN |
|  | Antenna configuration |  |  | $1 \times 2$ |
|  | RSRP |  | dBm/15kHz | -92 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE 1, Sidelink UE 2 |
| Sidelink UE 1 | Sidelink Transmissions |  |  | PSDCH |
|  | PSDCH RB allocation |  |  | PRB pairs $\{4 . .5\}$ |
|  | Time offset (NOTE 6) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 7) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |
|  | Antenna configuration |  |  | 1x2 Low |
| Sidelink UE 2 | Sidelink Transmissions |  |  | PSDCH |
|  | RB allocation |  |  | PRB pairs $\{6 . .7\}$ |
|  | Time offset (NOTE 6) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 7) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |
|  | Antenna co | ration |  | 1x2 Low |

NOTE 1: $\quad P_{B}=0$.
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.
NOTE 3: As specified in Table 4.2-2 in TS 36.211 [4].
NOTE 4: As specified in Table 4.2-1 in TS 36.211 [4].
NOTE 5: Applicable to both DL subframes and UL subframes configured for ProSe Direct Discovery.
NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.
NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.

Table 11.3.2-2: Minimum performance

| Test <br> num. | Band- <br> width | Sidelink <br> UE | Reference <br> channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | SNR (dB) |  |
| 1 | 5 | 1 | D.1 TDD | (NOTE 1) | 24.3 |
|  | MHz | 2 | D.1 TDD | 30 | 6.9 |
| NOTE 1: There is no BLER requirement for Sidelink UE 1. |  |  |  |  |  |

### 11.4 Multiple timing reference test

The purpose of this test is to check the demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overlapping in time).

### 11.4.1 FDD

The test parameters are specified in Table 11.4.1-1. Sidelink UE 2 and the receiver UE under test are associated with Cell 1. Sidelink UE 1 and 3 are associated with another cell and use a different timing, and UE 1 acts as a synchronization reference. The minimum requirements are specified in Table 11.4.1-2.

Table 11.4.1-1: Test Parameters

|  | Resource pool used for <br> transmissions |  | discRxPool(0) |
| :--- | :--- | :--- | :--- |

Table 11.4.1-2: Minimum performance

| Test num. | Band-width | Sidelink UE | Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | BLER of PSDCH (\%) ${ }^{\text {NOTE 1 }}$ | SNR (dB) |
| 1 | 5 MHz | 2 | D.1 FDD | 30 | 4.6 |
|  |  | D.1 FDD | 30 | 4.6 |  |

NOTE 1: The BLER is measured after 5 D2D Discovery periods (1600 frames) of lead time during which the test UE detects and synchronizes to Sidelink UE 1 SLSS.

### 11.5 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes supported by the UE as reported using UE capability signalling (discSupportedProc).

The UE is required to meet only the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE.

### 11.5.1 FDD

The test parameters are specified in Table 11.5.1-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.1-2.

Table 11.5.1-1: Test Parameters

| Parameter |  | Unit | Test 1-7 |
| :---: | :---: | :---: | :---: |
| Discovery resource pool configuration |  |  | As specified in Table A.7.1.1-3 (Configuration \#3-FDD) with parameters BWChannel, NPools = Number of configured resource pools (as specified in Table 11.5.1-2), and $N=$ discSupportedProc |
| DRX configuration |  |  | As specified in Table 11.1.2-1 |
| Active cell(s) |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  | Normal |
|  | Cell ID |  | 0 |

|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern ${ }^{\text {NOTE } 2}$ |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | Static propagation condition No external noise sources are applied |
|  | Antenna configuration |  |  | $1 \times 2$ |
|  | RSRP |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE $\mathrm{i}, \mathrm{i}=0, \ldots$, discSupportedProc-1 |
| Sidelink UE i | Sidelink Transmissions |  |  | PSDCH (D. 1 FDD) |
|  | Resource pool index (NOTE 3) |  |  | $\left\lfloor\frac{i}{N_{M A X_{-} S F}}\right\rfloor$ |
|  | PSDCH RB allocation (NOTE 3) |  |  |  |
|  | Time offset (NOTE 4) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 4) |  | Hz | 0 |
|  | Propagation Channel |  |  | Static propagation condition <br> No external noise sources are applied |
|  | Antenna co | uration |  | 1x2 Low |
| NOTE 1: $P_{B}=0$. |  |  |  |  |
| NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.. |  |  |  |  |
| NOTE 3: Nmax_sF represents the maximum number of Sidelink UEs transmitting in one subframe. Nmax_sF = 12 (5 $\mathrm{MHz}), 25(10 \mathrm{MHz}), 37(15 \mathrm{MHz}), 50(10 \mathrm{MHz})$. |  |  |  |  |
| NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE. |  |  |  |  |

Table 11.5.1-2: Minimum performance

| Test | Bandwidth | discSupportedProc | Number of <br> num. <br> nenfigured <br> resource <br> pools | $\hat{E}_{s}$ at <br> antenna port <br> (dBm/15kHz) | Reference value <br> for Sidelink UE <br> i=0...discSupportedProc-1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 5 MHz | 50 | 5 | -85 | Fraction of maximum throughput (\%) |

### 11.5.2 TDD

The test parameters are specified in Table 11.5.2-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.2-2.

Table 11.5.2-1: Test Parameters

| Parameter | Unit | Test 1-7 |
| :--- | :---: | :---: |
|  |  | As specified in Table A.7.1.2-2 <br> (Configuration \#2-TDD) |
| Discovery resource pool configuration |  | (C) <br> with parameters BWChannel, NPools = Number of configured <br> resource pools (as specified in Table 11.5.2-2), and $\mathrm{N}=$ <br> discSupportedProc |
| DRX configuration |  | As specified in Table 11.1.2-1 |
| Active cell(s) | Cell 1 (Serving cell) |  |

Table 11.5.2-2: Minimum performance

| Test | Bandwidth | discSupportedProc | Number of <br> num. <br> nenfigured <br> resource <br> pools | $\hat{E}_{s}$ at <br> antenna <br> port <br> (dBm/15 $\mathbf{k H z}$ | Fraction of maximum throughput (\%) <br> for Sidelink UE <br> i=0...discSupportedProc-1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Reference value |  |
| 1 | 5 MHz | 50 | 5 | -85 | 95 |
| 2 | 10 MHz | 50 | 2 | -85 | 95 |
| 3 | 15 MHz | 50 | 2 | -85 | 95 |
| 4 | 20 MHz | 50 | 1 | -85 | 95 |
| 5 | 10 MHz | 400 | 16 | -85 | 95 |
| 6 | 15 MHz | 400 | 11 | -85 | 95 |
| 7 | 20 MHz | 400 | 8 | -85 | 95 |

## 12 Performance requirement (ProSe Direct Communication)

This clause contains the performance requirements for the Sidelink physical channels specified for ProSe Direct Communication in TS 36.211 [4].

### 12.1 General

### 12.1.1 Applicability of requirements

### 12.1.1.1 Applicability of requirements for different channel bandwidths

The requirements in this clause are applicable to UEs that support ProSe Direct Communication. Test cases defined for 5 MHz channel bandwidth are applicable to UEs that support ProSe Direct Communication on only Band 31.

### 12.1.1.2 Test coverage for different number of component carriers

For FDD tests specified in 12.8 , if corresponding CA tests are tested, the test coverage can be considered fulfilled without executing single carrier tests.

### 12.1.1.3 Applicability and test rules for different CA configurations and bandwidth combination sets

The performance requirement for CA UE demodulation tests with active Sidelink in Clause 12 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.6A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined in Table 12.1.1.3-1. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

Table 12.1.1.3-1: Applicability and test rules for CA UE demodulation tests with active Sidelink

| Tests | CA capability <br> where the <br> tests apply | CA configuration from <br> the selected CA capbility <br> where the tests apply | CA Bandwidth <br> combination to be <br> tested in priority order |
| :---: | :---: | :---: | :---: |
|  | Any one of the <br> supported CA <br> capabilities with <br> largest <br> CA tests with <br> 2CCs in Clause <br> 12.8 | Any one of the supported <br> FDD CA configurations <br> bandwidth <br> combination | wargest aggregated CA <br> bandwidth combination | | Largest aggregated CA |
| :---: |
| bandwidth combination |

### 12.1.2 Reference DRX configuration

Table 12.1.2-1: Reference DRX configuration

| Parameter | Value | Comments |
| :--- | :---: | :---: |
| onDurationTimer | $\mathrm{psf1}$ |  |
| drx-InactivityTimer | $\mathrm{psf1}$ |  |
| drx-RetransmissionTimer | $\mathrm{psf1}$ |  |
| longDRX-CycleStartOffset | $\mathrm{sf2560}, 0$ |  |
| shortDRX | disabled |  |
| NOTE 1: For further information see clause 6.3.2 in TS 36.331. |  |  |

### 12.2 Demodulation of PSSCH

The purpose of the requirements in this subclause is to verify the PSSCH demodulation performance with a single active PSSCH link.

### 12.2.1 FDD

The minimum requirements are specified in Table 12.2.1-2 with the test parameters specified in Table 12.2.1-1. This test specifies an out-of-coverge scenario where Sidelink UE 1 is the synchronization reference only and Sidelink UE 2 transmits PSCCH and PSSCH.

Table 12.2.1-1: Test Parameters

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.7.2.1-1 (Configuration \#1-FDD) |
| $N_{o c}$ at antenna port (NOTE 1) |  | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -98 |
| Active cell(s) |  |  | None |
| Sidelink UE 1 | Sidelink <br> Transmissions |  | SLSS + PSBCH |
|  | networkControlledSyn cTx |  | ON |
|  | slssid |  | 30 |
|  | inCoverage (in MIBSL) |  | FALSE |
|  | syncOffsetIndicator |  | Set same as syncOffsetIndicator1 in Configuration \#1-FDD |
|  | Propagation channel |  | EPA5 |
|  | Antenna configuration |  | 1x2 Low |
|  | $\widehat{E}_{s}$ at antenna port | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -85 |
| Sidelink UE 2 | Sidelink <br> Transmissions |  | PSCCH + PSSCH |
|  | PSCCH RMC |  | $\begin{gathered} 5 \mathrm{MHz}: \text { CC. } 3 \text { FDD } \\ 10 \mathrm{MHz}: \mathrm{CC} .4 \text { FDD } \end{gathered}$ |
|  | PSCCH subframe allocation |  | As defined by TS 36.213 with $n_{\text {PSCCH }}$ chosen randomly (uniformly) in $\left[0,\left\lfloor M_{R B}^{P S C C H}{ }_{-R P} / 2\right\rfloor L_{P S C C H}-1\right]$ every sc-period |

### 12.3 Demodulation of PSCCH

The purpose of the requirements in this subclause is to verify the PSCCH demodulation performance with a single active PSSCH link.

### 12.3.1 FDD

The minimum requirements are specified in Table 12.3.1-2 with the test parameters specified in Table 12.3.1-1. This test specifies an out-of-coverage scenario where Sidelink UE 1 is the synchronization reference only and Sidelink UE 2 transmits PSCCH and PSSCH.

Table 12.3.1-1: Test Parameters

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.7.2.1-1 (Configuration \#1-FDD) |
| $N_{o c}$ at antenna port (NOTE 1) |  | $\underset{\mathrm{kHz}}{\mathrm{dBm} / 15}$ | -98 |
| Active cell(s) |  |  | None |
| Sidelink UE 1 | Sidelink <br> Transmissions |  | SLSS + PSBCH |
|  | networkControlledSyn cTx |  | ON |
|  | slssid |  | 30 |
|  | inCoverage (in MIBSL) |  | FALSE |
|  | syncOffsetIndicator |  | Set same as syncOffsetIndicator1 in Configuration \#1-FDD |
|  | Propagation channel |  | EPA5 |
|  | Antenna configuration |  | 1x2 Low |
|  | $\widehat{E}_{s}$ at antenna port | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -85 |
| Sidelink UE 2 | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | PSCCH RMC |  | As specified in Table 12.3.1-2 |
|  | PSCCH subframe allocation |  | As defined by TS 36.213 with $n_{P S C C H}$ chosen randomly (uniformly) in $\left[0,\left\lfloor M_{R B}^{P S C C H}{ }_{-R P} / 2\right\rfloor_{L_{P S C C H}}-1\right]$ every sc-period |
|  | PSCCH RB allocation |  |  |
|  | PSSCH RMC |  | CD. 1 FDD |
|  | PSSCH subframe allocation |  | As per time repetition pattern specified in PSCCH |
|  | PSSCH RB allocation |  | First transmission: Chosen randomly (uniformly) among the allowed RBs as per TS36.213 <br> HARQ retransmission: As per frequency hopping indicated in PSCCH and specified in TS36.213 |
|  | Time offset (NOTE 2) | $\mu \mathrm{S}$ | +1 |
|  | Frequency offset (NOTE 3) | Hz | +200 |
|  | Propagation Channel |  | EVA70 |
|  | Antenna configuration |  | 1x2 Low |
| NOTE 1: Applicable to both DL channel and ProSe Direct Communication Subframes on UL. <br> NOTE 2: Time offset of Sidelink UE 2 receive signal timing with respect to Sidelink UE 1 receive signal timing at the tested UE. <br> NOTE 3: Frequency offset of Sidelink UE 2 with respect to Sidelink UE 1 transmit frequency. |  |  |  |

Table 12.3.1-2: Minimum performance

| Test num. | Sidelink UE | Bandwidth | PSCCH Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Probability of missed PSCCH <br> (\%) (NOTE 1) | $\begin{aligned} & \text { SNR (dB) of } \\ & \text { PSCCH } \end{aligned}$ |
| 1 | 2 | 10 MHz | CC. 4 FDD | 1 | 4.7 |
|  |  | 5 MHz | CC. 3 FDD | 1 | 4.8 |
| NOTE 1: The probability is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |  |  |  |  |  |

### 12.4 Demodulation of PSBCH

The purpose of the requirements in this subclause is to verify the PSBCH demodulation performance with a single active link.

### 12.4.1 FDD

The minimum requirements are specified in Table 12.4.1-2 with the test parameters specified in Table 12.4.1-1.
Table 12.4.1-1: Test Parameters

| Parameter |  | Unit | Test 1 |  |  |  |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  | As specified in Table A.7.2.1-1 <br> (Configuration \#1-FDD) |  |  |  |  |
| $N_{o c}$ at antenna port |  |  |  |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) | Sidelink Transmissions |  | None |  |  |  |
| Sidelink UE 1 | networkControlledSyncTx |  | SLSS + PSBCH (CP.1 FDD) |  |  |  |
|  | stssid |  | ON |  |  |  |
|  | inCoverage (in MIB-SL) |  | 30 |  |  |  |
|  | syncOffsetIndicator |  | FALSE |  |  |  |
|  | Propagation channel |  | Set same as syncOffsetIndicator1 <br> in Configuration \#1-FDD |  |  |  |
|  | Antenna configuration |  | EPA5 |  |  |  |

Table 12.4.1-2: Minimum performance

| Test num. | SidelinkUE | Bandwidth | Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Probability of missed PSBCH (\%) (NOTE 1) | SNR (dB) |
| 1 | 1 | 10 MHz | PSBCH(CP. 1 FDD) | 1 | 4.4 |
|  |  | 5 MHz |  |  |  |
| NOTE 1: The probability is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |  |  |  |  |  |

### 12.5 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSSCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 12.5.1 FDD

The test parameters in Table 12.5.1-1 specifies an in-coverage scenario where Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSSCH on adjacent RBs. The minimum requirements are specified in Table 12.5.1-2.

Table 12.5.1-1: Test Parameters

| Parameter |  |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  |  | As specified in Table A.7.2.1-2 (Configuration \#2-FDD) |
| DRX configuration |  |  |  | As specified in Table 12.1.2-1 |
| $N_{o c}$ at antenna port (Note 3) |  |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern (Note 2) |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | AWGN |
|  | Antenna configuration |  |  | 1x2 |
|  | RSRP |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -92 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE 1, Sidelink UE 2 |
| Sidelink UE 1 | Sidelink Transmissions |  |  | PSCCH + PSSCH |
|  | PSCCH RMC |  |  | $5 \mathrm{MHz}: \mathrm{CC} .1$ FDD $10 \mathrm{MHz}: \mathrm{CC} .2$ FDD |
|  | PSCCH subframe allocation |  |  |  |
|  | PSCCH RB allocation |  |  | $n_{\text {PSCCH }}=0$ (as defined in TS 36.213) |
|  | $\widehat{E}_{s}$ of PSCCH at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |
|  | PSSCH RMC |  |  | As specified in Table 12.5.1-2 |
|  | PSSCH subframe allocation |  |  | As per time repetition pattern specified in PSCCH |
|  | PSSCH RB allocation |  |  | PRB pairs $\{4,5\}$ |
|  | Time offset (NOTE 4) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 5) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |
|  | Antenna configuration |  |  | $1 \times 2$ |
| Sidelink UE 2 | Sidelink Transmissions |  |  | PSCCH + PSSCH |
|  | PSCCH RMC |  |  | 5 MHz : CC. 1 FDD $10 \mathrm{MHz}: \mathrm{CC} .2$ FDD |
|  | PSCCH subframe allocation |  |  | $n_{\text {PSCCH }}=2$ (as defined in TS 36.213) |
|  | PSCCH RB allocation |  |  |  |
|  | $\widehat{E}_{s}$ of PSCCH at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |
|  | PSSCH RMC |  |  | As specified in Table 12.5.1-2 |
|  | PSSCH subframe allocation |  |  | As per time repetition pattern specified in PSCCH |
|  | PSSCH RB allocation |  |  | PRB pairs $\{6,7\}$ |
|  | Time offset (NOTE 4) |  | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (NOTE 5) |  | Hz | 0 |
|  | Propagation Channel |  |  | AWGN |
|  | Antenna configu | tion |  | $1 \times 2$ |
| NOTE 1: $P_{B}=0$. |  |  |  |  |
| NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs. |  |  |  |  |
| NOTE 3: Applicable to both DL channel and ProSe Direct Communication Subframes on UL. |  |  |  |  |
| NOTE 4: The power of PSCCH is set high to ensure reliable reception of PSCCH. |  |  |  |  |
| NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE. |  |  |  |  |
| NOTE 5: Freq | offset of Sidelink | JE with resp | ect to Cell 1 | link frequency. |

Table 12.5.1-2: Minimum performance

| Test <br> num. | Band- <br> width | Sidelink <br> UE | PSSCH Reference <br> channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | Fraction of maximum <br> throughput (\%) | SNR (dB) of <br> PSSCH |  |
| $5 / 10$ <br> MHz |  | 2 | CD.5 FDD | (NOTE 1) | 24.35 |
| NOTE 1: There is no throughput requirement for Sidelink UE 1. |  | 70 | 2.4 |  |  |

### 12.6 Multiple timing reference test

The puporse of this test is to check the PSSCH demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overalapping in time).

### 12.6.1 FDD

The test parameters are specified in Table 12.6.1-1. Sidelink UE 2 and the receiver UE under test are associated with Cell 1. Sidelink UE 1 and Sidelink UE 3 are associated with another cell and use a different timing, and Sidelink UE 1 acts as a synchronization reference only. The minimum requirements are specified in Table 12.6.1-2.

Table 12.6.1-1: Test Parameters

| Parameter |  |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  |  | As specified in Table A.7.2.1-3 (Configuration \#3-FDD) |
| DRX configuration |  |  |  | As specified in Table 12.1.2-1 |
| $N_{o c}$ at antenna port (Note 3) |  |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern ${ }^{\text {NOTE } 2}$ |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | AWGN |
|  | Antenna configuration |  |  | 1x2 |
|  | RSRP |  | dBm/15kHz | -92 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE 1, Sidelink UE 2, Sidelink UE 3 |
| Sidelink UE 1 | Sidelink Transmissions |  |  | SLSS + PSBCH |
|  | networkControlledSyncTx |  |  | ON |
|  | slssid |  |  | 30 |
|  | inCoverage (in MIB-SL) |  |  | TRUE |
|  | syncOffsetIndicator |  |  | Set same as syncOffsetIndicator in Configuration \#3-FDD |
|  | Time offset (NOTE 5) |  | ms | +12.51 ms |
|  | Frequency offset (NOTE 6) |  | Hz | $-100 \mathrm{~Hz}$ |
|  | Propagation channel |  |  | EPA5 |
|  | Antenna configuration |  |  | 1x2 Low |

|  | PSCCH RMC |  | $\begin{gathered} 5 \mathrm{MHz}: \text { CC. } 5 \text { FDD } \\ 10 \mathrm{MHz}: \mathrm{CC} .6 \text { FDD } \\ \hline \end{gathered}$ |
|  | PSCCH subframe allocation |  | As defined by TS 36.213 with $n_{\text {PSCCH }}$ chosen randomly (uniformly) in $\left[0,\left\lfloor M_{R B}^{P S C C H}-{ }^{R P} / 2\right\rfloor L_{\text {PSCCH }}-1\right]$ every sc-period |
|  | PSCCH RB allocation |  |  |
|  | $\widehat{E}_{s}$ of PSCCH at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |
|  | PSSCH RMC |  | As specified in Table 12.6.1-2 |
|  | PSSCH subframe allocation |  | As per time repetition pattern specified in PSCCH |
|  | PSSCH RB allocation |  | First transmission: Chosen randomly (uniformly) among the allowed RBs as per TS36.213 HARQ retransmission: As per frequency hopping indicated in PSCCH and specified in TS36.213 |
|  | Time offset (NOTE 5) | ms | +12.509 |
|  | Frequency offset (NOTE 6) | Hz | +300 |
|  | Propagation Channel |  | EVA70 |
|  | Antenna configuration |  | 1x2 Low |
| NOTE 1: $P_{B}=0$. |  |  |  |
| NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs. |  |  |  |
| NOTE 3: Applicable to both DL channel and ProSe Direct Communication Subframes on UL. |  |  |  |
| NOTE 4: Timing advance indication in PSSCH is set as $18\left(=288 \mathrm{~T}_{\mathrm{s}}\right)$ in this test. PSSCH timing is advanced with respect to PSCCH timing by the quantity (i.e., PSSCH timing shall be $+1 \mu \mathrm{~s}-288 \mathrm{~T}_{\mathrm{s}}$ in this test). |  |  |  |
| NOTE 5: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE. |  |  |  |

Table 12.6.1-2: Minimum performance

| Test num. | Bandwidth | Sidelink UE | PSSCHReferencechannel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Fraction of maximum throughput (\%) (NOTE 1) | SNR (dB) |
| 1 | 10 MHz | 2 | CD. 4 FDD | 70 | 3.0 |
|  |  | 3 | CD. 2 FDD | 70 | 2.8 |
|  | 5 MHz | 2 | CD. 3 FDD | 70 | 2.9 |
|  |  |  | CD. 2 FDD | $70$ | 2.8 |
| NOTE 1: The throughput is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1. |  |  |  |  |  |

### 12.7 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the UE.

### 12.7.1 FDD

The test parameters are specified in Table 12.7.1-1. Multiple communication resource pools are interleaved. Each active Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 12.7.1-2.

Table 12.7.1-1: Test Parameters

| Parameter | Unit | Test 1 |
| :--- | :---: | :---: |
| Communication resource pool configuration |  | As specified in Table A.7.2.1-4 <br> (Configuration \#4-FDD) |
| DRX configuration |  | As specified in Table 12.1.2-1 |

| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| :---: | :---: | :---: | :---: | :---: |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{\text {A }}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (NOTE 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern (Note 2) |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | Static propagation condition No external noise sources are applied |
|  | Antenna configuration |  |  | $1 \times 2$ |
|  | RSRP |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |
| Active Sidelink UE(s) |  |  |  | Sidelink UE i, $0 \leq \mathrm{i} \leq 15$ |
| $\begin{aligned} & \text { Sidelink UE } \mathrm{i}, \\ & 0 \leq \mathrm{i} \leq 15 \end{aligned}$ | Sidelink Transmissions |  |  | PSCCH + PSSCH |

| 1 |

### 12.8 Sustained downlink data rate with active Sidelink

The purpose of this test is to verify the downlink data rate is not impacted when Sidelink resource are also configured. The test parameters are in Table 12.8.1-1. Cell 1 is the serving cell and UE 1 and UE 2 are transmitters of Prose Direct Communication. The test UE is expected to receive all PDSCH transmissions, and prioritize the transmission of ACK/NACK over the reception of UE 2's PSSCH.

The test cases apply to UE categories and bandwidth combinations with maximum aggregated bandwidth as specified in Table 12.8.1-2. The minimum requirements are specified in Table 12.8.1-3. The TB success rate in the cellular link shall be sustained during at least 300 frames.

Table 12.8.1-1: Test parameters for sustained downlink data rate (FDD 64QAM) with active Sidelink

| Parameter | Unit | Test 1, 2, 3A, 3B, 4A, 6C |

|  | Antenna configuration |  | 1x2 Low |
|  | $\widehat{E}_{s}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -85 |

NOTE 1: For $\mathrm{N}_{\text {TRP }}=8$ (FDD) and trpt-Subset $=001$, ITRP $=0$ corresponds to a time repetition pattern of ( $1,0,0,0,0,0,0,0$ ), ITRP $=1$ corresponds to a time repetition pattern of ( $0,1,0,0,0,0,0,0$ ).
NOTE 2: Sidelink UE 2 transmits PSCCH but not PSSCH.
NOTE 3: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.
NOTE 4: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.
NOTE 5: Sidelink Communication resources are configured on the primary serving cell.

## 13 Void

## 14 Performance requirement (V2X Sidelink Communication)

This clause contains the performance requirements for the sidelink physical channels specified for V2X Sidelink Communication.

### 14.1 General

### 14.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support V2X sidelink communication using Band 47.
When GNSS or GNSS-equivalent synchronization source is used, the reference GNSS signal power is as specified in Table B.6.1-1 in TS 36.133.

The test case applicability is in according to Table 14.1.1-1.
Table 14.1.1-1: V2X test applicability

| Tests / clause | Applicable if UE supports the following capability |
| :---: | :---: |
| 14.2 14.3 14.4 14.8 Test 1 | UE supporting V2X sidelink <br> If the SL-C-RX Category 4 UE passes 14.11 Test 1 or 2, then the test coverage can be considered fulfilled without executing 14.8 Test 1. |
| 14.5 | UE with support of s/ss-TxRx-r14 [7] |
| $\begin{aligned} & \hline 14.6 \\ & 14.9 \end{aligned}$ | UE supporting concurrent operation band for V2X and E-UTRA |
| 14.7 | UE not supporting concurrent operation band for V2X and E-UTRA |
| 14.8 Test 2 | UE with support of $v 2 x$-HighReception-r14 [7]. <br> If the SL-C-RX Category 4 UE passes 14.11 Test 3 or 4 , then the test coverage can be considered fulfilled without executing 14.8 Test 2 . |
| $\begin{aligned} & \text { 14.10 Test } 1 \\ & \text { 14.11 Test } 1 \end{aligned}$ | UE with support of CA with 2 SL CCs and without support of CA with 3 SL CCs |
| $\begin{aligned} & \text { 14.10 Test } 2 \\ & \text { 14.11 Test } 2 \end{aligned}$ | UE with support of CA with 3 SL CCs |
| 14.11 Test 3 | UE with support of v2x-EnhancedHighReception-r15 [7] and CA with 2 SL CCs and without support of CA with 3 SL CCs |
| 14.11 Test 4 | UE with support of v2x-EnhancedHighReception-r15 [7] and CA with 3 SL CCs |

### 14.2 Demodulation of PSSCH

The purpose of the requirements in this subclause is to verify the PSSCH for V2X demodulation performance with a single active PSSCH link.

The minimum requirements are specified in Table 14.2-2 with the test parameters specified in Table 14.2-1. In this test scenario, GNSS or GNSS-equivalent synchronization source is used and Sidelink UE 1 transmits PSCCH and PSSCH.

Table 14.2-1: Test Parameters

| Parameter | Unit | Test 1, 2 | Test 3, 4 |
| :--- | :---: | :---: | :---: |
| Communication resource pool <br> configuration |  | As specified in Table A.9-1 <br> (Configuration \#1-V2X) |  |
| $N_{o c \mid}$ at antenna port | $\mathrm{dBm} / 15$ <br> kHz | -98 |  |
|  |  | None |  |
|  | Sidelink <br> Transmissions |  | $\mathrm{N} / \mathrm{A}$ |

Table 14.2-2: Minimum performance

| Test |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Test <br> num. | Bandwidth | PSSCH <br> Reference <br> channel | Propagation <br> condition | RSSeference value <br>  <br> (\%) |  |
| 1 | 20 MHz | CD.8 | EVA180 |  | SNR (dB) of <br> PSSCH |
| 2 | 10 MHz | CD.9 | EVA2700 |  | 14.2 |
| 3 | 20 MHz | CD.13 | EVA180 |  | 5.4 |
| 4 | 10 MHz | CD.14 | EVA2700 |  | 12.5 |

### 14.3 Demodulation of PSCCH

The purpose of the requirements in this subclause is to verify the PSCCH for V2X demodulation performance with a single active PSSCH link.

The minimum requirements are specified in Table 14.3-2 with the test parameters specified in Table 14.3-1. In this test scenario, GNSS or GNSS-equivalent synchronization source is used and Sidelink UE 1 transmits PSCCH and PSSCH.

Table 14.3-1: Test Parameters

| Parameter | Unit | Test 1  <br> Communication resource pool <br> configuration  <br> $N_{o c}$ at antenna port  <br> As specified in Table A.9-1 <br> (Configuration \#1-V2X)  <br> Active cell(s)  <br> Sidelink UE 1 Sidelink <br> Transmissions |
| :--- | :---: | :---: |

|  | Timing offset (Note 1) |  | CP/2-12Ts |
| :--- | :--- | :--- | :---: |
|  | Frequency offset <br> (Note 2) | Hz | +600 |
|  | Synchronization |  | GNSS or GNSS-equivalent |
|  | Antenna configuration |  | $1 \times 2$ Low |
|  | PSSCH RMC |  | CD.9 |
| Note 1: | Time offset of Sidelink UE receive signal with respect to GNSS reference timing. |  |  |
| Note 2: | Frequency offset of Sidelink UE with respect to GNSS reference frequency. |  |  |
| Note 3: | Cyclic shift for PSCCH DMRS is randomly selected between $\{0,3,6,9\}$ for each PSCCH transmission. |  |  |

Table 14.3-2: Minimum performance

| Test <br> number | Bandwidth | PSCCH Reference <br> channel | Propagation <br> condition | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Probability of <br> missed PSCCH <br> $(\%)$ |  |  |  |
| 1 | 10 MHz | CC. 8 | EVA1500 | 1 | 2.6 |

### 14.4 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSSCH transmissions from two Sidelink UEs with power imbalance in one subframe.

The minimum requirements are specified in Table 14.4-2 with the test parameters specified in Table 14.4-1. The Sidelink UE 1 and 2 are synchronized to GNSS or GNSS-equivalent synchronization reference.

Table 14.4-1: Test Parameters

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-2 (Configuration \#2-V2X) |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  | None |
| Active Sidelink UE(s) |  |  | Sidelink UE 1, Sidelink UE 2 |
| Sidelink UE 1 | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | PSCCH RB allocation |  | PRB pairs $\{5,6\}$ |
|  | PSSCH RMC |  | As specified in Table 14.4-2 |
|  | PSSCH RB allocation |  | PRB pairs $\{7,8,9\}$ |
|  | Time offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Propagation Channel |  | AWGN |
|  | Antenna configuration |  | $1 \times 2$ |
| Sidelink UE 2 | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | PSCCH RB allocation |  | PRB pairs $\{20,21\}$ |
|  | PSSCH RMC |  | As specified in Table 14.4-2 |
|  | PSSCH RB allocation |  | PRB pairs $\{22,23,24\}$ |
|  | Time offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Propagation Channel |  | AWGN |
|  | Antenna configuration |  | $1 \times 2$ |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. |  |  |  |

Table 14.4-2: Minimum performance

| Test number | Bandwidth | Sidelink UE | PSSCH Reference channel | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | PSSCH BLER (\%) | SNR (dB) of PSSCH |
| 1 | 20MHz | 1 | CD. 10 | (Note 1) | 30.35 |
|  |  | 2 | CD. 10 | 10 | 13.3 |

Note 1: There is no throughput requirement for Sidelink UE 1.

### 14.5 Demodulation of PSBCH

The purpose of the requirements in this subclause is to verify the PSBCH demodulation performance with a single active link.

The minimum requirements are specified in Table 14.5-2 with the test parameters specified in Table 14.5-1. The Sidelink UE 1 transmit PSBCH to tested UE and tested UE is synchronized to SLSS of Sidelink UE 1

Table 14.5-1: Test Parameters

|  | Parameter | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-1 (Configuration \#1-V2X) |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  | None |
| Sidelink UE 1 | Sidelink Transmissions |  | SLSS+PSBCH (Note 3) |
|  | slssid |  | 169 |
|  | Time offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Synchronization source |  | GNSS |
|  | Antenna configuration |  | 1x2 Low |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: PSBCH transmits together with corresponding SLSS in the same subframe. |  |  |  |

Table 14.5-2: Minimum performance

| Test <br> number | Bandwidth | PSBCH Reference <br> channel | Propagation <br> condition | Reference value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Probability of missed <br> PSBCH (\%) | SNR (dB) of <br> PSBCH |  |  |
| 1 | 20 MHz | CP.2 | EVA180 | 1 | 2.5 |

### 14.6 Demodulation of PSSCH with eNB based synchronization

The purpose of the requirements in this subclause is to verify the PSSCH for V2X demodulation performance with a single active PSSCH link under eNB based synchronization.

The minimum requirement is specified in Table 14.6-2 with the test parameters specified in Table 14.6-1. In this test scenario, eNB based synchronization source is used and Sidelink UE 1 transmits PSCCH and PSSCH.

Table 14.6-1: Test Parameters

| Parameter |  |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  |  | As specified in Table A.9-3 (Configuration \#3-V2X) |
| $N_{o c}$ at antenna port |  |  | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -98 |
| Active cell(s) |  |  |  | Cell 1 (Serving cell) |
| Cell 1 | Cyclic prefix |  |  | Normal |
|  | Cell ID |  |  | 0 |
|  | Downlink power allocation | $\rho_{A}$ | dB | 0 |
|  |  | $\rho_{B}$ | dB | 0 (Note 1) |
|  |  | $\sigma$ | dB | 0 |
|  | OCNG Pattern (Note 2) |  |  | OP. 1 FDD |
|  | Propagation channel |  |  | AWGN |

|  | Antenna configuration |  | 1x2 Low |
| :---: | :---: | :---: | :---: |
|  | RSRP | $\begin{gathered} \mathrm{dBm} / 15 \\ \mathrm{kHz} \end{gathered}$ | -92 |
| Sidelink UE 1 | Sidelink Transmissions |  | PSCCH+PSSCH |
|  | Timing offset (Note 3) |  | CP/2-24Ts |
|  | Frequency offset (Note 4) | Hz | +1300 |
|  | Synchronization source |  | Cell 1 |
|  | Antenna configuration |  | 1x2 Low |
| Note 1: $P_{B}=0$. |  |  |  |
| Note 2: OCNG is used to fully allocate the available resource blocks to virtual UEs. <br> Note 3: Time offset of Sidelink UE receive signal with respect to Cell1 reference timing. <br> Note 4: Frequency offset of Sidelink UE with respect to Cell 1 reference frequency. | OCNG is used to fully allocate the available resource blocks to virtual UEs. Time offset of Sidelink UE receive signal with respect to Cell1 reference timing. Frequency offset of Sidelink UE with respect to Cell 1 reference frequency. |  |  |

Table 14.6-2: Minimum performance

| Test |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| num. | Bandwidth | PSSCH <br> Reference <br> channel | Propagation <br> condition | Reference value  <br>   <br> (\%)  | PSSCH BLER <br> SSR (dB) of <br> PSSCH |
| 1 | 20 MHz | CD.12 | EVA180 | 10 | 4.9 |

### 14.7 Soft buffer test

The purpose of this test is to verify the maximum number of bits per TTI supported by the V2X UE.
The minimum requirement is specified in Table 14.7-2 with the test parameters specified in Table 14.7-1.
Table 14.7-1: Test Parameters

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-4 (Configuration \#4-V2X) |  |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |  |
| Active cell(s) |  |  | None |  |
| V2X Tx format (SL-V2X-TxProfileList-r15) |  |  | N/A | $\begin{gathered} \text { SL-V2X-TxProfile-r15 }= \\ \text { rel15 } \end{gathered}$ |
| Active Sidelink UE(s) |  |  | Sidelink UE i, $0 \leq \mathrm{i} \leq 14$ |  |
| $\begin{aligned} & \text { Sidelink UE i, } \\ & 0 \leq i \leq 14 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |  |
|  | Time gap between initial transmission and retransmission | Subframe | 15 |  |
|  | Timing offset (Note 1) | $\mu \mathrm{S}$ | 0 |  |
|  | Frequency offset (Note 2) | Hz | 0 |  |
|  | Synchronization source |  | GNSS or GNSS-equivalent |  |
|  | Antenna configuration |  | 1x2 |  |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: 15 sidelink UEs should transmit one by one circularly for every subframe. |  |  |  |  |

Table 14.7-2: Minimum performance

| Test num. | Bandwidth | PSSCH Reference channel | Propagation condition | Reference value |  | $\begin{gathered} \text { ue- } \\ \text { CategorySL- } \\ \text { C-RX } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $\begin{aligned} & \text { PSSCH } \\ & \text { BLER (\%) } \end{aligned}$ | SNR (dB) of PSSCH |  |
| 1 | 20 MHz | CD. 11 | AWGN | 5 | 8.0 | SL-C-RX Category 2 |

| 2 | 20 MHz | CD. 15 | AWGN | 5 | 12.0 | SL-C-RX <br> Category 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 14.8 PSCCH decoding capability test

The purpose of this test is to verify the maximum number of received PSCCHs per subframe supported by the V2X UE.

The minimum requirements are specified in Table 14.8-3 with the test parameters specified in Table 14.8-1 and Table 14.8-2 according to UE capability.

Table 14.8-1: Test Parameters

| Parameter |  | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-5 (Configuration \#5-V2X) |
| Active cell(s) |  |  | None |
| $\begin{aligned} & \text { Sidelink UE } \mathrm{i}, \\ & 0 \leq \mathrm{i} \leq 9 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | Timing offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Synchronization source |  | GNSS or GNSS-equivalent |
|  | Propagation Channel |  | Static propagation condition No external noise sources are applied |
|  | Antenna configuration |  | 1x2 |
|  | PSSCH RMC |  | CD. 12 |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: Cyclic shift for PSCCH DMRS is randomly selected between $\{0,3,6,9\}$ for each PSCCH transmission. |  |  |  |

Table 14.8-2: Test Parameters

| Parameter |  | Unit | Test 2 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-5 (Configuration \#5-V2X) |
| Active cell(s) |  |  | None |
| $\begin{aligned} & \text { Sidelink UE } \mathrm{i}, \\ & 0 \leq \mathrm{i} \leq 19 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | Timing offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Synchronization source |  | GNSS or GNSS-equivalent |
|  | Propagation Channel |  | Static propagation condition No external noise sources are applied |
|  | Antenna configuration |  | $1 \times 2$ |
|  | PSSCH RMC |  | CD. 10 |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: Cyclic shift for PSCCH DMRS is randomly selected between $\{0,3,6,9\}$ for each PSCCH transmission |  |  |  |

### 14.9 Sustained downlink data rate with active sidelink

The purpose of this test is to verify the WAN and V2X operation is not impacted with each other when UE is under concurrent operation. This test case applies to UEs support concurrent operation of V2X communication with E-UTRA uplink/downlink on the operating bands combinations listed in Table 5.5G-2.

The test parameters are in Table 14.9-1, and the test UE is expected to receive all PSSCH and PDSCH transmissions simultaneously.

For PDSCH, the test cases apply to UE categories and bandwidth as specified in Table 14.9-2. The minimum requirements for PSSCH are specified in Table 14.7-2, Table 14.10-3 and Table 14.10-4 with corresponding test applicability and the minimum requirements for PDSCH downlink data rate are specified in Table 14.9-3. Both PDSCH and PSSCH performance will be verified simultaneously. The TB success rate in the cellular link shall be sustained during at least 300 frames.

Table 14.9-1: Test parameters for sustained downlink data rate (FDD 64QAM) and maximum PSSCH processing capability

|  | Parameter | Unit | Test 1 |
| :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-4 (Configuration \#4-V2X) |
| $N_{o c}$ at antenna port |  | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  |  | Cell 1 (PCell) |
| Cell 1 | Test parameters |  | As specified in Table 8.7.1-1 and Table 14.92 |
| Active Sidelink UE(s) |  |  | Sidelink UE i, $0 \leq \mathrm{i} \leq 14$ |
| $\begin{aligned} & \text { Sidelink UE } \mathrm{i}, \\ & 0 \leq \mathrm{i} \leq 14 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |
|  | Time gap between initial transmission and retransmission | Subframe | 15 |
|  | Timing offset (Note 1) | $\mu \mathrm{s}$ | 0 |
|  | Frequency offset (Note 2) | Hz | 0 |
|  | Synchronization |  | GNSS or GNSS-equivalent |
|  | Antenna configuration |  | 1x2 |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: 15 sidelink UEs should transmit one by one circularly for every subframe. |  |  |  |
|  |  |  |  |
|  |  |  |  |

Table 14.9-2: Test cases for sustained data rate

| CA config | Maximum supported | Cat. 1 | Cat. 2 | Cat. 3 | Cat. 4 | Cat. 6,7 | Cat. 9,10 | Cat 11, 12 | DL Cat. 15 |

| NOTE 2: 71112 bits for sub-frame 5. |  |  |  |  |

### 14.10 Soft buffer test (CA)

The purpose of this test is to verify the maximum number of bits per TTI supported by the V2X UE with UE SL-C-RX Category 4 for UEs supporting V2X CA.

For CA with 2 SL CCs, the requirements are specified in Table 14.10-3, based on single carrier requirement specified in Table 14.10-2, with the test parameters specified in Table 14.10-1.

For CA with 3 SL CCs, the requirements are specified in Table 14.10-4, based on single carrier requirement specified in Table 14.10-2, with the test parameters specified in Table 14.10-1.

Table 14.10-1: Test Parameters

| Parameter | Unit | Test 1, 2 |
| :--- | :---: | :---: |
| Communication resource pool configuration |  | As specified in Table A.9-4 <br> (Configuration \#4-V2X) |
| $N_{o c}$ at antenna port | $\mathrm{dBm} / 15 \mathrm{kHz}$ | -98 |
| Active cell(s) |  | None |
| V2X Tx format <br> (SL-V2X-TxProfileList-r15) |  | SL-V2X-TxProfile-r15 = rel15 |

Table 14.10-2: Single carrier performance with different bandwidths for multiple CA configurations

| Bandwidth | PSSCH Reference <br> channel | Propagation <br> condition | Reference value |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | PSSCH <br> BLER (\%) | SNR (dB) of <br> PSSCH |  |
|  | CD.16 | AWGN | 5 | 12.0 |
| 20 MHz | CD. 15 | AWGN | 5 | 12.0 |

Table 14.10-3: Minimum performance for CA with 2 SL CCs

| Test <br> num. | CA Bandwidth <br> combination | Requirement | ue-CategorySL-C- <br> $\mathbf{R X}$ |
| :---: | :---: | :---: | :---: |
| 1 | $10+20 \mathrm{MHz}$ | As specified in $14.10-2$ per CC | SL-C-RX Category <br> 4 |

Table 14.10-4: Minimum performance for CA with 3 SL CCs

| Test <br> num. | CA Bandwidth <br> combination | Requirement | ue-CategorySL-C- <br> RX |
| :---: | :---: | :---: | :---: |
| 2 | $3 \times 10 \mathrm{MHz}$ | As specified in $14.10-2$ per CC | SL-C-RX Category <br> 4 |

### 14.11 PSCCH/PSSCH decoding capability test (CA)

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the UE with UE SL-C-RX Category 4 for UEs supporting V2X CA.

For CA with 2 SL CCs, the requirements are specified in Table 14.11-4 based on single carrier requirement specified in Table 14.11-3, with the test parameters specified in Table 14.11-1 and Table 14.11-2 according to UE capability.

For CA with 3 SL CCs, the requirements are specified in Table 14.11-5 based on single carrier requirement specified in Table 14.11-3, with test parameters specified in Table 14.11-1 and Table 14.11-2 according to UE capability.

Table 14.11-1: Test Parameters

| Parameter |  | Unit | Test 1 | Test 2 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-5 and A.9-6 (Configuration \#5-V2X and \#6-V2X) | As specified in Table A.9-6 (Configuration \#6-V2X) |
| V2X Tx format(SL-V2X-TxProfileList-r15) |  |  | SL-V2X-TxProfile-r15 = rel15 |  |
| Active cell(s) |  |  | None |  |
| $\begin{aligned} & \text { Sidelink UE } \mathrm{i}, \\ & 0 \leq \mathrm{i} \leq 14 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |  |
|  | Timing offset (Note 1) | $\mu \mathrm{s}$ | 0 |  |
|  | Frequency offset (Note 2) | Hz | 0 |  |
|  | Synchronization source |  | GNSS or GNSS-equivalent |  |
|  | Propagation Channel |  | Static propagation condition No external noise sources are applied |  |
|  | Antenna configuration |  | $1 \times 2$ |  |
|  | PSSCH RMC |  | CD. 17 and CD. 18 | CD. 18 |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: Cyclic shift for PSCCH DMRS is randomly selected between $\{0,3,6,9\}$ for each PSCCH transmission. |  |  |  |  |

Table 14.11-2: Test Parameters

| Parameter |  | Unit | Test 3 | Test 4 |
| :---: | :---: | :---: | :---: | :---: |
| Communication resource pool configuration |  |  | As specified in Table A.9-5 and A.9-6 (Configuration \#5-V2X and \#6-V2X) | As specified in Table A.9-6 <br> (Configuration \#6-V2X) |
| V2X Tx format <br> (SL-V2X-TxProfileList-r15) |  |  | SL-V2X-TxProfile-r15 = rel15 |  |
| Active cell(s) |  |  | None |  |
| $\begin{aligned} & \text { Sidelink UE i, } \\ & 0 \leq \mathrm{i} \leq 29 \end{aligned}$ | Sidelink Transmissions |  | PSCCH + PSSCH |  |
|  | Timing offset (Note 1) | $\mu \mathrm{S}$ | 0 |  |
|  | Frequency offset (Note 2) | Hz | 0 |  |
|  | Synchronization source |  | GNSS or GNSS-equivalent |  |
|  | Propagation Channel |  | Static propagation condition No external noise sources are applied |  |
|  | Antenna configuration |  | $1 \times 2$ |  |
|  | PSSCH RMC |  | CD. 19 and CD. 20 | CD. 20 |
| Note 1: Time offset of Sidelink UE receive signal with respect to GNSS reference timing. <br> Note 2: Frequency offset of Sidelink UE with respect to GNSS reference frequency. <br> Note 3: Cyclic shift for PSCCH DMRS is randomly selected between $\{0,3,6,9\}$ for each PSCCH transmission. |  |  |  |  |

Table 14.11-3: Single carrier performance with different bandwidths for multiple CA configurations

| Bandwidth | PSCCH Reference <br> channel | $\hat{E}_{S}$ at <br> antenna port <br> $(\mathbf{d B m} / 15 \mathrm{kHz})$ | Reference value <br>  |
| :---: | :---: | :---: | :---: |
| 10 MHz | CC .8 | -85 | 1 |

| 20 MHz | CC. 8 | -85 | 1 |
| :---: | :---: | :---: | :---: |

Table 14.11-4: Minimum performance for CA configuration with 2 SL CCs

| Test <br> number | CA Bandwidth combination <br> $(\mathbf{M H z})$ | Minimum performance requirement |
| :---: | :---: | :---: |
| 1 | $10+20$ | As defined in Table 14.11-3 per CC |
| 3 | $10+20$ | As defined in Table 14.11-3 per CC |

Table 14.11-5: Minimum performance for CA configuration with 3 SL CCs

| Test <br> number | CA Bandwidth combination <br> $\mathbf{( M H z )}$ | Minimum performance requirement |
| :---: | :---: | :---: |
| 2 | $3 \times 10$ | As defined in Table 14.11-3 per CC |
| 4 | $3 \times 10$ | As defined in Table 14.11-3 per CC |

## Annex A (normative): Measurement channels

## A. 1 General

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per datastream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all datastreams (codewords).

The UE category entry in the definition of the reference measurement channel in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual minimum requirements.

## A. 2 UL reference measurement channels

## A.2.1 General

The measurement channels in the following subclauses are defined to derive the requirements in clause 6 (Transmitter Characteristics) and clause 7 (Receiver Characteristics). The measurement channels represent example configurations of physical channels for different data rates.

## A.2.1.1 Applicability and common parameters

The UL reference measurement channels comprise transmission of PUSCH and Demodulation Reference signals only. The following conditions apply:

- 1 HARQ transmission
- Cyclic Prefix normal
- PUSCH hopping off
- Link adaptation off
- Demodulation Reference signal as per TS 36.211 [4] subclause 5.5.2.1.2.

Where ACK/NACK is transmitted, it is assumed to be multiplexed on PUSCH as per TS 36.212 [5] subclause 5.2.2.6.

- ACK/NACK 1 bit
- ACK/NACK mapping adjacent to Demodulation Reference symbol
- ACK/NACK resources punctured into data
- Max number of resources for ACK/NACK: 4 SC-FDMA symbols per subframe
- No CQI transmitted, no RI transmitted

## A.2.1.2 Determination of payload size

The algorithm for determining the payload size $A$ is as follows; given a desired coding rate $R$ and radio block allocation $N_{\text {RB }}$

1. Calculate the number of channel bits $N_{\mathrm{ch}}$ that can be transmitted during the first transmission of a given sub-frame.
2. Find $A$ such that the resulting coding rate is as close to $R$ as possible, that is,
$\min \left|R-\left(A+24^{*}\left(N_{C B}+1\right)\right) / N_{c h}\right|$, where $N_{C B}=\left\{\begin{array}{l}0, \text { if } C=1 \\ C, \text { if } C>1\end{array}\right.$,
subject to
a) A is a valid TB size according to section 7.1 .7 of TS 36.213 [6] assuming an allocation of $N_{\mathrm{RB}}$ resource blocks.
b) $C$ is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
c) For RMC-s, which at the nominal target coding rate do not cover all the possible UE categories for the given modulation, reduce the target coding rate gradually (within the same modulation), until the maximal possible number of UE categories is covered.
3. If there is more than one $A$ that minimises the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93 .

## A.2.1.3 Overview of UL reference measurement channels

In Table A.2.1.3-1 to A.2.1.3-1 K are listed the UL reference measurement channels specified in annexes A.2.2 and A.2.3 of this release of TS 36.101. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for requirements are annexes A.2.2 and A.2.3 as appropriate.

## A.2.2 Reference measurement channels for FDD

## A.2.2.1 Full RB allocation

## A.2.2.1.1 QPSK

Table A.2.2.1.1-1: Reference Channels for QPSK with full RB allocation

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |

| Allocated resource blocks |  | 6 | 15 | 25 | 50 | 75 | 100 |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 5$ | $1 / 6$ |
| Payload size | Bits | 600 | 1544 | 2216 | 5160 | 4392 | 4584 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (Note 1) |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per Sub-Frame | Bits | 1728 | 4320 | 7200 | 14400 | 21600 | 28800 |
| Total symbols per Sub-Frame |  | 864 | 2160 | 3600 | 7200 | 10800 | 14400 |
| UE Category |  | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ | $\geq 1$ |

Note 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit)

Table A.2.2.1.1-1a: Reference Channels for QPSK with full/maximum RB allocation for UE UL category 0

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 15 | 25 | 36 | 36 | 36 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate | Bits | $1 / 3$ | $1 / 5$ | $1 / 8$ | $1 / 10$ | $1 / 10$ | $1 / 10$ |
| Payload size | Bits | 24 | 872 | 904 | 1000 | 1000 | 1000 |
| Transport block CRC |  | 1 | 1 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (NOTE 1) |  |  | 1 | 1 | 1 | 1 |  |
| Total number of bits per Sub-Frame | Bits | 1728 | 4320 | 7200 | 10368 | 10368 | 10368 |
| Total symbols per Sub-Frame |  | 864 | 2160 | 3600 | 5184 | 5184 | 5184 |
| UE UL Category |  | 0 | 0 | 0 | 0 | 0 | 0 |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th, 6th, 12th, 13th, 14th, 20th, 21 st , 22nd, 28th, 29th, 30th, 36th, 37 th, and 38 th subframes every 40 ms . Information bit payload is available if uplink subframe is scheduled.

Table A.2.2.1.1-1b: Reference Channels for QPSK with full/maximum RB allocation for UE UL category M1

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 6 | 6 | 6 | 6 | 6 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate | Bits | $1 / 3$ | 600 | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 24 | 24 | 600 | 600 | 600 | 600 |
| Transport block CRC |  | 1 | 1 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (NOTE 1) | Bits | 1728 | 1728 | 1728 | 1728 | 1728 | 1728 |
| Total number of bits per Sub-Frame |  | 864 | 864 | 864 | 864 | 864 | 864 |
| Total symbols per Sub-Frame |  | M1 | M1 | M1 | M1 | M1 | M1 |
| UE UL Category |  |  |  | 1 | 1 | 1 |  |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $\mathrm{L}=24$ Bits is attached to each Code Block (otherwise L = 0 Bit)
NOTE 2: For HD-FDD UE with $N_{a b s}^{P U S C H}=1$, the uplink subframes are scheduled at the 4th, 5 th and 6 th subframes every 10 ms for the channel bandwidth $5 \mathrm{MHz} / 10 \mathrm{MHz} / 15 \mathrm{MHz} / 20 \mathrm{MHz}$. For HDFDD UE, the uplink subframes are scheduled at the 5 th, 6 th and 7 th subframes every 10 ms for the channel bandwidth $1.4 \mathrm{MHz} / 3 \mathrm{MHz}$. Information bit payload is available if uplink subframe is scheduled. $N_{a b s}^{P U S C H}$ is total number of absolute subframes a PUSCH with repetition spans [4].

```
NOTE 3: For HD-FDD UE with }\mp@subsup{N}{abs}{PUSCH}>1\mathrm{ , MPDCCH are scheduled at Oth DL subframe every \(N_{a b s}^{\text {PUSCH }}+5\) subframes (starting from the 0th subframe). The associated PUSCH is scheduled at the 4th to ( \(N_{a b s}^{\text {PUSCH }}+3\) )-th UL subframes every \(N_{a b s}^{\text {PUSCH }}+5\) subframes. Information bit payload is available if uplink subframe is scheduled.
```

Table A.2.2.1.1-1c: Reference Channels for QPSK with full/maximum RB allocation for UE UL category M2

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 12 | 24 | 24 | 24 | 24 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | QPSK | QPSK | QPSK | QPSK | QPSK | QPSK |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 600 | 1224 | 2472 | 2472 | 2472 | 2472 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (NOTE 1) |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per Sub-Frame | Bits | 1728 | 3456 | 6912 | 6912 | 6912 | 6912 |
| Total symbols per Sub-Frame |  | 864 | 1728 | 3456 | 3456 | 3456 | 3456 |
| UE UL Category |  | M 2 | M 2 | M 2 | M 2 | M 2 | M 2 |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit)
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10 ms for the channel bandwidth $5 \mathrm{MHz} / 10 \mathrm{MHz} / 15 \mathrm{MHz} / 20 \mathrm{MHz}$. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10 ms for the channel bandwidth $1.4 \mathrm{MHz} / 3 \mathrm{MHz}$. Information bit payload is available if uplink subframe is scheduled.

## A.2.2.1.2 16-QAM

Table A.2.2.1.2-1: Reference Channels for 16-QAM with full RB allocation

| Parameter | Unit | Value |  |  |  |  |  |

| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 5 | 5 | 5 | 5 | 5 | 5 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | 16 QAM | 16 QAM | 16QAM | 16QAM | 16QAM | 16QAM |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 872 | 872 | 872 | 872 | 872 | 872 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per Sub-Frame | Bits | 2880 | 2880 | 2880 | 2880 | 2880 | 2880 |
| Total symbols per Sub-Frame |  | 720 | 720 | 720 | 720 | 720 | 720 |
| UE Category |  | M1 | M1 | M1 | M1 | M1 | M1 |
| AETE |  |  |  |  |  |  |  |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit).
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10 ms for the channel bandwidth $5 \mathrm{MHz} / 10 \mathrm{MHz} / 15 \mathrm{MHz} / 20 \mathrm{MHz}$. For HD-FDD UE, the uplink subframes are scheduled at the 5 th, 6 th and 7 th subframes every 10 ms for the channel bandwidth $1.4 \mathrm{MHz} / 3 \mathrm{MHz}$. Information bit payload is available if uplink subframe is scheduled.

Table A.2.2.1.2-1c: Reference Channels for 16-QAM with maximum RB allocation for UE UL category M2

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 12 | 24 | 24 | 24 | 24 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | 16 QAM | 16 QAM | 16 QAM | 16 QAM | 16 QAM | 16 QAM |
| Target Coding rate |  | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ | $1 / 3$ |
| Payload size | Bits | 1032 | 2088 | 4264 | 4264 | 4264 | 4264 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame |  | 1 | 1 | 1 | 1 | 1 | 1 |
| Total number of bits per Sub-Frame | Bits | 3456 | 6912 | 13824 | 13824 | 13824 | 13824 |
| Total symbols per Sub-Frame |  | 864 | 1728 | 3456 | 3456 | 3456 | 3456 |
| UE Category |  | M2 | M2 | M2 | M2 | M2 | M2 |
| AETE |  |  |  |  |  |  |  |

NOTE 1: If more than one Code Block is present, an additional CRC sequence of $L=24$ Bits is attached to each Code Block (otherwise $L=0$ Bit).
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th and 6th subframes every 10 ms for the channel bandwidth $5 \mathrm{MHz} / 10 \mathrm{MHz} / 15 \mathrm{MHz} / 20 \mathrm{MHz}$. For HD-FDD UE, the uplink subframes are scheduled at the 5th, 6th and 7th subframes every 10 ms for the channel bandwidth $1.4 \mathrm{MHz} / 3 \mathrm{MHz}$. Information bit payload is available if uplink subframe is scheduled.

## A.2.2.1.3 64-QAM

Table A.2.2.1.3-1: Reference Channels for 64-QAM with full RB allocation

| Parameter | Unit | Value |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel bandwidth | MHz | 1.4 | 3 | 5 | 10 | 15 | 20 |
| Allocated resource blocks |  | 6 | 15 | 25 | 50 | 75 | 100 |
| DFT-OFDM Symbols per Sub-Frame |  | 12 | 12 | 12 | 12 | 12 | 12 |
| Modulation |  | 64QAM | 64QAM | 64QAM | 64QAM | 64QAM | 64QAM |

| Target Coding rate |  | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ | $3 / 4$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Payload size | Bits | 3752 | 9528 | 15840 | 31704 | 46888 | 63776 |
| Transport block CRC | Bits | 24 | 24 | 24 | 24 | 24 | 24 |
| Number of code blocks per Sub-Frame <br> (Note 1) |  | 1 | 2 | 3 | 6 | 8 | 11 |
| Total number of bits per Sub-Frame | Bits | 5184 | 12960 | 21600 | 43200 | 64800 | 86400 |
