The throughput measurement of each carrier derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.6.3A.5-1.

**Table 7.6.3A.1.5-1: Narrow-band blocking**

Parameter	Unit	CA Bandwidth Class				
		B	C	D	E	F
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
P <sub>uw</sub> (CW)			16			
F <sub>uw</sub> (offset for $\Delta f = 15$ kHz)	MHz		- F <sub>offset</sub> - 0.2 / + F <sub>offset</sub> + 0.2			
F <sub>uw</sub> (offset for $\Delta f = 7.5$ kHz)						
Note 1:	The transmitter shall be set to 4dB below P <sub>C<sub>MAX</sub>L</sub> or P <sub>C<sub>MAX</sub>L,CA</sub> as defined in subclause 6.2.5 for one uplink carrier and in subclause 6.2.5A for two uplink carriers.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The F <sub>interferer</sub> (offset) is relative to the centre frequency of the adjacent CC being tested and shall be further adjusted to $\lfloor F_{interferer} / 0.015 + 0.5 \rfloor 0.015 + 0.0075$ MHz to be offset from the sub-carrier raster for interferer signal above the wanted signal and adjusted to $\lfloor F_{interferer} / 0.015 + 0.5 \rfloor 0.015 - 0.0075$ MHz to be offset from the sub-carrier raster for interferer signal below the wanted signal.					

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.6.3A.1.5-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

### 7.6.3A.2 Narrow band blocking for CA (intra-band contiguous DL CA without UL CA)

#### 7.6.3A.2.1 Test Purpose

Same test purpose as 7.6.3A.1.

#### 7.6.3A.2.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support intra-band contiguous DL CA. This test case applies only for CA Configurations that do not support UL CA.

#### 7.6.3A.2.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.6.3A.0.

#### 7.6.3A.2.4 Test Description

##### 7.6.3A.2.4.1 Initial Conditions

Same initial conditions as in clause 7.6.3A.1.4.1 with the following exceptions:

- instead of Table 7.6.3A.1.4.1-1 → use Table 7.6.3A.2.4.1-1.
- Instead of clause 7.6.3A.1.4.3 → use clause 7.6.3A.2.4.3.

Table 7.6.3A.2.4.1-1: Test Configuration Table

Initial Conditions							
Test Environment as specified in TS 36.508[7] subclause 4.1					NC

#### 7.6.3A.2.4.2 Test Procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC according to Table 7.6.3A.2.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for  $C\_RNTI$  to schedule the UL RMC according to Table 7.6.3A.2.4.1-1 on PCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal below the aggregated component carriers according to Table 7.6.3A.1.5-1.

7. Set the downlink signal level according to the table 7.6.3A.1.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.6.3A.1.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. Measure the average throughput for each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.
9. Repeat steps from 6 to 8, using an interfering signal above the aggregated component carriers at step 6.

#### 7.6.3A.2.4.3 Message Contents

Same message contents as in clause 7.6.3.4.3.

#### 7.6.3A.2.5 Test Requirement

Same test requirement as in clause 7.6.3A.1.5 with the following exceptions:

- Instead of Table 7.6.3A.1.5-1 → use Table 7.6.3A.2.5-1.

**Table 7.6.3A.2.5-1: Narrow-band blocking**

Parameter	Unit	CA Bandwidth Class				
		B	C	D	E	F
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
		16	16			
P <sub>uw</sub> (CW)	dBm	-55	-55			
F <sub>uw</sub> (offset for $\Delta f = 15$ kHz)	MHz	- F <sub>offset</sub> - 0.2 / + F <sub>offset</sub> + 0.2	- F <sub>offset</sub> - 0.2 / + F <sub>offset</sub> + 0.2			
F <sub>uw</sub> (offset for $\Delta f = 7.5$ kHz)	MHz					
Note 1:	The transmitter shall be set to 4dB below P <sub>C<sub>MAX,L</sub></sub> or P <sub>C<sub>MAX,L,CA</sub></sub> as defined in subclause 6.2.5.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The F <sub>interferer</sub> (offset) is relative to the centre frequency of the adjacent CC being tested and shall be further adjusted to $\lfloor \frac{F_{interferer}}{0.015 + 0.5} \rfloor 0.015 + 0.0075$ MHz to be offset from the sub-carrier raster.					

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.6.3A.2.5-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

### 7.6.3A.3 Narrow band blocking for CA (inter-band DL CA without UL CA)

#### 7.6.3A.3.1 Test Purpose

Same test purpose as 7.6.3A.1.

#### 7.6.3A.3.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support inter-band DL CA without UL CA.

#### 7.6.3A.3.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.6.3A.0.

#### 7.6.3A.3.4 Test Description

##### 7.6.3A.3.4.1 Initial Conditions

Same initial conditions as in clause 7.6.3A.1.4.1 with the following exceptions:

- instead of Table 7.6.3A.1.4.1-1 → use Table 7.6.3A.3.4.1-1.
- Instead of clause 7.6.3A.1.4.3 → use clause 7.6.3A.3.4.3.

Table 7.6.3A.3.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1			NC			
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2			A: Mid range for PCC and SCC			
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE			Highest $N_{RB\_agg}$ for PCC and SCC			
Test Parameters for CA Configurations

100	50	QPSK	100	50	QPSK	50
100	75	QPSK	100	75	QPSK	100
100	100	QPSK	100	100	QPSK	75
100	100	QPSK	100	100	QPSK	50
Note 1: CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-2. Note 2: Depending on CA configurations, only the appropriate Uplink RB allocation value according to table 7.3A.3.5-2 for UE supporting one uplink carrier is tested per Test CA configuration. Note 3: The UL resource blocks shall be located as close as possible to the downlink PCC but confined within the transmission bandwidth configuration for the channel bandwidth (Table 5.4.2-1). Note 4: The frequencies of PCC and SCC shall be switched and tested in each configuration, according to the UE declared capability for UL support (within CA operation) in the individual bands. (given UL is supported in PCC band as per Table 5.2-1).						

## 7.6.3A.3.4.2 Test Procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.3A.3.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.

5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.3A.3.4.1-1 on PCC. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal below the SCC according to Table 7.6.3A.3.5-1.
7. Set the downlink signal level according to the table 7.6.3A.3.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.6.3A.3.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. Measure the average throughput of SCC for duration sufficient to achieve statistical significance according to Annex G.2.
9. Repeat steps from 6 to 8, using an interfering signal above the SCC at step 6.

#### 7.6.3A.3.4.3 Message Contents

Same message contents as in clause 7.6.3.4.3.

#### 7.6.3A.3.5 Test Requirement

For inter-band carrier aggregation with uplink assigned to one E-UTRA band the narrow-band blocking requirements are defined with the uplink active on the band other than the band whose downlink is being tested, i.e. the requirements are tested only for the SCell downlink. The UE shall meet the requirement for each component carrier, when operated as SCell, while both downlink carriers are active.

The throughput measured during the test procedure for each component carrier, when operated as SCell, shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.6.3A.3.5-1 (originated from the single carrier Table 7.6.3.5-1).

**Table 7.6.3A.3.5-1: Narrow-band blocking**

Parameter	Unit	Channel Bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	P <sub>REFSENS</sub> + channel-bandwidth specific value below					
		22	18	16	13	14	16
P <sub>uw</sub> (CW)	dBm	-55	-55	-55	-55	-55	-55
F <sub>uw</sub> (offset for $\Delta f = 15$ kHz from SCC)	MHz	0.9075	1.7025	2.7075	5.2125	7.7025	10.2075
F <sub>uw</sub> (offset for $\Delta f = 7.5$ kHz from SCC)	MHz						
Note 1: The transmitter shall be set a 4 dB below P <sub>C<sub>MAX,L</sub></sub> with P <sub>C<sub>MAX,L</sub></sub> as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.6.3A.3.5-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

#### 7.6.3A.4 Narrow band blocking for CA (intra-band non-contiguous DL CA without UL CA)

##### 7.6.3A.4.1 Test Purpose

Same as in clause 7.6.3A.1.1.

7.6.3A.4.2 Test Applicability

This test case applies to all types of E-UTRA UE release 11 and forward that support intra-band non-contiguous DL CA but no UL CA.

7.6.3A.4.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.6.3A.0.

7.6.3A.4.4 Test description

7.6.3A.4.4.1 Initial Conditions

Same as in clause 7.6.3A.1.4.1 with the following exceptions:

- Instead of Table 7.6.3A.1.4.1-1 → use Table 7.6.3A.4.4.1-1.

**Table 7.6.3A.4.4.1-1: Test Configuration Table**

Initial Conditions

23	100	100	160	QPSK	100+100	QPSK	P_100@0
Note 1:	CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-3.						
Note 2:	The carrier centre frequency of PCC in the UL operating band is configured closer to the DL operating band.						
Note 3:	Applicable if only Bandwidth Combination Set 0 is supported by the UE for the CA Configuration						
Note 4:	Not applicable if only Bandwidth Combination Set 0 is supported by the UE for the CA Configuration						

#### 7.6.3A.4.4.2 Test Procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.6.3A.4.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).

4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.3A.3.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.3A.4.4.1-1 on PCC. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the parameters of the signal generator for the interfering signal below the PCC according to Tables 7.6.3A.4.5-1.
7. Set the downlink signal level for PCC and SCC according to the table 7.6.3.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.6.3A.4.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. Measure the average throughput for each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.
9. Repeat steps from 6 to 8, using the interfering signal above the PCC at step 6.
10. Repeat the steps from 6 to 9, using the interferer signal to the SCC.

#### 7.6.3A.4.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 2, for SCC configuration there are no additional message contents.

#### 7.6.3A.4.5 Test Requirement

For intra-band non-contiguous carrier aggregation with one uplink carrier and two downlink carriers, the narrow band blocking requirements are defined with the uplink configuration of the PCC being in accordance with Table 7.3A.0-3. The UE shall meet the requirements specified in table 7.6.3A.4.5-1 for each component carrier while both downlink carriers are active. The requirements for each component carrier are the same as single carrier requirements in Table 7.6.3.5-1.

The throughput measurement derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.6.3A.4.5-1.

**Table 7.6.3A.4.5-1: Narrow-band blocking**

Parameter	Unit	Channel Bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Pw in Transmission Bandwidth Configuration, per CC	dBm	P <sub>REFSENS</sub> + channel-bandwidth specific value below					
		22	18	16	13	14	16
P <sub>uw</sub> (CW)	dBm	-55	-55	-55	-55	-55	-55
F <sub>uw</sub> (offset for $\Delta f = 15$ kHz)	MHz	0.9075	1.7025	2.7075	5.2125	7.7025	10.2075
F <sub>uw</sub> (offset for $\Delta f = 7.5$ kHz)	MHz						
Note 1: The transmitter shall be set a 4 dB below P <sub>CMAX,L</sub> with P <sub>CMAX,L</sub> as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.6.3A.4.5-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

#### 7.6.3A.5 Narrow band blocking for CA (3DL CA without UL CA)

##### 7.6.3A.5.1 Test Purpose

Same test purpose as 7.6.3A.1.

7.6.3A.5.2 Test Applicability

This test case applies to all types of E-UTRA UE release 10 and forward that support 3DL Intra-band contiguous CA or 3DL Inter-band CA or 3DL Intra-band contiguous + Inter-band CA.

This test case also applies to all types of E-UTRA UE release 11 and forward that support 3DL Intra-band non-contiguous CA + Inter-band CA or 3DL Intra-band non-contiguous + Intra-band contiguous CA.

This test case also applies to all types of E-UTRA UE release 12 and forward that support 3DL CA with FDD-TDD CA.

7.6.3A.5.3 Minimum Conformance Requirements

Same as in clause 7.6.3A.1.

7.6.3A.5.4 Test Description

7.6.3A.5.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA CA configurations specified in table 5.4.2A.1-1 through table 5.4.2A.1-2a. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.6.3A.5.4.1-1 through table 7.6.3A.5.4.1-5 as appropriate. The details of the uplink reference measurement channels (RMCs) are specified in Annex A.2 and A.3. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.6.3A.5.4.1-1: Test Configuration Table (Intra-band contiguous)**

Initial Conditions												
Test Environment as specified in TS 36.508 [7] subclause 4.1						NC						
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes.						For test frequencies refer to "Range" columns. For mapping within Band refer to "CC" columns						
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE.						Refer to "PCC $N_{RB}$ " and "SCCs $N_{RB}$ " columns						
Network signalling value						NS_01 by default, exceptions listed in Table 7.3.3-3, dependent on PCC Band						
Test Parameters for CA Configurations												
ID	CA Configuration / $N_{RB\_agg}$						DL Allocation			UL Allocation (Note 2,3)		
	CA Configuration			PCC $N_{RB}$	SCCs $N_{RB}$		CC MOD	PCC & SCCs RB allocation			CC MOD	PCC $L_{CRB}$ @ $RB_{start}$
	Band	Range	PCC CC		SCC1 CC	SCC2 CC		PCC	SCC1	SCC2		
Default Test Settings for a CA_XD Configuration												
1	X	Mid	CC1	CC2	CC3	Lowest $N_{RB\_agg}$	QPSK	All RBs			QPSK	REFSENS
2	X	Mid	CC1	CC2	CC3	Highest $N_{RB\_agg}$	QPSK	All RBs			QPSK	REFSENS
Note 1: CA Configuration Test CC Combination test settings are checked separately for each CA Configuration. Note 2: Use CA Configuration – specific test points if present in the table, otherwise use Default Test Settings test points. Note 3: X corresponds to the band of the CA Configuration. Eg. for CA_41D ,X=41 Note 4: REFSENS refers to the PCC band's and PCC $N_{RB}$ 's single carrier Uplink RB allocation for reference sensitivity according to table 7.3.5-2. Note 5: If in the CA Configuration UE supports multiple CC Combinations with the same $N_{RB\_agg}$ , choose for testing the Combination with maximum $N_{RB\_PCC}$ and then select maximum $N_{RB\_SCC1}$ for the chosen $N_{RB\_PCC}$												

**Table 7.6.3A.5.4.1-2: Test Configuration Table (Inter-band)**

Initial Conditions															
Test Environment as specified in TS 36.508[7] subclause 4.1											NC				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes.											For test frequencies refer to "Range" columns. For mapping within Band refer to "CC" columns				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE.											Refer to "PCC $N_{RB}$ " and "SCCs $N_{RB}$ " columns				
Network signalling value											NS_01 by default, exceptions listed in Table 7.3.3-3, dependent on PCC Band				
Test Parameters for CA Configurations															
ID	CA Configuration / $N_{RB\_agg}$							DL Allocation			UL Allocation (Note 2,3)				
	CA Configuration						PCC $N_{RB}$	SCCs $N_{RB}$		CC MOD	PCC & SCCs RB allocation			CC MOD	PCC $L_{CRB}$ @ $RB_{start}$
	PCC		SCC1		SCC2			SCC1	SCC2		PCC	SCC1	SCC2		
	Band	Range	Band	Range	Band	Range									
Default Test Settings for a CA_XA-YA-ZA Configuration															
1	X	Mid	Y	Mid	Z	Mid	Highest $N_{RB}$	Highest $N_{RB}$	Highest $N_{RB}$	QPSK	All RBs	QPSK	REFSENS		
2	Y	Mid	X	Mid	Z	Mid	Highest $N_{RB}$	Highest $N_{RB}$	Highest $N_{RB}$	QPSK	All RBs	QPSK	REFSENS		
3	Z	Mid	X	Mid	Y	Mid	Highest $N_{RB}$	Highest $N_{RB}$	Highest $N_{RB}$	QPSK	All RBs	QPSK	REFSENS		
Note 1: CA Configuration Test CC Combination test settings are checked separately for each CA Configuration. Note 2: Use CA Configuration – specific test points if present in the table, Otherwise use test points from matching Group Test Settings, if present in the table. Otherwise use the Default Test Settings test points. Note 3: If, according to the UE declared capability, UE does not support UL in an individual band within the CA Configuration, test points with that individual band as PCC are not applicable. Note 4: X,Y,Z correspond to the different bands in the CA Configuration. Eg. for CA_1A-3A-19A,X=1,Y=3,Z=19 Note 5: REFSSENS refers to the PCC band's and PCC $N_{RB}$ 's single carrier Uplink RB allocation for reference sensitivity according to table 7.3.5-2.															

**Table 7.6.3A.5.4.1-3: Test Configuration Table (Intra-band contiguous + Inter-band)**

Initial Conditions															
Test Environment as specified in TS 36.508[7] subclause 4.1										NC					
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes.										For test frequencies refer to “Range” columns. For mapping within Band refer to “CC” columns					
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE.										Refer to “PCC $N_{RB}$ ” and “SCCs $N_{RB}$ ” columns					
Network signalling value										NS_01 by default, exceptions listed in Table 7.3.3-3, dependent on PCC Band					
Test Parameters for CA Configurations															
ID	CA Configuration / $N_{RB\_agg}$							DL Allocation			UL Allocation (Note 2,3)				
	CA Configuration						PCC $N_{RB}$	SCCs $N_{RB}$		CC MOD	PCC & SCCs RB allocation			CC MOD	PCC $L_{CRB}$ @ $RB_{start}$

2	41	CC3	-	CC2	134.2	CC1	100	100	100	QPSK	All RBs	QPSK	100@0		
Note 1: CA Configuration Test CC Combination test settings are checked separately for each CA Configuration. Note 2: Use CA Configuration – specific test points if present in the table, otherwise use Default Test Settings test points. Note 3: If, according to the UE declared capability, UE does not support UL in an individual band within the CA Configuration, test points with that individual band as PCC are not applicable. Note 4: X corresponds to the band of the CA Configuration. Eg. for CA_41C-41A, X=41. Note 5: REFSENS refers to the PCC band's and PCC $N_{RB}$ 's single carrier Uplink RB allocation for reference sensitivity according to table 7.3.5-2. Note 6: If in the CA Configuration UE supports multiple CC Combinations with the same $N_{RB\_agg}$ , choose the Combination with $N_{RB\_CC1} = N_{RB\_CC2}$ for testing. If no such combination is supported, choose Combination with maximum $N_{RB\_CC1}$ for testing.															

1. Connect the SS to the UE antenna connectors as shown in TS 36.508[7] Annex A Figure group [TBD] as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause [4.4.3].
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1, and C.3.1, and uplink signals according to Annex H.1 and H.3.0.
4. The UL and DL Reference Measurement channels are set according to Table 7.6.3A.5.4.1-1 through Table 7.6.3A.5.4.1-5 as appropriate.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.6.3A.5.4.3.

**7.6.3A.5.4.2 Test Procedure**

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels except PHICH.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.6.3A.5.4.3

3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.3A.5.4.1-1 through Table 7.6.3A.5.4.1-5 as appropriate on PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.3A.5.4.1-1 through Table 7.6.3A.5.4.1-5 on PCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal below the aggregated component carriers according to Table 7.6.3A.5.4.2-1.
7. Set the downlink signal level according to the table 7.6.3A.5.4.2-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.6.3A.5.4.2-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. Measure the average throughput for the carrier(s) indicated in Table 7.6.3A.5.4.2-1 for duration sufficient to achieve statistical significance according to Annex G.2A.
9. Repeat steps from 6 to 8, using an interfering signal above the measured carrier(s) according to Table 7.6.3A.5.4.2-1 at step 6.
10. Repeat steps 1 to 9 for component carriers listed in Table 7.6.3A.5.4.2-1.

**Table 7.6.3A.5.4.2-1: Test repetition and measurement configuration**

CA configuration	ID (Note 1)	Throughput measured on (Note 3)	Table with test parameters to select (Note 2)
Intra-band contiguous	1	PCC, SCC1, SCC2	7.6.3A.5.5-1
	2		
Inter-band	1	SCC1	7.6.3A.5.5-2
		SCC2	
	2	SCC1	
		SCC2	
	3	SCC1	
		SCC2	
Intra-band contiguous + Inter-band	1	SCC2	7.6.3A.5.5-2
	2		
	3	SCC1, SCC2	7.6.3A.5.5-1
	4		
Intra-band non-contiguous + Inter-band	1	SCC2	7.6.3A.5.5-2
	2	SCC1, SCC2	7.6.3A.5.5-2
Intra-band non-contiguous + Intra-band contiguous		1	PCC
	SCC1, SCC2		7.6.3A.5.5-1
	2	SCC2	7.6.3A.5.5-2
		PCC, SCC1	7.6.3A.5.5-1
Note 1: Test point ID for the particular CA configuration as defined in section 7.6.3A.5.4.1. Note 2: The reference for the placement of the interferer signals is the centre frequency of the carrier closest to the interferer among the carriers throughput is measured on. Note 3: Where there are multiple rows for a single Test point ID, the test is repeated for each row.			

## 7.6.3A.5.4.3 Message Contents

Same message contents as in clause 7.6.3.4.3.

## 7.6.3A.5.5 Test Requirement

The throughput measurement of each carrier derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table Tables below, according to the type of CA.

**Table 7.6.3A.5.5-1: Narrow-band blocking (intra-band contiguous)**

Parameter	Unit	CA Bandwidth Class				
		B	C	D	E	F
Power per CC in Aggregated Transmission Bandwidth Configuration	dBm	REFSENS + CA Bandwidth Class specific value below				
		16	16 <sup>4</sup>	16		
$P_{uw}$ (CW)	dBm	-55	-55	-55		
$F_{uw}$ (offset for $\Delta f = 15$ kHz)		MHz	- $F_{offset} - 0.2$ / + $F_{offset} + 0.2$	- $F_{offset} - 0.2$ / + $F_{offset} + 0.2$	- $F_{offset} - 0.2$ / + $F_{offset} + 0.2$	
$F_{uw}$ (offset for $\Delta f = 7.5$ kHz)	MHz					
Note 1:	The transmitter shall be set to 4dB below $P_{CMAX,L}$ or $P_{CMAX,L,CA}$ as defined in subclause 6.2.5.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The $F_{interferer}$ (offset) is the frequency separation of the centre frequency of the carrier closest to the interferer and the centre frequency of the interferer and shall be further adjusted to $\lfloor F_{interferer} / 0.015 + 0.5 \rfloor \cdot 0.015 + 0.0075$ MHz to be offset from the sub-carrier raster.					
Note 4:	The requirement is applied for the band combinations whose component carriers' $BW \geq 5$ MHz.					

**Table 7.6.3A.5.5-2: Narrow-band blocking (inter-band, intra-band non-contiguous)**

Parameter	Unit	Channel Bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
$P_w$ for each CC	dBm	$P_{REFSENS}$ + channel-bandwidth specific value below					
		22	18	16	13	14	16
$P_{uw}$ (CW)	dBm	-55	-55	-55	-55	-55	-55
$F_{uw}$ (offset for $\Delta f = 15$ kHz from SCC)		MHz	0.9075	1.7025	2.7075	5.2125	7.7025
$F_{uw}$ (offset for $\Delta f = 7.5$ kHz from SCC)	MHz						
Note 1:	The transmitter shall be set to 4 dB below $P_{CMAX,L}$ with $P_{CMAX,L}$ as defined in clause 6.2.5.						
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						
Note 3:	For intra-band non-contiguous + inter-band CA, $\Delta R_{IBNC} = 0$ dB for all sub-block gaps.						

For a UE, which supports CA configuration in Table 7.3.3-1A or 7.3.3-1B,  $P_{uw}$  power defined in Table 7.6.3A.5.5-2 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A or 7.3.3-1B accordingly.

## 7.6.3B Narrow band blocking for UL-MIMO

## 7.6.3B.1 Test Purpose

Narrow band blocking for UL-MIMO is defined for an unwanted CW interfering signal falling near the UE that supports UL-MIMO receive band, at which a given average throughput shall meet or exceed the requirement for the specified measurement channels,

The lack of narrow-band blocking ability will decrease the coverage area when other e-NodeB transmitters exist (except in the adjacent channels and spurious response).

## 7.6.3B.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support UL-MIMO.

## 7.6.3B.3 Minimum Conformance Requirements

For UE with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements in clause 7.6 shall be met with the UL-MIMO configurations specified in Table 6.2.2B-2. For UL-MIMO, the parameter  $P_{\text{CMAX,L}}$  is defined as the total transmitter power over the two transmit antenna connectors.

## 7.6.3B.4 Test Description

### 7.6.3B.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.6.3B.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.6.3B.4.1-1: Test Configuration Table**

Initial Conditions						
Test Environment as specified in TS 36.508 [7] clause 4.1			NC			
Test Frequencies as specified in TS 36.508 [7] clause 4.3.1			Mid range			
Test Channel Bandwidths as specified in TS 36.508 [7] clause 4.3.1			Lowest, 5MHz, Highest			
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD	TDD		FDD	TDD
1.4MHz	QPSK	6	6	QPSK	6	6
3MHz	QPSK	15	15	QPSK	15	15
5MHz	QPSK	25	25	QPSK	25	25
5MHz	QPSK	25	N/A	QPSK	20	N/A
5MHz	QPSK	25	N/A	QPSK	15	N/A
5MHz	QPSK	25	N/A	QPSK	5 <sup>+</sup>	N/A
10MHz	QPSK	50	50	QPSK	50	50
10MHz	QPSK	50	N/A	QPSK	25	N/A
10MHz	QPSK	50	N/A	QPSK	20	N/A
10MHz	QPSK	50	N/A	QPSK	15	N/A
15MHz	QPSK	75	75	QPSK	75	75
15MHz	QPSK	75	N/A	QPSK	50	N/A
15MHz	QPSK	75	N/A	QPSK	25	N/A
15MHz	QPSK	75	N/A	QPSK	20	N/A
20MHz	QPSK	100	100	QPSK	100	100
20MHz	QPSK	100	N/A	QPSK	75	N/A
20MHz	QPSK	100	N/A	QPSK	50	N/A
20MHz	QPSK	100	N/A	QPSK	25	N/A
20MHz	QPSK	100	N/A	QPSK	20	N/A
Note 1: Test Channel Bandwidths are checked separately for each E-UTRA band, which applicable channel bandwidths are specified in Table 5.4.2.1-1. Note 2: Depending on E-UTRA band, only the appropriate Uplink RB allocation value according to table 7.3.3-2 is tested per Test Channel Bandwidth. Note 3: For the DL signal one sided dynamic OCNG Pattern OP.1 FDD/TDD is used. Note 4: Applicable only to E-UTRA FDD Band 31. The UL resource blocks shall be located at RBstart 10 (according to Table 7.3.3-2).						

1. Connect the SS to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.30.

2. The parameter settings for the cell are set up according to TS 36.508 [7] clause 4.4.3.
3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1
4. The UL and DL Reference Measurement channels are set according to Table 7.6.3B.4.1-1.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.6.3B.4.3.

#### 7.6.3B.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.3B.4.1-1. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 4 for C\_RNTI to schedule the UL RMC according to Table 7.6.3B.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of the CW signal generator for an interfering signal below the wanted signal according to Table 7.6.3B.5-1.
4. Set the downlink signal level according to the table 7.6.3B.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.6.3B.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement and the UE output power is mean sum power of each antenna connector for UE.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G.2.
6. Repeat steps from 3 to 5, using an interfering signal above the wanted signal at step 3.

#### 7.6.3B.4.3 Message Contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception.

**Table 7.6.3B.4.3-1: UplinkPowerControlDedicated**

Derivation Path: 36.331 clause 6.3.2			
Information Element	Value/remark	Comment	Condition
UplinkPowerControlDedicated-DEFAULT ::= SEQUENCE {			
p0-UePUSCH	0		
deltaMCS-Enabled	en0		
accumulationEnabled	TRUE		
p0-uePUCCH	0		
pSRS-Offset	3 (-6 dB)		
filterCoefficient	fc8	larger filter length is used to reduce the RSRP measurement variation	
}			

#### 7.6.3B.5 Test Requirement

The throughput measurement derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.6.3B.5-1.

Table 7.6.3B.5-1: Narrow-band blocking

Parameter	Unit	Channel Bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
$P_w$	dBm	$P_{REFSENS}$ + channel-bandwidth specific value below					
		22	18	16	13	14	16
$P_{uw}$ (CW)	dBm	-55	-55	-55	-55	-55	-55
$F_{uw}$ (offset for $\Delta f = 15$ kHz)	MHz	0.9075	1.7025	2.7075	5.2125	7.7025	10.2075
$F_{uw}$ (offset for $\Delta f = 7.5$ kHz)	MHz						
Note 1: The transmitter shall be set a 4 dB below $P_{CMAX,L}$ with $P_{CMAX,L}$ as defined in clause 6.2.5. Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{uw}$  power defined in Table 7.6.3B.5-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

### 7.6.3E Narrow band blocking for UE category 0

Editor's note: Following aspects missing or not yet determined:

- RB allocation within brackets
- Test tolerance for this case in Annex F is not completed
- Test requirement TBD

#### 7.6.3E.1 Test Purpose

Same test purpose as in clause 7.6.3.

#### 7.6.3E.2 Test Applicability

This test applies to all types of E-UTRA UE release 12 and forward of UE category 0.

#### 7.6.3E.3 Minimum Conformance Requirements

Same minimum conformance requirements as in clause 7.6.3.3.

#### 7.6.3E.4 Test Description

##### 7.6.3E.4.1 Initial Conditions

Same initial conditions as in clause 7.5.4.1 with the following exceptions:

- Instead of Table 7.6.3.4.1-1 → use Table 7.6.3E.4.1-1.
- Connect the SS to the UE antenna connectors as shown in TS 36.508[7] Annex A Figure A.5 using only main UE Tx/Rx antenna.

Table 7.6.3E.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508 [7] subclause 4.1			NC			
Test Frequencies as specified in TS 36.508 [7] subclause 4.3.1			Mid range			
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1			Lowest, 5MHz, Highest			
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD and HD-FDD	TDD		FDD and HD-FDD	TDD
1.4MHz	QPSK	6	6	QPSK	6	6
3MHz	QPSK	14	14	QPSK	15	15
5MHz	QPSK	14	14	QPSK	25	25
5MHz	QPSK	14	N/A	QPSK	20	N/A
10MHz	QPSK	14	14	QPSK	[36]	[36]
10MHz	QPSK	14	N/A	QPSK	25	N/A
10MHz	QPSK	14	N/A	QPSK	20	N/A
15MHz	QPSK	14	14	QPSK	[36]	[36]
15MHz	QPSK	14	N/A	QPSK	20	N/A
20MHz	QPSK	14	14	QPSK	[36]	[36]
20MHz	QPSK	14	N/A	QPSK	20	N/A
Note 1:	Test Channel Bandwidths are checked separately for each E-UTRA band, which applicable channel bandwidths are specified in Table 5.4.2.1-1.					
Note 2:	Depending on E-UTRA band, only the appropriate Uplink RB allocation value according to table 7.3E.3-3 is tested per Test Channel Bandwidth. The allocation shall be located as close as possible to the downlink operating band but confined within the transmission bandwidth configuration for the channel bandwidth (Table 5.4.2-1).					
Note 3:	For the DL signal one sided dynamic OCNG Pattern OP.1 FDD/TDD is used.					
Note 4:	Downlink RB position shall be $RB_{start} = 0$					

### 7.6.3E.4.2 Test Procedure

Same test procedure as in clause 7.6.3.4.2

### 7.6.3E.4.3 Message Contents

Same message contents as in clause 7.6.3.4.3

### 7.6.3E.5 Test Requirement

TBD

## 7.7 Spurious response

### 7.7.1 Test Purpose

Spurious response verifies the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in sub-clause 7.6.2 is not met.

The lack of the spurious response ability decreases the coverage area when other unwanted interfering signal exists at any other frequency.

### 7.7.2 Test Applicability

This test applies to all types of E-UTRA UE release 8 and forward.

## 7.7.3 Minimum Conformance Requirements

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Tables 7.7.3-1 and 7.7.3-2.

**Table 7.7.3-1: Spurious response parameters**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ at the minimum uplink configuration specified in Table 7.3.3-2 with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

**Table 7.7.3-2: Spurious Response**

Parameter	Unit	Level
$P_{\text{Interferer}}$ (CW)	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{\text{uw}}$  power defined in Table 7.7.3-2 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A.

The normative reference for this requirement is TS 36.101 [2] clause 7.7.

## 7.7.4 Test Description

### 7.7.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2.4.1 in order to test spurious responses obtained in clause 7.6.2 under the same conditions.

### 7.7.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for  $C_{\text{RNTI}}$  to transmit the DL RMC according to Table 7.6.2.4.1-1. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for  $C_{\text{RNTI}}$  to schedule the UL RMC according to Table 7.6.2.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7.5-2. The spurious frequencies are taken from records in the final step of test procedures in clause 7.6.2.4.2.
4. Set the downlink signal level according to the table 7.7.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.7.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
5. For the spurious frequency, measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G.2.

### 7.7.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exception.

Table 7.7.4.3-1: UplinkPowerControlDedicated

Derivation Path: 36.331 clause 6.3.2			
Information Element	Value/remark	Comment	Condition
UplinkPowerControlDedicated-DEFAULT ::= SEQUENCE {			
p0-UePUSCH	0		
deltaMCS-Enabled	en0		
accumulationEnabled	TRUE		
p0-uePUCCH	0		
pSRS-Offset	3 (-6 dB)		
filterCoefficient	fc8	larger filter length is used to reduce the RSRP measurement variation	
}			

## 7.7.5 Test Requirement

The throughput measurement derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Tables 7.7.5-1 and 7.7.5-2.

Table 7.7.5-1: Spurious response parameters

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX}_L}$ with $P_{\text{CMAX}_L}$ as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNB Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

Table 7.7.5-2: Spurious Response

Parameter	Unit	Level
$P_{\text{Interferer}}(\text{CW})$	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{\text{uw}}$  power defined in Table 7.7.5-2 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A.

## 7.7A Spurious response for CA

### 7.7A.0 Minimum conformance requirements

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one E-UTRA band the spurious response requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. The throughput measured in each downlink with  $F_{\text{interferer}}$  in Table 7.6.2A.1.3-0 at spurious response frequencies shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNB Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Tables 7.7.3-1 and 7.7.3-2. The UE shall meet these requirements for each component carrier while all downlink carriers are active.

For E-UTRA CA configurations including an operating band without uplink band (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the uplink active in the band(s) capable of UL operation. For E-UTRA CA configurations listed in Table 7.3A.0-1 under conditions for which reference sensitivity for the operating band being tested is N/A, the spurious response requirements of subclause 7.7A.0 do not apply.

For intra-band contiguous carrier aggregation the downlink SCC(s) shall be configured at nominal channel spacing to the PCC. For FDD, the PCC shall configure closest to the uplink band. All downlink carriers shall be active throughout the test. The uplink output power shall be set as specified in Table 7.7A.0-1 with the uplink configuration set according to Table 7.3A.0-2 for the applicable carrier aggregation configuration. For UE(s) supporting one uplink carrier, the uplink configuration of the PCC shall be in accordance with Table 7.3.3-2. The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Tables 7.7A.0-1 and 7.7A.0-2.

**Table 7.7A.0-1: Spurious response parameters**

Rx Parameter	Units	CA Bandwidth Class				
		B	C	D	E	F
Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
		9	9	9		
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5A.						
Note 2: Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						

**Table 7.7A.0-2: Spurious response**

Parameter	Unit	Level
$P_{\text{Interferer (CW)}}$	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

For intra-band non-contiguous carrier aggregation with one uplink carrier and more than or equal to two downlink carriers, the spurious response requirements are defined with the uplink configuration in accordance with Table 7.3A.0-3. For this uplink configuration, the UE shall meet the requirements specified in clauses 7.7.1.3 and 7.7A.3 for single component carrier and intra-band contiguous component carriers separately while all downlink carriers are active.

For combinations of intra-band contiguous and inter-band carrier aggregation with three downlink carriers and one uplink carrier assigned to one E-UTRA band, the requirement is defined with the uplink active in the band other than that supporting the downlink(s) under test and a configuration in accordance with Table 7.3.3-2. The downlink PCC carrier centre frequency shall be configured closer to the uplink operating band than the downlink SCC centre frequency when the uplink is active in the band supporting two component carriers. For each downlink the UE shall meet the spurious-response requirements applicable for inter-band carrier aggregation with one component carrier per operating band. The three downlink carriers shall be active throughout the tests.

For combinations of intra-band non-contiguous and inter-band carrier aggregation with three downlink carriers and one uplink carrier assigned to one E-UTRA band, the requirement is defined with the uplink active in the band other than that supporting the downlink(s) under test. The uplink configuration shall be in accordance with Table 7.3A.0-3 when the uplink is active in the band supporting two component carriers and in accordance with Table 7.3.3-2 when the uplink is active in the other band. For the two component carriers within the same band,  $P_{\text{wanted}}$  in Table 7.6.2A.1.3-0 is set using  $\Delta R_{\text{IBNC}} = 0$  dB for all sub-block gaps (Table 7.3A.0-3). For each downlink the UE shall meet the spurious-response requirements applicable for inter-band carrier aggregation with one component carrier per operating band. The three downlink carriers shall be active throughout the tests.

The normative reference for this requirement is TS 36.101 [2] clause 7.7.1A.

## 7.7A.1 Spurious response for CA (intra-band contiguous DL CA and UL CA)

### 7.7A.1.1 Test Purpose

Spurious response for CA verifies the receiver's ability to receive a wanted aggregated signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in sub-clause 7.6.2A is not met.

The lack of the spurious response ability decreases the coverage area when other unwanted interfering signal exists at any other frequency.

### 7.7A.1.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support intra-band contiguous DL CA and UL CA.

### 7.7A.1.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.7A.0.

### 7.7A.1.4 Test Description

#### 7.7A.1.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2A.1.4.1 in order to test spurious responses obtained in clause 7.6.2A.1 under the same conditions.

#### 7.7A.1.4.2 Test Procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.7A.1.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2A.1.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.2A.1.4.1-1 on both PCC and SCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7A.1.5-2. The spurious frequencies are taken from records in the final step of test procedures in clause 7.6.2A.1.4.2.
7. Set the downlink signal level according to the table 7.7A.1.5-1 for both carriers. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that for at least the duration of the throughput measurement:  
 The PCC output power is within (+0dB, -3.4 dB) of (target level in Table 7.7A.1.5-1 +  $10\log(P_{L_{CRB}}/N_{RB\_alloc})$ ), for carrier frequency  $f \leq 3.0\text{GHz}$ ,  
 or within (+0dB, -4 dB) of (target level in Table 7.7A.1.5-1 +  $10\log(P_{L_{CRB}}/N_{RB\_alloc})$ ) for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ .  
 The SCC output power is within (+0dB, -3.4 dB) of (target level in Table 7.7A.1.5-1 +  $10\log(S_{L_{CRB}}/N_{RB\_alloc})$ ), for carrier frequency  $f \leq 3.0\text{GHz}$ ,  
 or within (+0dB, -4 dB) of (target level in Table 7.7A.1.5-1 +  $10\log(S_{L_{CRB}}/N_{RB\_alloc})$ ) for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ .
8. For each spurious frequency, measure the average throughput for each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.

7.7A.1.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exception.

**Table 7.7A.1.4.3-1: UplinkPowerControlDedicatedSCell-r10**

7.7A.1.5 Test Requirement

The throughput measurement of each carrier derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.7A.1.5-1 and 7.7A.1.5-2.

**Table 7.7A.1.5-1: Spurious response parameters**

Rx Parameter	Units	CA Bandwidth Class				
		B	C	D	E	F
Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
			9			
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5 for one uplink carrier and in subclause 6.2.5A for two uplink carriers.						
Note 2: Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						

**Table 7.7A.1.5-2: Spurious response**

Parameter	Unit	Level
$P_{\text{Interferer}}$ (CW)	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{\text{Interferer}}$  power defined in Table 7.7A.1.5-2 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A.

## 7.7A.2 Spurious response for CA (intra-band contiguous DL CA without UL CA)

### 7.7A.2.1 Test Purpose

Same test purpose as in clause 7.7A.1.

### 7.7A.2.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support intra-band contiguous DL CA. This test case applies only for CA Configurations that do not support UL CA.

### 7.7A.2.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.7A.0.

### 7.7A.2.4 Test Description

#### 7.7A.2.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2A.2.4.1 in order to test spurious responses obtained in clause 7.6.2A.2 under the same conditions.

#### 7.7A.2.4.2 Test Procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2A.2.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.2A.2.4.1-1 on PCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7A.1.5-2. The spurious frequencies are taken from records in the final step of test procedures in clause 7.6.2A.2.4.2.
7. Set the downlink signal level according to the table 7.7A.1.5-1 for both carriers. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.7A.1.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. For each spurious frequency, measure the average throughput for each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.

#### 7.7A.2.4.3 Message Contents

Same message contents as in clause 7.7.4.3.

### 7.7A.2.5 Test Requirement

Same test requirement as in clause 7.7A.1.5 with the following exceptions :

- Instead of Table 7.7A.1.5-1 → use Table 7.7A.2.5-1.

**Table 7.7A.2.5-1: Spurious response parameters**

Rx Parameter	Units	CA Bandwidth Class				
		B	C	D	E	F

Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below			
		9	9		
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5.				
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.				

### 7.7A.3 Spurious response for CA (inter-band DL CA without UL CA)

#### 7.7A.3.1 Test Purpose

Same test purpose as in clause 7.7A.1.

#### 7.7A.3.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support inter-band DL CA without UL CA.

#### 7.7A.3.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.7A.0.

#### 7.7A.3.4 Test Description

##### 7.7A.3.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2A.3.4.1 in order to test spurious responses obtained in clause 7.6.2A.3 under the same conditions.

##### 7.7A.3.4.2 Test Procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2A.3.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.2A.3.4.1-1 on PCC. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7A.3.5-2. The spurious frequencies are taken from records in the step 9 of test procedures in clause 7.6.2A.3.4.2.
7. Set the downlink signal level according to the table 7.7A.3.5-1 for both carriers. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.7A.3.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. For each spurious frequency, measure the average throughput of SCC for duration sufficient to achieve statistical significance according to Annex G.2.

##### 7.7A.3.4.3 Message Contents

Same message contents as in clause 7.7.4.3.

#### 7.7A.3.5 Test Requirement

For inter-band carrier aggregation with uplink assigned to one E-UTRA band the spurious response requirements are defined with the uplink active on the band other than the band whose downlink is being tested i.e. the requirements are tested only for the SCell downlink. The UE shall meet the requirement for each component carrier, when operated as SCell, while both downlink carriers are active.

The throughput measured during the test procedure for each component carrier, when operated as SCell, shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Tables 7.7A.3.5-1 (originated from the single carrier Table 7.7.5-1) and 7.7A.3.5-2 (originated from Table 7.6.2A.3.5-2).

**Table 7.7A.3.5-1: Spurious response parameters**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9
Note 1: The transmitter shall be set to 4dB below P <sub>C<sub>MAX</sub>L</sub> with P <sub>C<sub>MAX</sub>L</sub> as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

**Table 7.7A.3.5-2: Spurious Response**

Parameter	Unit	Level
P <sub>Interferer</sub> (CW)	dBm	-44
F <sub>Interferer</sub>	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.7A.3.5-2 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

## 7.7A.4 Spurious response for CA (intra-band non-contiguous DL CA without UL CA)

### 7.7A.4.1 Test Purpose

Same test purpose as in clause 7.7A.1.

### 7.7A.4.2 Test Applicability

This test applies to all types of E-UTRA UE release 11 and forward that support intra-band non-contiguous DL CA without UL CA.

### 7.7A.4.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.7A.0.

### 7.7A.4.4 Test Description

#### 7.7A.4.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2A.4.4.1 in order to test spurious responses obtained in clause 7.6.2A.4 under the same conditions.

#### 7.7A.4.4.2 Test Procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.7A.4.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).

4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2A.4.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.2A.4.4.1-1 on PCC. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal below or above the wanted aggregated signal according to Table 7.7A.4.5-2. The spurious frequencies are taken from records in the step 9 of test procedures in clause 7.6.2A.4.4.2.
7. Set the downlink signal level according to the table 7.7A.4.5-1 for both carriers. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.7A.4.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. For each spurious frequency, measure the average throughput of each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.

### 7.7A.4.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6.

### 7.7A.4.5 Test Requirement

For intra-band non-contiguous carrier aggregation with one uplink carrier and two downlink carriers, the spurious response requirements are defined with the uplink configuration of the PCC being in accordance with Table 7.3A.0-3. The UE shall meet the requirements specified in tables 7.7A.4.5-1 and 7.7A.4.5-2 for each component carrier while both downlink carriers are active.

The requirements for each component carrier are the same as single carrier requirements in Tables 7.7.5-1 and 7.7.5-2.

**Table 7.7A.4.5-1: Spurious response parameters**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9
Note 1: The transmitter shall be set to 4dB below P <sub>C<sub>MAX,L</sub></sub> with P <sub>C<sub>MAX,L</sub></sub> as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							

**Table 7.7A.4.5-2: Spurious Response**

Parameter	Unit	Level
P <sub>Interferer (CW)</sub>	dBm	-44
F <sub>Interferer</sub>	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>uw</sub> power defined in Table 7.7A.4.5-2 is increased by the amount given by ΔR<sub>IB,c</sub> in Table 7.3.3-1A.

## 7.7A.5 Spurious response for CA (3DL CA without UL CA)

### 7.7A.5.1 Test Purpose

Same test purpose as in clause 7.7A.1.

### 7.7A.5.2 Test Applicability

This test case applies to all types of E-UTRA UE release 10 and forward that support 3DL Intra-band contiguous CA or 3DL Inter-band CA or 3DL Intra-band contiguous + Inter-band CA.

This test case also applies to all types of E-UTRA UE release 11 and forward that support 3DL Intra-band non-contiguous CA + Inter-band CA or 3DL Intra-band non-contiguous + Intra-band contiguous CA.

This test case also applies to all types of E-UTRA UE release 12 and forward that support 3DL CA with FDD-TDD CA.

### 7.7A.5.3 Minimum Conformance Requirements

The minimum conformance requirements are defined in clause 7.7A.0.

### 7.7A.5.4 Test Description

#### 7.7A.5.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2A.5.4.1 in order to test spurious responses obtained in clause 7.6.2A.5 under the same conditions.

#### 7.7A.5.4.2 Test Procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels except PHICH.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.7A.5.4.3
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2A.5.4.1-1 through Table 7.6.2A.5.4.1-5 as appropriate on PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.6.2A.5.4.1-1 through Table 7.6.2A.5.4.1-5 on PCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7A. 5.5. 25-. The spurious frequencies are taken from records in the final step of test procedures in clause 7.6.2A.5.4.2.
7. Set the downlink signal level according to the tables 7.7A.5.5-1 and 7.7A.5.5-3 for all carriers accordingly. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in corresponding tables 7.7A.5. 5-1 and 7.7A.5.5-3 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
8. For each spurious frequency, measure the average throughput for each component carrier for duration sufficient to achieve statistical significance according to Annex G.2A.

#### 7.7A.5.4.3 Message Contents

Same message contents as in clause 7.7.4.3.

### 7.7A.5.5 Test Requirement

The throughput measurement of each carrier derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Tables below, according to the type of CA.

**Table 7.7A.5.5-1: Spurious response parameters (Intra-band contiguous)**

Rx Parameter	Units	CA Bandwidth Class				
		B	C	D	E	F
Power per CC in Aggregated Transmission Bandwidth Configuration	dBm	REFSENS + CA Bandwidth Class specific value below				
		9	9	9		
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5.						
Note 2: Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						

**Table 7.7A.5.52: Spurious response (All types of CA)**

Parameter	Unit	Level
$P_{\text{Interferer (CW)}}$	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

**Table 7.7A.5.5-3: Spurious response parameters (Inter-band, Intra-band non-contiguous)**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration for each CC	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							
Note 3: For intra-band non-contiguous + inter-band CA, $\Delta R_{\text{IBNC}} = 0$ dB for all sub-block gaps.							

For a UE, which supports CA configuration in Table 7.3.3-1A or 7.3.3-1B,  $P_{\text{uw}}$  power defined in Table 7.7A.5.5-2 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A or 7.3.3-1B accordingly.

## 7.7B Spurious response for UL-MIMO

### 7.7B.1 Test Purpose

Spurious response verifies the ability of the UE that support UL-MIMO to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in sub-clause 7.6B.2 is not met.

The lack of the spurious response ability decreases the coverage area when other unwanted interfering signal exists at any other frequency.

### 7.7B.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support UL-MIMO.

### 7.7B.3 Minimum Conformance Requirements

For UE with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements in Clause 7.7.3 shall be met with the UL-MIMO configurations specified in Table 6.2.2B.3-2. For UL-MIMO, the parameter  $P_{\text{CMAX\_L}}$  is defined as the total transmitter power over the two transmit antenna connectors.

The normative reference for this requirement is TS 36.101 [2] clause 7.7.1B.

## 7.7B.4 Test Description

### 7.7B.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6B.2.4.1 in order to test spurious responses obtained in clause 7.6B.2 under the same conditions.

### 7.7B.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.6.2B.4.1-1. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 4 for C\_RNTI to schedule the UL RMC according to Table 7.6B.2.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of the CW signal generator for an interfering signal according to Table 7.7B.5-2. The spurious frequencies are taken from records in the final step of test procedures in clause 7.6B.2.4.2.
4. Set the downlink signal level according to the table 7.7B.5-1. Send uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in table 7.7B.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.
5. For the spurious frequency, measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G.2.

### 7.7B.4.3 Message Contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception.

**Table 7.7B.4.3-1: UplinkPowerControlDedicated**

Derivation Path: 36.331 clause 6.3.2			
Information Element	Value/remark	Comment	Condition
UplinkPowerControlDedicated-DEFAULT ::= SEQUENCE {			
p0-UePUSCH	0

accumulationEnabled	TRUE		
p0-uePUCCH	0		
pSRS-Offset	3 (-6 dB)		
filterCoefficient	fc8	larger filter length is used to reduce the RSRP measurement variation	
}			

## 7.7B.5 Test Requirement

The throughput measurement derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Tables 7.7B.5-1 and 7.7B.5-2.

**Table 7.7B.5-1: Spurious response parameters**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9

Note 1: The transmitter shall be set to 4dB below  $P_{CMAX\_L}$  with  $P_{CMAX\_L}$  as defined in clause 6.2.5.  
 Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNB Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.

**Table 7.7B.5-2: Spurious Response**

Parameter	Unit	Level
$P_{Interferer}$ (CW)	dBm	-44
$F_{Interferer}$	MHz	Spurious response frequencies

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{uw}$  power defined in Table 7.7B.5-2 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3.3-1A.

## 7.7E Spurious response for UE category 0

*Editor's note: Following aspects missing or not yet determined:*

- *Test tolerance for this case in Annex F is not completed*

### 7.7E.1 Test Purpose

Same test purpose as in clause 7.7.1.

### 7.7E.2 Test Applicability

This test applies to all types of E-UTRA UE release 12 and forward of UE category 0.

### 7.7E.3 Minimum Conformance Requirements

Same minimum conformance requirements as in clause 7.7.3.

### 7.7E.4 Test Description

#### 7.7E.4.1 Initial Conditions

The initial conditions shall be the same as in clause 7.6.2E.4.1 in order to test spurious responses obtained in clause 7.6.2E under the same conditions.

#### 7.7E.4.2 Test Procedure

Same test procedure as in clause 7.7.4.2

#### 7.7E.4.3 Message Contents

Same message contents as in clause 7.7.4.3

### 7.7E.5 Test Requirement

The throughput measurement derived in test procedure shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Tables 7.7E.5-1 and 7.7E.5-2.

**Table 7.7E.5-1: Spurious response parameters**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		6	6	6	6	7	9

Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.

**Table 7.7E.5-2: Spurious Response**

Parameter	Unit	Level
$P_{\text{Interferer}}$ (CW)	dBm	-44
$F_{\text{Interferer}}$	MHz	Spurious response frequencies

## 7.8 Intermodulation characteristics

### 7.8.1 Wide band Intermodulation

#### 7.8.1.1 Test purpose

Intermodulation response tests the UE's ability to receive data with a given average throughput for a specified reference measurement channel, in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal, under conditions of ideal propagation and no added noise.

A UE unable to meet the throughput requirement under these conditions will decrease the coverage area when two or more interfering signals exist which have a specific frequency relationship to the wanted signal.

#### 7.8.1.2 Test applicability

This test applies to all types of E-UTRA UE release 8 and forward.

#### 7.8.1.3 Minimum conformance requirements

Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.8.1.3-1 for the specified wanted signal mean power in the presence of two interfering signals.

**Table 7.8.1.3-1: Wide band intermodulation**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9

$P_{\text{Interferer 1}}$ (CW)	dBm	-46		
$P_{\text{Interferer 2}}$ (Modulated)	dBm	-46		
$BW_{\text{Interferer 2}}$		1.4	3	5
$F_{\text{Interferer 1}}$ (Offset)	MHz	$-BW/2 - 2.1$ / $+BW/2 + 2.1$	$-BW/2 - 4.5$ / $+BW/2 + 4.5$	$-BW/2 - 7.5$ / $+BW/2 + 7.5$
$F_{\text{Interferer 2}}$ (Offset)	MHz	$2 * F_{\text{Interferer 1}}$		
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ at the minimum uplink configuration specified in Table 7.3.3-2 with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.			
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.			
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 with set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$			

For the UE which supports inter band CA configuration in Table 7.3.1A-2,  $P_{\text{interferer1}}$  and  $P_{\text{interferer2}}$  powers defined in Table 7.8.1.1-1 are increased by the amount given by  $\Delta R_{\text{IB}}$  in Table 7.3.1A-2.

The normative reference for this requirement is TS 36.101 [2] clause 7.8.1 and TS 36.101 [2] Annexes A and D.

[FFS: Although it is not explicitly stated in TS 36.101 [2] whether the modulated interferer defined in 36.101 Annex D applies to wanted channel bandwidths of less than 5MHz, this test specification has assumed that the modulated interferer definition applies to all channel bandwidths. The content of TS 36.101 [2] Annex D.2 has been copied into Annex FFS of the present document]

## 7.8.1.4 Test description

### 7.8.1.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Table 7.8.1.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1				NC		
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1				Mid range		
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1				Lowest, 5MHz, Highest		
Test Parameters for Channel Bandwidths

20MHz	QPSK	100	N/A	QPSK	25	N/A
20MHz	QPSK	100	N/A	QPSK	20	N/A
Note 1:	Test Channel Bandwidths are checked separately for each E-UTRA band, which applicable channel bandwidths are specified in Table 5.4.2.1-1.					
Note 2:	Depending on E-UTRA band, only the appropriate Uplink RB allocation value according to table 7.3.3-2 is tested per Test Channel Bandwidth. The allocation shall be located as close as possible to the downlink operating band but confined within the transmission bandwidth configuration for the channel bandwidth (Table 5.4.2-1).					
Note 3:	For the DL signal one sided dynamic OCN Pattern OP.1 FDD/TDD is used.					
Note 4:	Applicable only to E-UTRA FDD Band 31. The UL resource blocks shall be located at RBstart 10 (according to Table 7.3.3-2).					

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure A.6.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. The UL and DL Reference Measurement channels are set according to Table 7.8.1.4.1-1.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1.4.3.

#### 7.8.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1.4.1-1. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.

3. Set the Downlink signal level to the value as defined in Table 7.8.1.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in Table 7.8.1.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the Throughput measurement.
4. Set the Interfering signal levels to the values as defined in Table 7.8.1.5-1 and frequency below the wanted signal, using a modulated interferer bandwidth as defined in Annex D of the present document.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G.2.
6. Repeat steps from 3 to 5, using an interfering signal above the wanted signal at step 4.

7.8.1.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exception.

**Table 7.8.1.4.3-1: UplinkPowerControlDedicated**

Derivation Path: 36.331 clause 6.3.2

$F_{\text{Interferer 2}}$ (Offset)	MHz	$2 \cdot F_{\text{Interferer 1}}$		
Note 1:	The transmitter shall be set to 4dB below $P_{\text{C}_{\text{MAX\_L}}}$ with $P_{\text{C}_{\text{MAX\_L}}}$ as defined in clause 6.2.5.			
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.			
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$			
Note 4:	For the UE which supports inter band CA configuration in Table 7.3A.3-0, $P_{\text{Interferer1}}$ and $P_{\text{Interferer2}}$ powers are increased by the amount given by $\Delta R_{\text{IB}}$ in Table 7.3A.3-0			

## 7.8.1A Wide band Intermodulation for CA

### 7.8.1A.0 Minimum conformance requirements

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one E-UTRA band the wide band intermodulation requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. The UE shall meet the requirements specified in subclause 7.8.1.3 for each component carrier while all downlink carriers are active. For E-UTRA CA configurations including an operating band without uplink band (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. For E-UTRA CA configurations listed in Table 7.3A.0-1 under conditions for which reference sensitivity for the operating band being tested is N/A, the wideband intermodulation requirements of subclause 7.8.1A.0 do not apply.

For intra-band contiguous carrier aggregation the downlink SCC(s) shall be configured at nominal channel spacing to the PCC. For FDD, the PCC shall be configured closest to the uplink band. All downlink carriers shall be active throughout the test. The uplink output power shall be set as specified in Table 7.8.1A.0-1 with the uplink configuration set according to Table 7.3A.0-1 for the applicable carrier aggregation configuration. For UE(s) supporting one uplink carrier, the uplink configuration of the PCC shall be in accordance with Table 7.3.3-2. The UE shall fulfil the minimum requirement in presence of an interfering signal specified in Table 7.8.1A.0-1 being on either side of the aggregated signal. The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.2.3 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.8.1A.0-1

**Table 7.8.1A.0-1: Wide band intermodulation**

Rx parameter	Units	CA Bandwidth Class				
		B	C	D	E	F
Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
		9	12	13.8		

$P_{\text{Interferer 1}}$ (CW)	dBm	-46				
$P_{\text{Interferer 2}}$ (Modulated)	dBm	-46				
$BW_{\text{Interferer 2}}$	MHz	5	5	5		
$F_{\text{Interferer 1}}$ (Offset)	MHz	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$		
$F_{\text{Interferer 2}}$ (Offset)	MHz	$2 \cdot F_{\text{Interferer 1}}$				
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5A.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 with set-up according to Annex C.3.1.					
Note 4:	The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5$ MHz					
Note 5:	The $F_{\text{interferer 1}}$ (offset) is the frequency separation of the centre frequency of the carrier closest to the interferer and the centre frequency of the CW interferer and $F_{\text{interferer 2}}$ (offset) is the frequency separation of the centre frequency of the carrier closest to the interferer and the centre frequency of the modulated interferer.					

For intra-band non-contiguous carrier aggregation with one uplink carrier and two downlink sub-blocks, the wide band intermodulation requirements are defined with the uplink configuration in accordance with Table 7.3.1A-3. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in subclause 7.8.1.1 and 7.8.1A.0 for a component carrier and intra-band contiguous component carriers per sub-block, respectively. The requirements apply for out-of-gap interferers while all downlink carriers are active.

For combinations of intra-band contiguous and inter-band carrier aggregation with three downlink carriers and one uplink carrier assigned to one E-UTRA band, the requirement is defined with the uplink active in the band other than that supporting the downlink(s) under test and a configuration in accordance with Table 7.3.3-2. The downlink PCC carrier centre frequency shall be configured closer to the uplink operating band than the downlink SCC centre frequency when the uplink is active in the band supporting two component carriers. For E-UTRA CA configurations including an operating band without uplink band, the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. For these uplink configurations, the UE shall meet the wide-band intermodulation requirements for intra-band contiguous carrier aggregation of two downlink carriers and for the remaining component carrier the requirements specified in subclause 7.8.1. The three downlink carriers shall be active throughout the tests.

For combinations of intra-band non-contiguous and inter-band carrier aggregation with three downlink carriers and one uplink carrier assigned to one E-UTRA band, the requirement is defined with the uplink active in the band other than that supporting the downlink(s) under test. The uplink configuration shall be in accordance with Table 7.3A.0-3 when the uplink is active in the band supporting two component carriers and in accordance with Table 7.3.3-2 when the uplink is active in the other band. For E-UTRA CA configurations including an operating band without uplink band, the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. For these uplink configurations, the UE shall meet the wide-band intermodulation requirements for intra-band non-contiguous carrier aggregation of two downlink carriers with  $\Delta R_{\text{IBNC}} = 0$  dB for all sub-block gaps (Table 7.3A.0-3) and for the remaining component carrier the requirements specified in subclause 7.8.1. The three downlink carriers shall be active throughout the tests.

The normative reference for this requirement is TS 36.101 [2] clause 7.8.1A and TS 36.101 [2] Annexes A and D.

## 7.8.1A.1 Wideband intermodulation for CA (intra-band contiguous DL CA and UL CA)

### 7.8.1A.1.1 Test purpose

Intermodulation response tests the UE's ability to receive data with a given average throughput for a specified reference measurement channel, in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal, under conditions of ideal propagation and no added noise.

A UE unable to meet the throughput requirement under these conditions will decrease the coverage area when two or more interfering signals exist which have a specific frequency relationship to the wanted signal.

### 7.8.1A.1.2 Test applicability

This test applies to all types of E-UTRA UE release 10 and forward that supports intra-band contiguous DL CA and UL CA.

### 7.8.1A.1.3 Minimum conformance requirements

Minimum conformance requirements are specified in clause 7.8.1A.0.

### 7.8.1A.1.4 Test description

#### 7.8.1A.1.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1A.1.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.8.1A.1.4.1-1: Test Configuration Table**

Initial Conditions									
Test Environment as specified in TS 36.508[7] subclause 4.1					NC				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2					C: Mid range				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE					Lowest $N_{RB\_agg}$ , Highest $N_{RB\_agg}$ (Note 3)				
Test Parameters for CA Configurations

100	100	QPSK	100+100		QPSK	130	P_100@0	S_30@0	
100	100	QPSK	100+100		QPSK	200	P_100@0	S_100@0	
Note 1: CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable channel bandwidths are specified in Table 5.4.2A.1-1.									
Note 2: Depending on CA configurations, only the appropriate Uplink RB allocation value according to table 7.3A.0-2 is tested per configuration.									
Note 3: If in the CA Configuration UE supports multiple CC Combinations with the same $N_{RB\_agg}$ , only the first of those is tested, the order on the Test Configuration Table list.									

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure group A.34 as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.

3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. The UL and DL Reference Measurement channels are set according to Table 7.8.1A.1.4.1-1.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1.1A.4.3.

#### 7.8.1A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.8.1A.1.4.3
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1A.1.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1A.1.4.1-1 on both PCC and SCC. Since the UE has no payload data to send, the UE sends uplink MAC padding bits on the UL RMC.
6. Set the Downlink signal level for PCC and SCC to the value as defined in Table 7.8.1A.1.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that for at least the duration of the Throughput measurement:  
The PCC output power is within (+0dB, -3.4 dB) of (target level in Table 7.8.1A.1.5-1 +  $10\log(P_{L\_CRB}/N_{RB\_alloc})$ ), for carrier frequency  $f \leq 3.0\text{GHz}$ ,  
or within (+0dB, -4 dB) of (target level in Table 7.8.1A.1.5-1 +  $10\log(P_{L\_CRB}/N_{RB\_alloc})$ ) for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ .  
The SCC output power is within (+0dB, -3.4 dB) of (target level in Table 7.8.1A.1.5-1 +  $10\log(S_{L\_CRB}/N_{RB\_alloc})$ ), for carrier frequency  $f \leq 3.0\text{GHz}$ ,  
or within (+0dB, -4 dB) of (target level in Table 7.8.1A.1.5-1 +  $10\log(S_{L\_CRB}/N_{RB\_alloc})$ ) for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ .
7. Set the Interfering signal levels to the values as defined in Table 7.8.1A.1.5-1 and frequency below the wanted signal, using a modulated interferer bandwidth as defined in Annex D of the present document.
8. Measure the average throughput for each component carrier for a duration sufficient to achieve statistical significance according to Annex G.2A.
9. Repeat steps from 6 to 8, using an interfering signal above the wanted signal at step 7.

#### 7.8.1A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exception.

**Table 7.8.1A.1.4.3-1: UplinkPowerControlDedicatedSCell-r10**

$F_{\text{Interferer 2}}$ (Offset)	MHz	$2 \cdot F_{\text{Interferer 1}}$				
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5 for one uplink carrier and in subclause 6.2.5 for two uplink carriers A.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 with set-up according to Annex C.3.1.					
Note 4:	The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$					

For the UE which supports inter band CA configuration in Table 7.3.3-1A,  $P_{\text{Interferer 1}}$  and  $P_{\text{Interferer 2}}$  power defined in Table 7.8.1A.1.5-1 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A.

### 7.8.1A.2 Wideband intermodulation for CA (intra-band contiguous DL CA without UL CA)

#### 7.8.1A.2.1 Test purpose

Same as 7.8.1A.1

#### 7.8.1A.2.2 Test applicability

This test applies to all types of E-UTRA UE release 10 and forward that supports intra-band contiguous DL CA. This test case applies only for CA Configurations that do not support UL CA.

#### 7.8.1A.2.3 Minimum conformance requirements

Same as 7.8.1A.1

#### 7.8.1A.2.4 Test description

##### 7.8.1A.2.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1A.2.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.8.1A.2.4.1-1: Test Configuration Table**

Initial Conditions									
Test Environment as specified in TS 36.508[7] subclause 4.1					Normal				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2					B: Mid range C: Mid range				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE					Lowest $N_{RB\_agg}$ , Highest $N_{RB\_agg}$ (Note 3)

100	100	QPSK	100+100		QPSK	100	P_100@0		
100	100	QPSK	100+100		QPSK	75	P_75@25		
100	100	QPSK	100+100		QPSK	50	P_50@50		
Note 1: CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-1. Note 2: Depending on CA configurations, only the appropriate Uplink RB allocation value according to table 7.3.3-2 is tested per Test CA configuration. Note 3: If in the CA Configuration UE supports multiple CC Combinations with the same $N_{RB\_agg}$ , only the first of those is tested, according to the order on the Test Configuration Table list.									

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure group A.34 as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1.2A.4.3.

**7.8.1A.2.4.2 Test procedure**

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1A.2.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.

5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1A.2.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the Downlink signal level to the value as defined in Table 7.8.1A.1.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in Table 7.8.1A.1.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the Throughput measurement.
7. Set the Interfering signal levels to the values as defined in subclause 7.8.1A.2.5 and frequency below the aggregated component carriers, using a modulated interferer bandwidth as defined in Annex D of the present document.
8. Measure the average throughput for each component carrier for a duration sufficient to achieve statistical significance according to Annex G.2.
9. Repeat steps from 6 to 8, using an interfering signal above the aggregated component carriers at step 7.

#### 7.8.1A.2.4.3 Message contents

Same message contents as in clause 7.8.1.4.3.

#### 7.8.1A.2.5 Test requirements

Same as 7.8.1A.1.5. with the following exceptions:

- Instead of Table 7.8.1A.1.5-1 → use Table 7.8.1A.2.5-1.

**Table 7.8.1A.2.5-1: Test parameters for Wide band intermodulation**

Rx parameter	Units	CA Bandwidth Class				
		B	C	D	E	F
P <sub>w</sub> in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + CA Bandwidth Class specific value below				
		9	12			
P <sub>Interferer 1</sub> (CW)	dBm	-46				
P <sub>Interferer 2</sub> (Modulated)	dBm	-46				
BW <sub>Interferer 2</sub>	MHz	5	5			
F <sub>Interferer 1</sub> (Offset)	MHz	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$			
F <sub>Interferer 2</sub> (Offset)	MHz	$2 \cdot F_{\text{Interferer 1}}$				
Note 1:	The transmitter shall be set to 4dB below P <sub>CMAX_L</sub> or P <sub>CMAX_L_CA</sub> as defined in subclause 6.2.5.					
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.					
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 with set-up according to Annex C.3.1.					
Note 4:	The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$					

For the UE which supports inter band CA configuration in Table 7.3.3-1A, P<sub>Interferer 1</sub> and P<sub>Interferer 2</sub> power defined in Table 7.8.1A.2.5-1 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3.3-1A.

### 7.8.1A.3 Wideband intermodulation for CA (inter-band DL CA without UL CA)

#### 7.8.1A.3.1 Test purpose

Intermodulation response tests the UE's ability to receive data with a given average throughput for a specified reference measurement channel, in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal, under conditions of ideal propagation and no added noise.

A UE unable to meet the throughput requirement under these conditions will decrease the coverage area when two or more interfering signals exist which have a specific frequency relationship to the wanted signal.

#### 7.8.1A.3.2 Test applicability

This test applies to all types of E-UTRA UE release 10 and forward that supports inter-band contiguous DL CA but not UL CA.

#### 7.8.1A.3.3 Minimum conformance requirements

Same as 7.8.1A.1

#### 7.8.1A.3.4 Test description

##### 7.8.1A.3.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1A.3.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.8.1A.3.4.1-1: Test Configuration Table**

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1		NC				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2		A: Mid range for PCC and SCC				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE		Highest $N_{RB\_agg}$ for PCC and SCC				
Test Parameters for CA Configurations

100	75	QPSK	100	75	QPSK	100
100	100	QPSK	100	100	QPSK	75
100	100	QPSK	100	100	QPSK	50
Note 1: CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-2. Note 2: Depending on CA configurations, only the appropriate Uplink RB allocation value according to table 7.3A.3.5-2for UE supporting one uplink carrier is tested per Test CA configuration. Note 3: The UL resource blocks shall be located as close as possible to the downlink PCC but confined within the transmission bandwidth configuration for the channel bandwidth (Table 5.4.2-1). Note 4: The frequencies of PCC and SCC shall be switched and tested in each configuration, according to the UE declared capability for UL support (within CA operation) in the individual bands.						

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure group A.34 as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.

3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1A.3.4.3.

#### 7.8.1A.3.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1A.3.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1A.3.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the Downlink signal level to the value as defined in Table 7.8.1A.3.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in Table 7.8.1A.3.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the Throughput measurement.
7. Set the Interfering signal levels to the values as defined in Table 7.8.1A.3.5-1 and frequency below the wanted signal, using a modulated interferer bandwidth as defined in Annex D of the present document.
8. Measure the average throughput of SCC for a duration sufficient to achieve statistical significance according to Annex G.2.
9. Repeat steps from 6 to 8, using an interfering signal above the wanted signal at step 4.

#### 7.8.1A.3.4.3 Message contents

Same message contents as in clause 7.8.1.4.3.

#### 7.8.1A.3.5 Test requirements

For inter-band carrier aggregation with uplink assigned to one E-UTRA band the in-band blocking requirements are defined with the uplink active on the band other than the band whose downlink is being tested, i.e., the requirements are tested only for the SCell downlink. The UE shall meet the requirement for each component carrier, when operated as SCell, while both downlink carriers are active.

The throughput measured during the test procedure for each component carrier, when operated as SCell, shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.8.1A.3.5-1 (originated from the single carrier Table 7.8.1.5-1).

**Table 7.8.1A.3.5-1: Test parameters for Wide band intermodulation**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9

$P_{\text{Interferer 1}}$ (CW)	dBm	-46		
$P_{\text{Interferer 2}}$ (Modulated)	dBm	-46		
$BW_{\text{Interferer 2}}$		1.4	3	5
$F_{\text{Interferer 1}}$ (Offset from SCC)	MHz	-BW/2 -2.1 / +BW/2+ 2.1	-BW/2 -4.5 / +BW/2 + 4.5	-BW/2 - 7.5 / +BW/2 + 7.5
$F_{\text{Interferer 2}}$ (Offset from SCC)	MHz	$2 * F_{\text{Interferer 1}}$		
Note 1:	The transmitter shall be set to 4dB below $P_{\text{C}_{\text{MAX\_L}}}$ with $P_{\text{C}_{\text{MAX\_L}}}$ as defined in clause 6.2.5.			
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.			
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$			
Note 4:	For the UE which supports inter band CA configuration in Table 7.3A.3-0, $P_{\text{Interferer1}}$ and $P_{\text{Interferer2}}$ powers are increased by the amount given by $\Delta R_{\text{IB}}$ in Table 7.3A.3-0			

#### 7.8.1A.4 Wideband intermodulation for CA (intra band non-contiguous DL CA without UL CA)

##### 7.8.1A.4.1 Test purpose

Same as 7.8.1A.1

##### 7.8.1A.4.2 Test applicability

This test case applies to all types of E-UTRA UE release 11 and forward that support intra-band non-contiguous DL CA but no UL CA.

##### 7.8.1A.4.3 Minimum conformance requirements

Same as 7.8.1A.1

##### 7.8.1A.4.4 Test description

###### 7.8.1A.4.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1A.4.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.8.1A.4.4.1-1: Test Configuration Table**

Initial Conditions							
Test Environment as specified in TS 36.508[7] subclause 4.1				NC			
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2				A: N/A (Range is not relevant)			
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration .				Refer to test point			
Test Parameters for CA Configurations							
ID	CA Configuration / $N_{RB\_agg}$		$W_{gap}$ [MHz]	DL Allocation		UL Allocation	
	PCC $N_{RB}$	SCCs $N_{RB}$		CC MOD	PCC & SCC RB allocation	CC MOD	PCC RB allocations ( $L_{CRB}$ @ $RB_{start}$ )

Test Parameters for CA_2A-2A Configuration

21	100	100	154	QPSK	100+100	QPSK	P_100@0
Test Parameters for CA_42A-42A Configuration							
22	100	25	175	QPSK	100+25	QPSK	P_100@0
23	100	100	160	QPSK	100+100	QPSK	P_100@0
Note 1:	CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-3.						
Note 2:	The carrier centre frequency of PCC in the UL operating band is configured closer to the DL operating band.						
Note 3:	Applicable if only Bandwidth Combination Set 0 is supported by the UE for the CA Configuration						
Note 4:	Not applicable if only Bandwidth Combination Set 0 is supported by the UE for the CA Configuration						

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure group A.34 as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1A.3.4.3.

#### 7.8.1A.4.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1A.3.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1A.4.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
6. Set the Downlink signal level to the value as defined in Table 7.8.1A.4.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level in Table 7.8.1A.4.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the Throughput measurement.
7. Set the Interfering signal levels to the values as defined in Table 7.8.1A.4.5-1 and frequency below SCC, using a modulated interferer bandwidth as defined in Annex D of the present document.
8. Measure the average throughput for each component carrier for a duration sufficient to achieve statistical significance according to Annex G.2A.
9. Repeat steps from 6 to 8, using an interfering signal above PCC at step 7.

#### 7.8.1A.4.4.3 Message contents

Same message contents as in clause 7.8.1.4.3.

#### 7.8.1A.4.5 Test requirements

The throughput measured during the test procedure for each component carrier, shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.8.1A.4.5-1 (originated from the single carrier Table 7.8.1.5-1).

**Table 7.8.1A.4.5-1: Test parameters for Wide band intermodulation**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Pw in Transmission Bandwidth Configuration, per CC	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9

$P_{\text{Interferer 1 (CW)}}$	dBm	-46		
$P_{\text{Interferer 2 (Modulated)}}$	dBm	-46		
$BW_{\text{Interferer 2}}$		1.4	3	5
$F_{\text{Interferer 1 (Offset)}}$	MHz	$-BW/2 - 2.1$ / $+BW/2 + 2.1$	$-BW/2 - 4.5$ / $+BW/2 + 4.5$	$-BW/2 - 7.5$ / $+BW/2 + 7.5$
$F_{\text{Interferer 2 (Offset)}}$	MHz	$2 * F_{\text{Interferer 1}}$		
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX,L}}$ with $P_{\text{CMAX,L}}$ as defined in clause 6.2.5.			
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.			
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$			
Note 4:	For the UE which supports inter band CA configuration in Table 7.3A.3-0, $P_{\text{Interferer1}}$ and $P_{\text{Interferer2}}$ powers are increased by the amount given by $\Delta R_{\text{IB}}$ in Table 7.3A.3-0			

### 7.8.1A.5 Wideband intermodulation for CA (3DL CA without UL CA)

#### 7.8.1A.5.1 Test purpose

Same as 7.8.1A.1

#### 7.8.1A.5.2 Test applicability

This test case applies to all types of E-UTRA UE release 10 and forward that support 3DL with Intra-band contiguous CA or 3DL with Inter-band CA, or 3DL with Inter-band and Intra-band contiguous CA.

This test case also applies to all types of E-UTRA UE release 11 and forward that support 3DL with Intra-band non-contiguous CA and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

This test case also applies to all types of E-UTRA UE release 12 and forward that support 3DL CA with FDD-TDD CA.

#### 7.8.1A.5.3 Minimum conformance requirements

Same as 7.8.1A.1.

#### 7.8.1A.5.4 Test description

##### 7.8.1A.5.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA CA configurations specified in table 5.4.2A.1-1 through table 5.4.2A.1-2a. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1A.5.4.1-1 through table 7.8.1A.5.4.1-5 as appropriate. The details of the uplink reference measurement channels (RMCs) are specified in Annex A.2 and A.3. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

**Table 7.8.1A.5.4.1-1: Test Configuration Table (Intra-band contiguous)**

Initial Conditions											
Test Environment as specified in TS 36.508[7] subclause 4.1							NC				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes.							For test frequencies refer to “Range” columns. For mapping within Band refer to “CC” columns				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE.							Refer to “PCC $N_{RB}$ ” and “SCCs $N_{RB}$ ” columns				
Network signalling value							NS_01 by default, exceptions listed in Table 7.3.3-3, dependent on PCC Band				
Test Parameters for CA Configurations											
ID	CA Configuration / $N_{RB\_agg}$						DL Allocation			UL Allocation (Note 2,3)	
	CA Configuration					PCC $N_{RB}$	SCCs $N_{RB}$		PCC & SCCs RB allocation	CC MOD	PCC $L_{CRB} @ RB_{start}$
	Band	Range	PCC CC	SCC1 CC	SCC2 CC		SCC1	SCC2			
Default Test Settings for a CA_XD Configuration											
1	X	Mid	CC1	CC2	CC3	Highest $N_{RB\_agg}$		QPSK	All RBs	QPSK	REFSENS
2	X	Mid	CC1	CC2	CC3	Lowest $N_{RB\_agg}$		QPSK	All RBs	QPSK	REFSENS
<p>Note 1: CA Configuration Test CC Combination test settings are checked separately for each CA Configuration.</p> <p>Note 2: Use CA Configuration – specific test points if present in the table, otherwise use Default Test Settings test points.</p> <p>Note 3: X corresponds to the band of the CA Configuration. Eg. for CA_41D ,X=41</p> <p>Note 4: REFSENS refers to the PCC band's and PCC <math>N_{RB}</math> 's single carrier Uplink RB allocation for reference sensitivity according to table 7.3.5-2.</p> <p>Note 5: If in the CA Configuration UE supports multiple CC Combinations with the same <math>N_{RB\_agg}</math>, choose for testing the Combination with maximum <math>N_{RB\_PCC}</math> and then select maximum <math>N_{RB\_SCC1}</math> for the chosen <math>N_{RB\_PCC}</math>.</p>											

**Table 7.8.1A.5.4.1-2: Test Configuration Table (Inter-band)**

Initial Conditions															
Test Environment as specified in TS 36.508[7] subclause 4.1											NC				
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes.											For test frequencies refer to “Range” columns. For mapping within Band refer to “CC” columns				
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE.											Refer to “PCC $N_{RB}$ ” and “SCCs $N_{RB}$ ” columns				
Network signalling value											NS_01 by default, exceptions listed in Table 7.3.3-3, dependent on PCC Band				
Test Parameters for CA Configurations															
ID	CA Configuration / $N_{RB\_agg}$							DL Allocation			UL Allocation (Note 2,3)

2	41	CC3	-	CC2	134.2	CC1	100	100	100	QPSK	All RBs	QPSK	100@0		
Note 1: CA Configuration Test CC Combination test settings are checked separately for each CA Configuration. Note 2: Use CA Configuration – specific test points if present in the table, otherwise use Default Test Settings test points. Note 3: If, according to the UE declared capability, UE does not support UL in an individual band within the CA Configuration, test points with that individual band as PCC are not applicable. Note 4: X corresponds to the band of the CA Configuration. Eg. for CA_41C-41A, X=41. Note 5: REFSSENS refers to the PCC band's and PCC $N_{RB}$ 's single carrier Uplink RB allocation for reference sensitivity according to table 7.3.5-2. Note 6: If in the CA Configuration UE supports multiple CC Combinations with the same $N_{RB\_agg}$ , choose the Combination with $N_{RB\_CC1} = N_{RB\_CC2}$ for testing. If no such combination is supported, choose Combination with maximum $N_{RB\_CC1}$ for testing.															

1. Connect the SS to the UE antenna connectors as shown in TS 36.508[7] Annex A Figure group [TBD] as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause [4.4.3].
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1, and C.3.1, and uplink signals according to Annex H.1 and H.3.0.
4. The UL and DL Reference Measurement channels are set according to Table 7.8.1A.5.4.1-1 through Table 7.8.1A.5.4.1-5 as appropriate.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.3A.5.4.3.

**7.8.1A.5.4.2 Test procedure**

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.8.1A.5.4.3

3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.3A.5.4.1-1 through Table 7.3A.5.4.1-5 as appropriate on PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table 7.8.1A.5.4.1-1 through Table 7.8.1A.5.4.1-5 as appropriate on PCC and SCCs. Since the UE has no payload and no loopback data to send the UE sends uplink MAC padding bits on the UL RMC.
6. Set the Downlink signal level to the value as defined in Table 7.8.1A.5.5-1 or 7.8.1A.5.5-2. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4 dB of the target level for carrier frequency  $f \leq 3.0\text{GHz}$  or within +0, -4.0 dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the Throughput measurement.
7. Set the Interfering signal levels to the values as defined in 7.8.1A.5.5-1 or 7.8.1A.5.5-2 and frequency below the measured carrier(s) according to table 7.8.1A.5.4.2-1, using a modulated interferer bandwidth as defined in Annex D of the present document.
8. Measure the average throughput for the carrier(s) indicated in table 7.8.1A.5.4.2-1 for a duration sufficient to achieve statistical significance according to Annex G.2.
9. Repeat steps from 6 to 8, using an interfering signal above the measured carrier(s) according to table 7.8.1A.5.4.2-1.
10. Repeat steps 6 to 9 for component carriers listed in table 7.8.1A.5.4.2-1.

**Table 7.8.1A.5.4.2-1: Test repetition and measurement configuration**

CA configuration	ID (Note 1)	Throughput measured on (Note 3)	Table with test parameters to select (Note 2)
Intra-band contiguous	1	PCC, SCC1, SCC2	7.8.1A.5.5-2
	2		
Inter-band	1	SCC1	7.8.1A.5.5-1
		SCC2	
	2	SCC1

	4		
Intra-band non-contiguous + Inter-band	1	SCC2	7.8.1A.5.5-1
	2	SCC1	
		SCC2	
Intra-band non-contiguous + Intra-band contiguous	1	PCC	7.8.1A.5.5-1
		SCC1, SCC2	7.8.1A.5.5-2
		SCC2	7.8.1A.5.5-1
	2	PCC, SCC1	7.8.1A.5.5-2
<p>Note 1: Test point ID for the particular CA configuration as defined in section 7.8.1A.5.4.1.</p> <p>Note 2: The reference for the placement of the interferer signals is the centre frequency of the carrier closest to the interferer among the carriers throughput is measured on.</p> <p>Note 3: Where there are multiple rows for a single Test point ID, the test is repeated for each row.</p> <p>Note 4: Skip the parts of the test procedure configuring in-gap interferer positions for a non-contiguous component carrier</p>			

#### 7.8.1A.5.4.3 Message contents

[Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 2, for SCCs configuration there are no additional message contents.]

#### 7.8.1A.5.5 Test requirement

The throughput of the carrier(s) under test shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.8.1A.5.5-1 or Table 7.8.1A.5.5-2 for the specified wanted signal mean power in the presence of two interfering signals.

Table 7.8.1A.5.5-1: Test parameters for Wide band intermodulation

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration for each CC	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9
$P_{\text{Interferer 1 (CW)}}$	dBm	-46					
$P_{\text{Interferer 2 (Modulated)}}$	dBm	-46					
$BW_{\text{Interferer 2}}$		1.4	3	5			
$F_{\text{Interferer 1 (Offset from SCC)}}$	MHz	-BW/2 -2.1 / +BW/2+ 2.1	-BW/2 -4.5 / +BW/2 + 4.5	-BW/2 - 7.5 / +BW/2 + 7.5			
$F_{\text{Interferer 2 (Offset from SCC)}}$	MHz	$2 * F_{\text{Interferer 1}}$					
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.						
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5$ MHz						
Note 4:	For the UE which supports inter band CA configuration in Table 7.3A.3-0, $P_{\text{Interferer 1}}$ and $P_{\text{Interferer 2}}$ powers are increased by the amount given by $\Delta R_{\text{IB}}$ in Table 7.3A.3-0						
Note 5:	For intra-band non-contiguous + inter-band CA, $\Delta R_{\text{BNC}} = 0$ dB for all sub-block gaps						

Table 7.8.1A.5.5-2: Wide band intermodulation

Rx parameter	Units	CA Bandwidth Class					
		B	C	D	E	F	
Power per CC in Aggregated Transmission Bandwidth Configuration	dBm	REFSENS + CA Bandwidth Class specific value below					
		9	12	13.8			
$P_{\text{Interferer 1 (CW)}}$	dBm	-46					
$P_{\text{Interferer 2 (Modulated)}}$	dBm	-46					
$BW_{\text{Interferer 2}}$	MHz	5	5	5			
$F_{\text{Interferer 1 (Offset)}}$	MHz	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$	$-F_{\text{offset}}-7.5$ / $+ F_{\text{offset}}+7.5$			
$F_{\text{Interferer 2 (Offset)}}$	MHz	$2 * F_{\text{Interferer 1}}$					
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ or $P_{\text{CMAX\_L\_CA}}$ as defined in subclause 6.2.5A.						
Note 2:	Reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 with set-up according to Annex C.3.1.						
Note 4:	The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5$ MHz						
Note 5:	The $F_{\text{interferer 1 (offset)}}$ is the frequency separation of the centre frequency of the carrier closest to the interferer and the centre frequency of the CW interferer and $F_{\text{interferer 2 (offset)}}$ is the frequency separation of the centre frequency of the carrier closest to the interferer and the centre frequency of the modulated interferer.						

## 7.8.1B Wide band Intermodulation for UL-MIMO

### 7.8.1B.1 Test purpose

Intermodulation response tests the ability of UE that support UL-MIMO to receive data with a given average throughput for a specified reference measurement channel, in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal, under conditions of ideal propagation and no added noise.

A UE unable to meet the throughput requirement under these conditions will decrease the coverage area when two or more interfering signals exist which have a specific frequency relationship to the wanted signal.

### 7.8.1B.2 Test applicability

This test applies to all types of E-UTRA UE release 10 and forward that support UL-MIMO.

### 7.8.1B.3 Minimum conformance requirements

For UE(s) with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements in subclause 7.8.1B.3 shall be met with the UL-MIMO configurations specified in Table 6.2.2B.3-2. For UL-MIMO, the parameter  $P_{\text{CMAX}_L}$  is defined as the total transmitter power over the two transmit antenna connectors.

The normative reference for this requirement is TS 36.101 [2] clause 7.8.1B and TS 36.101 [2] Annexes A and D.

### 7.8.1B.4 Test description

#### 7.8.1B.4.1 Initial condition

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.8.1B.4.1-1. The details of the uplink and downlink reference measurement channels (RMCs) are specified in Annexes A.2 and A.3 respectively. The details of the OCNG patterns used are specified in Annex A.5. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Table 7.8.1B.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1				NC		
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1				Mid range		
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1				Lowest, 5MHz, Highest		
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD	TDD		FDD	TDD
1.4MHz	QPSK	6	6	QPSK	6	6
3MHz	QPSK	15	15	QPSK	15	15
5MHz	QPSK	25	25	QPSK	25	25
5MHz	QPSK	25	N/A	QPSK	20	N/A
5MHz	QPSK	25	N/A	QPSK	15	N/A
5MHz	QPSK	25	N/A	QPSK	5 <sup>†</sup>	N/A
10MHz	QPSK	50	50	QPSK	50	50
10MHz	QPSK	50	N/A	QPSK	25	N/A
10MHz	QPSK	50	N/A	QPSK	20	N/A
10MHz	QPSK	50	N/A	QPSK	15	N/A
15MHz	QPSK	75	75	QPSK	75	75
15MHz	QPSK	75	N/A	QPSK	50	N/A
15MHz	QPSK	75	N/A	QPSK	25	N/A
15MHz	QPSK	75	N/A	QPSK	20	N/A
20MHz	QPSK	100	100	QPSK	100	100
20MHz	QPSK	100	N/A	QPSK	75	N/A
20MHz	QPSK	100	N/A	QPSK	50	N/A
20MHz	QPSK	100	N/A	QPSK	25	N/A
20MHz	QPSK	100	N/A	QPSK	20	N/A
Note 1: Test Channel Bandwidths are checked separately for each E-UTRA band, which applicable channel bandwidths are specified in Table 5.4.2.1-1. Note 2: Depending on E-UTRA band, only the appropriate Uplink RB allocation value according to table 7.3.3-2 is tested per Test Channel Bandwidth. Note 3: For the DL signal one sided dynamic OCNG Pattern OP.1 FDD/TDD is used. Note 4: Applicable only to E-UTRA FDD Band 31. The UL resource blocks shall be located at RBstart 10 (according to Table 7.3.3-2).						

1. Connect the SS and interfering sources to the UE antenna connectors as shown in TS 36.508 [7] Figure A.31.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.1, and uplink signals according to Annex H.1 and H.3.1.
4. The UL and DL Reference Measurement channels are set according to Table 7.8.1B.4.1-1.
5. Propagation conditions are set according to Annex B.0.
6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.8.1B.4.3.

#### 7.8.1B.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.8.1B.4.1-1. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information for each UL HARQ process via PDCCH DCI format 4 for C\_RNTI to schedule the UL RMC according to Table 7.8.1B.4.1-1. Since the UE has no payload data to send, the UE transmits uplink MAC padding bits on the UL RMC.
3. Set the Downlink signal level to the value as defined in Table 7.8.1B.5-1. Send Uplink power control commands to the UE (less or equal to 1dB step size should be used), to ensure that the UE output power is within +0, - 3.4

dB of the target level in Table 7.8.1B.5-1 for carrier frequency  $f \leq 3.0\text{GHz}$  or within  $+0, -4.0$  dB of the target level for carrier frequency  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ , for at least the duration of the throughput measurement.

4. Set the Interfering signal levels to the values as defined in Table 7.8.1B.5-1 and frequency below the wanted signal, using a modulated interferer bandwidth as defined in Annex D of the present document.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G.2.
6. Repeat steps from 3 to 5, using an interfering signal above the wanted signal at step 4.

#### 7.8.1B.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception.

**Table 7.8.1B.4.3-1: UplinkPowerControlDedicated**

Derivation Path: 36.331 clause 6.3.2			
Information Element	Value/remark	Comment	Condition
UplinkPowerControlDedicated-DEFAULT ::= SEQUENCE {			
p0-UePUSCH	0		
deltaMCS-Enabled	en0		
accumulationEnabled	TRUE		
p0-uePUCCH	0		
pSRS-Offset	3 (-6 dB)		
filterCoefficient	fc8	larger filter length is used to reduce the RSRP measurement variation	
}			

#### 7.8.1B.5 Test requirements

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.8.1B.5-1 for the specified wanted signal mean power in the presence of two interfering signals.

**Table 7.8.1B.5-1: Test parameters for Wide band intermodulation**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9
$P_{\text{Interferer 1 (CW)}}$	dBm	-46					
$P_{\text{Interferer 2 (Modulated)}}$	dBm	-46					
$BW_{\text{Interferer 2}}$		1.4	3	5			
$F_{\text{Interferer 1 (Offset)}}$	MHz	-BW/2 -2.1 / +BW/2+ 2.1	-BW/2 -4.5 / +BW/2 + 4.5	-BW/2 - 7.5 / +BW/2 + 7.5			
$F_{\text{Interferer 2 (Offset)}}$	MHz	$2 * F_{\text{Interferer 1}}$					
Note 1:	The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.						
Note 2:	The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.						
Note 3:	The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$ .						

## 7.8.1E Wide band Intermodulation for UE category 0

Editor's note: Following aspects missing or not yet determined:

- RB allocation within brackets
- Test tolerance for this case in Annex F is not completed

### 7.8.1E.1 Test purpose

Same test purpose as in clause 7.8.1.1.

### 7.8.1E.2 Test applicability

This test applies to all types of E-UTRA UE release 12 and forward of UE category 0.

### 7.8.1E.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 7.8.1.3.

### 7.8.1E.4 Test description

#### 7.8.1E.4.1 Initial condition

Same initial conditions as in clause 7.8.1.4.1 with the following exceptions:

- Instead of Table 7.8.1.4.1-1 → use Table 7.8.1E.4.1-1.
- Connect the SS to the UE antenna connectors as shown in TS 36.508[7] Annex A Figure A.6 using only main UE Tx/Rx antenna.

**Table 7.8.1E.4.1-1: Test Configuration Table**

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1				NC		
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1				Mid range		
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1				Lowest, 5MHz, Highest		
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD and HD-FDD	TDD		FDD and HD-FDD	TDD
1.4MHz	QPSK	6	6	QPSK	6	6
3MHz	QPSK	14	14	QPSK	15	15
5MHz	QPSK	14	14	QPSK	25	25
5MHz	QPSK	14	N/A	QPSK	20	N/A
10MHz	QPSK	14	14	QPSK	[36]	[36]

20MHz	QPSK	14	14	QPSK	[36]	[36]
20MHz	QPSK	14	N/A	QPSK	20	N/A
Note 1: Test Channel Bandwidths are checked separately for each E-UTRA band, which applicable channel bandwidths are specified in Table 5.4.2.1-1. Note 2: Depending on E-UTRA band, only the appropriate Uplink RB allocation value according to table 7.3E.3-3 is tested per Test Channel Bandwidth. The allocation shall be located as close as possible to the downlink operating band but confined within the transmission bandwidth configuration for the channel bandwidth (Table 5.4.2-1). Note 3: For the DL signal one sided dynamic OCNG Pattern OP.1 FDD/TDD is used. Note 4: Downlink RB position shall be RBstart = 0.						

### 7.8.1E.4.2 Test procedure

Same test procedure as in clause 7.8.1.4.2

### 7.8.1E.4.3 Message contents

Same message contents as in clause 7.8.1.4.3

### 7.8.1E.5 Test requirements

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annex A.3.2 with parameters specified in Table 7.8.1E.5-1 for the specified wanted signal mean power in the presence of two interfering signals.

**Table 7.8.1E.5-1: Test parameters for Wide band intermodulation**

Rx Parameter	Units	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Power in Transmission Bandwidth Configuration	dBm	REFSENS + channel bandwidth specific value below					
		12	8	6	6	7	9
$P_{\text{Interferer 1}}$ (CW)	dBm	-46					
$P_{\text{Interferer 2}}$ (Modulated)	dBm	-46					
$BW_{\text{Interferer 2}}$		1.4	3	5			
$F_{\text{Interferer 1}}$ (Offset)	MHz	-BW/2 -2.1	-BW/2 -4.5	-BW/2 - 7.5			
		/	/	/			
		+BW/2+ 2.1	+BW/2 + 4.5	+BW/2 + 7.5			
$F_{\text{Interferer 2}}$ (Offset)	MHz	$2 \cdot F_{\text{Interferer 1}}$					
Note 1: The transmitter shall be set to 4dB below $P_{\text{CMAX\_L}}$ with $P_{\text{CMAX\_L}}$ as defined in clause 6.2.5.							
Note 2: The reference measurement channel is specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1.							
Note 3: The modulated interferer consists of the Reference measurement channel specified in Annex A.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1 and set-up according to Annex C.3.1. The interfering modulated signal is 5MHz E-UTRA signal as described in Annex D for channel bandwidth $\geq 5\text{MHz}$							

## 7.8.2 Void

## 7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

### 7.9.1 Test Purpose

Test verifies the UE's spurious emissions meet the requirements described in clause 7.9.3.

Excess spurious emissions increase the interference to other systems.

### 7.9.2 Test Applicability

This test applies to all types of E-UTRA UE release 8 and forward.

## 7.9.3 Minimum Conformance Requirements

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.9.3-1

**Table 7.9.3-1: General receiver spurious emission requirements**

Frequency Band	Measurement Bandwidth	Maximum level	Note
$30\text{MHz} \leq f < 1\text{GHz}$	100 kHz	-57 dBm	
$1\text{GHz} \leq f \leq 12.75\text{ GHz}$	1 MHz	-47 dBm	
$12.75\text{ GHz} \leq f \leq 5^{\text{th}}$ harmonic of the upper frequency edge of the DL operating band in GHz	1 MHz	-47 dBm	Note 1
Note 1: Applies only for Band 22, Band 42 and Band 43.			
Note 2: Unused PDCCH resources are padded with resource element groups with power level given by PDCCH_RA/RB as defined in Annex C.3.1.			

The normative reference for this requirement is TS 36.101 [2] clause 7.9.1.

## 7.9.4 Test Description

### 7.9.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in table 7.9.4.1-1. The details of the downlink and uplink reference measurement channels (RMCs) are specified in Annexes A.3 and A.2 respectively.

**Table 7.9.4.1-1: Test Configuration Table**

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1				NC		
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1				Low range, Mid range, High range		
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1				Highest		
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD	TDD		FDD	TDD
1.4MHz	QPSK	0	0	QPSK	0	0
3MHz	QPSK	0	0	QPSK	0	0
5MHz	QPSK	0	0	QPSK	0	0
10MHz	QPSK	0	0	QPSK	0	0
15MHz	QPSK	0	0	QPSK	0	0
20MHz	QPSK	0	0	QPSK	0	0
Note 1: Test Channel Bandwidths are checked separately for each E-UTRA band. The applicable channel bandwidths are specified in Table 7.3.3-2.						

1. Connect a spectrum analyzer (or other suitable test equipment) to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.8.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.1.
4. The DL Reference Measurement channels are set according to Table 7.9.4.1-1.
5. Propagation conditions are set according to Annex B.0.

6. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.9.4.3.

### 7.9.4.2 Test Procedure

1. Sweep the spectrum analyzer (or equivalent equipment) over a frequency range and measure the average power of spurious emission.
2. Repeat step 1 for all E-UTRA Rx antennas of the UE.

### 7.9.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6.

## 7.9.5 Test Requirement

The measured spurious emissions derived in step 1), shall not exceed the maximum level specified in Table 7.9.5-1

**Table 7.9.5-1: General receiver spurious emission requirements**

Frequency Band	Measurement Bandwidth	Maximum level	Note
$30\text{MHz} \leq f < 1\text{GHz}$	100 kHz	-57 dBm	
$1\text{GHz} \leq f \leq 12.75\text{ GHz}$	1 MHz	-47 dBm	
$12.75\text{ GHz} \leq f \leq 5^{\text{th}}$ harmonic of the upper frequency edge of the DL operating band in GHz	1 MHz	-47 dBm	Note 1
Note 1: Applies only for Band 22, Band 42 and Band 43.			
Note 2: Unused PDCCH resources are padded with resource element groups with power level given by PDCCH_RA/RB as defined in Annex C.3.1.			

## 7.9A Spurious emissions for CA

**Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:**

- Connection diagram for UEs with separate antennas per carrier is not covered.

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

### 7.9A.1 Test Purpose

Test verifies the UE's spurious emissions meet the requirements described in clause 7.9A.3.

Excess spurious emissions increase the interference to other systems.

### 7.9A.2 Test Applicability

This test applies to all types of E-UTRA UE release 10 and forward that support inter-band DL CA with a DL-only band.

### 7.9A.3 Minimum Conformance Requirements

For E-UTRA CA configurations including an operating band without uplink band (as noted in Table 5.2-1), the power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.9A.3-1.

**Table 7.9A.3-1: General receiver spurious emission requirements**

Frequency band	Measurement bandwidth	Maximum level	Note
$30\text{MHz} \leq f < 1\text{GHz}$	100 kHz	-57 dBm	
$1\text{GHz} \leq f \leq 12.75\text{ GHz}$	1 MHz	-47 dBm	
NOTE 1: Unused PDCCH resources are padded with resource element groups with power level given by PDCCH_RA/RB as defined in Annex C.3.1.			
NOTE 2: The requirements apply when the UE is configured for carrier aggregation but is not transmitting.			

The normative reference for this requirement is TS 36.101 [2] clause 7.9.1A

### 7.9A.4 Test Description

#### 7.9A.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

The initial test configurations consist of environmental conditions, test frequencies, and channel bandwidths based on E-UTRA bands specified in Table 5.4.2.1-1. All of these configurations shall be tested with applicable test parameters for each channel bandwidth, and are shown in Table 7.9A.4.1-1. The details of the uplink reference measurement channels (RMCs) are specified in Annex A.2. Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Table 7.9A.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1			NC			
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1 for different CA bandwidth classes, and PCC and SCCs are mapped onto physical frequencies according to Table 7.1-2			A: Low range, Mid range, High range for PCC and SCC			
Test CC Combination setting ( $N_{RB\_agg}$ ) as specified in subclause 5.4.2A.1 for the CA Configuration across bandwidth combination sets supported by the UE			Highest $N_{RB\_agg}$ for PCC and SCC			
Test Parameters for CA Configurations						
CA Configuration / $N_{RB\_agg}$		DL Allocation			UL Allocation	
PCC $N_{RB}$	SCCs $N_{RB}$	CC MOD	PCC & SCC RB allocation		CC MOD	PCC $N_{RB\_alloc}$
50	50	QPSK	50	50	QPSK	0
50	50	QPSK	50	50	QPSK	0
50	50	QPSK	50	50	QPSK	0
50	50	QPSK	50	50	QPSK	0
50	75	QPSK	50	75	QPSK	0
50	100	QPSK	50	100	QPSK	0
50	100	QPSK	50	100	QPSK	0
50	100	QPSK	50	100	QPSK	0
75	50	QPSK	75	50	QPSK	0
75	100	QPSK	75	100	QPSK	0
100	50	QPSK	100	50	QPSK	0
100	50	QPSK	100	50	QPSK	0
100	50	QPSK	100	50	QPSK	0
100	75	QPSK	100	75	QPSK	0
100	100	QPSK	100	100	QPSK	0
100	100	QPSK	100	100	QPSK	0
Note 1: CA Configuration Test CC Combination settings are checked separately for each CA Configuration, which applicable aggregated channel bandwidths are specified in Table 5.4.2A.1-2.						

1. Connect the SS to the UE antenna connectors as shown in Figure TS 36.508 [7] Annex A, Figure A.8 as appropriate.
2. The parameter settings for the cell are set up according to TS 36.508 [7] subclause 4.4.3.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.0, and uplink signals according to Annex H.1 and H.3.0.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 7.9A.4.3.

#### 7.9A.4.2 Test Procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.1 for all downlink physical channels.

2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 7.9A.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table 7.9A.4.1-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Sweep the spectrum analyzer (or equivalent equipment) over a frequency range and measure the average power of spurious emission. During measurement SS sends no uplink scheduling information to the UE
6. Repeat step 1 to 5 for all E-UTRA Rx antennas of the UE.

### 7.9A.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6.

### 7.9A.5 Test Requirement

The measured spurious emissions derived in step 5), shall not exceed the maximum level specified in Table 7.9A.5-1

**Table 7.9A.5-1: General receiver spurious emission requirements**

Frequency band	Measurement bandwidth	Maximum level	Note
$30\text{MHz} \leq f < 1\text{GHz}$	100 kHz	-57 dBm	
$1\text{GHz} \leq f \leq 12.75\text{GHz}$	1 MHz	-47 dBm	
NOTE 1: Unused PDCCH resources are padded with resource element groups with power level given by PDCCH_RA/RB as defined in Annex C.3.1.			
NOTE 2: The requirements apply when the UE is configured for carrier aggregation but is not transmitting.			

## 7.9E Spurious emissions for UE category 0

**Editor's note: Following aspects missing or not yet determined:**

- **Test tolerance for this case in Annex F is not completed**

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

### 7.9E.1 Test Purpose

Same test purpose as in clause 7.9.1.

### 7.9E.2 Test Applicability

This test applies to all types of E-UTRA UE release 12 and forward of UE category 0.

### 7.9E.3 Minimum Conformance Requirements

Same minimum conformance requirements as in clause 7.9.3.

### 7.9E.4 Test Description

#### 7.9E.4.1 Initial Conditions

Same initial conditions as in clause 7.9.4.1 with the following exceptions:

- Instead of Table 7.9.4.1-1 → use Table 7.9E.4.1-1.
- Connect the SS to the UE antenna connectors as shown in TS 36.508[7] Annex A Figure A.8 using only main UE Tx/Rx antenna.

Table 7.9E.4.1-1: Test Configuration Table

Initial Conditions						
Test Environment as specified in TS 36.508[7] subclause 4.1			NC			
Test Frequencies as specified in TS36.508 [7] subclause 4.3.1			Low range, Mid range, High range			
Test Channel Bandwidths as specified in TS 36.508 [7] subclause 4.3.1			Highest			
Test Parameters for Channel Bandwidths						
Ch BW	Downlink Configuration			Uplink Configuration		
	Mod'n	RB allocation		Mod'n	RB allocation	
		FDD and HD-FDD	TDD		FDD and HD-FDD	TDD
1.4MHz	QPSK	0	0	QPSK	0	0
3MHz	QPSK	0	0	QPSK	0	0
5MHz	QPSK	0	0	QPSK	0	0
10MHz	QPSK	0	0	QPSK	0	0
15MHz	QPSK	0	0	QPSK	0	0
20MHz	QPSK	0	0	QPSK	0	0
Note 1: Test Channel Bandwidths are checked separately for each E-UTRA band. The applicable channel bandwidths are specified in Table 7.3E.3-3.						

## 7.9E.4.2 Test Procedure

Same test procedure as in clause 7.9.4.2

## 7.9E.4.3 Message Contents

Message contents are according to TS 36.508 [7] subclause 4.6.

## 7.9E.5 Test Requirement

The measured spurious emissions derived in step 1), shall not exceed the maximum level specified in Table 7.9E.5-1

Table 7.9E.5-1: General receiver spurious emission requirements

Frequency Band	Measurement Bandwidth	Maximum level	Note
$30\text{MHz} \leq f < 1\text{GHz}$	100 kHz	-57 dBm	
$1\text{GHz} \leq f \leq 12.75\text{ GHz}$	1 MHz	-47 dBm	
$12.75\text{ GHz} \leq f \leq 5^{\text{th}}$ harmonic of the upper frequency edge of the DL operating band in GHz	1 MHz	-47 dBm	Note 1
Note 1: Applies only for Band 22, Band 42 and Band 43.			
Note 2: Unused PDCCH resources are padded with resource element groups with power level given by PDCCH_RA/RB as defined in Annex C.3.1.			

## 7.10 Void

### 7.10A Receiver image for CA

TS 36.101 [2] clause 7.10.1A specifies minimum requirements for receiver image for CA but recommends that these requirements do not need to be tested.

## 8 Performance Requirement

### 8.1 General

The performance requirements for the physical channels specified in TS 36.211 [8] clause 6 (for downlink physical channels) shall be as defined in the respective sections below.

The requirements for the UE in this clause are specified for the downlink reference measurement channels specified in Annex A, the propagation conditions specified in Annex B and the downlink physical channels specified in Annex C.

Unless otherwise stated the throughput measurements in clause 8 shall be performed according to the general rules for statistical testing in Annex G clause G.3.

The requirement for a UE that support E-UTRA in downlink shall be tested according to the declared UE PDSCH category and CA capabilities.

The fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective test cases.

The UE performance in this section is considered to be operating band independent. Therefore, the required performance in the respective test cases can be verified in one of the operating bands supported by the UE under test. All the test points supported by the bands of the multiband UE (based on channel bandwidth, DL and UL configuration) need to be tested.

For CA testing, unless otherwise stated, the logical carriers PCC / SCC are mapped on physical frequencies as defined in Table 8.1-1.

**Table 8.1-1: PCC/SCCs frequency mapping**

CA Configuration	PCC-SCC mapping	Notes
Intra-band CA	CC1-CC2	1
Inter-band CA (CA_x-y)	Bx-By (if not supported by the UE, then By-Bx)	2
Note 1:	Notation CCi-CCj means PCC on component carrier CCi and SCC on component carrier CCj, with CCi/j frequencies defined in the corresponding intra-band contiguous / non-contiguous CA band in TS 36.508.	
Note 2:	Notation Bi-Bj means PCC on component Band i and SCC on component Band j, with single Band i/j frequencies defined in TS 36.508.	

#### 8.1.1 Receiver antenna capability

The performance requirements are based on UE(s) that utilize one or more antenna receivers.

For all test cases, the SNR is defined as:

$$SNR = \frac{\sum_{j=1}^{N_{RX}} \hat{E}_s^{(j)}}{\sum_{j=1}^{N_{RX}} N_{oc}^{(j)}}$$

where  $N_{RX}$  denotes the number of receiver antenna connectors and the superscript receiver antenna connector  $j$ . The above SNR definition assumes that the REs are not precoded. The SNR definition does not account for any gain which can be associated to the precoding operation. The relative power of physical channels transmitted is defined in Table C.3.2-1. The SNR requirement applies for the UE categories and CA capabilities given for each test.

For enhanced performance requirements type A, the SINR is defined as

$$SINR = \frac{\sum_{j=1}^{N_{RX}} \hat{E}_s^{(j)}}{\sum_{j=1}^{N_{RX}} N_{oc}^{(j)}}$$

where  $N_{RX}$  denotes the number of receiver antenna connectors and the superscript receiver antenna connector  $j$ . The above SINR definition assumes that the REs are not precoded. The SINR definition does not account for any gain which can be associated to the precoding operation. The relative power of physical channels transmitted is defined in Table C.3.2-1. The SINR requirement applies for the UE categories given for each test.

For the performance requirements specified in this clause, it is assumed that  $N_{RX}=2$  unless otherwise stated.

**Table 8.1.1-1: Void**

8.1.1.1 Simultaneous unicast and MBMS operations

8.1.1.2 Dual-antenna receiver capability in idle mode

8.1.2 Applicability of requirements

8.1.2.1 Applicability of requirements for different channel bandwidths

In Clause 8 the test cases may be defined with different channel bandwidth to verify the same target FRC conditions with the same propagation conditions, correlation matrix and antenna configuration.

Test cases defined for 5MHz channel bandwidth that reference this clause are applicable to UEs that support only Band 31.

8.1.2.2 Definition of CA capability

The definition with respect to CA capabilities for 2CCs is given as in Table 8.1.2.2-1.

**Table 8.1.2.2-1: Definition of CA capability with 2DL CCs**

CA Capability	CA Capability Description
CA2_C	Intra-band contiguous CA
CA2_A2	Inter-band CA (two bands)
CA2_N2	Intra-band non-contiguous CA (with two sub-blocks)
Note 1:	CA2_C corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-1 for 2 DL CCs. CA2_A2 corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-2 for 2 DL CCs. CA2_N2 corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-3 for 2 DL CCs.

The supported testable aggregated CA bandwidth combinations for 2CCs for each CA capability are listed in Table 8.1.2.2-2.

**Table 8.1.2.2-2: Supported testable aggregated CA bandwidth combinations for different CA capability with 2DL CCs**

CA Capability	Bandwidth combination for FDD CA	Bandwidth combination for TDD CA	Bandwidth combination for TDD-FDD CA
CA_C	[5+5MHz, 5+10MHz, 10+10MHz, 20+20MHz]	[20+20MHz, 15+20MHz]	NA
CA_A_2	[10+10MHz, 10+15MHz, 10+20MHz, 15+20MHz, 20+20MHz]	[20+20MHz]	[10(FDD)+20(TDD)MHz, 15(FDD)+20(TDD)MHz, 20(FDD)+20(TDD)MHz]
CA_N	[5+10MHz, 10+10MHz, 20+20MHz]	[20+20MHz]	NA
Note 1: This table is only for information and applicability and test rules of CA performance requirements are specified in 8.1.2.3 and 9.1.1.2.			

**Table 8.1.2.2-3: Definition of CA capability with 3 DL CCs**

CA Capability	CA Capability Description
CA_C	Intra-band contiguous CA
CA_A_2	Inter-band CA (two bands)
CA_A_3	Inter-band CA (three bands)
CA_N	Intra-band non-contiguous CA (with two sub-blocks)
Note 1: CA_C corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-1. CA_A_2 corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-2. CA_A_3 corresponds to E-UTRA CA configurations and bandwidth combination sets defined in and Table 5.4.2A.1-2a. CA_N corresponds to E-UTRA CA configurations and bandwidth combination sets defined in Table 5.4.2A.1-3.	

The supported largest aggregated CA bandwidth combinations for 3CCs for each CA capability are listed in Table 8.1.2.2-4.

**Table 8.1.2.2-4: Supported largest aggregated CA bandwidth combinations for different CA capability with 3 CCs**

CA capability	Bandwidth combination for FDD CA	Bandwidth combination for TDD CA	Bandwidth combination for TDD-FDD CA
CA_C	NA	[20+20+20MHz]	NA
CA_A_2	[5+10+20MHz, 10+10+20MHz, 10+20+20MHz, 20+20+20MHz]	[15+20+20MHz, 20+20+20MHz]	[15(FDD)+20(TDD)+20(TDD)MHz, 20(FDD)+20(TDD)+20(TDD)MHz]
CA_A_3	[10+10+20MHz, 10+15+15MHz, 10+20+20MHz, 15+15+20MHz, 15+20+20MHz, 20+20+20MHz]	NA	NA
CA_N	NA	[20+20+20MHz]	NA
Note 1: This table is only for information and applicability and test rules of CA performance requirements are specified in 8.1.2.3 and 9.1.1.2.			

For test cases with more than one component carrier, "Fraction of Maximum Throughput" in the performance requirement refers to the ratio of the sum of throughput values of all component carriers to the sum of the nominal maximum throughput values of all component carriers, unless otherwise stated.

### 8.1.2.3 Applicability and test rules for different CA configurations and bandwidth combination sets

The performance requirement for CA UE demodulation tests in Clause 8 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.4.2A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL CCs in Table 8.1.2.3-1 and 3DL CCs in Table 8.2.2.3-2. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

**Table 8.1.2.3-1: Applicability and test rules for CA UE demodulation tests with 2 DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order	No. of the supported bandwidth combinations to be tested from each selected CA configuration
CA tests with 2CCs in Clause 8.2.1.1.1_A, 8.2.1.4.2_A	Any one of the supported CA capabilities	Any one of the supported FDD CA configurations	10+10 MHz, 20+20 MHz, 5+5 MHz, and 10MHz+5MHz.	1
CA tests with 2CCs in Clause 8.2.1.3.1_A	Each supported CA capability	Any one of the supported FDD CA configurations in each CA capability	10+10 MHz, 20+20 MHz, 5+5 MHz, and 10MHz+5MHz.	1
CA tests with 2CCs in Clause 8.2.1.3.1A, 8.7.1.1_A	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported FDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 2CCs in Clause 8.2.1.7	CA2_C	Supported FDD intra-band contiguous CA configurations covering the lowest and highest operating bands	Largest aggregated CA bandwidth combinations	1
CA tests with 2CCs in Clause 8.2.2.1.1_A, 8.2.2.4.2_A	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 2CCs in Clause 8.2.2.3.1_A	Each supported CA capability	Any one of the supported TDD CA configurations in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 2CCs in Clause 8.2.2.3.1A, 8.7.2.1_A	Any one of the supported CA capabilities with largest aggregated CA bandwidth	Any one of the supported TDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 2CCs in 8.2.2.7	CA2_C	Supported TDD intra-band contiguous CA configurations covering the lowest and highest operating bands	Largest aggregated CA bandwidth combinations	1
CA tests with 2CCs in Clause [8.2.1.8.1]	CA2_N2	CA_3A-3A defined in Table 5.4.2A.1-3	10+10 MHz	1

Note 1: The applicability and test rules are specified in this table, unless otherwise stated.

**Table 8.1.2.3-2: Applicability and test rules for CA UE demodulation tests with 3 DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order	No. of the supported bandwidth combinations to be tested from each selected CA configuration
CA tests with 3CCs in Clause 8.2.1.1.1_A, 8.2.1.4.2_A, 8.7.1.1_A	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported FDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 3CCs in Clause 8.2.1.3.1_A	Each supported CA capability	Any one of the supported FDD CA configurations in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 3CCs in Clause 8.2.2.1.1_A, 8.2.2.4.2_A, 8.7.2.1_A	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
CA tests with 3CCs in Clause 8.2.2.3.1_A	Each supported CA capability	Any one of the supported TDD CA configurations in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
Note 1: The applicability and test rules are specified in this table, unless otherwise stated.				

### 8.1.2.3A

### 8.1.2.3B Applicability and test rules for different TDD-FDD CA configurations and bandwidth combination sets

The performance requirement for TDD-FDD CA UE demodulation tests in Clause 8 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.6A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL TDD-FDD CA in Table 8.1.2.3B-1 in Table 8.1.2.3B-2 and for 3 DL TDD-FDD CA. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

**Table 8.1.2.3B-1: Applicability and test rules for CA UE demodulation tests for TDD-FDD CA with 2 DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order
CA tests with 2CCs in Clause 8.2.3.1_A.1, 8.2.3.2A_A.1, 8.2.3.3_A.1, 8.7.5_A.1	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD-FDD CA configurations with FDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 2CCs in Clause 8.2.3.2_A.1	Each supported CA capability	Any one of the supported TDD-FDD CA configurations with FDD PCell in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 2CCs in Clause 8.2.3.1_A.2, 8.2.3.2A_A.2, 8.2.3.3_A.2, 8.7.5_A.2	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD-FDD CA configurations with TDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 2CCs in Clause 8.2.3.2_A.2	Each supported CA capability	Any one of the supported TDD-FDD CA configurations with TDD PCell in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination

**Table 8.1.2.3B-2: Applicability and test rules for CA UE demodulation tests for TDD-FDD CA with 3 DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order
CA tests with 3CCs in Clause 8.2.3.1_A.3, 8.2.3.2A_A.1, 8.2.3.3_A.1, 8.7.5_A.1	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD-FDD CA configurations with FDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 3CCs in Clause 8.2.3.2_A.1	Each supported CA capability	Any one of the supported TDD-FDD CA configurations with FDD PCell in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 3CCs in Clause 8.2.3.1_A.4, 8.2.3.2A_A.2, 8.2.3.3_A.2, 8.7.5_A.2	Any one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD-FDD CA configurations with TDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 3CCs in Clause 8.2.3.2_A.2	Each supported CA capability	Any one of the supported TDD-FDD CA configurations with TDD PCell in each CA capability with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination

#### 8.1.2.4 Test coverage for different number of component carriers

For FDD tests specified in 8.2.1.1.1, 8.2.1.3.1, 8.2.1.4.2, and 8.7.1.1, if corresponding CA tests are tested, the test coverage can be considered fulfilled without executing single carrier tests.

For TDD tests specified in 8.2.2.1.1, 8.2.2.3.1, 8.2.2.4.2, and 8.7.2.1, if corresponding CA tests are tested, the test coverage can be considered fulfilled without executing single carrier tests.

For FDD CA tests specified in 8.2.1.1.1\_A, 8.2.1.4.2\_A, and 8.7.1.1\_A, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For FDD CA tests specified in 8.2.1.3.1\_A, for each supported CA capability, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD CA tests specified in 8.2.2.1.1\_A, 8.2.2.4.2\_A, and 8.7.2.1\_A, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD CA tests specified in 8.2.2.3.1\_A, for each supported CA capability, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

## 8.2 Demodulation of PDSCH (Cell-Specific Reference Symbols)

### 8.2.1 FDD (Fixed Reference Channel)

The parameters specified in Table 8.2.1-1 are valid for all FDD tests unless otherwise stated.

Table 8.2.1-1: Common Test Parameters (FDD)

Parameter	Unit	Value	Comments
Inter-TTI Distance		1	
Number of HARQ processes	Processes	8	For FDD, 8 HARQ processes in the DL, as specified in TS 36.213 [10] clause 7. All 8 HARQ processes are used.
Scheduling of retransmissions			1. Retransmissions use the same Transport Block Size (TBS) as the initial transmission. 2. HARQ processes are scheduled consecutively, independent of the fact, whether retransmissions (for negatively acknowledged HARQ processes) or new transmissions (for positively acknowledged HARQ processes) occur.
Maximum number of HARQ transmission		4	It is always 4 for FDD, as specified in TS 36.213 [10] clause 8
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM	
Number of OFDM symbols for PDCCH	OFDM symbols	4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, 2 for 10 MHz, 15 MHz and 20 MHz bandwidths	The PCFICH carries information about the number of OFDM symbols used for transmission of PDCCHs in a subframe, as specified in TS 36.211 [8] clause 6.7
Cyclic Prefix		Normal	CP consist of the following physical resource blocks (RBs) parameters: 12 consecutive subcarriers at a 15 kHz spacing and 7 OFDM symbols, as specified in TS 36.211 [8] clause 6.2.3
Cell ID		0 (Note 1)	The Cell ID is uniquely defined by a number in the range of 0 to 503, representing the physical-layer cell identity, as specified in TS 36.211 [8] clause 6.11.
Cross carrier scheduling		Not configured	
Note 1: For CA tests, Cell ID = 0 applies to P-Cell. For (n)th S-Cell, Cell ID = n is used.			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.

### 8.2.1.1 FDD PDSCH Single Antenna Port Performance (Cell-Specific Reference Symbols)

#### 8.2.1.1.1 FDD PDSCH Single Antenna Port Performance

##### 8.2.1.1.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

##### 8.2.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

## 8.2.1.1.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.1.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.1.1.3-2 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

**Table 8.2.1.1.1.3-1: Test Parameters for Testing**

Parameter		Unit	Test 1- 5	Test 6- 8	Test 9- 15	Test 16- 18
Downlink power allocation	$\rho_A$	dB	0	0	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	0	0	0	0
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98	-98	-98
Symbols for unused PRBs			OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)
Modulation			QPSK	16QAM	64QAM	16QAM
PDSCH transmission mode			1	1	1	1
Note 1: $P_B = 0$						
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UE's with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.						

Table 8.2.1.1.1.3-2: Minimum performance (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz (Note 1)	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	-1.0	1-8
2	10 MHz	R.2 FDD	OP.1 FDD	ETU70	1x2 Low	70	-0.4	1-8
3	10 MHz	R.2 FDD	OP.1 FDD	ETU300	1x2 Low	70	0.0	1-8
4	10 MHz	R.2 FDD	OP.1 FDD	HST	1x2	70	-2.4	1-8
5	1.4 MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	0.0	1-8
6	10 MHz	R.3 FDD	OP.1 FDD	EVA5	1x2 Low	70	6.7	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	6.7	2-8
7	10 MHz	R.3 FDD	OP.1 FDD	ETU70	1x2 Low	30	1.4	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	ETU70	1x2 Low	30	1.4	2-8
8	10 MHz	R.3 FDD	OP.1 FDD	ETU300	1x2 High	70	9.4	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	ETU300	1x2 High	70	9.4	2-8
9	3 MHz	R.5 FDD	OP.1 FDD	EVA5	1x2 Low	70	17.6	1-8
10	5 MHz	R.6 FDD	OP.1 FDD	EVA5	1x2 Low	70	17.4	2-8
11	10 MHz	R.7 FDD	OP.1 FDD	EVA5	1x2 Low	70	17.7	2-8
12	10 MHz	R.7 FDD	OP.1 FDD	ETU70	1x2 Low	70	19.0	2-8
13	10 MHz	R.7 FDD	OP.1 FDD	EVA5	1x2 High	70	19.1	2-8
14	15 MHz	R.8 FDD	OP.1 FDD	EVA5	1x2 Low	70	17.7	2-8
15	20 MHz	R.9 FDD	OP.1 FDD	EVA5	1x2 Low	70	17.6	3-8
16	3 MHz	R.0 FDD	OP.1 FDD	ETU70	1x2 Low	30	1.9	1-8
17	10 MHz	R.1 FDD	OP.1 FDD	ETU70	1x2 Low	30	1.9	1-8
18	20 MHz	R.1 FDD	OP.1 FDD	ETU70	1x2 Low	30	1.9	1-8

Note 1: Test 1 may not be executed for UE-s for which Test 1 in section 8.2.1.1.1\_A.2 is applicable.  
Note 2: Test case applicability is defined in 8.1.2.1.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.1.

#### 8.2.1.1.1.4 Test description

##### 8.2.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Frequencies to be tested for 1PRB allocation: Low Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.1.4.3.

#### 8.2.1.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.1.3-1 and 8.2.1.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Tables 8.2.1.1.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each subtest in Table 8.2.1.1.5-1 as appropriate.

#### 8.2.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.2.1.1.5 Test requirement

Table 8.2.1.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for each throughput test shall meet or exceed the specified value in Table 8.2.1.1.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.1.1.1.5-1: Test requirement (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	-0.2	1-8
2	10 MHz	R.2 FDD	OP.1 FDD	ETU70	1x2 Low	70	+0.4	1-8
3	10 MHz	R.2 FDD	OP.1 FDD	ETU300	1x2 Low	70	+0.8	1-8
4	10 MHz	R.2 FDD	OP.1 FDD	HST	1x2	70	-1.8	1-8
5	1.4 MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	+0.8	1-8
6	10 MHz	R.3 FDD	OP.1 FDD	EVA5	1x2 Low	70	+7.5	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	+7.5	2-8
7	10 MHz	R.3 FDD	OP.1 FDD	ETU70	1x2 Low	30	+2.2	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	ETU70	1x2 Low	30	+2.2	2-8
8	10 MHz	R.3 FDD	OP.1 FDD	ETU300	1x2 High	70	+10.2	2-8
	5 MHz (Note 2)	R.3-1 FDD	OP.1 FDD	ETU300	1x2 High	70	+10.2	2-8
9	3 MHz	R.5 FDD	OP.1 FDD	EVA5	1x2 Low	70	+18.4	1-8
10	5 MHz	R.6 FDD	OP.1 FDD	EVA5	1x2 Low	70	+18.2	2-8
11	10 MHz	R.7 FDD	OP.1 FDD	EVA5	1x2 Low	70	+18.5	2-8
12	10 MHz	R.7 FDD	OP.1 FDD	ETU70	1x2 Low	70	+19.8	2-8
13	10 MHz	R.7 FDD	OP.1 FDD	EVA5	1x2 High	70	+19.9	2-8
14	15 MHz	R.8 FDD	OP.1 FDD	EVA5	1x2 Low	70	+18.5	2-8
15	20 MHz	R.9 FDD	OP.1 FDD	EVA5	1x2 Low	70	+18.4	3-8
16	3 MHz	R.0 FDD	OP.1 FDD	ETU70	1x2 Low	30	+2.7	1-8
17	10 MHz	R.1 FDD	OP.1 FDD	ETU70	1x2 Low	30	+2.7	1-8
18	20 MHz	R.1 FDD	OP.1 FDD	ETU70	1x2 Low	30	+2.7	1-8

Note 1: N/A.  
Note 2: Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.

### 8.2.1.1.1\_1 FDD PDSCH Single Antenna Port Performance (Release 9 and forward)

#### 8.2.1.1.1\_1.1 Test purpose

Same test purpose as in clause 8.2.1.1.1.1.

#### 8.2.1.1.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward of UE category 1 and 2.

## 8.2.1.1.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.1.1.1.3 with the following exceptions:

- Instead of Table 8.2.1.1.1.3-1 → use Table 8.2.1.1.1\_1.3-1.
- Instead of Table 8.2.1.1.1.3-2 → use Table 8.2.1.1.1\_1.3-2.

**Table 8.2.1.1.1\_1.3-1: Test Parameters for Testing**

Parameter		Unit	Test 1- 5	Test 6- 8	Test 9	Test 10- 15	Test 16- 18
Downlink power allocation	$\rho_A$	dB	N/A	0	N/A	0	N/A
	$\rho_B$	dB		0 (Note 1)		0 (Note 1)	
	$\sigma$	dB		0		0

---	--------	----------	----------	------	---------	----	------	----------

### 8.2.1.1.1\_A FDD PDSCH Single Antenna Port Performance for CA

#### 8.2.1.1.1\_A.1 FDD PDSCH Single Antenna Port Performance for CA (2DL CA)

##### 8.2.1.1.1\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

##### 8.2.1.1.1\_A.1.2 Test applicability

This test applies to E-UTRA FDD release 10 and forward UE of category 3 or higher that supports inter-band OR intra-band contiguous DL CA.

This test also applies to E-UTRA FDD release 11 and forward UE of category 3 or higher that supports intra-band non-contiguous DL CA.

##### 8.2.1.1.1\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.1.1\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.1.1\_A.1.3-2 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

**Table 8.2.1.1.1\_A.1.3-1: Test Parameters for CA**

Parameter		Unit	Test 1-2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: PUCCH format 1b with channel selection is used to feedback ACK/NACK.			
Note 4: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.1.1.1\_A.1.3-2: Minimum performance (FRC) for CA**

Test num.	Band-width	Reference channel	OCNG pattern	Propa-gation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum throughput (%)	SNR (dB)	
1	2x10 MHz	R.2 FDD	OP.1 FDD (Note 1)	EVA5	1x2 Low	70	-1.1	≥3
2	2x20 MHz	R.42 FDD	OP.1 FDD (Note 1)	EVA5	1x2 Low	70	-1.3	≥5
Note 1: The OCNG pattern applies for each CC. Note 2: 30usec timing difference between two CCs is applied in inter-band CA case. Note 3: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.1.

#### 8.2.1.1.1\_A.1.4 Test description

##### 8.2.1.1.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.1.1\_A.1.4-1.

CA Capability to be tested: Select one according to Table 8.2.1.1.1\_A.1.4-1

**Table 8.2.1.1.1\_A.1.4-1: Test point selection for TM1 CA**

CA Capability	Bandwidth combination	
	10+10	20+20
Inter-band CA (two bands) (CA2_A2)	Test1	Test2
Intra-band contiguous CA (CA2_C)	Test1	Test2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test1	Test2
Note1: Only one test point is tested. Select any one of the UE supported CA capabilities and then moving from left to right select the first CA bandwidth combination supported by the UE within the chosen CA capability.		

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.35 as appropriate
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.1.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.1.1\_A.1.4.3.

## 8.2.1.1.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.1.1.1\_A.1.4.3
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.1.1\_A.1.3-1 and 8.2.1.1.1\_A.1.3-2 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.1.1.1\_A.1.5-1 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers.

## 8.2.1.1.1\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 2, for SCC configuration there are no additional message contents.

## 8.2.1.1.1\_A.1.5 Test requirement

Table 8.2.1.1.1\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.1.1.1\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.1.1\_A.5-1: Test requirement (FRC)**

Test num.	Band-width Combination	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum throughput (%)	SNR (dB)	
1	2x10 MHz	R.2 FDD	OP.1 FDD (Note 1)	EVA5	1x2 Low	70	-0.3	≥3
2	2x20 MHz	R.42 FDD	OP.1 FDD (Note 1)	EVA5	1x2 Low	70	-0.5	≥5

Note 1: The OCNG pattern applies for each CC.  
 Note 2: 30usec or 922\*Ts timing difference between two CCs is applied in inter-band CA case.  
 Note 3: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

## 8.2.1.1.1\_A.2 FDD PDSCH Single Antenna Port Performance for CA (3DL CA)

**Editor's note: The following aspects are either missing or not yet determined:**

- SNR values are still in brackets in core spec.

## 8.2.1.1.1\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement

Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

#### 8.2.1.1.1\_A.2.2 Test applicability

This test case applies to all types of E-UTRA FDD release 10 and forward UE of categories 5 or higher that support 3DL intra-band contiguous CA, or 3DL inter-band CA, or 3DL with intra-band contiguous and inter-band CA (UE categories 5 and onwards).

This test case also applies to all types of E-UTRA FDD release 11 and forward UE of categories 5 or higher that support 3DL with intra-band non-contiguous and inter-band CA, or 3DL with intra-band non-contiguous and intra-band contiguous CA.

#### 8.2.1.1.1\_A.2.3 Minimum conformance requirements

For CA with 3DL CCs, the requirements are specified in Table 8.2.1.1.1\_A.2.3-3, based on single carrier requirement specified in Table 8.2.1.1.1\_A.2.3-2, with the addition of the parameters in Table 8.2.1.1.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

**Table 8.2.1.1.1\_A.2.3-1: Test Parameters for CA (3DL CA)**

Parameter		Unit	Value
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: PUCCH format 3 is used to feedback ACK/NACK for Tests in Table 8.2.1.1.1_A.2.3-3.			
Note 4: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.1.1.1\_A.2.3-2: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.3]
3MHz	R.42-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.1]
5MHz	R.42-2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.0]
10MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]
15MHz	R.42-3 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.6]
20MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]

**Table 8.2.1.1.1\_A.2.3-3: Minimum performance (FRC) based on single carrier performance for CA with 3DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
3	20MHz+20MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
4	20MHz+15MHz+15MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
5	20MHz+15MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
6	20MHz+10MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.1.1_A.2.3-2 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3		
Note 2:	30usec timing difference between PCell and any SCell is applied in inter-band CA case, where PCell can be assigned on any CC.		

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.1.

#### 8.2.1.1.1\_A.2.4 Test description

##### 8.2.1.1.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.1.1\_A.2.4-1.

CA Capability to be tested: Select one according to Table 8.2.1.1.1\_A.2.4-1

**Table 8.2.1.1.1\_A.2.4-1: Test point selection for TM1 CA**

CA Capability	Bandwidth combination							
	3x20	20+20+15	20+20+10	20+15+15	20+15+10	20+10+10	15+15+10	20+10+5
Intra-band contiguous CA (CA3_C)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (two bands) (CA3_A2)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (three bands) (CA3_A3)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8

Note1: Only one test point is tested.  
Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.59.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.1.1\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.1.1\_A.2.4.3.

#### 8.2.1.1.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.1.1.1\_A.2.4.3.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.1.1\_A.2.3-1 and 8.2.1.1.1\_A.2.3-2 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.1.1.1\_A.2.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

#### 8.2.1.1.1\_A.2.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 2, for SCCs configuration there are no additional message contents.

#### 8.2.1.1.1\_A.2.5 Test requirement

Table 8.2.1.1.1\_A.1.3-1 defines the primary level settings.

For CA with 3DL CCs, the requirements are specified in Table 8.2.1.1.1\_A.2.5-2, based on single carrier requirement specified in Table 8.2.1.1.1\_A.2.5-1.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.1.1.1\_A.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.1.1\_A.2.5-1: Single carrier Test requirement for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.3] +TT
3MHz	R.42-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.1] +TT
5MHz	R.42-2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.0] +TT
10MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7] +TT
15MHz	R.42-3 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.6] +TT
20MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7] +TT

**Table 8.2.1.1.1\_A.2.5-2: Test requirement (FRC) based on single carrier performance for CA with 3DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
3	20MHz+20MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
4	20MHz+15MHz+15MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
5	20MHz+15MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
6	20MHz+10MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.1.1_A.2.5-1 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3		
Note 2:	30usec timing difference between PCell and any SCell is applied in inter-band CA case, where PCell can be assigned on any CC.		

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

8.2.1.1.1\_A.3 Void

8.2.1.1.2 FDD PDSCH Single Antenna Port Performance with 1 PRB in presence of MBSFN

8.2.1.1.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS for 1 PRB allocation in presence of MBSFN.

## 8.2.1.1.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

## 8.2.1.1.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.1.2.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.1.1.2.3-2, for the specified SNR.

**Table 8.2.1.1.2.3-1: Test Parameters for Testing 1 PRB allocation**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Symbols for MBSFN portion of MBSFN subframes (Note 2)		OCNG (Note 3)	
PDSCH transmission mode		1	
Note 1: $P_B = 0$ Note 2: The MBSFN portion of an MBSFN subframe comprises the whole MBSFN subframe except the first two symbols in the first slot. Note 3: The MBSFN portion of the MBSFN subframes shall contain QPSK modulated data. Cell-specific reference signals are not inserted in the MBSFN portion of the MBSFN subframes, QPSK modulated MBSFN data is used instead.			

**Table 8.2.1.1.2.3-2: Minimum performance 1 PRB allocation (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.29 FDD	OP.3 FDD	ETU70	1x2 Low	30	2.0	1-8

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.1.

## 8.2.1.1.2.4 Test description

## 8.2.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Low Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Tables 8.2.1.1.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1, 8.2.1.1.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.1.2.4.3.

#### 8.2.1.1.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.1.2.3-1 and 8.2.1.1.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.2.1.1.2.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.1.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.2.1.1.2.4.3-1: SystemInformationBlockType2: Additional FDD PDSCH Single Antenna Port Performance for 1 PRB allocation with MBSFN subframes test point 1 requirement**

Derivation Path: TS 36.508 [7] clause 4.4.3.3, Table 4.4.3.3-1 SystemInformationBlockType2			
Information Element	Value/remark	Comment	Condition
SystemInformationBlockType2 ::= SEQUENCE {			
mbsfn-SubframeConfig ::= SEQUENCE {			
radioframeAllocationPeriod	n1	Every radio frame is with MBSFN subframe	
radioframeAllocationOffset	0		
subframeAllocation CHOICE {			
oneFrame	111111	Subframe 1, 2, 3, 6, 7, 8 is used for MBSFN	FDD
}			
}			
}			

#### 8.2.1.1.2.5 Test requirement

Table 8.2.1.1.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.1.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.1.2.5-1: Test requirement 1 PRB allocation with MBSFN subframes (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.29 FDD	OP.3 FDD	ETU70	1x2 Low	30	+2.8	1-8

### 8.2.1.2 FDD PDSCH Transmit Diversity Performance (Cell-Specific Reference Symbols)

#### 8.2.1.2.1 FDD PDSCH Transmit Diversity 2x2

##### 8.2.1.2.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using transmit diversity (SFBC).

##### 8.2.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 8.2.1.2.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.2.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.2.1.3-2 for the specified SNR. For transmit diversity (SFBC) performance with 2 transmitter antennas as specified.

**Table 8.2.1.2.1.3-1: Test Parameters for Testing Transmit Diversity Performance**

Parameter		Unit	Test 1-2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			2
Note 1: $P_b = 1$			

**Table 8.2.1.2.1.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	EVA5	2x2 Medium	70	6.8	2-8
	5 MHz (Note 1)	R.11-2 FDD	OP.1 FDD	EVA5	2x2 Medium	70	5.9	
2	10 MHz	R.10 FDD	OP.1 FDD	HST	2x2	70	-2.3	1-8
Note 1: Test case applicability is defined in 8.1.2.1.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.

#### 8.2.1.2.1.4 Test description

##### 8.2.1.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.2.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.2.1.4.3.

##### 8.2.1.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.2.1.3-1 and 8.2.1.2.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.1.2.1.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Table 8.2.1.2.1.5-1 as appropriate.

##### 8.2.1.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

##### 8.2.1.2.1.5 Test requirement

Table 8.2.1.2.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.1.2.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.2.1.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	EVA5	2x2 Medium	70	7.7	2-8
	5 MHz (Note 1)	R.11-2 FDD	OP.1 FDD	EVA5	2x2 Medium	70	6.8	2-8
2	10 MHz	R.10 FDD	OP.1 FDD	HST	2x2	70	-1.7	1-8
Note 1: Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.								

**8.2.1.2.1\_1 FDD PDSCH Transmit Diversity 2x2 (Release 9 and forward)****8.2.1.2.1\_1.1 Test purpose**

Same test purpose as in clause 8.2.1.2.1.1.

**8.2.1.2.1\_1.2 Test applicability**

This test applies to all types of E-UTRA FDD UE release 9 and forward of UE category 1.

**8.2.1.2.1\_1.3 Minimum conformance requirements**

Same minimum conformance requirements as in clause 8.2.1.2.1.3 with the following exceptions:

- Instead of Table 8.2.1.2.1.3-1 → use Table 8.2.1.2.1\_1.3-1.
- Instead of Table 8.2.1.2.1.3-2 → use Table 8.2.1.2.1\_1.3-2.

**Table 8.2.1.2.1\_1.3-1: Test Parameters for Testing Transmit Diversity Performance**

Parameter	Unit	Test 1
Downlink power allocation	$\rho_A$	dB
	$\rho_B$	dB
	$\sigma$	dB
$N_{oc}$ at antenna port	dBm/15kHz	-98
PDSCH transmission mode		2
Note 1: $P_B = 1$		

**Table 8.2.1.2.1\_1.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	5 MHz	R.11-2 FDD	OP.1 FDD	EVA5	2x2 Medium	70	5.9	1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.

**8.2.1.2.1\_1.4 Test description**

Same test description as in clause 8.2.1.2.1.4 with the following exceptions:

- Instead of Table 8.2.1.2.1.3-1 → use Table 8.2.1.2.1\_1.3-1.
- Instead of Table 8.2.1.2.1.3-2 → use Table 8.2.1.2.1\_1.3-2.
- Instead of Table 8.2.1.2.1.5-1 → use Table 8.2.1.2.1\_1.5-1.

#### 8.2.1.2.1\_1.5 Test requirement

Same test requirements as in clause 8.2.1.2.1.5 with the following exceptions:

- Instead of Table 8.2.1.2.1.3-1 → use Table 8.2.1.2.1\_1.3-1.
- Instead of Table 8.2.1.2.1.5-1 → use Table 8.2.1.2.1\_1.5-1.

**Table 8.2.1.2.1\_1.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	5 MHz	R.11-2 FDD	OP.1 FDD	EVA5	2x2 Medium	70	+6.8	1

#### 8.2.1.2.2 FDD PDSCH Transmit Diversity 4x2

##### 8.2.1.2.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using transmit diversity (SFBC-FSTD).

##### 8.2.1.2.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 8.2.1.2.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.2.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.2.2.3-2 for the specified SNR. For transmit diversity (SFBC) performance with 4 transmitter antennas as specified.

**Table 8.2.1.2.2.3-1: Test Parameters for Testing Transmit Diversity Performance**

Parameter	Unit	Test 1
Downlink power allocation	$\rho_A$	-3
	$\rho_B$	-3 (Note 1)
	$\sigma$	0
$N_{oc}$ at antenna port	dBm/15kHz	-98
PDSCH transmission mode		2
Note 1: $P_B = 1$		

**Table 8.2.1.2.2.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	1.4 MHz	R.12 FDD	OP.1 FDD	EPA5	4x2 Medium	70	0.6	1-8

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.

#### 8.2.1.2.2.4 Test description

##### 8.2.1.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.2.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11 for antenna configuration 4x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.2.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.2.2.4.3.

##### 8.2.1.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.2.2.3-1 and 8.2.1.2.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.1.2.2.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.2.1.2.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.2.1.2.2.4.3-1: PDSCH-ConfigDedicated-DEFAULT: Additional FDD PDSCH transmit diversity performance downlink power allocation test point 1 requirement**

Derivation Path: 36.331 clause 6.3.2

## 8.2.1.2.2.5 Test requirement

Table 8.2.1.2.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.1.2.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.2.2.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	1.4 MHz	R.12 FDD	OP.1 FDD	EPA5	4x2 Medium	70	1.5	1-8

## 8.2.1.2.2\_1 FDD PDSCH Transmit Diversity 4x2 (Release 9 and forward)

## 8.2.1.2.2\_1.1 Test purpose

Same test purpose as in clause 8.2.1.2.2.1.

## 8.2.1.2.2\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward.

## 8.2.1.2.2\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.1.2.2.3 with the following exceptions:

- Instead of Table 8.2.1.2.2.3-1 → use Table 8.2.1.2.2\_1.3-1.
- Instead of Table 8.2.1.2.2.3-2 → use Table 8.2.1.2.2\_1.3-2.

**Table 8.2.1.2.2\_1.3-1: Test Parameters for Testing Transmit Diversity Performance**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			2
Note 1: $P_B = 1$			

**Table 8.2.1.2.2\_1.3-2: Minimum performance Transmit Diversity (FRC)**

### 8.2.1.2.3

#### 8.2.1.2.3\_C FDD PDSCH Transmit diversity 2x2 for eICIC

##### 8.2.1.2.3\_C.1 FDD PDSCH Transmit diversity 2x2 for eICIC (non-MBSFN ABS)

###### 8.2.1.2.3\_C.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

###### 8.2.1.2.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

###### 8.2.1.2.3\_C.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.2.3\_C.1.3-1.

In Table 8.2.1.2.3\_C.1.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Table C.3.2-1 in Annex C.3.2 and for Cell 2 is according to Table C.3.3-1 in Annex C.3.3, respectively.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.2.3\_C.1.3-2 for the specified SNR.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.3.

#### 8.2.1.2.3\_C.1.4 Test description

##### 8.2.1.2.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.2.3\_C.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.2.1-1 and 8.2.1.2.3\_C.1.3-1 as appropriate.
3. Downlink signals are initially set up for Cell1 according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.2.3\_C.1.4.3.

##### 8.2.1.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.1.2.3\_C.1.5-1, 8.2.1.2.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.2.1.2.3\_C.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.2.1.2.3\_C.1.4.3-1: RadioResourceConfigDedicated-SRB2-DRB(n, m): Additional FDD PDSCH transmit diversity performance downlink power allocation**

## 8.2.1.2.3\_C.1.5 Test requirement

Table 8.2.1.2.3\_C.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.1.2.3\_C.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.2.3\_C.1.5-1: Test Parameters for Transmit Diversity (FRC)**

### 8.2.1.2.3\_D

#### 8.2.1.2.3\_E FDD PDSCH Transmit diversity 2x2 for feICIC

#### 8.2.1.2.3\_E.1 FDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)

##### 8.2.1.2.3\_E.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [14] of the aggressor cells with CRS assistance information.

##### 8.2.1.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

##### 8.2.1.2.3\_E.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.2.3\_E.1.3-1.

In Table 8.2.1.2.3\_E.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] includes Cell 2 and Cell 3.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.2.3\_E.1.3-2 for the specified SNR.

**Table 8.2.1.2.3\_E.1.3-2: Minimum Performance Transmit Diversity (FRC)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11-4 FDD (Note 4)	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Medium	70	3.4	2-8
Note 1:	The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.										
Note 2:	The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.										
Note 3:	SNR corresponds to $\hat{E}_s/N_{oc2}$ of Cell 1.										
Note 4:	Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.										
Note 5:	The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.										

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.3A.

#### 8.2.1.2.3\_E.1.4 Test description

##### 8.2.1.2.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.2.3\_E.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.2.3\_E.1.3-1 as appropriate.
3. Downlink signals are initially set up for Cell 1 according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.2.3\_E.1.4.3.

##### 8.2.1.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.2.1.2.3\_E.1.5-1, 8.2.1.2.3\_E.1.5-2, and C.3.3.2 of Annex C.3.3. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC.
2. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.2.3\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

8.2.1.2.3\_E.1.5 Test requirement

Table 8.2.1.2.3\_E.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.1.2.3\_E.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.2.3\_E.1.5-1: Test Parameters for Transmit diversity Performance (FRC)**

**Table 8.2.1.2.3\_E.1.5-2: Test requirement Transmit Diversity (FRC)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11-4 FDD (Note 4)	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Medium	70	4.3	2-8
Note 1:	The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.										
Note 2:	The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.										
Note 3:	SNR corresponds to $\hat{E}_s/N_{oc2}$ of Cell 1.										
Note 4:	Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.										
Note 5:	The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.										

#### 8.2.1.2.4 FDD PDSCH Transmit Diversity 2x2 with TM3 Interference Model – Enhanced Performance Requirement Type A

##### 8.2.1.2.4.1 Test purpose

The purpose is to verify the performance of transmit diversity (SFBC) with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of two dominant interfering cells applying transmission mode 3 interference model defined in clause B.5.2.

##### 8.2.1.2.4.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support enhanced receiver Type A.

##### 8.2.1.2.4.3 Minimum conformance requirements

The requirements are specified in Table 8.2.1.2.4.3-2, with the addition of parameters in Table 8.2.1.2.4.3-1 and the downlink physical channel setup according to Annex C.3.2. In Table 8.2.1.2.4.3-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

**Table 8.2.1.2.4.3-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model**

Parameter	Unit	Cell 1	Cell 2	Cell 3	
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0

Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A
DIP (Note 2)		dB	N/A	-2.23	-8.06
$BW_{Channel}$		MHz	10	10	10
Cyclic Prefix			Normal	Normal	Normal
Cell Id			0	1	2
Number of control OFDM symbols			2	2	2
PDSCH transmission mode			2	N/A	N/A
Interference model			N/A	As specified in clause B.5.2	As specified in clause B.5.2
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-0	N/A	N/A
Note 1: $P_B = 1$					
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.					
Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells.					
Note 4: Cell 2 transmission is delayed with respect to Cell 1 by 0.33 ms and Cell 3 transmission is delayed with respect to Cell 1 by 0.67 ms.					

**Table 8.2.1.2.4.3-2: Enhanced Performance Requirement Type A, Transmit Diversity (FRC) with TM3 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.46 FDD	OP. 1 FD D	N/A	N/A	EV A70	EV A70	EV A70	2x2 Low	70	-1.1	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.2.4.

#### 8.2.1.2.4.4 Test description

##### 8.2.1.2.4.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.2.4.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.2.4.4.3.

#### 8.2.1.2.4.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.2.4.5-1 and 8.2.1.2.4.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sets up parameters for cell 2 and cell 3 according to table 8.2.1.2.4.5-1 as appropriate.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SINR according to Tables 8.2.1.2.4.5-1 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5-15 in Annex G clause G.3.

#### 8.2.1.2.4.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.2.1.2.4.5 Test requirement

Table 8.2.1.2.4.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for throughput test shall meet or exceed the specified value in Table 8.2.1.2.4.5-2 for the specified SINR including test tolerances.

**Table 8.2.1.2.4.5-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0

Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A
DIP (Note 2)		dB	N/A	-1.88	-7.21
$BW_{Channel}$		MHz	10	10	10
Cyclic Prefix			Normal	Normal	Normal
Cell Id			0	1	2
Number of control OFDM symbols			2	2	2

Interference model			N/A	As specified in clause B.5.2	As specified in clause B.5.2
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-0	N/A	N/A
Note 1: $P_B = 1$					
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.					
Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells.					
Note 4: Cell 2 transmission is delayed with respect to Cell 1 by 0.33 ms and Cell 3 transmission is delayed with respect to Cell 1 by 0.67 ms.					

**Table 8.2.1.2.4.5-2: Test requirement for Enhanced Performance Requirement Type A, Transmit Diversity (FRC) with TM3 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.46 FDD	OP. 1 FD D	N/A	N/A	EV A70	EV A70	EV A70	2x2 Low	70	-0.15	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

**8.2.1.3 FDD PDSCH Open Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols)**

**8.2.1.3.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2**

**8.2.1.3.1.1 Test purpose**

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

**8.2.1.3.1.2 Test applicability**

This test applies to all types of E-UTRA FDD UE release 8 and forward.

### 8.2.1.3.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.1.3-1 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.1.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter		Unit	Test 1-2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			3
Note 1: $P_B = 1$			

**Table 8.2.1.3.1.3-2: Minimum performance Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1 (Note 1)	10 MHz	R.11 FDD	OP.1 FDD	EVA70	2x2 Low	70	13.0	$\geq 2$
2 (Note 2)	5 MHz	R.11-2 FDD	OP.1 FDD	EVA70	2x2 Low	70	12.7	$\geq 2$
Note 1: Test 1 may not be executed for UE-s for which Test 1 in 8.2.1.3.1_A.2 is applicable.								
Note 2: Test case applicability is defined in 8.1.2.1.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.

### 8.2.1.3.1.4 Test description

#### 8.2.1.3.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.3.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1.4.3.

8.2.1.3.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1.3-1 and 8.2.1.3.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.2.1.3.1.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.3.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.2.1.3.1.4.3-1: PhysicalConfigDedicated-DEFAULT: Additional FDD PDSCH open loop spatial multiplexing performance downlink power allocation**

8.2.1.3.1.5 Test requirement

Table 8.2.1.3.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.1.5-1: Test Requirement Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	EVA70	2x2 Low	70	13.9	≥2
2 (Note 2)	5 MHz	R.11-2 FDD	OP.1 FDD	EVA70	2x2 Low	70	13.6	≥2
Note 1:	N/A							
Note 2:	Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.							

## 8.2.1.3.1\_1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 (Release 11 and forward)

## 8.2.1.3.1\_1.1 Test purpose

Same test purpose as in clause 8.2.1.3.1.1.

## 8.2.1.3.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward.

## 8.2.1.3.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.1.3.1.3 with the following exceptions:

- Instead of Table 8.2.1.3.1.3-1 → use Table 8.2.1.3.1\_1.3-1.
- Instead of Table 8.2.1.3.1.3-2 → use Table 8.2.1.3.1\_1.3-2.

**Table 8.2.1.3.1\_1.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter		Unit	Test 1-2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			3
Note 1: $P_B = 1$			

**Table 8.2.1.3.1\_1.3-2: Minimum performance Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.35 FDD	OP.1 FDD	EVA200	2x2 Low	70	20.2	$\geq 2$
2	10 MHz	R.35-4 FDD	OP.1 FDD	ETU300	2x2 Low	70	19.7	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.

## 8.2.1.3.1\_1.4 Test description

Same test description as in clause 8.2.1.3.1.4 with the following exceptions:

- Instead of Table 8.2.1.3.1.3-1 → use Table 8.2.1.3.1\_1.3-1.
- Instead of Table 8.2.1.3.1.3-2 → use Table 8.2.1.3.1\_1.3-2.
- Instead of Table 8.2.1.3.1.5-1 → use Table 8.2.1.3.1\_1.5-1.

## 8.2.1.3.1\_1.5 Test requirement

Same test requirements as in clause 8.2.1.3.1.5 with the following exceptions:

- Instead of Table 8.2.1.3.1.3-1 → use Table 8.2.1.3.1\_1.3-1.
- Instead of Table 8.2.1.3.1.5-1 → use Table 8.2.1.3.1\_1.5-1.

### 8.2.1.3.1\_A FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA

#### 8.2.1.3.1\_A.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (2DL CA)

##### 8.2.1.3.1\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

##### 8.2.1.3.1\_A.1.2 Test applicability

This test applies to

E-UTRA FDD release 10 and forward UE of category 2 or higher that supports inter-band OR intra-band contiguous DL CA

This test also applies to E-UTRA FDD release 11 and forward UE of category 2 or higher that supports intra-band non-contiguous DL CA.

##### 8.2.1.3.1\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.1\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.1\_A.1.3-1 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.1\_A.1.3-1: Test Parameters for Large Delay CDD (FRC) for CA**

Parameter		Unit	Test 1 -4
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
dB $N_{oc}$ 0at antenna port		dBm/15kHz	-98
PDSCH Transmission mode			3
Note 1: $P_B = 1$			
Note 2: PUCCH format 1b with channel selection is used to feedback ACK/NACK.			
Note 3: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.1.3.1\_A.1.3-2: Minimum performance Large Delay CDD (FRC) for CA**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum Throughput (%)	SNR (dB)	
1	2x10 MHz	R.11 FDD	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	13.7	≥3

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.

#### 8.2.1.3.1\_A.1.4 Test description

##### 8.2.1.3.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.3.1\_A.1.4.1-1. CA Capability to be tested: Select one according to Table 8.2.1.3.1\_A.1.4.1-1

**Table 8.2.1.3.1\_A.1.4.1-1: Test point selection for TM3 2DLCA**

CA Capability	Bandwidth Combination			
	10+10	20+20	5+5	10+5
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2	Test 3	Test4
Intra-band contiguous CA (CA2_C)	Test 1	Test 2	Test 3	Test4
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	Test 2	Test 3	Test4
Note 1: One test point per UE supported CA capability is tested. For each UE supported CA capability, select the first bandwidth combination (moving from left to right) supported by the UE within the chosen CA capability.				

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.36 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.3.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

- Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1\_A.1.4.3.

8.2.1.3.1\_A.1.4.2 Test procedure

- Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
- The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for PhysicalConfigDedicated-DEFAULT is defined in Table 8.2.1.3.1\_A.1.4.3-1, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.2.1.3.1\_A.1.4.3-1A.
- SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
- SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1\_A.1.3-1 and 8.2.1.3.1\_A.1.3-2 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
- Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carrier according to Table 8.2.1.3.1\_A.1.5-1 as appropriate.
- Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval on both the component carrier.
- Repeat steps from 1 to 6 for each subtest in Table 8.2.1.3.1\_A.1.5-1 depending on UE CA capability as defined in Table 8.2.1.3.1\_A.1.4.1-1 and as appropriate.

8.2.1.3.1\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 with the following exceptions

**Table 8.2.1.3.1\_A.1.4.3-1: PhysicalConfigDedicated-DEFAULT: Additional FDD PDSCH open loop spatial multiplexing performance downlink power allocation**

}			

8.2.1.3.1\_A.1.5 Test requirement

Table 8.2.1.3.1\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for the throughput test shall meet or exceed the specified value in Tables 8.2.1.3.1\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.1\_A.1.5-1: Test Requirement Large Delay CDD (FRC) for CA**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum Throughput (%)	SNR (dB)	
1	2x10 MHz	R.11 FDD	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	14.6	≥3
2	2x20 MHz	R.30 FDD	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	14.1	≥5
3	2x5 MHz	R.11-2 FDD	OP.1 FDD	EVA70	2x2 Low	70	13.6	≥2
4	10MHz+5 MHz	R.11 FDD for 10MHz CC,	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	13.9	≥3
		R.11-2 FDD for 5MHz CC	OP.1 FDD (Note 1)			70	12.6	

Note 1: The OCNG pattern applies for each CC.  
 Note 2: Void  
 Note 3: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

8.2.1.3.1\_A.2 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (3DL CA)

**Editor’s notes: This test case is incomplete. The following items are missing or incomplete:**

**- The SNR values for minimum conformance and test requirements are still in brackets.**

8.2.1.3.1\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

## 8.2.1.3.1\_A.2.2 Test applicability

This test case applies to all types of E-UTRA FDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA FDD release 11 and forward UE of category 5 or higher that support 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

## 8.2.1.3.1\_A.2.3 Minimum conformance requirements

For CA with 3 DL CCs, the requirements are specified in Table 8.2.1.3.1\_A.2.3-3, based on single carrier requirement specified in Table 8.2.1.3.1\_A.2.3-2, with the addition of the parameters in Table 8.2.1.3.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Table 8.2.1.3.1\_A.2.3-1: Test Parameters for Large Delay CDD (FRC) for CA

Parameter	Unit	Value
Downlink power allocation	$\rho_A$	dB
	$\rho_B$	dB
	$\sigma$	dB
$N_{oc}$ at antenna port	dBm/15kHz	-98
PDSCH transmission mode		3
Note 1: $P_B = 1$ .		
Note 2: PUCCH format 3 with channel selection is used to feedback ACK/NACK for Tests in Table 8.2.1.3.1_A.2.3-3.		
Note 3: The same PDSCH transmission mode is applied to each component carrier.		

Table 8.2.1.3.1\_A.2.3-2: Single carrier performance for multiple CA configurations

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.11-5 FDD	OP.1 FDD	EVA70	2x2 Low	70	[13.6]
3MHz	R.11-6 FDD	OP.1 FDD	EVA70	2x2 Low	70	[12.3]
5MHz	R.11-2 FDD	OP.1 FDD	EVA70	2x2 Low	70	[12.3]
10MHz	R.11 FDD	OP.1 FDD	EVA70	2x2 Low	70	[12.9]
15MHz	R.11-7 FDD	OP.1 FDD	EVA70	2x2 Low	70	[12.8]
20MHz	R.30 FDD	OP.1 FDD	EVA70	2x2 Low	70	[12.9]

Table 8.2.1.3.1\_A.2.3-2: Minimum performance (FRC) based on single carrier performance for CA with 3DL CCs

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
2	20MHz+20MHz+15MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
3	20MHz+20MHz+10MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
4	20MHz+15MHz+15MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
5	20MHz+15MHz+10MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$

7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.3.1_A.2.3-2 per CC	$\geq 5$
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.

## 8.2.1.3.1\_A.2.4 Test description

## 8.2.1.3.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.3.1\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.1.3.1\_A.2.4.1-1.

**Table 8.2.1.3.1\_A.2.4.1-1: Test point selection for TM3 3DL CA**

CA Capability	Bandwidth combination							
	3x20	20+20+15	20+20+10	20+15+15	20+15+10	20+10+10	15+15+10	20+10+5
Intra-band contiguous (CA3_C)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (two bands) (CA3_A2)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (three bands) (CA3_A3)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Note1:	One test point per UE supported CA capability is tested. For each UE supported CA capability, select the largest aggregated CA bandwidth combination supported by the UE within the chosen CA capability.							

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.60.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.3.1\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1\_A.2.4.3.

## 8.2.1.3.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.1.3.1\_A.2.4.3.
3. The SS activates SCCs by sending the MAC-CE according to TS 36.321 [13] clauses 5.13 and 6.1.3.8. Wait for at least 2 seconds as per TS 36.133 [4] clause 8.3.3.2.

4. The SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1\_A.2.3-1 and 8.2.1.3.1\_A.2.3-2 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.1.3.1\_A.2.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

8.2.1.3.1\_A.2.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exceptions

**Table 8.2.1.3.1\_A.2.4.3-1: PhysicalConfigDedicated-DEFAULT: Additional FDD PDSCH open loop spatial multiplexing performance downlink power allocation**

7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.3.1_A.2.5-1 per CC	≥5
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.3.1_A.2.5-1 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

#### 8.2.1.3.1A FDD Soft buffer management test

##### 8.2.1.3.1A\_A.1 FDD PDSCH Soft buffer management test for CA (2 DL CA)

###### 8.2.1.3.1A\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

###### 8.2.1.3.1A\_A.1.2 Test applicability

This test applies to E-UTRA FDD UE category 3 and 4 release 10 and forward that support intra-band contiguous DL CA or inter-band DL CA.

This test applies also to E-UTRA FDD UE category 3 and 4 release 11 and forward that support intra-band non-contiguous DL CA.

###### 8.2.1.3.1A\_A.1.3 Minimum conformance requirements

The requirements are specified in Table 8.2.1.3.1A\_A.1.3-2, with the addition of the parameters in Table 8.2.1.3.1A\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C. The purpose is to verify the UE performance with proper instantaneous buffer implementation.

**Table 8.2.1.3.1A\_A.1.3-1: Test Parameters for soft buffer management test (FRC) for CA**

Parameter		Unit	Test 1-7
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			3
Note 1: $P_B = 1$			
Note 2: For CA test cases, PUCCH format 1b with channel selection is used to feedback ACK/NACK.			
Note 3: For CA test cases, the same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.1.3.1A\_A.1.3-2: Minimum performance soft buffer management test (FRC) for CA**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
						Fraction of maximum Throughput (%)	SNR (dB)
1	2x20 MHz	R.30 FDD	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	13.2
2	15MHz + 10MHz	R.35-2 FDD for 15MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	15.1
		R.35-3 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	15.1
3	20MHz + 10MHz	R.30 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	13.5
		R.11 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	13.5
4	20MHz + 15MHz	R.30 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	13.5
		R.30-1 FDD for 15MHz CC	OP.1 FDD (Note 1)			70	13.5
5	2x20 MHz	R.35-1 FDD	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	15.8
6	20MHz + 10MHz	R.35-1 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	15.9
		R.35-3 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	15.9
7	20MHz + 15MHz	R.35-1 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	15.9
		R.35-2 FDD for 15MHz CC	OP.1 FDD (Note 1)			70	15.9
Note 1: For CA test cases, the OCNG pattern applies for each CC.							
Note 2: For Test 2, 3, 4, 6, 7 the Fraction of maximum Throughput applies to each CC.							
Note 3: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.							

**Table 8.2.1.3.1A\_A.1.3-3: Test points for soft buffer management tests for CA**

UE category	Bandwidth combination with maximum aggregated bandwidth (Note 1)			
	2x20MHz	15MHz+10MHz	20MHz+10MHz	20MHz+15MHz
3	1	2	3	4
4	5	N/A	6	7
Note 1: Maximum over all supported CA configurations and bandwidth combination sets according to Table 5.4.2A.1-1 and Table 5.4.2A.1-2.

## 8.2.1.3.1A\_A.1.4 Test description

## 8.2.1.3.1A\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.3.1A\_A.1.4-1.

CA Capability to be tested: Select one according to Table 8.2.1.3.1A\_A.1.4-1.

**Table 8.2.1.3.1A\_A.1.4-1: Test point selection soft buffer management tests for CA**

CA Capability	Bandwidth combination			
	20+20	20+15	20+10	15+10
Inter-band CA (two bands) (CA2_A2)	Test 1 or 5	Test 4 or 7	Test 3 or 6	Test 2
Intra-band contiguous CA (CA2_C)	Test 1 or 5	Test 4 or 7	Test 3 or 6	Test 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1 or 5	Test 4 or 7	Test 3 or 6	Test 2
Note1:	Only one test point is tested. Select the first UE supported CA bandwidth combination (moving from left to right) and choose any one of the UE supported CA capabilities supporting that CA bandwidth combination.			
Note2:	One of the two tests per table position is selected, depending on UE category.			

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.36 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.3.1A\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1\_A.1.4.3.

## 8.2.1.3.1A\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for PhysicalConfigDedicated-DEFAULT is defined in Table 8.2.1.3.1\_A.1.4.3-1, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.2.1.3.1\_A.1.4.3-1A.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1A\_A.1.3-1 and 8.2.1.3.1A\_A.1.3-2 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carrier according to Table 8.2.1.3.1A\_A.1.5-1 as appropriate.

6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval on both the component carrier.

#### 8.2.1.3.1A\_A.1.4.3 Message contents

Same Message contents as 8.2.1.3.1\_A.1.4.3

#### 8.2.1.3.1A\_A.1.5 Test requirement

Table 8.2.1.3.1A\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for the throughput test shall meet or exceed the specified value in Tables 8.2.1.3.1A\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.1A\_A.1.5-1: Test Requirement soft buffer management test (FRC) for CA**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
						Fraction of maximum Throughput (%)	SNR (dB)
1	2x20 MHz	R.30 FDD	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	14.1
2	15MHz + 10MHz	R.35-2 FDD for 15MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	16.0
		R.35-3 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	16.0
3	20MHz + 10MHz	R.30 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	14.4
		R.11 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	14.4
4	20MHz + 15MHz	R.30 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA70	2x2 Low	70	14.4
		R.30-1 FDD for 15MHz CC	OP.1 FDD (Note 1)			70	14.4
5	2x20 MHz	R.35-1 FDD	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	16.7
6	20MHz + 10MHz	R.35-1 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	16.8
		R.35-3 FDD for 10MHz CC	OP.1 FDD (Note 1)			70	16.8
7	20MHz + 15MHz	R.35-1 FDD for 20MHz CC	OP.1 FDD (Note 1)	EVA5	2x2 Low	70	16.8
		R.35-2 FDD for 15MHz CC	OP.1 FDD (Note 1)			70	16.8
Note 1: For CA test cases, the OCNG pattern applies for each CC. Note 2: For Test 2, 3, 4, 6, 7 the Fraction of maximum Throughput applies to each CC. Note 3: There is no applicable test point for a UE supporting max 10+10 MHz bandwidth combination. Note 4: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.							

Decide pass or fail for each subtest according to Annex G.3A.4.

#### 8.2.1.3.1A\_A.2 Void

#### 8.2.1.3.1B FDD PDSCH Open Loop Spatial Multiplexing 2x2 – Enhanced Performance Requirement Type C

Editor's notes: This test case is incomplete. The following items are missing or are incomplete:

- Test tolerances are undefined

- The SNR values in minimum and test requirement are still in square brackets

- The minimum testing time in Annex G is still undefined.

#### 8.2.1.3.1B.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

#### 8.2.1.3.1B.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

#### 8.2.1.3.1B.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.1B.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.1B.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.1B.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			3
Note 1: $P_B = 1$ .			

**Table 8.2.1.3.1B.3-2: Enhanced Performance Requirement Type C, Large Delay CDD (FRC)**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	EVA70	2x2 Medium	70	[17.8]	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.1B.

#### 8.2.1.3.1B.4 Test description

##### 8.2.1.3.1B.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.1B.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.3.1B.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1B.4.3.

#### 8.2.1.3.1B.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1B.3-1 and 8.2.1.3.1B.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.2.1.3.1B.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.1.3.1B.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.2.1.3.1B.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.331 clause 6.3.2

}			
}			

#### 8.2.1.3.1B.5 Test requirement

Table 8.2.1.3.1B.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.1B.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.1B.5-1: Test requirement for Enhanced Performance Requirement Type C, Large Delay CDD (FRC)**

Test num	Bandwidth	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	EVA70	2x2 Medium	70	[17.8] +TT	≥2

### 8.2.1.3.1C FDD PDSCH Open Loop Spatial Multiplexing 2x2 with TM1 Interference – Enhanced Performance Requirement Type C

Editor's notes: This test case is incomplete. The following items are missing or are incomplete:

- Test tolerances are undefined
- Connection diagram is TBD
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.

#### 8.2.1.3.1C.1 Test purpose

The purpose is to verify the performance of open-loop spatial multiplexing performance with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell with transmission mode 1.

#### 8.2.1.3.1C.2 Test applicability

This test applies to all types of E-UTRA FDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

#### 8.2.1.3.1C.3 Minimum conformance requirements

The requirements are specified in Table 8.2.1.3.1C.3-2, with the addition of parameters in Table 8.2.1.3.1C.3-1 and the downlink physical channel setup according to Annex C.3.2. In Table 8.2.1.3.1C.3-1, Cell 1 is the serving cell, and Cell 2 is interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2 respectively.

**Table 8.2.1.3.1C.3-1: Test Parameters for Large Delay CDD (FRC) with TM1 interference**

Parameter		Unit	Cell 1	Cell 2
Bandwidth		MHz	10 MHz	
Downlink power allocation	$\rho_A$	dB	-3	0
	$\rho_B$		-3 (Note 1)	0
	$\sigma$		0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna port 0
Cyclic Prefix			Normal	Normal
Cell ID			0	1
Transmission mode			3	Note 2
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A
$\hat{E}_s/N_{oc}$ (Note 3)		dB	Reference Value in Table 8.2.1.3.1C.3-2	12.95
Correlation and antenna configuration			Medium (2x2)	Medium(1x2)
Number of OFDM symbols for PDCCH			2	N/A
Max number of HARQ transmissions			4	N/A
Redundancy version coding sequence			{0,1,2,3}	N/A
Note 1: $P_B = 1$				
Note 2: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.2 applying OCNB pattern OP.5 FDD as defined in Annex A.5.1.5.				
Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell.				
Note 4: All cells are time-synchronous.				
Note 5: SIB-1 will not be transmitted in Cell2 in this test.				

**Table 8.2.1.3.1C.3-2: Enhanced Performance Requirement Type C, Large Delay CDD (FRC) with TM1 interference**

Test Number	Reference Channel	OCNB Pattern		Propagation Conditions (Note 1)		Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2	Fraction of Maximum Throughput (%)	SNR (dB) (Note 2)	
1	R.11-8 FDD	OP.1 FDD	OP.5 FDD	EVA70	EVA70	70	[19.9]	$\geq 2$
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.								
Note 2: SNR corresponds to $\hat{E}_s/N_{oc}$ of Cell 1.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.1C.

#### 8.2.1.3.1C.4 Test description

##### 8.2.1.3.1C.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.1C.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.3.1C.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.1C.4.3.

8.2.1.3.1C.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1C.5-1 and 8.2.1.3.1C.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sets up parameters for cell 2 according to Table 8.2.1.3.1C.5-1 as appropriate.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.2.1.3.1C.5-1 and Table 8.2.1.3.1C.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.3.1C.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

}			
}			

8.2.1.3.1C.5 Test requirement

Table 8.2.1.3.1C.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.1C.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.1C.5-1: Test Parameters for Large Delay CDD (FRC) with TM1 interference**

Parameter		Unit	Cell 1	Cell 2
Bandwidth		MHz	10 MHz	
Downlink power allocation	$\rho_A$	dB	-3	0
	$\rho_B$		-3 (Note 1)	0
	$\sigma$		0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna port 0
Cyclic Prefix			Normal	Normal
Cell ID			0	1
Transmission mode			3	Note 2
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A
$\hat{E}_s/N_{oc}$ (Note 3)		dB	Reference Value in Table 8.2.1.3.1C.5-2	TBD
Correlation and antenna configuration			Medium (2x2)	Medium(1x2)
Number of OFDM symbols for PDCCH			2	N/A
Max number of HARQ transmissions			4	N/A
Redundancy version coding sequence			{0,1,2,3}	N/A
Note 1: $P_B = 1$ Note 2: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.2 applying OCNG pattern OP.5 FDD as defined in Annex A.5.1.5. Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell. Note 4: All cells are time-synchronous. Note 5: SIB-1 will not be transmitted in Cell2 in this test.				

**Table 8.2.1.3.1C.5-2: Test requirement for Enhanced Performance Requirement Type C, Large Delay CDD (FRC) with TM1 interference**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2	Fraction of Maximum Throughput (%)	SNR (dB) (Note 2)	
1	R.11-8 FDD	OP.1 FDD	OP.5 FDD	EVA70	EVA70	70	[19.9] + TT	≥2
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: SNR corresponds to $\hat{E}_s/N_{oc}$ of Cell 1.								

### 8.2.1.3.2 FDD PDSCH Open Loop Spatial Multiplexing 4x2

#### 8.2.1.3.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

#### 8.2.1.3.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward of UE category ≥2.

#### 8.2.1.3.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.2.3-1 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.2.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port	dBm/15kHz	-98	
PDSCH transmission mode		3	
Note 1: $P_B = 1$			

**Table 8.2.1.3.2.3-2: Minimum performance Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.14 FDD	OP.1 FDD	EVA70	4x2 Low	70	14.3	2-8

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.

#### 8.2.1.3.2.4 Test description

##### 8.2.1.3.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.2.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11 for antenna configuration 4x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.3.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.2.4.3.

##### 8.2.1.3.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.2.3-1 and 8.2.1.3.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.2.1.3.2.5-1 as appropriate.

3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.1.3.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 8.2.1.3.2.5 Test requirement

Table 8.2.1.3.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.2.5-1: Test Requirement Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.14 FDD	OP.1 FDD	EVA70	4x2 Low	70	15.2	2-8

## 8.2.1.3.3\_C FDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC

## 8.2.1.3.3\_C.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC (non-MBSFN ABS)

## 8.2.1.3.3\_C.1.1 Test purpose

To verify the UE's performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

## 8.2.1.3.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

## 8.2.1.3.3\_C.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.3\_C.1.3-1.

In Table 8.2.1.3.3\_C.1.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Table C.3.2-1 in Annex C.3.2 and for Cell 2 is according to Table C.3.3-1 in Annex C.3.3, respectively.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.3\_C.1.3-1 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.3\_C.1.3-1: Test Parameters for Large Delay CDD (FRC) non-MBSFN ABS**

Parameter	Unit	Cell 1	Cell 2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.3.

#### 8.2.1.3.3\_C.1.4 Test description

##### 8.2.1.3.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.3\_C.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.3.3\_C.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.3\_C.1.4.3.

##### 8.2.1.3.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.1.3.3\_C.1.5-1, 8.2.1.3.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.3.3\_C.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

### 8.2.1.3.3\_C.1.5 Test requirement

Table 8.2.1.3.3\_C.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.3\_C.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.3.3\_C.1.5-1: Test Parameters for Large Delay CDD (FRC) non-MBSFN ABS**

Parameter		Unit	Cell 1	Cell 2

### 8.2.1.3.3\_C.2 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC (MBSFN ABS)

#### 8.2.1.3.3\_C.2.1 Test purpose

To verify the UE's performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

#### 8.2.1.3.3\_C.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

#### 8.2.1.3.3\_C.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.3\_C.2.3-1.

In Table 8.2.1.3.3\_C.2.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Table C.3.2-1 in Annex C.3.2 and for Cell 2 is according to Table C.3.3-1 in Annex C.3.3, respectively.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.3\_C.2.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.3\_C.2.3-1: Test Parameters for Large Delay CDD (FRC) MBSFN ABS**

Parameter		Unit	Cell 1	Cell 2
Downlink power allocation	$\rho_A$	dB	-3	-3

#### 8.2.1.3.3\_C.2.4 Test description

##### 8.2.1.3.3\_C.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.3\_C.2.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.3.3\_C.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.3.3\_C.2.4.3.

##### 8.2.1.3.3\_C.2.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.1.3.3\_C.2.5-1, 8.2.1.3.3\_C.2.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.2.1.3.3\_D

## 8.2.1.3.3\_E FDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC

## 8.2.1.3.3\_E.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured, non-MBSFN ABS)

## 8.2.1.3.3\_E.1.1 Test purpose

To verify the UE's performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [9] of the aggressor cells with CRS assistance information.

## 8.2.1.3.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

## 8.2.1.3.3\_E.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.3.3\_E.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.3.3\_E.1.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.1.3.3\_E.1.3-2: Minimum performance Large Delay CDD (FRC) non-MBSFN ABS**

Test Number	Reference Channel	$\hat{E}_s/N_{oc2}$		OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 2	Cell 3	Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11 FDD (Note 4)	9	7	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Low	70	13.9	2-8
2	R.35 FDD (Note 4)	9	1	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Low	70	22.6	2-8

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc2}$  of Cell 1.  
Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.  
Note 5: The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.3.4.

#### 8.2.1.3.3\_E.1.4 Test description

##### 8.2.1.3.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.3.3\_E.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.3.3\_E.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.2.1.3.3\_E.1.4.3.

##### 8.2.1.3.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3 according to Tables 8.2.1.3.3\_E.1.5-1, 8.2.1.3.3\_E.1.5-2 and C.3.3-2 of Annex C.3.3 as appropriate. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC.
2. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.

3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.1.3.3\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

**8.2.1.3.3\_E.1.5 Test requirement**

Table 8.2.1.3.3\_E.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.3.3\_E.1.5-2 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.1.3.3\_E.1.5-2: Test Requirement Large Delay CDD (FRC)

Test Number	Reference Channel	$\hat{E}_s/N_{oc2}$		OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 2	Cell 3	Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11 FDD (Note 4)	8.8	6.8	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Low	70	14.8	2-8
2	R.35 FDD (Note 4)	8.8	0.8	OP.1 FDD	OP.1 FDD	OP.1 FDD	EVA5	EVA5	EVA5	2x2 Low	70	23.5	2-8

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc2}$  of Cell 1.  
Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.  
Note 5: The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.

#### 8.2.1.4 FDD PDSCH Closed Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols)

##### 8.2.1.4.1 FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2

###### 8.2.1.4.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

###### 8.2.1.4.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8.

###### 8.2.1.4.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.4.1.3-1 and 8.2.1.4.1.3-3 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.1.4.1.3-2 and 8.2.1.4.1.3-4 for the specified SNR. For single-layer spatial multiplexing closed loop rank-one performance with wideband and frequency selective precoding is specified. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.1.4.1.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)**

Parameter	Unit	Test 1	Test 1A	Test 2
Downlink power allocation	$\rho_A$	dB	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3 (Note 1)
	$\sigma$	dB	0	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98	-98
Precoding granularity	PRB	6	4	50
PMI delay (Note 2)	ms	8	8	8
Reporting interval	ms	1	1	1
Reporting mode		PUSCH 1-2	PUSCH 1-2	PUSCH 3-1
CodeBookSubsetRestriction bitmap		001111	001111	001111
PDSCH transmission mode		4	4	4
Note 1: $P_B = 1$				
Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).

4	10 MHz	R.11 FDD	OP.1 FDD	ETU70	2x2 Low	70	14.3	2-5
4A (Note 1)	5 MHz	R.11-2 FDD	OP.1 FDD	ETU70	2x2 Low	70	14.0	2-5

Note 1: Test case applicability is defined in 8.1.2.1.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.

#### 8.2.1.4.1.4 Test description

##### 8.2.1.4.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Tables 8.2.1.4.1.3-2 and 8.2.1.4.1.3-4 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1, 8.2.1.4.1.3-1 and 8.2.1.4.1.3-3 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.1.4.3.

##### 8.2.1.4.1.4.2 Test procedure

1. For single-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.1.3-1 and 8.2.1.4.1.3-2. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.1.3-3 and 8.2.1.4.1.3-4. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.1.4.1.5-1 and 8.2.1.4.1.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
5. Repeat steps from 1 to 4 for each test interval in Tables 8.2.1.4.1.5-1 and 8.2.1.4.1.5-2 as appropriate.

#### 8.2.1.4.1.5 Test requirement

Tables 8.2.1.4.1.3-1 and 8.2.1.4.1.3-3 define the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.4.1.5-1 and 8.2.1.4.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.4.1.5-1: Test requirement Single-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.10 FDD	OP.1 FDD	EVA5	2x2 Low	70	-1.6	1-5
1A(Note 1)	5 MHz	R.10-2 FDD	OP.1 FDD	EVA5	2x2 Low	70	-2.0	1-5
2	10 MHz	R.10 FDD	OP.1 FDD	EPA5	2x2 High	70	-1.4	1-5

Note 1: Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.

**Table 8.2.1.4.1.5-2: Test requirement Multi-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
3	10 MHz	R.11 FDD	OP.1 FDD	EVA5	2x2 Low	70	13.8	2-5
4	10 MHz	R.11 FDD	OP.1 FDD	ETU70	2x2 Low	70	15.2	2-5
4A (Note 1)	5 MHz	R.11-2 FDD	OP.1 FDD	ETU70	2x2 Low	70	14.9	2-5

Note 1: Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.

#### 8.2.1.4.1\_1 FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 (Release 9 and forward)

##### 8.2.1.4.1\_1.1 Test purpose

Same test purpose as in clause 8.2.1.4.1.1

##### 8.2.1.4.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward.

##### 8.2.1.4.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.1.4.1.3 with the following exceptions:

- Instead of Table 8.2.1.4.1.3-2 → use Table 8.2.1.4.1\_1.3-1.
- Instead of Table 8.2.1.4.1.3-4 → use Table 8.2.1.4.1\_1.3-2.

**Table 8.2.1.4.1\_1.3-1: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.10 FDD	OP.1 FDD	EVA5	2x2 Low	70	-2.5	1-8
1A (Note 1)	5 MHz	R.10-2 FDD	OP.1 FDD	EVA5	2x2 Low	70	-2.9	1-8
2	10 MHz	R.10 FDD	OP.1 FDD	EPA5	2x2 High	70	-2.3	1-8

Note 1: Test case applicability is defined in 8.1.2.1.

**Table 8.2.1.4.1\_1.3-2: Minimum performance Multi-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
3	10 MHz	R.35 FDD	OP.1 FDD	EPA5	2x2 Low	70	18.9	2-8
4	10 MHz	R.11 FDD	OP.1 FDD	ETU70	2x2 Low	70	14.3	2-8
4A (Note 1)	5 MHz	R.11-2 FDD	OP.1 FDD	ETU70	2x2 Low	70	14.0	2-8

Note 1: Test case applicability is defined in 8.1.2.1.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.

#### 8.2.1.4.1\_1.4 Test description

Same test description as in clause 8.2.1.4.1.4 with the following exceptions:

- Instead of Table 8.2.1.4.1.3-2 → use Table 8.2.1.4.1\_1.3-1.
- Instead of Table 8.2.1.4.1.3-4 → use Table 8.2.1.4.1\_1.3-2.

Note 1:	Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.							

**8.2.1.4.1\_A to D**

**8.2.1.4.1\_E** FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 for feICIC

**8.2.1.4.1\_E.1** FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)

**8.2.1.4.1\_E.1** Test purpose

To verify The purpose is to verify the closed loop rank-one performance with wideband precoding if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [14] of the aggressor cell with CRS assistance information.

**8.2.1.4.1\_E.1.2** Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

**8.2.1.4.1\_E.1.3** Minimum conformance requirements

The requirements are specified in Table 8.2.1.4.1\_E.1.3-2, with the addition of parameters in Table 8.2.1.4.1\_E.1.3-1. In Table 8.2.1.4.1\_E.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] includes Cell 2 and Cell 3.

Table 8.2.1.4.1\_E.1.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3 (Note 1)	-3 (Note 1)

CodeBookSubsetRestriction bitmap			1111	N/A	N/A
Cyclic prefix			Normal	Normal	Normal

Note 1:	$P_B = 1$ .
Note 2:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 3:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 4:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 5:	ABS pattern as defined in [14].
Note 6:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 7:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 8:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.
Note 10:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).
Note 11:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 12:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.

**Table 8.2.1.4.1\_E.1.3-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11 FDD (Note 4)	OP.1FD D	OP.1F DD	OP.1FD D	EPA5	EPA5	EPA5	2x2 High	70	6.1	≥2
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1. Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel. Note 5: The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.											

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.1C.

8.2.1.4.1\_E.1.4 Test description

8.2.1.4.1\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.4.1\_E.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1.4.1\_E.1.3-1 as appropriate.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.2.1.4.1\_E.1.4.3.

#### 8.2.1.4.1\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.2.1.4.1\_E.1.5-1, 8.2.1.4.1\_E.1.5-2, and C.3.3.2 of Annex C.3.3. SS transmits PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC.
2. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2
3. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
4. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.1.4.1\_E.1.5-2 as appropriate.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.1.4.1\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

#### 8.2.1.4.1\_E.1.5 Test requirement

Table 8.2.1.4\_E.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.4.1\_E.1.5-2 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.1.4.1\_E.1.5-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3 (Note 1)	-3 (Note 1)
	$\sigma$	dB	0	N/A	N/A
$N_{oc}$ at antenna port	$N_{oc1}$	dBm/15kHz	-98 (Note 2)	N/A	N/A
	$N_{oc2}$	dBm/15kHz	-98 (Note 3)	N/A	N/A
	$N_{oc3}$	dBm/15kHz	-93.1 (Note 4)	N/A	N/A
$\hat{E}_s / N_{oc2}$		dB	Reference Value in Table 8.2.1.4.1_E.1.5-2	11.8	9.8
BW <sub>Channel</sub>		MHz	10	10	10
Subframe Configuration			Non-MBSFN	Non-MBSFN	Non-MBSFN
Time Offset between Cells		μs	N/A	3	-1
Frequency shift between Cells		Hz	N/A	300	-100
Cell Id			0	126	1
ABS pattern (Note 5)			N/A	11000000 11000000 11000000 11000000 11000000	11000000 11000000 11000000 11000000 11000000
RLM/RRM Measurement Subframe Pattern (Note 6)			10000000 10000000 10000000 10000000 10000000	N/A	N/A
CSI Subframe Sets (Note7)	$C_{CSI,0}$		11000000 11000000 11000000 11000000 11000000	N/A	N/A
	$C_{CSI,1}$		00111111 00111111 00111111 00111111 00111111	N/A	N/A
Number of control OFDM symbols			2	Note 8	Note 8
PDSCH transmission mode			6	Note 9	Note 9
Precoding granularity		PRB	50	N/A	N/A
PMI delay (Note 10)		ms	8	N/A	N/A
Reporting interval		ms	1	N/A	N/A
Reporting mode			PUSCH 3-1	N/A	N/A
CodeBookSubsetRestriction bitmap			1111	N/A	N/A
Cyclic prefix			Normal	Normal	Normal

Note 1:	$P_B = 1$ .
Note 2:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 3:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 4:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 5:	ABS pattern as defined in [14]. Note 6: Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 7:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 8:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.
Note 10:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).
Note 11:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 12:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.

**Table 8.2.1.4.1\_E.1.5-2: Test requirement Single-Layer Spatial Multiplexing (FRC)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11 FDD (Note 4)	OP.1 FDD	OP.1 FDD	OP.1 FDD	EPA5	EPA5	EPA5	2x2 High	70	7.0	≥2
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1. Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel. Note 5: The maximum throughput is calculated from the total Payload in 9 subframes, averaged over 40ms.											

**8.2.1.4.2A FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 2x2 – Enhanced Performance Requirement Type C**

**Editor’s notes: This test case is incomplete. The following items are missing or are incomplete:**

- Test tolerances are undefined
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.

**8.2.1.4.2A.1 Test purpose**

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed loop rank-two spatial multiplexing with wideband and frequency selective precoding.

**8.2.1.4.2A.2 Test applicability**

This test applies to all types of E-UTRA FDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

## 8.2.1.4.2A.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.1.4.2A.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.1.4.2A.3-2 for the specified SNR.

**Table 8.2.1.4.2A.3-1: Test Parameters for Testing Multi-Layer Spatial Multiplexing**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Precoding granularity	PRB	50	
PMI delay (Note 2)	ms	8	
Reporting interval	ms	1	
Reporting mode		PUSCH 3-1	
CodeBookSubsetRestriction bitmap		110000	
PDSCH transmission mode		4	
Note 1: $P_B = 1$ .			
Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).			

**Table 8.2.1.4.2A.3-2: Enhanced Performance Requirement Type C, Multi-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	ETU70	2x2 Medium	70	[18.3]	≥2

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.2A.

## 8.2.1.4.2A.4 Test description

## 8.2.1.4.2A.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.4.2A.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1 and 8.2.1.4.2A.3-1 as appropriate.

3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.2A.4.3.

8.2.1.4.2A.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.2A.3-1 and 8.2.1.4.2A.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.1.4.2A.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.4.2A.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

8.2.1.4.2A.5 Test requirement

Table 8.2.1.4.2A.3-1 define the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.1.4.2A.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.4.2A.5-1: Test requirement for Enhanced Performance Requirement Type C, Multi-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 FDD	OP.1 FDD	ETU70	2x2 Medium	70	[18.3] +TT	≥2

#### 8.2.1.4.2 FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 4x2

##### 8.2.1.4.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

##### 8.2.1.4.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8.

##### 8.2.1.4.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.4.2.3-1 and 8.2.1.4.2.3-3 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.1.4.2.3-2 and 8.2.1.4.2.3-4 for the specified SNR. For single-layer spatial multiplexing closed loop rank-one performance with wideband and frequency selective precoding is specified. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.1.4.2.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing**

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.

#### 8.2.1.4.2.4 Test description

##### 8.2.1.4.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Tables 8.2.1.4.2.3-2 and 8.2.1.4.2.3-4 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11 for antenna configuration 4x2.

2. The parameter settings for the cell are set up according to Tables 8.2.1-1, 8.2.1.4.2.3-1 and 8.2.1.4.2.3-3 as appropriate.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.2.4.3.

8.2.1.4.2.4.2 Test procedure

1. For single-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.2.3-1 and 8.2.1.4.2.3-2. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.2.3-3 and 8.2.1.4.2.3-4. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.1.4.2.5-1 and 8.2.1.4.2.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
5. Repeat steps from 1 to 4 for each test interval in Tables 8.2.1.4.2.5-1 and 8.2.1.4.2.5-2 as appropriate.

8.2.1.4.2.5 Test requirement

Tables 8.2.1.4.2.3-1 and 8.2.1.4.2.3-3 define the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.4.25-1 and 8.2.1.4.2.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.4.2.5-1: Test requirement Single-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.13 FDD	OP.1 FDD	EVA5	4x2 Low	70	-2.3	1-5

**Table 8.2.1.4.2.5-2: Test requirement Multi-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz	R.14 FDD	OP.1 FDD	EVA5	4x2 Low	70	11.4	2-5

8.2.1.4.2\_1 FDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 4x2 (Release 9 and forward)

8.2.1.4.2\_1.1 Test purpose

Same test purpose as in clause 8.2.1.4.2.1

8.2.1.4.2\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward.

8.2.1.4.2\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.1.4.2.3 with the following exceptions:

- Instead of Table 8.2.1.4.2.3-2 → use Table 8.2.1.4.2\_1.3-1.
- Instead of Table 8.2.1.4.2.3-4 → use Table 8.2.1.4.2\_1.3-2.

**Table 8.2.1.4.2\_1.3-1: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category

1	10 MHz	R.13 FDD	OP.1 FDD	EVA5	4x2 Low	70	-2.3	1-8

**Table 8.2.1.4.2\_1.5-2: Test requirement Multi-Layer Spatial Multiplexing (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz	R.36 FDD	OP.1 FDD	EPA5	4x2 Low	70	+15.6	2-8

8.2.1.4.2\_A FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA

8.2.1.4.2\_A.1 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (2DL CA)

8.2.1.4.2\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

8.2.1.4.2\_A.1.2 Test applicability

This test applies to

E-UTRA FDD release10 and forward UE of category 3 or higher which supports inter-band OR intra-band contiguous DL CA.

**Editor's note: RAN4 is still in discussion to cover in the future also test points with lower UE categories than 3.**

This test also applies to E-UTRA FDD release 11 and forward UE of category 3 or higher that supports intra-band non-contiguous DL CA.

8.2.1.4.2\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.1.4.2\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.1.4.2\_A.1.3-2 for the specified SNR. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.1.4.2\_A.1.3-1: Test Parameters for Testing Multi-Layer Spatial Multiplexing for CA**

Parameter	Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
Precoding granularity	PRB	6	8
PMI delay (Note 2)	ms	8	8
Reporting interval	ms	1	1
Reporting mode		PUSCH 1-2	PUSCH 1-2
CodeBookSubsetRestriction bitmap		000000000000 000000000000 000000111111 111111110000 000000000000	000000000000 000000000000 000000111111 111111110000 000000000000
CSI request field (Note 3)		'10'	
PDSCH transmission mode		4	
Note 1: $P_B = 1$ . Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4). Note 3: Multiple CC-s under test are configured as the 1 <sup>st</sup> set of serving cells by higher layers. Note 4: ACK/NACK bits are transmitted using PUSCH with PUCCH format 1b with channel selection configured. Note 5: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.1.4.2\_A.1.3-2: Minimum performance Multi-Layer Spatial Multiplexing (FRC) for CA**

Test num.	Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum throughput (%)	SNR (dB)	
1	2x10 MHz	R.14 FDD	OP.1 FDD (Note 1)	EVA5	4x2 Low	70	10.8	3-8
2	2x20 MHz	R.14-3 FDD	OP.1 FDD (Note 1)	EVA5	4x2 Low	70	10.9	5-8

Note 1: The OCNG pattern applies for each CC.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.

8.2.1.4.2\_A.1.4 Test description

8.2.1.4.2\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.4.2\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.1.4.2\_A.1.4.1-1.

**Table 8.2.1.4.2\_A.1.4.1-1: Test point selection for TM4 2DL CA**

CA Capability	Bandwidth Combination	
	10+10	20+20
Inter-band CA (two bands) (CA2_A2)	Test1	Test2
Intra-band contiguous CA (CA2_C)	Test1	Test2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test1	Test2
Note1: Only one test point is tested. Select any one of the UE supported CA capabilities and then moving from left to right select the first CA bandwidth combination supported by the UE within the chosen CA capability.		

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.46 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1, 8.2.1.4.2\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.2\_A.1.4.3.

#### 8.2.1.4.2\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PDSCH-ConfigDedicated-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-1, *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-2, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-2A, *CQI-ReportConfig-r10-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-4, *CQI-ReportAperiodic-r10-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-6, *PUSCH-ConfigDedicated-DEFAULT* is defined in Table 8.2.1.4.2\_A.1.4.3-7.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.2\_A.1.3-1 and 8.2.1.4.2\_A.1.3-3. The SS sends downlink MAC padding bits on the DL RMC.
5. SS schedules the UL transmission to carry the PUSCH CSI feedback via PDCCH DCI format 0 with CSI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.1.4.2\_A.1.5-1 as appropriate.
7. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.1.4.2\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 with the following exceptions:

8.2.1.4.2\_A.1.5 Test requirement

Tables 8.2.1.4.2\_A.1.3-1 define the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.1.4.2\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.4.2\_A.1.5-1: Test requirement Multi-Layer Spatial Multiplexing (FRC) for CA**

Test num.	Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum throughput (%)	SNR (dB)	
1	2x10 MHz	R.14 FDD	OP.1 FDD (Note 1)	EVA5	4x2 Low	70	11.7	3-8
2	2x20 MHz	R.14-3 FDD	OP.1 FDD (Note 1)	EVA5	4x2 Low	70	11.8	5-8

Note 1: The OCNG pattern applies for each CC.

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

#### 8.2.1.4.2\_A.2 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (3DL CA)

**Editor's notes: This test case is incomplete. The following items are missing or incomplete:**

**- The SNR values for minimum conformance and test requirements are still in brackets.**

##### 8.2.1.4.2\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

##### 8.2.1.4.2\_A.2.2 Test applicability

This test case applies to all types of E-UTRA FDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA FDD release 11 and forward UE of category 5 or higher that support 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

##### 8.2.1.4.2\_A.2.3 Minimum conformance requirements

For CA with 3 DL CCs, the requirements are specified in Table 8.2.1.4.2\_A.2.3-3, based on single carrier requirement specified in Table 8.2.1.4.2\_A.2.3-2, with the addition of the parameters in Table 8.2.1.4.2\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

**Table 8.2.1.4.2\_A.2.3-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA**

Parameter	Unit	Value
Downlink power allocation	$\rho_A$	dB
	$\rho_B$	dB
	$\sigma$	dB
$N_{oc}$ at antenna port	dBm/15kHz	-98
Precoding granularity	PRB	4 for 3MHz and 5MHz CCs, 6 for 10MHz CCs, 8 for 15MHz and 20MHz CCs

5	20MHz+15MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.3-2 per CC	≥5
6	20MHz+10MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.3-2 per CC	≥5
7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.3-2 per CC	≥5
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.4.2_A.2.3-2 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.

#### 8.2.1.4.2\_A.2.4 Test description

##### 8.2.1.4.2\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.1.4.2\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.1.4.2\_A.2.4.1-1.

**Table 8.2.1.4.2\_A.2.4.1-1: Test point selection for TM4 3DL CA**

CA Capability	Bandwidth combination							
	3x20	20+20+15	20+20+10	20+15+15	20+15+10	20+10+10	15+15+10	20+10+5
Intra-band contiguous (CA3_C)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (two bands) (CA3_A2)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Inter-band CA (three bands) (CA3_A3)	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8
Intra-band non-	Test1	Test2	Test3	Test4	Test5	Test6	Test7	Test8

contiguous CA (with two sub-blocks) (CA3_N2)								
Note1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.								

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.61.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.4.2\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.2\_A.2.4.3.

8.2.1.4.2\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.1.4.2\_A.2.4.3.
3. The SS activates SCCs by sending the MAC-CE according to TS 36.321 [13] clauses 5.13 and 6.1.3.8. Wait for at least 2 seconds as per TS 36.133 [4] clause 8.3.3.2.
4. The SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.3.1\_A.2.3-1 and 8.2.1.3.1\_A.2.3-2 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. The SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.1.4.2\_A.2.5-1 as appropriate.
7. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

8.2.1.4.2\_A.2.4.3 Message contents

#### 8.2.1.4.2\_A.2.5 Test requirement

Table 8.2.1.4.2\_A.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2.2 for the throughput test shall meet or exceed the specified value in Table 8.2.1.4.2\_A.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.1.4.2\_A.2.5-1: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.14-4 FDD	OP.1 FDD	EVA5	4x2 Low	70	[11.3]
3MHz	R.14-5 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.4]
5MHz	R.14-6 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.4]
10MHz	R.14 FDD	OP.1 FDD	EVA5	4x2 Low	70	[11.0]
15MHz	R.14-7 FDD	OP.1 FDD	EVA5	4x2 Low	70	[11.0]
20MHz	R.14-3 FDD	OP.1 FDD	EVA5	4x2 Low	70	[11.2]

**Table 8.2.1.4.2\_A.2.5-2: Test requirement (FRC) based on single carrier performance for CA with 3DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
3	20MHz+20MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
4	20MHz+15MHz+15MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
5	20MHz+15MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
6	20MHz+10MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
7	15MHz+15MHz+10MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
8	20MHz+10MHz+5MHz	As specified in Table 8.2.1.4.2_A.2.5-1 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

#### 8.2.1.4.2\_A.2.5 Test requirement

FFS

#### 8.2.1.4.2\_A.3

#### 8.2.1.4.3 FDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 with TM4 Interference Model – Enhanced Performance Requirement Type A

##### 8.2.1.4.3.1 Test purpose

The purpose of these tests is to verify the closed loop rank one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of two dominant interfering cells applying transmission mode 4 interference model defined in clause B.5.3.

##### 8.2.1.4.3.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support enhanced receiver Type A.

##### 8.2.1.4.3.3 Minimum conformance requirements

The requirements are specified in Table 8.2.1.4.3-2, with the addition of parameters in Table 8.2.1.4.3.3-1 and the downlink physical channel setup according to Annex C.3.2. In Table 8.2.1.4.3.3-1, Cell 1 is the serving cell, and Cell 2, 3 are interfering cells. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1, Cell 2 and Cell 3, respectively.

**Table 8.2.1.4.3.3-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A

Cell Id			0	1	2
Number of control OFDM symbols			2	2	2
PDSCH transmission mode			6	N/A	N/A
Interference model			N/A	As specified in clause B.5.3	As specified in clause B.5.3
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Precoding granularity		PRB	50	6	6
PMI delay (Note 4)		ms	8	N/A	N/A
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-1	N/A	N/A
CodeBookSubsetRestriction bitmap			001111	N/A	N/A
Note 1: $P_B = 1$ Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1. Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells. Note 4: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4). Note 5: All cells are time-synchronous.					

**Table 8.2.1.4.3.3-2: Enhanced Performance Requirement Type A, Single-Layer Spatial Multiplexing (FRC) with TM4 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.47 FDD	OP. 1 FD D	N/A	N/A	EV A5	EV A5	EV A5	2x2 Low	70	0.8	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1. Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.4.1B.

#### 8.2.1.4.3.4 Test description

##### 8.2.1.4.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.4.3.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.1-1 and 8.2.1.4.3.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.4.3.4.3.

##### 8.2.1.4.3.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.4.3.5-1 and 8.2.1.4.3.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sets up parameters for cell 2 and cell 3 according to table 8.2.1.4.3.5-1 as appropriate.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SINR according to Tables 8.2.1.4.3.5-2 as appropriate.
4. Measure the average throughput for duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5-15 in Annex G clause G.3.

##### 8.2.1.4.3.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

## 8.2.1.5

## 8.2.1.6

## 8.2.1.7 Carrier aggregation with power imbalance

Editor's Note: This test case is incomplete. The following items are missing or are incomplete:

- Connection diagram in Annex A of TS 36.508 is TBD
- Test tolerances are undefined
- The minimum test time need to be added to G.3A.5

## 8.2.1.7\_A.1 FDD Carrier aggregation with power imbalance (intra-band contiguous DL CA)

## 8.2.1.7\_A.1.1 Test purpose

To verify the ability of an intraband adjacent carrier aggregation UE to demodulate the signal transmitted by the PCell or SCell in the presence of a stronger SCell signal on an adjacent frequency. Throughput is measured on the PCell or SCell only.

## 8.2.1.7\_A.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward that support intra-band contiguous DL CA.

## 8.2.1.7\_A.1.3 Minimum conformance requirements

The requirements are specified in Table 8.2.1.7\_A.1.3-2, with the addition of the parameters in Table 8.2.1.7\_A.1.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Table 8.2.1.7\_A.1.3-1: Test Parameters for CA

Parameter		Unit	Test 1	Test 2-3
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	0	0

3	5	5	NA	R.49-2 FDD	-79	[-85.9]	NA	85	$\geq 5$
Note 1: The OCNG pattern for PCell is used to fill the control channel. The OCNG pattern for SCell is used to fill the control channel and PDSCH.									
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.									

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.7.

#### 8.2.1.7\_A.1.4 Test description

##### 8.2.1.7\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.1.7\_A.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group TBD
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.1.7\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.1.7\_A.1.4.3.

#### 8.2.1.7\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels except control channel and PDSCH.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.1.7\_A.1.4.3
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.1.7\_A.1.3-1 and 8.2.1.7\_A.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition and the correlation matrix on each of the component carriers according to Tables 8.2.1.7\_A.1.5-1 as appropriate.
6. Measure the average throughput on PCC in test number 1 or measure the average throughput on SCC in test number 2 or 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-1. Count the number of NACKs, ACKs and statDTXs on the UL during the test on PCC in test number 1 or on SCC in test number 2 or 3.

#### 8.2.1.7\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 3, for SCC configuration there are no additional message contents.

#### 8.2.1.7\_A.1.5 Test requirement

Table 8.2.1.7\_A.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.1.7\_A.1.5-1 for the specified cell power levels including test tolerances for all throughput tests.

Table 8.2.1.7\_A.1.5-1: Test Requirement (FRC) for CA

Test Number	Bandwidth (MHz)		Reference channel		Power at antenna port (dBm/15KHz)		Reference value Fraction of Maximum Throughput (%)		UE Category
	PCell	SCell	PCell	SCell	$\hat{E}_{s\_PCell}$ for PCell	$\hat{E}_{s\_SCell}$ for SCell	PCell	SCell	
1	20	20	R.49 FDD	NA	-85	-79	85	NA	$\geq 5$
2	10	10	NA	R.49-1 FDD	-79	[-85.8]	NA	85	$\geq 5$
3	5	5	NA	R.49-2 FDD	-79	[-85.9]	NA	85	$\geq 5$
Note 1:	The OCNG pattern for PCell is used to fill the control channel. The OCNG pattern for SCell is used to fill the control channel and PDSCH.								
Note 2:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

## 8.2.2 TDD (Fixed Reference Channel)

The parameters specified in Table 8.2.2-1 are valid for all TDD tests unless otherwise stated.

Table 8.2.2-1: Common Test Parameters (TDD)

Parameter	Unit	Value	Comments
Uplink downlink configuration (Note 1)		1	
Special subframe configuration (Note 2)		4	
Inter-TTI Distance		1	
Number of HARQ processes	Processes	7	For TDD, 7 HARQ processes in the DL, as specified in TS 36.213 [10] clause 7. All 7 HARQ processes are used.
Scheduling of retransmissions			1. Retransmissions use the same Transport Block Size (TBS) as the initial transmission. 2. HARQ processes are scheduled consecutively, independent of the fact, whether retransmissions (for negatively acknowledged HARQ processes) or new transmissions (for positively acknowledged HARQ processes) occur. 3. In case when the initial transmission and the retransmissions are scheduled in subframes with a different $N_{PRB}$ (in terms of TS 36.213 [10] subclause 7.1.7) $29 \leq I_{MCS} \leq 31$ according to TS 36.213 [10] subclause 7.1.7.2 and the appropriate modulation is used.
Maximum number of HARQ transmission		4	It is always 4 for TDD, as specified in TS 36.213 [10] clause 8
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM	
Number of OFDM symbols for PDCCH	OFDM symbols	4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, 2 for 10 MHz, 15 MHz and 20 MHz bandwidths	The PCFICH carries information about the number of OFDM symbols used for transmission of PDCCHs in a subframe, as specified in TS 36.211 [8] clause 6.7
Cyclic Prefix		Normal	CP consist of the following physical resource blocks (RBs) parameters: 12 consecutive subcarriers at a 15 kHz spacing and 7 OFDM symbols, as specified in TS 36.211 [8] clause 6.2.3
Cell ID		0 (Note 3)	The Cell ID is uniquely defined by a number in the range of 0 to 503, representing the physical-layer cell identity, as specified in TS 36.211 [8] clause 6.11.
Cross carrier scheduling		Not configured	
Note 1: as specified in Table 4.2-2 in TS 36.211 [8] Note 2: as specified in Table 4.2-1 in TS 36.211 [8] Note 3: For CA tests, Cell ID = 0 applies only to P-Cell. For (n)th S-Cell, Cell ID = n is used.			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.

## 8.2.2.1 TDD PDSCH Single Antenna Port Performance (Cell-Specific Reference Symbols)

### 8.2.2.1.1 TDD PDSCH Single Antenna Port Performance

#### 8.2.2.1.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

#### 8.2.2.1.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

#### 8.2.2.1.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.1, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.1.1.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.1.1.3-2 for the specified SNR.

**Table 8.2.2.1.1.3-1: Test Parameters**

Parameter	Unit	Test 1- 5	Test 6- 8	Test 9- 15	Test 16- 18	
Downlink power allocation	$\rho_A$	dB	0	0	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	0	0	0	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98	-98	-98	
Symbols for unused PRBs		OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)	
Modulation		QPSK	16QAM	64QAM	16QAM	
ACK/NACK feedback mode		Multiplexing	Multiplexing	Multiplexing	Multiplexing	
PDSCH transmission mode		1	1	1	1	
Note 1: $P_B = 0$						
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.						

Table 8.2.2.1.1.3-2: Minimum performance (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	-1.2	≥1
2	10 MHz	R.2 TDD	OP.1 TDD	ETU70	1x2 Low	70	-0.6	≥1
3	10 MHz	R.2 TDD	OP.1 TDD	ETU300	1x2 Low	70	-0.2	≥1
4	10 MHz	R.2 TDD	OP.1 TDD	HST	1x2	70	-2.6	≥1
5	1.4 MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	0.0	≥1
6	10 MHz	R.3 TDD	OP.1 TDD	EVA5	1x2 Low	70	6.7	≥2
7	10 MHz	R.3 TDD	OP.1 TDD	ETU70	1x2 Low	30	1.4	≥2
8	10 MHz	R.3 TDD	OP.1 TDD	ETU300	1x2 High	70	9.3	≥2
9	3 MHz	R.5 TDD	OP.1 TDD	EVA5	1x2 Low	70	17.6	≥1
10	5 MHz	R.6 TDD	OP.1 TDD	EVA5	1x2 Low	70	17.6	≥2
11	10 MHz	R.7 TDD	OP.1 TDD	EVA5	1x2 Low	70	17.6	≥2
12	10 MHz	R.7 TDD	OP.1 TDD	ETU70	1x2 Low	70	19.1	≥2
13	10 MHz	R.7 TDD	OP.1 TDD	EVA5	1x2 High	70	19.1	≥2
14	15 MHz	R.8 TDD	OP.1 TDD	EVA5	1x2 Low	70	17.8	≥2
15	20 MHz	R.9 TDD	OP.1 TDD	EVA5	1x2 Low	70	17.7	≥3
16	3 MHz	R.0 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.1	≥1
17	10 MHz	R.1 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.0	≥1
18	20 MHz	R.1 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.1	≥1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.

#### 8.2.2.1.1.4 Test description

##### 8.2.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Frequencies to be tested for 1PRB allocation: Low Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.1.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.9.

2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.1.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.1.1.4.3.

#### 8.2.2.1.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.1.1.3-1 and 8.2.2.1.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the reference channel, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Tables 8.2.2.1.1.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each subtest in Tables 8.2.2.1.1.5-1 as appropriate.

#### 8.2.2.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.2.2.1.1.5 Test requirement

Table 8.2.2.1.1.3-1 defines the primary level settings including test tolerances for all throughput tests.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A for each throughput test shall meet or exceed the specified value in Tables 8.2.2.1.1.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.2.1.1.5-1: Test Requirement (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	-0.4	≥1
2	10 MHz	R.2 TDD	OP.1 TDD	ETU70	1x2 Low	70	0.2	≥1
3	10 MHz	R.2 TDD	OP.1 TDD	ETU300	1x2 Low	70	0.6	≥1
4	10 MHz	R.2 TDD	OP.1 TDD	HST	1x2	70	-2.0	≥1
5	1.4 MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	0.8	≥1
6	10 MHz	R.3 TDD	OP.1 TDD	EVA5	1x2 Low	70	7.5	≥2
7	10 MHz	R.3 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.2	≥2
8	10 MHz	R.3 TDD	OP.1 TDD	ETU300	1x2 High	70	10.1	≥2
9	3 MHz	R.5 TDD	OP.1 TDD	EVA5	1x2 Low	70	18.4	≥1
10	5 MHz	R.6 TDD	OP.1 TDD	EVA5	1x2 Low	70	18.4	≥2
11	10 MHz	R.7 TDD	OP.1 TDD	EVA5	1x2 Low	70	18.4	≥2
12	10 MHz	R.7 TDD	OP.1 TDD	ETU70	1x2 Low	70	19.9	≥2
13	10 MHz	R.7 TDD	OP.1 TDD	EVA5	1x2 High	70	19.9	≥2
14	15 MHz	R.8 TDD	OP.1 TDD	EVA5	1x2 Low	70	18.6	≥2
15	20 MHz	R.9 TDD	OP.1 TDD	EVA5	1x2 Low	70	18.5	≥3
16	3 MHz	R.0 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.9	≥1
17	10 MHz	R.1 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.8	≥1
18	20 MHz	R.1 TDD	OP.1 TDD	ETU70	1x2 Low	30	2.9	≥1

### 8.2.2.1.1\_1 TDD PDSCH Single Antenna Port Performance (Release 9 and forward)

#### 8.2.2.1.1\_1.1 Test purpose

Same test purpose as in clause 8.2.2.1.1.1.

#### 8.2.2.1.1\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward of UE category 1 and 2.

#### 8.2.2.1.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.1.1.3 with the following exceptions:

- Instead of Table 8.2.2.1.1.3-2 → use Table 8.2.2.1.1\_1.3-2.

#### Table 8.2.2.1.1\_1.3-1: Void

Table 8.2.2.1.1\_1.3-2: Minimum performance (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	N/A							
2	N/A							
3	N/A

### 8.2.2.1.1\_2 TDD PDSCH Single Antenna Port Performance (Release 10 and forward)

#### 8.2.2.1.1\_2.1 Test purpose

Same test purpose as in clause 8.2.2.1.1.1.

#### 8.2.2.1.1\_2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward.

#### 8.2.2.1.1\_2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.1.1.3 with the following exceptions:

- Instead of Table 8.2.2.1.1.3-1 → use Table 8.2.2.1.1\_2.3-1.
- Instead of Table 8.2.2.1.1.3-2 → use Table 8.2.2.1.1\_2.3-2.

Table 8.2.2.1.1\_2.3-1: Test Parameters

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Symbols for unused PRBs		OCNG (Note 2)	
Modulation		QPSK	
ACK/NACK feedback mode		Multiplexing	
PDSCH transmission mode		1	
Note 1: $P_B = 0$			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			

Table 8.2.2.1.1\_2.3-2: Minimum performance (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.41 TDD	OP.1 TDD	EVA5	1x2 Low	70	-5.3	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.1.

#### 8.2.2.1.1\_2.4 Test description

Same test description as in clause 8.2.2.1.1.4 with the following exceptions:

- Instead of Table 8.2.2.1.1.3-1 → use Table 8.2.2.1.1\_2.3-1.
- Instead of Table 8.2.2.1.1.3-2 → use Table 8.2.2.1.1\_2.3-2.
- Instead of Table 8.2.2.1.1.5-1 → use Table 8.2.2.1.1\_2.5-1.

#### 8.2.2.1.1\_2.5 Test requirement

Same test requirements as in clause 8.2.2.1.1.5 with the following exceptions:

- Instead of Table 8.2.2.1.1.3-1 → use Table 8.2.2.1.1\_2.3-1.
- Instead of Table 8.2.2.1.1.5-1 → use Table 8.2.2.1.1\_2.5-1.

Table 8.2.2.1.1\_1.5-1: Test Requirement (FRC)

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.41 TDD	OP.1 TDD	EVA5	1x2 Low	70	-4.5	$\geq 1$

## 8.2.2.1.1\_A TDD PDSCH Single Antenna Port Performance for CA

## 8.2.2.1.1\_A.1 TDD PDSCH Single Antenna Port Performance for CA (2DL CA)

Editor's note: The following aspects are either missing or not yet determined:

- SNR values in table 8.2.2.1.1\_A.1.3-2 are still in bracket in core spec.

## 8.2.2.1.1\_A.1.1 Test purpose

Same test purpose as 8.2.2.1.1.1.

## 8.2.2.1.1\_A.1.2 Test applicability

This test applies to E-UTRA TDD release 10 and forward UE of category 5 or higher that supports inter-band OR intra-band contiguous DL CA

This test also applies to E-UTRA TDD release 11 and forward UE of category 5 or higher that supports intra-band non-contiguous DL CA.

## 8.2.2.1.1\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.1, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.1.1\_A.1.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.1.1\_A.1.3-2 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

**Table 8.2.2.1.1\_A.1.3-1: Test Parameters for CA**

Parameter	Unit	Test 1-2	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Symbols for unused PRBs		OCNG (Note 2)	
Modulation		QPSK	
ACK/NACK feedback mode		PUCCH format 1b with channel selection	
PDSCH transmission mode		1	
Note 1:	$P_B = 0$		
Note 2:	These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.		
Note 3:	The same PDSCH transmission mode is applied to each component carrier.		

**Table 8.2.2.1.1\_A.1.3-2: Minimum performance (FRC) for CA**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.42 TDD	OP.1 TDD (Note1)	EVA5	1x2 Low	70	-1.2	≥5
2	20MHz+15MHz	R.42 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA5	1x2 Low	70	[-1.4]	≥5
		R.42-3 TDD for 15MHz CC	OP.1 TDD (Note 1)			70	[-1.4]	
Note 1: The OCNG pattern applies for each CC. Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

**Table 8.2.2.1.1\_A.1.3-3: Void**

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.1.

8.2.2.1.1\_A.1.4 Test description

8.2.2.1.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: Select one according to Table 8.2.2.1.1\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.1.1\_A.1.4.1

**Table 8.2.2.1.1\_A.1.4.1-1: Test point selection for TM3 2DL CA**

CA Capability	Bandwidth Combination	
	20+20	20+15
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2
Intra-band contiguous CA (CA2_C)	Test 1	Test 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	Test 2

Note1: Only one test point to be tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.
-------------------------------------------------------------------------------------------------------------------------------------------------------------

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.35 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.1.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.1.1\_A.1.4.3.

#### 8.2.2.1.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.2.1.1\_A.1.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.1.1\_A.1.3-1 and 8.2.2.1.1\_A.1.3-2 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the reference channel, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Tables 8.2.2.1.1\_A.1.5-1 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-6 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers.

#### 8.2.2.1.1\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

In test procedure step 2, for SCC configuration there are no additional message contents.

#### 8.2.2.1.1\_A.1.5 Test requirement

Table 8.2.2.1.1\_A.1.3-1 defines the primary level settings including test tolerances for all throughput tests.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause 3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.2.1.1\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.1.1\_A.1.5-1: Test Requirement (FRC) for CA**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.42 TDD	OP.1 TDD (Note1)	EVA5	1x2 Low	70	-0.4	≥5
2	20MHz+15MHz	R.42 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA5	1x2 Low	70	[-0.6]	≥5
		R.42-3 TDD for 15MHz CC	OP.1 TDD (Note 1)			70	[-0.6]	
Note 1: The OCNG pattern applies for each CC. Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

**Table 8.2.2.1.1\_A.1.5-3: Void**

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

**8.2.2.1.1\_A.2 TDD PDSCH Single Antenna Port Performance for CA (3DL CA)**

**Editor’s notes: This test case is incomplete. The following items are missing or incomplete:**

**- SNR values in minimum requirement and test requirement sections are still with square brackets.**

**8.2.2.1.1\_A.2.1 Test purpose**

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

**8.2.2.1.1\_A.2.2 Test applicability**

This test case applies to all types of E-UTRA TDD UE release 10 and forward of UE categories 5 and onwards that support 3DL Intra-band contiguous CA or 3DL Inter-band CA or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA TDD UE release 11 and forward of UE categories 5 and onwards that support 3DL with Intra-band non-contiguous and Inter-band CA or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

**8.2.2.1.1\_A.2.3 Minimum conformance requirements**

For CA with 3 DL CCs, the requirements are specified in Table 8.2.2.1.1\_A.4.3-2, based on single carrier requirement specified in Table 8.2.2.1.1\_A.2.3-1, with the addition of the parameters in Table 8.2.2.1.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

**Table 8.2.2.1.1\_A.2.3-1: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]
3MHz	R.42-1 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.8]
5MHz	R.42-2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.2]
10MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.6]
15MHz	R.42-3 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]
20MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]

**Table 8.2.2.1.1\_A.2.3-2: Minimum performance (FRC) based on single carrier performance for CA with 3 DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.2.1.1_A.2.3-1 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.1.1_A.2.3-1 per CC	≥5

Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3

The normative reference for this requirement is TS 36.101 [2] clause 8.2.1.1.

#### 8.2.2.1.1\_A.2.4 Test description

##### 8.2.2.1.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.1.1\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.1.1\_A.2.4.1-1

**Table 8.2.2.1.1\_A.2.4.1-1: Test point selection for TM1 CA**

CA Capability	Bandwidth combination	
	3x20	20+20+15
Intra-band contiguous (CA3_C)	Test1	NA
Inter-band (CA3_A2)	Test1	Test2
Inter-band CA (three bands) (CA_A3)	NA	NA
Intra-band non-contiguous (with two sub-blocks) (CA3_N2)	Test1	NA

Note1: Only one test point is tested.  
Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.59.
2. The parameter settings for the cell are set up according to Table 8.2.2-1 and 8.2.2.1.1\_A.2.3-1 as appropriate.

3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.1.1\_A.2.4.3.

8.2.2.1.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.2.1.1\_A.2.4.3.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.1.1\_A.1.3-1 and 8.2.2.1.1\_A.2.3-1 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.2.1.1\_A.2.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

8.2.1.1.1\_A.2.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 2, for SCCs configuration there are no additional message contents.

8.2.2.1.1\_A.2.5 Test requirement

Table 8.2.2.1.1\_A.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.2.1.1\_A.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.1.1\_A.2.5-1: Single carrier performance test requirement (FRC) for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propa-gation condi-tion	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	[0.2]
3MHz	R.42-1 TDD	OP.1 TDD	EVA5	1x2 Low	70	[0]
5MHz	R.42-2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.4]
10MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.8]
15MHz	R.42-3 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]
20MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]

**Table 8.2.2.1.1\_A.2.5-2: Test requirement (FRC) based on single carrier performance for CA with 3DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
-----------	---------------------------	-------------	-------------

1	3x20MHz	As specified in Table 8.2.2.1.1_A.2.5-1 per CC	$\geq 5$
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.1.1_A.2.5-1 per CC	$\geq 5$
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.			

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

### 8.2.2.1.2 TDD PDSCH Single Antenna Port Performance with 1 PRB in the presence of MBSFN

#### 8.2.2.1.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS and also for the transmission on a single-antenna port with single RB allocation in the presence of MBSFN.

#### 8.2.2.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

#### 8.2.2.1.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.1, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.1.2.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.1.2.3-2 for the specified SNR.

**Table 8.2.2.1.2.3-1: Test Parameters for Testing 1 PRB allocation**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for MBSFN portion of MBSFN subframes (Note 2)			OCNG (Note 3)
ACK/NACK feedback mode			Multiplexing
Note 1: $P_B = 0$ Note 2: The MBSFN portion of an MBSFN subframe comprises the whole MBSFN subframe except the first two symbols in the first slot. Note 3: The MBSFN portion of the MBSFN subframes shall contain QPSK modulated data. Cell-specific reference signals are not inserted in the MBSFN portion of the MBSFN subframes, QPSK modulated MBSFN data is used instead.			

**Table 8.2.2.1.2.3-2: Minimum performance 1 PRB allocation (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.29 TDD	OP.3 TDD	ETU70	1x2 Low	30	2.0	1-5

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.

#### 8.2.2.1.2.4 Test description

##### 8.2.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Low Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.1.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.1.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.1.2.4.3.

##### 8.2.2.1.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.1.2.3-1 and 8.2.2.1.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the reference channel, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Tables 8.2.2.1.1.2.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.2.2.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.2.2.1.2.4.3-1: SystemInformationBlockType2: Additional TDD PDSCH Single Antenna Port Performance for 1 PRB allocation with MBSFN subframes test point 1 requirement**

Derivation Path: TS 36.508 [7] clause 4.4.3.3, Table 4.4.3.3-1 SystemInformationBlockType2			
Information Element	Value/remark	Comment	Condition
SystemInformationBlockType2 ::= SEQUENCE {			
mbsfn-SubframeConfig ::= SEQUENCE {			
radioframeAllocationPeriod	n1	Every radio frame is with MBSFN subframe	
radioframeAllocationOffset	0		
subframeAllocation CHOICE {			
oneFrame	01001x	subframe 4 and 9 is used for MBSFN.	TDD
}			
}			
}			

#### 8.2.2.1.2.5 Test requirement

Table 8.2.2.1.2.3-1 defines the primary level settings including test tolerances for all throughput tests.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A for each throughput test shall meet or exceed the specified value in Tables 8.2.2.1.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.1.2.5-1: Test Requirement 1PRB with MBSFN subframes (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.29 TDD	OP.3 TDD	ETU70	1x2 Low	30	2.8	1-5

#### 8.2.2.2 TDD PDSCH Transmit Diversity Performance (Cell-Specific Reference Symbols)

##### 8.2.2.2.1 TDD PDSCH Transmit Diversity 2x2

###### 8.2.2.2.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using transmit diversity (SFBC).

###### 8.2.2.2.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

###### 8.2.2.2.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.2.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.2.1.3-2 for the specified SNR. For transmit diversity (SFBC) performance with 2 and 4 transmitter antennas as specified.

**Table 8.2.2.2.1.3-1: Test Parameters for Testing Transmit Diversity Performance (FRC)**

Parameter	Unit	Test 1-2	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		Multiplexing	
PDSCH transmission mode		2	
Note 1: $P_B = 1$			

**Table 8.2.2.2.1.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 TDD	OP.1 TDD	EVA5	2x2 Medium	70	6.8	$\geq 2$
2	10 MHz	R.10 TDD	OP.1 TDD	HST	2x2	70	-2.3	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.2.

#### 8.2.2.2.1.4 Test description

##### 8.2.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.2.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.2.1.4.3.

##### 8.2.2.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.2.1.3-1 and 8.2.2.2.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.2.1.5-1 as appropriate.

3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Table 8.2.2.2.1.5-1 as appropriate.

#### 8.2.2.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.2.2.2.1.5 Test requirement

Table 8.2.2.2.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Table 8.2.2.2.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.2.1.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11 TDD	OP.1 TDD	EVA5	2x2 Medium	70	7.7	≥2
2	10 MHz	R.10 TDD	OP.1 TDD	HST	2x2	70	-1.7	≥1

#### 8.2.2.2.1\_1 TDD PDSCH Transmit Diversity 2x2 (Release 9 and forward)

##### 8.2.2.2.1\_1.1 Test purpose

Same test purpose as in clause 8.2.2.2.1.1

##### 8.2.2.2.1\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward of UE category 1.

##### 8.2.2.2.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.2.1.3 with the following exceptions:

- Instead of Table 8.2.2.2.1.3-2 → use Table 8.2.2.2.1\_1.3-1.

**Table 8.2.2.2.1\_1.3-1: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	5 MHz	R.11-2 TDD	OP.1 TDD	EVA5	2x2 Medium	70	6.8	1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.2.

##### 8.2.2.2.1\_1.4 Test description

Same test description as in clause 8.2.2.2.1.4 with the following exceptions:

- Instead of Table 8.2.2.2.1.3-2 → use Table 8.2.2.2.1\_1.3-1.

- Instead of Table 8.2.2.2.1.5-1 → use Table 8.2.2.2.1\_1.5-1.

#### 8.2.2.2.1\_1.5 Test requirement

Same test requirements as in clause 8.2.2.2.1.5 with the following exceptions:

- Instead of Table 8.2.2.2.1.5-1 → use Table 8.2.2.2.1\_1.5-1.

**Table 8.2.2.2.1\_1.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	5 MHz	R.11-2 TDD	OP.1 TDD	EVA5	2x2 Medium	70	+7.7	1

#### 8.2.2.2.2 TDD PDSCH Transmit Diversity 4x2

##### 8.2.2.2.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on four antenna ports using transmit diversity (SFBC-FSTD).

##### 8.2.2.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

##### 8.2.2.2.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.2.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.2.2.3-2 for the specified SNR. For transmit diversity (SFBC) performance with 2 and 4 transmitter antennas as specified.

**Table 8.2.2.2.2.3-1: Test Parameters for Testing Transmit Diversity Performance (FRC)**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		Multiplexing	
PDSCH transmission mode		2	
Note 1: $P_B = 1$			

**Table 8.2.2.2.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	1.4 MHz	R.12 TDD	OP.1 TDD	EPA5	4x2 Medium	70	0.2	≥1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.2.

#### 8.2.2.2.2.4 Test description

##### 8.2.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11 for antenna configuration 4x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.2.4.3.

##### 8.2.2.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.2.3-1 and 8.2.2.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.2.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.2.2.2.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.2.2.2.4.3-1: PDSCH-ConfigDedicated-DEFAULT: Additional TDD PDSCH transmit diversity performance downlink power allocation test point 1 requirement**

#### 8.2.2.2.2.5 Test requirement

Table 8.2.2.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Table 8.2.2.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.2.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	1.4 MHz	R.12 TDD	OP.1 TDD	EPA5	4x2 Medium	70	1.1	≥1

#### 8.2.2.2.2\_1 TDD PDSCH Transmit Diversity 4x2 (Release 9 and forward)

##### 8.2.2.2.2\_1.1 Test purpose

Same test purpose as in clause 8.2.2.2.1.

##### 8.2.2.2.2\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward.

##### 8.2.2.2.2\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.2.3 with the following exceptions:

- Instead of Table 8.2.2.2.3-2 → use Table 8.2.2.2\_1.3-1.

**Table 8.2.2.2\_1.3-1: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.13 TDD	OP.1 TDD	ETU70	4x2 Low	70	-0.5	≥1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.2.

##### 8.2.2.2.2\_1.4 Test description

Same test description as in clause 8.2.2.2.4 with the following exceptions:

- Instead of Table 8.2.2.2.3-2 → use Table 8.2.2.2\_1.3-1.

- Instead of Table 8.2.2.2.2.5-1 → use Table 8.2.2.2.2\_1.5-1.

#### 8.2.2.2.2\_1.5 Test requirement

Same test requirements as in clause 8.2.2.2.2.5 with the following exceptions:

- Instead of Table 8.2.2.2.2.5-1 → use Table 8.2.2.2.2\_1.5-1.

**Table 8.2.2.2.2\_1.5-1: Test requirement Transmit Diversity (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.13 TDD	OP.1 TDD	ETU70	4x2 Low	70	+0.4	≥1

#### 8.2.2.2.3\_C TDD PDSCH Transmit diversity 2x2 for eICIC

##### 8.2.2.2.3\_C.1 TDD PDSCH Transmit diversity 2x2 for eICIC (non-MBSFN ABS)

###### 8.2.2.2.3\_C.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

###### 8.2.2.2.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward. Applicability requires support for FGI bit 115.

###### 8.2.2.2.3\_C.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.2.3\_C.1.3-1.

In Table 8.2.2.2.3\_C.1.3-1, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Table C.3.2-1 in Annex C.3.2 and for Cell 2 is according to Table C.3.3-1 in Annex C.3.3, respectively.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.2.3\_C.1.3-2 for the specified SNR.

#### 8.2.2.2.3\_C.1.4 Test description

##### 8.2.2.2.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.2.3\_C.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.2.2-1 and 8.2.2.2.3\_C.1.3-1 as appropriate.
3. Downlink signals are initially set up for Cell1 according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.2.3\_C.1.4.3.

##### 8.2.2.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.2.2.3\_C.1.5-1, 8.2.2.2.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.2.2.2.3\_C.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

## 8.2.2.2.3\_D

## 8.2.2.2.3\_E TDD PDSCH Transmit diversity 2x2 for feICIC

## 8.2.2.2.3\_E.1 TDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)

## 8.2.2.2.3\_E.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [14] of the aggressor cells with CRS assistance information.

## 8.2.2.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE – Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

## 8.2.2.2.3\_E.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1 and 8.2.2.2.3\_E.1.3-1.

In Table 8.2.2.2.3\_E.1-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] includes Cell 2 and Cell 3.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.2.3\_E.1.3-2 for the specified SNR.

#### 8.2.2.2.3\_E.1.4 Test description

##### 8.2.2.2.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.2.3\_E.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.2.2-1 and 8.2.2.2.3\_E.1.3-1 as appropriate.
3. Downlink signals are initially set up for Cell1 according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.2.3\_E.1.4.3.

##### 8.2.2.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.2.2.2.3\_E.1.5-1, 8.2.2.2.3\_E.1.5-2, and C.3.3.2 of Annex C.3.3. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC.
2. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.2.2.3\_E.1.5 Test requirement

Table 8.2.2.2.3\_E.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 for each throughput test shall meet or exceed the specified value in Table 8.2.2.2.3\_E.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3\_E.1.5-1: Test Parameters for Transmit diversity Performance (FRC)**

Parameter		Unit	Cell 1	Cell 2	Cell 3

#### 8.2.2.2.4 TDD PDSCH Transmit Diversity 2x2 with TM3 Interference Model – Enhanced Performance Requirement Type A

**Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:**

##### 8.2.2.2.4.1 Test purpose

To verify the performance of transmit diversity (SFBC) with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of two dominant interfering cells applying transmission mode 3 interference model.

##### 8.2.2.2.4.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support enhanced receiver Type A.

##### 8.2.2.2.4.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.2.4.3-1 and 8.2.2.2.4.3-2 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.2.4.3-2 for the specified SINR.

**Table 8.2.2.4.3-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A
DIP (Note 2)		dB	N/A	-1.73	-8.66
$BW_{Channel}$		MHz	10	10	10
Cyclic Prefix			Normal	Normal	Normal
Cell Id			0	1	2
Number of control OFDM symbols			2	2	2
PDSCH transmission mode			2	N/A	N/A
Interference model			N/A	As specified in clause B.5.2	As specified in clause B.5.2
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-0	N/A	N/A
ACK/NACK feedback mode			Multiplexing	N/A	N/A
Note 1: $P_B = 1$					
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.					
Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells.					
Note 4: All cells are time-synchronous.					

**Table 8.2.2.4.3-2: Enhanced Performance Requirement Type A, Transmit Diversity (FRC) with TM3 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.46 TDD	OP.1 TDD	N/A	N/A	EVA 70	EVA 70	EVA 70	2x2 Low	70	-1.4	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.2.

8.2.2.2.4.4 Test description

8.2.2.2.4.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.2.4.5-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell1 are set up according to Tables 8.2.2-1, 8.2.2.2.4.5-1 and 8.2.2.2.4.5-2 as appropriate.
3. Downlink signals are initially set up for cell1 according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.2.4.4.3.

#### 8.2.2.2.4.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.2.2.2.4.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters for cell1 and cell2 according to Tables 8.2.2.2.4.5-1 and 8.2.2.2.4.5-2 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.2.2.4.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.2.2.2.4.5 Test requirement

Table 8.2.2.2.4.5-1 defines the primary level settings.

**Table 8.2.2.4.5-1: Test Parameters for Transmit diversity Performance (FRC) with TM3 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A
DIP (Note 2)		dB	N/A	-1.44	-7.77
$BW_{Channel}$		MHz	10	10	10
Cyclic Prefix			Normal	Normal	Normal
Cell Id			0	1	2
Number of control OFDM symbols			2	2	2
PDSCH transmission mode			2	N/A	N/A
Interference model			N/A	As specified in clause B.5.2	As specified in clause B.5.2
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-0	N/A	N/A
ACK/NACK feedback mode			Multiplexing	N/A	N/A
Note 1: $P_B = 1$					
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.					
Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells.					
Note 4: All cells are time-synchronous.					

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Table 8.2.2.4.3.5-2 for the specified SINR including test tolerances for all throughput tests.

**Table 8.2.2.4.5-2: Enhanced Performance Requirement Type A, Transmit Diversity (FRC) with TM3 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.46 TDD	OP.1 TDD	N/A	N/A	EVA 70	EVA 70	EVA 70	2x2 Low	70	-0.41	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

### 8.2.2.3 TDD PDSCH Open Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols)

#### 8.2.2.3.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2

##### 8.2.2.3.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

##### 8.2.2.3.1.2 Test applicability

This test applies to all types of E-UTRA TDD release 8 and forward UE of category 2-8.

##### 8.2.2.3.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.1.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.2.3.1.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter	Unit	Test 1
Downlink power allocation	$\rho_A$	dB
	$\rho_B$	dB
	$\sigma$	dB
$N_{oc}$ at antenna port	dBm/15kHz	-98
ACK/NACK feedback mode		Bundling
PDSCH transmission mode		3
Note 1: $P_B = 1$		

**Table 8.2.2.3.1.3-2: Minimum performance Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	EVA70	2x2 Low	70	13.1	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.

##### 8.2.2.3.1.4 Test description

###### 8.2.2.3.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.3.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.3.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1.4.3.

#### 8.2.2.3.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1.3-1 and 8.2.2.3.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.1.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.2.3.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.2.2.3.1.4.3-1: *PhysicalConfigDedicated-DEFAULT*: Additional TDD PDSCH open loop spatial multiplexing performance downlink power allocation for Test number 1**

}			

#### 8.2.2.3.1.5 Test requirement

Table 8.2.2.3.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Tables 8.2.2.3.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3.5-1: Test requirement Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	EVA70	2x2 Low	70	14.0	≥2

8.2.2.3.1\_1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 (Release 11 and forward)

8.2.2.3.1\_1.1 Test purpose

Same test purpose as in clause 8.2.2.3.1.1.

8.2.2.3.1\_1.2 Test applicability

This test applies to all types of E-UTRA TDD release 11 and forward UE of category 2-8.

8.2.2.3.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.3.1.3 with the following exceptions:

- Instead of Table 8.2.2.3.1.3-2 → use Table 8.2.2.3.1\_1.3-1.

**Table 8.2.2.3.1\_1.3-1: Minimum performance Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.35 TDD	OP.1 TDD	EVA200	2x2 Low	70	20.3	≥2

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.

8.2.2.3.1\_1.4 Test description

Same test description as in clause 8.2.2.3.1.4 with the following exceptions:

- Instead of Table 8.2.2.3.1.3-2 → use Table 8.2.2.3.1\_1.3-1.
- Instead of Table 8.2.2.3.1.5-1 → use Table 8.2.2.3.1\_1.5-1.

8.2.2.3.1\_1.5 Test requirement

Same test requirements as in clause 8.2.2.3.1.5 with the following exceptions:

- Instead of Table 8.2.2.3.1.5-1 → use Table 8.2.2.3.1\_1.5-1.

**Table 8.2.2.3.1\_1.5-1: Test Requirement Large Delay CDD (FRC)**

Test number	Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.35 TDD	OP.1 TDD	EVA200	2x2 Low	70	21.2	≥2

## 8.2.2.3.1\_A TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA

## 8.2.2.3.1\_A.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (2DL CA)

Editor's note: The following aspects are either missing or not yet determined:

- SNR values in table 8.2.2.3.1\_A.1.3-2 are still in bracket in core spec.

## 8.2.2.3.1\_A.1.1 Test purpose

Same test purpose as 8.2.2.3.1.1.

## 8.2.2.3.1\_A.1.2 Test applicability

This test applies to E-UTRA TDD release 10 and forward UE of category 5 or higher that supports inter-band or intra-band contiguous DL CA

This test also applies to E-UTRA TDD release 11 and forward UE of category 5 or higher that supports intra-band non-contiguous DL CA.

## 8.2.2.3.1\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.1\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.1\_A.1.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.2.3.1\_A.1.3-1: Test Parameters for Large Delay CDD (FRC) for CA**

Parameter	Unit	Test 1-2	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		PUCCH format 1b with channel selection	
PDSCH transmission mode		3	
Note 1: $P_B = 1$			
Note 2: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.2.3.1\_A.1.3-2: Minimum performance Large Delay CDD (FRC) for CA**

Test number	Band width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.30-1 TDD	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	13.7	≥5
2	20MHz +15MHz z	R.30-1 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	[13.0]	≥5
		R.11-9 TDD for 15MHz CC	OP.1 TDD (Note 1)	EVA70		70	[12.9]	
Note 1: The OCNG pattern applies for each CC Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

**Table 8.2.2.3.1\_A.1.3-3: Void**

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.

8.2.2.3.1\_A.1.4 Test description

8.2.2.3.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.3.1\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.3.1\_A.1.4.1

**Table 8.2.2.3.1\_A.1.4.1-1: Test point selection for TM3 2DL CA**

CA Capability	Bandwidth Combination	
	20+20	20+15
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2
Intra-band contiguous CA (CA2_C)	Test 1	Test 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	Test 2
Note 1: One test point per UE supported CA capability is tested. For each UE supported CA capability, select the largest aggregated CA bandwidth combination supported by the UE within the chosen CA capability.		

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.36 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.3.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1\_A.1.4.3.

#### 8.2.2.3.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.2.3.1\_A.1.4.3-1. *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.2.3.1\_A.1.4.3-1A.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1\_A.1.3-1 and 8.2.2.3.1\_A.1.5-1 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.1\_A.1.5-1 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-7 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers
7. Repeat steps from 1 to 6 for each subtest in Tables 8.2.2.3.1\_A.1.5-1 as appropriate depending on UE CA capability as defined in Table 8.2.2.3.1\_A.1.4.1-1.

#### 8.2.2.3.1\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 with the following exceptions.

**Table 8.2.2.3.1\_A.1.4.3-1: *PhysicalConfigDedicated-DEFAULT*: Additional TDD PDSCH open loop spatial multiplexing performance downlink power allocation**

}			

8.2.2.3.1\_A.1.5 Test requirement

Table 8.2.2.3.1\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for the throughput test shall meet or exceed the specified value in Tables 8.2.2.3.1\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3.1\_A.1.5-1: Test requirement Large Delay CDD (FRC) for CA**

Test number	Band width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.30-1 TDD	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	14.6	≥5
2	20MHz+15MHz	R.30-1 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	[13.9]	≥5
		R.11-9 TDD for 15MHz CC	OP.1 TDD (Note 1)	EVA70		70	[13.8]	
Note1: For CA capable UE, the OCNG pattern applies for each CC								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

8.2.2.3.1\_A.2 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (3DL CA)

**Editor’s notes: This test case is incomplete. The following items are missing or incomplete:**

**- The SNR values for minimum conformance and test requirements are still in brackets.**

8.2.2.3.1\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on on two antenna ports using large delay CDD.

## 8.2.2.3.1\_A.2.2 Test applicability

This test case applies to all types of E-UTRA TDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA TDD release 11 and forward UE of category 5 or higher that support 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

## 8.2.2.3.1\_A.2.3 Minimum conformance requirements

For CA with 3 DL CCs, the requirements are specified in Table 8.2.2.3.1\_A.2.3-3, based on single carrier requirement specified in Table 8.2.2.3.1\_A.2.3-2, with the addition of the parameters in Table 8.2.2.3.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

**Table 8.2.2.3.1\_A.2.3-1: Test Parameters for Large Delay CDD (FRC) for CA with 3DL CCs**

Parameter	Unit	Test 1, 2	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		PUCCH format 3	
PDSCH transmission mode		3	
Note 1: $P_B = 1$			
Note 2: Void			
Note 3: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.2.3.1\_A.2.3-2: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.11-5 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.2]
3MHz	R.11-6 TDD	OP.1 TDD	EVA70	2x2 Low	70	[12.8]
5MHz	R.11-7 TDD	OP.1 TDD	EVA70	2x2 Low	70	[12.6]
10 MHz	R.11-8 TDD	OP.1 TDD	EVA70	2x2 Low	70	[12.8]
15MHz	R.11-9 TDD	OP.1 TDD	EVA70	2x2 Low	70	[12.9]
20MHz	R.30-1 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.0]

**Table 8.2.2.3.1\_A.2.3-3: Minimum performance (FRC) based on single carrier performance for CA with 3 DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.2.3.1_A.2.3-2 per CC	$\geq 5$
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.3.1_A.2.3-2 per CC	$\geq 5$
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3

## 8.2.2.3.1\_A.2.4 Test description

## 8.2.2.3.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.3.1\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.3.1\_A.2.4.1-1.

**Table 8.2.2.3.1\_A.2.4.1-1: Test point selection for TM3 3DL CA**

CA Capability	Bandwidth combination	
	3x20	20+20+15
Intra-band contiguous (CA3_C)	Test1	Test2
Inter-band CA (two bands) (CA3_A2)	Test1	Test2
Inter-band CA (three bands) (CA3_A3)	Test1	Test2
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test1	Test2
Note1: One test point per UE supported CA capability is tested. For each UE supported CA capability, select the largest aggregated CA bandwidth combination supported by the UE within the chosen CA capability.		

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.60.
2. The parameter settings for the cell are set up according to Table 8.2.2-1 and 8.2.2.3.1\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1\_A.2.4.3.

## 8.2.2.3.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.2.3.1\_A.2.4.3.
3. The SS activates SCCs by sending the MAC-CE according to TS 36.321 [13] clauses 5.13 and 6.1.3.8. Wait for at least 2 seconds as per TS 36.133 [4] clause 8.3.3.2.
4. The SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1\_A.2.3-1 and 8.2.2.3.1\_A.2.3-2 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.2.3.1\_A.2.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

## 8.2.2.3.1\_A.2.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6 with the following exceptions.

## 8.2.2.3.1\_A.2.5 Test requirement

Table 8.2.2.3.1\_A.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2.1 for the throughput test shall meet or exceed the specified value in Table 8.2.2.3.1\_A.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3.1\_A.2.5-1: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.11-5 TDD	OP.1 TDD	EVA70	2x2 Low	70	[14.1]
3MHz	R.11-6 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.7]
5MHz	R.11-7 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.5]
10MHz	R.11-8 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.7]
15MHz	R.11-9 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.8]
20MHz	R.30-1 TDD	OP.1 TDD	EVA70	2x2 Low	70	[13.9]

**Table 8.2.2.3.1\_A.2.5-2: Test requirement (FRC) based on single carrier performance for CA with 3 DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.2.3.1_A.2.5-1 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.3.1_A.2.5-1 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

#### 8.2.2.3.1A TDD Soft buffer management test

##### 8.2.2.3.1A\_A.1 TDD PDSCH Soft buffer management test for CA (2 DL CA)

###### 8.2.2.3.1A\_A.1.1 Test purpose

The test purpose is to verify UE performance with proper instantaneous buffer implementation.

###### 8.2.2.3.1A\_A.1.2 Test applicability

This test applies to E-UTRA TDD release 10 and forward UE of category 3 and 4 which support intra-band contiguous DL CA or inter-band DL CA.

This test applies also to E-UTRA TDD release 11 and forward UE of category 3 and 4 which support intra-band non-contiguous DL CA.

###### 8.2.2.3.1A\_A.1.3 Minimum conformance requirements

The requirements are specified in Table 8.2.2.3.1A\_A.1.3-2, with the addition of the parameters in Table 8.2.2.3.1A\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C. The purpose is to verify UE performance with proper instantaneous buffer implementation.

**Table 8.2.2.3.1A\_A.1.3-1: Test Parameters for soft buffer management (FRC) for CA**

Parameter	Unit	Test 1-2	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		- (Note 2)	
PDSCH transmission mode		3	
Note 1: $P_B = 1$			
Note 2: PUCCH format 1b with channel selection is used to feedback ACK/NACK.			
Note 3: For CA test cases, the same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.2.3.1A\_A.1.3-2: Minimum performance soft buffer management test (FRC) for CA**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		Cat
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.30-2 TDD	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	13.2	
2	2x20 MHz	R.35-1 TDD	OP.1 TDD (Note 1)	EVA5	2x2 Low	70	15.7	
Note 1: The OCNG pattern applies for each CC.								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.1A.

#### 8.2.2.3.1A\_A.1.4 Test description

##### 8.2.2.3.1A\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.3.1A\_A.1.4.1-1

CA Capability to be tested: Select one according to Table 8.2.2.3.1A\_A.1.4.1-1

**Table 8.2.2.3.1A\_A.1.4.1-1: Test point selection soft buffer management tests for CA**

CA Capability	Bandwidth combination
	20+20
Inter-band CA (two bands) (CA2_A2)	Test 1 or 2
Intra-band contiguous CA (CA2_C)	Test 1 or 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1 or 2

Only one test point is tested.

Note1: Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.

Note2: One of the two tests per table position is selected, depending on UE category.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.36 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.3.1A\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1\_A.1.4.3.

#### 8.2.2.3.1A\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.2.3.1A.1.4.3-1. *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.2.3.1\_A.1.4.3-1A.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1A\_A.1.3-1 and 8.2.2.3.1A\_A.1.5-1 or 8.2.2.3.1A\_A.1.5-2 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.1A\_A.1.5-1 or 8.2.2.3.1A\_A.1.5-2 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-14 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers

#### 8.2.2.3.1A\_A.1.4.3 Message contents

Same Message contents as 8.2.2.3.1\_A.1.4.3.

#### 8.2.2.3.1A\_A.1.5 Test requirement

Table 8.2.2.3.1A\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for the throughput test shall meet or exceed the specified value in Tables 8.2.2.3.1A\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3.1A\_A.1.5-1: Test requirement Large Delay CDD (FRC) for CA**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.30-2 TDD	OP.1 TDD (Note 1)	EVA70	2x2 Low	70	14.1	3
2	2x20 MHz	R.35-1 TDD	OP.1 TDD (Note 1)	EVA5	2x2 Low	70	16.6	4

Note 1: The OCNG pattern applies for each CC.  
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

Decide pass or fail for each subtest according to Annex G.3A.4.

8.2.2.3.1A\_A.2 Void

8.2.2.3.1A\_A.3 Void

### 8.2.2.3.1B TDD PDSCH Open Loop Spatial Multiplexing 2x2 - Enhanced Performance Requirement Type C

Editor's notes: This test case is incomplete. The following item is missing or incomplete:

- Test tolerances are TBD

#### 8.2.2.3.1B.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using large delay CDD.

#### 8.2.2.3.1B.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

#### 8.2.2.3.1B.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.3.1B.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.1B.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.2.3.1B.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter	Unit	Test 1
Downlink power allocation	$\rho_A$	dB
	$\rho_B$	dB
	$\sigma$	dB
$N_{oc}$ at antenna port	dBm/15kHz	-98
ACK/NACK feedback mode		Bundling
PDSCH transmission mode		3
Note 1: $P_B = 1$		

**Table 8.2.2.3.1B.3-2: Enhanced Performance Requirement Type C, Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	EVA70	2x2 Medium	70	[17.4]	≥2

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.1B.

#### 8.2.2.3.1B.4 Test description

##### 8.2.2.3.1B.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.3.1B.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.3.1B.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1B.4.3.

##### 8.2.2.3.1B.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1B.3-1 and 8.2.2.3.1B.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.1B.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.2.2.3.1B.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.2.2.3.1B.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.508 Table 5.5.1.2-1			
Information Element	Value/remark	Comment	Condition
PhysicalConfigDedicated-DEFAULT ::= SEQUENCE {

release	NULL		
}			
}			
}			

### 8.2.2.3.1B.5 Test requirement

Table 8.2.2.3.1B.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Tables 8.2.2.3.1B.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.3.1B.5-1: Test requirement for Enhanced Performance Requirement Type C, Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	EVA70	2x2 Medium	70	[17.4 +TT]	≥2

### 8.2.2.3.1C TDD PDSCH Open Loop Spatial Multiplexing 2x2 with TM1 Interference – Enhanced Performance Requirement Type C

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Test tolerances are undefined
- Connection diagram is TBD
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.

#### 8.2.2.3.1C.1 Test purpose

The purpose is to verify the performance of open-loop spatial multiplexing performance with 2 transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell with transmission mode 1.

#### 8.2.2.3.1C.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

## 8.2.2.3.1C.3 Minimum conformance requirements

The requirements are specified in Table 8.2.2.3.1C.3-2, with the addition of parameters in Table 8.2.2.3.1C.3-1 and the downlink physical channel setup according to Annex C.3.2. In Table 8.2.2.3.1C.3-1, Cell 1 is the serving cell, and Cell 2 is interfering cell. The downlink physical channel setup is according to Annex C.3.2 for each of Cell 1 and Cell 2 respectively.

**Table 8.2.2.3.1C.3-1: Test Parameters for Large Delay CDD (FRC) with TM1 interference**

Parameter		Unit	Cell 1	Cell 2
Bandwidth		MHz	10 MHz	
Downlink power allocation	$\rho_A$	dB	-3	0
	$\rho_B$		-3 (Note 1)	0
	$\sigma$		0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna port 0
Cyclic Prefix			Normal	Normal
Cell ID			0	1
Transmission mode			3	Note 2
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A
$\hat{E}_s/N_{oc}$ (Note 3)		dB	Reference Value in Table 8.2.2.3.1C.3-2	12.95
Correlation and antenna configuration			Medium (2x2)	Medium(1x2)
Number of OFDM symbols for PDCCH			2	N/A
Max number of HARQ transmissions			4	N/A
Redundancy version coding sequence			{0,1,2,3}	N/A
Note 1: $p_B = 1$				
Note 2: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.2 applying OCNG pattern OP.5 TDD as defined in Annex A.5.2.5.				
Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell.				
Note 4: All cells are time-synchronous.				
Note 5: SIB-1 will not be transmitted in Cell2 in this test.				

**Table 8.2.2.3.1C.3-2: Enhanced Performance Requirement Type C, Large Delay CDD (FRC) with TM1 interference**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2	Fraction of Maximum Throughput (%)	SNR (dB) (Note 2)	
1	R.11-10 TDD	OP.1 TDD	OP.5 TDD	EVA70	EVA70	70	[19.6]	$\geq 2$
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.								
Note 2: SNR corresponds to $\hat{E}_s/N_{oc}$ of Cell 1.								

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.1C.

## 8.2.2.3.1C.4 Test description

## 8.2.2.3.1C.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.3.1C.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.2-1 and 8.2.2.3.1C.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.1C.4.3.

**8.2.2.3.1C.4.2 Test procedure**

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.1C.5-1 and 8.2.2.3.1C.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sets up parameters for cell 2 according to Table 8.2.2.3.1C.5-1 as appropriate.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.1C.5-1 and Table 8.2.2.3.1C.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

**8.2.2.3.1C.4.3 Message contents**

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.2.2.3.1C.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.508 Table 5.5.1.2-1

Max number of HARQ transmissions			4	N/A
Redundancy version coding sequence			{0,1,2,3}	N/A
Note 1: $P_B = 1$				
Note 2: Downlink physical channel setup in Cell 2 in accordance with Annex C.3.2 applying OCNG pattern OP.5 TDD as defined in Annex A.5.2.5.				
Note 3: Cell 1 is the serving cell. Cell 2 is the interfering cell.				
Note 4: All cells are time-synchronous.				
Note 5: SIB-1 will not be transmitted in Cell2 in this test.				

**Table 8.2.2.3.1C.5-2: Test requirement for Enhanced Performance Requirement Type C, Large Delay CDD (FRC) with TM1 interference**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2	Fraction of Maximum Throughput (%)	SNR (dB) (Note 2)	
1	R.11-10 TDD	OP.1 TDD	OP.5 TDD	EVA70	EVA70	70	[19.6] +TT	$\geq 2$
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.								
Note 2: SNR corresponds to $\hat{E}_s/N_{oc}$ of Cell 1.								

### 8.2.2.3.2 TDD PDSCH Open Loop Spatial Multiplexing 4x2

#### 8.2.2.3.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on four antenna ports using large delay CDD.

#### 8.2.2.3.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 8 and forward UE of category 2-8.

#### 8.2.2.3.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.2.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

**Table 8.2.2.3.2.3-1: Test Parameters for Large Delay CDD (FRC)**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port	dBm/15kHz	-98	
ACK/NACK feedback mode		Bundling	
PDSCH transmission mode		3	
Note 1: $P_B = 1$			

**Table 8.2.2.3.2.3-2: Minimum performance Large Delay CDD (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.14 TDD	OP.1 TDD	EVA70	4x2 Low	70	14.2	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.

#### 8.2.2.3.2.4 Test description

##### 8.2.2.3.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.3.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11 for antenna configuration 4x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.3.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.2.4.3.

##### 8.2.2.3.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.3.2.3-1 and 8.2.2.3.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.

2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.3.2.5-1 as appropriate.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.2.3.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 with the following exceptions.

						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.14 TDD	OP.1 TDD	EVA70	4x2 Low	70	15.1	≥2

### 8.2.2.3.3\_C TDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC

#### 8.2.2.3.3\_C.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC (non-MBSFN ABS)

##### 8.2.2.3.3\_C.1.1 Test purpose

To verify the UE's performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

##### 8.2.2.3.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward. Applicability requires support for FGI bit 115.

##### 8.2.2.3.3\_C.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.3\_C.1.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

The requirements for non-MBSFN ABS are specified in Table 8.2.2.3.3\_C.1.3-2, with the addition of parameters in Table 8.2.2.3.3\_C.1.3-1 and the downlink physical channel setup according to Annex C.3.2 and Annex C.3.3.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.3\_C.1.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

Table 8.2.2.3.3\_C.1.3-1: Test Parameters for Large Delay CDD (FRC) – non-MBSFN ABS

Parameter		Unit	Cell 1	Cell 2
Uplink downlink configuration			1	1

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.3.

#### 8.2.2.3.3\_C.1.4 Test description

##### 8.2.2.3.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.3.3\_C.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.2-1 and 8.2.2.3.3\_C.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.3\_C.1.4.3.

##### 8.2.2.3.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.2.3.3\_C.1.5-1 and 8.2.2.3.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.2.2.3.3\_C.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 8.2.2.3.3\_C.1.5 Test requirement

Table 8.2.2.3.3\_C.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.2.3.3\_C.1.5-2 for the specified SNR including test tolerances for all throughput tests.

### 8.2.2.3.3\_C.2 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for eICIC (MBSFN ABS)

#### 8.2.2.3.3\_C.2.1 Test purpose

To verify the UE's performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

#### 8.2.2.3.3\_C.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward. Applicability requires support for FGI bit 115.

#### 8.2.2.3.3\_C.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.3\_C.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

The requirements for MBSFN ABS are specified in Table 8.2.2.3.3\_C.2.3-2, with the addition of parameters in Table 8.2.2.3.3\_C.2.3-1 and the downlink physical channel setup according to Annex C.3.2 and Annex C.3.3.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.3\_C.2.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

#### 8.2.2.3.3\_C.2.4 Test description

##### 8.2.2.3.3\_C.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.3.3\_C.2.3-2, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.2-1 and 8.2.2.3.3\_C.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.3.3\_C.2.4.3.

##### 8.2.2.3.3\_C.2.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.2.2.3.3\_C.2.5-1, 8.2.2.3.3\_C.2.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

**Table 8.2.2.3.3\_C.2.5-2: Test Requirement Large Delay CDD (FRC)**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Correlation Matrix and Antenna Configuration	Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2		Fraction of Maximum Throughput (%) Note 5	SNR (dB) (Note 2)	
1	R.11 TDD Note 4	OP.1 TDD	OP.1 TDD	EVA 5	EVA 5	2x2 Low	70	13.1	2-8
Note 1: The propagation conditions for Cell 1 and Cell2 are statistically independent. Note 2: SNR corresponds to of cell 1. Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2. Note 4: Cell 1 Reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel. Note 5: The maximum Throughput is calculated from the total Payload in 2 subframes, averaged over 20ms.									

8.2.2.3.3\_D

8.2.2.3.3\_E TDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC

8.2.2.3.3\_E.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (demodulation subframe overlaps with aggressor cell ABS and CRS assistance information are configured, non-MBSFN ABS)

8.2.2.3.3\_E.1.1 Test purpose

To verify the UE’s performance of large delay CDD with 2 transmit antennas if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [9] of the aggressor cells with CRS assistance information.

8.2.2.3.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling – Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

8.2.2.3.3\_E.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.3.3\_E.1.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

The requirements for non-MBSFN ABS are specified in Table 8.2.2.3.3\_E.1.3-2, with the addition of parameters in Table 8.2.2.3.3\_E.1.3-1 and the downlink physical channel setup according to Annex C.3.2 and Annex C.3.3.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.3.3\_E.1.3-2 for the specified SNR. For open-loop spatial multiplexing performance with large delay CDD is specified.

Table 8.2.2.3.3\_E.1.3-1: Test Parameters for Large Delay CDD (FRC) – non-MBSFN ABS

Parameter		Unit	Cell 1	Cell 2	Cell 3
Uplink downlink configuration			1	1	1

<p>Note 1: <math>P_B = 1</math>.</p> <p>Note 2: This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.</p> <p>Note 3: This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.</p> <p>Note 4: This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS</p> <p>Note 5: ABS pattern as defined in [14].</p> <p>Note 6: Time-domain measurement resource restriction pattern for PCell measurements as defined in [5]</p> <p>Note 7: As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7].</p> <p>Note 8: The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.</p> <p>Note 9: Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex C.3.3 applying OCN pattern as defined in Annex A.5.</p> <p>Note 10: The number of the CRS ports in Cell1, Cell2 and Cell 3 is the same.</p> <p>Note 11: SIB-1 will not be transmitted in Cell2 and Cell 3 in this test.</p>					

Table 8.2.2.3.3\_E.1.3-2: Minimum performance Large Delay CDD (FRC) – non-MBSFN ABS

Test Number	Reference Channel	$\hat{E}_s/N_{oc2}$		OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 2	Cell 3	Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%) (Note 5)	SNR (dB) (Note 3)	
1	R.11 TDD (Note 4)	9	7	OP.1 TDD	OP.1 TDD	OP.1 TDD	EVA5	EVA5	EVA5	2x2 Low	70	14.2	2-8
2	R.35 TDD (Note 4)	9	1	OP.1 TDD	OP.1 TDD	OP.1 TDD	EVA5	EVA5	EVA5	2x2 Low	70	22.7	2-8

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc2}$  of Cell 1.  
Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.  
Note 5: The maximum throughput is calculated from the total Payload in 2 subframes, averaged over 20ms.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.3.3.

#### 8.2.2.3.3\_E.1.4 Test description

##### 8.2.2.3.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.3.3\_E.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell 1 are set up according to Tables 8.2.2-1 and 8.2.2.3.3\_E.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.2.2.3.3\_E.1.4.3.

##### 8.2.2.3.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell1, Cell2 and Cell3 according to Tables 8.2.2.3.3\_E.1.5-1, 8.2.2.3.3\_E.1.5-2 and C.3.3-2 of Annex C.3.3 as appropriate. SS transmits PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2.
2. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.2.3.3\_E.1.5 Test requirement

Table 8.2.2.3.3\_E.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.2.3.3\_E.1.5-2 for the specified SNR including test tolerances for all throughput tests.

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc2}$  of Cell 1.  
Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.  
Note 5: The maximum throughput is calculated from the total Payload in 2 subframes, averaged over 20ms.

#### 8.2.2.4 TDD PDSCH Closed Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols)

##### 8.2.2.4.1 TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2

###### 8.2.2.4.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed loop spatial multiplexing with wideband and frequency selective precoding.

###### 8.2.2.4.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8.

###### 8.2.2.4.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.4.1.3-1 and 8.2.2.4.1.3-3 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.4.1.3-2 and 8.2.2.4.1.3-4 for the specified SNR. For single-layer spatial multiplexing closed loop rank-one performance with wideband and frequency selective precoding is specified. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.2.4.1.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)**

Parameter		Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3 (Note 1)
	$\sigma$	dB	0	0
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98
Precoding granularity		PRB	6	50
PMI delay (Note 2)		ms	10 or 11	10 or 11
Reporting interval		ms	1 or 4 (Note 3)	1 or 4 (Note 3)
Reporting mode			PUSCH 1-2	PUSCH 3-1
CodeBookSubsetRestriction bitmap			001111	001111
ACK/NACK feedback mode			Multiplexing	Multiplexing
PDSCH transmission mode			4	4
Note 1: $P_B = 1$ Note 2: If the UE reports in an available uplink reporting instance at SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4) Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms				

**Table 8.2.2.4.1.3-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

#### 8.2.2.4.1.4 Test description

##### 8.2.2.4.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.4.1.3-2 and 8.2.2.4.1.3-4 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.4.1.3-1 and 8.2.2.4.1.3-3 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.1.4.3.

##### 8.2.2.4.1.4.2 Test procedure

1. For single-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.1.3-1 and 8.2.2.4.1.3-2. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.1.3-3 and 8.2.2.4.1.3-4. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.2.4.1.5-1 and 8.2.2.4.1.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
5. Repeat steps from 1 to 4 for each test interval in Tables 8.2.2.4.1.5-1 and 8.2.2.4.1.5-2 as appropriate.

#### 8.2.2.4.1.5 Test requirement

Tables 8.2.2.4.1.3-1 and 8.2.2.4.1.3-3 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Tables 8.2.2.4.1.5-1 and 8.2.2.4.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.4.1.5-1: Test requirement Single-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.10 TDD	OP.1 TDD	EVA5	2x2 Low	70	-2.2	1-5
2	10 MHz	R.10 TDD	OP.1 TDD	EPA5	2x2 High	70	-2.0	1-5

**Table 8.2.2.4.1.5-2: Test requirement Multi-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
3	10 MHz	R.11-1 TDD	OP.1 TDD	EVA5	2x2 Low	70	13.7	2-5
4	10 MHz	R.11-1 TDD	OP.1 TDD	ETU70	2x2 Low	70	14.8	2-5

#### 8.2.2.4.1\_1 TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 (Release 9 and forward)

##### 8.2.2.4.1\_1.1 Test purpose

Same test purpose as in clause 8.2.2.4.1.1.

##### 8.2.2.4.1\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward.

##### 8.2.2.4.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.2.2.4.1.3 with the following exceptions:

- Instead of Table 8.2.2.4.1.3-2 → use Table 8.2.2.4.1\_1.3-1.
- Instead of Table 8.2.2.4.1.3-4 → use Table 8.2.2.4.1\_1.3-2.

**Table 8.2.2.4.1\_1.3-1: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category

## 8.2.2.4.1\_A to D

8.2.2.4.1\_E TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 for f eICIC

8.2.2.4.1\_E.1 TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 for f eICIC (non-MBSFN ABS)

8.2.2.4.1\_E.1 Test purpose

To verify The purpose is to verify the closed loop rank-one performance with wideband precoding if the PDSCH transmission in the serving cell takes place in subframes that overlap with ABS [14] of the aggressor cell with CRS assistance information.

8.2.2.4.1\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

8.2.2.4.1\_E.1.3 Minimum conformance requirements

The requirements are specified in Table 8.2.2.4.1\_E.1.3-2, with the addition of parameters in Table 8.2.2.4.1\_E.1.3-1. In Table 8.2.2.4.1\_E.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] includes Cell 2 and Cell 3.

Table 8.2.2.4.1\_E.1.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)

Parameter		Unit	Cell 1	Cell 2	Cell 3
Uplink downlink configuration			1	1	1

PDSCH transmission mode			6	Note 9	Note 9
Precoding granularity		PRB	50	N/A	N/A
PMI delay (Note 10)		ms	10 or 11	N/A	N/A
Reporting interval		ms	1 or 4 (Note 11)	N/A	N/A
Reporting mode			PUSCH 3-1	N/A	N/A
CodeBookSubsetRestriction bitmap			1111	N/A	N/A
Cyclic prefix			Normal	Normal	Normal

Note 1:	$P_B = 1$ .
Note 2:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 3:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 4:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 5:	ABS pattern as defined in [14].
Note 6:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 7:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 8:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.
Note 10:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).
Note 11:	For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms.
Note 12:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 13:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.

**Table 8.2.2.4.1\_E.1.3-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)(Note 5)	SNR (dB) (Note 3)	
1	R.11 TDD (Note 4)	OP.1 TDD	OP.1 FDD	OP.1 TDD	EPA5	EPA5	EPA5	2x2 High	70	6.4	≥2
Note 1:	The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.										
Note 2:	The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.										
Note 3:	SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.										
Note 4:	Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.										
Note 5:	The maximum throughput is calculated from the total Payload in 2 subframes, averaged over 20ms.										

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4.1C.

#### 8.2.2.4.1\_E.1.4 Test description

##### 8.2.2.4.1\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.4.1\_E.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2.4.1\_E.1.3-1 as appropriate.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.2.2.4.1\_E.1.4.3.

#### 8.2.2.4.1\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.2.2.4.1\_E.1.5-1, 8.2.2.4.1\_E.1.5-2, and C.3.3.2 of Annex C.3.3. SS transmits PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC.
2. The SS sends downlink MAC padding bits on the DL RMC. Propagation conditions are set according to Annex B clause B.2
3. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
4. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.4.1\_E.1.5-2 as appropriate.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.2.4.1\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

1	R.11 TDD (Note 4)	OP.1T DD	OP.1F DD	OP.1TD D	EPA5	EPA5	EPA5	2x2 High	70	7.3	≥2
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1. Note 4: Cell 1 reference channel is modified: PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel. Note 5: The maximum throughput is calculated from the total Payload in 2 subframes, averaged over 20ms.											

8.2.2.4.2 TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 4x2

8.2.2.4.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on four antenna ports using closed loop spatial multiplexing with wideband and frequency selective precoding.

8.2.2.4.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8.

8.2.2.4.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.4.2.3-1 and 8.2.2.4.2.3-3 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.4.2.3-2 and 8.2.2.4.2.3-4 for the specified SNR. For single-layer spatial multiplexing closed loop rank-one performance with wideband and frequency selective precoding is specified. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.2.4.2.3-1: Test Parameters for Testing Single-Layer Spatial Multiplexing (FRC)**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Precoding granularity	PRB	6	
PMI delay (Note 2)	ms	10 or 11	
Reporting interval	ms	1 or 4 (Note 3)	
Reporting mode		PUSCH 1-2	
CodeBookSubsetRestriction bitmap		000000000000 000000000000 000000000000 000000000111 111111111111	
ACK/NACK feedback mode		Multiplexing	
PDSCH transmission mode		4	
Note 1: $P_B = 1$ Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4) Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms			

**Table 8.2.2.4.2.3-2: Minimum performance Single-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4.

#### 8.2.2.4.2.4 Test description

##### 8.2.2.4.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.4.2.3-2 and 8.2.2.4.2.3-4 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 Figure A.11 for antenna configuration 4x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.4.2.3-1 and 8.2.2.4.2.3-3 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.2.4.3.

8.2.2.4.2.4.2 Test procedure

1. For single-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.2.3-1 and 8.2.2.4.2.3-2. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.2.3-3 and 8.2.2.4.2.3-4. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.2.4.2.5-1 and 8.2.2.4.2.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
5. Repeat steps from 1 to 4 for each test interval in Tables 8.2.2.4.2.5-1 and 8.2.2.4.2.5-2 as appropriate.

8.2.2.4.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

8.2.2.4.2.5 Test requirement

Tables 8.2.2.4.2.3-1 and 8.2.2.4.2.3-3 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Tables 8.2.2.4.2.5-1 and 8.2.2.4.2.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.4.2.5-1: Test requirement Single-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.13 TDD	OP.1 TDD	EVA5	4x2 Low	70	-2.6	1-5

**Table 8.2.2.4.2.5-2: Test requirement Multi-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category

## 8.2.2.4.2\_A TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA

## 8.2.2.4.2\_A.1 TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (2DL CA)

**Editor's note: The following aspects are either missing or not yet determined:**

- SNR values in table 8.2.2.4.2\_A.1.3-3 are still in brackets in core spec.
- SNR value for 1.4 MHz channel bandwidth is still TBD

## 8.2.2.4.2\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

## 8.2.2.4.2\_A.1.2 Test applicability

E-UTRA TDD release 10 and forward UE of category 5 or higher that supports inter-band OR intra-band contiguous DL CA

This test also applies to E-UTRA TDD release 11 and forward UE of category 5 or higher that supports intra-band non-contiguous DL CA.

## 8.2.2.4.2\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.2, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.2.4.2\_A.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.2.2.4.2\_A.1.3-2 for the specified SNR. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

For CA with 2 DL CCs except for 2x20MHz, the requirements are specified in Table 8.2.2.4.2\_A.1.3-4, based on single carrier requirement specified in Table 8.2.2.4.2\_A.1.3-3.

**Table 8.2.2.4.2\_A.1.3-1: Test Parameters for Testing Multi-Layer Spatial Multiplexing for CA**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port		dBm/15kHz	-98
Precoding granularity		PRB	8
PMI delay (Note 2)		ms	10 or 11
Reporting interval		ms	1 or 4 (Note 3)
Reporting mode			PUSCH 1-2
ACK/NACK feedback mode			PUCCH format 1b with channel selection
CodeBookSubsetRestriction bitmap			00000000000000000000000000000000 00001111111111111111100000000 00000000
CSI request field (Note 4)			'10'
PDSCH transmission mode			4
Note 1: $P_B = 1$ . Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4) Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms. Note 4: Multiple CC-s under test are configured as the 1 <sup>st</sup> set of serving cells by high layers. Note 5: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.2.4.2\_A.1.3-2: Minimum performance Multi-Layer Spatial Multiplexing (FRC) for CA**

Test number	Band width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.43 TDD	OP.1 TDD (Note 1)	EVA5	4x2 Low	70	11.1	≥5
2	20MHz +15MHz	R.43 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA5	4x2 Low	70	[10.7]	≥5
		R.43-5TDD for 15MHz CC	OP.1 TDD (Note 1)	EVA5		70	[10.6]	
Note 1: The OCNG pattern applies for each CC Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

**Table 8.2.2.4.2\_A.1.3-3: Single carrier performance for multiple CA configurations**

Bandwidth Num.	Band-width	Reference channel	OCNG pattern	Propa- gation condition	Correlation matrix and antenna config.	Reference value	
						Fraction of maximum throughput (%)	SNR (dB)

1	1.4MHz	R.43-1 TDD	OP.1 TDD	EVA5	4x2 Low	70	[TBD]
2	3MHz	R.43-2 TDD	OP.1 TDD	EVA5	4x2 Low	70	[9.8]
3	5MHz	R.43-3 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.0]
4	10 MHz	R.43-4 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.5]
5	15MHz	R.43-5 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.6]
6	20MHz	R.43 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.7]

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4.

#### 8.2.2.4.2\_A.1.4 Test description

##### 8.2.2.4.2\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.4.2\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.3.1\_A.1.4.1

**Table 8.2.2.4.2\_A.1.4.1-1: Test point selection for TM4 2DLCA**

CA Capability	Bandwidth Combination	
	20+20	20+15
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2
Intra-band contiguous CA (CA2_C)	Test 1	Test 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	Test 2
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.		

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group 46 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.1-1, 8.2.2.4.2\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.2\_A.1.4.3.

##### 8.2.2.4.2\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.

2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PDSCH-ConfigDedicated-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-1, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-2A, *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-2, *CQI-ReportConfigSCell-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-4, *CQI-ReportAperiodic-r10-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 8.2.2.4.2\_A.1.4.3-6.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.2\_A.1.3-1 and 8.2.2.4.2\_A.1.3-2 or 8.2.2.3.1\_A.1.3-4. The SS sends downlink MAC padding bits on the DL RMC.
5. SS schedules the UL transmission to carry the PUSCH CSI feedback via PDCCH DCI format 0 with CSI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.2.4.2\_A.1.5-1 or 8.2.2.4.2\_A.1.5-2 as appropriate.
7. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.2.2.4.2\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 with the following exceptions:

8.2.2.4.2\_A.1.5 Test requirement

Tables 8.2.2.4.2\_A.1.3-1 define the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.2.4.2\_A.1.5-1 or 8.2.2.4.2\_A.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.4.2\_A.1.5-1: Test requirement Multi-Layer Spatial Multiplexing (FRC) for CA**

Test number	Band width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	2x20 MHz	R.43 TDD	OP.1 TDD (Note 1)	EVA5	4x2 Low	70	12.0	≥5
2	20MHz+15MHz	R.43 TDD for 20MHz CC	OP.1 TDD (Note 1)	EVA5	4x2 Low	70	[10.7] +TT	≥5
		R.43-5 TDD for 15MHz CC	OP.1 TDD (Note 1)	EVA5			[10.6] +TT	
Note1: For CA capable UE, the OCNG pattern applies for each CC								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.								

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

8.2.2.4.2\_A.2 TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (3DL CA)

Editor’s notes: This test case is incomplete. The following items are missing or incomplete:

- The SNR values for minimum conformance and test requirements are still in brackets.

#### 8.2.2.4.2\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed-loop spatial multiplexing.

#### 8.2.2.4.2\_A.2.2 Test applicability

This test case applies to all types of E-UTRA TDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA TDD release 11 and forward UE of category 5 or higher that support 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

#### 8.2.2.4.2\_A.2.3 Minimum conformance requirements

For CA with 3 DL CCs, the requirements are specified in Table 8.2.2.4.2\_A.2.3-3, based on single carrier requirement specified in Table 8.2.2.4.2\_A.2.3-2, with the addition of the parameters in Table 8.2.2.4.2\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

**Table 8.2.2.4.2\_A.2.3-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA**

Parameter	Unit	Test 3, 4	
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Precoding granularity	PRB	8	
PMI delay (Note 2)	ms	10 or 11	
Reporting interval	ms	1 or 4 (Note 3)	
Reporting mode		PUSCH 1-2	
ACK/NACK feedback mode		PUCCH format 3	
CodeBookSubsetRestriction bitmap		00000000000000000000000000000000 00001111111111111111111100000000 00000000	
CSI request field (Note 4)		'10'	
PDSCH transmission mode		4	
Note 1: $P_B = 1$ . Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4) Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms. Note 4: Multiple CC-s under test are configured as the 1 <sup>st</sup> set of serving cells by high layers. Note 5: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.2.4.2\_A.2.3-2: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.43-1 TDD	OP.1 TDD	EVA5	4x2 Low	70	[TBD]
3MHz	R.43-2 TDD	OP.1 TDD	EVA5	4x2 Low	70	[9.8]
5MHz	R.43-3 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.0]
10MHz	R.43-4 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.5]
15MHz	R.43-5 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.6]
20MHz	R.43 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.7]

**Table 8.2.2.4.2\_A.2.3-3: Minimum performance (FRC) based on single carrier performance for CA with 3 DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.2.4.2_A.2.3-2 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.4.2_A.2.3-2 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4

8.2.2.4.2\_A.2.4 Test description

8.2.2.4.2\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.2.4.2\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.4.2\_A.2.4.1-1.

**Table 8.2.2.4.2\_A.2.4.1-1: Test point selection for TM4 3DL CA**

CA Capability	Bandwidth combination	
	3x20	20+20+15
Intra-band contiguous (CA3_C)	Test1	Test2
Inter-band CA (two bands) (CA3_A2)	Test1	Test2
Inter-band CA (three bands) (CA3_A3)	Test1	Test2
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test1	Test2
Note1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.		

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.61.
2. The parameter settings for the cell are set up according to Table 8.2.2-1 and 8.2.2.4.1\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.2\_A.2.4.3.

#### 8.2.2.4.2\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.2.4.2\_A.2.4.3.
3. The SS activates SCCs by sending the MAC-CE according to TS 36.321 [13] clauses 5.13 and 6.1.3.8. Wait for at least 2 seconds as per TS 36.133 [4] clause 8.3.3.2.
4. The SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.2\_A.2.3-1 and 8.2.2.4.2\_A.2.3-2 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. The SS schedules the UL transmission to carry the PUSCH CSI feedback via PDCCH DCI format 0 with CSI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.2.4.2\_A.2.5-1 as appropriate.
7. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A.5 on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

#### 8.2.2.4.2\_A.2.5 Test requirement

Table 8.2.2.4.2\_A.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2.2 for the throughput test shall meet or exceed the specified value in Table 8.2.2.4.2\_A.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.4.2\_A.2.5-1: Single carrier performance for multiple CA configurations**

Band-width	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value	
					Fraction of maximum throughput (%)	SNR (dB)
1.4MHz	R.43-1 TDD	OP.1 TDD	EVA5	4x2 Low	70	[TBD]
3MHz	R.43-2 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.7]
5MHz	R.43-3 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.9]
10MHz	R.43-4 TDD	OP.1 TDD	EVA5	4x2 Low	70	[11.4]
15MHz	R.43-5 TDD	OP.1 TDD	EVA5	4x2 Low	70	[11.5]
20MHz	R.43 TDD	OP.1 TDD	EVA5	4x2 Low	70	[11.6]

**Table 8.2.2.4.2\_A.2.5-2: Test requirement (FRC) based on single carrier performance for CA with 3 DL CCs**

Test num.	CA Band-width combination	Requirement	UE category
1	3x20MHz	As specified in Table 8.2.2.4.2_A.2.5-1 per CC	≥5
2	20MHz+20MHz+15MHz	As specified in Table 8.2.2.4.2_A.2.5-1 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3			

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

#### 8.2.2.4.2A TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 2x2 – Enhanced Performance Requirement Type C

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Test tolerances are undefined
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.

##### 8.2.2.4.2A.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using closed loop rank-two spatial multiplexing with wideband and frequency selective precoding.

##### 8.2.2.4.2A.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C.

##### 8.2.2.4.2A.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1 and 8.2.2.4.2A.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.4.2A.3-2 for the specified SNR.

**Table 8.2.2.4.2A.3-1: Test Parameters for Testing Multi-Layer Spatial Multiplexing**

Parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Precoding granularity	PRB	50	
PMI delay (Note 2)	ms	10 or 11	
Reporting interval	ms	1 or 4 (Note 3)	
Reporting mode		PUSCH 3-1	
ACK/NACK feedback mode		Bundling	
CodeBookSubsetRestriction bitmap		110000	
PDSCH transmission mode		4	
Note 1: $P_B = 1$ .			
Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).			
Note 3: For Uplink - downlink configuration 1 the reporting interval will alternate between 1ms and 4ms.			

**Table 8.2.2.4.2A.3-2: Enhanced Performance Requirement Type C, Multi-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	ETU70	2x2 Medium	70	[17.8]	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4.2A.

#### 8.2.2.4.2A.4 Test description

##### 8.2.2.4.2A.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Table 8.2.2.4.2A.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1 and 8.2.2.4.2A.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.2A.4.3.

8.2.2.4.2A.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.2A.3-1 and 8.2.2.4.2A.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.2.2.4.2A.5-1 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.2.2.4.2A.5 Test requirement

Table 8.2.2.4.2A.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Table 8.2.2.4.2A.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.2.4.2A.5-1: Test requirement for Enhanced Performance Requirement Type C, Multi-Layer Spatial Multiplexing (FRC)**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz	R.11-1 TDD	OP.1 TDD	ETU70	2x2 Medium	70	[17.8] +TT	≥2

## 8.2.2.4.3 TDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 with TM4 Interference Model – Enhanced Performance Requirement Type A

**Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:**

## 8.2.2.4.3.1 Test purpose

To verify the closed loop rank-one performance with wideband precoding with two transmit antennas when the PDSCH transmission in the serving cell is interfered by PDSCH of two dominant interfering cells applying transmission mode 4 interference model.

## 8.2.2.4.3.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support enhanced receiver Type A.

## 8.2.2.4.3.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.2.2-1, 8.2.2.4.3.3-1 and 8.2.2.4.3.3-2 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.2.4.3.3-2 for the specified SINR. For single-layer spatial multiplexing closed loop rank-one performance with wideband and frequency selective precoding is specified. For multi-layer spatial multiplexing closed loop rank-two performance with wideband and frequency selective precoding is specified.

**Table 8.2.2.4.3.3-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3

<p>Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.</p> <p>Note 2: SINR corresponds to <math>\hat{E}_s / N_{oc}</math> of Cell 1 as defined in clause 8.1.1.</p> <p>Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.</p>											

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.4.

#### 8.2.2.4.3.4 Test description

##### 8.2.2.4.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: As specified per test number in Tables 8.2.2.4.3.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for cell1 are set up according to Tables 8.2.2-1, 8.2.2.4.3.5-1 and 8.2.2.4.3.5-2 as appropriate.
3. Downlink signals are initially set up for cell1 according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.4.3.4.3.

##### 8.2.2.4.3.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.4.3.5-1 and 8.2.2.4.3.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.
3. Set the parameters for cell1, cell2 and cell 3 according to Tables 8.2.2.4.3.5-1.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.2.2.4.3.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

8.2.2.4.3.5 Test requirement

Table 8.2.2.4.3.5-1 defines the primary level settings.

**Table 8.2.2.4.3.5-1: Test Parameters for Single-Layer Spatial Multiplexing (FRC) with TM4 interference model**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	$\rho_A$	dB	-3	-3	-3
	$\rho_B$	dB	-3 (Note 1)	-3	-3
	$\sigma$	dB	0	0	0
Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1	Antenna ports 0,1
$N_{oc}$ at antenna port		dBm/15kHz	-98	N/A	N/A
DIP (Note 2)		dB	N/A	-1.44	-7.77
BW <sub>Channel</sub>		MHz	10	10	10
Cyclic Prefix			Normal	Normal	Normal
Cell Id			0	1	2
Number of control OFDM symbols			2	2	2
PDSCH transmission mode			6	N/A	N/A
Interference model			N/A	As specified in clause B.5.3	As specified in clause B.5.3
Probability of occurrence of transmission rank in interfering cells	Rank 1	%	N/A	80	80
	Rank 2	%	N/A	20	20
Precoding granularity		PRB	50	6	6
PMI delay (Note 4)		ms	10 or 11	N/A	N/A
Reporting interval		ms	5	N/A	N/A
Reporting mode			PUCCH 1-1	N/A	N/A
CodeBookSubsetRestriction bitmap			001111	N/A	N/A
ACK/NACK feedback mode			Multiplexing	N/A	N/A
Note 1: $P_B = 1$					
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.					
Note 3: Cell 1 is the serving cell. Cell 2, 3 are the interfering cells.					
Note 4: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).					
Note 5: All cells are time-synchronous.					

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2, for each throughput test shall meet or exceed the specified value in Table 8.2.2.4.3.5-2 for the specified SINR including test tolerances for all throughput tests.

**Table 8.2.2.4.3.5-2: Test requirement for Enhanced Performance Requirement Type A, Single-Layer Spatial Multiplexing (FRC) with TM4 interference model**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions			Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.47 TDD	OP. 1 TD D	N/A	N/A	EV A5	EV A5	EV A5	2x2 Low	70	2.09	1-8
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.											
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.											
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1, Cell 2 and Cell 3.											

## 8.2.2.5

## 8.2.2.6

## 8.2.2.7 Carrier aggregation with power imbalance

Editor's Note: This test case is incomplete. The following items are missing or are incomplete:

- Connection diagram in Annex A of TS 36.508 is TBD
- Test tolerances are undefined
- Power at antenna port in test 2 is still TBD

## 8.2.2.7\_A.1 TDD Carrier aggregation with power imbalance (intra-band contiguous DL CA)

## 8.2.2.7\_A.1.1 Test purpose

To verify the ability of an intraband adjacent carrier aggregation UE to demodulate the signal transmitted by the PCell or SCell in the presence of a stronger SCell or PCell signal on an adjacent frequency. Throughput is measured on the PCell or SCell only.

## 8.2.2.7\_A.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that support intra-band contiguous DL CA.

## 8.2.2.7\_A.1.3 Minimum conformance requirements

The requirements are specified in Table 8.2.2.7\_A.1.3-2, with the addition of the parameters in Table 8.2.2.7\_A.1.3-1 and the downlink physical channel setup according to table C.3.2-1 in Annex C.

Table 8.2.2.7\_A.1.3-1: Test Parameters for CA

Parameter		Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	0	0
$N_{oc}$ at antenna port		dBm/15kHz	Off (Note 2)	Off (Note 2)
Symbols for unused PRBs			OCNG (Note 3)	OCNG (Note 3)
Modulation			64 QAM	64 QAM
Maximum number of HARQ transmission			1	1
Redundancy version coding sequence			{0}	{0}
PDSCH transmission mode of PCell			1	3
PDSCH transmission mode of SCell			3	1
OCNG Pattern	PCell		OP.1 TDD	OP.5 TDD

2	20	15	NA	R.49-1 TDD	-79	[-85.8]	NA	85	$\geq 5$
Note 1: The OCNG pattern for PCell is used to fill the control channel. The OCNG pattern for SCell is used to fill the control channel and PDSCH.									
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.									

The normative reference for this requirement is TS 36.101 [2] clause 8.2.2.7.

#### 8.2.2.7\_A.1.4 Test description

##### 8.2.2.7\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.7\_A.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group TBD
2. The parameter settings for the cell are set up according to Table 8.2.2-1 and 8.2.2.7\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.7\_A.1.4.3.

#### 8.2.2.7\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels except control channel and PDSCH.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.2.7\_A.1.4.3
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.2.7\_A.1.3-1 and 8.2.2.7\_A.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition and the correlation matrix on each of the component carriers according to Tables 8.2.2.7\_A.1.5-1 as appropriate.
6. Measure the average throughput on PCC in test number 1 or measure the average throughput on SCC in test number 2 for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-6. Count the number of NACKs, ACKs and statDTXs on the UL during the test on PCC in test number 1 or on SCC in test number 2.

#### 8.2.2.7\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] subclause 4.6. In test procedure step 3, for SCC configuration there are no additional message contents.

#### 8.2.2.7\_A.1.5 Test requirement

Table 8.2.2.7\_A.1.5-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.1 for the throughput test shall meet or exceed the specified value in Table 8.2.2.7\_A.1.5-1 for the specified cell power levels including test tolerances for all throughput tests.

Table 8.2.2.7\_A.1.5-1: Test Requirement (FRC) for CA

Test Number	Bandwidth (MHz)		Reference channel		Power at antenna port (dBm/15KHz)		Reference value Fraction of Maximum Throughput (%)		UE Category
	PCell	SCell	PCell	SCell	$\hat{E}_{s\_PCell}$ for PCell	$\hat{E}_{s\_SCell}$ for SCell	PCell	SCell	
1	20	20	R.49 TDD	NA	-85+TT	-79+TT	85	NA	$\geq 5$
2	20	15	NA	R.49-1 TDD	-79+TT	[-85.8] +TT	NA	85	$\geq 5$

Note 1: The OCNG pattern for PCell is used to fill the control channel. The OCNG pattern for SCell is used to fill the control channel and PDSCH.

Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

### 8.2.3 TDD FDD CA (Fixed Reference Channel)

The parameters specified in Table 8.2.3-1 are valid for all the TDD FDD CA tests unless otherwise stated.

Table 8.2.3-1: Common Test Parameters

Parameter	Unit	Value	
Uplink downlink configuration (Note 1) for TDD CC only		1	
Special subframe configuration (Note 2) for TDD CC only		4	
Inter-TTI Distance		1	
Maximum number of HARQ processes per component carrier	FDD PCell	Processes	8 for FDD and TDD CCs
	TDD PCell	Processes	11 for FDD CC; 7 for TDD CC
Maximum number of HARQ transmission		4	
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM	
Number of OFDM symbols for PDCCH per component carrier	OFDM symbols	4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, 2 for 10 MHz, 15 MHz and 20 MHz bandwidths	
Cyclic Prefix		Normal	
Cell_ID		0	
Cross carrier scheduling		Not configured	
ACK/NACK feedback mode		PUCCH format 3	
Downlink HARQ-ACK timing	FDD PCell		As specified in Clause 7.3.3 in TS36.213 [10]
	TDD PCell		As specified in Clause 7.3.4 in TS36.213 [10]
Note 1:	as specified in Table 4.2-2 in TS 36.211 [8].		
Note 2:	as specified in Table 4.2-1 in TS 36.211 [8].		

The applicability of the requirements are specified in Clause 8.1.2.3. The single carrier performance with different bandwidths for multiple CA configurations specified in Clause 8.2.3 cannot be applied for UE single carrier test.

The normative reference for this requirement is TS 36.101 [2] clause 8.2.3.

### 8.2.3.1\_A TDD FDD CA PDSCH Single Antenna Port Performance

#### 8.2.3.1\_A.1 TDD FDD CA PDSCH Single Antenna Port Performance for FDD PCell (2DL CA)

**Editor's note:** The following aspects are either missing or not yet determined:

The SNR values in table 8.2.3.1\_A.2.3-3 and 8.2.3.1\_A.2.3-4 are still in bracket in core spec.

Test tolerance is FFS

Message contents are FFS

##### 8.2.3.1\_A.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

##### 8.2.3.1\_A.1.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 3 or higher that support E-UTRA FDD and TDD and 2DL CA with FDD as PCELL.

##### 8.2.3.1\_A.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.3.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.3.1\_A.1.3-4 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

**Table 8.2.3.1\_A.1.3-1: Test Parameters for CA**

Parameter		Unit	Test 1- 6
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.3.1\_A.1.3-2: Single carrier performance with different bandwidths for multiple CA configurations for FDD PCell and SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.3]
3 MHz	R.42-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.1]
5MHz	R.42-2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.0]
10MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]
15MHz	R.42-3 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.6]
20MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]

**Table 8.2.3.1\_A.1.3-3: Single carrier performance with different bandwidths for multiple CA configurations for TDD SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]
3 MHz	R.42-1 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.8]
5MHz	R.42-2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.2]
10MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.6]
15MHz	R.42-3 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]
20MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]

**Table 8.2.3.1\_A.1.3-4: Minimum performance for multiple CA configurations with 2DL CCs (FRC)**

Test number	CA Bandwidth combination (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	2x20	20	20	As defined in Table 8.2.3.1.1-2 and Table 8.2.3.1.1-3 per CC	≥5

3	10+5	5	10	As defined in Table 8.2.3.1.1-2 and Table 8.2.3.1.1-3 per CC	≥3
4	20+15	15	20	As defined in Table 8.2.3.1.1-2 and Table 8.2.3.1.1-3 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.				
Note 2:	30usec timing difference between PCell and any SCell is applied in inter-band CA case, where PCell can be assigned on any CC.				

The normative reference for this requirement is TS 36.101 [2] clause 8.2.3.1.

8.2.3.1\_A.1.4 Test description

8.2.3.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.3.1\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.3.1\_A.1.4.1-1.

**Table 8.2.3.1\_A.1.4.1-1: Test point selection for TM1 2DLCA**

CA Capability	Bandwidth combination			
	20+20	10+20	5+10	15+20
Inter-band CA2_A2	Test1	Test2	Test3	Test4
Note1: Select the first UE supported CA bandwidth combination (moving from left to right) and then choose any one of the UE supported CA capabilities				

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.35 as appropriate.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.3.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.3.1\_A.1.4.3.

#### 8.2.3.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.3.1\_A.1.4.3
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.1\_A.1.3-2 and 8.2.3.1\_A.1.3-3 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.3.1\_A.1.5-1 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-1 and G.3A.5-6 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers.

#### 8.2.3.1\_A.1.4.3 Message contents

FFS

#### 8.2.3.1\_A.1.5 Test requirement

Table 8.2.3.1\_A.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.3.1\_A.1.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.3.1\_A.5-1: Test requirement (FRC)

Test num.	Bandwidth Combination	Reference channel	OCNG pattern	Propagation condition	Correlation matrix and antenna config.	Reference value		UE category
						Fraction of maximum throughput (%)	SNR (dB)	
1	20(FDD)+20(TDD)MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]+TT	≥5
		R.42 TDD	OP.1 TDD			70	[-1.4]+TT	
2	10(FDD)+20(TDD)MHz	R.2 FDD For 10MHz CC	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]+TT	≥5
		R.42 TDD For 20MHz CC	OP.1 TDD			70	[-1.4]+TT	
3	5(FDD)+10(TDD)MHz	R.42-2 FDD For 5MHz CC	OP.1 FDD	EVA5	1x2 Low	70	[-1.0]+TT	≥3
		R.2 TDD For 10MHz CC	OP.1 TDD			70	[-1.6]+TT	
4	15(FDD)+20(TDD)MHz	R.42-3 FDD For 15MHz CC	OP.1 FDD	EVA5	1x2 Low	70	[-1.6]+TT	≥5
		R.42 TDD For 20MHz CC	OP.1 TDD			70	[-1.4]+TT	
Note 1: The OCNG pattern applies for each CC. Note 2: 30usec or 922*Ts timing difference between two CCs is applied in inter-band CA case. Note 3: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.								

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

## 8.2.3.1\_A.2 TDD FDD CA PDSCH Single Antenna Port Performance for TDD PCell (2DL CA)

Editor's note: The following aspects are either missing or not yet determined:

The SNR values in table 8.2.3.1\_A.2.3-3 and 8.2.3.1\_A.2.3-4 are still in bracket in core spec.

Test tolerance is FFS

Message contents are FFS

## 8.2.3.1\_A.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

## 8.2.3.1\_A.2.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 3 or higher that support E-UTRA FDD and TDD and 2DL CA with TDD as PCELL.

## 8.2.3.1\_A.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.3-1, 8.2.3.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.3.1\_A.2.3-4 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

**Table 8.2.3.1\_A.2.3-1: Test Parameters for CA**

Parameter		Unit	Test 1- 6
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: The same PDSCH transmission mode is applied to each component carrier.			

**Table 8.2.3.1\_A.2.3-2: Single carrier performance with different bandwidths for multiple CA configurations for FDD SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.3]
3 MHz	R.42-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.1]
5MHz	R.42-2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.0]
10MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]
15MHz	R.42-3 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.6]
20MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]

**Table 8.2.3.1\_A.2.3-3: Single carrier performance with different bandwidths for multiple CA configurations for TDD PCell and SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]
3 MHz	R.42-1 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.8]
5MHz	R.42-2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.2]
10MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.6]
15MHz	R.42-3 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]
20MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]

**Table 8.2.3.1\_A.2.3-4: Minimum performance for multiple CA configurations with 2DL CCs (FRC)**

Test number	Aggregated Bandwidth (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	2x20	20	20	As defined in Table 8.2.3.1.2-2 and Table 8.2.3.1.2-3 per CC	≥5

3	10+5	5	10	As defined in Table 8.2.3.1.2-2 and Table 8.2.3.1.2-3 per CC	≥3
4	20+15	15	20	As defined in Table 8.2.3.1.1-2 and Table 8.2.3.1.1-3 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B				
Note 2:	30usec timing difference between PCell and any SCell is applied in inter-band CA case, where PCell can be assigned on any CC.				

The normative reference for this requirement is TS 36.101 [2] clause 8.2.3.1.

#### 8.2.3.1\_A.2.4 Test description

##### 8.2.3.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: Select one according to Table 8.2.3.1\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.3.1\_A.1.4.1

**Table 8.2.3.1\_A.1.4.1-1: Test point selection for TM1 2DLCA**

CA Capability	Bandwidth Combination			
	20+20	20+10	10+5	20+15
Inter-band (CA_A_2)	Test 1	Test 2	Test3	Test4
Note1: Select the first UE supported CA bandwidth combination (moving from left to right) and then choose any one of the UE supported CA capabilities				

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group A.35 as appropriate.
2. The parameter settings for the cell are set up according to Tables 8.2.2-1, 8.2.2.1.1\_A.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.2.1.1\_A.1.4.3.

#### 8.2.3.1\_A.2.4.2 Test procedure

1. Configure SCC according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.3.1\_A.1.4.3.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.1\_A.1.3-1 and 8.2.3.1\_A.1.3-2 or 8.2.3.1\_A.1.3-3 on both PCC and SCC. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the reference channel, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Tables 8.2.3.1\_A.1.5-1 as appropriate.
6. Measure the average throughput per component carrier for a duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-1 and G.3A.5-6 on both PCC and SCC. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on both component carriers.

		R.42-2 FDD	OP.1 FDD			70	[-1.0] +TT	
4	20(FDD)+15 (TDD)MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4] +TT	≥5
		R.42-3 FDD	OP.1 FDD			70	[-1.6] +TT	
Note 1: The OCNG pattern applies for each CC.								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B..								

### 8.2.3.1\_A.3 TDD FDD CA PDSCH Single Antenna Port Performance for FDD PCell (3DL CA)

**Editor's note: The following aspects are either missing or not yet determined:**

The SNR values in table 8.2.3.1\_A.3.3-3 and 8.2.3.1\_A.3.3-4 are still in bracket in core spec.

Test tolerance is FFS

Message contents are FFS

#### 8.2.3.1\_A.3.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

#### 8.2.3.1\_A.3.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 3 or higher that support E-UTRA FDD and TDD and 3DL CA with FDD as PCELL.

#### 8.2.3.1\_A.3.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.1-1, 8.2.3.1\_A.3.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.3.1\_A.3.3-4 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

Table 8.2.3.1\_A.3.3-1: Test Parameters for CA

Parameter		Unit	Test 1- 6
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: The same PDSCH transmission mode is applied to each component carrier.

#### 8.2.3.1\_A.3.4 Test description

##### 8.2.3.1\_A.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.3.1\_A.3xx.

CA Capability to be tested: Select one according to Table 8.2.3.1\_A.3xx

**Table 8.2.3.1\_A.3.4.1-1: Test point selection for TM1 CA**

CA Capability	Bandwidth combination		
	3x20	20+20+15	20+10+10
Inter-band CA (three bands) CA3_A3	Test1	Test2	Test3
Inter-band CA (two bands) CA3_A2	Test1	Test2	Test3

Note1: Only one test point is tested.  
 Select left to right the first UE supported CA bandwidth combination  
 and then choose any one of the UE supported CA capabilities  
 supporting that CA bandwidth combination.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.59.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.3.1\_A.3.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.3.1\_A.2.4.3.

#### 8.2.3.1\_A.3.4.2 Test procedure

1. Configure SCCs according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.3.1\_A.2.4.3.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.1\_A.3.3-2 and 8.2.3.1\_A.3.3-3 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.3.1\_A.2.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-2 and [G.3A.5-x] on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

#### 8.2.3.1\_A.3.4.3 Message contents

FFS

#### 8.2.3.1\_A.3.5 Test requirement

Table 8.2.3.1\_A.3.3-1 defines the primary level settings including test tolerances for all throughput tests.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause 3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.3.1\_A.3.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.2.3.1\_A.3.5-1: Test Requirement (FRC) for CA

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	20(FDD)+20(TDD)+20(TDD)MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]+TT	≥5
		R.42 TDD	OP.1 TDD			70	[-1.4] +TT	
2	15(FDD)+20(TDD)+20(TDD)MHz	R.42-3 FDD for 15 MHz CC	OP.1 FDD	EVA5	1x2 Low	70	[-1.6] +TT	≥5
		R.42 TDD	OP.1 TDD			70	[-1.4] +TT	
3	10(FDD)+20(TDD)+20(TDD)MHz	R.2 FDD FDD for 15 MHz CC	OP.1 FDD	EVA5	1x2 Low	70	[-1.7] +TT	≥5
		R.42 TDD	OP.1 TDD			70	[-1.4] +TT	
Note 1: The OCNG pattern applies for each CC.								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.								

#### 8.2.3.1\_A.4 TDD FDD CA PDSCH Single Antenna Port Performance for TDD PCell (3DL CA)

Editor's note: The following aspects are either missing or not yet determined:

The SNR values in table 8.2.3.1\_A.3.3-3 and 8.2.3.1\_A.3.3-4 are still in bracket in core spec.

Test tolerance is FFS

Message contents are FFS

##### 8.2.3.1\_A.4.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on a single-antenna port with different channel models and MCS.

##### 8.2.3.1\_A.4.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 3 or higher that support E-UTRA FDD and TDD and 3DL CA with TDD as PCELL.

##### 8.2.3.1\_A.4.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.1, with the addition of the relevant parameters in Tables 8.2.3-1, 8.2.3.1\_A.4.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.2.3.1\_A.4.3-4 for the specified SNR. For QPSK and 64QAM performance the bandwidths specified in Table 5.4.2.1-1 are verified.

Table 8.2.3.1\_A.4.3-1: Test Parameters for CA

Parameter		Unit	Test 1- 6
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Modulation			QPSK
PDSCH transmission mode			1
Note 1: $P_B = 0$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			
Note 3: The same PDSCH transmission mode is applied to each component carrier.			

Table 8.2.3.1\_A.4.3-2: Single carrier performance with different bandwidths for multiple CA configurations for FDD SCell (FRC)

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.3]
3 MHz	R.42-1 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.1]
5MHz	R.42-2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.0]
10MHz	R.2 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]
15MHz	R.42-3 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.6]
20MHz	R.42 FDD	OP.1 FDD	EVA5	1x2 Low	70	[-1.7]

Table 8.2.3.1\_A.4.3-3: Single carrier performance with different bandwidths for multiple CA configurations for TDD PCell and SCell (FRC)

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.4 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.6]
3 MHz	R.42-1 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-0.8]
5MHz	R.42-2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.2]
10MHz	R.2 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.6]
15MHz	R.42-3 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]
20MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4]

**Table 8.2.3.1\_A.4.3-4: Minimum performance for multiple CA configurations with 3DL CCs (FRC)**

Test number	Aggregated Bandwidth (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	3x20	20	2x20	As defined in Table 8.2.3.1.2-2 and Table 8.2.3.1.2-3 per CC	≥5
2	20+20+15	15	2x20	As defined in Table 8.2.3.1.2-2 and Table 8.2.3.1.2-3 per CC	≥5
3	20+20+10	10	2x20	As defined in Table 8.2.3.1.2-2 and Table 8.2.3.1.2-3 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.				
Note 2:	30usec timing difference between PCell and any SCell is applied in inter-band CA case, where PCell can be assigned on any CC.				

The normative reference for this requirement is TS 36.101 [2] clause 8.2.3.1.

#### 8.2.3.1\_A.4.4 Test description

##### 8.2.3.1\_A.4.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.3.1\_A.4.xx

CA Capability to be tested: Select one according to Table 8.2.3.1\_A.4xx

**Table 8.2.3.1\_A.4.4.1-1: Test point selection for TM1 CA**

CA Capability	Bandwidth combination		
	3x20	20+20+15	20+10+10
Inter-band CA (three bands) CA3_A3	Test1	Test2	Test3
Inter-band CA (two bands) CA3_A2	Test1	Test2	Test3
Note1: Only one test point is tested. Select left to right the first UE supported CA bandwidth combination and then choose any one of the UE supported CA capabilities supporting that CA bandwidth combination.			

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.59.
2. The parameter settings for the cell are set up according to Table 8.2.1-1 and 8.2.3.1\_A.2.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.3.1\_A.2.4.3.

8.2.3.1\_A.4.4.2 Test procedure

1. Configure SCCs according to Annex C0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents are defined in clause 8.2.3.1\_A.4.4.3.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.1\_A.3.3-2 and 8.2.3.1\_A.3.3-3 on both PCC and SCCs. The SS sends downlink MAC padding bits on the DL RMC.
5. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR on each of the component carriers according to Tables 8.2.3.1\_A.4.5-1 as appropriate.
6. Measure the average throughput per component carrier for duration sufficient to achieve statistical significance according to Annex G clause G.3A, Table G.3A.5-2 and [G.3A.5-x] on each of the component carriers. Count the number of NACKs, ACKs and statDTXs on the UL during each subtest on each of the component carriers.

8.2.3.1\_A.4.4.3 Message contents

FFS

8.2.3.1\_A.4.5 Test requirement

Table 8.2.3.1\_A.4.3-1 defines the primary level settings including test tolerances for all throughput tests.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause 3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.2.3.1\_A.3.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.3.1\_A.4.5-1: Test Requirement (FRC) for CA**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	20(FDD)+20(TDD)+20(TDD)MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4] +TT	≥5
		R.42 FDD	OP.1 FDD			70	[-1.7] +TT	
2	15(FDD)+20(TDD)+20(TDD)MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4] +TT	≥5
		R.42-3 FDD for 15MHz CC	OP.1 FDD			70	[-1.6] +TT	
3	10(FDD)+20(TDD)+20(TDD)MHz	R.42 TDD	OP.1 TDD	EVA5	1x2 Low	70	[-1.4] +TT	≥5
		R.2 FDD for 10MHz CC	OP.1 FDD			70	[-1.7] +TT	
Note 1: The OCNG pattern applies for each CC.								
Note 2: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.								

8.2.3.3.2.1 TDD FDD CA PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for TDD PCell (2DL CA)

Editor's note: The following aspects are either missing or not yet determined:

- SNR values are still in brackets in core spec.
- Test tolerance is FFS
- Message contents might need an update

8.2.3.3.2.1.1 Test purpose

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

8.2.3.3.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 3 or higher that support E-UTRA FDD and TDD and 2DL CA with TDD as PCell.

8.2.3.3.2.1.3 Minimum conformance requirements

For TDD FDD CA with TDD PCell and 2DL CCs, the requirements are specified in Table 8.2.3.3.2.1.3-4 based on single carrier requirement specified in Table 8.2.3.3.2.1.3-2 and Table 8.2.3.3.2.1.3-3, with the addition of the parameters in Table 8.2.3.3.2.1.3-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.

**Table 8.2.3.3.2.1.3-1: Test Parameters for Multi-Layer Spatial Multiplexing (FRC) for CA**

Parameter		Unit	Value
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6 (Note 1)
	$\sigma$	dB	3
$N_{oc}$ at antenna port		dBm/15kHz	-98
Precoding granularity		PRB	Wideband pre-coding for 1.4MHz, 4 for 3MHz and 5MHz CCs, 6 for 10MHz CCs, 8 for 15MHz and 20MHz CCs
PMI delay (Note 2)	FDD CC	ms	8
	TDD CC	ms	10 or 11
Reporting interval	FDD CC	ms	1
	TDD CC	ms	1 or 4 (Note 3)

## 8.2.3.3.2.1.4 Test description

## 8.2.3.3.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.3.3.2.1.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.3.2.1.4.1-1.

**Table 8.2.3.3.2.1.4.1-1: Test point selection for TM4 TDD FDD 2DL CA TDD PCell**

CA Capability	Bandwidth Combination			
	20+20	20+15	20+10	10+5
Inter-band (CA_A2)	Test 1	Test 4	Test 2	Test 3
Note1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.				

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure group 46 as appropriate.
2. The parameter settings for Pcell are set up according to Tables 8.2.3-1, 8.2.3.3.2.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.3.3.2.1.4.3.

## 8.2.3.3.2.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PDSCH-ConfigDedicated-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-1, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-2A, *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-2, *CQI-ReportConfigSCell-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-4, *CQI-ReportAperiodic-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-6.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.3.2.1.3-1 and 8.2.3.3.2.1.3-2 or 8.2.3.3.2.1.3-3. The SS sends downlink MAC padding bits on the DL RMC.
5. SS schedules the UL transmission to carry the PUSCH CSI feedback via PDCCH DCI format 0 with CSI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.3.3.2.1.5-1 or 8.2.3.3.2.1.5-2 as appropriate.

- 7. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.3.3.2.1.5 Test requirement

Tables 8.2.3.3.2.1.3-1 define the primary level settings.

For TDD FDD CA with TDD PCell and 2DL CCs, the requirements are specified in Table 8.2.3.3.2.1.5-3 based on single carrier requirement specified in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 and A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.3.3.2.1.5-1 or 8.2.3.3.2.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.3.3.2.1.5-1: Single carrier test requirement with different bandwidths for multiple CA configurations for FDD SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.14-4 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.4]+TT
3 MHz	R.14-5 FDD	OP.1 FDD	EVA5	4x2 Low	70	[9.5] +TT
5MHz	R.14-6 FDD	OP.1 FDD	EVA5	4x2 Low	70	[9.5] +TT
10MHz	R.14 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.1] +TT
15MHz	R.14-7 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.1] +TT
20MHz	R.14-3 FDD	OP.1 FDD	EVA5	4x2 Low	70	[10.3] +TT

**Table 8.2.3.3.2.1.5-2: Single carrier test requirement with different bandwidths for multiple CA configurations for TDD PCell and SCell (FRC)**

Band-width	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value	
					Fraction of Maximum Throughput (%)	SNR (dB)
1.4 MHz	R.43-1 TDD	OP.1 TDD	EVA5	4x2 Low	70	[11.0] +TT
3 MHz	R.43-2 TDD	OP.1 TDD	EVA5	4x2 Low	70	[9.8] +TT
5MHz	R.43-3 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.0] +TT
10MHz	R.43-4 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.5] +TT
15MHz	R.43-5 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.6] +TT
20MHz	R.43 TDD	OP.1 TDD	EVA5	4x2 Low	70	[10.7] +TT

**Table 8.2.3.3.2.1.5-3: Test requirement for multiple CA configurations with 2DL CCs (FRC)**

Test number	Aggregated Bandwidth (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	2x20	20	20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
2	20+10	10	20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
3	10+5	5	10	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥3
4	20+15	15	20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B				

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

### 8.2.3.3.2.2 TDD FDD CA PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for TDD PCell (3DL CA)

Editor's note: The following aspects are either missing or not yet determined:

- SNR values are still in brackets in core spec.
- Test tolerance is FFS
- Message contents might need a update
- This test would be impacted by the simplification method defined in Annex C.3.5 of 36.101 which need to be further revised.

#### 8.2.3.3.2.2.1 Test purpose

The purpose of these tests is to verify the closed loop rank-two performance with wideband and frequency selective precoding.

#### 8.2.3.3.2.2.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD Release 12 and forward UE of categories 5 or higher that support E-UTRA FDD and TDD and 3DL CA with TDD as PCell.

#### 8.2.3.3.2.2.3 Minimum conformance requirements

For TDD FDD CA with TDD PCell and 3DL CCs, the requirements are specified in Table 8.2.3.3.2.2.3-1 based on single carrier requirement specified in Table 8.2.3.3.2.1.3-2 and Table 8.2.3.3.2.1.3-3, with the addition of the parameters in Table 8.2.3.3.2.1.3-1 and the downlink physical channel setup according to Annex C.3.2.

The test coverage for different number of component carriers is defined in 8.1.2.4.

**Table 8.2.3.3.2.2.3-1: Minimum performance for multiple CA configurations with 3DL CCs (FRC)**

Test number	Aggregated Bandwidth (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	3x20	20	2x20	As defined in Table 8.2.3.3.2.1.3-2 and Table 8.2.3.3.2.1.3-3 per CC	≥5
2	20+20+15	15	2x20	As defined in Table 8.2.3.3.2.1.3-2 and Table 8.2.3.3.2.1.3-3 per CC	≥5
3	20+20+10	10	2x20	As defined in Table 8.2.3.3.2.1.3-2 and Table 8.2.3.3.2.1.3-3 per CC	≥5
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.				

The normative reference for this requirement is TS 36.101 [2] clause 8.2.3.3.2.

#### 8.2.3.3.2.2.4 Test description

##### 8.2.3.3.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 8.2.3.3.2.2.4.1-1.

CA Capability to be tested: Select one according to Table 8.2.2.3.2.2.4.1

**Table 8.2.3.3.2.2.4.1-1: Test point selection for TM4 TDD FDD 3DL CA TDD PCell**

CA Capability	Bandwidth Combination		
	3x20	20+20+15	20+20+10
Inter-band CA (two bands) (CA3_A2)	Test1	Test2	Test3
Inter-band CA (three bands) (CA3_A3)	Test1	Test2	Test3
Note1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.			

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.61 as appropriate.
2. The parameter settings for Pcell are set up according to Tables 8.2.3-1, 8.2.3.3.2.1.3-1 as appropriate.
3. Downlink signals for PCC are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.2.3.3.2.2.4.3.

#### 8.2.3.3.2.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *PDSCH-ConfigDedicated-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-1, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-2A, *PhysicalConfigDedicated-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-2, *CQI-ReportConfigSCell-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-4, *CQI-ReportAperiodic-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 8.2.3.3.2.1.4.3-6.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. For multi-layer spatial multiplexing, SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Tables 8.2.3.3.2.1.3-1 and 8.2.3.3.2.1.3-2 or 8.2.3.3.2.1.3-3. The SS sends downlink MAC padding bits on the DL RMC.
5. SS schedules the UL transmission to carry the PUSCH CSI feedback via PDCCH DCI format 0 with CSI request bit set to '10' and I\_MCS=29 and N\_PRB allocated to be less or equal to 20.
6. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.2.3.3.2.1.5-1 or 8.2.3.3.2.1.5-2 as appropriate.
7. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3A.5. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

#### 8.2.3.3.2.2.4.3 Message contents

Same Message contents as in clause 8.2.3.3.2.1.4.3.

#### 8.2.3.3.2.2.5 Test requirement

Tables 8.2.3.3.2.1.3-1 define the primary level settings.

For TDD FDD CA with TDD PCell and 3DL CCs, the requirements are specified in Table 8.2.3.3.2.2.5-1 based on single carrier requirement specified in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.2 and A.3.4.2 for each throughput test shall meet or exceed the specified value in Tables 8.2.3.3.2.1.5-1 or 8.2.3.3.2.1.5-2 for the specified SNR including test tolerances for all throughput tests.

**Table 8.2.3.3.2.2.5-1: Test requirement for multiple CA configurations with 3DL CCs (FRC)**

Test number	Aggregated Bandwidth (MHz)			Minimum performance requirement	UE Category
	Total	FDD CC	TDD CC		
1	3x20	20	2x20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
2	20+20+15	15	2x20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
3	20+20+10	10	2x20	As defined in Table 8.2.3.3.2.1.5-1 and Table 8.2.3.3.2.1.5-2 per CC	≥5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3B.					

Decide pass or fail for each subtest according to Annex G.3A.4. Decide the entire test pass or fail according to Annex G.3A.6.

## 8.3 Demodulation of PDSCH (User-Specific Reference Symbols)

### 8.3.1 FDD

The parameters specified in Table 8.3.1-1 are valid for FDD unless otherwise stated.

**Table 8.3.1-1: Common Test Parameters for User-specific Reference Symbols**

Parameter	Unit	Value
Cyclic prefix		Normal
Cell ID		0
Inter-TTI Distance		1
Number of HARQ processes	Processes	8
Maximum number of HARQ transmission		4
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH	OFDM symbols	2
Precoder update granularity		Frequency domain: 1 PRG for Transmission mode 9 and 10 Time domain: 1 ms
Note 1: Void		
Note 2: Void		

### 8.3.1.1 FDD PDSCH Single-layer Spatial Multiplexing Performance (UE-Specific Reference Symbols)

#### 8.3.1.1.1\_D FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 without a simultaneous transmission for eDL-MIMO

##### 8.3.1.1.1\_D.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 without a simultaneous transmission on the other antenna port and multiple CSI reference symbols configurations with non-zero and zero transmission power.

##### 8.3.1.1.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 8.3.1.1.1\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.1.1\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.1.1\_D.3-2 for the specified SNR.

**Table 8.3.1.1.1\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations**

parameter	Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3
Cell-specific reference signals		Antenna ports 0,1	
CSI reference signals		Antenna ports 15,...,18	Antenna ports 15,...,18
Beamforming model		Annex B.4.1	Annex B.4.1
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$	Subframes	5 / 2	5 / 2
CSI reference signal configuration		0	3
Zero-power CSI-RS configuration $I_{\text{CSI-RS}} / \text{ZeroPowerCSI-RS}$ bitmap	Subframes / bitmap	3 / 0001000000000000	3 / 0001000000000000
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
Symbols for unused PRBs		OCNG (Note 4)	OCNG (Note 4)
Number of allocated resource blocks (Note 2)	PRB	50	50
Simultaneous transmission		No	Yes (Note 3, 5)
PDSCH transmission mode		9	9
<p>Note 1: <math>P_B = 1</math>.</p> <p>Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8.</p> <p>Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test.</p> <p>Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.</p> <p>Note 5: The two UEs' scrambling identities <math>n_{\text{SCID}}</math> are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.</p>			

**Table 8.3.1.1.1\_D.3-2: Minimum performance for CDM-multiplexed DM RS without simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.43 FDD	OP.1 FDD	EVA5	2x2 Low	70	-1	1-8

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.1.

## 8.3.1.1.1\_D.4 Test description

## 8.3.1.1.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.1.1\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.1.1\_D.4.3.

## 8.3.1.1.1\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.1.1\_D.3-1, 8.3.1.1.1\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.1.1\_D.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/PDSCH for the test UE are sent on antenna port 7 (or 8) using two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.1-1. CSI-RS are sent on antenna ports 15-18 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.3.1.1.1\_D.4.3 Message contents

8.3.1.1.1\_D.5 Test requirement

Table 8.3.1.1.1\_D.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.3.2 for the throughput test shall meet or exceed the specified value in Table 8.3.1.1.1\_D.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.1.1.1\_D.5-1: Test requirement for CDM-multiplexed DM RS without simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.43 FDD	OP.1 FDD	EVA5	2x2 Low	70	-0.1	1-8

### 8.3.1.1.2\_D FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with a simultaneous transmission for eDL-MIMO

#### 8.3.1.1.2\_D.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 with a simultaneous transmission on the other antenna port and multiple CSI reference symbols configurations with non-zero and zero transmission power.

#### 8.3.1.1.2\_D.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 103.

#### 8.3.1.1.2\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.1.2\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.1.2\_D.3-2 for the specified SNR.

**Table 8.3.1.1.2\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations**

parameter	Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3
Cell-specific reference signals		Antenna ports 0,1	
CSI reference signals		Antenna ports 15,...,18	Antenna ports 15,...,18
Beamforming model		Annex B.4.1	Annex B.4.1
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$	Subframes	5 / 2	5 / 2
CSI reference signal configuration		0	3
Zero-power CSI-RS configuration $I_{\text{CSI-RS}} / \text{ZeroPowerCSI-RS}$ bitmap	Subframes / bitmap	3 / 0001000000000000	3 / 0001000000000000
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
Symbols for unused PRBs		OCNG (Note 4)	OCNG (Note 4)
Number of allocated resource blocks (Note 2)	PRB	50	50
Simultaneous transmission		No	Yes (Note 3, 5)
PDSCH transmission mode		9	9
Note 1: $P_B = 1$ . Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8. Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test. Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. Note 5: The two UEs' scrambling identities $n_{\text{SCID}}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.			

**Table 8.3.1.1.2\_D.3-2: Minimum performance for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz 64QAM 1/2	R.50 FDD	OP.1 FDD	EPA5	2x2 Low	70	21.9	2-8
Note 1: The reference channel applies to both the input signal under test and the interfering signal.								

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.1.

## 8.3.1.1.2\_D.4 Test description

## 8.3.1.1.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.1.2\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.1.2\_D.4.3.

## 8.3.1.1.2\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.1.2\_D.3-1, 8.3.1.1.2\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.1.2\_D.5-1 as appropriate. BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/PDSCH for the test UE are sent on antenna port 7 (or 8) and another simultaneous transmission of DRS/PDSCH not for the test UE are sent on antenna port 8 (or 7). The DRS/PDSCH transmissions use two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.1-1. CSI-RS are sent on antenna ports 15-18 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.3.1.1.2\_D.4.3 Message contents

8.3.1.1.2\_D.5 Test requirement

Table 8.3.1.1.2\_D.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.3.2 for the throughput test shall meet or exceed the specified value in Table 8.3.1.1.2\_D.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.1.1.2\_D.5-1: Test requirement for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz 64QAM 1/2	R.50 FDD	OP.1 FDD	EPA5	2x2 Low	70	22.8	2-8

Note 1: The reference channel applies to both the input signal under test and the interfering signal.

### 8.3.1.1.3 FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model - Enhanced Performance Requirement Type A

#### 8.3.1.1.3.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4.

#### 8.3.1.1.3.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support enhanced receiver Type A.

#### 8.3.1.1.3.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.1.3.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.1.3.3-2 for the specified SNR.

**Table 8.3.1.1.3.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model**

parameter		Unit	Cell 1	Cell 2
Downlink power allocation	$\rho_A$	dB	0	0

Symbols for unused PRBs			OCNG (Note 6)	N/A
Simultaneous transmission			No simultaneous transmission on the other antenna port in (7 or 8) not used for the input signal under test	N/A
Note 1: $P_B = 1$ Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1. Note 3: The modulation symbols of the signal under test in Cell 1 are mapped onto antenna port 7 or 8. Note 4: The precoder in clause B.4.3 follows UE recommended PMI. Note 5: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI				

Note 6:	cannot be applied at the eNB downlink before SF#(n+4). These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 7:	All cells are time-synchronous.

**Table 8.3.1.1.3.3-2: Enhanced Performance Requirement Type A, CDM-multiplexed DM RS with TM9 interference model**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions		Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.48 FDD	OP.1 FDD	N/A	EVA5	EVA5	4x2 Low	70	-1.1	1-8
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.									
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.									
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.									

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.1A.

#### 8.3.1.1.3.4 Test description

##### 8.3.1.1.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.49.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.1.3.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.1.3.4.3.

##### 8.3.1.1.3.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.1.3.5-1, 8.3.1.1.3.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.1.3.5-2 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/PDSCH for the test UE are sent on antenna port 7 (or 8) using four Tx antennas with beam-forming model as specified in

Annex B.4.3 and precoder update granularity specified in Table 8.3.1.1.3.5-1. CSI-RS are sent on antenna ports 15-18 using four Tx antennas with mapping according to beam-forming model as specified in Annex B.4.3.

3. Set the Cell2 –aggressor cell- as defined in Tables 8.3.1.1.3.5-1, 8.3.1.1.3.5-2 and according to Annex B.5.4.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.									

### 8.3.1.2 FDD PDSCH Dual-layer Spatial Multiplexing Performance (UE-Specific Reference Symbols)

#### 8.3.1.2.1\_D FDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO

##### 8.3.1.2.1\_D.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation with multiple CSI reference symbol configurations with non-zero and zero transmission power.

##### 8.3.1.2.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 8.3.1.2.1\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.2.1\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.2.1\_D.3-2 for the specified SNR.

**Table 8.3.1.2.1\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations**

parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3
Cell-specific reference signals		Antenna ports 0 and 1	
CSI reference signals		Antenna ports 15,16	
Beamforming model		Annex B.4.2	
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$	Subframes	5 / 2	
CSI reference signal configuration		8	
Zero-power CSI-RS configuration $l_{\text{CSI-RS}} / \text{ZeroPowerCSI-RS}$ bitmap	Subframes / bitmap	3 / 0010000000000000	
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Symbols for unused PRBs		OCNG (Note 2)	
Number of allocated resource blocks (Note 2)	PRB	50	
Simultaneous transmission		No	
PDSCH transmission mode		9	
Note 1: $P_B = 1$ . Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 FDD	OP.1 FDD	EPA5	2x2 Low	70	13.3	2-8

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.2.

8.3.1.2.1\_D.4 Test description

8.3.1.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.2.1\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.2.1\_D.4.3.

8.3.1.2.1\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.2.1\_D.3-1, 8.3.1.2.1\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.2.1\_D.5-1 as appropriate.  
 BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna ports 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.1-1. CSI-RS are sent on antenna ports 15 and 16 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.2.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

### 8.3.1.2.1\_D.5 Test requirement

Table 8.3.1.2.1\_D.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.3.1 for the throughput test shall meet or exceed the specified value in Table 8.3.1.2.1\_D.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.1.2.1\_D.5-1: Test requirement for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 FDD	OP.1 FDD	EPA5	2x2 Low	70	14.2	2-8

### 8.3.1.2.1\_D\_1 FDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO (Release 11 and forward)

#### 8.3.1.2.1\_D\_1.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

#### 8.3.1.2.1\_D\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support eDL-MIMO.

#### 8.3.1.2.1\_D\_1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.2.1\_D\_1.3-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.2.1\_D\_1.3-2 for the specified SNR.

**Table 8.3.1.2.1\_D\_1.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations**

parameter	Unit	Test 1		
		Cell 1	Cell 2	
Downlink power allocation	$\rho_A$	dB	4	0
	$\rho_B$	dB	4 (Note 1)	0
	$\sigma$	dB	-3	-3

Cell-specific reference signals		Antenna ports 0 and 1	Antenna ports 0 and 1
Cell ID		0	126
CSI reference signals		Antenna ports 15,16	NA
Beamforming model		Annex B.4.2	NA
CSI-RS periodicity and subframe offset $T_{CSI-RS} / \Delta_{CSI-RS}$	Subframes	5 / 2	NA
CSI reference signal configuration		8	NA
Zero-power CSI-RS configuration $l_{CSI-RS} / ZeroPowerCSI-RS$ bitmap	Subframes / bitmap	3 / 0010000000000000	NA
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
$\hat{E}_s / N_{oc}$		Reference Value in Table 8.3.1.2.1_D_1.3-2	7.25dB
Symbols for unused PRBs		OCNG (Note 2)	NA
Number of allocated resource blocks (Note 2)	PRB	50	NA
Simultaneous transmission		No	NA
PDSCH transmission mode		9	Blanked
<p>Note 1: <math>P_B = 1</math></p> <p>Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.</p>			

**Table 8.3.1.2.1\_D\_1.3-2: Minimum performance for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern		Propagation Condition		Correlation Matrix and Antenna Configuration	Reference value		UE Category
			Cell1	Cell 2	Cell 1	Cell 2		Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 FDD	OP.1 FDD	N/A	ETU5	ETU5	2x2 Low	70	14.2	≥2
<p>Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.</p> <p>Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.</p> <p>Note 3: SNR corresponds to <math>\hat{E}_s / N_{oc}</math> of Cell 1.</p>

## 8.3.1.2.1\_D\_1.4 Test description

## 8.3.1.2.1\_D\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.2.1\_D\_1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.2.1\_D\_1.4.3.

## 8.3.1.2.1\_D\_1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.2.1\_D\_1.3-1, 8.3.1.2.1\_D\_1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.2.1\_D\_1.5-2 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna ports 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.1-1. CSI-RS are sent on antenna ports 15 and 16 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.2.
3. Set Cell 2 as defined in Tables 8.3.1.2.1\_D\_1.5-1 and 8.3.1.2.1\_D\_1.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2. Note 3: SNR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1.										

8.3.1.2.2 FDD PDSCH Dual-layer Spatial Multiplexing – Enhanced Performance Requirement Type C

Editor’s notes: This test case is incomplete. The following items are missing or are incomplete:

- Test tolerances are undefined
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.
- Whether test applicability requires FGI bit or not is still TBD and this part is kept in square brackets.

#### 8.3.1.2.2.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation with multiple CSI reference symbol configurations with non-zero and zero transmission power.

#### 8.3.1.2.2.2 Test applicability

This test applies to all types of E-UTRA FDD release 12 and forward UE of Category 2 or higher that support eDL-MIMO and enhanced receiver Type C. [Applicability requires support for FGI bit 103.]

#### 8.3.1.2.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.2.2.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.2.2.3-2 for the specified SNR.

**Table 8.3.1.2.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations**

parameter	Unit	Test 1	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3
Cell-specific reference signals		Antenna ports 0 and 1	
CSI reference signals		Antenna ports 15,16	
Beamforming model		Annex B.4.2	
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$	Subframes	5 / 2	
CSI reference signal configuration		8	
Zero-power CSI-RS configuration $I_{\text{CSI-RS}} / \text{ZeroPowerCSI-RS}$ bitmap	Subframes / bitmap	3 / 0010000000000000	
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Symbols for unused PRBs		OCNG (Note 2)	
Number of allocated resource blocks (Note 2)	PRB	50	
Simultaneous transmission		No	
PDSCH transmission mode		9	
Note 1: $P_B = 1$			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			

**Table 8.3.1.2.3-2: Enhanced Performance Requirement Type C for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 FDD	OP.1 FDD	EPA5	2x2 Medium	70	[17.4]	≥2

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.2A.

#### 8.3.1.2.2.4 Test description

##### 8.3.1.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.1-1 and 8.3.1.2.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.2.2.4.3.

8.3.1.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.2.2.3-1, 8.3.1.2.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.2.2.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna ports 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.1-1. CSI-RS are sent on antenna ports 15 and 16 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.2.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.3.1.2.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

### 8.3.1.3 FDD PDSCH Performance with DCI format 2D and non Quasi Co-located Antenna Ports

#### 8.3.1.3.1\_F FDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and single NZP CSI-RS resource for CoMP

##### 8.3.1.3.1\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

##### 8.3.1.3.1\_F.2 Test applicability

This test applies to E-UTRA FDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

##### 8.3.1.3.1\_F.3 Minimum conformance requirements

The requirements are specified in Table 8.3.1.3.1\_F.3-3, with the addition of the parameters in Table 8.3.1.3.1\_F.3-1 and Table 8.3.1.3.1\_F.3-2. In table 8.3.1.3.1\_F.3-1 transmission point 1 (TP1) is the serving cell and transmission point 2 (TP2) transmits PDSCH. The downlink physical channel setup for TP1 is according to Table C.3.4-1 and for TP2 according to Table C.3.4-2.

Table 8.3.1.3.1\_F.3-1: Test Parameters for quasi co-location type B: same Cell ID

Parameter	Unit	TP 1	TP 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0

Note 2: The correlation matrix and antenna configuration apply for TP1 and TP2.  
Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of TP2.

The normative reference for this requirement is TS 36.101 [2] clause 8.3.1.3.1.

#### 8.3.1.3.1\_F.4 Test description

##### 8.3.1.3.1\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 and TP 2 are set up according to table 8.3.1-1, table 8.3.1.3.1\_F.3-1 and 8.3.1.3.1\_F.3-2 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.3.1\_F.4.3.

##### 8.3.1.3.1\_F.4.2 Test procedure

1. SS transmits PDCCH on TP 1. PQI set and PDSCH transmission hypothesis in PDCCH format 2D are configured according to Table 8.3.1.3.1\_F.3-2.

2. SS transmits PDSCH on TP 1 and TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Table 8.3.1.3.1\_F.3-3. The SS sends downlink MAC padding bits on the DL RMC.
3. Set the parameters of the reference channel, timing offset (TP 2 timing - TP 1 timing), the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.3.1\_F.3-3 Test 1 as appropriate.
4. Wait for at least 1 second before measuring throughput.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
6. Repeat steps 1 to 4 for Test 2 in Table 8.3.1.3.1\_F.3-3.

### 8.3.1.3.1\_F.5 Test requirement

Table 8.3.1.3.1\_F.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.3.2 for the throughput test shall meet or exceed the specified value in Table 8.3.1.3.1\_F.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.1.3.1\_F.5-1: Test requirements for quasi co-location type B: same Cell ID**

Test Number	Reference Channel	OGCN pattern		Time offset between TPs (Note 4)	Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP1	TP2		TP1	TP2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.52 FDD	NA	OP.1 FDD	57Ts	EPA	EPA	2x2 Low	70	13.0	2-8
2	R.52 FDD	NA	OP.1 FDD	-11Ts	EPA	EPA	2x2 Low	70	13.5	2-8

Note 1: The propagation conditions for TP1 and TP2 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for TP1 and TP2.  
Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of TP2.  
Note 4: Timing offset in units of Ts:  $T_s = 1/(15000 \times 2048)$  seconds, the basic timing unit defined in TS 36.211 [8].

### 8.3.1.3.2\_F FDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and multiple NZP CSI-RS resources for CoMP

#### 8.3.1.3.2\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points share the same Cell ID by verifying that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

#### 8.3.1.3.2\_F.2 Test applicability

This test applies to all types of E-UTRA FDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of Three or Four on a component carrier within a band with PDSCH transmission mode 10.

#### 8.3.1.3.2\_F.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1, 8.3.1.3.2\_F.3-1 and 8.3.1.3.2\_F.3-2.

In table 8.3.1.3.2\_F.2-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) has same Cell ID as TP 1. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between 2 TPs with multiple PDSCH RE Mapping and Quasi-Co-Location Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.1.3.2\_F.3-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.3.2\_F.3-3 for the specified SNR.

**Table 8.3.1.3.2\_F.3-1: Test Parameters for timing offset compensation with DPS transmission**

Parameter		Unit	TP 1	TP 2
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0
	$\sigma$	dB	-3	-3

			TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	2	R.53 FDD	OP.1 FDD	OP.1 FDD	EPA 5	EPA 5	2x2 Low	70	12.2	2-8
2	-0.5	R.53 FDD	OP.1 FDD	OP.1 FDD	EPA 5	EPA 5	2x2 Low	70	12.5	2-8

Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent.  
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc}$  of both TP 1 and TP 2 as defined in clause 8.1.1.

The normative reference for these requirements is TS 36.101 [2] clause 8.3.1.3.2.

#### 8.3.1.3.2\_F.4 Test description

##### 8.3.1.3.2\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.3.3\_C.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 and TP 2 are set up according to table 8.3.1-1, 8.3.1.3.2\_F.3-1 and 8.3.1.3.2\_F.3-2 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.3.2\_F.4.3.

##### 8.3.1.3.2\_F.4.2 Test procedure

1. SS transmits PDCCH on TP 1. PQI set and PDSCH transmission hypothesis in PDCCH format 2D are configured according to Table 8.3.1.3.2\_F.3-2.
2. SS transmits PDSCH on TP 1 and TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.3.2\_F.3-1 and 8.3.1.3.2\_F.3-2. The SS sends downlink MAC padding bits on the DL RMC. PDSCH transmission from TPs shall be randomly determined independently for each subframe. Probabilities of occurrence of PDSCH transmission from TPs are specified according to Table 8.3.1.3.2\_F.3-1. The probability of occurrence of PQI set in each TP is equal.
3. Set the parameters of the reference channel, timing offset (TP 2 timing - TP 1 timing), the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.3.2\_F.3-3 Test 1 as appropriate.
4. Wait for at least 1 second before measuring throughput.

5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
6. Repeat steps 1 to 4 for Test 2 in Table 8.3.1.3.2\_F.5-1.

8.3.1.3.2\_F.5 Test requirements

Table 8.3.1.3.2\_F.2-1 and 8.3.1.3.2\_F.2-2 defines the primary level setting.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Table 8.3.1.3.2\_F.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.1.3.2\_F.5-1: Test Requirements for timing offset compensation with DPS transmission**

Test Number	Timing offset (Note 4)	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
			TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	57Ts	R.53 FDD	OP.1 FDD	OP.1 FDD	EPA5	EPA5	2x2 Low	70	13.1	2-8
2	11Ts	R.53 FDD	OP.1 FDD	OP.1 FDD	EPA5	EPA5	2x2 Low	70	13.4	2-8

Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent.  
 Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2.  
 Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of both TP 1 and TP 2 as defined in clause 8.1.1.  
 Note 4: Timing offset in units of Ts:  $T_s = 1 / (15000 \times 2048)$  seconds, the basic timing unit defined in TS 36.211 [8].

### 8.3.1.3.3\_F FDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Different Cell ID, Colliding CRS and single NZP CSI-RS resource for CoMP

#### 8.3.1.3.3\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points have different Cell ID and colliding CRS by verifying that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

#### 8.3.1.3.3\_F.2 Test applicability

This test applies to all types of E-UTRA FDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

#### 8.3.1.3.3\_F.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.1-1 and 8.3.1.3.3\_F.3-1.

In table 8.3.1.3.3\_F.3-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) transmit PDSCH with different Cell ID. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.1.3.3\_F.3-2 for the specified SNR.

**Table 8.3.1.3.3\_F.3-1: Test Parameters for quasi co-location type B with different Cell ID and Colliding CRS**

parameter	Unit	TP 1	TP 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3

Beamforming model		N/A	As specified in clause B.4.2
Cell-specific reference signals		Antenna ports 0,1	Antenna ports 0,1
CSI reference signals 0		N/A	Antenna ports {15,16}
CSI-RS 0 periodicity and subframe offset $T_{CSI-RS} / \Delta_{CSI-RS}$	Subframes	N/A	5 / 2
CSI reference signal 0 configuration		N/A	0
Zero-power CSI-RS 0 configuration $l_{CSI-RS} / ZeroPower\ CSI-RS\ bitmap$	Subframes /bitmap	N/A	2/ 0010000000000000
$\hat{E}_s / N_{oc}$	dB	Reference point in Table 8.3.1.3.3_F.3-2 + 4dB	Reference Value in Table 8.3.1.3.3_F.3-2
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
$BW_{Channel}$	MHz	10	10
Cyclic Prefix		Normal	Normal
Cell Id		0	126
Number of control OFDM symbols		1	2
Timing offset between TPs	us	N/A	0
Frequency offset between TPs	Hz	N/A	200
<i>qcl-Operation, PDSCH RE Mapping and Quasi-Co-Location Indicator'</i>		Type B, '00'	
PDSCH transmission mode		Blank	10
Number of allocated resource block		N/A	50
Symbols for unused PRBs		N/A	OCNG (Note 2)
Note 1: $P_b = 1$ Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			

**Table 8.3.1.3.3\_F.3-2: Performance Requirements for quasi co-location type B with different Cell ID and Colliding CRS**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.54 FDD	N/A	OP.1 FDD	EPA5	ETU5	2x2 Low	70	14.4	2-8
Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2. Note 3: SNR corresponds to $\hat{E}_s / N_{oc}$ of TP 2 as defined in clause 8.1.1.									

The normative reference for these requirements is TS 36.101 [2] clause 8.3.1.3.3.

#### 8.3.1.3.3\_F.4 Test description

##### 8.3.1.3.3\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: As specified per test number in Table 8.2.2.3.3\_C.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 are set up according to tables 8.3.1-1 and 8.3.1.3.3\_F.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.3.3\_F.4.3.

##### 8.3.1.3.3\_F.4.2 Test procedure

1. SS transmits PDCCH DCI format 2D on TP 1 according to Tables 8.3.1.3.3\_F.3-1, 8.3.1.3.3\_F.3-2 and Annex C3.4.
2. SS transmits PDSCH on TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Tables 8.3.1.3.3\_F.3-1, 8.3.1.3.3\_F.3-2 and Annex C3.4. The SS sends downlink MAC padding bits on the DL RMC.
3. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.1.3.3\_F.5-1 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.3.1.3.3\_F.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

8.3.1.3.3\_F.5 Test requirements

Table 8.3.1.3.3\_F.3-1 defines the primary level setting.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Table 8.3.1.3.3\_F.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.1.3.3\_F.5-1: Test Requirements for quasi co-location type B with different Cell ID and Colliding CRS**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.54 FDD	N/A	OP.1 FDD	EPA5	ETU5	2x2 Low	70	15.3	2-8
Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2. Note 3: SNR corresponds to $\hat{E}_s / N_{oc}$ of TP 2 as defined in clause 8.1.1.									

8.3.2 TDD

The parameters specified in Table 8.3.2-1 are valid for TDD unless otherwise stated.

**Table 8.3.2-1: Common Test Parameters for User-specific Reference Symbols**

Parameter	Unit	Value
Uplink downlink configuration (Note 1)		1
Special subframe configuration (Note 2)		4
Cyclic prefix		Normal
Cell ID		0
Inter-TTI Distance		1
Number of HARQ processes. All these HARQ processes are used.	Processes	7
Maximum number of HARQ transmission		4
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH	OFDM symbols	2
Precoder update granularity		Frequency domain: 1 PRB for Transmission mode 7 & 8, 1 PRG for Transmission mode 9 and 10 Time domain: 1 ms
ACK/NACK feedback mode		Multiplexing
Note 1: as specified in Table 4.2-2 in TS 36.211 [8].		
Note 2: as specified in Table 4.2-1 in TS 36.211 [8].		

For all test cases, the SNR is defined as:

$$SNR = \frac{\hat{E}_s^{(1)} + \hat{E}_s^{(2)}}{N_{oc}^{(1)} + N_{oc}^{(2)}}$$

where the superscript indicates the receiver antenna connector. The SNR requirement applies for the UE categories given for each test.

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

### 8.3.2.1 TDD PDSCH Single-layer Spatial Multiplexing Performance (UE-Specific Reference Symbols)

#### 8.3.2.1.1 TDD PDSCH Single-layer Spatial Multiplexing on antenna port 5 (Release 8 and forward)

##### 8.3.2.1.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna port 5 using user-specific reference signals with full RB or single RB allocation.

##### 8.3.2.1.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

## 8.3.2.1.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.1, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.1.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.3.2.1.1.3-2 for the specified SNR.

**Table 8.3.2.1.1.3-1: Test Parameters for Testing DRS**

parameter	Unit	Test 1	Test 2	Test 3	Test 4	
Downlink power allocation	$\rho_A$	dB	0	0	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	0	0	0	0
Cell-specific reference signals	Antenna port 0					
Beamforming model	Annex B.4.1					
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98	-98	-98	
Symbols for unused PRBs		OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)	OCNG (Note 2)	
PDSCH transmission mode		7	7	7	7	
Note 1: $P_B = 0$						
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.						

**Table 8.3.2.1.1.3-2: Minimum performance DRS (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.25 TDD	OP.1 TDD	EPA5	2x2 Low	70	-0.8	$\geq 1$
2	10 MHz 16QAM 1/2	R.26 TDD	OP.1 TDD	EPA5	2x2 Low	70	7.0	$\geq 2$
3	10 MHz 64QAM 3/4	R.27 TDD	OP.1 TDD	EPA5	2x2 Low	70	17.0	$\geq 2$
4	10 MHz 16QAM 1/2	R.28 TDD	OP.1 TDD	EPA5	2x2 Low	30	1.7	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

## 8.3.2.1.1.4 Test description

## 8.3.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.1.4.3.

8.3.2.1.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.1.3-1, 8.3.2.1.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.1.5-1 as appropriate.

BCH/CRS/PDCCH/PCFICH are sent on antenna port 0 using one Tx antenna, while DRS/Dedicated data for the test UE are sent on antenna port 5 using two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.2-1.

3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Tables 8.3.2.1.1.5-1 as appropriate.

8.3.2.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

**Table 8.3.2.1.1.4.3-1: PhysicalConfigDedicated-DEFAULT: Additional TDD PDSCH DRS performance downlink power allocation test point 1 requirement for Test number 1 - 4**

8.3.2.1.1.5 Test requirement

Table 8.3.2.1.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.1 for each throughput test shall meet or exceed the specified value in Table 8.3.2.1.1.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.3.2.1.1.5-1: Test requirement DRS

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.25 TDD	OP.1 TDD	EPA5	2x2 Low	70	0.1	≥1
2	10 MHz 16QAM 1/2	R.26 TDD	OP.1 TDD	EPA5	2x2 Low	70	7.9	≥2
3	10 MHz 64QAM 3/4	R.27 TDD	OP.1 TDD	EPA5	2x2 Low	70	17.9	≥2
4	10 MHz 16QAM 1/2	R.28 TDD	OP.1 TDD	EPA5	2x2 Low	30	2.6	≥1

### 8.3.2.1.1\_1 TDD PDSCH Single-layer Spatial Multiplexing on antenna port 5 (Release 9 and forward)

#### 8.3.2.1.1\_1.1 Test purpose

Same test purpose as in clause 8.3.2.1.1.1.

#### 8.3.2.1.1\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward of UE category 1.

#### 8.3.2.1.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 8.3.2.1.1.3 with the following exceptions:

- Instead of Table 8.3.2.1.1.3-1 -> use Table 8.3.2.1.1\_1.3-1.
- Instead of Table 8.3.2.1.1.3-2 -> use Table 8.3.2.1.1\_1.3-2.

Table 8.3.2.1.1\_1.3-1: Test Parameters for Testing DRS (Antenna port 5)

Parameter		Unit	Test 1 (Note 4)	Test 2	Test 3	Test 4 (Note 4)
Downlink power allocation	$\rho_A$	dB	N/A	0	0	NA
	$\rho_B$	dB		0 (Note 1)	0 (Note 1)	
	$\sigma$	dB		0	0	
Cell-specific reference signals	Antenna port 0					
Beamforming model	Annex B.4.1					
$N_{oc}$ at antenna port	dBm/15kHz	N/A	-98	-98	NA	
Symbols for unused PRBs		N/A	OCNG (Note 2)	OCNG (Note 2)	N/A	
PDSCH transmission mode		N/A	7	7	N/A	
Note 1: $P_B = 0$ Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. Note 3: The modulation symbols of the signal under test are mapped onto antenna port 5. Note 4: This tests are covered in subclause 8.3.2.1.1						

**Table 8.3.2.1.1\_1.3-2: Minimum performance DRS (FRC) (Antenna port 5)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1 (Note 1)	N/A

3	10 MHz 64QAM 3/4	R.27-1 TDD	OP.1 TDD	EPA5	2x2 Low	70	17.0	1
4 (Note 1)	N/A							
Note 1: These tests are covered in subclause 8.3.2.1.1								

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

#### 8.3.2.1.1\_1.4 Test description

Same test description as in clause 8.3.2.1.1.4 with the following exceptions:

- Instead of Table 8.3.2.1.1.3-1 -> use Table 8.3.2.1.1\_1.3-1.
- Instead of Table 8.3.2.1.1.3-2 -> use Table 8.3.2.1.1\_1.3-2.
- Initial conditions - Bandwidths to be tested: Depending on the bandwidth specified per test number in Table 8.3.2.1.1\_1.3-2, as defined in TS 36.508 [7] clause 4.3.1.2.
- Instead of Table 8.3.2.1.1.5-1 -> use Table 8.3.2.1.1\_1.5-1.

#### 8.3.2.1.1\_1.5 Test requirement

Same test requirement as in clause 8.3.2.1.1.5 with the following exceptions:

- Instead of Table 8.3.2.1.1.3-1 -> use Table 8.3.2.1.1\_1.3-1.
- Instead of Table 8.3.2.1.1.5-1 -> use Table 8.3.2.1.1\_1.5-1.

**Table 8.3.2.1.1\_1.5-1: Test requirement DRS (FRC) (Antenna port 5)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1 (Note 1)	N/A							
2	5MHz 16QAM 1/2	R.26-1 TDD	OP.1 TDD	EPA5	2x2 Low	70	7.9	1
3	10 MHz 64QAM 3/4	R.27-1 TDD	OP.1 TDD	EPA5	2x2 Low	70	17.9	1
4 (Note 1)	N/A							
Note 1: These tests are covered in subclause 8.3.2.1.1								

### 8.3.2.1.2 TDD PDSCH Single-layer Spatial Multiplexing on antenna port 7 or 8 without a simultaneous transmission

#### 8.3.2.1.2.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna port 7 or 8 without a simultaneous transmission on the other antenna port using DM-RS with full RB allocation.

#### 8.3.2.1.2.2 Test applicability

This test applies to Release 9 UEs that support enhanced Dual Layer TDD (TM8) and all types of E-UTRATDD UE release 10 and forward.

#### 8.3.2.1.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.2.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.3.2.1.2.3-2 for the specified SNR.

**Table 8.3.2.1.2.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer)**

parameter		Unit	Test 1	Test 2	Test 3	Test 4 (Note 3)	Test 5 (Note 3)
Downlink power allocation	$\rho_A$	dB	0	0	0	N/A	N/A
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)	0 (Note 1)	N/A	N/A
	$\sigma$	dB	-3	-3	-3		
Cell-specific reference signals			Antenna port 0 and antenna port 1				
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98	-98	N/A	N/A
Symbols for unused PRBs			OCNG (Note 4)	OCNG (Note 4)	OCNG (Note 4)	N/A	N/A
Simultaneous transmission			No	No	No	N/A	N/A
Note 1: $P_B = 1$ Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8. Note 3: Test 4 and Test 5 are covered in subclause 8.3.2.1.3. Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.							

**Table 8.3.2.1.2.3-2: Minimum performance for CDM-multiplexed DM RS without simultaneous transmission (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.31 TDD	OP.1 TDD	EVA5	2x2 Low	70	-1.0	≥1
2	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	7.7	≥2
	5MHz 16QAM 1/2	R.32-1 TDD	OP.1 TDD	EPA5	2x2 Medium	70	7.7	1

	10 MHz 64QAM 3/4	R.33-1 TDD	OP.1 TDD	EPA5	2x2 Low	70	17.7	1

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

#### 8.3.2.1.2.4 Test description

##### 8.3.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: Depending on the bandwidth specified per test number in Table 8.3.2.1.2.3-2, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.2.4.3.

##### 8.3.2.1.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2B for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.2.3-1, 8.3.2.1.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.2.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/Dedicated data for the test UE are sent on antenna port 7 (or 8) using two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.2-1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

4. Repeat steps from 1 to 3 for each test interval in Tables 8.3.2.1.2.5-1 as appropriate.

8.3.2.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions.

8.3.2.1.2.5 Test requirement

Table 8.3.2.1.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.1.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.2.1.2.5-1: Test requirement for CDM-multiplexed DM RS without simultaneous transmission (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.31 TDD	OP.1 TDD	EVA5	2x2 Low	70	-0.1	≥1
2	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	8.6	≥2
	5 MHz 16QAM 1/2	R.32-1 TDD	OP.1 TDD	EPA5	2x2 Medium	70	8.6	1
3	10 MHz 64QAM 3/4	R.33 TDD	OP.1 TDD	EPA5	2x2 Low	70	18.6	≥2

8.3.2.1.2\_D TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 without a simultaneous transmission for eDL-MIMO

8.3.2.1.2\_D.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 without a

simultaneous transmission on the other antenna port and multiple CSI reference symbol configurations with non-zero and zero transmission power.

### 8.3.2.1.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 104.

### 8.3.2.1.2\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.5, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.2\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.1.2\_D.3-2 for the specified SNR.

**Table 8.3.2.1.2\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations**

Parameter	Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3

#### 8.3.2.1.2\_D.4 Test description

##### 8.3.2.1.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.2\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.2\_D.4.3.

##### 8.3.2.1.2\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.2\_D.3-1, 8.3.2.1.2\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.2\_D.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna port 7 (or 8) using two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.2-1. CSI-RS are sent on antenna ports 15-22 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

1	10 MHz QPSK 1/3	R.50 TDD	OP.1 TDD	EVA5	2x2 Low	70	0.3	1-8

### 8.3.2.1.3 TDD PDSCH Single-layer Spatial Multiplexing on antenna port 7 or 8 with a simultaneous transmission

#### 8.3.2.1.3.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna port 7 or 8 with a simultaneous transmission on the other antenna port using DM-RS with full RB allocation.

#### 8.3.2.1.3.2 Test applicability

This test applies to Release9 UEs that support enhanced Dual Layer TDD (TM8) and all types of E-UTRA TDD UE release 10 and forward.

#### 8.3.2.1.3.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.3.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.3.2.1.3.3-2 for the specified SNR.

**Table 8.3.2.1.3.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer)**

parameter	Unit	Test 1 (Note 6)	Test 2 (Note 6)	Test 3 (Note 6)	Test 4	Test 5	
Downlink power allocation	$\rho_A$	dB	N/A	N/A	N/A	0	0
	$\rho_B$	dB	N/A	N/A	N/A	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	N/A	N/A	N/A	-3	-3
Cell-specific reference signals		Antenna port 0 and antenna port 1					
Beamforming model		Annex B.4.1

Symbols for unused PRBs		N/A	N/A	N/A	OCNG (Note 4)	OCNG (Note 4)	
Simultaneous transmission		N/A	N/A	N/A	Yes (Note 3, 5)	Yes (Note 3, 5)	
PDSCH transmission mode		N/A	N/A	N/A	8	8	
Note 1: $P_B = 1$ Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8. Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test. Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. Note 5: The two UEs' scrambling identities $n_{SCID}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases. Note 6: Test 1, Test 2 and Test 3 are covered in subclause 8.3.2.1.2.							

**Table 8.3.2.1.3.3-2: Minimum performance for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
4	10 MHz 16QAM 1/2	R.32 TDD (Note 1)	OP.1 TDD	EPA5	2x2 Medium	70	21.9	≥2
5	10 MHz 64QAM 1/2	R.34 TDD (Note 1)	OP.1 TDD	EPA5	2x2 Low	70	22.0	≥2

Note 1: The reference channel applies to both the input signal under test and the interfering signal.

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

#### 8.3.2.1.3.4 Test description

##### 8.3.2.1.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.3.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.3.4.3.

##### 8.3.2.1.3.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2B for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.3.3-1, 8.3.2.1.3.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.3.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/Dedicated data for the test UE are sent on antenna port 7 (or 8) and another simultaneous transmission of DRS/Dedicated data not for the test UE is sent on antenna port 8 (or 7). The DRS/Dedicated data transmissions use two Tx antennas with different beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.2-1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Tables 8.3.2.1.3.5-1 as appropriate.

## 8.3.2.1.3.5 Test requirement

Table 8.3.2.1.3.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.1.3.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.2.1.3.5-1: Test requirement for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
4	10 MHz 16QAM 1/2	R.32 TDD (Note 1)	OP.1 TDD	EPA5	2x2 Medium	70	22.8	≥2
5	10 MHz 64QAM 1/2	R.34 TDD (Note 1)	OP.1 TDD	EPA5	2x2 Low	70	22.9	≥2

Note 1: The reference channel applies to both the input signal under test and the interfering signal.

## 8.3.2.1.3\_D TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with a simultaneous transmission for eDL-MIMO

## 8.3.2.1.3\_D.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 with a simultaneous transmission on the other antenna port and multiple CSI reference symbol configurations with non-zero and zero transmission power.

## 8.3.2.1.3\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 103.

## 8.3.2.1.3\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.5, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.3\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.1.3\_D.3-2 for the specified SNR.

**Table 8.3.2.1.3\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with multiple CSI-RS configurations**

Parameter		Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	-3	-3
Cell-specific reference signals			Antenna ports 0,1	
CSI reference signals			Antenna ports 15,...,22	Antenna ports 15,...,18
Beamforming model			Annex B.4.1	Annex B.4.1
CSI-RS periodicity and subframe offset $T_{CSI-RS} / \Delta_{CSI-RS}$		Subframes	5 / 4	5 / 4
CSI reference signal configuration			1	3
Zero-power CSI-RS configuration $I_{CSI-RS} /$ ZeroPowerCSI-RS bitmap		Subframes / bitmap	4 / 0010000100000000	4 / 0010000000000000
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98
Symbols for unused PRBs			OCNG (Note 4)	OCNG (Note 4)
Number of allocated resource blocks (Note 2)		PRB	50	50
Simultaneous transmission			No	Yes
PDSCH transmission mode			9	9
Note 1: $P_B = 1$ .				
Note 2: The modulation symbols of the signal under test are mapped onto antenna port 7 or 8.				
Note 3: Modulation symbols of an interference signal is mapped onto the antenna port (7 or 8) not used for the input signal under test.				
Note 4: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.				
Note 5: The two UEs' scrambling identities $n_{SCID}$ are set to 0 for CDM-multiplexed DM RS with interfering simultaneous transmission test cases.				

**Table 8.3.2.1.3\_D.3-2: Minimum performance for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz 64QAM 1/2	R.44 TDD	OP.1 TDD	EPA5	2x2 Low	70	22.1	2-8

Note 1: The reference channel applies to both the input signal under test and the interfering signal.

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.1A.

8.3.2.1.3\_D.4 Test description

8.3.2.1.3\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.3\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.3\_D.4.3.

8.3.2.1.3\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.3\_D.3-1, 8.3.2.1.3\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.3\_D.5-1 as appropriate. BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna port 7 (or 8) and another simultaneous transmission of DRS/PDSCH not for the test UE are sent on antenna port 8 (or 7). The DRS/PDSCH transmissions use two Tx antennas with beam-forming model as specified in Annex B.4.1 and precoder update granularity specified in Table 8.3.2-1. CSI-RS are sent on antenna ports 15-18 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

8.3.2.1.3\_D.4.3 Message contents

8.3.2.1.3\_D.5 Test requirement

Table 8.3.2.1.3\_D.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.4 for the throughput test shall meet or exceed the specified value in Table 8.3.2.1.3\_D.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.2.1.3\_D.5-1: Test requirement for CDM-multiplexed DM RS with interfering simultaneous transmission (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
2	10 MHz 64QAM 1/2	R.44 TDD	OP.1 TDD	EPA5	2x2 Low	70	23	2-8

Note 1: The reference channel applies to both the input signal under test and the interfering signal.

#### 8.3.2.1.4 TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model - Enhanced Performance Requirement Type A

##### 8.3.2.1.4.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for single-layer transmission on antenna ports 7 or 8 without a simultaneous transmission on the other antenna port in the serving cell when the PDSCH transmission in the serving cell is interfered by PDSCH of one dominant interfering cell applying transmission mode 9 interference model defined in clause B.5.4.

##### 8.3.2.1.4.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support enhanced receiver Type A.

##### 8.3.2.1.4.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.1.4.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.1.4.3-2 for the specified SNR.

**Table 8.3.2.1.4.3-1: Test Parameters for Testing CDM-multiplexed DM RS (single layer) with TM9 interference model**

parameter		Unit	Cell 1	Cell 2
Downlink power allocation	$\rho_A$	dB	0	0

Symbols for unused PRBs			OCNG (Note 6)	N/A
Simultaneous transmission			No simultaneous transmission on the other antenna port in (7 or 8) not used for the input signal under test	N/A
Note 1: $P_B = 1$				
Note 2: The respective received power spectral density of each interfering cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.				
Note 3: The modulation symbols of the signal under test in Cell 1 are mapped onto antenna port 7 or 8.				
Note 4: The precoder in clause B.4.3 follows UE recommended PMI.				
Note 5: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI				

Note 6:	cannot be applied at the eNB downlink before SF#(n+4). These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.
Note 7:	All cells are time-synchronous.

**Table 8.3.2.1.4.3-2: Enhanced Performance Requirement Type A, CDM-multiplexed DM RS with TM9 interference model**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions		Correlation Matrix and Antenna Configuration (Note 3)	Reference Value		UE Category
		Cell 1	Cell 2	Cell 1	Cell 2		Fraction of Maximum Throughput (%)	SINR (dB) (Note 2)	
1	R.48 TDD	OP.1 TDD	N/A	EVA5	EVA5	4x2 Low	70	-1.0	1-8
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.									
Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.									
Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.									

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.1B.

#### 8.3.2.1.4.4 Test description

##### 8.3.2.1.4.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.49.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.1.4.5-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.1.4.4.3.

##### 8.3.2.1.4.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.1.4.5-1, 8.3.2.1.4.5-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.1.4.5-2 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/PDSCH for the test UE are sent on antenna port 7 (or 8) using four Tx antennas with beam-forming model as specified in

Annex B.4.3 and precoder update granularity specified in Table 8.3.2.1.4.5-1. CSI-RS are sent on antenna ports 15-18 using four Tx antennas with mapping according to beam-forming model as specified in Annex B.4. 3.

3. Set the Cell2 –aggressor cell- as defined in Tables 8.3.2.1.4.5-1, 8.3.2.1.4.5-2 and according to Annex B.5.4.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1. Note 3: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.									

### 8.3.2.2 TDD PDSCH Dual-layer Spatial Multiplexing Performance (UE-Specific Reference Symbols)

#### 8.3.2.2.1 TDD PDSCH Dual-layer Spatial Multiplexing

##### 8.3.2.2.1.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation.

##### 8.3.2.2.1.2 Test applicability

This test applies to Release 9 UEs that support enhanced Dual Layer TDD (TM8) and all types of E-UTRA TDD UE release 10 and forward.

##### 8.3.2.2.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.2.1.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.3.2.2.1.3-2 for the specified SNR.

**Table 8.3.2.2.1.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer)**

Parameter		Unit	Test 1	Test 2
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0 (Note 1)
	$\sigma$	dB	-3	-3
Cell-specific reference symbols			Antenna port 0 and antenna port 1	
Beamforming model			Annex B.4.2	
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98
Symbols for unused PRBs			OCNG (Note 2)	OCNG (Note 2)
Number of allocated resource blocks		PRB	50	50
PDSCH transmission mode			8	8
Note 1: $P_B = 1$ Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.				

**Table 8.3.2.2.1.3-2: Minimum performance for CDM-multiplexed DM RS (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.31 TDD	OP.1 TDD	EVA5	2x2 Low	70	4.5	$\geq 2$
2	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	21.7	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.

#### 8.3.2.2.1.4 Test description

##### 8.3.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.2.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.2.1.4.3.

#### 8.3.2.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2B for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.2.1.3-1, 8.3.2.2.1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.2.1.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/Dedicated data for test UE are sent on antenna ports 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.2-1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Tables 8.3.2.2.1.5-1 as appropriate.

#### 8.3.2.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions .

#### 8.3.2.2.1.5 Test requirement

Table 8.3.2.2.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.2.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.2.2.1.5-1: Test requirement for CDM-multiplexed DM RS (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz QPSK 1/3	R.31 TDD	OP.1 TDD	EVA5	2x2 Low	70	5.4	$\geq 2$
2	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	22.6	$\geq 2$

### 8.3.2.2.1\_D TDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO

#### 8.3.2.2.1\_D.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation with multiple CSI reference symbol configurations with non-zero and zero transmission power.

#### 8.3.2.2.1\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 that support eDL-MIMO. Applicability requires support for FGI bit 103.

#### 8.3.2.2.1\_D.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.2.1\_D.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.2.1\_D.3-2 for the specified SNR.

**Table 8.3.2.2.1\_D.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations**

parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	0

8.3.2.2.1\_D.4 Test description

8.3.2.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.2.1\_D.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.2.1\_D.4.3.

#### 8.3.2.2.1\_D.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.2.1\_D.3-1, 8.3.2.2.1\_D.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.2.1\_D.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna port 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.2-1. CSI-RS are sent on antenna ports 15 and 16 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.2.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

## 8.3.2.2.1\_D.5 Test requirement

Table 8.3.2.2.1\_D.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.3 for the throughput test shall meet or exceed the specified value in Table 8.3.2.2.1\_D.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.2.2.1\_D.5-1: Test requirement for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 TDD	OP.1 TDD	EPA5	2x2 Low	70	15.4	2-8

### 8.3.2.2.1\_D\_1 TDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO (Release 11 and forward)

#### 8.3.2.2.1\_D\_1.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation with multiple CSI reference symbol configurations with non-zero and zero transmission power, and to verify that the UE correctly estimate SNR.

#### 8.3.2.2.1\_D\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support eDL-MIMO.

#### 8.3.2.2.1\_D\_1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.2.1\_D\_1.3-1 where Cell 1 is the serving cell and Cell 2 is the interfering cell. The downlink physical channel setup is set according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.2.1\_D\_1.3-2 for the specified SNR.

**Table 8.3.2.2.1\_D\_1.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer) with multiple CSI-RS configurations**

parameter		Unit	Test 1	
			Cell 1	Cell 2
Downlink power allocation	$\rho_A$	dB	4	0
	$\rho_B$	dB	4 (Note 1)	0
	$\sigma$	dB	-3	-3

Cell-specific reference signals		Antenna ports 0 and 1	Antenna ports 0 and 1
Cell ID		0	126
CSI reference signals		Antenna ports 15,16	NA
Beamforming model		Annex B.4.2	NA
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$	Subframes	5 / 4	NA
CSI reference signal configuration		8	NA
Zero-power CSI-RS configuration $l_{\text{CSI-RS}} / \text{ZeroPowerCSI-RS bitmap}$	Subframes / bitmap	4 / 0010000000000000	NA
$N_{oc}$ at antenna port	dBm/15kHz	-98	-98
$\hat{E}_s / N_{oc}$		Reference Value in Table 8.3.2.2.1_D_1.3-2	7.25dB
Symbols for unused PRBs		OCNG (Note 2)	NA
Number of allocated resource blocks (Note 2)	PRB	50	NA
Simultaneous transmission		No	NA
PDSCH transmission mode		9	Blanked
<p>Note 1: <math>P_B = 1</math></p> <p>Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.</p>			

**Table 8.3.2.2.1\_D\_1.3-2: Minimum performance for CDM-multiplexed DM RS (FRC) with multiple CSI-RS configurations**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern		Propagation Condition		Correlation Matrix and Antenna Configuration	Reference value		UE Category
			Cell 1	Cell 2	Cell 1	Cell 2		Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.51 TDD	OP.1 TDD	N/A	ETU5	ETU5	2x2 Low	70	14.8	≥2
<p>Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.</p> <p>Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2.</p> <p>Note 3: SNR corresponds to <math>\hat{E}_s / N_{oc}</math> of Cell 1.</p>										

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.3.

## 8.3.2.2.1\_D\_1.4 Test description

## 8.3.2.2.1\_D\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.2.1\_D\_1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.2.1\_D\_1.4.3.

## 8.3.2.2.1\_D\_1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.2.1\_D\_1.3-1, 8.3.2.2.1\_D\_1.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of Cell 1 for the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.2.1\_D.5-2 as appropriate. BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/ PDSCH for the test UE are sent on antenna port 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.2-1. CSI-RS are sent on antenna ports 15 and 16 using two Tx antennas with mapping according to beam-forming model as specified in Annex B.4.2.
3. Set Cell 2 as defined in Tables 8.3.2.2.1\_D\_1.5-1 and 8.3.2.2.1\_D\_1.5-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of Cell 1 and Cell 2. Note 3: SNR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1.										

8.3.2.2.2 TDD PDSCH Dual-layer Spatial Multiplexing – Enhanced Performance Requirement Type C

Editor’s notes: This test case is incomplete. The following items are missing or are incomplete:

- Test tolerances are undefined
- The SNR values in minimum and test requirement are still in square brackets
- The minimum testing time in Annex G is still undefined.

#### 8.3.2.2.2.1 Test purpose

To verify the UE's rank-2 performance and ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for dual-layer transmission on antenna ports 7 and 8 using DM-RS with full RB allocation.

#### 8.3.2.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category 2 or higher that support enhanced receiver Type C

#### 8.3.2.2.2.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.2.3-1, and the downlink physical channel setup according to Table C.3.2-1 in Annex C.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Tables 8.3.2.2.3-2 for the specified SNR.

**Table 8.3.2.2.3-1: Test Parameters for Testing CDM-multiplexed DM RS (dual layer)**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	-3
Cell-specific reference symbols			Antenna port 0 and antenna port 1
Beamforming model			Annex B.4.2
$N_{oc}$ at antenna port		dBm/15kHz	-98
Symbols for unused PRBs			OCNG (Note 2)
Number of allocated resource blocks		PRB	50
PDSCH transmission mode			8
Note 1: $P_B = 1$ .			
Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			

**Table 8.3.2.2.3-2: Enhanced Performance Requirement Type C for CDM-multiplexed DM RS (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	[17.0]	≥2

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.2A.

#### 8.3.2.2.2.4 Test description

##### 8.3.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Tables 8.3.2-1 and 8.3.2.2.2.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.2.2.4.3.

##### 8.3.2.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2B for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.2.2.3-1, 8.3.2.2.2.3-2. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the bandwidth, MCS, reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.2.2.5-1 as appropriate.  
BCH/CRS/PDCCH/PCFICH are sent on antenna ports 0 and 1 using two Tx antennas, while DRS/Dedicated data for test UE are sent on antenna ports 7 and 8 using two Tx antennas with beam-forming model as specified in Annex B.4.2 and precoder update granularity specified in Table 8.3.2-1.
3. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during each test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
4. Repeat steps from 1 to 3 for each test interval in Tables 8.3.2.2.2.5-1 as appropriate.

##### 8.3.2.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions .

#### 8.3.2.2.2.5 Test requirement

Table 8.3.2.2.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.3.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.2.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.2.2.5-1: Test requirement for Enhanced Performance Requirement Type C for CDM-multiplexed DM RS (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE Category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.32 TDD	OP.1 TDD	EPA5	2x2 Medium	70	[17.0] +TT	≥2

#### 8.3.2.3 Dual-Layer Spatial Multiplexing (with multiple CSI-RS configurations)

TBD

#### 8.3.2.4 TDD PDSCH Performance with DCI format 2D and non Quasi Co-located Antenna Ports

##### 8.3.2.4.1\_F TDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and single NZP CSI-RS resource for CoMP

##### 8.3.2.4.1\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points share the same Cell ID. In particular the test verifies that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

## 8.3.2.4.1\_F.2 Test applicability

This test applies to E-UTRA TDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

## 8.3.2.4.1\_F.3 Minimum conformance requirements

The requirements are specified in Table 8.3.2.4\_F.3-3, with the addition of the parameters in Table 8.3.2.4\_F.3-1 and Table 8.3.2.4\_F.3-2. In table 8.3.2.4\_F.3-1 transmission point 1 (TP1) is the serving cell and transmission point 2 (TP2) transmits PDSCH. The downlink physical channel setup for TP1 is according to Table C.3.4-1 and for TP2 according to Table C.3.4-2.

**Table 8.3.2.4.1\_F.3-1: Test Parameters for quasi co-location type B: same Cell ID**

Parameter	Unit	TP 1	TP 2
Downlink power allocation	$\rho_A$	dB	0

Symbols for unused PRBs		NA	OCNG (Note 3)
Note 1: $P_B = 1$ Note 2: REs for antenna ports 0 and 1 have zero transmission power. Note 3: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.			

Table 8.3.2.4.1\_F.3-2: Configurations of PQI and DL transmission hypothesis for each PQI set

PQI set index	Parameters in each PQI set		DL transmission hypothesis for each PQI Set	
	NZP CSI-RS Index (For quasi co-location)	ZP CSI-RS configuration	TP 1	TP 2
PQI set 0	CSI-RS 0	ZP CSI-RS 0	Blanked	PDSCH

Table 8.3.2.4.1\_F.3-3: Minimum performance for quasi co-location type B: same Cell ID

Test Number	Reference Channel	OGCN pattern		Time offset between TPs ( $\mu$ s)	Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP1	TP2		TP1	TP2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.52 TDD	NA	OP. 1 TDD	2	EP A	EPA	2x2 Low	70	12	2-8
2	R.52 TDD	NA	OP. 1 TDD	-0.5	EP A	EPA	2x2 Low	70	12.4	2-8

Note 1: The propagation conditions for TP1 and TP2 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for TP1 and TP2.  
Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of TP2.

The normative reference for this requirement is TS 36.101 [2] clause 8.3.2.4.1.

#### 8.3.2.4.1\_F.4 Test description

##### 8.3.2.4.1\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 and TP 2 are set up according to table 8.3.1-1, table 8.3.2.4.1\_F.3-1 and 8.3.2.4.1\_F.3-2 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.4.1\_F.4.3.

## 8.3.2.4.1\_F.4.2 Test procedure

1. SS transmits PDCCH on TP 1. PQI set and PDSCH transmission hypothesis in PDCCH format 2D are configured according to Table 8.3.2.4.1\_F.3-2.
2. SS transmits PDSCH on TP 1 and TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Table 8.3.2.4.1\_F.3-3. The SS sends downlink MAC padding bits on the DL RMC.
3. Set the parameters of the reference channel, timing offset (TP 2 timing - TP 1 timing), the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.4.1\_F.3-3 Test 1 as appropriate.
4. Wait for at least 1 second before measuring throughput.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
6. Repeat steps 1 to 4 for Test 2 in Table 8.3.2.4.1\_F.3-3.

#### 8.3.2.4.1\_F.5 Test requirement

Table 8.3.2.4.1\_F.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.3.3.2 for the throughput test shall meet or exceed the specified value in Table 8.3.2.4.1\_F.5-1 for the specified SNR including test tolerances for the throughput test.

**Table 8.3.2.4.1\_F.5-1: Minimum performance for quasi co-location type B: same Cell ID**

Test Number	Reference Channel	OGCN pattern		Time offset between TPs (Note 4)	Propagation Conditions (Note 1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP1	TP2		TP1	TP2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.52 TDD	NA	OP. 1 TDD	57Ts	EP A	EPA	2x2 Low	70	12.9	2-8
2	R.52 TDD	NA	OP. 1 TDD	-11Ts	EP A	EPA	2x2 Low	70	13.3	2-8

Note 1: The propagation conditions for TP1 and TP2 are statistically independent.  
Note 2: The correlation matrix and antenna configuration apply for TP1 and TP2.  
Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of TP2.  
Note 4: Timing offset in units of Ts: Ts = 1/(15000 x 2048) seconds, the basic timing unit defined in TS 36.211 [8].

#### 8.3.2.4.2\_F TDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and multiple NZP CSI-RS resources for CoMP

##### 8.3.2.4.2\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points share the same Cell ID by verifying that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the timing difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

##### 8.3.2.4.2\_F.2 Test applicability

This test applies to all types of E-UTRA TDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of Three or Four on a component carrier within a band with PDSCH transmission mode 10.

##### 8.3.2.4.2\_F.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.2-1, 8.3.2.4.2\_F.3-1 and 8.3.2.4.2\_F.3-2.

In table 8.3.2.4.2\_F.3-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) has same Cell ID as TP 1. Multiple NZP CSI-RS resources and ZP CSI-RS resources are configured. In each sub-frame, DL PDSCH transmission is dynamically switched between 2 TPs with multiple PDSCH RE Mapping and Quasi-Co-Location Indicator configuration (PQI). Configurations of PDSCH RE Mapping and Quasi-Co-Location Indicator and downlink transmission hypothesis are defined in Table 8.3.2.4.2\_F.3-2. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.4.2\_F.3-3 for the specified SNR.

**Table 8.3.2.4.2\_F.3-1: Test Parameters for timing offset compensation with DPS transmission**

parameter	Unit	TP 1	TP 2
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)

PQI set 1	CSI-RS 1	ZP CSI-RS 1	Blanked	PDSCH

**Table 8.3.2.4.2\_F.3-3: Minimum Requirements for timing offset compensation with DPS transmission**

Test Number	Timing offset(us)	Reference Channel	OCNG Pattern		Propagation Conditions		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
			TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	2	R.53 TDD	OP.1 TDD	OP.1 TDD	EPA5	EPA5	2x2 Low	70	12.3	2-8
2	-0.5	R.53 TDD	OP.1 TDD	OP.1 TDD	EPA5	EPA5	2x2 Low	70	12.5	2-8

Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent.  
Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2.  
Note 3: SNR corresponds to  $\hat{E}_s/N_{oc}$  of both TP 1 and TP 2.

The normative reference for these requirements is TS 36.101 [2] clause 8.3.2.4.2.

#### 8.3.2.4.2\_F.4 Test description

##### 8.3.2.4.2\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 and TP 2 are set up according to table 8.3.1-1, 8.3.2.4.2\_F.3-1 and 8.3.2.4.2\_F.3-2 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.1.3.2\_F.4.3.

##### 8.3.2.4.2\_F.4.2 Test procedure

1. SS transmits PDCCH on TP 1. PQI set and PDSCH transmission hypothesis in PDCCH format 2D are configured according to Table 8.3.2.4.2\_F.3-2.
2. SS transmits PDSCH on TP 1 and TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.4.2\_F.3-1 and 8.3.2.4.2\_F.3-2. The SS sends downlink MAC padding bits on the DL RMC. PDSCH transmission from TPs shall be randomly determined independently for each subframe. Probabilities of occurrence of PDSCH transmission from TPs are specified according to Table 8.3.2.4.2\_F.3-1. The probability of occurrence of PQI set in each TP is equal.

3. Set the parameters of the reference channel, timing offset (TP 2 timing - TP 1 timing), the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.4.2\_F.3-3 Test 1 as appropriate.
4. Wait for at least 1 second before measuring throughput.
5. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.
6. Repeat steps 1 to 4 for Test 2 in Table 8.3.2.4.2\_F.3-3.

8.3.2.4.2\_F.5 Test requirements

Table 8.3.2.4.2\_F.3-1 and 8.3.2.4.2\_F.3-2 defines the primary level setting.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.4.2\_F.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.3.2.4.2\_F.5-1: Test Requirements for timing offset compensation with DPS transmission**

Test Number	Timing offset (Note 4)	Reference Channel	OCNG Pattern		Propagation Conditions		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
			TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	57Ts	R.53 TDD	OP.1 TDD	OP.1 TDD	EPA5	EPA5	2x2 Low	70	13.2	2-8
2	11Ts	R.53 TDD	OP.1 TDD	OP.1 TDD	EPA5	EPA5	2x2 Low	70	13.4	2-8

Note 1: The propagation conditions for TP1 and TP2 are statistically independent.  
 Note 2: Correlation matrix and antenna configuration parameters apply for each of TP1 and TP2.  
 Note 3: SNR corresponds to  $\hat{E}_s / N_{oc}$  of both TP 1 and TP 2.  
 Note 4: Timing offset in units of Ts: Ts = 1/(15000 x 2048) seconds, the basic timing unit defined in TS 36.211 [8].

#### 8.3.2.4.3\_F TDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Different Cell ID, Colliding CRS and single NZP CSI-RS resource for CoMP

##### 8.3.2.4.3\_F.1 Test purpose

To verify the UE capability of supporting non quasi-collocated antenna ports when the UE receives DCI format 2D in a scenario where the two transmission points have different Cell ID and colliding CRS by verifying that the UE, configured with quasi co-location type B, performs correct tracking and compensation of the frequency difference between two transmission points, channel parameters estimation and rate matching behaviour according to the 'PDSCH RE Mapping and Quasi-Co-Location Indicator' (PQI) signalling.

##### 8.3.2.4.3\_F.2 Test applicability

This test applies to all types of E-UTRA TDD category 2-8 UE release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

##### 8.3.2.4.3\_F.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause A.3.3.3, with the addition of the relevant parameters in Tables 8.3.2-1 and 8.3.2.4.3\_F.3-1.

In table 8.3.2.4.3\_F.3-1, transmission point 1 (TP 1) is the serving cell transmitting PDCCH, synchronization signals and PBCH, and transmission point 2 (TP 2) transmit PDSCH with different Cell ID. The downlink physical channel setup for TP 1 is according to Table C.3.4-1 and for TP 2 according to Table C.3.4-2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.3.2.4.3\_F.3-2 for the specified SNR.

**Table 8.3.2.4.3\_F.3-1: Test Parameters for quasi co-location type B with different Cell ID and Colliding CRS**

parameter		Unit	TP1	TP2
Downlink power allocation	$\rho_A$	dB	0	0
	$\rho_B$	dB	0 (Note 1)	0
	$\sigma$	dB	-3	-3
Beamforming model			N/A	As specified in clause B.4.2
Cell-specific reference signals			Antenna ports 0,1	Antenna ports 0,1
CSI reference signals 0			N/A	Antenna ports {15,16}
CSI-RS 0 periodicity and subframe offset $T_{CSI-RS} / \Delta_{CSI-RS}$		Subframes	N/A	5 / 4
CSI reference signal 0 configuration			N/A	0
Zero-power CSI-RS 0 configuration $l_{CSI-RS} / \text{ZeroPower CSI-RS bitmap}$		Subframes /bitmap	N/A	4/ 0010000000000000
$\hat{E}_s / N_{oc}$		dB	Reference point in Table 8.3.2.4.3_F.3-2 + 4dB	Reference Value in Table 8.3.2.4.3_F.3-2
$N_{oc}$ at antenna port		dBm/15kHz	-98	-98
BW <sub>Channel</sub>		MHz	10	10
Cyclic Prefix			Normal	Normal
Cell Id			0	126
Number of control OFDM symbols			1	2
Timing offset between TPs		us	N/A	0
Frequency offset between TPs		Hz	N/A	200
<i>qcl-Operation</i> , 'PDSCH RE Mapping and Quasi-Co-Location Indicator'			Type B, '00'	
PDSCH transmission mode			Blank	10
Number of allocated resource block			N/A	50
Symbols for unused PRBs			N/A	OCNG(Note2)
Note 1: $P_B = 1$ . Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.				

**Table 8.3.2.4.3\_F.3-2: Performance Requirements for quasi co-location type B with different Cell ID and Colliding CRS**

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	

1	R.54 TDD	N/A	OP.1 TDD	EPA5	ETU5	2x2 Low	70	14.7	2-8
Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2. Note 3: SNR corresponds to $\widehat{E}_s/N_{oc}$ of TP2.									

The normative reference for these requirements is TS 36.101 [2] clause 8.3.2.4.3.

#### 8.3.2.4.3\_F.4 Test description

##### 8.3.2.4.3\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the TP 1 are set up according to tables 8.3.2-1 and 8.3.2.4.3\_F.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.3.2.4.3\_F.4.3.

##### 8.3.2.4.3\_F.4.2 Test procedure

1. SS transmits PDCCH DCI format 2D on TP 1 according to Tables 8.3.2.4.3\_F.3-1, 8.3.2.4.3\_F.3-2 and Annex C3.4.
2. SS transmits PDSCH on TP 2 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Tables 8.3.2.4.3\_F.3-1, 8.3.2.4.3\_F.3-2 and Annex C3.4. The SS sends downlink MAC padding bits on the DL RMC.
3. Set the parameters of the reference channel, the propagation condition, the correlation matrix and the SNR according to Table 8.3.2.4.3\_F.3-2 as appropriate.
4. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Count the number of NACKs, ACKs and statDTXs on the UL during the test interval and decide pass or fail according to Tables G.3.5 and G.3.6 in Annex G clause G.3.

##### 8.3.2.4.3\_F.4.3 Message contents

## 8.3.2.4.3\_F.5 Test requirements

Table 8.3.2.4.3\_F.3-1 defines the primary level setting.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause A.3.4.2 for each throughput test shall meet or exceed the specified value in Table 8.3.2.4.3\_F.5-1 for the specified SNR including test tolerances for all throughput tests.

Table 8.3.2.4.3\_F.5-1: Test Requirements for quasi co-location type B with different Cell ID and Colliding CRS

Test Number	Reference Channel	OCNG Pattern		Propagation Conditions (Note1)		Correlation Matrix and Antenna Configuration (Note 2)	Reference Value		UE Category
		TP 1	TP 2	TP 1	TP 2		Fraction of Maximum Throughput (%)	SNR (dB) (Note 3)	
1	R.54 TDD	N/A	OP.1 TDD	EPA5	ETU5	2x2 Low	70	15.6	2-8
Note 1: The propagation conditions for TP 1 and TP 2 are statistically independent. Note 2: Correlation matrix and antenna configuration parameters apply for each of TP 1 and TP 2. Note 3: SNR corresponds to $\hat{E}_s / N_{oc}$ of TP2.									

## 8.4 Demodulation of PCFICH/PDCCH

### 8.4.1 FDD

#### 8.4.1.1 FDD PCFICH/PDCCH Single-antenna Port Performance

##### 8.4.1.1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for a single-antenna port with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.1 remains below a given reference value.

##### 8.4.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 8.4.1.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.1.1.3-1: Test Parameters for PDCCH/PCFICH**

Parameter		Unit	Single antenna port
Number of PDCCH symbols		symbols	2
Number of PHICH groups ( $N_g$ )			1
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	0
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
Note: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.4.1.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.1.3-2.

**Table 8.4.1.1.3-2: Minimum performance PDCCH/PCFICH**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and Correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	8 CCE	R.15 FDD	OP.1 FDD	ETU70	1x2 Low	1	-1.7

The normative reference for this requirement is TS 36.101 [2] clause 8.4.1.

#### 8.4.1.1.4 Test description

##### 8.4.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 8.4.1.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.1.4.3.

##### 8.4.1.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC according to Table 8.4.1.1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.4.1.1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). If Pm-dsg is less than the value specified in table 8.4.1.1.5-1, pass the UE. Otherwise fail the UE.

##### 8.4.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

##### 8.4.1.1.5 Test requirement

For the parameters specified in Table 8.4.1.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.1.5-1.

**Table 8.4.1.1.5-1: Test requirement PDCCH/PCFICH**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	8 CCE	R.15 FDD	OP.1 FDD	ETU70	1x2 Low	1	-0.9

## 8.4.1.2 FDD PCFICH/PDCCH Transmit Diversity Performance

### 8.4.1.2.1 FDD PCFICH/PDCCH Transmit Diversity 2x2

#### 8.4.1.2.1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for transmit diversity with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.1 remains below a given reference value.

#### 8.4.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8.

#### 8.4.1.2.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (P<sub>m-dsg</sub>). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.1.2.1.3-1: Test Parameters for PDCCH/PCFICH**

Parameter		Unit	Transmit diversity
Number of PDCCH symbols		symbols	2
Number of PHICH groups ( $N_g$ )			1
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
Note: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.4.1.2.1.3-1 the average probability of a missed downlink scheduling grant (P<sub>m-dsg</sub>) shall be below the specified value in Table 8.4.1.2.1.3-2.

**Table 8.4.1.2.1.3-2: Minimum performance PDCCH/PCFICH 2 Tx Antenna Port**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							P <sub>m-dsg</sub> (%)	SNR (dB)
1	1.4 MHz	2 CCE	R.16 FDD	OP.1 FDD	EPA5	2 x 2 Low	1	4.3

The normative reference for this requirement is TS 36.101 [2] clause 8.4.1.

#### 8.4.1.2.1.4 Test description

##### 8.4.1.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 1.4MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.4.1.2.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.2.1.4.3.

##### 8.4.1.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.1.2.1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.4.1.2.1.5-1.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.1.5-1, pass the UE. Otherwise fail the UE.

##### 8.4.1.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 8.4.1.2.1.5 Test requirement

For the parameters specified in Table 8.4.1.2.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.1.5-1.

**Table 8.4.1.2.1.5-1: Test requirement PDCCH/PCFICH 2 Tx Antenna Port**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	1.4 MHz	2 CCE	R.16 FDD	OP.1 FDD	EPA5	2 x 2 Low	1	5.3

#### 8.4.1.2.1\_1 FDD PCFICH/PDCCH Transmit Diversity 2x2 (Release 9 and forward)

##### 8.4.1.2.1\_1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for transmit diversity with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.1 remains below a given reference value.

##### 8.4.1.2.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward.

##### 8.4.1.2.1\_1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.1.2.1\_1.3-1: Test Parameters for PDCCH/PCFICH**

Parameter		Unit	Transmit diversity
Number of PDCCH symbols		symbols	2
Number of PHICH groups (Ng)			1
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
Note: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.4.1.2.1\_1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.1\_1.3-2.

**Table 8.4.1.2.1\_1.3-2: Minimum performance PDCCH/PCFICH 2 Tx Antenna Port**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	4 CCE	R.16_1 FDD	OP.1 FDD	EVA70	2 x 2 Low	1	-0.6

#### 8.4.1.2.1\_1.4 Test description

##### 8.4.1.2.1\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.4.1.2.1\_1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.2.1\_1.4.3.

8.4.1.2.1\_1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.1.2.1\_1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.4.1.2.1\_1.5-1.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.1\_1.5-1, pass the UE. Otherwise fail the UE.

8.4.1.2.1\_1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 8.4.1.2.1\_1.4.3-1: PhysicalConfigDedicated-DEFAULT**

1	10 MHz	4 CCE	R.17 FDD	OP.1 FDD	EVA5	4 x 2 Medium	1	0.9

The normative reference for this requirement is TS 36.101 [2] clause 8.4.1.

## 8.4.1.2.2.4 Test description

## 8.4.1.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 8.4.1.2.2.3-1.
3. The downlink signals are initially set up according to Annex C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.2.2.4.3.

8.4.1.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.1.2.2.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.4.1.2.2.5-1.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). If Pm-dsg is less than the value specified in table 8.4.1.2.2.5-1, pass the UE. Otherwise fail the UE.

8.4.1.2.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

8.4.1.2.3

8.4.1.2.3\_C FDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC

8.4.1.2.3\_C.1 FDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC (non-MBSFN ABS)

8.4.1.2.3\_C.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

8.4.1.2.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

8.4.1.2.3\_C.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.1.2.3\_C.1.3-1: Void**

For the parameters for non-MBSFN ABS specified in Table 8.4.1.2.3\_C.1.3-2, the average probability of a missed downlink scheduling grant ( $P_{m-dsg}$ ) shall be below the specified value in Table 8.4.1.2.3\_C.1.3-3. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.4.1.2.3\_C.1.3-2, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

**Table 8.4.1.2.3\_C.1.3-2: Test Parameters for PDCCH/PCFICH – Non-MBSFN ABS**

Parameter		Unit	Cell 1	Cell 2

#### 8.4.1.2.3\_C.1.4 Test description

##### 8.4.1.2.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.1.2.3\_C.1.3-1 and 8.4.1.2.3\_C.1.3-2.
3. The downlink signals are initially set up according to Annex C.0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.2.3\_C.1.4.3.

##### 8.4.1.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.4.1.2.3\_C.1.5-1, 8.4.1.2.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC in the subframes overlapping with ABS of the aggressor cell. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2A respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
2. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.3\_C.1.5-2, pass the UE. Otherwise fail the UE.

#### 8.4.1.2.3\_C.2 FDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC (MBSFN ABS)

##### 8.4.1.2.3\_C.2.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

##### 8.4.1.2.3\_C.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

##### 8.4.1.2.3\_C.2.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

#### **Table 8.4.1.2.3\_C.2.3-1: Void**

For the parameters for MBSFN ABS specified in Table 8.4.1.2.3\_C.2.3-2, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.3\_C.2.3-3. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.4.1.2.3\_C.2.3-2, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

8.4.1.2.3\_C.2.4 Test description

8.4.1.2.3\_C.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.1.2.3\_C.2.3-1 and 8.4.1.2.3\_C.2.3-2.
3. The downlink signals are initially set up according to Annex C.0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.1.2.3\_C.2.4.3.

## 8.4.1.2.3\_C.2.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.4.1.2.3\_C.2.5-1, 8.4.1.2.3\_C.2.5-2, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC in the subframes overlapping with ABS of the aggressor cell. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2A respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
2. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.3\_C.2.5-2, pass the UE. Otherwise fail the UE.

Note 1: The propagation conditions for Cell 1 and Cell2 are statistically independent.									
Note 2: SNR corresponds to $\hat{E}_s / N_{oc2}$ of cell 1									
Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.									

8.4.1.2.3\_D

8.4.1.2.3\_E FDD PCFICH/PDCCH Transmit Diversity 2x2 for felCIC

8.4.1.2.3\_E.1 FDD PCFICH/PDCCH Transmit Diversity 2x2 for felCIC (non-MBSFN ABS)

8.4.1.2.3\_E.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

8.4.1.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

8.4.1.2.3\_E.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

For the parameters for non-MBSFN ABS specified in Table 8.4.1.2.3\_E.1.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.3\_E.1.3-2.

In Tables 8.4.1.2.3\_E.1.3-1 and 8.4.1.2.3\_E.1.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] including Cell 2 and Cell 3 is provided.

#### 8.4.1.2.3\_E.1.4 Test description

##### 8.4.1.2.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.1.2.3\_E.1.3-1 and 8.4.1.2.3\_E.1.3-2.
3. The downlink signals are initially set up according to Annex C.0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.4.1.2.3\_E.1.4.3.

8.4.1.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.4.1.2.3\_E.1.5-1, 8.4.1.2.3\_E.1.5-2, Annex C.3.2 for Cell 1, and Annex C.3.3 for Cell 2 and Cell 3. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively.
2. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
3. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.3\_E.1.5-2, pass the UE. Otherwise fail the UE.

8.4.1.2.3\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

#### 8.4.1.2.3\_E.2 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)

##### 8.4.1.2.3\_E.2.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

##### 8.4.1.2.3\_E.2.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

##### 8.4.1.2.3\_E.2.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

For the parameters for non-MBSFN ABS specified in Table 8.4.2.2.3\_E.2.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.1.2.3\_E.2.3-2.

In Tables 8.4.1.2.3\_E.2.3-1 and 8.4.1.2.3\_E.2.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] including Cell 2 and Cell 3 is provided.

**Table 8.4.1.2.3\_E.2.3-1: Test Parameters for PDCCH/PCFICH – MBSFN ABS**

Parameter		Unit	Cell 1	Cell 2	Cell 3
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3	-3	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3	-3	-3

CSI Subframe Sets (Note 6)	$C_{csi,0}$		0001000000 0100000010 0000001000 0000000000	N/A	N/A
	$C_{csi,1}$		1110111111 1011111101 1111110111 1111111111	N/A	N/A
MBSFN Subframe Allocation (Note 7)			N/A	001000 100001 000100 000000	001000 100001 000100 000000
Number of control OFDM symbols			2	Note 8	Note 8
Number of PHICH groups ( $N_g$ )			1	N/A	N/A
PHICH duration			Normal	N/A	N/A
Unused RE-s and PRB-s			OCNG	OCNG	OCNG
Cyclic prefix			Normal	Normal	Normal

Note 1:	This noise is applied in OFDM symbols #1, #2, #3, #4, #5, #6, #7, #8, #9, #10, #11, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 2:	This noise is applied in OFDM symbols #0 of a subframe overlapping with the aggressor ABS.
Note 3:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS
Note 4:	ABS pattern as defined in [14]. The 4 <sup>th</sup> , 12 <sup>th</sup> , 19 <sup>th</sup> and 27 <sup>th</sup> subframes indicated by ABS pattern are MBSFN ABS subframes. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the MBSFN ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5].
Note 6:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5].
Note 7:	MBSFN Subframe Allocation as defined in [5], four frames with 24 bits are chosen for MBSFN subframe allocation.
Note 8:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9:	The maximum number of uplink HARQ transmission is $\leq 2$ so that each PHICH channel transmission is in a subframe protected by MBSFN ABS in this test.
Note 10:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 11:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.

**Table 8.4.1.2.3\_E.2.3-2: Minimum performance PDCCH/PCFICH – MBSFN ABS**

Test Number	Aggregation Level	Reference Channel	OCNG Pattern			Propagation Conditions (Note 1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value	
			Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Pm-dsg (%)	SNR (dB) (Note 3)

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.											

The normative reference for this requirement is TS 36.101 [2] clause 8.4.1.2.4.

#### 8.4.1.2.3\_E.2.4 Test description

##### 8.4.1.2.3\_E.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.1.2.3\_E.2.3-1 and 8.4.1.2.3\_E.2.3-2.
3. The downlink signals are initially set up according to Annex C.0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.

- 5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.4.1.2.3\_E.2.4.3.

8.4.1.2.3\_E.2.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell3, according to Tables 8.4.1.2.3\_E.2.5-1, 8.4.1.2.3\_E.2.5-2, Annex C.3.2 for Cell 1, and Annex C.3.3 for Cell 2 and Cell 3. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC. The details of PDCCH and PDSCH are specified in Table A.3.5.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
2. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.1.2.3\_E.2.5-2, pass the UE. Otherwise fail the UE.

8.4.1.2.3\_E.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

Unused RE-s and PRB-s			OCNG	OCNG	OCNG
Cyclic prefix			Normal	Normal	Normal

Note 1:	This noise is applied in OFDM symbols #1, #2, #3, #4, #5, #6, #7, #8, #9, #10, #11, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 2:	This noise is applied in OFDM symbols #0 of a subframe overlapping with the aggressor ABS.
Note 3:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS ABS pattern as defined in [14]. The 4 <sup>th</sup> , 12 <sup>th</sup> , 19 <sup>th</sup> and 27 <sup>th</sup> subframes indicated by ABS pattern are MBSFN ABS subframes. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the MBSFN ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 4:	
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5].
Note 6:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5].
Note 7:	MBSFN Subframe Allocation as defined in [5], four frames with 24 bits are chosen for MBSFN subframe allocation.
Note 8:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.
Note 9:	The maximum number of uplink HARQ transmission is ≤ 2 so that each PHICH channel transmission is in a subframe protected by MBSFN ABS in this test.
Note 10:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.
Note 11:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in this test.

**Table 8.4.1.2.3\_E.2.5-2: Test Requirement PDCCH/PCFICH – MBSFN ABS**

Test Number	Aggregation Level	Reference Channel	OCNG Pattern			Propagation Conditions (Note 1)			Correlation Matrix and Antenna Configuration (Note 2)	Reference Value	
			Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Pm-dsg (%)	SNR (dB) (Note 3)

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.											

## 8.4.2 TDD

### 8.4.2.1 TDD PCFICH/PDCCH Single-antenna Port Performance

#### 8.4.2.1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for a single-antenna port with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.2 remains below a given reference value.

#### 8.4.2.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

#### 8.4.2.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.2.1.3-1: Test Parameters for PDCCH/PCFICH**

Parameter		Unit	Single antenna port
Uplink downlink configuration (Note 1)			0
Special subframe configuration (Note 2)			4
Number of PDCCH symbols		symbols	2
Number of PHICH groups ( $N_g$ )			1
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	0
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
ACK/NACK feedback mode			Multiplexing
Note 1: as specified in Table 4.2-2 in TS 36.211 [8]			
Note 2: as specified in Table 4.2-1 in TS 36.211 [8]			
Note 3: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.4.2.1.3-1 the average probability of a missed downlink scheduling grant ( $P_{m-dsg}$ ) shall be below the specified value in Table 8.4.2.1.3-2.

**Table 8.4.2.1.3-2: Minimum performance PDCCH/PCFICH**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							$P_{m-dsg}$ (%)	SNR (dB)
1	10 MHz	8 CCE	R.15 TDD	OP.1 TDD	ETU70	1x2Low	1	-1.6

The normative reference for this requirement is TS 36.101 [2] clause 8.4.2.

#### 8.4.2.1.4 Test description

##### 8.4.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to 8.4.2.1.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.1.4.3.

#### 8.4.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC according to Table 8.4.2.1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.4.2.1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the radio (statDTX)/(NACK +ACK+statDTX). If Pm-dsg is less than the value specified in table 8.4.2.1.5-1, pass the UE. Otherwise fail the UE.

#### 8.4.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception:.

**Table 8.4.2.1.4.3-1: TDD-Configuration-DEFAULT**

Derivation Path: 36.508 clause 4.6.4			
Information Element	Value/remark	Comment	Condition
TDD-Configuration-DEFAULT ::= SEQUENCE {			
subframeAssignment	sa0		
specialSubframePatterns	Ssp4		
}			

#### 8.4.2.1.5 Test requirement

For the parameters specified in Table 8.4.2.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.1.5-1.

**Table 8.4.2.1.5-1: Test requirement PDCCH/PCFICH**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	8 CCE	R.15 TDD	OP.1 TDD	ETU70	1x2Low	1	-0.8

### 8.4.2.2 TDD PCFICH/PDCCH Transmit Diversity Performance

#### 8.4.2.2.1 TDD PCFICH/PDCCH Transmit Diversity 2x2

##### 8.4.2.2.1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for transmit diversity with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.2 remains below a given reference value.

## 8.4.2.2.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8.

## 8.4.2.2.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.2.2.1.3-1: Test Parameters for PDCCH/PCFICH**

Parameter		Unit	Transmit diversity
Uplink downlink configuration (Note 1)			0
Special subframe configuration (Note 2)			4
Number of PDCCH symbols		symbols	2
Number of PHICH groups ( $N_g$ )			1
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
ACK/NACK feedback mode			Multiplexing
Note 1: as specified in Table 4.2-2 in TS 36.211 [8]			
Note 2: as specified in Table 4.2-1 in TS 36.211 [8]			
Note 3: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group			

For the parameters specified in Table 8.4.2.2.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.1.3-2.

**Table 8.4.2.2.1.3-2: Minimum performance PDCCH/PCFICH 2 Tx Antenna Port**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	1.4 MHz	2 CCE	R.16 TDD	OP.1 TDD	EPA5	2 x 2 Low	1	4.2

The normative reference for this requirement is TS 36.101 [2] clause 8.4.2.

## 8.4.2.2.1.4 Test description

## 8.4.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 1.4MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to 8.4.2.2.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.2.1.4.3.

#### 8.4.2.2.1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.2.2.1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.4.2.2.1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the radio (statDTX)/(NACK + ACK + statDTX). If Pm-dsg is less than the value specified in table 8.4.2.2.1.5-1, pass the UE. Otherwise fail the UE

#### 8.4.2.2.2.4 Test description

##### 8.4.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to 8.4.2.2.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.2.4.3.

8.4.2.2.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.2.2.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.4.2.2.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the radio (statDTX)/(NACK +ACK+statDTX). If Pm-dsg is less than the value specified in table 8.4.2.2.5-1, pass the UE. Otherwise fail the UE

8.4.2.2.5 Test requirement

For the parameters specified in Table 8.4.2.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.5-1.

Table 8.4.2.2.5-1: Test requirement PDCCH/PCFICH 2 Tx Antenna Port

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	4 CCE	R.17 TDD	OP.1 TDD	EVA5	4 x 2 Medium	1	2.2

## 8.4.2.2.2\_1 TDD PCFICH/PDCCH Transmit Diversity 4x2 (Release 9 and forward)

## 8.4.2.2.2\_1.1 Test purpose

This test verifies the demodulation performance of PCFICH/PDCCH for transmit diversity with a given SNR for which the average probability of miss-detection of the Downlink Scheduling Grant, tested jointly on PDCCH and PCFICH of the specified reference measurement channels in A.3.5.2 remains below a given reference value.

## 8.4.2.2.2\_1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward.

## 8.4.2.2.2\_1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

Table 8.4.2.2\_1.3-1: Test Parameters for PDCCH/PCFICH

Parameter	Unit	Transmit diversity	
Uplink downlink configuration (Note 1)		0	
Special subframe configuration (Note 2)		4	
Number of PDCCH symbols	symbols	2	
Number of PHICH groups (Ng)		1	
PHICH duration		Normal	
Unused RE-s and PRB-s		OCNG	
Cell ID		0	
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Cyclic prefix		Normal	
ACK/NACK feedback mode		Multiplexing	
Note 1: as specified in Table 4.2-2 in TS 36.211 [8] Note 2: as specified in Table 4.2-1 in TS 36.211 [8] Note 3: PHICH power setting refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.4.2.2.2\_1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.2\_1.3-2.

**Table 8.4.2.2.2\_1.3-2: Minimum performance PDCCH/PCFICH 2 Tx Antenna Port**

#### 8.4.2.2.2\_1.4 Test description

##### 8.4.2.2.2\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 5 MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to 8.4.2.2.2\_1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.2.2\_1.4.3.

##### 8.4.2.2.2\_1.4.2 Test procedure

1. SS transmits PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to Table 8.4.2.2.2\_1.3-2. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.4.2.2.2\_1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK + ACK + statDTX). If Pm-dsg is less than the value specified in table 8.4.2.2.2\_1.5-1, pass the UE. Otherwise fail the UE

8.4.2.2.3\_C TDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC

8.4.2.2.3\_C.1 TDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC (non-MBSFN ABS)

8.4.2.2.3\_C.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

8.4.2.2.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward. Applicability requires support for FGI bit 115.

#### 8.4.2.2.3\_C.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

##### **Table 8.4.2.2.3\_C.1.3-1: Void**

For the parameters for non-MBSFN ABS specified in Table 8.4.2.2.3\_C.1.3-2, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.3\_C.1.3-3. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.4.2.2.3\_C.1.3-2, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Table 8.4.2.2.3\_C.1.3-2: Test Parameters for PDCCH/PCFICH – Non-MBSFN ABS

Parameter		Unit	Cell 1	Cell 2

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: SNR corresponds to $\hat{E}_s/N_{oc2}$ of cell 1. Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.									

The normative reference for this requirement is TS 36.101 [2] clause 8.4.2.2.3

#### 8.4.2.2.3\_C.1.4 Test description

##### 8.4.2.2.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.2.2.3\_C.1.3-1 and 8.4.2.2.3\_C.1.3-2.
3. The downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.2.3\_C.1.4.3.

##### 8.4.2.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.4.2.2.3\_C.1.3-2, 8.4.2.2.3\_C.1.5-1, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC in the subframes overlapping with ABS of the aggressor cell. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2A respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
2. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.2.2.3\_C.1.5-2, pass the UE. Otherwise fail the UE.

Cyclic prefix			Normal	Normal
Note 1:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10,#12, #13 of a subframe overlapping with the aggressor ABS.			
Note 2:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.			
Note 3:	This noise is applied in OFDM symbols of a subframe overlapping with aggressor non-ABS			
Note 4:	ABS pattern as defined in [14]. PDCCH/PCFICH other than that associated with SIB1/Paging are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell.			
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5].			
Note 6:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5].			
Note 7:	Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell1 and Cell2 is the same.			
Note 8:	SIB-1 will not be transmitted in Cell2 in the test.			

**Table 8.4.2.2.3\_C.1.5-2: Test Requirement PDCCH/PCFICH – Non-MBSFN ABS**

Test Number	Aggregation Level	Reference Channel	OCNG Pattern		Propagation Conditions (Note 1)		Correlation Matrix and Antenna Configuration	Reference Value	
			Cell 1	Cell 2	Cell 1	Cell 2		Pm-dsg (%)	SNR (dB) (Note 2)
1	8 CCE	R15-1 TDD	OP.1 TDD	OP.1 TDD	EVA5	EVA5	2x2 Low	1	-3
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: SNR corresponds to $\hat{E}_s / N_{oc2}$ of cell 1. Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.									

**8.4.2.2.3\_C.2 TDD PCFICH/PDCCH Transmit Diversity 2x2 for eICIC (MBSFN ABS)****8.4.2.2.3\_C.2.1 Test purpose**

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

**8.4.2.2.3\_C.2.2 Test applicability**

This test applies to all types of E-UTRA TDD UE release 10 and forward. Applicability requires support for FGI bit 115.

**8.4.2.2.3\_C.2.3 Minimum conformance requirements**

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

**Table 8.4.2.2.3\_C.2.3-1: Void**

For the parameters for MBSFN ABS specified in Table 8.4.2.2.3\_C.2.3-2, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.3\_C.2.3-3.

The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3. In Table 8.4.2.2.3\_C.2.3-2, Cell 1 is the serving cell, and Cell 2 is the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 is according to Annex C.3.3, respectively.

Note 2: SNR corresponds to  $\hat{E}_s / N_{oc2}$  of cell 1.

Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.

The normative reference for this requirement is TS 36.101 [2] clause 8.4.2.2.3

#### 8.4.2.2.3\_C.2.4 Test description

##### 8.4.2.2.3\_C.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.2.2.3\_C.2.3-1.
3. The downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.4.2.2.3\_C.2.4.3.

##### 8.4.2.2.3\_C.2.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.4.2.2.3\_C.2.3-2, 8.4.2.2.3\_C.2.5-1, C.3.3-1 of Annex C.3.3 as appropriate, and SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC in the subframes overlapping with ABS of the aggressor cell. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2A respectively. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
2. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.2.2.3\_C.2.5-2, pass the UE. Otherwise fail the UE.

##### 8.4.2.2.3\_C.2.4.3 Message contents

## 8.4.2.2.3\_D

8.4.2.2.3\_E TDD PCFICH/PDCCH Transmit Diversity 2x2 for felCIC

8.4.2.2.3\_E.1 TDD PCFICH/PDCCH Transmit Diversity 2x2 for felCIC (non-MBSFN ABS)

8.4.2.2.3\_E.1.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

8.4.2.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

8.4.2.2.3\_E.1.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

For the parameters for non-MBSFN ABS specified in Table 8.4.2.2.3\_E.1.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.3\_E.1.3-2.

In Tables 8.4.2.2.3\_E.1.3-1 and 8.4.2.2.3\_E.1.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] including Cell 2 and Cell 3 is provided.

#### 8.4.2.2.3\_E.1.4 Test description

##### 8.4.2.2.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.2.2.3\_E.1.3-1 and 8.4.2.2.3\_E.1.3-2.
3. The downlink signals are initially set up according to Annex C.0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.4.2.2.3\_E.1.4.3.

##### 8.4.2.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell 1, Cell 2 and Cell 3, according to Tables 8.4.2.2.3\_E.1.5-1, 8.4.2.2.3\_E.1.5-2, Annex C.3.2 for Cell 1, and Annex C.3.3 for Cell 2 and Cell 3. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2A respectively.
2. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
3. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.2.2.3\_E.1.5-2, pass the UE. Otherwise fail the UE.

8.4.2.2.3\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.											

#### 8.4.2.2.3\_E.2 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)

##### 8.4.2.2.3\_E.2.1 Test purpose

To verify the UE's performance of transmit diversity (SFBC) with 2 transmit antennas if the PCFICH/PDCCH transmission in the serving cell takes place in subframes that overlap with ABS of the aggressor cell.

##### 8.4.2.2.3\_E.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

##### 8.4.2.2.3\_E.2.3 Minimum conformance requirements

The receiver characteristics of the PDCCH/PCFICH are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). PDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of PDCCH.

For the parameters for non-MBSFN ABS specified in Table 8.4.2.2.3\_E.2.3-1, the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.4.2.2.3\_E.2.3-2.

In Tables 8.4.2.2.3\_E.2.3-1 and 8.4.2.2.3\_E.2.3-2, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information TS 36.331 [5] including Cell 2 and Cell 3 is provided.

#### 8.4.2.2.3\_E.2.4 Test description

##### 8.4.2.2.3\_E.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell1 are set up according to Tables 8.4.2.2.3\_E.2.3-1 and 8.4.2.2.3\_E.2.3-2.
3. The downlink signals are initially set up according to Annex C0, C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.4.2.2.3\_E.2.4.3.

##### 8.4.2.2.3\_E.2.4.2 Test procedure

1. Set the parameters for Cell1, Cell2 and Cell3, according to Tables 8.4.2.2.3\_E.2.5-1, 8.4.2.2.3\_E.2.5-2, Annex C.3.2 for Cell 1, and Annex C.3.3 for Cell 2 and Cell 3. SS transmits PDSCH via PDCCH DCI format 1 for C\_RNTI to transmit the DL RMC. The details of PDCCH and PDSCH are specified in Table A.3.5.2-1 and Table A.3.5.2-2A respectively.
2. The SS sends downlink MAC padding bits on the DL RMC. Transmission scheme for the PDSCH shall be transmit diversity. Propagation conditions are set according to Annex B clause B.2.
3. Measure the Pm-dsg in the subframes overlapping with ABS of the aggressor cell for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX).

If Pm-dsg is less than the value specified in table 8.4.2.2.3\_E.2.5-2, pass the UE. Otherwise fail the UE.

8.4.2.2.3\_E.2.4.3 Message contents

## 8.5 Demodulation of PHICH

### 8.5.1 FDD

#### 8.5.1.1 FDD PHICH Single-antenna Port Performance

##### 8.5.1.1.1 Test purpose

This test verifies the demodulation performance of PHICH for a single antenna port with a given SNR for which the average probability of miss detection of Hybrid Indicator ("ACK to NACK") of the specified reference measurement channels remains below a specified value.

##### 8.5.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 8.5.1.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

**Table 8.5.1.1.3-1: Test Parameters for PHICH**

Parameter		Unit	Single antenna port
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	0
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	0
PHICH duration			Normal
Number of PHICH groups (Note 1)			Ng = 1
PDCCH Content		UL Grant should be included with the proper information aligned with A.3.6.	
Unused RE-s and PRB-s			OCNG
Cell ID			0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
Note 1: according to Clause 6.9 in TS 36.211 [8]			
Note 2: PHICH power settings refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.5.1.1.3-1 the average probability of a miss-detecting an ACK for a NACK ( $P_{m-an}$ ) shall be below the specified value in Table 8.5.1.1.3-2.

**Table 8.5.1.1.3-2: Minimum performance PHICH**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						$P_{m-an}$ (%)	SNR (dB)
1	10 MHz	R.18	OP.1 FDD	ETU70	1 x 2 Low	0.1	5.5
2	10 MHz	R.24	OP.1 FDD	ETU70	1 x 2 Low	0.1	0.6

The normative reference for this requirement is TS 36.101 [2] clause 8.5.

#### 8.5.1.1.4 Test description

##### 8.5.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 8.5.1.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.1.1.4.3.

8.5.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.1.1.5-1 Test 1 as appropriate.
2. SS shall schedule PUSCH transmissions according to Annex A.2.2.1.1 Table A.2.2.1.1-1 to happen during 8 consecutive uplink TTIs via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions will transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.1.1.4.2-1 indicates the transmissions for one cycle.

**Table 8.5.1.1.4.2-1: PHICH test pattern**

TTI	1-4	5-8	9-12	13-16	17-20	21-24
PDCCH	S	S	-	-	S	S
PHICH	-	-	A	A	-	-
PUSCH		T	T	R	R	T
UL HARQ Process	1-4	5-8	1-4	5-8	1-4	5-8
Note 1: This table gives an example test pattern for HARQ process for FDD PHICH test Note 2: Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK						

3. SS will only monitor for uplink retransmissions due to ACK missed-detections. Such re-transmissions (if they occur) will potentially happen in TTI 13 to 20. DTxs on TTI 13 to 20 are counted as successful ACK receptions while any transmission on these TTIs is counted as NACKs.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).  
If Pm-an is less than the value specified in table 8.5.1.1.5-1, pass the UE. Otherwise fail the UE.
5. Repeat the same procedure (steps 1 to 3 ) with test conditions according to the Table 8.5.1.1.5-1 for Test 2.

8.5.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6, with the following exceptions

8.5.1.1.5 Test requirement

For the parameters specified in Table 8.5.1.1.3-1 the average probability of a miss-detecting ACK for NACK (Pm-dsg) shall be below the specified value in Table 8.5.1.1.5-1.

**Table 8.5.1.1.5-1: Test requirement PHICH**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-an (%)	SNR (dB)
1	10 MHz	R.18	OP.1 FDD	ETU70	1 x 2 Low	0.1	6.4
2	10 MHz	R.24	OP.1 FDD	ETU70	1 x 2 Low	0.1	1.5

## 8.5.1.2 FDD PHICH Transmit Diversity Performance

### 8.5.1.2.1 FDD PHICH Transmit Diversity 2x2

#### 8.5.1.2.1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which the average probability of miss detection of Hybrid Indicator ("ACK to NACK") of the specified reference measurement channels remains below a specified value.

#### 8.5.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8.

#### 8.5.1.2.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

**Table 8.5.1.2.1.3-1: Test Parameters for PHICH**

Parameter		Unit	Transmit diversity
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3
PHICH duration			Normal
Number of PHICH groups (Note 1)			Ng = 1
PDCCH Content		UL Grant should be included with the proper information aligned with A.3.6.	
Unused RE-s and PRB-s			OCNG
Cell ID			0
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
Note 1: according to Clause 6.9 in TS 36.211 [8]			
Note 2: PHICH power settings refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.5.1.2.1.3-1 the average probability of a miss-detecting an ACK for a NACK (Pm-an) shall be below the specified value in Table 8.5.1.2.1.3-2

**Table 8.5.1.2.1.3-2: Minimum performance PHICH 2 Tx Antenna Port**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-an (%)	SNR (dB)
1	1.4 MHz	R.19	OP.1 FDD	EPA5	2 x 2 Low	0.1	5.6
1A	5MHz (Note 1)	R.19-1	OP.1 FDD	EVA 70	2x2 Low	0.1	4

Note 1: Test case applicability is defined in 8.1.2.1.

The normative reference for this requirement is TS 36.101 [2] clause 8.5.1.

#### 8.5.1.2.1.4 Test description

##### 8.5.1.2.1.4.1 Initial conditions

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: Depending on the bandwidth specified per test number in Table 8.5.1.2.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.5.1.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.1.2.1.4.3.

##### 8.5.1.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.1.2.1.5-1.
2. SS shall schedule PUSCH transmissions according to Annex A.2.2.1.1 Table A.2.2.1.1-1 to happen during 8 consecutive uplink TTIs via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions will transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.1.2.1.4.2-1 indicates the transmissions for one cycle.

**Table 8.5.1.2.1.4.2-1: PHICH test pattern**

TTI	1-4	5-8	9-12	13-16	17-20	21-24
PDCCH	S	S	-	-	S	S
PHICH	-	-	A	A	-	-
PUSCH		T	T	R	R	T
UL HARQ Process	1-4	5-8	1-4	5-8	1-4	5-8
Note 1:	This table gives an example test pattern for HARQ process for FDD PHICH test					
Note 2:	Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK					

- SS will only monitor for uplink retransmissions due to ACK missed-detections. Such re-transmissions (if they occur) will potentially happen in TTI 13 to 20. DTXs on TTI 13 to 20 are counted as successful ACK receptions while any transmission on these TTIs is counted as NACKs.
- Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure P<sub>m-an</sub>. P<sub>m-an</sub> is (NACK) / (ACK + NACK).  
If P<sub>m-an</sub> is less than the value specified in table 8.5.1.2.1.5-1, pass the UE. Otherwise fail the UE.

#### 8.5.1.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions

**Table 8.5.1.2.1.4.3-1: MAC-MainConfig-RBC**

Derivation Path: TS 36.508 [7] clause 4.8.2.1.5, Table 4.8.2.1.5-1

dl-SCH-Config SEQUENCE {	Not present		
ul-SCH-Config SEQUENCE {			
maxHARQ-Tx	n2	Only one retransmission per UL HARQ	

#### 8.5.1.2.1.5 Test requirement

For the parameters specified in Table 8.5.1.2.1.3-1 the average probability of a miss-detecting ACK for NACK (P<sub>m-dsg</sub>) shall be below the specified value in Table 8.5.1.2.1.5-1.

**Table 8.5.1.2.1.5-1: Test requirement PHICH 2 Tx Antenna Port**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						P <sub>m-an</sub> (%)	SNR (dB)
1	1.4 MHz	R.19	OP.1 FDD	EPA5	2 x 2 Low	0.1	6.7
1A	5MHz (Note 1)	R.19-1	OP.1 FDD	EVA 70	2x2 Low	0.1	5.1

Note 1: Test case is applicable (according to sub clause 8.1.2.1) to UE's which, from the E-UTRA operating bands defined in Table 5.2-1, support only E-UTRA band 31.

## 8.5.1.2.1\_1 FDD PHICH Transmit Diversity 2x2 (Release 9 and forward)

## 8.5.1.2.1\_1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which the average probability of miss detection of Hybrid Indicator ("ACK to NACK") of the specified reference measurement channels remains below a specified value.

## 8.5.1.2.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward.

## 8.5.1.2.1\_1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

**Table 8.5.1.2.1\_1.3-1: Test Parameters for PHICH**

Parameter		Unit	Transmit diversity

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-an (%)	SNR (dB)
1	10 MHz	R.19_1	OP.1 FDD	EVA70	2 x 2 Low	0.1	4.4
1A	5MHz (Note 1)	R.19-1	OP.1 FDD	EVA 70	2x2 Low	0.1	4
Note 1: Test case applicability is defined in 8.1.2.1.							

The normative reference for this requirement is TS 36.101 [2] clause 8.5.1.

## 8.5.1.2.1\_1.4 Test description

## 8.5.1.2.1\_1.4.1 Initial conditions

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.5.1.2.1\_1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.5.1.2.1\_1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.1.2.1\_1.4.3.

## 8.5.1.2.1\_1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.1.2.1\_1.5-1.
2. SS shall schedule PUSCH transmissions according to Annex A.2.2.1.1 Table A.2.2.1.1-1 to happen during 8 consecutive uplink TTIs via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions will transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.1.2.1\_1.4.2-1 indicates the transmissions for one cycle.

**Table 8.5.1.2.1\_1.4.2-1: PHICH test pattern**

Note 1: This table gives an example test pattern for HARQ process for FDD PHICH test Note 2: Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK						

3. SS will only monitor for uplink retransmissions due to ACK missed-detections. Such re-transmissions (if they occur) will potentially happen in TTI 13 to 20. DTXs on TTI 13 to 20 are counted as successful ACK receptions while any transmission on these TTIs is counted as NACKs.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK). If Pm-an is less than the value specified in table 8.5.1.2.2\_1.5-1, pass the UE. Otherwise fail the UE.

8.5.1.2.2\_1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions

**Table 8.5.1.2.2\_1.4.3-1: MAC-MainConfig-RBC**

##### 8.5.1.2.3\_B

##### 8.5.1.2.3\_C FDD PHICH Transmit Diversity 2x2 for eICIC

##### 8.5.1.2.3\_C.1 FDD PHICH Transmit Diversity 2x2 for eICIC (non-MBSFN ABS)

##### 8.5.1.2.3\_C.1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which the average probability of miss detection of Hybrid Indicator ("ACK to NACK") of the specified reference measurement channels remains below a specified value.

##### 8.5.1.2.3\_C.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward. Applicability requires support for FGI bit 115.

##### 8.5.1.2.3\_C.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.								
Note 2: SNR corresponds to $\hat{E}_s / N_{oc2}$ of cell 1.								
Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.								

The normative reference for this requirement is TS 36.101 [2] clause 8.5.1.2.3.

#### 8.5.1.2.3\_C.1.4 Test description

##### 8.5.1.2.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna transmit diversity 2x2 configuration.
2. The parameter settings for the cell are set up according to Table 8.5.1.2.3\_C.1.3-1 and 8.5.1.2.3\_C.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1, C.3.2 and C.3.3 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.1.2.3\_C.1.4.3.

##### 8.5.1.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.5.1.2.3\_C.1.5-1, 8.5.1.2.3\_C.1.5-2, C.3.3-1 of Annex C.3.3 as appropriate. Propagation conditions are set according to Annex B clause B.2.
2. SS shall schedule PUSCH transmissions according to Annex A.2.2.1.1 Table A.2.2.1.1-1 via PDCCH DCI format 0 with the new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmission will transmit the associated ACK. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate TTI-s. Table 8.5.1.2.3\_C.1.4.2-1 indicates the transmissions for two cycles.

**Table 8.5.1.2.3\_C.1.4.2-1: PHICH test pattern**

TTI	6	10	14	18	22	26	30	34	38
PDCCH	S	-	-	-	S	-	-	-	S
PUSCH	-	T	-	R	-	T	-	R	-
PHICH	-	-	A	-	-	-	A	-	-
Note 1:	This table gives an example test pattern for HARQ process for FDD PHICH test								
Note 2:	Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK								
Note 3:	In the other TTI-s there are no DCI-0, PHICH and PUSCH transmissions								

- SS will monitor for uplink retransmissions due to ACK missed-detection. Such re-transmission (if it occurs) will potentially happen in TTI 18 (34 and so on). DTX from the UE side on this TTI is counted as successful ACK receptions while any transmission on this TTI is counted as NACK.
- Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure P<sub>m-an</sub>. P<sub>m-an</sub> is (NACK) / (ACK + NACK).  
If P<sub>m-an</sub> is less than the value specified in table 8.5.1.2.3\_C.1.5-2, pass the UE. Otherwise fail the UE.

#### 8.5.1.2.3\_C.1.4.3 Message contents

Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent. Note 2: SNR corresponds to $\hat{E}_s / N_{oc2}$ of cell 1. Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.								

## 8.5.1.2.3\_D

## 8.5.1.2.3\_E FDD PHICH Transmit Diversity 2x2 for feICIC

## 8.5.1.2.3\_E.1 FDD PHICH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)

## 8.5.1.2.3\_E.1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which the average probability of miss detection of Hybrid Indicator ("ACK to NACK") of the specified reference measurement channels remains below a specified value where PHICH transmission subframes overlap with ABS of the aggressor cell.

## 8.5.1.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

## 8.5.1.2.3\_E.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

Table 8.5.1.2.3\_E.1.3-1: Test Parameters for PHICH

Note 1:		The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.								
Note 2:		The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.								
Note 3:		SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.								

The normative reference for this requirement is TS 36.101 [2] clause 8.5.1.2.4.

#### 8.5.1.2.3\_E.1.4 Test description

##### 8.5.1.2.3\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna transmit diversity 2x2 configuration.
2. The parameter settings for the cell are set up according to Table 8.5.1.2.3\_E.1.3-1 and 8.5.1.2.3\_E.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1, C.3.2 and C.3.3 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clauses B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.5.1.2.3\_E.1.4.3.

8.5.1.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell1, Cell2 and Cell3 according to Tables 8.5.1.2.3\_E.1.3-1, 8.5.1.2.3\_E.1.5-1 and C.3.3-2 of Annex C.3.3 as appropriate. Propagation conditions are set according to Annex B clause B.2.
2. SS shall schedule PUSCH transmissions according to Annex A.2.2.1.1 Table A.2.2.1.1-1 via PDCCH DCI format 0 with the new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmission will transmit the associated ACK. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate TTI-s. Table 8.5.1.2.3\_E.1.4.2-1 indicates the transmissions for two cycles.

**Table 8.5.1.2.3\_E.1.4.2-1: PHICH test pattern**

PHICH	-	-	A	-	-	-	A	-	-
Note 1:	This table gives an example test pattern for HARQ process for FDD PHICH test								
Note 2:	Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK								
Note 3:	In the other TTI-s there are no DCI-0, PHICH and PUSCH transmissions								

3. SS will monitor for uplink retransmissions due to ACK missed-detection. Such re-transmission (if it occurs) will potentially happen in TTI 18 (34 and so on). DTX from the UE side on this TTI is counted as successful ACK receptions while any transmission on this TTI is counted as NACK.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an in the subframes overlapping with ABS of the aggressor cell. Pm-an is (NACK) / (ACK + NACK).  
If Pm-an is less than the value specified in table 8.5.1.2.3\_E.1.5-2, pass the UE. Otherwise fail the UE.

Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.										

## 8.5.2 TDD

### 8.5.2.1 TDD PHICH Single-antenna Port Performance

#### 8.5.2.1.1 Test purpose

This test verifies the demodulation performance of PHICH for a single antenna port with a given SNR for which a certain Hybrid Indicator detection error rate (i.e. missed detection of "NACK to ACK" and "ACK to NACK") of the specified reference measurement channels is achieved.

#### 8.5.2.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

#### 8.5.2.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

**Table 8.5.2.1.3-1: Test Parameters for PHICH**

Parameter		Unit	Single antenna port
Uplink downlink configuration (Note 1)			1
Special subframe configuration (Note 2)			4
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	0
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	0
PHICH duration			Normal
Number of PHICH groups (Note 3)			$N_g = 1$
Cell ID			0
PDCCH Content		UL Grant should be included with the proper information aligned with A.3.6.	
Unused RE-s and PRB-s			OCNG
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
ACK/NACK feedback mode			Multiplexing
Note 1: as specified in Table 4.2-2 in TS 36.211 [8] Note 2: as specified in Table 4.2-1 in TS 36.211 [8] Note 3: according to Clause 6.9 in TS 36.211 [8] Note 4: PHICH power settings refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.5.2.1.3-1 the average probability of a miss-detecting ACK for NACK ( $P_{m-an}$ ) shall be below the specified value in Table 8.5.2.1.3-2.

**Table 8.5.2.1.3-2: Minimum performance of PHICH**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						$P_{m-an}$ (%)	SNR (dB)
1	10 MHz	R.18	OP.1 TDD	ETU70	1 x 2 Low	0.1	5.8
2	10 MHz	R.24	OP.1 TDD	ETU70	1 x 2 Low	0.1	1.3

The normative reference for this requirement is TS 36.101 [2] clause 8.5.2.

#### 8.5.2.1.4 Test description

##### 8.5.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1

Bandwidths to be tested: As specified per test number in Tables 8.5.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex a, Figure A.9.
2. The parameter settings for the cell are set up according to 8.5.2.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.2.1.4.3.

8.5.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.2.1.5-1 Test 1 as appropriate.
2. In Each HARQ process (4 HARQ processes for UL/DL configuration 1); SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions shall transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.2.1.4.2-1 indicates the transmissions for one cycle.
3. SS will only monitor for uplink retransmissions due to ACK missed-detections. DTX from the UE side is counted as successful ACK reception, while any transmission on these subframes is counted as NACKs.

**Table 8.5.2.1.4.2-1: PHICH test pattern**

Subframe Index	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9
PDCCH		S			S		S			S										
PHICH												A			A		A			A
PUSCH			R?	R?				T	T				T	T					R?	R?
HARQ process		1	3	4	2		3	1	2	4		1	3	4	2		3	1	2	4
Note 1:	This table gives an example test pattern for HARQ process for TDD PHICH test																			
Note 2:	Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK																			
Note 3:	TDD UL/DL configuration 1 is used here, special subframe is denoted as blue																			

4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).  
  
If Pm-an is less than the value specified in table 8.5.2.1.5-1, pass the UE. Otherwise fail the UE.
5. Repeat the same procedure (steps 1 to 4 ) with test conditions according to the Table 8.5.2.1.5-1 for Test 2.

8.5.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6, with the following exceptions

**Table 8.5.1.1.4.3-1: MAC-MainConfig-RBC**

Derivation Path: TS 36.508 [7] clause 4.8.2.1.5, Table 4.8.2.1.5-1

### 8.5.2.1.5 Test requirement

For the parameters specified in Table 8.5.2.1.3-1 the average probability of a miss-detecting ACK for NACK ( $P_{m-an}$ ) shall be below the specified value in Table 8.5.2.1.5-1.

**Table 8.5.2.1.5-1: Test requirement of PHICH**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						$P_{m-an}$ (%)	SNR (dB)
1	10 MHz	R.18	OP.1 TDD	ETU70	1 x 2 Low	0.1	6.7
2	10 MHz	R.24	OP.1 TDD	ETU70	1 x 2 Low	0.1	2.2

### 8.5.2.2 TDD PHICH Transmit Diversity Performance

#### 8.5.2.2.1 TDD PHICH Transmit Diversity 2x2

##### 8.5.2.2.1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which a certain Hybrid Indicator detection error rate (i.e. missed detection of "NACK to ACK" and "ACK to NACK") of the specified reference measurement channels is achieved.

##### 8.5.2.2.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8.

##### 8.5.2.2.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK ( $P_{m-an}$ ). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

**Table 8.5.2.2.1.3-1: Test Parameters for PHICH**

Parameter		Unit	Transmit diversity
Uplink downlink configuration (Note 1)			1
Special subframe configuration (Note 2)			4
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3

PDCCH Content		UL Grant should be included with the proper information aligned with A.3.6.	
Unused RE-s and PRB-s			OCNG
$N_{oc}$ at antenna port		dBm/15kHz	-98
Cyclic prefix			Normal
ACK/NACK feedback mode			Multiplexing
Note 1: as specified in Table 4.2-2 in TS 36.211 [8] Note 2: as specified in Table 4.2-1 in TS 36.211 [8] Note 3: according to Clause 6.9 in TS 36.211 [8] Note 4: PHICH power settings refer to PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.			

For the parameters specified in Table 8.5.2.2.1.3-1 the average probability of a miss-detecting ACK for NACK ( $P_{m-an}$ ) shall be below the specified value in Table 8.5.2.2.1.3-2.

**Table 8.5.2.2.1.3-2: Minimum performance of PHICH 2 Tx Antenna Port**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						$P_{m-an}$ (%)	SNR (dB)
1	1.4 MHz	R.19	OP.1 TDD	EPA5	2 x 2 Low	0.1	5.3

The normative reference for this requirement is TS 36.101 [2] clause 8.5.2.

#### 8.5.2.2.1.4 Test description

##### 8.5.2.2.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2

Bandwidths to be tested: 1.4 MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.5.2.2.1.3-1.

3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.2.2.1.4.3.

8.5.2.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.2.2.1.5-1.
2. In Each HARQ process (4 HARQ processes for UL/DL configuration 1), SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions shall transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.2.2.1.4.2-1 indicates the transmissions for one cycle.
3. SS will only monitor for uplink retransmissions due to ACK missed-detections. DTX from the UE side is counted as successful ACK reception, while any transmission on these subframes is counted as NACKs.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).

If Pm-an is less than the value specified in table 8.5.2.2.1.5-1, pass the UE. Otherwise fail the UE.

**Table 8.5.2.2.1.4.2-1: PHICH test pattern**

The normative reference for this requirement is TS 36.101 [2] clause 8.5.2.

8.5.2.2.1\_1.4 Test description

8.5.2.2.1\_1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2

Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.5.2.2.1\_1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.2.2.1\_1.4.3.

8.5.2.2.1\_1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.2.2.1\_1.5-1.
2. In Each HARQ process (4 HARQ processes for UL/DL configuration 1), SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions shall transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.2.2.1\_1.4.2-1 indicates the transmissions for one cycle.
3. SS will only monitor for uplink retransmissions due to ACK missed-detections. DTX from the UE side is counted as successful ACK reception, while any transmission on these subframes is counted as NACKs.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).

If Pm-an is less than the value specified in table 8.5.2.2.1\_1.5-1, pass the UE. Otherwise fail the UE.

**Table 8.5.2.2.1\_1.4.2-1: PHICH test pattern**

8.5.2.2.1\_1.5 Test requirement

For the parameters specified in Table 8.5.2.2.1\_1.3-1 the average probability of a miss-detecting ACK for NACK (Pm-an) shall be below the specified value in Table 8.5.2.2.1\_1.5-1.

Table 8.5.2.2.1\_1.5-1: Test requirement of PHICH 2 Tx Antenna Port

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-an (%)	SNR (dB)
1	10 MHz	R.19_1	OP.1 TDD	EVA70	2 x 2 Low	0.1	+5.3

## 8.5.2.2.2 TDD PHICH Transmit Diversity 4x2

## 8.5.2.2.2.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which a certain Hybrid Indicator detection error rate (i.e. missed detection of "NACK to ACK" and "ACK to NACK") of the specified reference measurement channels is achieved.

## 8.5.2.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8.

## 8.5.2.2.2.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK (Pm-an). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

Table 8.5.2.2.3-1: Test Parameters for PHICH

Parameter		Unit	Transmit diversity
Uplink downlink configuration (Note 1)			1
Special subframe configuration (Note 2)			4
Downlink power allocation	PDCCH_RA PHICH_RA OCNG_RA	dB	-3
	PCFICH_RB PDCCH_RB PHICH_RB OCNG_RB	dB	-3

#### 8.5.2.2.2.4 Test description

##### 8.5.2.2.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2

Channel Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 8.5.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.2.2.4.3.

##### 8.5.2.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.5.2.2.5-1.
2. In Each HARQ process (4 HARQ processes for UL/DL configuration 1), SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmissions shall transmit the associated ACKs. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate sub-frames. Table 8.5.2.2.4.2-1 indicates the transmissions for one cycle.
3. SS will only monitor for uplink retransmissions due to ACK missed-detections. DTX from the UE side is counted as successful ACK reception, while any transmission on these subframes is counted as NACKs.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).

If Pm-an is less than the value specified in table 8.5.2.2.5-1, pass the UE. Otherwise fail the UE.

1	R.19_1	OP.1 TDD	OP.1 TDD	EPA5	EPA5	2x2 Low	0.1	4.6
Note 1: The propagation conditions for Cell 1 and Cell 2 are statistically independent.								
Note 2: SNR corresponds to $\hat{E}_s / N_{oc2}$ of cell 1.								
Note 3: The correlation matrix and antenna configuration apply for Cell 1 and Cell 2.								

The normative reference for this requirement is TS 36.101 [2] clause 8.5.2.2.3.

#### 8.5.2.2.3\_C.1.4 Test description

##### 8.5.2.2.3\_C.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2

Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A Figure A.40 for antenna transmit diversity 2x2 configuration .
2. The parameter settings for the cell are set up according to Table 8.5.2.2.3\_C.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.5.2.2.3\_C.1.4.3.

##### 8.5.2.2.3\_C.1.4.2 Test procedure

1. Set the parameters for Cell1 and Cell2 according to Tables 8.5.2.2.3\_C.1.3-1, 8.5.2.2.3\_C.1.5-1, C.3.3-1 of Annex C.3.3 as appropriate. Propagation conditions are set according to Annex B clause B.2.
2. SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with the new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmission shall transmit the associated ACK. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate TTI-s. Table 8.5.2.2.3\_C.1.4.2-1 indicates the transmissions for two cycles.
3. SS will only monitor for uplink retransmissions due to ACK missed-detection. Such re-transmission (if it occurs) will potentially happen in TTI 24 (44 and so on). DTX from the UE side on this TTI is counted as successful ACK reception, while any transmission on this TTI is counted as NACK.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure Pm-an. Pm-an is (NACK) / (ACK + NACK).

If Pm-an is less than the value specified in table 8.5.2.2.3\_C.1.5-2, pass the UE. Otherwise fail the UE.

**Table 8.5.2.2.3\_C.1.4.2-1: PHICH test pattern**

## 8.5.2.2.3\_C.1.5 Test requirement

For the parameters specified in Table 8.5.2.2.3\_C.1.5-1 the average probability of a miss-detecting ACK for NACK (P<sub>m-an</sub>) shall be below the specified value in Table 8.5.2.2.3\_C.1.5-2.

**Table 8.5.2.2.3\_C.1.5-1: Test Parameters for PHICH**

**Table 8.5.2.2.3\_C.1.5-2: Test requirement of PHICH 2 Tx Antenna Port**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-an (%)	SNR (dB)
1	10 MHz	R.19_1	OP.1 TDD	EPA5	2 x 2 Low	0.1	5.5

#### 8.5.2.2.3\_D

#### 8.5.2.2.3\_E TDD PHICH Transmit Diversity 2x2 for feICIC

#### 8.5.2.2.3\_E.1 TDD PHICH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)

##### 8.5.2.2.3\_E.1.1 Test purpose

This test verifies the demodulation performance of PHICH for transmit diversity with a given SNR for which a certain Hybrid Indicator detection error rate (i.e. missed detection of "NACK to ACK" and "ACK to NACK") of the specified reference measurement channels is achieved where PHICH transmission subframes overlap with ABS of the aggressor cell.

##### 8.5.2.2.3\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling and ss-CCH interference handling – UE Category 2-8 release 11 and forward. Applicability requires support of FGI bit 115.

##### 8.5.2.2.3\_E.1.3 Minimum conformance requirements

The receiver characteristics of the PHICH are determined by the probability of miss-detecting an ACK for a NACK ( $P_{m-an}$ ). It is assumed that there is no bias applied to the detection of ACK and NACK (zero-threshold detection).

Table 8.5.2.2.3\_E.1.3-1: Test Parameters for PHICH

Parameter		Unit	Cell 1	Cell 2	Cell 3

For the parameters specified in Table 8.5.2.2.3\_E.1.3-1 the average probability of a miss-detecting ACK for NACK ( $P_{m-an}$ ) shall be below the specified value in Table 8.5.2.2.3\_E.1.3-2. The downlink physical setup is in accordance with Annex C.3.2 and Annex C.3.3, In Table 8.5.2.2.3\_E.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cell. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information is provided for Cell 2 and Cell 3.

**Table 8.5.2.2.3\_E.1.3-2: Minimum performance of PHICH 2 Tx Antenna Port**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note 1)			Antenna Configuration and Correlation Matrix (Note 2)	Reference Value	
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Pm-an (%)	SNR (dB) (Note 3)
1	R.19_1	OP.1 TDD	OP.1 TDD	OP.1 TDD	EPA5	EVA5	EVA5	2x2 Low	0.1	5.7
Note 1: The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent. Note 2: The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3. Note 3: SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.										

The normative reference for this requirement is TS 36.101 [2] clause 8.5.2.2.4.

#### 8.5.2.2.3\_E.1.4 Test description

##### 8.5.2.2.3\_E.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2

Bandwidths to be tested: 10 MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A Figure A.48 for antenna transmit diversity 2x2 configuration.
2. The parameter settings for the cell are set up according to Table 8.5.2.2.3\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 8.5.2.2.3\_E.1.4.3.

##### 8.5.2.2.3\_E.1.4.2 Test procedure

1. Set the parameters for Cell1, Cell2 and Cell3 according to Tables 8.5.2.2.3\_E.1.3-1, 8.5.2.2.3\_E.1.5-1 and C.3.3-2 of Annex C.3.3 as appropriate. Propagation conditions are set according to Annex B clause B.2.
2. SS shall schedule PUSCH transmissions according to Annex A.2.3.1.1 Table A.2.3.1.1-1 via PDCCH DCI format 0 with the new data indicator set to true. Since the UE has no payload, the UE shall send uplink MAC padding bits in PUSCH. SS upon receiving the PUSCH transmission shall transmit the associated ACK. PHICH is set according to Annex 3.6 Table A.3.6-1. SS will only transmit PDCCH to schedule PUSCH transmission in the appropriate TTI-s. Table 8.5.2.2.3\_E.1.4.2-1 indicates the transmissions for two cycles.
3. SS will only monitor for uplink retransmissions due to ACK missed-detection. Such re-transmission (if it occurs) will potentially happen in TTI 24 (44 and so on). DTX from the UE side on this TTI is counted as successful ACK reception, while any transmission on this TTI is counted as NACK.
4. Repeat steps 1 – 3 for a duration sufficient to achieve statistical significance according to Annex G clause G.4 and measure  $P_{m-an}$  in the subframes overlapping with ABS of the aggressor cell.  $P_{m-an}$  is (NACK) / (ACK + NACK).

If  $P_{m-an}$  is less than the value specified in table 8.5.2.2.3\_E.1.5-2, pass the UE. Otherwise fail the UE.

**Table 8.5.2.2.3\_E.1.4.2-1: PHICH test pattern**

TTI	10	14	20	24	30	34	40	44	50
PDCCH	S	-	-	-	S	-	-	-	S
PUSCH	-	T	-	R	-	T	-	R	-
PHICH	-	-	A	-	-	-	A	-	-
Note 1:	This table gives an example test pattern for HARQ process for FDD PHICH test								
Note 2:	Following notation is used: S: represents sending PDCCH DCI format 0 to schedule a future PUSCH transmission A: represents the ACK transmission on PHICH T: represents a scheduled PUSCH transmission R: represents a potential PUSCH re-transmission due to a missed ACK								
Note 3:	TDD UL/DL configuration 1 is used here								
Note 4:	In the other TTI-s there are no DCI-0, PHICH and PUSCH transmissions								

## 8.5.2.2.3\_E.1.4.3 Message contents

Note 6:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [7]			
Note 7:	The number of control OFDM symbols is not available for ABS and is 2 for the subframe indicated by "0" of ABS pattern.			
Note 8:	The number of the CRS ports in Cell 1, Cell 2 and Cell 3 is the same.			
Note 9:	SIB-1 will not be transmitted in Cell 2 and Cell 3 in the test.			

**Table 8.5.2.2.3\_E.1.5-2: Test requirement TDD PHICH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)**

Test Number	Reference Channel	OCNG Pattern			Propagation Conditions (Note 1)			Antenna Configuration and Correlation Matrix (Note 2)	Reference Value	
		Cell 1	Cell 2	Cell 3	Cell 1	Cell 2	Cell 3		Pm-an (%)	SNR (dB) (Note 3)
1	R.19_1	OP.1 TDD	OP.1 TDD	OP.1 TDD	EPA5	EVA5	EVA5	2x2 Low	0.1	6.6
Note 1:	The propagation conditions for Cell 1, Cell 2 and Cell 3 are statistically independent.									
Note 2:	The correlation matrix and antenna configuration apply for Cell 1, Cell 2 and Cell 3.									
Note 3:	SNR corresponds to $\hat{E}_s / N_{oc2}$ of Cell 1.									

## 8.6 Demodulation of PBCH

RAN4 will specify the PBCH performance requirements and has recommended that these requirements do not need to be tested.

## 8.7 Sustained downlink data rate provided by lower layers

### 8.7.1 FDD

The parameters specified in Table 8.7.1-1 are valid for all FDD tests unless otherwise stated.

**Table 8.7.1-1: Common Test Parameters (FDD)**

Parameter	Unit	Value
Cyclic prefix		Normal
Cell ID		0 (Note 1)
Inter-TTI Distance		1
Number of HARQ processes	Processes	Downlink: 8 Uplink: 8
Maximum number of HARQ transmission		Downlink: 4 Uplink: 1
Scheduling of retransmissions		1. Retransmissions use the same Transport Block Size (TBS) as the initial transmission. 2. HARQ processes are scheduled consecutively, independent of the fact, whether retransmissions (for negatively acknowledged HARQ processes) or new transmissions (for positively acknowledged HARQ processes) occur. 3. Despite of 1) and 2) the number of RB-s to be allocated in each SF remains firm as specified in the RMC. Thus in case of RMC-s with SF dependent allocation, for retransmissions the TBS and the modulation scheme (MCS) are indicated implicitly ( $29 \leq I_{MCS} \leq 31$ ) according to TS 36.213 [10] subclause 7.1.7.2.
Redundancy version coding sequence		{0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH	OFDM symbols	1
Cross carrier scheduling		Not configured
Propagation condition		Static propagation condition No external noise sources are applied
Note 1: For CA tests, Cell ID = 0 applies to P-Cell, Cell ID = n (where n is 1, 2, 3..) applies to S-Celln (where n is 1, 2, 3..), respectively		

The normative reference for this requirement is TS 36.101[2] clause 8.7.1.

## 8.7.1.1 FDD sustained data rate performance

### 8.7.1.1.1 Test purpose

The purpose of the test is to verify that the Layer 1 and Layer 2 correctly process in a sustained manner the received packets corresponding to the maximum number of DL-SCH transport block bits received within a TTI for the UE category indicated. The sustained downlink data rate shall be verified in terms of the success rate of delivered PDCP SDU(s) by Layer 2. The test case below specifies the RF conditions and the required success rate of delivered TB by Layer 1 to meet the sustained data rate requirement. The size of the TB per TTI corresponds to the largest possible DL-SCH transport block for each UE category using the maximum number of layers for spatial multiplexing. Transmission modes 1 and 3 are used with radio conditions resembling a scenario where sustained maximum data rates are available. Test case is selected according to table 8.7.1.1.1-1 depending on UE capability for CA and EPDCCH.

**Table 8.7.1.1.1-1: SDR test applicability**

	Single carrier UE not supporting EPDCCH	CA UE not supporting EPDCCH	Single carrier UE supporting EPDCCH	CA UE supporting EPDCCH

FDD	8.7.1.1, 8.7.1.1_1	8.7.1.1_A	8.7.3.1	8.7.1.1_A, 8.7.3.1
-----	--------------------	-----------	---------	--------------------

### 8.7.1.1.2 Test applicability

This test applies to E-UTRA FDD Release 9 and forward UE of category 1 to 4.

### 8.7.1.1.3 Minimum requirements

**Table 8.7.1.1.3-1: Void**

The requirements are specified in Table 8.7.1.1.3-3, with the addition of the parameters in Table 8.7.1.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category as specified in Table 8.7.1.1.3-4. The TB success rate shall be sustained during at least 300 frames.

**Table 8.7.1.1.3-2: Test Parameters for sustained downlink data rate (FDD)**

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15 kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$		
1	10	1	1 x 2	N/A	0	0	0	-85	OP.6 FDD
2	10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3, 4, 6	20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3A	10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3C, 4B	15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD

**Table 8.7.1.1.3-3: Minimum Requirement (FDD)**

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
1	10296	R.31-1 FDD	95
2	25456	R.31-2 FDD	95
3	51024	R.31-3 FDD	95
3A	36696 (Note 2)	R.31-3A FDD	85
3C	51024	R.31-3C FDD	85
4	75376 (Note 3)	R.31-4 FDD	85
4B	55056 (Note 5)	R.31-4B FDD	85
6	75376 (Note 3)	R.31-4 FDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 35160 bits for sub-frame 5.  
Note 3: 71112 bits for sub-frame 5.  
Note 4: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.  
Note 5: 52752 bits for sub-frame 5.

**Table 8.7.1.1.3-4: Test points for sustained data rate (FRC)**

CA config	Maximum supported Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	3A	3A	-	-
	15	-	-	3C	4B	-	-
	20	-	-	3	4	6	6
Note 1: If UE can be tested for CA configuration, single carrier test is skipped.							
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.							

The normative reference for this requirement is TS 36.101[2] clause 8.7.1

8.7.1.1.4 Test description

8.7.1.1.4.1 Initial conditions

**Table 8.7.1.1.4.1-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]
1	R.31-1 FDD	R.1-1 FDD	10296	1	$\text{FLOOR}((\text{TB}_{\text{size}} - 96)/8)$	1275
2	R.31-2 FDD	R.1-2 FDD	25456	3	$\text{FLOOR}((\text{TB}_{\text{size}} - 152)/24)$	1054
3	R.31-3 FDD	R.1-3 FDD	51024	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	1270
3A	R.31-3A FDD	R.1-3A FDD	36696 (Note 3)	4	$\text{FLOOR}((\text{TB}_{\text{size}} - 184)/32)$	1141
3C	R.31-3C FDD	TBD	51024	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	1270
4	R.31-4 FDD	R.1-4 FDD	75376 (Note 4)	7	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	1341
4B	R.31-4B FDD	TBD	55056 (Note 5)	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	1371
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).</p> <p>The PDCP SDU size of each PDCP SDU is:</p> $\text{PDCP SDU size} = (\text{TB}_{\text{size}} - N \cdot \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of RLC STATUS PDU}) / N,$ <p>where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16+(N-1) \cdot 12)/8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: <math>\text{PDCP SDU size} = 8 \cdot \text{FLOOR}((\text{TB}_{\text{size}} - N \cdot 16 - 8 \cdot \text{CEIL}[(16+(N-1) \cdot 12)/8] - 64)/(8 \cdot N))</math> bits.</p> <p>The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p> <p>Note 3: 35160 bits for sub-frame 5</p> <p>Note 4: 71112 bits for sub-frame 5</p> <p>Note 5: 52752 bits for sub-frame 5.</p>						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: according to Table 8.7.1.1.5-2 depending on the UE category according to Table 8.7.1.1.5-3.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.3 for test 1 and Figure A.10 for tests 2-4 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.1.1.5-2 and Table 8.7.1.1.5-1 depending on the UE category according to Table 8.7.1.1.5-3.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3. Message contents are defined in clause 8.7.1.1.4.3. PhysicalConfigDedicated-DEFAULT for transmission mode 3 is defined in Table 8.7.1.1.4.3-3.

#### 8.7.1.1.4.2 Test procedure

1. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
2. The SS looks up  $TB_{size}$  in Table 8.7.1.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.1.1.5-3.
3. SS sets the counters  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
4. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.1.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
5. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
6. Steps 4 to 5 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
7. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
8. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
9. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
10. The UE passes the test if  $A \geq$  "corresponding TB success rates according to Table 8.7.1.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 and 4.7A, with the following exceptions:

8.7.1.1.5 Test requirement

The requirements are specified in Table 8.7.1.1.5-1 depending on the UE category according to Table 8.7.1.1.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

Table 8.7.1.1.5-1: Test requirements per test

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
1	10296	R.31-1 FDD	95
2	25456	R.31-2 FDD	95
3	51024	R.31-3 FDD	95
3A	36696 (Note 2)	R.31-3A FDD	85
3C	51024	R.31-3C FDD	85
4	75376 (Note 3)	R.31-4 FDD	85
4B	55056 (Note 5)	R.31-4B FDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 35160 bits for sub-frame 5.  
Note 3: 71112 bits for sub-frame 5.  
Note 4: The TB success rate is defined as TB success rate =  $100\% \cdot N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.  
Note 5: 52752bits for sub-frame 5.

Table 8.7.1.1.5-2: Test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$

3A	10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3C, 4B	15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD

Table 8.7.1.1.5-3: Test applicability per UE category

CA config	Maximum supported Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	3A	3A	-	-
	15	-	-	3C	4B	-	-
	20	-	-	3	4	-	-

Note 1: If UE can be tested for CA configuration, single carrier test is skipped.  
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.

### 8.7.1.1\_1 FDD sustained data rate performance (Rel-10 and forward)

#### 8.7.1.1\_1.1 Test purpose

Same test purpose as in clause 8.7.1.1.

#### 8.7.1.1\_1.2 Test applicability

This test case applies to E-UTRA FDD UE release 10 and forward of UE category 6 and 7.

#### 8.7.1.1\_1.3 Minimum requirements

Same minimum conformance requirements as in clause 8.7.1.1.3.

8.7.1.1\_1.4 Test description

Same test description as in clause 8.7.1.1.4 with the following exceptions:

- Connection diagram Figure A.10 (without using faders and AWGN generators).
- Instead of Table 8.7.1.1.4.1-1 -> use Table 8.7.1.1\_1.4-1.
- Instead of Table 8.7.1.1.5-1 -> use Table 8.7.1.1\_1.5-1.
- Instead of Table 8.7.1.1.5-2 -> use Table 8.7.1.1\_1.5-2.
- Instead of Table 8.7.1.1.5-3 -> use Table 8.7.1.1\_1.5-3.

**Table 8.7.1.1\_1.4-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement Channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]
6	R.31-4 FDD	R.1-4 FDD	75376 (Note 3)	7	FLOOR((TB <sub>size</sub> - 264)/56))	1341
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).</p> <p>The PDCP SDU size of each PDCP SDU is:</p> <p>PDCP SDU size = (TB<sub>size</sub> - N*PDCP header size - AMD PDU header size - MAC header size - Size of Timing Advance - Size of RLC STATUS PDU) / N,</p> <p>where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is CEIL((16+(N-1)*12)/8) bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = 8*FLOOR((TB<sub>size</sub> - N*16 - 8*CEIL((16+(N-1)*12)/8) - 64)/(8*N)) bits.</p> <p>The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p> <p>Note 3: 71112 bits for sub-frame 5</p>						

8.7.1.1\_1.5 Test requirement

The requirements are specified in Table 8.7.1.1\_1.5-1 depending on the UE category according to Table 8.7.1.1\_1.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

**Table 8.7.1.1\_1.5-1: Test requirements per test**

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
6	75376 (Note 2)	R.31-4 FDD	85
<p>Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.</p> <p>Note 2: 71112 bits for sub-frame 5.</p> <p>Note 3: The TB success rate is defined as TB success rate = 100%*N<sub>DL_correct_rx</sub> / (N<sub>DL_newtx</sub> + N<sub>DL_retx</sub>), where N<sub>DL_newtx</sub> is the number of newly transmitted DL transport blocks, N<sub>DL_retx</sub> is the number of retransmitted DL transport blocks, and N<sub>DL_correct_rx</sub> is the number of correctly received DL transport blocks.</p>			

Table 8.7.1.1\_1.5-2: Test parameters per test

6	20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD

Table 8.7.1.1\_1.5-3: Test applicability per UE category

CA config	Maximum supported Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	20	-	-	-	-	6	6
Note 1: If UE can be tested for CA configuration, single carrier test is skipped.							
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.							

### 8.7.1.1\_A FDD sustained data rate performance for CA

#### 8.7.1.1\_A.1 FDD Sustained data rate performance for CA (2DL CA)

##### 8.7.1.1\_A.1.1 Test purpose

Same test purpose as 8.7.1.1

##### 8.7.1.1\_A.1.2 Test applicability

This test applies to E-UTRA FDD release 10 and forward UEs of category 3, 4, 6 and 7 which support inter-band OR intra-band contiguous DL CA.

This test also applies to E-UTRA FDD release 11 and forward UEs of category 3, 4, 6 and 7 which support intra band non-contiguous DL CA.

##### 8.7.1.1\_A.1.3 Minimum requirements

Table 8.7.1.1\_A.1.3-1: Void

The requirements are specified in Table 8.7.1.1\_A.1.3-3, with the addition of the parameters in Table 8.7.1.1\_A.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category, CA capability and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.1.1\_A.1.3-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.1.1\_A.1.3-2: Test Parameters for sustained downlink data rate for CA (FDD)

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$		
3A	10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3B, 4A	2x10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
3C, 4B	15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6A	2x20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6B	10+15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6C	10+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6D	15+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6E	2x15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
Note 1: For CA test cases, PUCCH format 1b with channel selection is used to feedback ACK/NACK for Test 1-6E, and PUCCH format 3 is used to feedback ACK/NACK for Test 7-7G.									

Table 8.7.1.1\_A.1.3-3: Minimum requirement for CA (FDD)

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
3A	36696 (Note 2)	R.31-3A FDD	85
3B	25456	R.31-2 FDD	95

4A	36696 (Note 2)	R.31-3A FDD	85
4B	55056 (Note 5)	R.31-4B FDD	85
6A	75376 (Note 3)	R.31-4 FDD	85
6B	36696 (Note 2) for 10MHz CC 55056 for 15MHz CC	R.31-3A FDD for 10MHz CC R.31-5 FDD for 15MHz CC	85
6C	36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	85
6D	55056 for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	85
6E	55056 (Note 5) for two 15MHz CCs	R.31-4B FDD for two 15MHz CCs	85
Note 1:	For 2 layer transmissions, 2 transport blocks are received within a TTI.		
Note 2:	35160 bits for sub-frame 5.		
Note 3:	71112 bits for sub-frame 5.		
Note 4:	The TB success rate is defined as $TB\ success\ rate = 100\% * N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where $N_{DL\_newtx}$ is the number of newly transmitted DL transport blocks, $N_{DL\_retx}$ is the number of retransmitted DL transport blocks, and $N_{DL\_correct\_rx}$ is the number of correctly received DL transport blocks.		
Note 5:	52752bits for sub-frame 5.		
Note 6:	15840bits for sub-frame 0 and 5.		

Table 8.7.1.1\_A.1.3-4: Test points for sustained data rate for CA (FRC)

CA config	Maximum supported Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9,10
CA with 2CCs	10+10	-	-	3B	4A	4A	4A
	10+15	-	-	3B	4A	6B	6B
	10+20	-	-	3B	4A	6C	6C
	15+15	-	-	3B	4A	6E	6E
	15+20	-	-	3B	4A	6D	6D
	20+20	-	-	3B or 3 (Note 4)	4A or 4 (Note 4)	6A	6A
Note 1:	Void.						
Note 2:	For non-CA UE, test is selected for maximum supported bandwidth.						
Note 3:	Void.						
Note 4:	If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, the single carrier test is selected, i.e., Test 3 for UE category 3 and Test 4 for UE category 4. Otherwise, Test 3B applies for category 3 UE and Test 4A applies for category 4 UE.						
Note 5:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in TS 36.101 [2] 8.1.2.3.						

The normative reference for this requirement is TS 36.101[2] clause 8.7.1

8.7.1.1\_A.1.4 Test description

8.7.1.1\_A.1.4.1 Initial conditions

Table 8.7.1.1\_A.1.4.1-1: Further test parameters per test

Test	DL Measurement channel	UL Measurement channel	TBsize per Codeword per Component Carrier	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]

6C	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	R.1-4 FDD	36696 (Note 3) for 10MHz CC 75376 (Note 4) for 20MHz CC	4 for 10MHz CC 7 for 20 MHz CC	$\text{FLOOR}((\text{TBsize} - 184)/32)$ for 10MHz CC $\text{FLOOR}((\text{TBsize} - 264)/56)$ for 20 MHz CC	1141 for 10MHz CC 1341 for 20MHz CC
6D	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	R.1-4 FDD	55056 for 15MHz CC 75376 (Note 4) for 20MHz CC	6 for 15MHz CC 7 for 20 MHz CC	$\text{FLOOR}((\text{TBsize} - 240)/48)$ for 15 MHz CC $\text{FLOOR}((\text{TBsize} - 264)/56)$ for 20 MHz CC	1142 for 15MHz CC 1341 for 20MHz CC
6E	R.31-4B FDD for two 15MHz CCs	R.1-4B FDD	55056 (Note 5) for two 15MHz CCs	6 for two 15MHz CCs	$\text{FLOOR}((\text{TBsize} - 240)/48)$ for two 15 MHz CCs	1142 for two 15MHz CCs
Note 1:	Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.					
Note 2:	Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is: $\text{PDCP SDU size} = (\text{TBsize} - N \cdot \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of RLC STATUS PDU}) / N$ , where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is $\text{CEIL}[(16 + (N-1) \cdot 12)/8]$ bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: $\text{PDCP SDU size} = 8 \cdot \text{FLOOR}((\text{TBsize} - N \cdot 16 - 8 \cdot \text{CEIL}[(16 + (N-1) \cdot 12)/8] - 64) / (8 \cdot N))$ bits. The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.					
Note 3:	35160 bits for sub-frame 5.					
Note 4:	71112 bits for sub-frame 5.					
Note 5:	52752 bits for sub-frame 5.					

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: according to Table 8.7.1.1\_A.1.5-2 depending on the UE category according to Table 8.7.1.1\_A.1.5-3.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.36 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.1.5-2 and Table 8.7.1.1\_A.1.5-1 depending on the UE category according to Table 8.7.1.1\_A.1.5-3.
3. Downlink signals for PCC are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3. Message contents are defined in clause 8.7.1.1\_A.1.4.3.

#### 8.7.1.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.1.1\_A.1.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.1.1\_A.1.4.3-3A.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.1.1\_A.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.1.1\_A.1.5-3.
6. SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.1.1\_A.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.1.1\_A.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

8.7.1.1\_A.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 and 4.7A, with the following exceptions:

#### 8.7.1.1\_A.1.5 Test requirement

The requirements are specified in Table 8.7.1.1\_A.1.5-1 depending on the UE category according to Table 8.7.1.1\_A.1.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

Table 8.7.1.1\_A.1.5-1: Test requirements per test

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
3B	25456	R.31-2 FDD	95
4A	36696 (Note 2)	R.31-3A FDD	85
6A	75376 (Note 3) for 20MHz CC	R.31-4 FDD for 20MHz CC	85
6B	36696 (Note 2) for 10MHz CC	R.31-3A FDD for 10MHz CC	85
6C	55056 for 15MHz CC	R.31-5 FDD for 15MHz CC	85
	36696 (Note 2) for 10MHz CC	R.31-3A FDD for 10MHz CC	
6D	75376 (Note 3) for 20MHz CC	R.31-4 FDD for 20MHz CC	85
	55056 for 15MHz CC	R.31-5 FDD for 15MHz CC	
6E	75376 (Note 3) for 20MHz CC	R.31-4 FDD for 20MHz CC	85
6E	55056 (Note 6) for two 15MHz CCs	R.31-4B FDD for two 15MHz CCs	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 35160 bits for sub-frame 5.  
Note 3: 71112 bits for sub-frame 5.  
Note 4: The TB success rate is defined as TB success rate = 100%\*N<sub>DL\_correct\_rx</sub> / (N<sub>DL\_newtx</sub> + N<sub>DL\_retx</sub>), where N<sub>DL\_newtx</sub> is the number of newly transmitted DL transport blocks, N<sub>DL\_retx</sub> is the number of retransmitted DL transport blocks, and N<sub>DL\_correct\_rx</sub> is the number of correctly received DL transport blocks.  
Note 5: For category 6 and 7 UE, select one CA configuration among CA configurations corresponding to largest aggregated CA bandwidth signalled by UE.  
Note 6: 52752 bits for sub-frame 5.  
Note 7: In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.

Table 8.7.1.1\_A.1.5-2: Test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$		
3B, 4A	2x10	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6A	2x20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6B	10+15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6C	10+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6D	15+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6E	2x15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD

Note 1: PUCCH format 1b with channel selection is used to feedback ACK/NACK.

Table 8.7.1.1\_A.1.5-3: Test applicability per UE category

CA config	Maximum supported Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9,10
CA with 2CCs	10+10	-	-	3B	4A	4A	4A
	10+15	-	-	3B	4A	6B	6B
	10+20	-	-	3B	4A	6C	6C
	15+15	-	-	3B	4A	6E	6E
	15+20	-	-	3B	4A	6D	6D
	20+20	-	-	3B or 3 (Note 4)	4A or 4 (Note 4)	6A	6A
Note 1:	Void.						
Note 2:	For non-CA UE, test is selected for maximum supported bandwidth.						
Note 3:	Void.						
Note 4:	If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, the single carrier test is selected, i.e., Test 3 for UE category 3 and Test 4 for UE category 4. Otherwise, Test 3B applies for category 3 UE and Test 4A applies for category 4 UE.						
Note 5:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.						
Note 6:	Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities. Only one test point to be tested						

### 8.7.1.1\_A.2 FDD Sustained data rate performance for CA (3DL CA)

Editor's notes: This test case is incomplete. The following items are missing or incomplete:

- RMC R.31-6 FDD definition for 5MHz BW in Table A.3.9.1-2 still has error.
- PDCCH Aggregation Level in Table C.3.2-5 for 5MH BW is TBD.
- Test requirements are still with square brackets.

#### 8.7.1.1\_A.2.1 Test purpose

Same test purpose as 8.7.1.1.

#### 8.7.1.1\_A.2.2 Test applicability

This test case applies to all types of E-UTRA FDD UE release 10 and forward of UE category 6, 7, 9, 10, 11 and 12 that support 3DL Intra-band contiguous CA or 3DL Inter-band CA or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA FDD UE release 11 and forward of UE category 6, 7, 9, 10, 11 and 12 that support 3DL with Intra-band non-contiguous and Inter-band CA or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

#### 8.7.1.1\_A.2.3 Minimum conformance requirements

For UE not supporting 256QAM, the requirements are specified in Table 8.7.1.1\_A.2.3-2, with the addition of the parameters in Table 8.7.1.1\_A.2.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.1.1\_A.2.3-3. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.1.1\_A.2.3-1: test parameters for sustained downlink data rate (FDD 64QAM)

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$		
6A	2x20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
6D	15+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7	3x20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7A	15+20+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7B	10+20+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7C	15+15+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7D	10+15+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7E	10+10+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7F	10+15+15	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD
7G	5+10+20	3	2 x 2	10	-3	-3	0	-85	OP.1 FDD

Note 1: For CA test cases, PUCCH format 1b with channel selection is used to feedback ACK/NACK for Test 1-6E, and PUCCH format 3 is used to feedback ACK/NACK for Test 7-7G.

Table 8.7.1.1\_A.2.3-2: Minimum requirement (FDD 64QAM)

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
6A	75376 (Note 3)	R.31-4 FDD	85
6D	55056 for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	85
7	75376 (Note 3)	R.31-4 FDD	[85]
7A	55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	[85]
7B	36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]
7C	55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	85
7D	36696 (Note 2) for 10MHz CC 55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	[85]
7E	36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]
7F	36696 (Note 2) for 10MHz CC 55056 (Note 5) for 15MHz CC	R.31-3A FDD for 10MHz CC R.31-5 FDD for 15MHz CC	[85]
7G	18336 (Note 6) for 5MHz CC 36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-6 FDD for 5MHz CC R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 35160 bits for sub-frame 5.  
Note 3: 71112 bits for sub-frame 5.  
Note 4: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.  
Note 5: 52752bits for sub-frame 5.  
Note 6: 15840bits for sub-frame 0 and 5.

Table 8.7.1.1\_A.2.3-3: Test points for sustained data rate (FRC 64QAM)

CA config	Maximum supported Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9,10	Cat 11, 12

<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is: PDCP SDU size = <math>(\text{TB}_{\text{size}} - N * \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of RLC STATUS PDU}) / N</math>, where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16 + (N-1) * 12) / 8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = <math>R/R/E/LCID/F/L</math> MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + <math>R/R/E/LCID</math> MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = <math>8 * \text{FLOOR}((\text{TB}_{\text{size}} - N * 16 - 8 * \text{CEIL}[(16 + (N-1) * 12) / 8] - 64) / (8 * N))</math> bits. The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p> <p>Note 3: 35160 bits for sub-frame 5. Note 4: 71112 bits for sub-frame 5. Note 5: 52752 bits for sub-frame 5. Note 6: 15840bits for sub-frame 0 and 5.</p>						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: according to Table 8.7.1.1\_A.2.5-2 depending on the UE category according to Table 8.7.1.1\_A.2.5-3.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.60 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.1-1 and Table 8.7.1.1\_A.2.5-1 depending on the UE category according to Table 8.7.1.1\_A.2.5-3.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3. Message contents are defined in clause 8.7.1.1\_A.2.4.3.

## 8.7.1.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4 with two SCCs configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.1.1\_A.2.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.1.1\_A.2.4.3-3A.
3. The SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13,6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.1.1\_A.2.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.1.1\_A.2.5-3.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.1.1\_A.2.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.1.1\_A.2.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

## 8.7.1.1\_A.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 and 4.7A, with the following exceptions:

8.7.1.1\_A.2.5 Test requirement

The requirements are specified in Table 8.7.1.1\_A.2.5-1 depending on the UE category according to Table 8.7.1.1\_A.2.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

Table 8.7.1.1\_A.2.5-1: Minimum requirement

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
6A	75376 (Note 3)	R.31-4 FDD	85
6D	55056 for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	85
7	75376 (Note 3)	R.31-4 FDD	[85]
7A	55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	[85]
7B	36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]
7C	55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	85
7D	36696 (Note 2) for 10MHz CC 55056 (Note 5) for 15MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-5 FDD for 15MHz CC R.31-4 FDD for 20MHz CC	[85]
7E	36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]
7F	36696 (Note 2) for 10MHz CC 55056 (Note 5) for 15MHz CC	R.31-3A FDD for 10MHz CC R.31-5 FDD for 15MHz CC	[85]
7G	18336 (Note 6) for 5MHz CC 36696 (Note 2) for 10MHz CC 75376 (Note 3) for 20MHz CC	R.31-6 FDD for 5MHz CC R.31-3A FDD for 10MHz CC R.31-4 FDD for 20MHz CC	[85]
Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI. Note 2: 35160 bits for sub-frame 5. Note 3: 71112 bits for sub-frame 5. Note 4: The TB success rate is defined as TB success rate = $100\% \cdot N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where $N_{DL\_newtx}$ is the number of newly transmitted DL transport blocks, $N_{DL\_retx}$ is the number of retransmitted DL transport blocks, and $N_{DL\_correct\_rx}$ is the number of correctly received DL transport blocks. Note 5: 52752bits for sub-frame 5. Note 6: 15840bits for sub-frame 0 and 5.			

Table 8.7.1.1\_A.2.5-2: test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$

8.7.1.1\_A.3 Void

## 8.7.2 TDD

The parameters specified in Table 8.7.2-1 are valid for all TDD tests unless otherwise stated.

**Table 8.7.2-1: Common Test Parameters (TDD)**

Parameter	Unit	Value
Special subframe configuration (Note 1)		4
Cyclic prefix		Normal
Cell ID		0 (Note2)
Inter-TTI Distance		1
Maximum number of HARQ transmission		Downlink: 4 Uplink: 1
Redundancy version coding sequence		{0,0,1,2} for 64QAM
Scheduling of retransmissions		1. Retransmissions use the same Transport Block Size (TBS) as the initial transmission. 2. HARQ processes are scheduled consecutively, independent of the fact, whether retransmissions (for negatively acknowledged HARQ processes) or new transmissions (for positively acknowledged HARQ processes) occur. 3. Despite of 1) and 2) the number of RB-s to be allocated in each SF remains firm as specified in the RMC. Thus in case of RMC-s with SF dependent allocation, for retransmissions the TBS and the modulation scheme (MCS) are indicated implicitly ( $29 \leq I_{MCS} \leq 31$ ) according to TS 36.213 [10] subclause 7.1.7.2.
Number of OFDM symbols for PDCCH	OFDM symbols	1
Cross carrier scheduling		Not configured
Propagation conditions		Static propagation condition No external noise sources are applied
Note 1:	as specified in Table 4.2-1 in TS 36.211 [4].	
Note 2:	For CA tests, Cell ID = 0 applies to P-Cell, Cell ID = n (where n is 1, 2, 3..) applies to S-Celln (where n is 1, 2, 3..), respectively.	

The normative reference for this requirement is TS 36.101[2] clause 8.7.2.

## 8.7.2.1 TDD sustained data rate performance

### 8.7.2.1.1 Test purpose

The purpose of the test is to verify that the Layer 1 and Layer 2 correctly process in a sustained manner the received packets corresponding to the maximum number of DL-SCH transport block bits received within a TTI for the UE category indicated. The sustained downlink data rate shall be verified in terms of the success rate of delivered PDCP SDU(s) by Layer 2. The test case below specifies the RF conditions and the required success rate of delivered TB by Layer 1 to meet the sustained data rate requirement. The size of the TB per TTI corresponds to the largest possible DL-SCH transport block for each UE category using the maximum number of layers for spatial multiplexing. Transmission modes 1 and 3 are used with radio conditions resembling a scenario where sustained maximum data rates are available. Test case is selected according to table 8.7.2.1.1-1 depending on UE capability for CA and EPDCCH.

**Table 8.7.2.1.1-1: SDR test applicability**

	Single carrier UE not supporting EPDCCH	CA UE not supporting EPDCCH	Single carrier UE supporting EPDCCH	CA UE supporting EPDCCH

-----	--------------------	-----------	---------	--------------------

### 8.7.2.1.2 Test applicability

This test applies to E-UTRA TDD UE release 9 and forward UEs of category 1 to 4.

### 8.7.2.1.3 Minimum requirements

**Table 8.7.2.1.3-1: Void**

The requirements are specified in Table 8.7.2.1.3-3, with the addition of the parameters in Table 8.7.2.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category as specified in Table 8.7.2.1.3-4. The TB success rate shall be sustained during at least 300 frames.

**Table 8.7.2.1.3-2: Test parameters for sustained downlink data rate (TDD)**

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15 kHz)	ACK/NACK feedback mode	Symbols for unused PRBs

3A	51024/0	R.31-3A TDD	85
4	75376/0 (Note 2)	R.31-4 TDD	85
6	75376/0 (Note 2)	R.31-4 TDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.2.1.3-4: Test points for sustained data rate (FRC)

CA config	Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	-	-	-	-
	15	-	-	3A	3A	-	-
	20	-	-	3	4	6	6
Note 1: If UE can be tested for CA configuration, single carrier test is skipped.							
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.							

The normative reference for this requirement is TS 36.101[2] clause 8.7.2

#### 8.7.2.1.4 Test description

##### 8.7.2.1.4.1 Initial conditions

Table 8.7.2.1.4.1-1: Further test parameters per test

Test	DL Measurement channel	UL Measurement Channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword for normal/special sub-frame	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets] for normal/special sub-frame
1	R.31-1 TDD	R.1-1 TDD	10296	1/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 96)/8)$	1275/0
2	R.31-2 TDD	R.1-2 TDD	25456	3/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 152)/24)$	1054/0
3	R.31-3 TDD	R.1-3 TDD	51024	5/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	1270/0
3A	R.31-3B TDD	R.1-3B TDD	51024	4/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 184)/32)$ "	1588
4	R.31-4 TDD	R.1-4 TDD	75376 (Note 3)	7/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	1341/0
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).</p> <p>The PDCP SDU size of each PDCP SDU is:</p> $\text{PDCP SDU size} = (\text{TB}_{\text{size}} - N \cdot \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of Timing Advance} - \text{Size of RLC STATUS PDU}) / N,$ <p>where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16 + (N-1) \cdot 12)/8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: <math>\text{PDCP SDU size} = 8 \cdot \text{FLOOR}((\text{TB}_{\text{size}} - N \cdot 16 - 8 \cdot \text{CEIL}[(16 + (N-1) \cdot 12)/8] - 64) / (8 \cdot N))</math> bits.</p> <p>The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p> <p>Note 3: 71112 bits for sub-frame 5.</p>						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: according to Table 8.7.2.1.5-2 depending on the UE category according to Table 8.7.2.1.5-3.

1. Connect the SS, to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.3 for test 1 and Figure A.10 for tests 2-5 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.2.1.5-2 and Table 8.7.2.1.5-1 depending on the UE category according to Table 8.7.2.1.5-3.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3. Message contents are defined in clause 8.7.2.1.4.3. PhysicalConfigDedicated-DEFAULT for transmission mode 3 is defined in Table 8.7.2.1.4.3-3.

#### 8.7.2.1.4.2 Test procedure

1. Propagation conditions are set according to Annex B.1. No external noise sources are applied.
2. The SS looks up  $TB_{size}$  in Table 8.7.2.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.2.1.5-3.
3. SS sets the counters  $N_{DL\_newtx}$ ,  $N_{DL\_retr}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
4. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.2.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
5. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retr}$  by one.
6. Steps 4 to 5 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
7. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one.
8. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retr})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retr}$ ) in order to validate HARQ feedback received from the UE.
9. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
10. The UE passes the test if  $A \geq$  "corresponding TB success rates according to Table 8.7.2.1.5-1" and  $B = 0$ .

NOTE 1 In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.2.1.4.3 Message contents

## 8.7.2.1.5 Test requirement

The requirements are specified in Table 8.7.2.1.5-1 depending on the UE category according to Table 8.7.2.1.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

Table 8.7.2.1.5-1: Test requirements per test

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
1	10296/0	R.31-1 TDD	95
2	25456/0	R.31-2 TDD	95
3	51024/0	R.31-3 TDD	95
3A	51024/0	R.31-3A TDD	85
4	75376/0 (Note 2)	R.31-4 TDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.2.1.5-2: Test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
1	10	1	1 x 2	N/A	0	0	0	-85	Bundling	OP.6 TDD
2	10	3	2 x 2	10	-3	-3	0	-85	Bundling	OP.1 TDD

4	20	3	2 x 2	10	-3	-3	0	-85	Multiplexing	OP.1 TDD

Note 1: N/A.

Table 8.7.2.1.5-3: Test applicability per UE category

CA config	Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	-	-	-	-
	15	-	-	3A	3A	-	-
	20	-	-	3	4	-	-

Note 1: If UE can be tested for CA configuration, single carrier test is skipped.  
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.

## 8.7.2.1\_1 TDD sustained data rate performance (Rel-10 and forward)

## 8.7.2.1\_1.1 Test purpose

Same test purpose as in clause 8.7.2.1.

## 8.7.2.1\_1.2 Test applicability

This test case applies to E-UTRA TDD release 10 and forward of UEs category 6 and 7.

## 8.7.2.1\_1.3 Minimum requirements

Table 8.7.2.1\_1.3-1: Void

Same minimum conformance requirements as in clause 8.7.2.1.3.

## 8.7.2.1\_1.4 Test description

Same test description as in clause 8.7.2.1.4 with the following exceptions:

- Connection diagram Figure A.10 (without using faders and AWGN generators).
- Instead of Table 8.7.2.1.4.1-1 -> use Table 8.7.2.1\_1.4-1.
- Instead of Table 8.7.2.1.5-1 -> use Table 8.7.2.1\_1.5-1.
- Instead of Table 8.7.2.1.5-2 -> use Table 8.7.2.1\_1.5-2.
- Instead of Table 8.7.2.1.5-3 -> use Table 8.7.2.1\_1.5-3.

**Table 8.7.2.1\_1.4-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement Channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword for normal/special sub-frame	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets] for normal/special sub-frame
6	R31-4 TDD	R.1-4 TDD	75376 (Note 3)	7/0	FLOOR((TB <sub>size</sub> – 264)/56)	1341/0
Note 1:	Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.					
Note 2:	Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).					
	The PDCP SDU size of each PDCP SDU is:					
	PDCP SDU size = (TB <sub>size</sub> – N*PDCP header size - AMD PDU header size - MAC header size – Size of Timing Advance - Size of RLC STATUS PDU) / N,					
	where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is CEIL[(16+(N-1)*12)/8] bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = 8*FLOOR((TB <sub>size</sub> – N*16- 8*CEIL((16+(N-1)*12)/8) – 64)/(8*N)) bits.					
	The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.					
Note 3:	71112 bits for sub-frame 5.					

## 8.7.2.1\_1.5 Test requirement

The requirements are specified in Table 8.7.2.1.5-1 depending on the UE category according to Table 8.7.2.1\_1.5-3. The TB success rate shall be sustained during at least 300 frames.

**Table 8.7.2.1\_1.5-1: Test requirements for sustained downlink data rate (TDD)**

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
6	75376/0 (Note 2)	R.31-4 TDD	85
Note 1:	For 2 layer transmissions, 2 transport blocks are received within a TTI.		
Note 2:	71112 bits for sub-frame 5.		
Note 3:	The TB success rate is defined as TB success rate = 100%*N <sub>DL_correct_rx</sub> / (N <sub>DL_newtx</sub> + N <sub>DL_retx</sub> ), where N <sub>DL_newtx</sub> is the number of newly transmitted DL transport blocks, N <sub>DL_retx</sub> is the number of retransmitted DL transport blocks, and N <sub>DL_correct_rx</sub> is the number of correctly received DL transport blocks.		

Table 8.7.2.1\_1.5-2: Test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
6	20	3	2 x 2	10	-3	-3	0	-85	Multiplexing	OP.1 TDD
Note 1: N/A.										

Table 8.7.2.1\_1.5-3: Test applicability per UE category

CA config	Bandwidth/ Bandwidth combination (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	20	-	-	-	-	6	6
Note 1: If UE can be tested for CA configuration, single carrier test is skipped.							
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.							

### 8.7.2.1\_A TDD sustained data rate performance for CA

#### 8.7.2.1\_A.1 TDD sustained data rate performance for CA (2DL CA)

##### 8.7.2.1\_A.1.1 Test purpose

Same test purpose as in clause 8.7.2.1.

##### 8.7.2.1\_A.1.2 Test applicability

This test applies to E-UTRA TDD release 10 and forward UEs of category 3, 4, 6, 7, 9 and 10 which support inter-band DL CA OR intra-band contiguous DL CA.

This test also applies to E-UTRA TDD release 11 and forward UEs of category 3, 4, 6, 7, 9 and 10 which support intra band non-contiguous DL CA.

##### 8.7.2.1\_A.1.3 Minimum requirements

For UE not supporting 256QAM, the requirements are specified in Table 8.7.2.1\_A.1.3-3, with the addition of the parameters in Table 8.7.2.1\_A.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.2.1\_A.1.3-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.2.1\_A.1.3-1: Void

Table 8.7.2.1\_A.1.3-2: Test parameters for sustained downlink data rate for CA (TDD 64QAM)

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
3	20	3	2 x 2	10	-3	-3	0	-85	Bundling	OP.1 TDD
4	20	3	2 x 2	10	-3	-3	0	-85	Multiplexing	OP.1 TDD
6A	2x20	3	2 x 2	10	-3	-3	0	-85	- (Note 1)	OP.1 TDD
6B	20+15	3	2 x 2	10	-3	-3	0	-85	(Note 1)	OP.1 TDD

Note 1: PUCCH format 1b with channel selection is used to feedback ACK/NACK.

Table 8.7.2.1\_A.1.3-3: Minimum requirement for CA (TDD 64QAM)

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
3	51024/0	R31-3 TDD	95
4	75376/0 (Note 2)	R31-4 TDD	85
6A	75376/0 (Note 2)	R.31-4 TDD	85
6B	55056/0 for 15MHz CC 75376/0 for 20MHz CC (Note 2)	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	[85]

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.2.1\_A.1.3-4: Test points for sustained data rate for CA (FRC 64QAM)

CA config	Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9, 10	Cat 11, 12
CA with 2CCs	20+20	-	--	3(Note 4)	4 (Note 4)	6A	6A	-
	15+20	-	-	3(Note 4)	4 (Note 4)	6B	6B	-

Note 1: Void.  
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.  
Note 3: Void.  
Note 4: If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, single carrier test is selected.  
Note 5: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

The normative reference for this requirement is TS 36.101[2] clause 8.7.2

8.7.2.1\_A.1.4 Test description

8.7.2.1\_A.1.4.1 Initial conditions

**Table 8.7.2.1\_A.1.4.1-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement channel	TB <sub>size</sub> per Codeword per Component Carrier	Number of PDCP SDU per Codeword for normal/special sub-frame	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets] for normal/special sub-frame
6A	R.31-4 TDD	R.1-4 TDD	75376 (Note 3)	7/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	1341/0
6B	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	R.1-4 TDD	55056/0 for 15MHz CC 75376/0 for 20MHz CC (Note 3)	6 for 15MHz CC 7 for 20 MHz CC	$\text{FLOOR}((\text{TB}_{\text{size}} - 240)/48)$ for 15 MHz CC $\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$ for 20 MHz CC	1142 for 15MHz CC 1341 for 20MHz CC
Note 1:	Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.					
Note 2:	Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).  The PDCP SDU size of each PDCP SDU is:  $\text{PDCP SDU size} = (\text{TB}_{\text{size}} - \text{N} \times \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of RLC STATUS PDU}) / \text{N}$ ,  where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is $\text{CEIL}[(16 + (\text{N} - 1) \times 12) / 8]$ bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: $\text{PDCP SDU size} = 8 \times \text{FLOOR}((\text{TB}_{\text{size}} - \text{N} \times 16 - 8 \times \text{CEIL}[(16 + (\text{N} - 1) \times 12) / 8] - 64) / (8 \times \text{N}))$ bits.  The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.					
Note 3:	71112 bits for sub-frame 5					

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: according to Table 8.7.2.1\_A.1.5-2 depending on the UE category according to Table 8.7.2.1\_A.1.5-3.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.36 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.2.1\_A.1.5-2 and Table 8.7.2.1\_A.1.5-1 depending on the UE category according to Table 8.7.2.1\_A.1.5-3.
3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3/4.5.4.5. Message contents are defined in clause 8.7.2.1\_A.1.4.3.

#### 8.7.2.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.2.1\_A.1.4.3-1, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.2.1\_A.1.4.3-1A.
3. The SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1. No external noise sources are applied.
5. The SS looks up  $TB_{size}$  in Table 8.7.2.1\_A.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.2.1\_A.1.5-3.
6. SS sets the counters  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.2.1\_A.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
11. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
12. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.2.1\_A.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.2.1\_A.1.4.3 Message contents

Same message contents as in clause 8.7.2.1.4.3 with the following exceptions:

8.7.2.1\_A.1.5 Test requirement

The requirements are specified in Table 8.7.2.1\_A.1.5-1 depending on the UE category according to Table 8.7.2.1\_A.1.5-3. The TB success rate shall be sustained during at least 300 frames.

**Table 8.7.2.1\_A.1.5-1: Test requirements per test**

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
6A	75376/0 (Note 2)	R.31-4 TDD	85
6B	55056/0 for 15MHz CC 75376/0 for 20MHz CC (Note 2)	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	[85]
Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI. Note 2: 71112 bits for sub-frame 5. Note 3: The TB success rate is defined as TB success rate = $100\% \cdot N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where $N_{DL\_newtx}$ is the number of newly transmitted DL transport blocks, $N_{DL\_retx}$ is the number of retransmitted DL transport blocks, and $N_{DL\_correct\_rx}$ is the number of correctly received DL transport blocks.			

Table 8.7.2.1\_A.1.5-2: Test parameters per test

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
6A	2x20	3	2 x 2	10	-3	-3	0	-85	- (Note 1)	OP.1 TDD
6B	20+15	3	2 x 2	10	-3	-3	0	-85	(Note 1)	OP.1 TDD

Note 1: PUCCH format 1b with channel selection is used to feedback ACK/NACK.

Table 8.7.2.1\_A.1.5-3: Test applicability per UE category

CA config	Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9, 10	Cat 11, 12
CA with 2CCs	20+20	-	--	3(Note 4)	4 (Note 4)	6A	6A	-
	15+20	-	-	3(Note 4)	4 (Note 4)	6B	6B	-

Note 1: Void.  
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.  
Note 3: Void.  
Note 4: If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, single carrier test is selected.  
Note 5: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.  
Note 6: Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities. Only one test point to be tested.

8.7.2.1\_A.2 Void

8.7.2.1\_A.3 Void

8.7.2.1\_A.4 TDD Sustained data rate performance for CA (3DL CA)

**Editor's notes: This test case is incomplete. The following items are missing or incomplete:**

**- TB success rate requirements are still with square brackets.**

8.7.2.1\_A.4.1 Test purpose

Same test purpose as in clause 8.7.2.1.

8.7.2.1\_A.4.2 Test applicability

This test case applies to all types of E-UTRA TDD UE release 10 and forward of UE category 6, 7, 9, 10, 11 and 12 that support 3DL Intra-band contiguous CA or 3DL Inter-band CA or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA TDD UE release 11 and forward of UE category 6, 7, 9, 10, 11 and 12 that support 3DL with Intra-band non-contiguous and Inter-band CA or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

8.7.2.1\_A.4.3 Minimum conformance requirements

For UE not supporting 256QAM, the requirements are specified in Table 8.7.2.1\_A.4.3-2, with the addition of the parameters in Table 8.7.2.1\_A.4.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.2.1\_A.4.3-3. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.2.1\_A.4.3-1: test parameters for sustained downlink data rate (TDD 64QAM)

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15 kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
6A	2x20	3	2 x 2	10	-3	-3	0	-85	- (Note 1)	OP.1 TDD
7	3x20	3	2 x 2	10	-3	-3	0	-85	(Note 2)	OP.1 TDD
7A	15+20+20	3	2 x 2	10	-3	-3	0	-85	(Note 2)	OP.1 TDD

Note 1: PUCCH format 1b with channel selection is used to feedback ACK/NACK.  
Note 2: PUCCH format 3 is used to feedback ACK/NACK.

Table 8.7.2.1\_A.4.3-2: Minimum requirement (TDD 64QAM)

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
6A	75376/0 (Note 2)	R.31-4 TDD	85
7	75376/0 (Note 2)	R.31-4 TDD	[85]
7A	55056/0 for 15MHz CC 75376/0 for 20MHz CC (Note 2)	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	[85]

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.2.1\_A.4.3-3: Test points for sustained data rate (FRC 64QAM)

CA config	Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9, 10	Cat 11, 12
CA with 3 CCs	3x20	-	-	-	-	6A	7	7
	15+20+20	-	-	-	-	6A	7A	7A

Note 1: Void.  
Note 2: For non-CA UE, test is selected for maximum supported bandwidth.  
Note 3: Void.  
Note 4: If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, single carrier test is selected.  
Note 5: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3.

The normative reference for this requirement is TS 36.101 [2] clause 8.7.2.

8.7.2.1\_A.4.4 Test description

8.7.2.1\_A.4.4.1 Initial conditions

**Table 8.7.2.1\_A.4.4.1-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement channel	TBsize per Codeword per Component Carrier	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]
6A	R.31-4 TDD for two 20MHz CCs	R.1-4 TDD	75376 (Note 3)	7 for two 20MHz CCs	$FLOOR((TB_{size} - 264)/56)$	1341 for two 20MHz CCs
7	R.31-4 TDD for three 20MHz CCs	R.1-4 TDD	75376 (Note 3)	7 for three 20MHz CCs	$FLOOR((TB_{size} - 264)/56)$	1341 for three 20MHz CCs
7A	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	R.1-4 TDD	55056 for 15MHz CC 75376 (Note 3) for 20MHz CC	6 for 15MHz CC 7 for 20 MHz CC	$FLOOR((TB_{size} - 240)/48)$ for 15 MHz CC $FLOOR((TB_{size} - 264)/56)$ for 20 MHz CC	1142 for 15MHz CC 1341 for 20MHz CC
Note 1:	Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.					
Note 2:	Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is: $PDCP\ SDU\ size = (TB_{size} - N * PDCP\ header\ size - AMD\ PDU\ header\ size - MAC\ header\ size - Size\ of\ RLC\ STATUS\ PDU) / N$ , where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is $CEIL[(16+(N-1)*12)/8]$ bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: $PDCP\ SDU\ size = 8 * FLOOR((TB_{size} - N * 16 - 8 * CEIL[(16+(N-1)*12)/8] - 64) / (8 * N))$ bits. The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.					
Note 3:	71112 bits for sub-frame 5.					

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum WGap for Intra-band non-contiguous CA, otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: according to Table 8.7.2.1\_A.4.5-2 depending on the UE category according to Table 8.7.2.1\_A.4.5-3.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.60 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.2-1 and Table 8.7.2.1\_A.4.5-1 depending on the UE category according to Table 8.7.2.1\_A.4.5-3.

3. Downlink signals for PCC are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 5.2A.3. Message contents are defined in clause 8.7.2.1\_A.2.4.3.

#### 8.7.2.1\_A.4.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4 with two SCCs configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.2.1\_A.4.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.2.1\_A.4.4.3-3A.
3. The SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.2.1\_A.4.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.2.1\_A.4.5-3.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retr}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.2.1\_A.4.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retr}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retr})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retr}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.2.1\_A.4.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.2.1\_A.4.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 5.5 and 4.6 and 4.7A, with the following exceptions:

8.7.2.1\_A.4.5 Test requirement

The requirements are specified in Table 8.7.2.1\_A.2.5-1 depending on the UE category according to Table 8.7.2.1\_A.2.5-3. The PDCP SDU success rate shall be sustained during at least 300 frames.

**Table 8.7.2.1\_A.4.5-1: Minimum requirement**

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
6A	75376/0 (Note 2)	R.31-4 TDD	85
7	75376/0 (Note 2)	R.31-4 TDD	[85]
7A	55056/0 for 15MHz CC 75376/0 for 20MHz CC (Note 2)	R.31-5 TDD for 15MHz CC R.31-4 TDD for 20MHz CC	[85]

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
 Note 2: 71112 bits for sub-frame 5.  
 Note 3: The TB success rate is defined as TB success rate = 100%\*N<sub>DL\_correct\_rx</sub>/ (N<sub>DL\_newtx</sub> + N<sub>DL\_retx</sub>), where N<sub>DL\_newtx</sub> is the number of newly transmitted DL transport blocks, N<sub>DL\_retx</sub> is the number of retransmitted DL transport blocks, and N<sub>DL\_correct\_rx</sub> is the number of correctly received DL transport blocks.

**Table 8.7.2.1\_A.4.5-2: test parameters per test**

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)			$\hat{E}_s$ at antenna port (dBm/15 kHz)	ACK/NACK feedback mode	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$			
6A	2x20	3	2 x 2	10	-3	-3	0	-85	- (Note 1)	OP.1 TDD
7	3x20	3	2 x 2	10	-3	-3	0	-85	(Note 2)	OP.1 TDD
7A	15+20+20	3	2 x 2	10	-3	-3	0	-85	(Note 2)	OP.1 TDD

Note 1: PUCCH format 1b with channel selection is used to feedback ACK/NACK.  
 Note 2: PUCCH format 3 is used to feedback ACK/NACK.

Table 8.7.2.1\_A.4.5-3: Test points per UE category

CA config	Bandwidth/ Bandwidth combination (MHz)	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6,7	Cat. 9, 10	Cat 11, 12
CA with 3 CCs	3x20	-	-	-	-	6A	7	7
	15+20+20	-	-	-	-	6A	7A	7A
Note 1: Void. Note 2: For non-CA UE, test is selected for maximum supported bandwidth. Note 3: Void. Note 4: If the intra-band contiguous CA is the only CA configuration supported by category 3 or 4 UE, single carrier test is selected. Note 5: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 8.1.2.3. Note 6: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.								

### 8.7.3 FDD (EPDCCH scheduling)

The parameters specified in Table 8.7.3-1 are valid for all FDD tests unless otherwise stated.

**Table 8.7.3-1: Common test parameters (FDD)**

Parameter	Unit	Value
Cyclic prefix		Normal
Cell ID		0
Inter-TTI Distance		1
Number of HARQ processes per component carrier	Processes	8
Maximum number of HARQ transmission		4
Redundancy version coding sequence		{0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH per component carrier	OFDM symbols	1
Cross carrier scheduling		Not configured
Number of EPDCCH sets		1
EPDCCH transmission type		Localized
Number of PRB per EPDCCH set and EPDCCH PRB pair allocation		2 PRB pairs 10MHz BW: Resource blocks $n_{PRB} = 48, 49$ 15MHz BW: Resource blocks $n_{PRB} = 70, 71$ 20MHz BW: Resource blocks $n_{PRB} = 98, 99$
EPDCCH Starting Symbol		Derived from CFI (i.e. default behaviour)
ECCE Aggregation Level		2 ECCEs
Number of EREGs per ECCE		4
EPDCCH scheduling		EPDCCH candidate is randomly assigned in each subframe
EPDCCH precoder (Note 1)		Fixed PMI 0
EPDCCH monitoring SF pattern		1111111111 0000000000 1111111111 0000000000
Timing advance	$\mu$ s	100
Propagation condition		Static propagation condition No external noise sources are applied
Note 1: EPDCCH precoder parameters are defined for tests with 2 x 2 antenna configuration		

The normative reference for this requirement is TS 36.101[2] clause 8.7.3

### 8.7.3.1 FDD sustained data rate performance for EPDCCH scheduling

#### 8.7.3.1.1 Test purpose

Same test purpose as in clause 8.7.1.1.

#### 8.7.3.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE Release 11 and forward supporting EPDCCH.

## 8.7.3.1.3 Minimum requirements

Table 8.7.3.1.3-1: Void

The requirements are specified in Table 8.7.3.1.3-3, with the addition of the parameters in Table 8.7.3.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category, CA capability and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.3.1.3-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.3.1.3-2: Test parameters for SDR test for PDSCH scheduled by EPDCCH (FDD)

Test	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)				$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs
					$\rho_A$	$\rho_B$	$\sigma$	$\delta$		
1	10	1	1 x 2	N/A	0	0	0	0	-85	OP.6 FDD
2	10	3	2 x 2	10	-3	-3	0	3	-85	OP.1 FDD
3,4,6	20	3	2 x 2	10	-3	-3	0	3	-85	OP.1 FDD
3A	10	3	2 x 2	10	-3	-3	0	3	-85	OP.1 FDD
3C, 4B	15	3	2 x 2	10	-3	-3	0	3	-85	OP.1 FDD

Table 8.7.3.1.3-3: Minimum requirement (FDD)

Test	Number of bits of a DL-SCH transport block received within a TTI	Measurement channel	Reference value
			TB success rate [%]
1	10296	R.31E-1 FDD	95
2	25456	R.31E-2 FDD	95
3	51024	R.31E-3 FDD	95
3A	36696 (Note 2)	R.31E-3A FDD	85
3C	51024	R.31E-3C FDD	85
4	75376 (Note 3)	R.31E-4 FDD	85
4B	55056 (Note 5)	R.31E-4B FDD	85
6	75376 (Note 3)	R.31E-4 FDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 35160 bits for sub-frame 5.  
Note 3: 71112 bits for sub-frame 5.  
Note 4: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.  
Note 5: 52752 bits for sub-frame 5.

Table 8.7.3.1.3-4: Test points for sustained data rate (FRC)

CA config	Bandwidth (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	3A	3A	-	-
	15	-	-	3C	4B	-	-
	20	-	-	3	4	6	6

Note 1: The test is selected for maximum supported bandwidth.

The normative reference for this requirement is TS 36.101[2] clause 8.7.3

## 8.7.3.1.4 Test description

## 8.7.3.1.4.1 Initial conditions

Table 8.7.3.1.4.1-1: Further test parameters per test

Test	DL Measurement channel	UL Measurement channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]
1	R31E-1 FDD	R.1-1 FDD	10296	1	$\text{FLOOR}((\text{TB}_{\text{size}} - 96)/8)$	
2	R31E-2 FDD	R.1-2 FDD	25456	3	$\text{FLOOR}((\text{TB}_{\text{size}} - 152)/24)$	
3	R31E-3 FDD	R.1-3 FDD	51024	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	
3A	R31E-3A FDD	R.1-3A FDD	36696 (Note 3)	4	$\text{FLOOR}((\text{TB}_{\text{size}} - 184)/32)$	
3C	R31E-3C FDD	R.1-3C FDD	51024	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	
4	R31E-4 FDD	R.1-4 FDD	75376 (Note 4)	7	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	
4B	R31E-4B FDD	R.1-4 FDD	55056 (Note 5)	5	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	
6	R31E-4 FDD	R.1-4 FDD	75376 (Note 4)	7	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	

Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.

Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).  
The PDCP SDU size of each PDCP SDU is:  
PDCP SDU size = (TB<sub>size</sub> – N\*PDCP header size - AMD PDU header size - MAC header size - Size of RLC STATUS PDU) / N,  
where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is CEIL[(16+(N-1)\*12)/8] bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK\_SN field and one NACK\_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = 8\*FLOOR((TB<sub>size</sub> – N\*16 - 8\*CEIL((16+(N-1)\*12)/8) – 64)/(8\*N)) bits.  
The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.

Note 3: 35160 bits for sub-frame 5  
Note 4: 71112 bits for sub-frame 5  
Note 5: 52752 bits for sub-frame 5.

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to table 8.7.3.1.3-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.3 for test 1 and Figure A.10 for tests 2-6.
2. The parameter settings for the cell are set up according to Table 8.7.3.1.5-1 and Table 8.7.3.1.5-2.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4 (Loopback activated) according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.3.1.4.3.

#### 8.7.3.1.4.2 Test procedure

1. Propagation conditions are set according to Annex B.1. No external noise sources are applied.
2. The SS looks up  $TB_{size}$  in table 8.7.3.1.4.1-1 according to the UE category under test.
3. SS sets the counters  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
4. SS sends Timing Advance Command MAC CE with timing advance 100us to UE.
5. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.3.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
6. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
7. Steps 5 to 6 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
8. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
9. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
10. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
11. The UE passes the test if  $A \geq$  "corresponding TB success rates according to Table 8.7.3.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.3.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 and 4.7A, with the following exceptions:

Note 1: The test is selected for maximum supported bandwidth.

## 8.7.4 TDD (EPDCCH scheduling)

The parameters specified in Table 8.7.4- 1 are valid for all TDD tests unless otherwise stated.

**Table 8.7.4-1: Common test parameters (TDD)**

Parameter	Unit	Value
Special subframe configuration (Note 1)		4
Cyclic prefix		Normal
Cell ID		0
Inter-TTI Distance		1
Maximum number of HARQ transmission		4
Redundancy version coding sequence		{0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH per component carrier	OFDM symbols	1
Cross carrier scheduling		Not configured
Number of EPDCCH sets		1
EPDCCH transmission type		Localized
Number of PRB per EPDCCH set and EPDCCH PRB pair allocation		2 PRB pairs 10MHz BW: Resource blocks $n_{PRB} = 48, 49$ 15MHz BW: Resource blocks $n_{PRB} = 70, 71$ 20MHz BW: Resource blocks $n_{PRB} = 98, 99$
EPDCCH Starting Symbol		Derived from CFI (i.e. default behaviour)
ECCE Aggregation Level		2 ECCEs
Number of EREGs per ECCE		4 for normal subframe and 8 for special subframe
EPDCCH scheduling		EPDCCH candidate is randomly assigned in each subframe
EPDCCH precoder (Note 2)		Fixed PMI 0
EPDCCH monitoring SF pattern		UL-DL configuration 1: 1101111111 0000000000 UL-DL configuration 5: 1100111001 0000000000
Timing advance	$\mu\text{s}$	100
Propagation condition		Static propagation condition No external noise sources are applied
Note 1:	As specified in Table 4.2-1 in TS 36.211 [4].	
Note 2:	EPDCCH precoder parameters are defined for tests with 2 x 2 antenna configuration	

The normative reference for this requirement is TS 36.101[2] clause 8.7.4.

#### 8.7.4.1 TDD sustained data rate performance for EPDCCH scheduling

##### 8.7.4.1.1 Test purpose

Same test purpose as in clause 8.7.2.1.

##### 8.7.4.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE Release 11 and forward supporting EPDCCH.

## 8.7.4.1.3 Minimum requirements

Table 8.7.4.1.3-1: Void

The requirements are specified in Table 8.7.4.1.3-3, with the addition of the parameters in Table 8.7.4.1.3-2 and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category, CA capability and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.4.1.3-4. The TB success rate shall be sustained during at least 300 frames.

Table 8.7.4.1.3-2: Test parameters for SDR test for PDSCH scheduled by EPDCCH (TDD)

	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)				$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs	ACK/NACK feedback mode
					$\rho_A$	$\rho_B$	$\sigma$	$\delta$			
1	10	1	1 x 2	N/A	0	0	0	0	-85	OP.6 TDD	Bundling
2	10	3	2 x 2	10	-3	-3	0	3	-85	OP.1 TDD	Bundling
3	20	3	2 x 2	10	-3	-3	0	3	-85	OP.1 TDD	Bundling
3A	15	3	2 x 2	10	-3	-3	0	3	-85	OP.2 TDD	Multiplexing
4,6	20	3	2 x 2	10	-3	-3	0	3	-85	OP.1 TDD	Multiplexing

Table 8.7.4.1.3-3: Minimum requirement (TDD)

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
1	10296/0	R.31E-1 TDD	95
2	25456/0	R.31E-2 TDD	95
3	51024/0	R.31E-3 TDD	95
3A	51024/0	R.31E-3A TDD	85
4	75376/0 (Note 2)	R.31E-4 TDD	85
6	75376/0 (Note 2)	R.31E-4 TDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.4.1.3-4: Test points for sustained data rate (FRC)

CA config	Bandwidth/ Bandwidth combination (MHz)	Category 1	Category 2	Category 3	Category 4	Category 6	Category 7
Single carrier	10	1	2	-	-	-	-
	15	-	-	3A	3A	-	-
	20	-	-	3	4	6	6

Note 1: The test is selected for maximum supported bandwidth.

The normative reference for this requirement is TS 36.101[2] clause 8.7.4

## 8.7.4.1.4 Test description

## 8.7.4.1.4.1 Initial conditions

**Table 8.7.4.1.4.1-1: Further test parameters per test**

Test	DL Measurement channel	UL Measurement channel	TB <sub>size</sub> per Codeword	Number of PDCP SDU per Codeword	PDCP SDU size [Octets] Calculation (Note 1)	PDCP SDU size [Octets]
1	R.31E-1 TDD	R.1-1 TDD	10296	1/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 96)/8)$	
2	R.31E-2 TDD	R.1-2 TDD	25456	3/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 152)/24)$	
3	R.31E-3 TDD	R.1-3 TDD	51024	5/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 208)/40)$	
3A	R.31E-3A TDD	R.1-3B TDD	51024	4/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 184)/32)$ "	
4	R.31E-4 TDD	R.1-4 TDD	75376 (Note 3)	7/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	
6	R.31E-4 TDD	R.1-4 TDD	75376 (Note 3)	7/0	$\text{FLOOR}((\text{TB}_{\text{size}} - 264)/56)$	

Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation.

Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).  
The PDCP SDU size of each PDCP SDU is:  
PDCP SDU size = (TB<sub>size</sub> – N\*PDCP header size - AMD PDU header size - MAC header size - Size of RLC STATUS PDU) / N,  
where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is  $\text{CEIL}[(16+(N-1)*12)/8]$  bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK\_SN field and one NACK\_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size =  $8*\text{FLOOR}((\text{TB}_{\text{size}} - N*16 - 8*\text{CEIL}[(16+(N-1)*12)/8] - 64)/(8*N))$  bits.  
The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.

Note 3: 71112 bits for sub-frame 5.

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to table 8.7.4.1.3-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.3 for test 1 and Figure A.10 for tests 2-6.
2. The parameter settings for the cell are set up according to Table 8.7.4.1.5-1 and Table 8.7.4.1.5-2.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4 (Loopback activated) according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.4.1.4.3.

## 8.7.4.1.4.2 Test procedure

1. Propagation conditions are set according to Annex B.1. No external noise sources are applied.
2. The SS looks up  $TB_{size}$  in table 8.7.4.1.4.1-1 according to the UE category under test.
3. SS sets the counters  $N_{DL\_newtx}$ ,  $N_{DL\_retr}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
4. SS sends Timing Advance Command MAC CE with timing advance 100us to UE.
5. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.4.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
6. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retr}$  by one.
7. Steps 5 to 6 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
8. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
9. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retr})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retr}$ ) in order to validate HARQ feedback received from the UE.
10. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
11. The UE passes the test if  $A \geq$  "corresponding TB success rates according to Table 8.7.4.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

## 8.7.4.1.5 Test requirement

The requirements are specified in Table 8.7.4.1.5-1. The PDCP SDU success rate shall be sustained during at least 300 frames.

Table 8.7.4.1.5-1: Test requirements per test

Test	Number of bits of a DL-SCH transport block received within a TTI for normal/special sub-frame	Measurement channel	Reference value
			TB success rate [%]
1	10296/0	R.31E-1 TDD	95
2	25456/0	R.31E-2 TDD	95
3	51024/0	R.31E-3 TDD	95
3A	51024/0	R.31E-3A TDD	85
4	75376/0 (Note 2)	R.31E-4 TDD	85
6	75376/0 (Note 2)	R.31E-4 TDD	85

Note 1: For 2 layer transmissions, 2 transport blocks are received within a TTI.  
Note 2: 71112 bits for sub-frame 5.  
Note 3: The TB success rate is defined as TB success rate = 100% \*  $N_{DL\_correct\_rx} / (N_{DL\_newtx} + N_{DL\_retx})$ , where  $N_{DL\_newtx}$  is the number of newly transmitted DL transport blocks,  $N_{DL\_retx}$  is the number of retransmitted DL transport blocks, and  $N_{DL\_correct\_rx}$  is the number of correctly received DL transport blocks.

Table 8.7.4.1.5-2: Test parameters per test

	Bandwidth (MHz)	Transmission mode	Antenna configuration	Codebook subset restriction	Downlink power allocation (dB)				$\hat{E}_s$ at antenna port (dBm/15kHz)	Symbols for unused PRBs	ACK/NACK feedback mode

Note 1: The test is selected for maximum supported bandwidth.

## 8.7.5 TDD FDD CA Sustained data rate performance

The parameters specified in Table 8.7.5-1 are valid for all TDD FDD CA tests unless otherwise stated.

Table 8.7.5-1: Common Test Parameters (TDD FDD CA)

Parameter		Unit	Value
Uplink downlink configuration (Note 1) for TDD CC			1
Special subframe configuration (Note 2) for TDD CC			4
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
Cyclic prefix			Normal
Cell ID			0
Inter-TTI Distance			1
Maximum number of HARQ processes per component carrier	FDD PCell	Processes	8 for FDD and TDD CCs
	TDD PCell	Processes	11 for FDD CC; 7 for TDD CC
Maximum number of HARQ transmission			4
Redundancy version coding sequence			{0,0,1,2} for 64QAM, 256QAM
Number of OFDM symbols for PDCCH per component carrier		OFDM symbols	1
Cross carrier scheduling			Not configured
Propagation condition			Static propagation condition No external noise sources are applied
Transmission mode			TM3
Codebook subset restriction			10
Antenna configuration			2 x 2
$\hat{E}_s$ at antenna port (dBm/15kHz)			-85
Symbols for unused PRBs			OP.1 FDD for FDD CC, OP.1 TDD for TDD CC
ACK/NACK feedback mode			PUCCH format 3
Downlink HARQ-ACK timing	FDD PCell		As specified in Clause 7.3.3 in TS36.213 [6]
	TDD PCell		As specified in Clause 7.3.4 in TS36.213 [6]
Note 1:		as specified in Table 4.2-2 in TS 36.211 [4].	
Note 2:		as specified in Table 4.2-1 in TS 36.211 [4].	

The normative reference for this requirement is TS 36.101[2] clause 8.7.5.

### 8.7.5.1 TDD FDD CA Sustained data rate performance for FDD PCell

#### 8.7.5.1.1 TDD FDD CA Sustained data rate performance for FDD PCell (2DL CA)

**Editor's notes: This test case is incomplete. The following items are missing or incomplete:**

- TB success rate requirements are still with square brackets.
- Scheduling of retransmissions needs to be specified.

##### 8.7.5.1.1.1 Test purpose

Same test purpose as in clause 8.7.1.1.

## 8.7.5.1.1.2 Test applicability

This test applies to all types of UE Release 12 and forward of UE category 3, 4, 6, 7, 9 and 10 that support E-UTRA FDD and TDD, 2DL TDD-FDD CA with FDD as PCell.

## 8.7.5.1.1.3 Minimum requirements

For UE not supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.1.1.3-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.5.1.1.3-2. The TB success rate shall be sustained during at least 300 frames.

The applicability of the requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

**Table 8.7.5.1.1.3-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)**

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value

	TDD CC	75376/0	75376/0	75376/0	36696/0	36696/0
Number of PDCP SDU per Codeword	FDD CC	7	4	6	4	2
	TDD CC	7	7	7	4	4
PDCP SDU size [Octets] Calculation (Note 1)	FDD CC	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$	$\text{FLOOR}((\text{TBSize} - 240)/48)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$	$\text{FLOOR}((\text{TBSize} - 128)/16)$
	TDD CC	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$
PDCP SDU size [Octets]	FDD CC	1341	1141	1142	1141	1138
	TDD CC	1341	1341	1341	1141	1141
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is: PDCP SDU size = (TBSize – N*PDCP header size - AMD PDU header size - MAC header size - Size of RLC STATUS PDU) / N, where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16+(N-1)*12)/8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = <math>8*\text{FLOOR}((\text{TBSize} - N*16 - 8*\text{CEIL}[(16+(N-1)*12)/8] - 64)/(8*N)</math> bits. The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p>						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to Table 8.7.5.1.1.5-1 depending on the UE category according to Table 8.7.5.1.1.5-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.36 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.5-1 and Table 8.7.5.1.1.5-1 depending on the UE category according to Table 8.7.5.1.1.5-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.5.1.1.4.3.

#### 8.7.5.1.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4 with SCC configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.5.1.1.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.5.1.1.4.3-3A.
3. The SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13,6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.5.1.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.5.1.1.5-2.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.5.1.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.5.1.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

8.7.5.1.1.5 Test requirement

The requirements are specified in Table 8.7.5.1.1.5-1 depending on the UE category according to Table 8.7.5.1.1.5-2. The PDCP SDU success rate shall be sustained during at least 300 frames.

**Table 8.7.5.1.1.5-1: Test requirements per test**

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value
	Total	FDD CC	TDD CC	FDD CC	TDD CC	FDD CC	TDD CC	TB success rate [%]
1	2x20	20	20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
2	10+20	10	20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]
2A	15+20	15	20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
3	10+10	10	10	36696	36696/0	R.31-3A FDD	R.31-6 TDD	[85]
4	5+10	5	10	18336	36696/0	R.31-6 FDD	R.31-6 TDD	[85]
Note 1:	For 2 layer transmissions, 2 transport blocks are received within a TTI.							
Note 2:	The TB success rate is defined as TB success rate = 100%*N <sub>DL_correct_rx</sub> / (N <sub>DL_newtx</sub> + N <sub>DL_retx</sub> ), where N <sub>DL_newtx</sub> is the number of newly transmitted DL transport blocks, N <sub>DL_retx</sub> is the number of retransmitted DL transport blocks, and N <sub>DL_correct_rx</sub> is the number of correctly received DL transport blocks.							

Table 8.7.5.1.1.5-2: Test applicability per UE category

CA config	Maximum supported Bandwidth/ Bandwidth combination (MHz)			Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6, 7	Cat. 9,10	Cat 11, 12
	Total	FDD CC	TDD CC							
CA with 2CCs	2x20	20	20	-	-	3	3	1	1	-
	10+20	10	20	-	-	3	3	2	2	-
	15+20	15	20	-	-	3	3	2A	2A	-
	10+10	10	10	-	-	3	3	3	3	-
	5+10	5	10	-	-	4	4	4	4	-
Note 1:	Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.									

### 8.7.5.1.2 TDD FDD CA Sustained data rate performance for FDD PCell (3DL CA)

Editor's notes: This test case is incomplete. The following items are missing or incomplete:

- TB success rate requirements are still with square brackets.
- Scheduling of retransmissions needs to be specified.

#### 8.7.5.1.2.1 Test purpose

Same test purpose as in clause 8.7.1.1.

#### 8.7.5.1.2.2 Test applicability

This test applies to all types of UE Release 12 and forward of UE category 6, 7, 9, 10, 11 and 12 that support E-UTRA FDD and TDD, 3DL TDD-FDD CA with FDD as PCell.

#### 8.7.5.1.2.3 Minimum requirements

For UE not supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.1.2.3-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.5.1.2.3-2. The TB success rate shall be sustained during at least 300 frames.

The applicability of the requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

**Table 8.7.5.1.2.3-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)**

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value
	Total	FDD CC	TDD CC	FDD CC	TDD CC	FDD CC	TDD CC	TB success rate [%]
1	2x20	20	20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
2	10+20	10	20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]
2A	15+20	15	20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
5	3x20	20	2x20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
6	15+20+20	15	2x20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
7	10+20+20	10	2x20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]

TBSize per Codeword	FDD CC	75376	36696	55056	75376	55056	36696
	TDD CC	75376/0	75376/0	75376/0	75376/0	75376/0	75376/0
Number of PDCP SDU per Codeword	FDD CC	7	4	6	7	6	4
	TDD CC	7	7	7	7	7	7
PDCP SDU size [Octets] Calculation (Note 1)	FDD CC	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$	$\text{FLOOR}((\text{TBSize} - 240)/48)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 240)/48)$	$\text{FLOOR}((\text{TBSize} - 184)/32)$
	TDD CC	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$
PDCP SDU size [Octets]	FDD CC	1341	1141	1142	1341	1142	1141
	TDD CC	1341	1341	1341	1341	1341	1341
Note 1:	Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.						
Note 2:	Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is: PDCP SDU size = (TBSize – N*PDCP header size - AMD PDU header size - MAC header size - Size of RLC STATUS PDU) / N, where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is $\text{CEIL}[(16+(N-1)*12)/8]$ bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives: PDCP SDU size = $8*\text{FLOOR}((\text{TBSize} - N*16 - 8*\text{CEIL}[(16+(N-1)*12)/8] - 64)/(8*N))$ bits. The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to Table 8.7.5.1.2.5-1 depending on the UE category according to Table 8.7.5.1.2.5-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.60 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.5-1 and Table 8.7.5.1.2.5-1 depending on the UE category according to Table 8.7.5.1.2.5-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.5.1.2.4.3.

#### 8.7.5.1.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4 with SCCs configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.5.1.2.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.5.1.2.4.3-3A.
3. The SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.5.1.2.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.5.1.2.5-2.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retr}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.5.1.2.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retr}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retr})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retr}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.5.1.2.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.5.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 and 4.7A, with the following exceptions:

## 8.7.5.2 TDD FDD CA Sustained data rate performance for TDD PCell

### 8.7.5.2.1 TDD FDD CA Sustained data rate performance for TDD PCell (2DL CA)

Editor's notes: This test case is incomplete. The following items are missing or incomplete:

- TB success rate requirements are still with square brackets.
- Scheduling of retransmissions needs to be specified.

#### 8.7.5.2.1.1 Test purpose

Same test purpose as in clause 8.7.2.1.

#### 8.7.5.2.1.2 Test applicability

This test applies to all types of UE Release 12 and forward of UE category 3, 4, 6, 7, 9 and 10 that support E-UTRA FDD and TDD, 2DL TDD-FDD CA with TDD as PCell.

#### 8.7.5.2.1.3 Minimum requirements

For UE not supporting 256QAM, the requirements for TDD FDD CA with FDD PCell are specified in Table 8.7.5.2.1.3-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.5.2.1.3-2. The TB success rate shall be sustained during at least 300 frames.

The applicability of the requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.7.5.2.1.3-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value

	TDD CC	1341	1341	1341	1141	1141
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12). The PDCP SDU size of each PDCP SDU is:  <math>\text{PDCP SDU size} = (\text{TBSize} - \text{N} \times \text{PDCP header size} - \text{AMD PDU header size} - \text{MAC header size} - \text{Size of RLC STATUS PDU}) / \text{N}</math>,  where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16 + (\text{N} - 1) \times 12) / 8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (24 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives:  <math>\text{PDCP SDU size} = 8 \times \text{FLOOR}((\text{TBSize} - \text{N} \times 16 - 8 \times \text{CEIL}[(16 + (\text{N} - 1) \times 12) / 8] - 64) / (8 \times \text{N}))</math> bits.  The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p>						

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to Table 8.7.5.2.1.5-1 depending on the UE category according to Table 8.7.5.2.1.5-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.36 (without using faders and AWGN generators).
2. The parameter settings for the cell are set up according to Table 8.7.5-1 and Table 8.7.5.2.1.5-1 depending on the UE category according to Table 8.7.5.2.1.5-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.5.2.1.4.3.

#### 8.7.5.2.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4 with SCC configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.5.2.1.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.5.2.1.4.3-3A.
3. The SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.5.2.1.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.5.2.1.5-2.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.5.2.1.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.5.2.1.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.5.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 and 4.7A, with the following exceptions:

### 8.7.5.2.1.5 Test requirement

The requirements are specified in Table 8.7.5.2.1.5-1 depending on the UE category according to Table 8.7.5.2.1.5-2. The PDCP SDU success rate shall be sustained during at least 300 frames.

**Table 8.7.5.2.1.5-1: Test requirements per test**

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value
	Total	FDD CC	TDD CC	FDD CC	TDD CC	FDD CC	TDD CC	
1	2x20	20	20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
2	10+20	10	20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]
2A	15+20	15	20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
3	10+10	10	10	36696	36696/0	R.31-3A FDD	R.31-6 TDD	[85]
4	5+10	5	10	18336	36696/0	R.31-6 FDD	R.31-6 TDD	[85]
Note 1:	For 2 layer transmissions, 2 transport blocks are received within a TTI.							
Note 2:	The TB success rate is defined as TB success rate = 100%*NDL_correct_rx/ (NDL_newtx + NDL_retx), where NDL_newtx is the number of newly transmitted DL transport blocks, NDL_retx is the number of retransmitted DL transport blocks, and NDL_correct_rx is the number of correctly received DL transport blocks.							

Table 8.7.5.2.1.5-2: Test applicability per UE category

CA config	Maximum supported Bandwidth/ Bandwidth combination (MHz)			Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6, 7	Cat. 9,10	Cat 11, 12
	Total	FDD CC	TDD CC							
CA with 2CCs	2x20	20	20	-	-	3	3	1	1	-
	10+20	10	20	-	-	3	3	2	2	-
	15+20	15	20	-	-	3	3	2A	2A	-
	10+10	10	10			3	3	3	3	-
	5+10	5	10	-	-	4	4	4	4	-
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.										

### 8.7.5.2.2 TDD FDD CA Sustained data rate performance for TDD PCell (3DL CA)

Editor's notes: This test case is incomplete. The following items are missing or incomplete:

- TB success rate requirements are still with square brackets.
- Scheduling of retransmissions needs to be specified.

#### 8.7.5.2.2.1 Test purpose

Same test purpose as in clause 8.7.2.1.

#### 8.7.5.2.2.2 Test applicability

This test applies to all types of UE Release 12 and forward of UE category 6, 7, 9, 10, 11 and 12 that support E-UTRA FDD and TDD, 3DL TDD-FDD CA with TDD as PCell.

#### 8.7.5.2.2.3 Minimum requirements

For UE not supporting 256QAM, the requirements for TDD FDD CA with TDD PCell are specified in Table 8.7.5.2-1 with the additional parameters specified in Table 8.7.5-1, and the downlink physical channel setup according to Annex C.3.2. The test points are applied to UE category and bandwidth combination with maximum aggregated bandwidth as specified in Table 8.7.5.2-2. The TB success rate shall be sustained during at least 300 frames.

The applicability of the requirements are specified in Clause 8.1.2.3B. The test coverage for different number of component carriers is defined in 8.1.2.4.

Table 8.7.5.2-1: test parameters for sustained downlink data rate (TDD FDD CA 64QAM)

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value
	Total	FDD CC	TDD CC	FDD CC	TDD CC	FDD CC	TDD CC	TB success rate [%]
1	2x20	20	20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
2	10+20	10	20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]

	TDD CC	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$	$\text{FLOOR}((\text{TBSize} - 264)/56)$
PDCP SDU size [Octets]	FDD CC	1341	1141	1142	1341	1142	1141
	TDD CC	1341	1341	1341	1341	1341	1341
<p>Note 1: Transport block size under test according to applicable Fixed Reference Channel for sustained data-rate test in annex A.3.9. In case of varying TBS across SFs of the RMC, only the maximum TBS is used for PDCP SDU size calculation. In case of different resulting PDCP SDU sizes among component carriers, the smaller calculated PDCP SDU size is used across all the carriers.</p> <p>Note 2: Each PDCP SDU is limited to 1500 octets (to keep below maximum SDU size of ESM as specified in TS 24.301 clause 9.9.4.12).  The PDCP SDU size of each PDCP SDU is:  PDCP SDU size = (TBSize – N*PDCP header size - AMD PDU header size - MAC header size - Size of RLC STATUS PDU) / N,  where PDCP header size is 16 bits for the RLC AM and 12-bit SN case; AMD PDU header size is <math>\text{CEIL}[(16+(N-1)*12)/8]</math> bytes which includes 16 bit standard AM header and (N-1) Length indicators; and MAC header size = R/R/E/LCID/F/L MAC subheader (8 bits for MAC SDU for RLC STATUS PDU with 15 bit LI) + R/R/E/LCID MAC subheader (8 bits for MAC SDU for RLC Data PDU) = 32 bits. The size of RLC STATUS PDU including one ACK_SN field and one NACK_SN field is 32 bits (if no STATUS PDU is sent or if the size of the STATUS PDU is less than 32 bits then padding will be used to fill the 32 bits). This gives:  PDCP SDU size = <math>8 * \text{FLOOR}((\text{TBSize} - N * 16 - 8 * \text{CEIL}[(16+(N-1)*12)/8] - 64) / (8 * N))</math> bits.  The calculation of PDCP SDU sizes does not consider timing advance MAC CE as timing advance is not transmitted by SS for RF test cases, and the header sizes are informative and may vary during the test.</p>							

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: According to Table 8.7.5.2.2.5-1 depending on the UE category according to Table 8.7.5.2.2.5-2.

1. Connect the SS to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure group A.60 (without using faders and AWGN generators).

2. The parameter settings for the cell are set up according to Table 8.7.5-1 and Table 8.7.5.2.2.5-1 depending on the UE category according to Table 8.7.5.2.2.5-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4A-RF according to TS 36.508 [7] clause 4.5.4. Message contents are defined in clause 8.7.5.2.2.4.3.

#### 8.7.5.2.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4 with SCCs configured. PhysicalConfigDedicated-DEFAULT is defined in Table 8.7.5.2.2.4.3-3, PhysicalConfigDedicatedSCell-r10-DEFAULT is defined in Table 8.7.5.2.2.4.3-3A.
3. The SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Propagation conditions are set according to Annex B.1 (No external noise sources are applied).
5. The SS looks up  $TB_{size}$  in Table 8.7.5.2.2.4.1-1 for the tests to be performed depending on the UE category according to Table 8.7.5.2.2.5-2.
6. The SS sets the counters,  $N_{DL\_newtx}$ ,  $N_{DL\_retx}$ ,  $N_{UL\_PDCP}$ , and  $N_{DL\_PDCP}$  to 0.
7. For each new DL HARQ transmission the SS generates sufficient PDCP SDUs to fill up the TB in accordance with Table 8.7.5.2.2.4.1-1 (Note 1). The SS ciphers the PDCP SDUs, concatenates the resultant PDCP PDUs to form an RLC PDU and then a MAC PDU. The SS transmits the MAC PDU. The SS increments then  $N_{DL\_newtx}$  by one and  $N_{DL\_PDCP}$  by the number of new PDCP SDUs (Note 1) included in the sent MAC PDU.
8. If PHY requests a DL HARQ retransmission, the SS performs a HARQ retransmission and increments  $N_{DL\_retx}$  by one.
9. Steps 7 to 8 are repeated at every TTI for at least 300 frames and the SS waits for 300ms to let any HARQ retransmissions and RLC retransmissions to finish.
10. For each PDCP SDU received at the SS, if the content of the data matches that of the truncated version of the original PDCP SDU generated at the SS, the SS increments  $N_{UL\_PDCP}$  by one
11. The SS calculates the TB success rate as  $A = 100\% * N_{DL\_newtx} / (N_{DL\_newtx} + N_{DL\_retx})$ . Measurements are not based on UE feedback but on SS counters instead ( $N_{DL\_newtx}$  and  $N_{DL\_retx}$ ) in order to validate HARQ feedback received from the UE.
12. The SS calculates the PDCP SDU loss as  $B = N_{DL\_PDCP} - N_{UL\_PDCP}$
13. The UE passes the test if  $A \geq$  "corresponding TB success rate according to Table 8.7.5.2.2.5-1" and  $B = 0$ .

NOTE 1: In case of RLC PDU retransmission, the number of new required PDCP SDUs is as many as to fill the rest of TB.

#### 8.7.5.2.2.5 Test requirement

The requirements are specified in Table 8.7.5.2.2.5-1 depending on the UE category according to Table 8.7.5.2.2.5-2. The PDCP SDU success rate shall be sustained during at least 300 frames.

**Table 8.7.5.2.2.5-1: Test requirements per test**

Test number	Bandwidth (MHz)			Number of bits of a DL-SCH transport block received within a TTI (for normal/special subframe for TDD, except for subframe #5)		Measurement channel		Reference value
	Total	FDD CC	TDD CC	FDD CC	TDD CC	FDD CC	TDD CC	TB success rate [%]
1	2x20	20	20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
2	10+20	10	20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]
2A	15+20	15	20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
5	3x20	20	2x20	75376	75376/0	R.31-4 FDD	R.31-4 TDD	[85]
6	15+20+20	15	2x20	55056	75376/0	R.31-5 FDD	R.31-4 TDD	[85]
7	10+20+20	10	2x20	36696	75376/0	R.31-3A FDD	R.31-4 TDD	[85]

Table 8.7.5.2.2.5-2: Test applicability per UE category

CA configuration	Maximum supported Bandwidth/ Bandwidth combination (MHz)			Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 6, 7	Cat. 9,10	Cat 11, 12
	Total	FDD CC	TDD CC							
CA	3x20	20	2x20	-	-	-	-	1	5	5
with	15+20+20	15	2x20	-	-	-	-	2A	6	6
3CCs	10+20+20	10	2x20	-	-	-	-	2	7	7

Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.

## 8.8 Demodulation of EPDCCH

### 8.8.1 Distributed Transmission

#### 8.8.1.1 FDD distributed EPDCCH performance

##### 8.8.1.1.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). EPDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of EPDCCH.

##### 8.8.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward supporting EPDCCH.

##### 8.8.1.1.3 Minimum conformance requirements

The parameters specified in Table 8.8.1.1.3-1 are valid for all FDD distributed EPDCCH tests unless otherwise stated.

**Table 8.8.1.1.3-1: Test Parameters for Distributed EPDCCH**

Parameter	Unit	Value	
Number of PDCCH symbols	symbols	2 (Note 1)	
PHICH duration		Normal	
Unused RE-s and PRB-s		OCNG	
Cell ID		0	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
	$\delta$	dB	3
$N_{oc}$ at antenna port	dBm/15 kHz	-98	
Cyclic prefix		Normal	
Subframe Configuration		Non-MBSFN	
Precoder Update Granularity	PRB	1	
	ms	1	
Beamforming Pre-Coder		Annex B.4.4	
Cell Specific Reference Signal		Port 0 and 1	
Number of EPDCCH Sets Configured		2 (Note 2)	
Number of PRB per EPDCCH Set		4 (1 <sup>st</sup> Set)	
		8 (2 <sup>nd</sup> Set)	
EPDCCH Subframe Monitoring		NA	
PDSCH TM		TM3	
DCI Format		2A	
Note 1:	The starting symbol for EPDCCH is derived from the PCFICH. RRC signalling <i>epdcch-StartSymbol-r11</i> is not configured.		
Note 2:	The two sets are distributed EPDCCH sets and non-overlapping with PRB = {3, 17, 31, 45} for the first set and PRB = {0, 7, 14, 21, 28, 35, 42, 49} for the second set. EPDCCH is scheduled in the first set for Test 1 and second set for Test 2, respectively. Both sets are always configured.		

For the parameters specified in Table 8.8.1.1.3-1 the average probability of a missed downlink scheduling grant ( $P_{m-dsg}$ ) shall be below the specified value in Table 8.8.1.1.3-2. The downlink physical setup is in accordance with Annex C.3.2.

**Table 8.8.1.1.3-2: Minimum performance Distributed EPDCCH**

Test number	Band width	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							$P_{m-dsg}$ (%)	SNR (dB)
1	10 MHz	4 ECCE	R.55 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	2.6
2	10 MHz	16 ECCE	R.56 FDD	OP.7 FDD	EVA70	2 x 2 Low	1	-3.2

The normative reference for this requirement is TS 36.101 [2] clause 8.8.1.1.

#### 8.8.1.1.4 Test description

##### 8.8.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.8.1.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.1.1.4.3.

#### 8.8.1.1.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Table 8.8.1.1.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.8.1.1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). If Pm-dsg is less than the value specified in table 8.8.1.1.5-1, pass the UE. Otherwise fail the UE.

#### 8.8.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception:

**Table 8.8.1.1.4.3-1: EPDCCH-Config-r11-DEFAULT**

Derivation Path: 36.508 clause 4.6.3, Table 4.6.3-2B, Condition: FDD
----------------------------------------------------------------------

#### 8.8.1.1.5 Test requirement

For the parameters specified in Table 8.8.1.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.1.1.5-1.

**Table 8.8.1.1.5-1: Test requirement Distributed EPDCCH**

Test number	Band width	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	4 ECCE	R.55 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	3.5
2	10 MHz	16 ECCE	R.56 FDD	OP.7 FDD	EVA70	2 x 2 Low	1	-2.3

## 8.8.1.2 TDD distributed EPDCCH performance

### 8.8.1.2.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). EPDCCH and PCFICH are tested jointly, i.e. a miss detection of PCFICH implies a miss detection of EPDCCH.

### 8.8.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward supporting EPDCCH.

### 8.8.1.2.3 Minimum conformance requirements

The parameters specified in Table 8.8.1.2.3-1 are valid for all TDD distributed EPDCCH tests unless otherwise stated.

**Table 8.8.1.2.3-1: Test Parameters for Distributed EPDCCH**

Parameter		Unit	Value
Number of PDCCH symbols		symbols	2 (Note 1)
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
	$\delta$	dB	3
$N_{oc}$ at antenna port		dBm/15 kHz	-98
Cyclic prefix			Normal
Subframe Configuration			Non-MBSFN
Precoder Update Granularity	PRB		1
	ms		1
Beamforming Pre-Coder			Annex B.4.4
Cell Specific Reference Signal			Port 0 and 1
Number of EPDCCH Sets Configured			2 (Note 2)
Number of PRB per EPDCCH Set			4 (1 <sup>st</sup> Set) 8 (2 <sup>nd</sup> Set)
EPDCCH Subframe Monitoring			NA
PDSCH TM			TM3
DCI Format			2A
TDD UL/DL Configuration			0
TDD Special Subframe			1 (Note 3)
Note 1:	The starting symbol for EPDCCH is derived from the PCFICH. RRC signalling <i>epdcch-StartSymbol-r11</i> is not configured.		
Note 2:	The two sets are distributed EPDCCH sets and non-overlapping with PRB = {3, 17, 31, 45} for the first set and PRB = {0, 7, 14, 21, 28, 35, 42, 49} for the second set. EPDCCH is scheduled in the first set for Test 1 and second set for Test 2, respectively. Both sets are always configured.		
Note 3:	Demodulation performance is averaged over normal and special subframe.		

For the parameters specified in Table 8.8.1.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.1.2.3-2. The downlink physical setup is in accordance with Annex C.3.2.

**Table 8.8.1.2.3-2: Minimum performance Distributed EPDCCH**

Test number	Band width	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	4 ECCE	R.55 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	2.8
2	10 MHz	16 ECCE	R.56 TDD	OP.7 TDD	EVA70	2 x 2 Low	1	-3.1

The normative reference for this requirement is TS 36.101 [2] clause 8.8.1.2

#### 8.8.1.2.4 Test description

##### 8.8.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to 8.8.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.1.2.4.3.

##### 8.8.1.2.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to Table 8.8.1.2.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.8.1.2.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK + ACK + statDTX). If Pm-dsg is less than the value specified in table 8.8.1.2.5-1, pass the UE. Otherwise fail the UE.

##### 8.8.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception:

**Table 8.8.1.2.4.3-1: EPDCCH-Config-r11-DEFAULT**

Derivation Path: 36.508 clause 4.6.3, Table 4.6.3-2B, Condition: TDD

### 8.8.1.2.5 Test requirement

For the parameters specified in Table 8.8.1.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.1.2.5-1.

Table 8.8.1.2.5-1: Test requirement Distributed EPDCCH

Test number	Band width	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	4 ECCE	R.55 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	3.7
2	10 MHz	16 ECCE	R.56 TDD	OP.7 TDD	EVA70	2 x 2 Low	1	-2.2

## 8.8.2 Localized Transmission with TM9

### 8.8.2.1 FDD localized EPDCCH performance with TM9

Editor's notes: The following items are missing or incomplete:

- Test Tolerance

#### 8.8.2.1.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). In this test, EPDCCH and PCFICH are not tested jointly.

#### 8.8.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward supporting EPDCCH and FGI bit 103.

#### 8.8.2.1.3 Minimum conformance requirements

The parameters specified in Table 8.8.2.1.3-1 are valid for all FDD TM9 localized ePDCCH tests unless otherwise stated.

Table 8.8.2.1.3-1: Test Parameters for Localized EPDCCH

Parameter		Unit	Value
Number of PDCCH symbols		symbols	1 (Note 1)
EPDCCH starting symbol		symbols	2 (Note 1)
PHICH duration			Normal
Unused RE-s and PRB-s			OCNG
Cell ID			0
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0
	$\sigma$	dB	-3
	$\delta$	dB	0
$N_{oc}$ at antenna port		dBm/15 kHz	-98
Cyclic prefix			Normal
Subframe Configuration			Non-MBSFN
Precoder Update Granularity	PRB		1
	ms		1
Beamforming Pre-Coder			Annex B.4.5
Cell Specific Reference Signal			Port 0 and 1
CSI-RS Reference Signal			Port 15 and 16
CSI-RS reference signal resource configuration			0
CSI reference signal subframe configuration $l_{CSI-RS}$			2
ZP-CSI-RS configuration bitmap			0000010000000000
ZP-CSI-RS subframe configuration $l_{ZP-CSI-RS}$			2
Number of EPDCCH Sets			2 (Note 2)
EPDCCH Subframe Monitoring pattern <i>subframePatternConfig-r11</i>			1111111110 1111111101 1111111011 1111110111 (Note 3)
PDSCH TM			TM9
Note 1: The starting symbol for EPDCCH is signalled with <i>epdcch-StartSymbol-r11</i> . However, CFI is set to 1.			
Note 2: The first set is distributed transmission with PRB = {0, 49} and the second set is localized transmission with PRB = {0, 7, 14, 21, 28, 35, 42, 49}. ePDCCH is scheduled in the second set for all tests.			
Note 3: EPDCCH is scheduled in every SF. UE is required to monitor ePDCCH for UE-specific search space only in SFs configured by <i>subframePatternConfig-r11</i> . Legacy PDCCH is not scheduled.			

For the parameters specified in Table 8.8.2.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.2.1.3-2. EPDCCH subframe monitoring is configured and the subframe monitoring requirement in EPDCCH restricted subframes is statDTX of 99.9%. The downlink physical setup is in accordance with Annex C.3.2.

Table 8.8.2.1.3-2: Minimum performance Localized EPDCCH with TM9

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	2 ECCE	R.57 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	12.2
2	10 MHz	8 ECCE	R.58 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	2.5

The normative reference for this requirement is TS 36.101 [2] clause 8.8.2.1.

#### 8.8.2.1.4 Test description

##### 8.8.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 8.8.2.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.2.1.4.3.

##### 8.8.2.1.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Table 8.8.2.1.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.8.2.1.5-1 as appropriate.
3. Measure the Pm-dsg on monitoring subframes for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval for monitoring subframes. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). Also, count the number of statDTX on the UL PUCCH for unmonitoring subframes and calculate the ratio of (number of statDTX on the UL PUCCH for unmonitoring subframes)/(the number of configured unmonitoring subframes). If Pm-dsg is less than the value specified in table 8.8.2.1.5-1 and the ratio of statDTX on the UL PUCCH for unmonitoring subframes is no less than 99.9%+TT, pass the UE. Otherwise fail the UE.

### 8.8.2.1.5 Test requirement

For the parameters specified in Table 8.8.2.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.2.1.5-1. EPDCCH subframe monitoring is configured and the subframe monitoring requirement in EPDCCH restricted subframes is no less than statDTX of 99.9%+TT.

**Table 8.8.2.1.5-1: Test requirement localized EPDCCH with TM9**

Test number	Bandwidth	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	2 ECCE	R.57 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	13.1
2	10 MHz	8 ECCE	R.58 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	3.4

### 8.8.2.2 TDD localized EPDCCH performance with TM9

**Editor's notes:** The following items are missing or incomplete:

- **Test Tolerance**

#### 8.8.2.2.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). In this test, EPDCCH and PCFICH are not tested jointly.

#### 8.8.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward supporting EPDCCH and FGI bit 103.

#### 8.8.2.2.3 Minimum conformance requirements

The parameters specified in Table 8.8.2.2.3-1 are valid for all TDD TM9 localized ePDCCH tests unless otherwise stated.

Table 8.8.2.3-1: Test Parameters for Localized EPDCCH with TM9

Parameter		Unit	Value
Number of PDCCH symbols		symbols	1 (Note 1)
EPDCCH starting symbol		symbols	2 (Note 1)
PHICH duration			Normal

TDD UL/DL Configuration			0
TDD Special Subframe			1 (Note 4)
Note 1: The starting symbol for EPDCCH is signalled with <i>epdcch-StartSymbol-r11</i> . However, CFI is set to 1.			
Note 2: The first set is distributed transmission with PRB = {0, 49} and the second set is localized transmission with PRB = {0, 7, 14, 21, 28, 35, 42, 49}. ePDCCH is scheduled in the second set for all tests.			
Note 3: EPDCCH is scheduled in every SF. UE is required to monitor ePDCCH for UE-specific search space only in SFs configured by <i>subframePatternConfig-r11</i> . Legacy PDCCH is not scheduled.			
Note 4: Demodulation performance is averaged over normal and special subframe.			

For the parameters specified in Table 8.8.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.2.3-2. EPDCCH subframe monitoring is configured and the subframe monitoring requirement in EPDCCH restricted subframes is statDTX of 99.9%.

The downlink physical setup is in accordance with Annex C.3.2.

Table 8.8.2.3-2: Minimum performance Localized EPDCCH with TM9

Test number	Band width	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
							Pm-dsg (%)	SNR (dB)
1	10 MHz	2 ECCE	R.57 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	12.8
2	10 MHz	8 ECCE	R.58 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	2.0

The normative reference for this requirement is TS 36.101 [2] clause 8.8.2.2.

## 8.8.2.2.4 Test description

## 8.8.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to 8.8.2.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.2.2.4.3.

## 8.8.2.2.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to Table 8.8.2.2.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Tables 8.8.2.2.5-1 as appropriate.
3. Measure the Pm-dsg on monitoring subframes for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval for monitoring subframes. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). Also, count the number of statDTX on the UL PUCCH for unmonitoring subframes and calculate the ratio of (number of statDTX on the UL PUCCH for unmonitoring subframes)/(the number of configured unmonitoring subframes). If Pm-dsg is less than the value specified in table 8.8.2.2.5-1 and the ratio of statDTX on the UL PUCCH for unmonitoring subframes is no less than 99.9%+TT, pass the UE. Otherwise fail the UE.

## 8.8.2.2.4.3 Message contents

### 8.8.2.2.5 Test requirement

For the parameters specified in Table 8.8.2.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.2.2.5-1. EPDCCH subframe monitoring is configured and the subframe monitoring requirement in EPDCCH restricted subframes is no less than statDTX of 99.9%+TT.

**Table 8.8.2.2.5-1: Test requirement Localized EPDCCH with TM9**

							Pm-dsg (%)	SNR (dB)
1	10 MHz	2 ECCE	R.57 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	13.7
2	10 MHz	8 ECCE	R.58 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	2.9

## 8.8.3 Localized transmission with TM10 Type B quasi co-location type

### 8.8.3.1 FDD localized EPDCCH transmission with TM10 Type B quasi co-location type

#### 8.8.3.1.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). In this test, EPDCCH and PCFICH are not tested jointly.

#### 8.8.3.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward supporting EPDCCH with multiple CSI processes on a component carrier within a band with PDSCH transmission mode 10.

#### 8.8.3.1.3 Minimum conformance requirements

For the parameters specified in Table 8.8.3.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.3.1.3-2. In Table 8.8.3.1.3-1, transmission point 1 (TP 1) is the serving cell. The downlink physical setup is accordance with Annex C.3.2.

**Table 8.8.3.1.3-1: Test Parameters for Localized Transmission TM10 Type B quasi co-location type**

Parameter		Unit	Test 1		Test 2	
			TP 1	TP 2	TP 1	TP 2

2	2 ECCE	R.59 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	13.4

The normative reference for this requirement is TS 36.101 [2] clause 8.8.3.1.

#### 8.8.3.1.4 Test description

##### 8.8.3.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Table 8.8.3.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.3.1.4.3.

#### 8.8.3.1.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Table 8.8.3.1.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.1-1 and Table A.3.5.1-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, antenna configuration, the correlation matrix and the SNR according to Table 8.8.3.1.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK+ACK+statDTX). If Pm-dsg is less than the value specified in table 8.8.3.1.5-1, pass the UE. Otherwise fail the UE.

### 8.8.3.1.5 Test requirement

For the parameters specified in Table 8.8.3.1.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.3.1.5-1.

**Table 8.8.3.1.5-1: Test Performance**

Test number	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						Pm-dsg (%)	SNR (dB)
1	2 ECCE	R.59 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	14.3
2	2 ECCE	R.59 FDD	OP.7 FDD	EVA5	2 x 2 Low	1	14.3

### 8.8.3.2 TDD localized EPDCCH transmission with TM10 Type B quasi co-location type

#### 8.8.3.2.1 Test purpose

This test verifies the receiver characteristics of the EPDCCH which are determined by the probability of miss-detection of the Downlink Scheduling Grant (Pm-dsg). In this test, EPDCCH and PCFICH are not tested jointly.

#### 8.8.3.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward supporting EPDCCH with multiple CSI processes on a component carrier within a band with PDSCH transmission mode 10.

#### 8.8.3.2.3 Minimum conformance requirements

For the parameters specified in Table 8.8.3.2.3-1 the average probability of a missed downlink scheduling grant (Pm-dsg) shall be below the specified value in Table 8.8.3.2.3-2. In Table 8.8.3.2.3-1, transmission point 1 (TP1) is the serving cell. The downlink physical setup is accordance with Annex C.3.2.

### 8.8.3.2.4 Test description

#### 8.8.3.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and EPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to 8.8.3.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.8.3.2.4.3.

#### 8.8.3.2.4.2 Test procedure

1. SS transmits PDSCH via EPDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to Table 8.8.3.2.3-2. The details of EPDCCH and PDSCH are specified in Table A.3.10.2-1 and Table A.3.5.2-2 respectively. The SS sends downlink MAC padding bits on the DL RMC.
2. Set the parameters of the propagation condition, the correlation matrix, antenna configuration and the SNR according to Table 8.8.3.2.5-1 as appropriate.
3. Measure the Pm-dsg for a duration sufficient to achieve statistical significance according to Annex G clause G.4. Count the number of NACKs, ACKs and statDTXs on the UL PUCCH during each subtest interval. Pm-dsg is the ratio (statDTX)/(NACK + ACK + statDTX). If Pm-dsg is less than the value specified in table 8.8.3.2.5-1 pass the UE. Otherwise fail the UE.

### 8.8.3.2.5 Test requirement

For the parameters specified in Table 8.8.3.2.3-1 the average probability of a missed downlink scheduling grant (P<sub>m-dsg</sub>) shall be below the specified value in Table 8.8.3.2.5-1.

**Table 8.8.3.2.5-1: Test Performance**

Test number	Aggregation level	Reference Channel	OCNG Pattern	Propagation Condition	Antenna configuration and correlation Matrix	Reference value	
						P <sub>m-dsg</sub> (%)	SNR (dB)
1	2 ECCE	R.59 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	14.5
2	2 ECCE	R.59 TDD	OP.7 TDD	EVA5	2 x 2 Low	1	14.5

## 8.9 Demodulation (Single receiver antenna)

The SNR definition is given in Clause 8.1.1 where the number of receiver antennas  $N_{RX}$  assumed for the minimum performance requirement in this clause is 1.

### 8.9.1 PDSCH

#### 8.9.1.1 FDD and half-duplex FDD (Fixed Reference Channel)

The parameters specified in Table 8.9.1.1-1 are valid for FDD and half-duplex FDD tests unless otherwise stated.

**Table 8.9.1.1-1: Common Test Parameters (FDD and half-duplex FDD)**

Parameter	Unit	Value
Inter-TTI Distance		1
Number of HARQ processes per component carrier	Processes	8
Maximum number of HARQ transmission		4
Redundancy version coding sequence		{0,1,2,3} for QPSK and 16QAM {0,0,1,2} for 64QAM
Number of OFDM symbols for PDCCH per component carrier	OFDM symbols	4 for 1.4 MHz bandwidth, 3 for 3 MHz and 5 MHz bandwidths, 2 for 10 MHz, 15 MHz and 20 MHz bandwidths
Cyclic Prefix		Normal
Precoder update granularity		Frequency domain: 1 PRG Time domain: 1 ms for transmission mode 9

The normative reference for this requirement is TS 36.101 [2] clause 8.9.1.

#### 8.9.1.1.1 Transmit diversity performance (Cell-Specific Reference Symbols)

**Editor's Note: This test case is incomplete. The following items are missing or are incomplete:**

- Connection diagram in Annex A of TS 36.508 is TBD
- Test tolerances are undefined
- The minimum test time need to be added to Annex G
- Applicability spec needs to be updated
- RMCs are TBD

- Test Procedure is TBD

#### 8.9.1.1.1.1 Test purpose

To verify the UE's ability to receive a predefined test signal, representing a multi-path fading channel that is determined by the SNR with a percentage of the information bit throughput for a specified downlink Reference Measurement Channel (RMC) not falling below a specified value for transmission on two antenna ports using transmit diversity.

#### 8.9.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 12 and forward of UE category 0.

#### 8.9.1.1.1.3 Minimum conformance requirements

The requirements are specified in terms of the percentage of information bit throughput for the downlink reference measurement channels specified in Annex A clause [A.3.3.2], with the addition of the relevant parameters in Tables 8.9.1.1-1 and 8.9.1.2.1.3-1 and the downlink physical channel setup according to Table C.3.2-1 in Annex C.3.2.

Using this configuration the fraction of maximum throughput percentage shall meet or exceed the minimum requirements specified in Table 8.9.1.1.3-2 for the specified SNR. For transmit diversity (SFBC) performance with 2 transmitter antennas (SFBC) as specified.

**Table 8.9.1.1.3-1: Test Parameters for Transmit diversity Performance (FRC)**

Parameter		Unit	Test 1
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port		dBm/15kHz	-98
PDSCH transmission mode			2
Note 1: $P_B = 1$ .			

**Table 8.9.1.1.3-2: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE downlink category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.xx FDD	OP.1 FDD	EPA5	2x1 Low	70	9.0	0

#### 8.9.1.1.1.4 Test description

##### 8.9.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 8.9.1.1.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, the faders and AWGN noise sources to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD for antenna configuration 2x1.
2. The parameter settings for the cell are set up according to Tables 8.9.1.1-1 and 8.9.1.1.1.3-1 as appropriate.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 8.9.1.1.1.4.3.

#### 8.9.1.1.1.4.2 Test procedure

FFS

#### 8.9.1.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6.

#### 8.9.1.1.1.5 Test requirement

Table 8.9.1.1.1.3-1 defines the primary level settings.

The fraction of maximum throughput percentage for the downlink reference measurement channels specified in Annex A clause [A.3.3.2] for each throughput test shall meet or exceed the specified value in Table 8.9.1.1.1.5-1 for the specified SNR including test tolerances for all throughput tests.

**Table 8.9.1.1.1.5-1: Minimum performance Transmit Diversity (FRC)**

Test number	Bandwidth and MCS	Reference Channel	OCNG Pattern	Propagation Condition	Correlation Matrix and Antenna Configuration	Reference value		UE downlink category
						Fraction of Maximum Throughput (%)	SNR (dB)	
1	10 MHz 16QAM 1/2	R.xx FDD	OP.1 FDD	EPA5	2x1 Low	70	9.0+T T	0

## 9 Reporting of Channel State Information

### 9.1 General

For the cases in this clause it is expected that the UE will not always detect the PDCCH, resulting in a statDTX for the uplink ACK/NACK transmission. The downlink configuration for evaluating CQI performance does not use retransmission. Therefore any BLER and Throughput calculations must exclude any packets where the UE may have attempted to combine data from more than one transmission due to missed new data indicators from lost PDCCH transmissions. Thus in all test cases in which there are not retransmission (Max number of HARQ transmissions = 1), if the number of consecutive discarded statDTX for any one process is an odd number including one, also discard the next response for that HARQ process regardless whether it is an ACK or NACK. In the calculation of Throughput the discarded ACK / NACK is considered as a statDTX.

This section includes requirements for the reporting of channel state information (CSI). For all test cases in this section,

the definition of SNR is in accordance with the one given in clause 8.1.1, where  $SNR = \frac{\sum \hat{I}_{or}^{(j)}}{\sum N_{oc}^{(j)}}$ .

The fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective test cases.

The UE performance in this section is considered to be operating band independent. Therefore, the required performance in the respective test cases can be verified in one of the operating bands supported by the UE under test. All the test points supported by the bands of the multiband UE (based on channel bandwidth, DL and UL configuration) need to be tested.

For CA testing, unless otherwise stated, the logical carriers PCC / SCC are mapped on physical frequencies as defined in Table 9.1-1.

**Table 9.1-1: PCC/SCCs frequency mapping**

CA Configuration	PCC-SCC mapping	Notes
Intra-band CA	CC1-CC2	1
Inter-band CA (CA_x-y)	Bx-By (if not supported by the UE, then By-Bx)	2
Note 1:	Notation CCi-CCj means PCC on component carrier CCi and SCC on component carrier CCj, with CCi/j frequencies defined in the corresponding intra-band contiguous / non-contiguous CA band in TS 36.508.	
Note 2:	Notation Bi-Bj means PCC on component Band i and SCC on component Band j, with single Band i/j frequencies defined in TS 36.508.	

#### 9.1.1 Applicability of requirements

##### 9.1.1.1 Applicability of requirements for different channel bandwidths

In Clause 9 the test cases may be defined with different channel bandwidth to verify the same CSI requirement.

Test cases defined for 5MHz channel bandwidth that reference this clause are applicable to UEs that support only Band 31.

##### 9.1.1.2 Applicability and test rules for different CA configurations and bandwidth combination sets

The performance requirement for CA CQI tests in Clause 9 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.4.2A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL CCs in Table 9.1.1.2-1. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

**Table 9.1.1.2-1: Applicability and test rules for CA UE CQI tests with 2 DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order	No. of the supported bandwidth combinations to be tested from each selected CA configuration
CA tests with 2CCs in Clause 9.6.1.1_A	Any of one of the supported CA capabilities	Any one of the supported FDD CA configurations	10+10 MHz, 20+20 MHz, 5+5 MHz, and 10MHz+5MHz.	1
CA tests with 2CCs in Clause 9.6.1.2_A	Any of one of the supported CA capabilities with largest aggregated CA bandwidth combination	Any one of the supported TDD CA configurations with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination	1
Note 1: The applicability and test rules are specified in this table, unless otherwise stated.				

**9.1.1.2A Applicability and test rules for different TDD-FDD CA configurations and bandwidth combination sets**

The performance requirement for TDD-FDD CA CQI tests in Clause 9 are defined independent of CA configurations and bandwidth combination sets specified in Clause 5.4.2A.1. For UEs supporting different CA configurations and bandwidth combination sets, the applicability and test rules are defined for the tests for 2 DL TDD-FDD CA in Table 9.1.1.2A-1 and for 3 DL TDD-FDD CA in Table 9.1.1.2A-2. For simplicity, CA configuration below refers to combination of CA configuration and bandwidth combination set.

**Table 9.1.1.2A-1: Applicability and test rules for CA UE CQI tests for TDD-FDD CA with 2DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order
CA tests with 2CCs in Clause 9.6.1.3	Any of one of the supported CA capabilities	Any one of the supported TDD-FDD CA configurations with FDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 2CCs in Clause 9.6.1.4	Any of one of the supported CA capabilities	Any one of the supported TDD-FDD CA configurations with TDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
Note 1: The applicability and test rules are specified in this table, unless otherwise stated.			
Note 2: Number of the supported bandwidth combinations to be tested from each selected CA configuration is 1.			

**Table 9.1.1.2A-2: Applicability and test rules for CA UE CQI tests for TDD-FDD CA with 3DL CCs**

Tests	CA capability where the tests apply	CA configuration from the selected CA capability where the tests apply	CA Bandwidth combination to be tested in priority order
CA tests with 3CCs in Clause 9.6.1.3	Any of one of the supported CA capabilities	Any one of the supported TDD-FDD CA configurations with FDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
CA tests with 3CCs in Clause 9.6.1.4	Any of one of the supported CA capabilities	Any one of the supported TDD-FDD CA configurations with TDD PCell with largest aggregated CA bandwidth combination	Largest aggregated CA bandwidth combination
Note 1:	The applicability and test rules are specified in this table, unless otherwise stated.		
Note 2:	Number of the supported bandwidth combinations to be tested from each selected CA configuration is 1.		

### 9.1.1.3 Test coverage for different number of component carriers

For FDD CA tests specified in 9.6.1.1\_A, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD CA tests specified in 9.6.1.2\_A, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the CA tests with less than the largest number of CCs supported by the UE.

For TDD FDD CA tests specified in 9.6.1.3 and 9.6.1.4, among all supported CA capabilities, if corresponding CA tests with the largest number of CCs supported by the UE are tested, the test coverage can be considered fulfilled without executing the TDD FDD CA tests with less than the largest number of CCs supported by the UE.

## 9.2 CQI Reporting under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [10] clause 7.2. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.2.1 CQI Reporting under AWGN conditions - PUCCH 1-0 (Cell-Specific Reference Symbols)

#### 9.2.1.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0

**Editor's notes: This test case is incomplete and awaiting for RAN4 decision:**

- Some test parameters in Table 9.2.1.1.3-2 are still in square brackets

- The applicability of requirements to and test settings for UE Category 1 is in RAN4 under investigation.

##### 9.2.1.1.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.2.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 8 and forward.

### 9.2.1.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 1$ . For the parameters specified in Table 9.2.1.1.3-1 and Table 9.2.1.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1 FDD / RC.14 FDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1

The applicability of the requirement with 5MHz bandwidth as specified in Table 9.2.1.1.3-2 is defined in clause 9.1.1.1.

**Table 9.2.1.1.3-1: PUCCH 1-0 static test**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10			
PDSCH transmission mode			1			
Downlink power allocation	$\rho_A$	dB	0			
	$\rho_B$	dB	0			
	$\sigma$	dB	0

$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions			1			
Physical channel for CQI reporting			PUCCH Format 2			
PUCCH Report Type			4			
Reporting periodicity		ms	$N_{pd} = 5$			
<i>cqi-pmi-ConfigurationIndex</i>			6			
Note 1: Reference measurement channel RC.14 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.						
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.1.

#### 9.2.1.1.4 Test description

##### 9.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.2.1.1.3-1 and 5MHz for tests defined in Table 9.2.1.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.2.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.1.1.4.3.

##### 9.2.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.1.3-1 for 10MHz tests or Table 9.2.1.1.3-2 for 5MHz tests as appropriate.

2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.1.3-1 for 10MHz or table 9.2.1.1.3-2 for 5MHz for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.2.1.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.2.1.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-0

**Editor's note:** - The applicability of requirements to and test settings for UE Category 1 is in RAN4 under investigation.

##### 9.2.1.2.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based on wideband median CQI-1 and wideband median CQI or the transport format based on wideband median CQI and wideband median CQI +1.

##### 9.2.1.2.2 Test applicability

This test applies to E-UTRA TDD UE release 8 and forward.

##### 9.2.1.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 1$ . For the parameters specified in Table 9.2.1.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1 TDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

ACK/NACK feedback mode			Multiplexing			
Note 1:		Reference measurement channel RC.1 TDD according to clause A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1				
Note 2:		For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 3:		To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.				

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.2.

#### 9.2.1.2.4 Test description

##### 9.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.2.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.1.2.4.3.

## 9.2.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values are in the range (Median CQI - 1)  $\leq$  Median CQI  $\leq$  (Median CQI + 1) then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio (NACK / (ACK + NACK))  $\leq$  0.1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio (NACK / (ACK + NACK)) > 0.1

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio (NACK / (ACK + NACK))  $\leq$  0.1

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.2.1.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.1.3

## 9.2.1.3\_C FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC

## 9.2.1.3\_C.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC (non-MBSFN ABS)

## 9.2.1.3\_C.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes - is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

### 9.2.1.3\_C.1.2 Test applicability

This test applies to E-UTRA FDD UE Category 1-8 - release 10 and forward. Applicability requires support for FGI bit 115.

### 9.2.1.3\_C.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.3\_C.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-1 for Cell 2 and C.3.2-2, the reported CQI value according to RC.2 FDD / RC.6 FDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1. The value of the median CQI obtained by reports in CSI subframe sets  $C_{CSI,0}$  minus the median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  shall be larger than or equal to 2 and less than or equal to 5 in Test 1 and shall be larger than or equal to 0 and less than or equal to 1 in Test 2.

Table 9.2.1.3\_C.1.3-1: PUCCH 1-0 static test (FDD)

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [14].
Note 3:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5]
Note 4:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5]
Note 5:	Cell 1 is the serving cell. Cell 2 is the aggressor cell.
Note 6:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 7:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 9:	Downlink physical channel setup in Cell 2 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.1.5
Note 10:	Reference measurement channel in Cell 1 RC.2 FDD according to Table A.4-1 for UE Category 2-8 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1, and RC.6 FDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1 and A.5.1.2.
Note 11:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 12:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 13:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.3.

#### 9.2.1.3\_C.1.4 Test description

##### 9.2.1.3\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Table 9.2.1.3\_C.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.1.3\_C.1.4.3.

##### 9.2.1.3\_C.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Tables 9.2.1.3\_C.1.3-1 and C.3.3-1 of Annex C.3.3 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for

subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared respectively as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.
4. If Median CQI<sub>0</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$  AND the difference Median CQI<sub>0</sub> minus Median CQI<sub>1</sub> is  $2 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 5$  for Test 1 and  $0 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 1$  for Test 2, then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.3\_C.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.2.1.3\_C.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.3\_C.1.4.2.

## 9.2.1.4

## 9.2.1.4\_C TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC

## 9.2.1.4\_C.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC (non-MBSFN ABS)

## 9.2.1.4\_C.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes - is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

#### 9.2.1.4\_C.1.2 Test applicability

This test applies to E-UTRA TDD UE Category 1-8 release 10 and forward. Applicability requires support for FGI bit115.

#### 9.2.1.4\_C.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.4\_C.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-1 for Cell2 and C.3.2-2, the reported CQI value according to RC.2 TDD / RC.6 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1. The value of the median CQI obtained by reports in CSI subframe sets  $C_{CSI,0}$  minus the median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  shall be larger than or equal to 2 and less than or equal to 5 in Test 1 and shall be larger than or equal to 0 and less than or equal to 1 in Test 2.

Table 9.2.1.4\_C.1.3-1: PUCCH 1-0 static test (TDD)

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [14].
Note 3:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5].
Note 4:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5]
Note 5:	Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell1 and Cell2 is the same.
Note 6:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 7:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS
Note 8:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 9:	Downlink physical channel setup in Cell 2 in accordance with Annex C.3.3 applying OCNB pattern as defined in Annex A.5.2.5.
Note 10:	Reference measurement channel in Cell 1 RC.2 TDD according to Table A.4-1 for UE Category 2-8 with one sided dynamic OCNB Pattern OP.1 TDD as described in Annex A.5.2.1, and RC.6 TDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNB Pattern OP.1/2 TDD as described in Annex A.5.2.1 and Annex A.5.2.2.
Note 11:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 12:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 13:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.4.

#### 9.2.1.4\_C.1.4 Test description

##### 9.2.1.4.\_C.14.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Table 9.2.1.4\_C.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.1.4\_C.1.4.3.

##### 9.2.1.4\_C.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.4\_C.1.3-1 and C.3.3-1 of Annex C.3.3 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for

subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared respectively as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.
4. If Median CQI<sub>0</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$  AND the difference Median CQI<sub>0</sub> minus Median CQI<sub>1</sub> is  $2 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 5$  for Test 1 and  $0 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 1$  for Test 2, then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median-CQI<sub>1</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.4\_C.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.2.1.4\_C.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.4\_C.1.4.2.

## 9.2.1.5

### 9.2.1.5\_E FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feICIC

#### 9.2.1.5\_E.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feICIC (non-MBSFN ABS)

##### 9.2.1.5\_E.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.2.1.5\_E.1.2 Test applicability

This test applies to E-UTRA FDD UE and CRS interference handling - UE Category 2-8 - release 11 and forward. Applicability requires support of FGI bit 115.

##### 9.2.1.5\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.5\_E.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC.2 FDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time.

For test 1, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

Table 9.2.1.5\_E.1.3-1: PUCCH 1-0 static test (FDD)

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [9].
Note 3:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 4:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell 1, Cell 2, and Cell 3 are the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex TS 36.521-1 [10] C.3.3 applying OCN pattern as defined in TS 36.521-1 [10] Annex A.5.1.5
Note 11:	Reference measurement channel in Cell 1 RC.2 FDD according to Table A.4-1 with one sided dynamic OCN Pattern OP.1 FDD as described in Annex A.5.1.1.
Note 12:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 13:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 14:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.5.

### 9.2.1.5\_E.1.4 Test description

#### 9.2.1.5\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 (without faders) for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.2.1.5\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.2.1.5\_E.1.4.3.

#### 9.2.1.5\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.5\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The

UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$ , then continue with step 5, otherwise go to step 8.

For Test1

5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

For Test2

5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0</sub> value and Non-ABS subframes according to the wideband median- CQI<sub>1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 7.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 8, otherwise go to step 11.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC in ABS subframes according to the wideband median-  $CQI_{0+1}$  value and Non-ABS subframes according to the wideband median-  $CQI_{1+2}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 13.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 9.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 10, otherwise go to step 11.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in Non-ABS subframes according to the wideband median-  $CQI_{1+2}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 10, otherwise go to step 11

8. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in ABS subframes according to the wideband median-  $CQI_{0+1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 9, otherwise go to step 11.

9. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in Non-ABS subframes according to the wideband median-  $CQI_{1-1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

10. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in ABS subframes according to the wideband median-  $CQI_{0-1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

11. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC in ABS subframes according to the wideband median-  $CQI_{0-1}$  value, Non-ABS subframes according to the wideband median-  $CQI_{1-1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

12. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 11) for the other SNR point as appropriate. Otherwise fail the UE.13. If both tests have not been done, then repeat the same procedure (For Test1 steps 1 to 8, For Test2 steps 1 to 12) with test conditions according to the table 9.2.1.5\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.1.5\_E.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.5\_E.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.1.6

#### 9.2.1.6\_E TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feICIC

##### 9.2.1.6\_E.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feICIC (non-MBSFN ABS)

##### 9.2.1.6\_E.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

### 9.2.1.6\_E.1.2 Test applicability

This test applies to E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling - UE Category 2-8 - release 11 and forward. Applicability requires support of FGI bit 115.

### 9.2.1.6\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.6\_E.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC.2 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time.

For test 1, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1.

ACK/NACK feedback mode		Multiplexing			Multiplexing		

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [9].
Note 3:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 4:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell 1, Cell 2, and Cell 3 is the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.2.5.
Note 11:	Reference measurement channel in Cell 1 RC.2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.
Note 12:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 13:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 14:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.6.

## 9.2.1.6\_E.1.4 Test description

### 9.2.1.6\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 (without faders) for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.2.1.6\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.2.1.6\_E.1.4.3.

### 9.2.1.6\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.6\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for

subframe set  $C_{\text{CSI},1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for subframe set  $C_{\text{CSI},0}$  and for subframe set  $C_{\text{CSI},1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{\text{CSI},0}$  and for subframe set  $C_{\text{CSI},1}$ . Calculate respectively the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{\text{CSI},0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{\text{CSI},1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$  AND the difference Median CQI<sub>0</sub> minus Median CQI<sub>1</sub> is  $2 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 5$  for Test 1 and  $0 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 1$  for Test 2, then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{\text{RNTI}}$  to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{\text{RNTI}}$  to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{\text{RNTI}}$  to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.6\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.1.6\_E.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.16\_E.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.2 CQI Reporting under AWGN conditions - PUCCH 1-1 (Cell-Specific Reference Symbols)

### 9.2.2.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1

#### 9.2.2.1.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

#### 9.2.2.1.2 Test applicability

This test applies to E-UTRA FDD release 8 and forward UEs of Category 2 and onwards.

#### 9.2.2.1.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.2.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2.2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

The normative reference for this requirement is TS 36.101 [2] clause 9.2.2.1.

#### 9.2.2.1.4 Test description

##### 9.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.2.2.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.2.1.4.3.

## 9.2.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.2.1.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≥ 0.1 for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.2.2.1.4.3 Message contents

### 9.2.2.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.2.1\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.1\_D.4.2.

[TT TBD]

## 9.2.2.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1

### 9.2.2.2.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 - 1$  and wideband median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 + 1$  and wideband median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

### 9.2.2.2.2 Test applicability

This test applies to E-UTRA TDD release 8 and forward UEs of Category 2 and onwards.

### 9.2.2.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.2.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2.2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as:

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

Table 9.2.2.3-1: PUCCH 1-1 static test (TDD)

<p>Note 1: Reference measurement channel RC.2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p> <p>Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.2.2.

#### 9.2.2.2.4 Test description

##### 9.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.2.2.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.2.2.4.3.

#### 9.2.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.2.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.2.2.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.  
  
If the ratio (NACK /ACK + NACK ) ≤ 0.1  
  
then, and go to step 6, otherwise go to step 7.
6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK)  $\geq$  0.1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.2.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.2.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.3 CQI Reporting under AWGN conditions - PUCCH 1-1 (CSI Reference Symbols)

#### 9.2.3.1\_D FDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO

##### 9.2.3.1\_D.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

##### 9.2.3.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 9.2.3.1\_D.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.3.1\_D.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2 -2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as:

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

PUCCH Report Type for CQI/PMI			2			
Physical channel for RI reporting			PUCCH Format 2			
PUCCH Report Type for RI			3			
Reporting periodicity		ms	$N_{pd} = 5$			
CQI delay		ms	8			
<i>cqi-pmi-ConfigurationIndex</i>			2			
<i>ri-ConfigIndex</i>			1			
<p>Note 1: Reference measurement channel RC.7 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.3.1.

### 9.2.3.1\_D.4 Test description

#### 9.2.3.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.2.3.1\_D.3-1.

3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.3.1\_D.4.3.

#### 9.2.3.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.3.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.3.1\_D.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≥ 0.1 for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.3.1\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.3.1\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.3.1\_D.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.3.2\_D TDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO

#### 9.2.3.2\_D.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

#### 9.2.3.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO. Applicability requires support for FGI bit 104.

#### 9.2.3.2\_D.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 2$ . The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the

transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

For the parameters specified in table 9.2.3.2\_D.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2 -2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

PUCCH Report Type for RI/ first PMI			5			
Reporting periodicity		ms	$N_{pd} = 5$			
CQI delay		ms	10 or 11			
<i>cqi-pmi-ConfigurationIndex</i>			3			
<i>ri-ConfigIndex</i>			805 (Note 4)			
ACK/NACK feedback mode			Multiplexing			
Note 1: Reference measurement channel RC.7 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.						
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						
Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.						
Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.3.2.

### 9.2.3.2\_D.4 Test description

#### 9.2.3.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure 47.
2. The parameter settings for the cell are set up according to Table 9.2.3.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.3.2\_D.4.3.

#### 9.2.3.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.3.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.3.2\_D.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1

then, and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports

from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≥ 0.1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.3.2\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

9.2.3.2\_D.4.3 Message contents

### 9.2.3.2\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.3.2\_D.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.4 CQI Reporting under AWGN conditions - Single CSI Process

### 9.2.4.1\_F FDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP

#### 9.2.4.1\_F.1 Test purpose

To verify compliance to the minimum requirements for dual codeword transmission being defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*.

#### 9.2.4.1\_F.2 Test applicability

This test applies to all types of E-UTRA FDD category 2-8 UEs release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.2.4.1\_F.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

For the parameters specified in table 9.2.4.1\_F-1, and using the downlink physical channels specified in tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband CQI<sub>1</sub> shall be within the set {median CQI<sub>1</sub> -1, median CQI<sub>1</sub>, median CQI<sub>1</sub> +1} for more than 90% of the time, where the resulting wideband values CQI<sub>1</sub> shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median CQI<sub>0</sub> - 1 and median CQI<sub>1</sub> - 1 shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median CQI<sub>0</sub> + 1 and median CQI<sub>1</sub> + 1 shall be greater than or equal to 0.1.

Table 9.2.4.1\_F.3-1: PUCCH 1-1 static test (FDD)

Note 2:	REs for antenna ports 0 and 1 CRS have zero transmission power.						
Note 3:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						
Note 4:	N/A						
Note 5:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.						

#### 9.2.4.1\_F.4 Test description

##### 9.2.4.1\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and AWGN noise source(s) to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A. Figure 52 (without faders).
2. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.4 and uplink signals according to Annex H.1 and H.3.2.
3. Propagation conditions are set according to Annex B.0.
4. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.4.1\_F.4.3.

##### 9.2.4.1\_F.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.4.1\_F.3-1 as appropriate.
2. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.4.1\_F.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median CQI<sub>0</sub> - 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub> - 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $NACK / (ACK + NACK) \leq 0.1$  for both codeword #0 and codeword #1 then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $NACK / (ACK + NACK) \geq 0.1$  for both codeword #0 and codeword #1 then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.4.1\_F.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.4.1\_F.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.4.1\_F.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.4.2\_F TDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP

### 9.2.4.2\_F.1 Test purpose

To verify compliance to the minimum requirements for dual codeword transmission being defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*.

### 9.2.4.2\_F.2 Test applicability

This test applies to all types of E-UTRA TDD category 2-8 UEs release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

### 9.2.4.2\_F.3 Minimum conformance requirements

The following requirements apply to UE Category 2-8. For the parameters specified in table 9.2.4.2\_F.3-1, and using the downlink physical channels specified in tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.2.4.2\_F.3-1: PUCCH 1-1 static test (TDD)

Reporting periodicity		ms	$N_{pd} = 5$	N/A		$N_{pd} = 5$	N/A	
CQI Delay		ms	10 or 11	N/A		10 or 11	N/A	
cqi-pmi-ConfigurationIndex			3	N/A		3	N/A	
ri-ConfigIndex			805 (Note 6)	N/A		805 (Note 6)	N/A	
ACK/NACK feedback mode			Multiplexing	N/A		Multiplexing	N/A	
PDSCH scheduled sub-frames			3,4,8,9			3,4,8,9		
Timing offset between TPs		us	0			0		
Frequency offset between TPs		Hz	0			0		

Note 1:	Reference measurement channel RC.10 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.
Note 2:	REs for antenna ports 0 and 1 CRS have zero transmission power.
Note 3:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 4:	N/A
Note 5:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.
Note 6:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.

The normative reference for this requirement is TS 36.101 clause 9.2.4.2.

#### 9.2.4.2\_F.4 Test description

##### 9.2.4.2\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.53(without faders).
2. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.4 and uplink signals according to Annex H.1 and H.3.2.
3. Propagation conditions are set according to Annex B.0.
4. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.4.2\_F.4.3.

##### 9.2.4.2\_F.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.4.2\_F.3-1 as appropriate.
2. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe # 2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI0 is defined as Wideband CQI of codeword #0 and wideband CQI1 is calculated according to clause 9.2.4.2\_F.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI0 is based on the wideband CQI0 and wideband median CQI1 is based on the wideband CQI1.

4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI1 values are in the range  $(\text{Median CQI1} - 1) \leq \text{Median CQI} \leq (\text{Median CQI1} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI0 - 1 and the transport format of codeword #1 is according to the wideband median CQI1 -- 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $\text{NACK} / (\text{ACK} + \text{NACK}) \leq 0.1$  for both codeword #0 and codeword #1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband medianCQI0 + 1 and the transport format of codeword #1 is according to the wideband median-CQI1 + 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $\text{NACK} / (\text{ACK} + \text{NACK}) \geq 0.1$  for both codeword #0 and codeword #1 then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.4.2\_F.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.4.2\_F.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.4.2\_F.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.3 CQI Reporting under fading conditions

### 9.3.1 Frequency-selective scheduling mode

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective fading conditions is determined by a double-sided percentile of the reported differential CQI offset level 0 per sub-band, and the relative increase of the throughput obtained when transmitting on any one of the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any

sub-band in set of TS 36.213 [10]. To account for sensitivity of the input SNR the sub-band CQI reporting under frequency selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.1.1 CQI Reporting under fading conditions – PUSCH 3-0 (Cell-Specific Reference Symbols)

#### 9.3.1.1.1 FDD CQI Reporting under fading conditions – PUSCH 3-0

##### 9.3.1.1.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

##### 9.3.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.3.1.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.1.1.1.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI.

**Table 9.3.1.1.1.3-1: Sub-band test for single antenna transmission (FDD)**

#### 9.3.1.1.1.4 Test description

##### 9.3.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.1.1.1.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.1.1.4.3.

#### 9.3.1.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 \cdot \beta \% / 100$ ". (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.1.1.1.5 Test requirement

**Table 9.3.1.1.5-1: Test requirement (FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.1.2 TDD CQI Reporting under fading conditions – PUSCH 3-0

## 9.3.1.1.2.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

## 9.3.1.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.1.1.2.3-2 and by the following

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;

- c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance].

#### 9.3.1.1.2.4 Test description

##### 9.3.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.1.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.1.2.4.3.

#### 9.3.1.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.1.2.3-1 for the other test as appropriate.

#### 9.3.1.2.1\_D.4 Test description

##### 9.3.1.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.3.1.2.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.2.1\_D.4.3.

#### 9.3.1.2.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.2.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 * \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 * \beta \% / 100$ ". (2000= No of full-size subband reports, 100 because of %) If yes, continue with step 5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and  $(\text{NACK} / (\text{ACK} + \text{NACK})) \geq 0.05$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.2.1\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.1.2.1\_D.5 Test requirement

Table 9.3.1. 2.1.5-1: Test requirement (FDD)

Parameter	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	40	40
$\gamma$	1.09	1.09
UE Category	1-8	1-8
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.2.2\_D TDD CQI Reporting under fading conditions – PUSCH 3-1 for eDL MIMO

## 9.3.1.2.2\_D.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

#### 9.3.1.2.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that supports eDL MIMO. Applicability requires support for FGI bit 103.

#### 9.3.1.2.2\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.2.2\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.2\_D.3-2 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha\%$  of the time but less than  $\beta\%$  for each sub-band;
- b) the ratio of the throughput obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI.

#### 9.3.1.2.2\_D.4 Test description

##### 9.3.1.2.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.3.1.2.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.2.2\_D.4.3.

#### 9.3.1.2.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.2.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 10 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.2.2\_D.3-1 for the other test as appropriate.

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.1.3 CQI Reporting under fading conditions – PUSCH 3-0 (Cell-Specific Reference Symbols)

#### 9.3.1.3.1

##### 9.3.1.3.1\_E FDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC

##### 9.3.1.3.1\_E.1 FDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC (non-MBSFN ABS)

###### 9.3.1.3.1\_E.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

###### 9.3.1.3.1\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling release 11 and forward. Applicability requires support of FGI bit 115.

###### 9.3.1.3.1\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.3.1\_E.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.3.1\_E.1.3-2 and by the following

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput in ABS subframes obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to  $\epsilon$ .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. T

#### 9.3.1.3.1\_E.1.4 Test description

##### 9.3.1.3.1\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.54 for antenna configuration 1x2.
2. The parameter settings for the cell are set up according to Table 9.3.1.3.1\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.3.1.3.1\_E.1.4.3.

#### 9.3.1.3.1\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.3.1\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband for subframe set  $C_{CSL0}$  have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 10 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSL0}$ . Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI<sub>0</sub>.
4. Check if “ $2000 * \alpha \% / 100 \leq \text{number of CQI reports with index 0 for each full-size subband} \leq 2000 * \beta \% / 100$ ”. (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the wideband Median CQI<sub>0</sub> in each downlink transmission instance randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq \varepsilon$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.3.1\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.1.3.1\_E.1.5 Test requirement

**Table 9.3.1.3.1\_E.1.5-1: Test requirement (FDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
$\varepsilon$	0.01	0.01
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.3.2

## 9.3.1.3.2\_E TDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC

## 9.3.1.3.2\_E.1 TDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC (non-MBSFN ABS)

## 9.3.1.3.2\_E.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.3.2\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling release 11 and forward. Applicability requires support of FGI bit 115.

## 9.3.1.3.2\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.3.2\_E.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.3.2\_E.1.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput in ABS subframes obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to  $\epsilon$ .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.6.

**Table 9.3.1.3.2\_E.1.3-1: Sub-band test for single antenna transmission (TDD)**

#### 9.3.1.3.2\_E.1.4 Test description

##### 9.3.1.3.2\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.54 for antenna configuration 1x2.
2. The parameter settings for the cell are set up according to Table 9.3.1.3.2\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.3.1.3.2\_E.1.4.3.

## 9.3.1.3.2\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.3.2\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to CQI value 8 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband for subframe set C<sub>CSI,0</sub> have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 10 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set C<sub>CSI,0</sub>. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI<sub>0</sub>.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the wideband Median CQI<sub>0</sub> in each downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS and (NACK/(ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK/(ACK + NACK))  $\geq 0.05$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.3.2\_E.1.3-1 for the other test as appropriate.

## 9.3.1.3.2\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

## 9.3.1.3.2\_E.1.5 Test requirement

**Table 9.3.1.3.2\_E.1.5-1: Test requirement (TDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
$\varepsilon$	0.01	0.01
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.2 Frequency non-selective scheduling mode

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective fading conditions is determined by the reporting variance, and the relative increase of the throughput obtained when the transport format transmitted is that indicated by the reported CQI compared to the case for which a fixed transport format configured according to the reported median CQI is transmitted. In addition, the reporting accuracy is determined by a minimum BLER using the transport formats indicated by the reported CQI. To account for sensitivity of the input SNR the CQI reporting under frequency non-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.2.1 CQI Reporting under fading conditions – PUCCH 1-0 (Cell-Specific Reference Symbols)

#### 9.3.2.1.1 FDD CQI Reporting under fading conditions – PUCCH 1-0

##### 9.3.2.1.1.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling

##### 9.3.2.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 8 and forward of UE category  $\geq 2$ .

##### 9.3.2.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.1.1.3-1 and Table 9.3.2.1.1.3-3, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.2.1.1.3-2 and Table 9.3.2.1.1.3-4 and by the following:

- a) CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha$  % of the time;
- b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02

The applicability of the requirement with 5MHz bandwidth as specified in Table 9.3.2.1.1-3 and Table 9.3.2.1.1-4 is defined in clause 9.1.1.1.

**Table 9.3.2.1.1.3-1 Fading test for single antenna (FDD)**

The normative reference for this requirement is TS 36.101 [2] clause 9.3.2.1.1.

#### 9.3.2.1.1.4 Test description

##### 9.3.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.3.2.1.1.3-1 and 5MHz for tests defined in Table 9.3.2.1.1.3-2, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.2.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.1.1.4.3.

#### 9.3.2.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.1.1.3-1 for 10MHz tests or Table 9.3.2.1.1.3-2 for 5MHz tests as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 100000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 2 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 100000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.  
If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  is greater or equal to 0.02, then pass the UE for this test and go to step 8. Otherwise go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.1.1.3-1 for 10MHz or table 9.3.2.1.1.3-2 for 5MHz for the other Test as appropriate. Otherwise pass the UE.

## 9.3.2.1.1.5 Test requirement

The applicability of the test requirement with 5MHz bandwidth as specified in Table 9.3.2.1.5-2 is defined in clause 9.1.1.1.

**Table 9.3.2.1.1.5-1: Test requirement (10MHz FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE category	2-8	2-8

**Table 9.3.2.1.1.5-2: Minimum requirement (5MHz FDD)**

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE Category	2-8	2-8

To pass the test,  $\alpha$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.2.1.1\_1 FDD CQI Reporting under fading conditions - PUCCH 1-0 (Release 9 and forward)

#### 9.3.2.1.1\_1.1 Test purpose

Same test purpose as in clause 9.3.2.1.1.1.

#### 9.3.2.1.1\_1.2 Test applicability

This test applies to E-UTRA FDD UE release 9 and forward of UE category 1.

#### 9.3.2.1.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.2.1.1.3.

#### 9.3.2.1.1\_1.4 Test description

##### 9.3.2.1.1\_1.4.1 Initial conditions

Same initial conditions as in clause 9.3.2.1.1.4.1.

##### 9.3.2.1.1\_1.4.2 Test procedure

Same test procedure as in clause 9.3.2.1.1.4.2.

##### 9.3.2.1.1\_1.4.3 Message contents

Same message contents as in clause 9.3.2.1.1.4.3.

##### 9.3.2.1.1\_1.5 Test requirement

Same test requirements as in clause 9.3.2.1.1.5 with the following exceptions:

Instead of table 9.3.2.1.1.5.1-> use table 9.3.2.1.1\_1.5-1 below for 10MHz bandwidth tests:

**Table 9.3.2.1.1\_1.5-1: Test requirement (FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE category	1	1

Or instead of table 9.3.2.1.1.5.2-> use table 9.3.2.1.1\_1.5-2 below for 5MHz bandwidth tests:

**Table 9.3.2.1.1\_1.5-2: Test requirement (5MHz FDD)**

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE Category	1	1

### 9.3.2.1.2 TDD CQI Reporting under fading conditions – PUCCH 1-0

#### 9.3.2.1.2.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the transport format according to the prevailing channel state for frequently non-selective scheduling

#### 9.3.2.1.2.2 Test applicability

This test applies to E-UTRA TDD UE release 8 and forward of UE category  $\geq 2$ .

#### 9.3.2.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.2.1.2.3-2 and by the following

- a) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha\%$  of the time;
- b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02

**Table 9.3.2.1.2.3-1: Fading test for single antenna (TDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10 MHz			
Transmission mode			1 (port 0)

Physical channel for CQI reporting			PUSCH (Note 4)			
PUCCH Report Type			4			
cqi-pmi-ConfigurationIndex			3			
Max number of HARQ transmissions			1			
ACK/NACK feedback mode			Multiplexing			
<p>Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4)</p> <p>Note 2: Reference measurement channel RC.1 TDD according to Table A.4-1 for Category 2-8 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1 and RC.4 TDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.</p> <p>Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 4: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p>						

**Table 9.3.2.1.2.3-2: Minimum requirement (TDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.05	1.05
UE Category	1-8	1-8

The normative reference for this requirement is TS 36.101 [2] clause 9.3.2.1.2.

#### 9.3.2.1.2.4 Test description

##### 9.3.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.2.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.1.2.4.3.

##### 9.3.2.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH Continue transmission of the PDSCH until 100000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 100000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.

If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(NACK / (ACK + NACK))$  is greater or equal to 0.02, then pass the UE and go to step 8. Otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.1.2.3-1 for the other test as appropriate.

9.3.2.2.1\_D.4 Test description

9.3.2.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.2.2.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.2.1\_D.4.3.

#### 9.3.2.2.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.2.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 2000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  is greater or equal to 0.02, then pass the UE for this test and go to step 8. Otherwise go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.2.1\_D.3-1 for the other test as appropriate.

## 9.3.2.2.1\_D.5 Test requirement

**Table 9.3.2.2.1\_D.3-2: Test requirement (FDD)**

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
UE Category	2-8	2-8
BLER	0.02	0.02

To pass the test,  $\alpha$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.2.2.2\_D TDD CQI Reporting under fading conditions – PUCCH 1-1 for eDL-MIMO

## 9.3.2.2.2\_D.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling.

## 9.3.2.2.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward of Category 2-8 that support eDL-MIMO. Applicability requires support for FGI bits 104 and 110.

## 9.3.2.2.2\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.2.2\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.2.2.2\_D.3-2 and by the following:

- CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha$  % of the time;
- The ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- When transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

#### 9.3.2.2.2\_D.4 Test description

##### 9.3.2.2.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure 47.
2. The parameter settings for the cell are set up according to Table 9.3.2.2.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.2.2\_D.4.3.

##### 9.3.2.2.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.2.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 2000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the

sequence of responses for each HARQ process, discard all the statDTX responses.

If the ratio ( $t_{wideband} / t_{median}$ )  $\geq \gamma$  and ratio (NACK / (ACK + NACK)) is greater or equal to 0.02, then pass the UE and go to step 8. Otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.2.2\_D.3-1 for the other test as appropriate.

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
UE Category	2-8	2-8
BLER	0.02	0.02

To pass the test,  $\alpha$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.3 Frequency-selective interference

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective interference conditions is determined by a double-sided percentile of the reported differential CQI offset level +2 for a preferred sub-band, and the relative increase of the throughput obtained when transmitting on any one of the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any sub-band in set of TS 36.213 [10]. The purpose is to verify that preferred sub-bands are used for frequently-selective scheduling under frequency-selective interference conditions.

### 9.3.3.1 CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0 (Cell-Specific Reference Symbols)

#### 9.3.3.1.1 FDD CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0

##### 9.3.3.1.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling with frequency-selective interference situation.

##### 9.3.3.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.3.3.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.3.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.3.1.1.3-2 and by the following:

- a) a sub-band differential CQI offset level of +2 shall be reported at least  $\alpha$  % for at least one of the sub-bands of full size at the channel edges;
- b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

**Table 9.3.3.1.1.3-1 Sub-band test for single antenna transmission (FDD)**

#### 9.3.3.1.1.4 Test description

##### 9.3.3.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, interfering source and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.21.
2. The parameter settings for the cell are set up according to Table 9.3.3.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.3.1.1.4.3.

#### 9.3.3.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.3.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If for at least one of the full-size subbands at the channel edges, a subband differential CQI offset level of +2 is reported in  $\alpha$  % or more of 2000 reports, then continue with step 5, otherwise fail the UE.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on an each TTI randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3.

Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.  
If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.3.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

$\gamma$	1.50	1.50

## 9.3.3.1.2 TDD CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0

## 9.3.3.1.2.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling with frequency-selective interference situation.

## 9.3.3.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

## 9.3.3.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.3.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.3.1.2.3-2 and by the following:

- a sub-band differential CQI offset level of +2 shall be reported at least  $\alpha$  % for at least one of the sub-bands of full size at the channel edges;
- the ratio of the throughput obtained when transmitting on any one of the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

**Table 9.3.3.1.2.3-1: Sub-band test for single antenna transmission (TDD)**

Parameter	Unit	Test 1	Test 2

#### 9.3.3.1.2.4 Test description

##### 9.3.3.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and interfering source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.21.
2. The parameter settings for the cell are set up according to Table 9.3.3.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.3.1.2.4.3.

#### 9.3.3.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.3.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If for at least one of the full-size subbands at the channel edges, a subband differential CQI offset level of +2 is reported in  $\alpha$  % or more of 2000 reports, then continue with step 5, otherwise fail the UE.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in an each available downlink transmission instance randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval. If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise fail the UE.

7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.3.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

Parameter	Test 1	Test 2
$\alpha$ [%]	40	40
$\gamma$	1.50	1.50

### 9.3.4 UE-selected subband CQI

The accuracy of UE-selected subband channel quality indicator (CQI) reporting under frequency-selective fading conditions is determined by the relative increase of the throughput obtained when transmitting on the UE-selected subbands with the corresponding transport format compared to the case for which a fixed format is transmitted on any subband in set  $S$  of TS 36.213 [10]. The purpose is to verify that correct subbands are accurately reported for frequency-selective scheduling. To account for sensitivity of the input SNR the subband CQI reporting under frequency-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.4.1 CQI Reporting under fading conditions – PUSCH 2-0 (Cell-Specific Reference Symbols)

#### 9.3.4.1.1 FDD CQI Reporting under fading conditions – PUSCH 2-0

##### 9.3.4.1.1.1 Test purpose

To verify that UE-selected sub-bands can be used for frequently-selective scheduling.

##### 9.3.4.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward. Applicability requires support for FGI bit 1.

##### 9.3.4.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.4.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.4.1.1.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting on a randomly selected subband among the best  $M$  subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each TTI for FDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the  $N_{PRB}$  entry in Table 7.1.7.2.1-1 of TS 36.213 [10] that corresponds to the subband size.

#### 9.3.4.1.1.4 Test description

##### 9.3.4.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.1.1.4.3.

##### 9.3.4.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in one full-size subband selected among the M subbands reported by the UE and with the corresponding TBS. Differential CQI offset level is selected from {1, 2, 3, 4}. Note that the SS shall send PDSCH in the same full-size subband until

next UE report is available. In case when same full-size subbands are reported subsequently, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.

Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 5) with test conditions according to the table 9.3.4.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

9.3.4.1.2 TDD CQI Reporting under fading conditions – PUSCH 2-0

9.3.4.1.2.1 Test purpose

To verify that UE-selected sub-bands can be used for frequently-selective scheduling.

9.3.4.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward. Applicability requires support for FGI bit 1.

9.3.4.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.4.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.4.1.2.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting on a randomly selected subband among the best  $M$  subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each available downlink transmission instance for TDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the  $N_{PRB}$  entry in Table 7.1.7.2.1-1 of TS 36.213 [10] that corresponds to the subband size.

**Table 9.3.4.1.2.3-1: Sub-band test for single antenna transmission (TDD)**

Parameter		Unit	Test 1		Test 2

#### 9.3.4.1.2.4 Test description

##### 9.3.4.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.1.2.4.3.

##### 9.3.4.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in one full-size subband selected among the M subbands reported by the UE and with the corresponding TBS. Differential CQI offset level is selected from {1, 2, 3, 4}. Note that the SS shall send PDSCH in the same full-size until next UE report is available. In case when same full-size subbands are reported subsequently, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .

Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.4.2.1.4 Test description

##### 9.3.4.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.2.1.4.3.

##### 9.3.4.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. In this process the SS collects wideband CQI reports and also cases where UE transmits nothing in its wideband CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in the full-size subband reported by the UE and with the corresponding TBS. When the UE reports a non-full-size SB, the SS schedules the recent reported SB for bandwidth part with  $j=1$  and with the corresponding TBS. Note that the SS shall send PDSCH in the same full-size subband until next subband UE report is available. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.4.2.2.4 Test description

##### 9.3.4.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.2.2.4.3.

##### 9.3.4.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.2.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. In this process the SS collects wideband CQI reports and also cases where UE transmits nothing in its wideband CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in the full-size subband reported by the UE and with the corresponding TBS. When the UE reports a non-full-size SB, the SS schedules the recent reported SB for bandwidth part with  $j=1$  and with the corresponding TBS. Note that the SS shall send PDSCH in the same full-size subband until next subband UE report is available. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput

according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.2.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.5 Additional requirements for enhanced receiver Type A

### 9.3.5.1 PUCCH 1-0 (Cell-Specific Reference Symbol)

#### 9.3.5.1.1 FDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A

##### 9.3.5.1.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

##### 9.3.5.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support enhanced receiver Type A.

##### 9.3.5.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.1.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

**Table 9.3.5.1.1.3-1: Fading test for single antenna (FDD)**

Parameter	Unit	Cell 1	Cell 2

**Table 9.3.5.1.1.3-2: Minimum requirement (FDD)**

$\gamma$	1.8
UE Category	1-8

The normative reference for this requirement is TS 36.101 [2] clause 9.3.5.1.1.

#### 9.3.5.1.1.4 Test description

##### 9.3.5.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.50.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.1.1.4.3.

##### 9.3.5.1.1.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.1.3-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .
5. If the ratio  $(t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}) \geq \gamma$  and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

### 9.3.5.1.2 TDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A

#### 9.3.5.1.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

#### 9.3.5.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support enhanced receiver Type A.

#### 9.3.5.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.1.2.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

**Table 9.3.5.1.2.3-1: Fading test for single antenna (TDD)**

#### 9.3.5.1.2.4 Test description

##### 9.3.5.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.50.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.1.2.4.3.

##### 9.3.5.1.2.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.2.3-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .
5. If the ratio  $(t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}) \geq \gamma$  and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

### 9.3.5.2 PUCCH 1-1 (CSI Reference Symbol)

#### 9.3.5.2.1 FDD CQI Reporting under fading conditions - PUCCH 1-1 - Enhanced Performance Requirement Type A

##### 9.3.5.2.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

##### 9.3.5.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward of Category 2-8 that support enhanced receiver Type A.

##### 9.3.5.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.2.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.2.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

**Table 9.3.5.2.1.3-1: Fading test for single antenna (FDD)**

#### 9.3.5.2.1.4 Test description

##### 9.3.5.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.51.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.2.1.5-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.2.1.4.3.

##### 9.3.5.2.1.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.1.5-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.1.5-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .

5. If the ratio ( $t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}$ )  $\geq \gamma$  in Table 9.3.5.2.1.5-2 and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

### 9.3.5.2.2 TDD CQI Reporting under fading conditions - PUCCH 1-1 - Enhanced Performance Requirement Type A

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

**- Message contents are FFS**

#### 9.3.5.2.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

#### 9.3.5.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward of Category 2-8 that support enhanced receiver Type A.

#### 9.3.5.2.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.2.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in 9.3.5.2.2.3-2 and by the following

- the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

PUCCH Report Type for RI		3	N/A
<i>cqi-pmi-ConfigurationIndex</i>		3	N/A
<i>ri-ConfigIndex</i>		805 (Note 9)	N/A
Max number of HARQ transmissions		1	N/A
ACK/NACK feedback mode		Multiplexing	N/A
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4)		
Note 2:	Reference measurement channel RC.11 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.		
Note 3:	To avoid collisions between CQI/ PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#2 and #7.		
Note 4:	The respective received power spectral density of each interfering		

	cell relative to $N_{oc}$ is defined by its associated DIP value as specified in clause B.5.1.
Note 5:	Two cells are considered in which Cell 1 is the serving cell and Cell 2 is the interfering cell. Interfering cell is fully loaded.
Note 6:	Both cells are time-synchronous.
Note 7:	Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present.
Note 8:	SINR corresponds to $\hat{E}_s/N_{oc}$ of Cell 1 as defined in clause 8.1.1.
Note 9:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification and the reported CQI in subframe SF#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.

**Table 9.3.5.2.3-2: Minimum requirement (TDD)**

#### 9.3.5.2.2.4 Test description

##### 9.3.5.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.51.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.2.2.5-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.2.2.4.3.

##### 9.3.5.2.2.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.2.5-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as

$t_{\text{wideband\_interference}}$  · The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.

3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.2.5-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as

$t_{\text{wideband\_gaussian\_noise}}$  ·

5. If the ratio ( $t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}$ )  $\geq \gamma$  in Table 9.3.5.2.2.5-2 and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

## 9.3.6 CQI Reporting under fading conditions (With multiple CSI processes)

### 9.3.6.1\_F FDD CQI Reporting under fading conditions with CSI processes for CoMP

#### 9.3.6.1\_F.1 FDD CQI Reporting under fading conditions with Single CSI process for CoMP

##### 9.3.6.1\_F.1.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for single CSI process.

##### 9.3.6.1\_F.1.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

##### 9.3.6.1\_F.1.3 Minimum conformance requirements

Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.3.6.1\_F.1.3-1. For UE supports one CSI process, CSI process 2 is configured and the corresponding requirements shall be fulfilled. For UE supports three CSI processes, CSI processes 0, 1 and 2 are configured and the corresponding requirements shall be fulfilled. For UE supports four CSI processes, CSI processes 0, 1, 2 and 3 are configured and the corresponding requirements shall be fulfilled. And the Table 9.3.6.1\_F.1.3-1 is valid for FDD and TDD.

**Table 9.3.6.1\_F.1.3-1: Configuration of CSI processes**

	CSI process 0	CSI process 1	CSI process 2	CSI process 3
CSI-RS resource	CSI-RS signal 0	CSI-RS signal 1	CSI-RS signal 0	CSI-RS signal 1
CSI-IM resource	CSI-IM resource 0	CSI-IM resource 0	CSI-IM resource 1	CSI-IM resource 2

For the parameters specified in Table 9.3.6.1\_F.1.3-2, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.1\_F.1.3-3 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha\%$  of the time but less than  $\beta\%$  for each sub-band for CSI process 1, 2, or 3;
- b) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\delta\%$  of the time for CSI process 0;
- c) the difference of the median CQIs of the reported wideband CQI for configured CSI processes shall be greater or equal to the values as in Table 9.3.6.1\_F.1.3-4;
- d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

#### 9.3.6.1\_F.1.4 Test description

##### 9.3.6.1\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.1.4.3.

##### 9.3.6.1\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for CSI process 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback for CSI process 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 * \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 * \beta \% / 100$ ” for CSI process 2. (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.6.1\_F.1.5 Test requirement

**Table 9.3.6.1\_F.1.5-1: Test requirement (FDD)**

	CSI process 2
$\alpha$ [%]	2
$\beta$ [%]	40
$\delta$ [%]	N/A
$\gamma$	1.01
UE Category	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

## 9.3.6.1\_F.2 FDD CQI Reporting under fading conditions with Three CSI processes for CoMP

## 9.3.6.1\_F.2.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Three CSI processes.

## 9.3.6.1\_F.2.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of Three on a component carrier within a band with PDSCH transmission mode 10.

## 9.3.6.1\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.1\_F.1.3.

### 9.3.6.1\_F.2.4 Test description

#### 9.3.6.1\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.2.4.3.

#### 9.3.6.1\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for each of CSI process 0, 1 and 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback for CSI process 1 and 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 \cdot \beta \% / 100$ " for CSI process 1 and 2. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1 and 2 shall be greater or equal to the values as in Table 9.3.6.1\_F.2.5-2. ( $2000 = \text{No of full-size subband reports, } 100 \text{ because of } \%$ ). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and  $(NACK / (ACK + NACK)) \geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

$\gamma$	N/A	N/A	1.01
UE Category	$\geq 1$		

**Table 9.3.6.1\_F.2.5-2: Minimum median CQI difference between configured CSI processes (FDD)**

	CSI process 1	CSI process 2
CSI process 0	N/A	1
UE Category	$\geq 1$	

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

### 9.3.6.1\_F.3 FDD CQI Reporting under fading conditions with Four CSI processes for CoMP

#### 9.3.6.1\_F.3.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Four CSI processes.

#### 9.3.6.1\_F.3.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.3.6.1\_F.3.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.1\_F.1.3.

#### 9.3.6.1\_F.3.4 Test description

##### 9.3.6.1\_F.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.3.4.3.

##### 9.3.6.1\_F.3.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for each of CSI process 0, 1, 2, and 3. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback for CSI process 1, 2, and 3 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 * \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 * \beta \% / 100$ ” for CSI process 1, 2 and 3. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 * \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1, 2 and 3 shall be greater or equal to the values as in Table 9.3.6.1\_F.3.5-2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and  $(NACK / (ACK + NACK)) \geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.6.1\_F.3.5 Test requirement

Table 9.3.6.1\_F.3.5-1: Test requirement (FDD)

	CSI process 0	CSI process 1	CSI process 2	CSI process 3
$\alpha$ [%]	N/A	2	2	2
$\beta$ [%]	N/A	40	40	40
$\delta$ [%]	10	N/A	N/A	N/A
$\gamma$	N/A	N/A	1.01	N/A
UE Category	$\geq 1$			

Table 9.3.6.1\_F.3.5-2: Minimum median CQI difference between configured CSI processes (FDD)

	CSI process 1	CSI process 2	CSI process 3
CSI process 0	N/A	1	3
UE Category	$\geq 1$		

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

### 9.3.6.2\_F TDD CQI Reporting under fading conditions with CSI processes for CoMP

#### 9.3.6.2\_F.1 TDD CQI Reporting under fading conditions with Single CSI process for CoMP

##### 9.3.6.2\_F.1.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for single CSI process.

##### 9.3.6.2\_F.1.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

##### 9.3.6.2\_F.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.6.2\_F.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.2\_F.1.3-2 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha\%$  of the time but less than  $\beta\%$  for each sub-band for CSI process 1, 2, or 3;
- b) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\delta\%$  of the time for CSI process 0;
- c) the difference of the median CQIs of the reported wideband CQI for configured CSI processes shall be greater or equal to the values as in Table 9.3.6.2\_F.1.3-3;
- d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.6.2\_F.1.3-1: Fading test for TDD

Max number of HARQ transmissions		1	N/A	1	N/A
ACK/NACK feedback mode		Multiplexing	N/A	Multiplexing	N/A
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4)				
Note 2:	3 symbols allocated to PDCCH				
Note 3:	Reference measurement channel RC.12 TDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 4 and 9 from TP1.				
Note 4:	TM10 OCNG is transmitted as specified in A.5.2.8 on subframe 3 and 8 from TP1.				
Note 5:	TM10 OCNG is transmitted as specified in A.5.2.8 on subframe 3, 4, 8 and 9 from TP2				
Note 6:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.				
Note 7:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 8:	PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#3 and #8 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#7 and #2.				
Note 9:	For these sub-bands which are not selected for PDSCH transmission, TM10 OCNG should be transmitted.				
Note 10:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification and the reported CQI in subframe SF#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.

#### 9.3.6.2\_F.1.4 Test description

##### 9.3.6.2\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.1.4.3.

##### 9.3.6.2\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for CSI process 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 * \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 * \beta \% / 100$ ” for CSI process 2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

## 9.3.6.2\_F.1.5 Test requirement

Table 9.3.6.2\_F.1.5-1: Test requirement (TDD)

	CSI process 2
$\alpha$ [%]	2
$\beta$ [%]	40
$\delta$ [%]	N/A
$\gamma$	1.01
UE Category	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.6.2\_F.2 TDD CQI Reporting under fading conditions with Three CSI processes for CoMP

## 9.3.6.2\_F.2.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Three CSI processes.

## 9.3.6.2\_F.2.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of Three on a component carrier within a band with PDSCH transmission mode 10.

## 9.3.6.2\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.2\_F.1.3.

### 9.3.6.2\_F.2.4 Test description

#### 9.3.6.2\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.2.4.3.

#### 9.3.6.2\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10, and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for each of CSI process 0, 1 and 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 1 and 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 \cdot \beta \% / 100$ " for CSI process 1 and 2. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1 and 2 shall be greater or equal to the values as in Table 9.3.6.2\_F.2.5-2.  
(2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.  
Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and  $(NACK / (ACK + NACK)) \geq FFS$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

	CSI process 0	CSI process 1	CSI process 2
$\alpha$ [%]	N/A	2	2
$\beta$ [%]	N/A	40	40
$\delta$ [%]	10	N/A	N/A
$\gamma$	N/A	N/A	1.01
UE Category	$\geq 1$		

**Table 9.3.6.2\_F.2.5-2: Minimum median CQI difference between configured CSI processes (TDD)**

	CSI process 1	CSI process 2
CSI process 0	N/A	1
UE Category	$\geq 1$	

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

### 9.3.6.2\_F.3 TDD CQI Reporting under fading conditions with Four CSI processes for CoMP

#### 9.3.6.2\_F.3.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Four CSI processes.

#### 9.3.6.2\_F.3.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.3.6.2\_F.3.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.2\_F.1.3.

#### 9.3.6.2\_F.3.4 Test description

##### 9.3.6.2\_F.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.3.4.3.

##### 9.3.6.2\_F.3.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for each of CSI process 0, 1, 2, and 3. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 1, 2, and 3 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 \cdot \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 \cdot \beta \% / 100$ ” for CSI process 1, 2 and 3. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1, 2 and 3 shall be greater or equal to the values as in Table 9.3.6.2\_F.3.5-2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

#### 9.3.6.2\_F.3.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception:

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

## 9.3.7 PUSCH 3-2 for eDL MIMO Enhancement

### 9.3.7.1\_G FDD CQI Reporting under fading conditions - PUSCH 3-2 for eDL MIMO Enhancement

Editor's notes: This test case is incomplete. The following item is missing or incomplete:

- Some test parameters are still in square brackets
- Missing test tolerances
- RAN WG5 is waiting on feedback on whether Release 10 Feature Group Indicator 103 is necessary for the Release 12 test cases.

#### 9.3.7.1\_G.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the sub band CQI and sub band PMI operation.

#### 9.3.7.1\_G.2 Test applicability

This test applies to all types of E-UTRA FDD UE releases 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit [FFS].

#### 9.3.7.1\_G.3 Minimum conformance requirements

For the parameters specified in Table 9.3.7.1\_G.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.1\_G.3-2 and by the following.

- a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be  $\geq \alpha$ ;
- b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH 3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be  $\geq \beta$ ;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC.16 FDD for test 1 and according to RC.17 FDD for test 2.

<p>Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink subframe not later than SF#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF#(n+4)</p> <p>Note 2: Reference measurement channel according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.</p> <p>Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 4: Randomization of the principle beam direction shall be used as specified in B.2.3A.4.</p> <p>Note 5: The values of time offset are [0ns 65ns 0ns 65ns] for antenna port [0, 1, 2, 3] respectively.</p> <p>Note 6: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#1 and #6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#0 and #5.</p>						

Table 9.3.7.1\_G.3-2: Minimum requirement (FDD)

	Test 1	Test 2
$\alpha$	[1.05]	-
$\beta$	-	[1.15]
UE Category	$\geq 1$	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.3.7.1.

#### 9.3.7.1\_G.4 Test description

##### 9.3.7.1\_G.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.7.1\_G.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.7.1\_G.4.3.

#### 9.3.7.1\_G.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.7.1\_G.3-1 as appropriate.

For Test1

2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and wideband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-1 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in every subframe (Table A.4.1-1).
5. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.1\_G.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .
8. If the ratio  $(t_{subband} / t_{wideband}) \geq \alpha$  which is specified in Table 9.3.7.1\_G.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.

For Test2

9. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by

the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.

10. The SS shall send PDSCH via PDCCH DCI format 2C for  $C_{RNTI}$  to transmit the DL RMC according to the wideband CQI value and subband PMI value in each available downlink transmission instance randomly selected full-size subband. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 1-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
11. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in every subframe (Table A.4.1-1).
12. The SS shall transmit an RRC Connection Reconfiguration message to set **reporting mode** according to Table 9.3.7.1\_G.3-1.
13. The UE shall transmit RRC Connection Reconfiguration Complete message.
14. The SS shall transmit PDSCH via PDCCH DCI format 2C for  $C_{RNTI}$  to transmit the DL RMC according to the highest UE reported full-size subband CQI value and full-size subband PMI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI and full-size subband PMI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{wideband}) \geq \beta$  which is specified in Table 9.3.7.1\_G.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.
15. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 14) for the other SNR point as appropriate. Otherwise fail the UE.
16. If both tests have not been done, then repeat the same procedure (steps 1 to 15) with test conditions according to the Table 9.3.7.1\_G.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.7.1\_G.5 Test requirement

**Table 9.3.7.1\_G.5-1: Test requirement (FDD)**

	Test 1	Test 2
$\alpha$	[1.05]+TT	-
$\beta$	-	[1.15]+TT
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.7.2\_G TDD CQI Reporting under fading conditions - PUSCH 3-2 for eDL MIMO Enhancement

**Editor's notes: This test case is incomplete. The following item is missing or incomplete:**

- Some test parameters are still in square brackets

- Missing test tolerances

- RAN WG5 is waiting on feedback on whether Release 10 Feature Group Indicator 103 is necessary for the Release 12 test cases.

#### 9.3.7.2\_G.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the sub band CQI and sub band PMI operation.

#### 9.3.7.2\_G.2 Test applicability

This test applies to all types of E-UTRA TDD UE releases 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit [FFS].

#### 9.3.7.2\_G.3 Minimum conformance requirements

For the parameters specified in Table 9.3.7.2\_G.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.2\_G.3-2 and by the following.

- a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be  $\geq \alpha$ ;
- b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be  $\geq \beta$ ;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC.14 TDD for test 1 and RC.15 TDD for test 2.

**Table 9.3.7.2\_G.3-1: Sub-band test for TDD**

9.3.7.2\_G.4 Test description

9.3.7.2\_G.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.7.2\_G.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.7.2\_G.4.3.

#### 9.3.7.2\_G.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.7.2\_G.3-1 as appropriate.

For Test1

2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and wideband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-1 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#3 and #8 (Table A.4.1-2).
5. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.2\_G.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .
8. If the ratio  $(t_{subband} / t_{wideband}) \geq \alpha$  which is specified in Table 9.3.7.2\_G.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.

For Test2

9. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
10. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value in each available downlink transmission instance randomly selected full-size subband. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 1-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
11. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#3 and #8 (Table A.4.1-2).
12. The SS shall transmit an RRC Connection Reconfiguration message to set **reporting mode** according to Table 9.3.7.2\_G.3-1.
13. The UE shall transmit RRC Connection Reconfiguration Complete message.
14. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value and full-size subband PMI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI and full-size subband PMI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{wideband}) \geq \beta$  which is specified in Table 9.3.7.2\_G.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.
15. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 14) for the other SNR point as appropriate. Otherwise fail the UE.
16. If both tests have not been done, then repeat the same procedure (steps 1 to 15) with test conditions according to the Table 9.3.7.2\_G.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.7.2\_G.5 Test requirement

**Table 9.3.7.2\_G.3-1: Test requirement (TDD)**

	Test 1	Test 2
$\alpha$	[1.05] +TT	-
$\beta$	-	[1.15] +TT
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.4 Reporting of Precoding Matrix Indicator (PMI)

The minimum performance requirements of PMI reporting are defined based on the precoding gain, expressed as the relative increase in throughput when the transmitter is configured according to the UE reports compared to the case when the transmitter is using random precoding. When the transmitter uses random precoding, for each PDSCH allocation a precoder is randomly generated and applied to the PDSCH. A fixed transport format (FRC) configured.

The requirements for transmission mode 6 and transmission mode 9 with 4 TX are specified in terms of the ratio

$$\gamma = \frac{t_{ue}}{t_{rnd}}$$

In the definition of  $\gamma$ , for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with precoders configured according to the UE reports.

For the PUCCH 2-1 single PMI requirement,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding on a randomly selected full-size subband in set S subbands, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with both the precoder and the preferred full-size subband applied according to the UE reports;

For PUSCH 2-2 multiple PMI requirements,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding on a randomly selected full-size subband in set S subbands, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with both the subband precoder and a randomly selected full-size subband (within the preferred subbands) applied according to the UE reports.

The requirements for transmission mode 9 with 8 TX and transmission mode 9 with 4TX enhanced codebook are specified in terms of the ratio

$$\gamma = \frac{t_{ue, follow1, follow2}}{t_{rnd1, rnd2}}$$

In the definition of  $\gamma$ , for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements,  $t_{follow1, follow2}$  is 70% of the maximum throughput obtained at  $SNR_{follow1, follow2}$  using the precoders configured according to the UE reports, and  $t_{rnd1, rnd2}$  is the throughput measured at  $SNR_{follow1, follow2}$  with random precoding.

## 9.4.1 Single PMI

### 9.4.1.1 PMI Reporting – PUSCH 3-1 (Single PMI) (Cell-Specific Reference Symbols)

#### 9.4.1.1.1 FDD PMI Reporting – PUSCH 3-1 (Single PMI)

##### 9.4.1.1.1.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

##### 9.4.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.4.1.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.4.1.1.1.3-2.

**Table 9.4.1.1.1.3-1: PMI test for single-layer (FDD)**

Parameter		Unit	Test 1
Bandwidth		MHz	10
Transmission mode			6
Propagation channel			EVA5
Precoding granularity		PRB	50
Correlation and antenna configuration			Low 2 x 2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
Reporting mode			PUSCH 3-1
Reporting interval		ms	1
PMI delay (Note 2)		ms	8
Measurement channel			R.10 FDD
OCNG Pattern			OP.1 FDD
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
Note 1:	For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity)		
Note 2:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).		

**Table 9.4.1.1.1.3-2: Minimum requirement (FDD)**

Parameter	Test 1
$\gamma$	1.1
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.1.1.

#### 9.4.1.1.1.4 Test description

##### 9.4.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.1.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.1.1.4.3.

##### 9.4.1.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{rnd}$  and  $SNR_{rnd}$  according to annex G.5.2
3. Set SNR to  $SNR_{rnd}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 every subframe. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{rnd}}$ . If the ratio (throughput /  $t_{rnd}$ )  $\geq \gamma$  which is specified in table 9.4.1.1.1.5-1, then the test is pass. Otherwise, the test is fail.

##### 9.4.1.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.4.1.1.1.5 Test requirement

**Table 9.4.1.1.1.5-1: Test requirement (FDD)**

Parameter	Test 1
$\gamma$	1.09

The ratio of throughput using precoding matrix of PMI reports from the UE to using random precoding matrix shall equal or exceed the value specified in table 9.4.1.1.1.5.

#### 9.4.1.1.2 TDD PMI Reporting – PUSCH 3-1 (Single PMI)

##### 9.4.1.1.2.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

##### 9.4.1.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

##### 9.4.1.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in 9.4.1.1.2.3-2.

**Table 9.4.1.1.2.3-1: PMI test for single-layer (TDD)**

Parameter	Unit	Test 1	
Bandwidth	MHz	10	
Transmission mode		6	
Uplink downlink configuration		1	
Special subframe configuration		4	
Propagation channel		EVA5	
Precoding granularity	PRB	50	
Correlation and antenna configuration		Low 2 x 2

Measurement channel		R.10 TDD	
OCNG Pattern		OP.1 TDD	
Max number of HARQ transmissions		4	
Redundancy version coding sequence		{0,1,2,3}	
ACK/NACK feedback mode		Multiplexing	
Note 1: For random precoder selection, the precoder shall be updated in each available downlink transmission instance Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4)			

**Table 9.4.1.1.2.3-2: Minimum requirement (TDD)**

Parameter	Test 1
$\gamma$	1.1
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.1.2.

#### 9.4.1.1.2.4 Test description

##### 9.4.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.1.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.1.2.4.3.

9.4.1.1.2.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.1.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3

4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

9.4.1.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

9.4.1.1.2.5 Test requirement

**Table 9.4.1.1.2.5-1: Test requirement (TDD)**

Parameter	Test 1
$\gamma$	1.09

9.4.1.2 PMI Reporting – PUCCH 2-1 (Single PMI) (Cell-Specific Reference Symbols)

9.4.1.2.1 FDD PMI Reporting – PUCCH 2-1 (Single PMI)

9.4.1.2.1.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

9.4.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward. Applicability requires support for FGI bit 2.

9.4.1.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.2.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.4.1.2.1.3-2.

**Table 9.4.1.2.1.3-1: PMI test for single-layer (FDD)**

Parameter		Unit	Test 1
Bandwidth		MHz	10
Transmission mode			6
Propagation channel			EVA5
Correlation and antenna configuration			Low 4 x 2
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6
	$\sigma$	dB	3
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
PMI delay		ms	8 or 9
Reporting mode			PUCCH 2-1 (Note 6)
Reporting periodicity		ms	$N_p = 2$
Physical channel for CQI reporting			PUSCH (Note 3)
PUCCH Report Type for wideband CQI/PMI			2
PUCCH Report Type for subband CQI			1
Measurement channel			R.14-1 FDD
OCNG Pattern			OP. 1/2 FDD
Precoding granularity		PRB	6 (full size)
Number of bandwidth parts ( $J$ )			3
K			1
<i>cqi-pmi-ConfigIndex</i>			1
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
<p>Note 1: For random precoder selection, the precoder shall be updated every two TTI (2 ms granularity)</p> <p>Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).</p> <p>Note 3: To avoid collisions between HARQ-ACK and wideband CQI/PMI or subband CQI, it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1, #3, #7 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#5, #7, #1 and #3.</p> <p>Note 4: Reports for the short subband (having 2RBs in the last bandwidth part) are to be disregarded and instead data is to be transmitted on the most recently used subband for bandwidth part with <math>j=1</math>.</p> <p>Note 5: In the case where wideband PMI is reported, data is to be transmitted on the most recently used subband.</p> <p>Note 6: The bit field for PMI confirmation in DCI format 1B shall be mapped to "0" and TPMI information shall indicate the codebook index used in Table 6.3.4.2.3-2 of TS 36.211 [4] according to the latest PMI report on PUCCH.</p>			

**Table 9.4.1.2.1.3-2: Minimum requirement (FDD)**

	Test 1
$\gamma$	1.2
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.2.1.

#### 9.4.1.2.1.4 Test description

##### 9.4.1.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.2.1.4.3.

##### 9.4.1.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.2.1.3-1 as appropriate.
2. The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 FDD) on a randomly selected full-size subband with a randomly selected precoding matrix from the codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]), regardless of the SB and PMI reports from the UE. Note that each full-size subband and each precoding matrix shall be selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#1, #3, #7 and #9 to schedule UL RMC in uplink subframes #5, #7, #1 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CSI reports using PUSCH.  
Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 FDD) on the full-size subband and with the latest precoding matrix reported by the UE. When the UE reports a non-full-size subband, the SS schedules the recent reported subband for bandwidth part with  $j=1$  with the latest reported precoding matrix. Note that the SS shall send PDSCH in the same full-size subband and with the latest reported precoding matrix until next UE subband report is available. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 in downlink SF#1, #3, #7 and #9 to schedule UL RMC in uplink subframes #5, #7, #1 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CSI reports using PUSCH. Measure  $t_{ue}$  according to Annex G.5.3.
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.1.2.2.5-1, then the test is pass. Otherwise, the test is fail.
