5. The MME forwards Write-Replace Warning Message Request to eNodeBs. The MME shall use the Tracking Area ID list to determine the eNodeBs in the delivery area. If the Tracking Area ID list is empty the message is forwarded to all eNodeBs that are connected to the MME.

6. When S1-flex is used the eNodeB may receive same message from multiple MMEs. The eNodeB detects duplicate messages by checking the message identifier and serial number fields within the warning message. If any redundant messages are detected only the first one received will be broadcasted by the cells. The eNodeB shall use the Warning Area information to determine the cell(s) in which the message is to be broadcast. The eNodeBs return a Distribute Warning Message Response to the MME, even if it was a duplicate.

   If there is a warning broadcast message already ongoing and the CWM Indicator is included in the Write-Replace Warning Message Request, the eNodeB does not stop existing broadcast message but start broadcasting the new message concurrently. Otherwise the eNodeB shall immediately replace the existing broadcast message with the newer one.

NOTE 3: If concurrent warning messages are not supported, this requires the CBE/CBC to take care that 'lower' priority warnings are not sent while a higher priority warning is still being sent.

   The eNodeB broadcasts the message frequently according to the attributes set by the CBC that originated the warning message distribution.

7. If the UE has been configured to receive warning messages and the UE has authenticated the core network of the eNodeB it is camped on, then the UE proceeds as follows:

   The UE can use "warning type" values, 'earthquake', 'tsunami' or 'earthquake and tsunami', immediately to alert the user. When "warning type" is 'test', the UE silently discards the primary notification, but the UE specially designed for testing purposes may proceed with the following procedures.

   The UE activates reception of the broadcast messages containing the "warning message".

   The UE indicates the contents of the "warning message" to the user

   UE shall consider a message duplicated if the combination of "message identifier" and "serial number" matches with those of the previous message that was received from the same PLMN. The UE shall ignore the message detected as a duplicated.

   For ETWS, the UE shall perform duplicate message detection independently for primary and secondary notifications.

8. From the Write-Replace Warning Response messages returned by eNodeBs the MME determines the success or failure of the delivery and creates a trace record. Any OMC ID received in step 2 is written to the trace record to permit the O&M system to deliver them to the desired destination.

18.1.2.3 Test description

18.1.2.3.1 Pre-test conditions

System Simulator:

- Cell 1
- System information combination 1 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell

UE:

None.

Preamble:

- The UE is in state Generic RB Established (state 3) according to [18].

18.1.2.3.2 Test procedure sequence

Table 18.1.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message	-	-
1	The SS include a CMAS message with new *messageIdentifier* and *serialNumber* in *SystemInformationBlockType12* and transmit a *Paging* message including *cmas-Indication* on Cell 1 (NOTE 1).	<--	*Paging*	-	-
2	Check: Does the UE indicate the contents of the "warning message" to the user (NOTE 2)?	-	-	1	P

18.1.3 PWS reception in RRC_CONNECTED State/Power On

18.1.3.1 Test Purpose (TP)

(1)

with { UE being powered down }

```
ensure that {
when { UE is powered up while CMAS notification is present }
  then { UE successfully receives the PWS message and alerts the user accordingly  }
           }
```

(2)

```
with { UE in RRC_CONNECTED state }
ensure that {
when { the network transmits two consecutive different PWS messages and pages the UE, one paging message per a defaultPagingCycle, to indicate the presence of each PWS message }
  then { the UE successfully receives each of the messages and alerts the user accordingly }
           }
```

18.1.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.2.2.2, 5.2.2.4, 5.2.2.19, 5.2.1.3, 5.3.2.3; TS 23.041 clause 9.1.3.4.

[TS 36.331, clause 5.2.2.2]

The UE shall apply the system information acquisition procedure upon selecting (e.g. upon power on) and upon re-selecting a cell, after handover completion, after entering E-UTRA from another RAT, upon return from out of coverage, upon receiving a notification that the system information has changed, upon receiving an indication about the presence of an ETWS notification, upon receiving an indication about the presence of a CMAS notification, upon receiving a request from CDMA2000 upper layers and upon exceeding the maximum validity duration. Unless explicitly stated otherwise in the procedural specification, the system information acquisition procedure overwrites any stored system information, i.e. delta configuration is not applicable for system information and the UE discontinues using a field if it is absent in system information unless explicitly specified otherwise.

…

[TS 36.331, clause 5.2.2.4]

The UE shall:

…

1> if the UE is CMAS capable:

2> upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> discard any previously buffered *warningMessageSegment*;

3> clear, if any, stored values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType12* associated with the discarded *warningMessageSegment* ;

2> when the UE acquires *SystemInformationBlockType1* following CMAS indication, upon entering a cell during RRC_IDLE, following successful handover and upon connection re-establishment:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType12* is present:

4> acquire *SystemInformationBlockType12*;

NOTE 1: UEs shall start acquiring *SystemInformationBlockType12* as described above even when *systemInfoValueTag* in *SystemInformationBlockType1* has not changed.

The UE may apply the received SIBs immediately, i.e. the UE does not need to delay using a SIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 2: While attempting to acquire a particular SIB, if the UE detects from *schedulingInfoList* that it is no longer present, the UE should stop trying to acquire the particular SIB.

[TS 36.331, clause 5.2.2.19]

Upon receiving *SystemInformationBlockType12*, the UE shall:

1> if the *SystemInformationBlockType12* contains a complete warning message:

2> forward the received warning message, *messageIdentifier*, *serialNumber* and *dataCodingScheme* to upper layers;

2> continue reception of *SystemInformationBlockType12*;

1> else:

2> if the received values of *messageIdentifier* and *serialNumber* are the same (each value is the same) as a pair for which a warning message is currently being assembled:

3> store the received *warningMessageSegment*;

3> if all segments of a warning message have been received:

4> assemble the warning message from the received *warningMessageSegment*;

4> forward the received warning message, *messageIdentifier*, *serialNumber* and *dataCodingScheme* to upper layers;

4> stop assembling a warning message for this *messageIdentifier* and *serialNumber* and delete all stored information held for it;

3> continue reception of *SystemInformationBlockType12*;

2> else if the received values of *messageIdentifier* and/or *serialNumber* are not the same as any of the pairs for which a warning message is currently being assembled:

3> start assembling a warning message for this *messageIdentifier* and *serialNumber* pair;

3> store the received *warningMessageSegment*;

3> continue reception of *SystemInformationBlockType12*;

The UE should discard *warningMessageSegment* and the associated values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType12* if the complete warning message has not been assembled within a period of 3 hours.

NOTE 3: The number of warning messages that a UE can re-assemble simultaneously is a function of UE implementation.

[TS 36.331, clause 5.2.1.3]

E-UTRAN may not update *systemInfoValueTag* upon change of some system information e.g. ETWS information, CMAS information, regularly changing parameters like CDMA2000 system time (see 6.3). Similarly, E-UTRAN may not include the *systemInfoModification* within the *Paging* message upon change of some system information.

The UE verifies that stored system information remains valid by either checking *systemInfoValueTag* in *SystemInformationBlockType1* after the modification period boundary, or attempting to find the *systemInfoModification* indication at least *modificationPeriodCoeff* times during the modification period in case no paging is received, in every modification period. If no paging message is received by the UE during a modification period, the UE may assume that no change of system information will occur at the next modification period boundary. If UE in RRC_CONNECTED, during a modification period, receives one paging message, it may deduce from the presence/ absence of *systemInfoModification* whether a change of system information other than ETWS and CMAS information will occur in the next modification period or not.

ETWS and/or CMAS capable UEs in RRC_CONNECTED shall attempt to read paging at least once every *defaultPagingCycle* to check whether ETWS and/or CMAS notification is present or not.

…

[TS 36.331, clause 5.3.2.3]

Upon receiving the *Paging* message, the UE shall:

…

1> if the *cmas-Indication* is included and the UE is CMAS capable:

2> re-acquire *SystemInformationBlockType1* immediately, i.e., without waiting until the next system information modification period boundary as specified in 5.2.1.5;

2> if the *schedulingInfoList* indicates that *SystemInformationBlockType12* is present:

3> acquire *SystemInformationBlockType12*;

[TS 23.041, clause 9.1.3.4]

…

The warning message to be broadcast is delivered via MMEs to multiple eNodeBs. The eNodeB(s) are responsible for scheduling the broadcast of the new message and the repetitions in each cell.

The overall warning message delivery procedure is presented in figure 9.1.3.4.2-1:

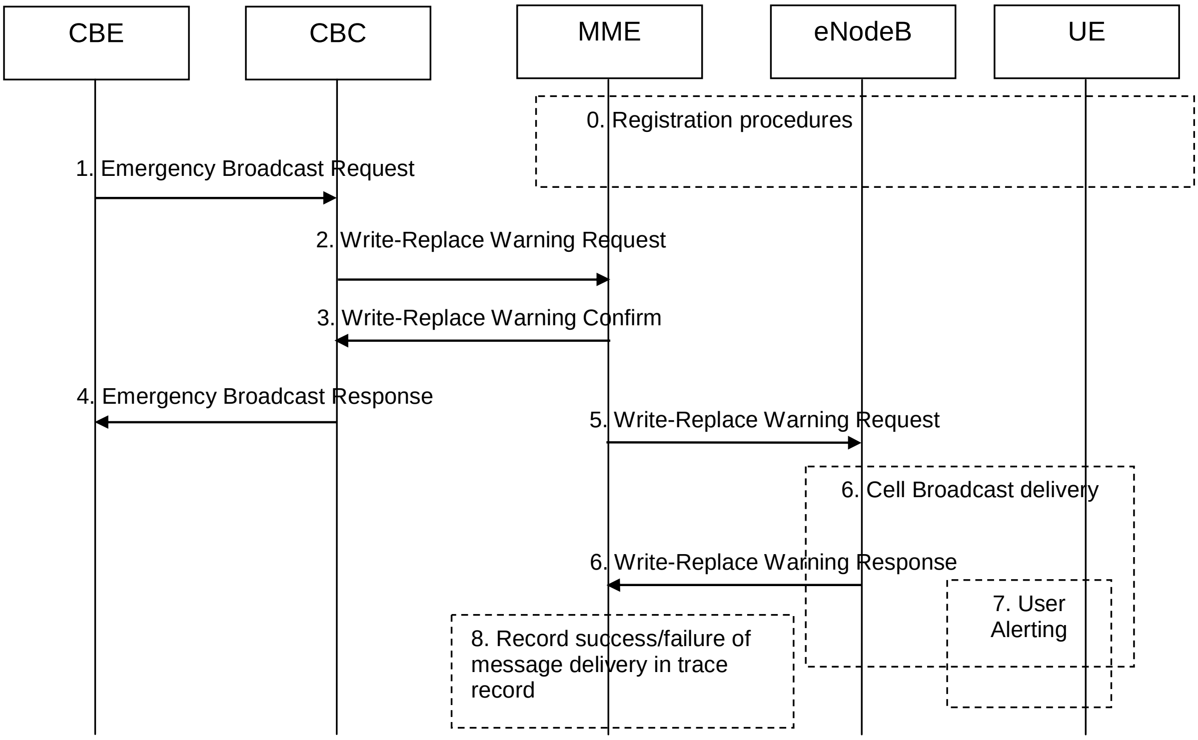

Figure 9.1.3.4.2-1: Warning message delivery procedure in E-UTRAN

0. Network registration and security (e.g. mutual authentication) procedures are performed. The UE stores a flag that indicates whether or not it has authenticated the network.

NOTE 1: This step is performed each time a UE is attached to a network (e.g. after each power on).

1. CBE (e.g. Information Source such as PSAP or Regulator) sends emergency information (e.g. "warning type", "warning message", "impacted area", "time period") to the CBC. The CBC shall authenticate this request.

2. Using the "impacted area" information, the CBC identifies which MMEs need to be contacted and determines the information to be place into the Warning Area Information Element. The CBC sends a Write-Replace Warning Request message containing the warning message to be broadcast and the delivery attributes (Message identifier, Serial Number, Tracking Area ID list, Warning Area, OMC ID, CWM Indicator) to MMEs.

   The warning messages use the coding scheme for CBS data specified in 3GPP TS 23.038 [3].

   The Tracking Area ID list is only used by the MME. The MME uses it for selecting which eNodeBs to forward the Write-Replace Warning Request message to.

   The Warning Area shall be a list of Cell IDs and/or a list of TAIs and/or one or more Emergency Area IDs. The Warning Area is only used by the eNodeB. The eNodeB is configured with the TAI(s) and Cell ID(s) it serves and the Emergency Area ID(s) that it belongs to. The eNodeB checks for any match of the contents of the Warning Area with these IDs to identify the cells where to distribute the warning message. The Warning Area is an optional information element. If the Warning Area is absent, it shall be interpreted as "all cells on the eNodeB". The number of cell IDs will be limited by the message size on SBc and S1-MME. An Emergency Area ID is unique within the PLMN.

   The message may include an OMC ID. If present, it indicates the OMC to which the Trace record generated in step 8 is destined. Co-location of that OMC with the CBC is an operator option.

   CBC shall set the Concurrent Warning Message (CWM) indicator in all Write-Replace Warning Request messages, if the PLMN supports concurrent warning message broadcasts.

NOTE 2: Due to requirements in earlier versions of the specification, it is possible that "digital signature" and "timestamp" information are transmitted within the "warning message".

3. The MME sends a Write-Replace Warning Confirm message that indicates to the CBC that the MME has started to distribute the warning message to eNodeBs.

   If this message is not received by the CBC within an appropriate time period, the CBC can attempt to deliver the warning message via another MME in the same pool area.

4. Upon reception of the Write-Replace Confirm messages from the MMEs, the CBC may confirm to the CBE that it has started to distribute the warning message.

5. The MME forwards Write-Replace Warning Message Request to eNodeBs. The MME shall use the Tracking Area ID list to determine the eNodeBs in the delivery area. If the Tracking Area ID list is empty the message is forwarded to all eNodeBs that are connected to the MME.

6. When S1-flex is used the eNodeB may receive same message from multiple MMEs. The eNodeB detects duplicate messages by checking the message identifier and serial number fields within the warning message. If any redundant messages are detected only the first one received will be broadcasted by the cells. The eNodeB shall use the Warning Area information to determine the cell(s) in which the message is to be broadcast. The eNodeBs return a Distribute Warning Message Response to the MME, even if it was a duplicate.

   If there is a warning broadcast message already ongoing and the CWM Indicator is included in the Write-Replace Warning Message Request, the eNodeB does not stop existing broadcast message but start broadcasting the new message concurrently. Otherwise the eNodeB shall immediately replace the existing broadcast message with the newer one.

NOTE 3: If concurrent warning messages are not supported, this requires the CBE/CBC to take care that 'lower' priority warnings are not sent while a higher priority warning is still being sent.

   The eNodeB broadcasts the message frequently according to the attributes set by the CBC that originated the warning message distribution.

7. If the UE has been configured to receive warning messages , and the UE has authenticated the core network of the eNodeB it is camped on, then the UE proceeds as follows:

   The UE can use "warning type" values, 'earthquake', 'tsunami' or 'earthquake and tsunami', immediately to alert the user. When "warning type" is 'test', the UE silently discards the primary notification, but the UE specially designed for testing purposes may proceed with the following procedures.

   The UE activates reception of the broadcast messages containing the "warning message".

   The UE indicates the contents of the "warning message" to the user.

8. From the Write-Replace Warning Response messages returned by eNodeB's the MME determines the success or failure of the delivery and creates a trace record. Any OMC ID received in step 2 is written to the trace record to permit the O&M system to deliver them to the desired destination.

18.1.3.3 Test description

18.1.3.3.1 Pre-test conditions

System Simulator:

- Cell 1
- System information combination 17 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell.

UE:

None.

19 Device to Device Proximity Service

19.1 ProSe Direct communication

19.1.1 ProSe direct Communication /Pre-configured authorisation / UE in RRC_IDLE on an E-UTRAN cell operating on the carrier frequency provisioned for ProSe direct service / Utilisation of the resources of (serving) cells/PLMNs / Transmission

19.1.1.1 Test Purpose (TP)

(0)

```
with { UE supporting ProSe direct communication }
ensure that {
  when { UE performs Attach procedure, or, Normal tracking area updating procedure }
    then { UE announces its ProSe capabilities }
            }
```

(0A)

```
with { UE being authorised for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" on frequency
f1, and, UE is in RRC_IDLE on Cell1/f1/PLMN1 which is not transmitting SystemInformationBlockType18
(i.e. ProSe direct communication is supported by the network) }
ensure that {
  when { UE receives a request from upper layers to transmit sidelink communication }
    then { UE does not initiate ProSe direct communication }
            }
```

(1)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", and, UE is in
RRC_IDLE on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 which does not include
commTxPoolNormalCommon }
ensure that {
  when { UE receives a request from upper layers to transmit sidelink communication }
    then { UE initiates an RRC connection, and, successfully completes a Sidelink UE information
procedure to indicate the sidelink communication transmission resources required }
            }
```

(2)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", and, UE is in
RRC_IDLE on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 indicating the provision of
resources for sidelink communication (commTxResources set to setup and resources provided in
commTxPoolNormalDedicated) }
ensure that {
  when { UE is triggered by an upper layer application to transmit sidelink communication }
    then { UE is able to transmit sidelink communication using the configured resources in
Cell1/f1/PLMN1 }
            }
```

(3)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", and, UE is in
RRC_IDLE on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 indicating the provision of
resources for sidelink communication }
ensure that {
  when { Cell2/f1/PLMN4 (equivalent PLMN) which is broadcasting SystemInformationBlockType18
providing resources for sidelink communication (commTxResources set to scheduled) becomes the
highest ranked cell, and, UE reselects to Cell2/f1/PLMN4 }
```

```
    then { UE is able to transmit sidelink communication using the configured resources in
Cell2/f1/PLMN4) }
            }
```

(4) Void

(5)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", and, UE is in
RRC_IDLE on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 indicating the provision of
resources for sidelink communication and including syncTxThreshIC }
ensure that {
  when { the RSRP measurement of the serving cell is below the value of syncTxThreshIC }
    then { UE transmits SLSS and MasterInformationBlock-SL message in the same subframe }
            }
```

(6)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", and, UE is in
RRC_IDLE on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 indicating the provision of
resources for sidelink communication }
ensure that {
  when { Cell11/f1/PLMN3 which is broadcasting SystemInformationBlockType18 indicating the provision
of resources for sidelink communication (commTxResources set to setup and resources provided in
commTxPoolNormalDedicated) becomes the highest ranked PCell, and, UE reselects to Cell11/f1/PLMN3 }
    then { UE does not initiate an RRC connection and does not transmit a SidelinkUEInformation
message to indicate the transmission resources required, and, does not transmit sidelink
communication over the PC5 in the assigned resources in Cell11/f1/PLMN3 }
            }
```

(7)Void

(8)

```
with { UE registered on PLMN1 and being authorized for performing ProSe Direct Communication in two
PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by
E-UTRAN", and, UE in EMM-IDLE mode and in limited service state on Cell4/f1/PLMN2 after attempting
TAU on Cell4/f1/PLMN2 and receiving a TRACKING AREA UPDATE REJECT message with the EMM cause #11
"PLMN not allowed", and, n Cell4/f1/PLMN2 is operating on the same carrier frequency as the one pre-
configured in the UE and is transmitting SystemInformationBlockType18 indicating the provision of
resources for sidelink communication }
ensure that {
  when { UE receives a request from upper layers to send data for ProSe direct communication  }
    then { UE  transmits sidelink communication utilising the resources provided on Cell4/f1/PLMN2 }
            }
```

19.1.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: T TS 24.301, clauses 5.5.1.2.2, 5.5.3.2.2S 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, 10.2.3, TS 36.331, clauses 5.2.2.4, 5.2.2.25, 5.3.3.1a, 5.10.1a, 5.10.2.1, 5.10.2.2, 5.10.2.3. U, 5.10.4nless otherwise stated these are Rel-12 requirements.

[TS 24.301, clause 5.5.1.2.2]

If the UE supports ProSe direct communication, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct communication bit to "ProSe direct communication supported" in the UE network capability IE of the ATTACH REQUEST message.

[TS 24.301, clause 5.5.3.2.2]

The UE in state EMM-REGISTERED shall initiate the tracking area updating procedure by sending a TRACKING AREA UPDATE REQUEST message to the MME,

...

b) when the periodic tracking area updating timer T3412 expires;

...

If the UE has to request resources for ProSe direct discovery or Prose direct communication (see 3GPP TS 36.331 [22]), then the UE shall set the "active" flag to 1 in the TRACKING AREA UPDATE REQUEST message.

...

For all cases except case b, if the UE supports ProSe direct communication, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct communication bit to "ProSe direct communication supported" in the UE network capability IE of the TRACKING AREA UPDATE REQUEST message.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

a) served by E-UTRAN and authorised for ProSe direct communication in the registered PLMN;

...

c) in EMM-IDLE mode and in limited service state as specified in 3GPP TS 23.122 [24] and authorized for ProSe direct communication for "not served by E-UTRAN", if the reason for the UE being in limited service state is one of the following:

...

ii) the UE received an ATTACH REJECT message or a TRACKING AREA UPDATE REJECT message or a SERVICE REJECT message with the EMM cause #11 "PLMN not allowed" as specified in 3GPP TS 24.301 [11] or a LOCATION UPDATING REJECT message or a GPRS ATTACH REJECT message or ROUTING AREA UPDATE REJECT message or SERVICE REJECT message with cause #11 "PLMN not allowed" as specified in 3GPP TS 24.008 [30]; or

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

…

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or
- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 24.334, clause 10.2.3]

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

NOTE 2: If the lower layers find that there exists a cell operating the provisioned radio resources (i.e., carrier frequency), and the cell belongs to the registered PLMN or a PLMN equivalent to the registered PLMN, and the UE is authorized for ProSe direct communication in this PLMN, the UE can use the radio parameters indicated by the cell as specified in 3GPP TS 36.331 [12].

- else if the lower layers report that one or more PLMNs operate in the provisioned radio resources (i.e. carrier frequency) then:
  a) if the following conditions are met:
     1) none of the PLMNs reported by the lower layers is the registered PLMN or equivalent to the registered PLMN; and
     2) at least one of the PLMNs reported by the lower layers is in the list of authorised PLMNs for ProSe direct communication and provides radio resources for ProSe direct communication as specified in 3GPP TS 36.331 [12];

     then the UE shall:

     1) if in EMM-IDLE mode, perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or
     2) else if in EMM-CONNECTED mode, either:
        i) perform a detach procedure as specified in 3GPP TS 24.301 [11] and then perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or
        ii) not initiate ProSe direct communication.

     Whether the UE performs i) or ii) above is left up to UE implementation; or

  b) else the UE shall not initiate ProSe direct communication.

If the registration to the selected PLMN is successful, the UE shall proceed with the procedure to initiate ProSe direct communication as specified in subclause 10.2.2.

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.2.2.25]

Upon receiving *SystemInformationBlockType18*, the UE shall:

1> if *SystemInformationBlockType18* message includes the *commConfig*:

...

2> if configured to transmit sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commTxPoolNormalCommon* or by *commTxPoolExceptional* for sidelink communication transmission, as specified in 5.10.4;

[TS 36.331, clause 5.3.3.1a]

For sidelink communication an RRC connection is initiated only in the following case:

1> if configured by upper layers to transmit sidelink communication and related data is available for transmission:

2> if *SystemInformationBlockType18* is broadcast by the cell on which the UE camps; and if the valid version of *SystemInformationBlockType18* does not include *commTxPoolNormalCommon*;

…

NOTE: Upper layers initiate an RRC connection. The interaction with NAS is left to UE implementation.

[TS 36.331, clause 5.10.1a]

When it is specified that the UE shall perform a particular sidelink operation only if the conditions defined in this section are met, the UE shall perform the concerned sidelink operation only if:

1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

1> if the UE is camped on a serving cell (RRC_IDLE) on which it fulfils the conditions to support sidelink communication in limited service state as specified in TS 23.303 [68, 4.5.6]; and if either the serving cell is on the frequency used for sidelink operation or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

…

[TS 36.331, clause 5.10.2.1]

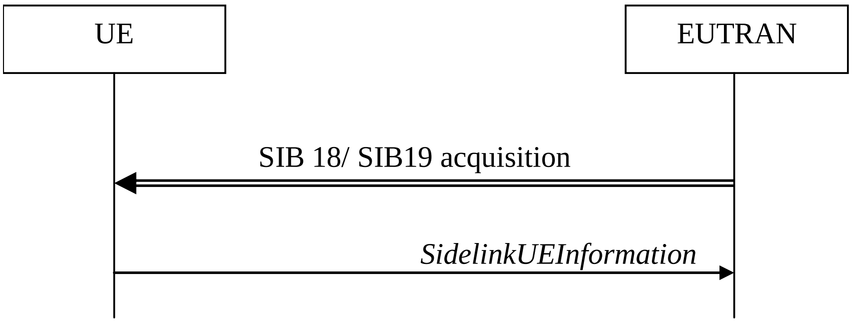

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

NOTE 1: A UE in RRC_IDLE that is configured to transmit sidelink communication/ discovery announcements, while *SystemInformationBlockType18*/ *SystemInformationBlockType19* does not include the resources for transmission (in normal conditions), initiates connection establishment in accordance with 5.3.3.1a.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType18* for the PCell;

...

2> if configured by upper layers to transmit sidelink communication:

3> if the UE did not transmit a *SidelinkUEInformation* message since entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *commTxResourceReq*; or if the information carried by the *commTxResourceReq* has changed since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it does no longer require sidelink communication transmission resources in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

...

2> if configured by upper layers to transmit sidelink communication:

3> include *commTxResourceReq* and set its fields as follows:

4> set *carrierFreq* to indicate the sidelink communication frequency i.e. the same value as indicated in *commRxInterestedFreq* if included;

4> set *destinationInfoList* to include the sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;

...

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication and has related data to be transmitted shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

...

3> else (i.e. sidelink communication in RRC_IDLE or on cell other than PCell in RRC_CONNECTED):

4> if the cell chosen for sidelink communication transmission broadcasts *SystemInformationBlockType18*:

5> if *SystemInformationBlockType18* includes *commTxPoolNormalCommon*:

6> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolNormalCommon*;

19.1.1.3 Test description

19.1.1.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.1.1.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instance.

Table 19.1.1.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	PLMN4
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_PLMN} PLMN2: PLMN2 in USIM EF_{PROSE_PLMN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=03. PLMN4 is an equivalent PLMN to PLMN1; MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=04. Note 2: The Frequency f1 shall be the frequency pre-configured in the UE for when UE is "not served by E-UTRAN". Note 3: A single frequency has been chosen for all PLMNs to allow the TC to be		

	applicable even for UEs supporting a single band which comprises a single frequency.

- System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells.

SS-UE

- SS-UE1. As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication receiving device on the resources which the UE is expected to use for transmission (as specified in the relevant procedure steps in Table 19.1.1.3.2-1).

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; the UE is equipped with a USIM containing values shown in Table 19.1.1.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, etc.).

Table 19.1.1.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

    - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 10 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

Preamble:

- The UE is in State Switched OFF (state 1) according to TS 36.508 [18].

19.1.1.3.2 Test procedure sequence

Table 19.1.1.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.1.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11
T0	Cell-specific RS EPRE	dBm/15k Hz	-85	"Off"	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15k Hz	-85	-79	"Off"	"Off"
T2	Cell-specific RS EPRE	dBm/15k Hz	"Off"	-85	-79	"Off"
T3	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-87	"Off"
T4	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-87	-79
T5	Void	-	-	-	-	-
T6	Cell-specific RS	dBm/15k	"Off"	"Off"	-79	"Off"

	EPRE	Hz				

Table 19.1.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
0	The SS configures: SW-NW - Cell 1 **does not** transmit *SystemInformationBlockType18*.	-	-	-	-
0A	The UE is switched on.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 1.	-	-	-	-
0B	Check: Does the Generic test procedure from step 1 to 16c1 for 'UE Registration (State 2)' defined in TS 36.508 [18] clause 4.5.2 take place during which the UE announces its ProSe direct communication capabilities in the ATTACH REQUEST message?	-	-	0	-
0C	The SS-NW transmits a UPDATE UE LOCATION INFORMATION message which provides location data as the one pre-configured in the UE for ProSe communication when UE is "not served by E-UTRAN".	<--	UPDATE UE LOCATION INFORMATION	-	-
0D	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
1	Force the UE upper layer application to request continuous transmission of sidelink communication (a maximum of 100 Bytes per communication "message"). NOTE: This can be done e.g. via a MMI command. Note that the max of 100 Bytes is not a 3GPP requirement rather it is requested only for the purpose of facilitating the test case specification.	-	-	-	-
1A	Check: Does the UE transmit during the next 3 transmission periods sidelink communication data in accordance with the resources preconfigured in the UE (the first entry in *preconfigComm* in *SL-Preconfiguration* defined in TS 36.508 [18], section 6.8.1.1 based on the UE's own timing)?	-->	-	0A	F
1B	SS-NW starts transmitting *SystemInformationBlockType18* not including *commTxPoolNormalCommon* (i.e. ProSe direct communication supported by the network, no resources provided yet).	-	-	-	-
2	Check: Does the UE transmit an RRCConnectionRequest message?	-->	*RRCConnectionRequest*	1	P
3	SS-NW transmits an RRCConnectionSetup message.	<--	*RRCConnectionSetup*	-	-
4	Check: Does the UE transmit an RRCConnectionSetupComplete message and a SERVICE REQUEST message to request resources for Prose direct communication transmission?	-->	*RRCConnectionSetupComplete* SERVICE REQUEST	1	P
5	Check: Does the UE transmit a *SidelinkUEInformation* message requesting resources for transmission of sidelink communication?	-->	*SidelinkUEInformation*	1	P
6	SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
6A	SS-NW changes *SystemInformationBlockType18* to include *commTxPoolNormalCommon*.	-	-	-	-
6B	Wait for 2 modification periods to allow for the UE to obtain the new version of the *SystemInformationType18*.	-	-	-	-

7	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources indicated in Cell 1 *SystemInformationBlockType18?* NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	2	P
8-20	Void	-	-	-	-
21	The SS configures: SW-NW Cell 1 and Cell 2 parameters according to the row "T1" in table 19.1.1.3.2-1-0 in order to simulate needs for cell reselection to Cell2. Cell 2 broadcasts *SystemInformationBlockType18* including *commTxPoolNormalCommon*.	-	-	-	-
21A	Wait for 5 sec to allow the UE to adjust to cell changes and start transmission.	-	-	-	-
22-26	Void	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 2.	-	-	-	-
27	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources indicated in the broadcast on Cell 2 *SystemInformationBlockType18*? NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	3	P
28	The SS configures: SS-NW Cell 2 and Cell 4 parameters according to the row "T2" in table 19.1.1.3.2-1-0 in order to simulate cell reselection to Cell 4. Cell 4 broadcasts *SystemInformationBlockType18* providing different resources for sideling communication transmission than those provided on Cell 2. In addition to all other settings the *syncTxThreshIC* is included with value 7 (this is needed for TP5). NOTE 1: Value 7 is chosen to ensure that the Power level of Cell 4 is such that it is ensured that the RSRP measurement of the Cell 4 (serving) cell is NOT below the power value that corresponds to 7 (-85dBm).	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 4.	-	-	-	-
-	EXCEPTION: In parallel to steps 4-5 in the procedure described in step 29, the event described in Table 19.1.1.3.2-4 takes place.	-	-	-	-
29	Check: Does the Generic test procedure for 'Tracking area updating procedure' defined in TS 36.508 [18] clause 4.5A.2 take place during which the UE announces its ProSe direct communication capabilities in the TRACKING AREA UPDATE REQUEST message?	-	-	1	-
30-32	Void	-	-	-	-

33	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources indicated in the broadcasted on Cell 4 *SystemInformationBlockType18*? NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	4	P
-	EXCEPTION: Steps 34 - 35 are repeated 3 times.	-	-	-	-
34	Check: Does the UE transmit SLSS in the next transmission period?	-->	SLSS	5	F
35	Check: Does the UE transmit *MasterInformationBlock-SL* message in the same subframe as the SLSS in step 34?	-->	*MasterInformationBlock-SL*	5	F
36	The SS configures: SW-NW Cell 4 parameters according to the row "T3" in table 19.1.1.3.2-1-0. NOTE 2: The Power level of Cell 4 is such that it is ensured that the RSRP measurement of the serving cell is below the value of syncTxThreshIC (7 (-85dBm)) included in *SystemInformationBlockType18*.	-	-	-	-
36A	Wait for 1 sec to allow the UE to adjust to cell changes and start transmission.	-	-	-	-
-	EXCEPTION: Steps 37 - 38 are repeated 3 times.	-	-	-	-
37	Check: Does the UE transmit SLSS in the next transmission period in accordance with the information provided in the *SystemInformationBlockType18* (SLSSID, a subframe indicated by *syncOffsetIndicator* does not corresponds to the first subframe of the discovery transmission pool)?	-->	SLSS	5	P
38	Check: Does the UE transmit *MasterInformationBlock-SL* message in the same subframe as the SLSS in step 37?	-->	*MasterInformationBlock-SL*	5	P
39	The SS configures: SW-NW Cell 4 and Cell 11 parameters according to the row "T4" in table 19.1.1.3.2-1-0 in order to simulate needs for cell reselection to Cell 11. Cell 11 broadcasts *SystemInformationBlockType18* providing resources for sidelink communication transmission.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 11.	-	-	-	-
-	EXCEPTION: In parallel to the procedure described in step 40 the event described in Table 19.1.1.3.2-2 takes place.	-	-	-	-
40	The Generic test procedure for 'Tracking area updating procedure' defined in TS 36.508 [18] clause 4.5A.2 takes place.	-	-	-	-
41-43	Void.	-	-	-	-
44	Check: Does the UE transmit during the next 3 transmission periods sidelink communication over the PC5 interface in the next transmission period in accordance with the resources indicated in the *SystemInformationBlockType18* transmitted on	-->	-	6	F

	Cell 11?				
45-50	Void	-	-	-	-
51	The SS configures: SW-NW Cell 11 and Cell 4 parameters according to the row "T6" in table 19.1.1.3.2-1-0 in order to simulate needs for cell reselection to Cell4. Cell 4 is transmitting *SystemInformationBlockType18* providing resources for ProSe direct communication transmission.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 4.	-	-	-	-
51A	The UE transmits an *RRCConnectionRequest* message on the cell specified in the test case.	-->	*RRCConnectionRequest*	-	-
51B	SS-NW transmits an *RRCConnectionSetup* message.	<--	*RRCConnectionSetup*	-	-
-	EXCEPTION: In parallel to steps 52-53, the event described in Table 19.1.1.3.2-4 takes place.	-	-	-	-
52	The UE transmits a TRACKING AREA UPDATE REQUEST message.	-->	*RRCConnectionSetupComplete* TRACKING AREA UPDATE REQUEST	-	-
53	The SS-NW transmits a TRACKING AREA UPDATE REJECT message with cause value set to "PLMN not allowed".	<--	TRACKING AREA UPDATE REJECT	-	-
54	Void	-	-	-	-
55	SS-NW transmits an RRCConnectionRelease message to release RRC connection	<--	*RRCConnectionRelease*	-	-
56	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink data communication over the PC5 interface in accordance with the resources indicated on Cell 4? NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	8	P

Void

19.1.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, TS 36.331, clauses 5.2.2.4, 5.2.2.25, 5.10.1a, 5.10.3. Unless otherwise stated these are Rel-12 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

a) served by E-UTRAN and authorised for ProSe direct communication in the registered PLMN;

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

…

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or
- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.2.2.25]

Upon receiving *SystemInformationBlockType18*, the UE shall:

1> if *SystemInformationBlockType18* message includes the *commConfig*:

2> if configured to receive sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commRxPool* for sidelink communication monitoring, as specified in 5.10.3;

[TS 36.331, clause 5.10.1a]

When it is specified that the UE shall perform a particular sidelink operation only if the conditions defined in this section are met, the UE shall perform the concerned sidelink operation only if:

1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

[TS 36.331, clause 5.10.3]

A UE capable of sidelink communication that is configured by upper layers to receive sidelink communication shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

3> if the cell chosen for sidelink communication reception broadcasts *SystemInformationBlockType18* including *commRxPool*:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated by *commRxPool*;

NOTE 1: If *commRxPool* includes one or more entries including *rxParametersNCell*, the UE may only monitor such entries if the associated PSS/SSS or SLSSIDs is detected. When monitoring such pool(s), the UE applies the timing of the concerned PSS/SSS or SLSS.

19.1.2.3 Test description

19.1.2.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.1.2.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instance.

Table 19.1.2.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	PLMN4
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_PLMN} PLMN2: PLMN2 in USIM EF_{PROSE_PLMN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=03. PLMN4 is an equivalent PLMN to PLMN1; MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=04. Note 2: The Frequency f1 shall be the frequency pre-configured in the UE for when UE is "not served by E-UTRAN". Note 3: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells.

SS-UE

- SS-UE1
- As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting device on the resources provided by different cells (as specified in the relevant procedure steps in Table 19.1.2.3.2-1).
- SS-UE2
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting device transmitting as well Synchronisation information on the resources provided by different cells (as specified in the relevant procedure steps in Table 19.1.2.3.2-1).
  - When SS-UE2 is simulated, SS-UE2 and SS-UE1 transmit simultaneously.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; the UE is authorised to perform ProSe Direct Communication; the UE is equipped with a USIM containing values shown in Table 19.1.2.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, etc.).

Table 19.1.2.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.

EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

- For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 5 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

Preamble:

- The UE is in State RB Established, UE Test Mode Activated (State 3A) with TEST LOOP MODE E being activated on Cell 1 according to TS 36.508 [18]. During the registration PLMN4 is assigned as Equivalent PLMN.

19.1.2.3.2 Test procedure sequence

Table 19.1.2.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.2.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11
T0	Cell-specific RS EPRE	dBm/15k Hz	-85	"Off"	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15k Hz	-85	-79	"Off"	"Off"
T2	Cell-specific RS EPRE	dBm/15k Hz	-85	"Off"	-79	"Off"
T3	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-85	-79
T4	Void					
T5	Void					

Table 19.1.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
0	Close UE Test Loop with bit E0 in UE test loop mode E LB setup IE set to one (TEST LOOP MODE E, TRIGGER = RECEIVE) and bring UE into state Loopback Activated (State 4). NOTE: The loop is closed here and used towards the end of the test sequence to allow that most of the time the UE is kept out of coverage and is not moving often between in and out of coverage.	<--	CLOSE UE TEST LOOP	-	-
0A	The UE responds with CLOSE UE TEST LOOP COMPLETE.	-->	CLOSE UE TEST LOOP COMPLETE	-	-
0B	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
1	Force the UE upper layer application to request reception of sidelink communication.	-	-	-	-
1A	Wait for [5] sec to allow the UE to process the request and start reception.	-	-	-	-

19.1.3 ProSe Direct Communication/Pre-configured authorisation / UE in RRC_CONNECTED on an E-UTRAN cell operating on the carrier frequency provisioned for ProSe direct service / Utilisation of the resources of (serving) cells/PLMNs / Transmission / RRC connection reconfiguration with/without *mobilityControlInfo* / RRC connection re-establishment

19.1.3.1 Test Purpose (TP)

(1)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication }
ensure that {
  when { UE receives a request from upper layers to transmit sidelink communication }
    then { UE successfully completes a Sidelink UE information procedure to indicate the sidelink communication transmission resources required, **and**, UE is able to transmit sidelink communication using the configured resources in Cell1/f1/PLMN1 (*commTxResources* set to *setup* and resources provided in *commTxPoolNormalDedicated*) }
            }

(2)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having successfully completed Sidelink UE information procedure to indicate the sidelink communication transmission resources required and transmitting sidelink communication using the configured resources in Cell1/f1/PLMN1 (*commTxResources* set to setup and resources provided in *commTxPoolNormalDedicated*) }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message which does not include *mobilityControlInfo* and includes *commTxResources* set to *release* }
    then { UE from the next SC period releases the resources allocated for sidelink communication transmission previously configured by commTxResources in Cell1/f1/PLMN1, **and**, UE re-starts transmission of sidelink communication when resources become available (*commTxResources* set to *setup*, *scheduled* and resources provided in *sc-CommTxConfig* }
            }

(2A)

with { UE being authorised for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having successfully completed Sidelink UE information procedure requesting sidelink communication transmission resources and transmitting sidelink communication }
ensure that {
  when { UE receives a request from upper layers to stop sidelink communication transmission }
    then { the UE transmits a *SidelinkUEInformation* message indicating it does no longer require sidelink communication transmission resources, and, stops sidelink communication transmission on Cell1/f1/PLMN1 }
            }

(3)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having sent a *SidelinkUEInformation* message requesting sidelink communication transmission resources on Cell1/f1/PLMN1 }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message which includes *mobilityControlInfo* (handover) less than 1 sec after the UE transmitted the *SidelinkUEInformation* message, **and**, MAC

successfully completes the random access procedure to the targeted PCell Cell2/f1/PLMN4 (equivalent PLMN) which is broadcasting *SystemInformationBlockType18* }
then { UE initiates a Sidelink UE information procedure in Cell2/f1/PLMN4 requesting sidelink communication transmission resources, **and**, UE is able to transmit sidelink communication using the configured resources in Cell2/f1/PLMN4 (*commTxResources* set to setup and resources provided in *commTxPoolNormalDedicated*) }
}

(4)

with { UE being authorised for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell2/f1/PLMN4 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having sent a *SidelinkUEInformation* message requesting sidelink communication transmission resources on Cell2/f1/PLMN4 }
ensure that {
when { UE detects radio link failure >1 sec after the UE transmitted the *SidelinkUEInformation* message, **and**, T301 is running and the cell on which the UE initiated connection re-establishment (Cell1/f1/PLMN1) broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional* }
then { UE transmits sidelink communication using the pool of resources indicated by the first entry in *commTxPoolExceptional* on Cell1/f1/PLMN1, **and**, after the T301 expires UE initiates a Sidelink UE information procedure requesting sidelink communication transmission resources, **and**, UE is able to transmit sidelink communication using the configured resources in Cell1/f1/PLMN1 (*commTxResources* set to setup and resources provided in *commTxPoolNormalDedicated*) }
}

(5)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE transmitting and receiving sidelink communication using the configured resources in Cell1/f1/PLMN1 (*commTxPoolNormalDedicated* and *commRxPool*) }
ensure that {
when { UE receives *RRCConnectionReconfiguration* message which includes *mobilityControlInfo* (handover), **and**, MAC successfully completes the random access procedure to the targeted PCell Cell4/f1/PLMN2 and the cell is broadcasting *SystemInformationBlockType18* }
then { UE successfully completes a Sidelink UE information procedure requesting sidelink communication transmission resources, **and**, UE is able to transmit sidelink communication using the configured resources in Cell4/f1/PLMN2 }
}

(6)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having successfully completed Sidelink UE information procedure requesting sidelink communication transmission resources and transmitting sidelink communication }
ensure that {
when { UE is in RRC_CONNECTED, **and**, *networkControlledSyncTx* is configured and set to *on* }
then { UE transmits SLSS and *MasterInformationBlock-SL* message in the same subframe }
}

(7)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having successfully completed Sidelink UE information procedure requesting sidelink communication transmission resources and transmitting sidelink communication }
ensure that {
when { UE is in RRC_CONNECTED, **and**, *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType18,* and, the RSRP measurement of the serving cell is below the value of *syncTxThreshIC* }
then { UE transmits SLSS and *MasterInformationBlock-SL* message in the same subframe }
}

(8) **Void**

(9)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-configured in the UE and is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having successfully completed Sidelink UE information procedure requesting sidelink communication transmission resources and transmitting sidelink communication }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo*, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell11/f1/PLMN3 which is broadcasting *SystemInformationBlockType18* }
    then { UE does not transmit a SidelinkUEInformation message to indicate the transmission resources required, **and**, does not transmit sidelink communication over the PC5 in the assigned resources in Cell11/f1/PLMN3 (*commTxResources* set to setup and resources provided in *commTxPoolNormalDedicated*) }
            }

(10)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and being provisioned with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE in RRC_CONNECTED on Cell11/f1/PLMN3 which is broadcasting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication on the serving PLMN, **and**, UE has previously successfully completed a Sidelink UE information procedure requesting sidelink communication transmission resources }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo*, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell1/f1/PLMN1 which is NOT broadcasting *SystemInformationBlockType18* }
    then { UE does not transmit a SidelinkUEInformation message to indicate the transmission resources required, **and**, does not transmit sidelink communication over the PC5 in Cell1/f1/PLMN1 }
            }

19.1.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, 10.2.3, TS 36.331, clauses 5.2.2.4, 5.3.5.3, 5.3.5.4, 5.3.7.5, 5.3.10.15, 5.10.1a, 5.10.2.1, 5.10.2.2, 5.10.2.3, 5.10.4, 5.10.7.1, 5.10.7.2, 5.10.7.3, 5.10.7.4, 5.10.9.1, 5.10.9.2. Unless otherwise stated these are Rel-12 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

a) served by E-UTRAN and authorised for ProSe direct communication in the registered PLMN;

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

If the UE is camped on an E-UTRAN cell not operating on the carrier frequency provisioned for ProSe direct communication which indicates that ProSe direct communication is supported by the network, the UE can perform either ProSe direct communication procedures specified in subclause 10.2.2 or ProSe direct communication procedures specified in subclause 10.2.3.

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or
- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 24.334, clause 10.2.3]

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

NOTE 2: If the lower layers find that there exists a cell operating the provisioned radio resources (i.e., carrier frequency), and the cell belongs to the registered PLMN or a PLMN equivalent to the registered PLMN, and the UE is authorized for ProSe direct communication in this PLMN, the UE can use the radio parameters indicated by the cell as specified in 3GPP TS 36.331 [12].

- else if the lower layers report that one or more PLMNs operate in the provisioned radio resources (i.e. carrier frequency) then:
  a) if the following conditions are met:
    1) none of the PLMNs reported by the lower layers is the registered PLMN or equivalent to the registered PLMN; and
    2) at least one of the PLMNs reported by the lower layers is in the list of authorised PLMNs for ProSe direct communication and provides radio resources for ProSe direct communication as specified in 3GPP TS 36.331 [12];

  then the UE shall:

1) if in EMM-IDLE mode, perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or

2) else if in EMM-CONNECTED mode, either:

i) perform a detach procedure as specified in 3GPP TS 24.301 [11] and then perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or

ii) not initiate ProSe direct communication.

Whether the UE performs i) or ii) above is left up to UE implementation; or

b) else the UE shall not initiate ProSe direct communication.

If the registration to the selected PLMN is successful, the UE shall proceed with the procedure to initiate ProSe direct communication as specified in subclause 10.2.2.

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.3.5.3]

If the *RRCConnectionReconfiguration* message does not include the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

...

1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:

2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;

...

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission using the new configuration, upon which the procedure ends;

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

...

1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:

2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;

...

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;

1> if MAC successfully completes the random access procedure:

...

2> if *SystemInformationBlockType18* is broadcast by the target PCell; and the UE transmitted a *SidelinkUEInformation* message including *commRxInterestedFreq* or *commTxResourceReq* during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*; or:

...

3> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.3.7.5]

NOTE 1: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> stop timer T301;

1> consider the current cell to be the PCell;

1> re-establish PDCP for SRB1;

1> re-establish RLC for SRB1;

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10;

1> resume SRB1;

...

1> if *SystemInformationBlockType18* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message including *commRxInterestedFreq* or *commTxResourceReq* during the last 1 second preceding detection of radio link failure; or

...

2> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.3.10.15]

The UE shall:

1> if the *RRCConnectionReconfiguration* message includes the *sl-CommConfig*:

2> if *commTxResources* is included and set to *setup*:

3> from the next SC period use the resources indicated by *commTxResources* for sidelink communication transmission, as specified in 5.10.4;

2> else if *commTxResources* is included and set to *release*:

3> from the next SC period, release the resources allocated for sidelink communication transmission previously configured by *commTxResources*;

[TS 36.331, clause 5.10.1a]

When it is specified that the UE shall perform a particular sidelink operation only if the conditions defined in this section are met, the UE shall perform the concerned sidelink operation only if:

1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

[TS 36.331, clause 5.10.2.1]

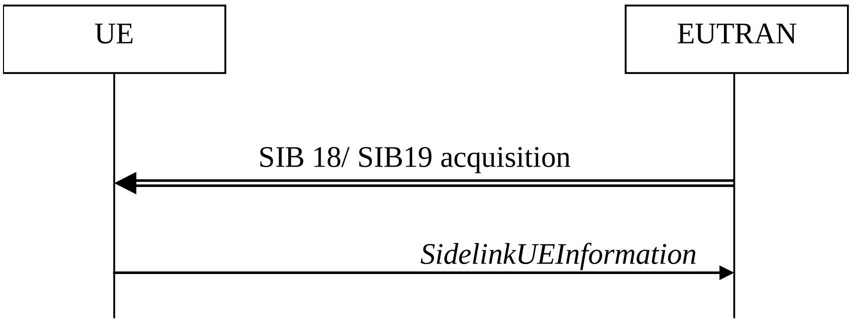

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

NOTE 1: A UE in RRC_IDLE that is configured to transmit sidelink communication/ discovery announcements, while *SystemInformationBlockType18*/ *SystemInformationBlockType19* does not include the resources for transmission (in normal conditions), initiates connection establishment in accordance with 5.3.3.1a.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType18* for the PCell;

...

2> if configured by upper layers to transmit sidelink communication:

3> if the UE did not transmit a *SidelinkUEInformation* message since entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *commTxResourceReq*; or if the information carried by the *commTxResourceReq* has changed since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it does no longer require sidelink communication transmission resources in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

...

2> if configured by upper layers to transmit sidelink communication:

3> include *commTxResourceReq* and set its fields as follows:

4> set *carrierFreq* to indicate the sidelink communication frequency i.e. the same value as indicated in *commRxInterestedFreq* if included;

4> set *destinationInfoList* to include the sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;

...

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication and has related data to be transmitted shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

3> if the UE is in RRC_CONNECTED and uses the PCell for sidelink communication:

4> if the UE is configured, by the current PCell/ the PCell in which physical layer problems or radio link failure was detected, with *commTxResources* set to *scheduled*:

5> if T310 or T311 is running; and if the PCell at which the UE detected physical layer problems or radio link failure broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional*; or

5> if T301 is running and the cell on which the UE initiated connection re-establishment broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional*:

6> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolExceptional*;

5> else:

6> configure lower layers to request E-UTRAN to assign transmission resources for sidelink communication;

4> else if the UE is configured with *commTxPoolNormalDedicated*:

5> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolNormalDedicated*;

[TS 36.331, clause 5.10.7.1]

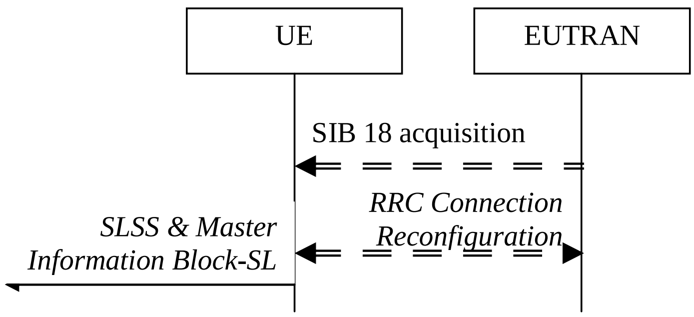

Figure 5.10.7.1-1: Synchronisation information transmission for sidelink communication, in (partial) coverage

...

The purpose of this procedure is to provide synchronisation information to a UE. The synchronisation information concerns a Sidelink Synchronisation Signal (SLSS) for sidelink discovery, while it concerns an SLSS, timing information and some additional configuration parameters (i.e. the *MasterInformationBlock-SL* message) for sidelink communication. A UE transmits synchronisation information either when E-UTRAN configures it to do so by dedicated signalling (i.e. network based), or when not configured by dedicated signalling (i.e. UE based) and E-UTRAN broadcasts (in coverage) or pre-configures a threshold (out of coverage).

The synchronisation information transmitted by the UE may be derived from information/ signals received from E-UTRAN (in coverage) or received from a UE acting as synchronisation reference for the transmitting UE. In the remainder, the UE acting as synchronisation reference is referred to as SyncRef UE.

[TS 36.331, clause 5.10.7.2]

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication shall, irrespective of whether or not it has data to transmit:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];

3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

A UE shall, when transmitting sidelink communication in accordance with 5.10.4 and when the following conditions are met:

1> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

2> if the UE is in RRC_CONNECTED; and *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType18*; and the RSRP measurement of the cell chosen for sidelink communication transmission is below the value of *syncTxThreshIC*; or

2> if the UE is in RRC_IDLE; and *syncTxThreshIC* is included in *SystemInformationBlockType18*; and the RSRP measurement of the cell chosen for sidelink communication transmission is below the value of *syncTxThreshIC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];

3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

1> else (i.e. out of coverage):

2> if *syncTxThreshOoC* is included in the preconfigured sidelink parameters (i.e. *SL-Preconfiguration* defined in 9.3); and the UE has no selected SyncRef UE or the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];

3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

[TS 36.331, clause 5.10.7.3]

The UE shall select the SLSSID and the subframe in which to transmit SLSS as follows:

...

1> if triggered by sidelink communication:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

3> select the SLSSID included in the entry of *commSyncConfig* that is included in the received *SystemInformationBlockType18* and includes *txParameters*;

3> use *syncOffsetIndicator* corresponding to the selected SLSSID;

3> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*:

4> select the subframe(s) indicated by *syncOffsetIndicator*;

3> else (when transmitting communication):

4> select the subframe(s) indicated by *syncOffsetIndicator* within the SC period in which the UE intends to transmit sidelink control information or data;

2> else (i.e. out of coverage on sidelink carrier):

3> select the synchronisation reference UE (i.e. SyncRef UE) as defined in 5.10.8;

3> if the UE has a selected SyncRef UE and *inCoverage* in the *MasterInformationBlock-SL* message received from this UE is set to *TRUE*; or

3> if the UE has a selected SyncRef UE and *inCoverage* in the *MasterInformationBlock-SL* message received from this UE is set to *FALSE* while the SLSS from this UE is part of the set defined for out of coverage, see TS 36.211 [21]:

4> select the same SLSSID as the SLSSID of the selected SyncRef UE;

4> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3), such that the subframe timing is different from the SLSS of the selected SyncRef UE;

3> else if the UE has a selected SyncRef UE:

4> select the SLSSID from the set defined for out of coverage having an index that is 168 more than the index of the SLSSID of the selected SyncRef UE, see TS 36.211 [21];

4> select the subframe in which to transmit the SLSS according to *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3), such that the subframe timing is different from the SLSS of the selected SyncRef UE;

3> else (i.e. no SyncRef UE selected):

4> randomly select, using a uniform distribution, an SLSSID from the set of sequences defined for out of coverage, see TS 36.211 [21];

4> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* (arbitrary selection between these) included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3);

[TS 36.331, clause 5.10.7.4]

The UE shall set the contents of the *MasterInformationBlock-SL* message as follows:

1> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

2> set *inCoverage* to *TRUE*;

2> set *sl-Bandwidth* to the value of *ul-Bandwidth* as included in the received *SystemInformationBlockType2* of the cell chosen for sidelink communication;

2> if *tdd-Config* is included in the received *SystemInformationBlockType1*:

3> set *subframeAssignmentSL* to the value representing the same meaning as of s*ubframeAssignment* that is included in *tdd-Config* in the received *SystemInformationBlockType1*;

2> else:

3> set *subframeAssignmentSL* to *none*;

2> if *syncInfoReserved* is included in an entry of *commSyncConfig* from the received *SystemInformationBlockType18*;

3> set *reserved* to the value of *syncInfoReserved* in the received *SystemInformationBlockType18*;

2> else:

3> set all bits in *reserved* to 0;

1> else if the UE has a selected SyncRef UE (as defined in 5.10.8):

2> set *inCoverage* to *FALSE*;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the received *MasterInformationBlock-SL*;

1> else (i.e. no SyncRef UE selected):

2> set *inCoverage* to *FALSE*;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the preconfigured sidelink parameters (i.e. *preconfigGeneral* in *SL-Preconfiguration* defined in 9.3);

1> set *directFrameNumber* and *directSubframeNumber* according to the subframe used to transmit the SLSS, as specified in 5.10.7.3;

1> submit the *MasterInformationBlock-SL* message to lower layers for transmission upon which the procedure ends;

[TS 36.331, clause 5.10.9.1]

The sidelink common control information is carried by a single message, the *MasterInformationBlock-SL* (MIB-SL) message. The MIB-SL includes timing information as well as some configuration parameters and is transmitted via SL-BCH.

The MIB-SL uses a fixed schedule with a periodicity of 40 ms without repetitions. In particular, the MIB-SL is scheduled in subframes indicated by *syncOffsetIndicator* i.e. for which (10*DFN + subframe number) mod 40 = *syncOffsetIndicator*.

The sidelink common control information may change at any transmission i.e. neither a modification period nor a change notification mechanism is used.

A UE configured to receive or transmit sidelink communication shall:

1> if the UE has a selected SyncRef UE, as specified in 5.10.8.2:

2> ensure having a valid version of the *MasterInformationBlock-SL* message of that SyncRefUE:

[TS 36.331, clause 5.10.9.2]

Upon receiving *MasterInformationBlock-SL*, the UE shall:

1> apply the values of *sl-Bandwidth*, *subframeAssignmentSL*, *directFrameNumber* and *directSubframeNumber* included in the received *MasterInformationBlock-SL* message;

19.1.3.3 Test description

19.1.3.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.1.3.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instance.

Table 19.1.3.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	PLMN4
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_PLMN} PLMN2: PLMN2 in USIM EF_{PROSE_PLMN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=03. PLMN4 is an equivalent PLMN to PLMN1; MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=04. Note 2: The Frequency f1 shall be the frequency pre-configured in the UE for when UE is "not served by E-UTRAN". Note 3: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells.

SS-UE

- SS-UE1. As defined in TS 36.508 [18], configured and operating for/as ProSe Direct Communication receiving device on the resources which the UE is expected to use for transmission (as specified in the relevant procedure steps in Table 19.1.3.3.2-1).

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; the UE is equipped with a USIM containing values shown in Table 19.1.3.3.3-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, etc.).

Table 19.1.3.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

  - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 12 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

Preamble:

- The UE is in State 2 RRC_IDLE on Cell 1 according to TS 36.508 [18]. During the registration PLMN4 is assigned as Equivalent PLMN.

19.1.3.3.2 Test procedure sequence

Table 19.1.3.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.3.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11
T0	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15kHz	-85	-79	"Off"	"Off"
T2	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	"Off"	"Off"
T3	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	-79	"Off"
T4	Cell-specific RS EPRE	dBm/15kHz	"Off"	"Off"	-87	"Off"
T5	Cell-specific RS EPRE	dBm/15kHz	"Off"	"Off"	-87	-79
T6	Cell-specific RS EPRE	dBm/15kHz	-79	"Off"	"Off"	-85

Table 19.1.3.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Force the UE upper layer application to request continuous transmission of sidelink communication (a maximum of 100 Bytes per communication "message"). NOTE: This can be done e.g. via a MMI command. Note that the max of 100 Bytes is not a 3GPP requirement rather it is requested only for the purpose of facilitating the test case specification.	-	-	-	-

19.1.4 ProSe Direct Communication/Pre-configured authorisation / UE in RRC_CONNECTED on an E-UTRAN cell operating on the carrier frequency provisioned for ProSe direct service / Utilisation of the resources of (serving) cells/PLMNs / Reception / RRC connection reconfiguration with *mobilityControlInfo* / RRC connection re-establishment

19.1.4.1 Test Purpose (TP)

(1)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*) }
ensure that {
  when { UE receives a request from upper layers to receive sidelink communication }
    then { UE successfully completes a Sidelink UE information procedure to indicate it is interested in receiving sidelink communication, **and**, UE is able to receive sidelink communication on the configured resources in Cell1/f1/PLMN1 }
            }

(2)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*), **and**, UE having successfully completed Sidelink UE information procedure indicating its interest receiving sidelink communication and receiving sidelink communication on the resources provided by cell Cell1/f1/PLMN1 }
ensure that {
  when { UE is triggered by an upper layer application to stop sidelink communication reception }
    then { the UE transmits a *SidelinkUEInformation* message indicating it is no longer interested in sidelink communication reception }
            }

(3)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication, **and**, UE having sent a *SidelinkUEInformation* message to indicate it is interested in receiving sidelink communication on Cell1/f1/PLMN1 }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message which includes *mobilityControlInfo* (handover) less than 1 sec after the UE transmitted the *SidelinkUEInformation* message, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell2/f1/PLMN4 (equivalent PLMN) which is broadcasting *SystemInformationBlockType18* (*commRxPool*) }
    then { UE initiates a Sidelink UE information procedure in Cell2/f1/PLMN4 indicating the sidelink communication reception frequency of interest, **and**, UE is able to receive sidelink communication on the configured resources in Cell2/f1/PLMN4 }
            }

(4)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell2/f1/PLMN4 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*), **and**, UE having sent a *SidelinkUEInformation* message to indicate it is interested in receiving sidelink communication on Cell1/f1/PLMN1 }
ensure that {
  when { UE detects radio link failure >1 sec after the UE transmitted the *SidelinkUEInformation* message, **and**, the cell on which the UE initiated connection re-establishment (Cell1/f1/PLMN1) transmits *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*) }

```
    then { UE is able to receive sidelink communication on the configured resources in
Cell1/f1/PLMN1 }
            }
```

(5)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell1/f1/PLMN1 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*), **and**, UE receiving sidelink communication on the configured resources in Cell1/f1/PLMN1 }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message which includes *mobilityControlInfo* (handover) more than 1 sec after the UE transmitted the *SidelinkUEInformation* message, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell4/f1/PLMN2 and the cell is broadcasting *SystemInformationBlockType18* (*commRxPool* includes entries including *rxParametersNCell*) }
    then { UE is able to receive sidelink communication from two different devices one operating on the configured for *rxParametersNCell* resources in Cell4/f1/PLMN2 and one on the resources not including *rxParametersNCell* }
            }

(6)

with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2) and pre-configured with Radio parameters for when the UE is "not served by E-UTRAN", **and**, UE is in RRC_CONNECTED on Cell4/f1/PLMN2 which is operating on the same carrier frequency as the one pre-configured in the UE and is transmitting *SystemInformationBlockType18* indicating the provision of resources for sidelink communication (*commRxPool*), **and**, UE receiving sidelink communication on the configured resources in Cell4/f1/PLMN2 }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo* (handover), **and**, MAC successfully completes the random access procedure to the targeted PCell Cell11/f1/PLMN3 (PLMN not authorised for performing ProSe Direct Communication) which is broadcasting *SystemInformationBlockType18 (commRxPool)* }
    then { UE does not transmit a *SidelinkUEInformation* message to indicate the reception frequency of interest does not receive sidelink communication over the PC5 in the assigned resources in Cell11/f1/PLMN3 }
            }

19.1.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, 10.2.3, TS 36.331, clauses 5.2.2.4, 5.2.2.25, 5.3.5.4, 5.3.7.5, 5.10.1a, 5.10.2.1, 5.10.2.2, 5.10.2.3, 5.10.3. Unless otherwise stated these are Rel-12 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

a) served by E-UTRAN and authorised for ProSe direct communication in the registered PLMN;

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

If the UE is camped on an E-UTRAN cell not operating on the carrier frequency provisioned for ProSe direct communication which indicates that ProSe direct communication is supported by the network, the UE can perform either ProSe direct communication procedures specified in subclause 10.2.2 or ProSe direct communication procedures specified in subclause 10.2.3.

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or

- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 24.334, clause 10.2.3]

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

NOTE 2: If the lower layers find that there exists a cell operating the provisioned radio resources (i.e., carrier frequency), and the cell belongs to the registered PLMN or a PLMN equivalent to the registered PLMN, and the UE is authorized for ProSe direct communication in this PLMN, the UE can use the radio parameters indicated by the cell as specified in 3GPP TS 36.331 [12].

- else if the lower layers report that one or more PLMNs operate in the provisioned radio resources (i.e. carrier frequency) then:

  a) if the following conditions are met:

    1) none of the PLMNs reported by the lower layers is the registered PLMN or equivalent to the registered PLMN; and

2) at least one of the PLMNs reported by the lower layers is in the list of authorised PLMNs for ProSe direct communication and provides radio resources for ProSe direct communication as specified in 3GPP TS 36.331 [12];

then the UE shall:

1) if in EMM-IDLE mode, perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or

2) else if in EMM-CONNECTED mode, either:

i) perform a detach procedure as specified in 3GPP TS 24.301 [11] and then perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or

ii) not initiate ProSe direct communication.

Whether the UE performs i) or ii) above is left up to UE implementation; or

b) else the UE shall not initiate ProSe direct communication.

If the registration to the selected PLMN is successful, the UE shall proceed with the procedure to initiate ProSe direct communication as specified in subclause 10.2.2.

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.2.2.25]

Upon receiving *SystemInformationBlockType18*, the UE shall:

1> if *SystemInformationBlockType18* message includes the *commConfig*:

2> if configured to receive sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commRxPool* for sidelink communication monitoring, as specified in 5.10.3;

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

...

1> if MAC successfully completes the random access procedure:

...

2> if *SystemInformationBlockType18* is broadcast by the target PCell; and the UE transmitted a *SidelinkUEInformation* message including *commRxInterestedFreq* or *commTxResourceReq* during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*; or:

...

3> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.3.7.5]

NOTE 1: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> stop timer T301;

1> consider the current cell to be the PCell;

1> re-establish PDCP for SRB1;

1> re-establish RLC for SRB1;

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10;

1> resume SRB1;

...

1> if *SystemInformationBlockType18* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message including *commRxInterestedFreq* or *commTxResourceReq* during the last 1 second preceding detection of radio link failure; or

...

2> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.1a]

When it is specified that the UE shall perform a particular sidelink operation only if the conditions defined in this section are met, the UE shall perform the concerned sidelink operation only if:

1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

[TS 36.331, clause 5.10.2.1]

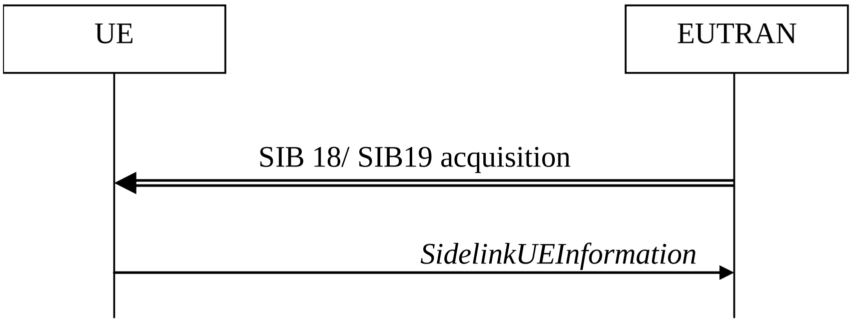

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

...

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType18* for the PCell;

2> if configured by upper layers to receive sidelink communication:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*; or

NOTE 2: After handover/ re-establishment from a source PCell not broadcasting *SystemInformationBlockType18* the UE repeats the same interest information that it provided previously as such a source PCell may not forward the interest information.

3> if the last transmission of the *SidelinkUEInformation* message did not include *commRxInterestedFreq*; or if the frequency configured by upper layers to receive sidelink communication on has changed since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink communication reception frequency of interest in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *commRxInterestedFreq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it is no longer interested in sidelink communication reception in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

1> if *SystemInformationBlockType18* is broadcast by the PCell:

2> if configured by upper layers to receive sidelink communication:

3> include *commRxInterestedFreq* and set it to the sidelink communication frequency;

...

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.3]

A UE capable of sidelink communication that is configured by upper layers to receive sidelink communication shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

3> if the cell chosen for sidelink communication reception broadcasts *SystemInformationBlockType18* including *commRxPool*:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated by *commRxPool*;

NOTE 1: If *commRxPool* includes one or more entries including *rxParametersNCell*, the UE may only monitor such entries if the associated PSS/SSS or SLSSIDs is detected. When monitoring such pool(s), the UE applies the timing of the concerned PSS/SSS or SLSS.

19.1.4.3 Test description

19.1.4.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.1.4.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instance.

Table 19.1.4.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	PLMN4
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_PLMN} PLMN2: PLMN2 in USIM EF_{PROSE_PLMN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=03. PLMN4 is an equivalent PLMN to PLMN1; MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=04. Note 2: The Frequency f1 shall be the frequency pre-configured in the UE for when UE is "not served by E-UTRAN". Note 3: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells.

SS-UE

- SS-UE1
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting device on the resources provided by different cells (as specified in the relevant procedure steps in Table 19.1.4.3.2-1).
- SS-UE2
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting device transmitting as well Synchronisation information on the resources provided by different cells (as specified in the relevant procedure steps in Table 19.1.4.3.2-1).
  - When SS-UE2 is simulated, SS-UE2 and SS-UE1 transmit simultaneously.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; the UE is equipped with a USIM containing values shown in Table 19.1.4.3.3-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, etc.).

Table 19.1.4.3.3-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.

EF_PST	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_AD	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

- For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 5 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

Preamble:

- The UE is in state Generic RB Established, UE Test Mode Activated (State 3A) with TEST LOOP MODE E being activated according to TS 36.508 [18] on Cell 1. During the registration PLMN4 is assigned as Equivalent PLMN. Cell 1 is broadcasting SystemInformationBlockType18 providing Rx resources for reception in RRC_IDLE and RRC_CONNECTED, and, Tx resources for transmission in RRC_IDLE.

19.1.4.3.2 Test procedure sequence

Table 19.1.4.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.4.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15kHz	-85	-79	"Off"	"Off"
T2	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	"Off"	"Off"
T3	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	-79	"Off"
T4	Cell-specific RS EPRE	dBm/15kHz	"Off"	"Off"	-85	-79

(5) Void

(6) Void

(7)

```
with { UE being authorized for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" carrier
frequency f1, and, UE in RRC_CONNECTED on Cell3/f2/PLMN1 which does not indicate that ProSe direct
communication is supported by the network }
ensure that {
  when { UE wants to transmit prose direct communication, and, UE is capable of simultaneous
transmission of EUTRA and sidelink communication (on different carriers), and, the lower layers find
that there are not cells operating on the preconfigured radio resources (i.e. carrier frequency) }
    then { UE is able to transmit sidelink communication using the preconfigured for "not served by
E-UTRAN" resources }
            }
```

(8)

```
with { UE being authorised for performing ProSe Direct Communication in two PLMNs (PLMN1 and PLMN2)
and being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" carrier
frequency f1, and, UE in RRC_CONNECTED on Cell3/f2/PLMN1 which does not indicate that ProSe direct
communication is supported by the network }
ensure that {
  when { UE wants to transmit prose direct communication, and, UE us capable of simultaneous
transmission of EUTRA and sidelink communication (on different carriers), and, the lower layers find
that there are not cells operating on the preconfigured radio resources (i.e. carrier frequency) }
    then { UE is able to receive sidelink communication using the preconfigured "not served by E-
UTRAN" resources }
            }
```

19.1.5.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, 10.2.3, TS 36.331, clauses 5.2.2.4, 5.2.2.25, 5.10.1a, 5.10.3, 5.10.4. Unless otherwise stated these are Rel-12 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

a) served by E-UTRAN and authorised for ProSe direct communication in the registered PLMN;

b) not served by E-UTRAN, and authorised for ProSe direct communication for "not served by E-UTRAN"; or

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

If the UE is camped on an E-UTRAN cell not operating on the carrier frequency provisioned for ProSe direct communication which indicates that ProSe direct communication is supported by the network, the UE can perform either ProSe direct communication procedures specified in subclause 10.2.2 or ProSe direct communication procedures specified in subclause 10.2.3.

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or
- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 24.334, clause 10.2.3]

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

NOTE 2: If the lower layers find that there exists a cell operating the provisioned radio resources (i.e., carrier frequency), and the cell belongs to the registered PLMN or a PLMN equivalent to the registered PLMN, and the UE is authorized for ProSe direct communication in this PLMN, the UE can use the radio parameters indicated by the cell as specified in 3GPP TS 36.331 [12].

- else if the lower layers report that one or more PLMNs operate in the provisioned radio resources (i.e. carrier frequency) then:
  a) if the following conditions are met:
    1) none of the PLMNs reported by the lower layers is the registered PLMN or equivalent to the registered PLMN; and

2) at least one of the PLMNs reported by the lower layers is in the list of authorised PLMNs for ProSe direct communication and provides radio resources for ProSe direct communication as specified in 3GPP TS 36.331 [12];

then the UE shall:

1) if in EMM-IDLE mode, perform PLMN selection triggered by ProSe direct communication as specified in 3GPP TS 23.122 [24]; or

...

If the registration to the selected PLMN is successful, the UE shall proceed with the procedure to initiate ProSe direct communication as specified in subclause 10.2.2.

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.2.2.25]

Upon receiving *SystemInformationBlockType18*, the UE shall:

1> if *SystemInformationBlockType18* message includes the *commConfig*:

2> if configured to receive sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commRxPool* for sidelink communication monitoring, as specified in 5.10.3;

2> if configured to transmit sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commTxPoolNormalCommon* or by *commTxPoolExceptional* for sidelink communication transmission, as specified in 5.10.4;

[TS 36.331, clause 5.10.1a]

When it is specified that the UE shall perform a particular sidelink operation only if the conditions defined in this section are met, the UE shall perform the concerned sidelink operation only if:

1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink operation as defined in TS 36.304 [4, 11.4]; or

[TS 36.331, clause 5.10.3]

A UE capable of sidelink communication that is configured by upper layers to receive sidelink communication shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

3> if the cell chosen for sidelink communication reception broadcasts *SystemInformationBlockType18* including *commRxPool*:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated by *commRxPool*;

NOTE 1: If *commRxPool* includes one or more entries including *rxParametersNCell*, the UE may only monitor such entries if the associated PSS/SSS or SLSSIDs is detected. When monitoring such pool(s), the UE applies the timing of the concerned PSS/SSS or SLSS.

2> else (i.e. out of coverage on the sidelink carrier):

3> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources that were preconfigured (i.e. *preconfigComm* in *SL-Preconfiguration* defined in 9.3);

NOTE 2: The UE may monitor in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UE's own timing.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication and has related data to be transmitted shall:

1> if the conditions for sidelink operation as defined in 5.10.1a are met:

2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4, 11.4]:

...

3> else (i.e. sidelink communication in RRC_IDLE or on cell other than PCell in RRC_CONNECTED):

4> if the cell chosen for sidelink communication transmission broadcasts *SystemInformationBlockType18*:

5> if *SystemInformationBlockType18* includes *commTxPoolNormalCommon*:

6> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolNormalCommon*;

5> else:

6> if the last connection establishment was initiated to request sidelink communication transmission resources and resulted in T300 expiry; and

6> if the cell on which the UE initiated connection establishment broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional*:

7> from the moment T300 expired, as specified in 5.3.3.6, until receiving an *RRCConnectionReconfiguration* including *sl-CommConfig* or until receiving an *RRCConnectionRelease* or an *RRCConnectionReject*;

8> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolExceptional*;

2> else (i.e. out of coverage on sidelink carrier):

3> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources that were preconfigured i.e. indicated by the first entry in *preconfigComm* in *SL-Preconfiguration* defined in 9.3 and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;

19.1.5.3 Test description

19.1.5.3.1 Pre-test conditions

System Simulator:

SS-NW

- 3 cells with parameters defined in Table 19.1.5.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instant.

Table 19.1.5.3.1-1: Cell parameters values

Cell	Frequency	PLMN
3	f2	HPLMN (PLMN1)
2	f1	PLMN1
4	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_PLMN} PLMN3 is an equivalent PLMN to PLMN1; MCC = MCC of PLMN1 in USIM EF_{PROSE_PLMN}; MNC=04. Note 2: The Frequency f1 shall be the frequency pre-configured in the UE for when UE is "not served by E-UTRAN". The Frequency f2 is a frequency for which the UE is not authorised/preconfigured for ProSe.		

- System information combination 1 as defined in TS 36.508 [18] clause 4.4.3.1 is used on Cell 3 (Cell 3 does not broadcast SIB18). System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used on Cell 2 and Cell 4when active.

SS-UE

- SS-UE1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device on the resources provided by cells Cell 2 and Cell 4 when active (as specified in the relevant procedure steps in Table 19.1.5.3.2-1).
- SS-UE2.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device on the resources configured in the UE for transmission/reception of ProSe Direct Communication when "not served by E-UTRAN".

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; the UE is equipped with a USIM containing values shown in Table 19.1.5.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, etc.).

Table 19.1.5.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

    - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 9 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

Preamble:

- The UE is in state Generic RB Established, UE Test Mode E Activated (State 3A) according to [18] on Cell 3. During the registration PLMN3 is assigned as Equivalent PLMN.

19.1.5.3.2 Test procedure sequence

Table 19.1.5.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.5.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 3	Cell 2	Cell 4
T0	Cell-specific RS EPRE	dBm/15kHz	-79	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15kHz	-79	-85	"Off"
T2	Cell-specific RS EPRE	dBm/15kHz	-79	"Off"	-85
T3	Cell-specific RS EPRE	dBm/15kHz	-79	"Off"	"Off"

Table 19.1.5.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Close UE Test Loop with bit E0 in UE test loop mode E LB setup IE set to one and bring UE into state Loopback Activated (State 4). NOTE: The loop is closed here and used towards the end of the test sequence to allow that most of the time the UE is kept out of coverage and is not moving often between in and out of coverage.	<--	CLOSE UE TEST LOOP	-	-
2	The UE responds with CLOSE UE TEST LOOP COMPLETE.	-->	CLOSE UE TEST LOOP COMPLETE	-	-
2A	The SS-NW sends UPDATE UE LOCATION INFORMATION message which provides location data = to one of the location areas pre-configured in the UE for prose communication (e.g. area 1).	<--	UPDATE UE LOCATION INFORMATION	-	-
3	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
4	The SS configures: SS-NW Cell 3 and Cell 2 parameters according to the row "T1" in table 19.1.5.3.2-0. Cell 2 is transmitting *SystemInformationBlockType18* providing resources for transmission in RRC_IDLE.	-	-	-	-
5	Wait for 5 sec to allow the UE to acquire the *SystemInformationBlockType18* transmitted on Cell 2.				
6	Force the UE upper layer application to request continuous transmission and reception of sidelink communication (the transmissions should be a maximum of 100 Bytes per communication "message"). NOTE: This can be done e.g. via a MMI command. Note that the max of 100 Bytes is not a 3GPP requirement rather it is requested only for the purpose of facilitating the test case specification.	-	-	-	-
6A	Wait for 5 sec to allow the UE to start transmission.	-	-	-	-
7	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in	-->	*STCH PDCP SDU packet*	1	P

	accordance with the resources provided by Cell 2 (*commTxPoolNormalCommon*/SL-CommResourcePool-r12[1])? NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.				
-	EXCEPTION: Step 8 is repeated 3 times.	-	-	-	-
8	SS-UE1 transmits sidelink communication in the next transmission period in accordance with the resources indicated in the *SystemInformationBlockType18* on cell 2. For the transmission the SS-UE1 shall use the resources indicated in *SystemInformationBlockType18/commRxPool-r12/SL-CommResourcePool-r12[3]*. Note that SIB18 does not include a corresponding Tx resource for transmission in RRC_IDLE, i.e. the SS-UE1 is behaving as an UE transmitting announcements in RRC_CONNECTED. For avoiding testing complexity, the transmission pools in step 11 and 12 are deliberately different to avoid collisions between the transmissions of the UE and the SS-UE1. NOTE: This step verifies TP2 - it is expected that the UE will be able to receive these packets - if they were received is checked in step 25.	<--	*STCH PDCP SDU packet*	-	-
9	The SS configures: SS-NW Cell 3, Cell 2 and Cell 4 parameters according to the row "T2" in table 19.1.5.3.2-0. Cell 4 is transmitting *SystemInformationBlockType18* providing resources for transmission in RRC_IDLE.	-	-	-	-
10	Wait for 5 sec to allow the UE to acquire the *SystemInformationBlockType18* transmitted on Cell 4				
11	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources provided by Cell 4 (*commTxPoolNormalCommon*/SL-CommResourcePool-r12[2])? NOTE: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	3	P
-	EXCEPTION: Step 12 is repeated 3 times.	-	-	-	-
12	SS-UE1 transmits sidelink communication in the next transmission period in accordance with the resources indicated in the *SystemInformationBlockType18* (*commRxPool*) on cell 4. For the transmission the SS-UE1 shall use the resources indicated in *SystemInformationBlockType18/commRxPool-r12/SL-CommResourcePool-r12[3]*. Note that SIB18 does not include a corresponding Tx resource for transmission in	<--	*STCH PDCP SDU packet*	-	-

	RRC_IDLE, i.e. the SS-UE1 is behaving as an UE transmitting announcements in RRC_CONNECTED. For avoiding testing complexity, the transmission pools in step 11 and 12 are deliberatelydifferent to avoid collisions between the transmissions of the UE and the SS-UE1. NOTE: This step verifies TP4 - it is expected that the UE will be able to receive these packets - if they were received is checked in step 25.

19.1.6 ProSe Direct Communication/Pre-configured authorisation / UE out of coverage on the frequency used for sidelink communication / Transmission and Reception / Operation with/without SyncRef UE / Usage information report list sending procedure

19.1.6.1 Test Purpose (TP)

(1)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE determines itself as being not
located in that geographical area }
    then { UE does not initiate ProSe direct communication }
            }
```

(2)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE has determined itself located in
that geographical area, and, UE does not have a selected SyncRef UE }
    then { UE is able to transmit ProSe Direct Communication utilizing the radio parameters
associated with that geographical area based on the UE's own timing }
            }
```

(3)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE can determine itself located in
that geographical area, and, syncTxThreshOoC is included in the preconfigured sidelink parameters
and the UE does not have a selected SyncRef UE }
    then { UE selects the correct SLSSID and subframe for transmission and transmits SLSS and
MasterInformationBlock-SL message }
            }
```

(4)

with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, **and**, UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE has determined itself located in that geographical area, and, UE does have a selected SyncRef UE }
    then { UE is able to transmit ProSe Direct Communication utilizing the radio parameters associated with that geographical area and in accordance with the timing of the selected SyncRef UE }
            }

(5)

with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, **and**, UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE can determine itself located in that geographical area, and, s*yncTxThreshOoC* is included in the preconfigured sidelink parameters and the UE has selected SyncRef UE and the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*, and, *inCoverage* in the *MasterInformationBlock-SL* message received from this UE is set to *TRUE* }
    then { UE selects the correct SLSSID and subframe for transmission and transmits SLSS and MasterInformationBlock-SL message }
            }

(6)

with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, **and**, UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to transmit ProSe direct communication, and, UE can determine itself located in that geographical area, and, s*yncTxThreshOoC* is included in the preconfigured sidelink parameters and the UE has selected SyncRef UE and the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*, and, *inCoverage* in the *MasterInformationBlock-SL* message received from this UE is set to FALSE while the SLSS from this UE is NOT part of the set defined for out of coverage }
    then { UE selects the correct SLSSID and subframe for transmission and transmits SLSS and MasterInformationBlock-SL message }
            }

(7)

with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, **and**, UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to receive ProSe direct communication, and, UE can determine itself located in that geographical area, and, UE does not have a selected SyncRef UE }
    then { UE is able to receive ProSe Direct Communication utilizing the radio parameters associated with that geographical area based on the UE's own timing }
            }

(8)

with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, **and**, UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE wants to receive ProSe direct communication, and, UE can determine itself located in that geographical area, and, UE does have a selected SyncRef UE }
    then { UE is able to receive ProSe Direct Communication utilizing the radio parameters associated with that geographical area and in accordance with the timing of the selected SyncRef UE }
            }

(9)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE returns to coverage, and, a usage information report list sending procedure was not
performed yet after beginning of ProSe direct communication, the configured collection period has
elapsed since beginning of ProSe direct communication and the configured reporting window has not
elapsed after the configured collection period elapsed, and, UE is in the RRC CONNECTED mode, and,
UE has usage information for at least one collection period }
    then { UE performs the usage information report list sending procedure }
            }
```

(10)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with two geographical areas, and,
UE out of coverage on the frequency used for sidelink communication }
ensure that {
  when { UE moves from one to another geographical are }
    then { UE obeys the resource configured for the new geographical area and uses them for
transmission/reception of ProSe Direct Communication }
            }
```

19.1.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 5.1.2, 10.2.1, 10.2.2, 10.2.3, 10.3.2.1.1, 10.3.2.1.2, TS 36.331, clauses 5.2.2.4, 5.2.2.25, 5.10.3, 5.10.4, 5.10.7.1, 5.10.7.2, 5.10.7.3, 5.10.7.4, 5.10.9.1, 5.10.9.2. Unless otherwise stated these are Rel-12 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 10.2.1]

One-to-many ProSe direct communication is applicable only to ProSe-enabled Public Safety UEs. One-to-many ProSe direct communication can only apply when the UE is:

...

b) not served by E-UTRAN, and authorised for ProSe direct communication for "not served by E-UTRAN"; or

...

Upon receiving a request from upper layers to send or receive data for ProSe direct communication in a given group, the UE shall initiate the procedure for ProSe direct communication. For case a, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.2. For case b and c, the UE shall perform ProSe direct communication procedures specified in subclause 10.2.3.

...

The UE shall obtain the ProSe direct communication policy parameters for that group as specified in subclause 5.

If the ProSe direct communication policy parameters indicate that the UE is configured to use IPv6 for that group, the UE shall auto-configures a link local IPv6 Address following procedures defined in RFC 4862 [15]. This address can only be used as the source IP address for one-to-many ProSe direct communication.

If the ProSe Direct communication policy parameters group indicate that the UE is configured to use IPv4 for that group, then the UE shall:

- use the configured IPv4 address for that group as source address; or
- if there is no configured IPv4 address for that group, use Dynamic Configuration of IPv4 Link-Local Addresses as specified in IETF RFC 3927 [16].

[TS 24.334, clause 10.2.2]

When the UE is served by E-UTRAN and intends to use the ProSe radio resources (i.e. carrier frequency) provided by an E-UTRAN cell, the UE requests the parameters from the lower layers for transmitting or receiving ProSe direct communication (see 3GPP TS 36.331 [12]). The UE shall perform direct communication only if the lower layers indicate that ProSe direct communication is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct communication as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. Once the radio resources for transmitting or receiving ProSe direct communication are provided by eNodeB as specified in 3GPP TS 36.331 [12], the UE shall start ProSe direct communication.

[TS 24.334, clause 10.2.3]

When the UE is not served by E-UTRAN, the UE shall select the radio parameters to be used for ProSe direct communication as follows:

- if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, the UE shall select the radio parameters associated with that geographical area; or
- in all other cases, the UE shall not initiate ProSe direct communication.

NOTE 1: It is out of scope of the present specification to define how the UE can locate itself in a specific Geographical Area. When the UE is in coverage of a 3GPP RAT it can for example use information derived from the serving PLMN. When the UE is not in coverage of a 3GPP RAT it can use other techniques as determined by local regulations.

...

If the UE is performing ProSe direct communication using radio parameters associated with a geographical area and moves out of that geographical area, the UE shall stop performing ProSe direct communication and then:

- if the UE is not served by E-UTRAN or the UE intends to use radio resources for ProSe other than those operated by the serving E-UTRAN cell, the UE shall select appropriate radio parameters for the new geographical area as specified above; or
- if the UE is served by E-UTRAN and intends to use radio resources for ProSe operated by the serving E-UTRAN cell, the UE shall proceed with the procedure to initiate ProSe direct communication when served by E-UTRAN.

[TS 24.334, clause 10.3.2.1.1]

The purpose of the usage information report list sending procedure is to enable a ProSe-enabled Public Safety UE to provide information necessary for composing of charging events related to the ProSe direct communication as defined in 3GPP TS 32.277 [27].

The UE shall perform the usage information report list sending procedure with the Accounting Data Forwarding (ADF) function block of the Charging Trigger Function (CTF) in the ProSe Function (ProSe Function CTF (ADF)) residing in the HPLMN.

The UE shall construct the usage information report based on the policy described in subclause 5.1.3.

[TS 24.334, clause 10.3.2.1.2]

The UE shall perform the usage information report list sending procedure if the UE is in E-UTRAN coverage and if:

a) the following is true:

1) if a usage information report list sending procedure was already performed after beginning of ProSe direct communication, the configured collection period has elapsed since the end of the previous usage information report list sending procedure;

2) if a usage information report list sending procedure was not performed yet after beginning of ProSe direct communication, the configured collection period has elapsed since beginning of ProSe direct communication;

3) the configured reporting window has not elapsed after the configured collection period elapsed;

4) the UE is in the RRC CONNECTED mode; and

5) the UE has usage information for at least one collection period; or

b) the following is true:

1) if a usage information report list sending procedure was already performed after beginning of ProSe direct communication, the configured collection period has elapsed since the end of the previous usage information report list sending procedure;

2) if a usage information report list sending procedure was not performed yet after beginning of ProSe direct communication, the configured collection period has elapsed since beginning of ProSe direct communication;

3) the configured reporting window has elapsed after the configured collection period elapsed; and

4) the UE has usage information for at least one collection period.

The UE shall initiate the usage information report list sending procedure by sending a USAGE_INFORMATION_REPORT_LIST message to the ProSe Function CTF (ADF).

If the UE is configured with the IP address of the ProSe Function CTF (ADF), the UE shall send the USAGE_INFORMATION_REPORT_LIST message to the configured IP address of the ProSe Function CTF (ADF). If the UE is not configured with the IP address of the ProSe Function CTF (ADF), the UE shall send the USAGE_INFORMATION_REPORT_LIST message to the IP address of the ProSe Function discovered as described in subclause 5.1.2.

In the USAGE_INFORMATION_REPORT_LIST message, the UE:

a) shall include a new transaction ID;

b) shall include the UE identity set to the UE's IMSI;

c) for each collection period:

1) shall include a sequence number of the usage information report;

2) if the UE is configured to report the time stamps when it went in and out of E-UTRAN coverage during the collection period in the usage information, for each going in or out of E-UTRAN coverage:

A) shall include information whether the UE was in or out of E-UTRAN coverage;

B) shall include the time stamp of the move; and

C) if the UE was in E-UTRAN coverage and the UE is configured to report the list of locations of the UE when in E-UTRAN coverage during the collection period in the usage information, for each camping on a cell or usage of a cell in the EMM-CONNECTED mode:

i) shall include the E-UTRAN cell global identification of the cell; and

ii) shall include the time stamp of beginning of the camping on the cell or of beginning of the usage of the cell in the EMM-CONNECTED mode;

3) if the UE is configured to report the group parameters in the usage information, for each group:

A) shall include the ProSe Layer-2 Group ID;

B) shall include the ProSe Group IP multicast address;

C) if the UE transmitted data during the collection period and the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include the time stamp of the first transmission to the ProSe Group IP multicast address in the collection period;

D) if the UE received data during the collection period and the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include the time stamp of the first reception from the ProSe Group IP multicast address in the collection period;

E) shall include an IP address used by the UE as a source address;

F) shall include the ProSe UE ID;

G) for each transmitter in one-to-many ProSe direct communication, shall include the Source L2 ID and IP address of the transmitter;

H) if the UE is configured to report the amount of data transmitted during the collection period with location information in the usage information, per each in or out of E-UTRAN coverage period and per each E-UTRAN cell used when in E-UTRAN coverage:

i) shall indicate whether the data are sent in or out of E-UTRAN coverage;

ii) if the UE transmitted data in an E-UTRAN cell during an in E-UTRAN coverage period:

- shall include the E-UTRAN cell global identification of the E-UTRAN cell;
- shall include amount of the data transmitted in the E-UTRAN cell;
- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first transmission in the E-UTRAN cell; and
- if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the indicator of which radio resources were used;

iii) if the UE transmitted data during out of E-UTRAN coverage period:

- shall include amount of the data transmitted during the out of E-UTRAN coverage period; and
- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first transmission during the out of E-UTRAN coverage period; and

iv) if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the used radio frequency; and

I) if the UE is configured to report the amount of data transmitted during the collection period without location information in the usage information, per each in or out of E-UTRAN coverage period:

i) shall indicate whether the data are sent in or out of E-UTRAN coverage;

ii) if the UE transmitted data during in E-UTRAN coverage period:

- shall include amount of the data transmitted during the in E-UTRAN coverage period;
- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first transmission during the in E-UTRAN coverage period; and
- if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the indicator of which radio resources were used;

iii) if the UE transmitted data during out of E-UTRAN coverage period:

- shall include amount of the data transmitted during the out of E-UTRAN coverage period; and

- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first transmission during the out of E-UTRAN coverage period; and

iv) if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the used radio frequency; and

J) if the UE is configured to report the amount of data received during the collection period with location information in the usage information, per each in or out of E-UTRAN coverage period and per each E-UTRAN cell used when in E-UTRAN coverage:

i) shall indicate whether the data are sent in or out of E-UTRAN coverage;

ii) if the UE received data in an E-UTRAN cell during an in E-UTRAN coverage period:

- shall include the E-UTRAN cell global identification of the E-UTRAN cell;

- shall include amount of the data received in the E-UTRAN cell;

- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first reception in the E-UTRAN cell; and

- if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the indicator of which radio resources were used;

iii) if the UE received data during out of E-UTRAN coverage period:

- shall include amount of the data received during the out of E-UTRAN coverage period; and

- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first reception during the out of E-UTRAN coverage period; and

iv) if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the used radio frequency; and

K) if the UE is configured to report the amount of data received during the collection period without location information in the usage information, per each in or out of E-UTRAN coverage period:

i) shall indicate whether the data are sent in or out of E-UTRAN coverage;

ii) if the UE received data during in E-UTRAN coverage period:

- shall include amount of the data received during the in E-UTRAN coverage period;

- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first reception during the in E-UTRAN coverage period; and

- if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the indicator of which radio resources were used;

iii) if the UE received data during out of E-UTRAN coverage period:

- shall include amount of the data received during the out of E-UTRAN coverage period; and

- if the UE is configured to report the time stamps of the first transmission/reception during the collection period in the usage information, shall include time stamp of the first reception during the out of E-UTRAN coverage period; and

iv) if the UE is configured to report the radio parameters used for ProSe direct communication (i.e. indicator of which radio resources used and radio frequency used) during the reporting period in the usage information, shall include the used radio frequency; and

4) if configured radio parameters for the ProSe direct communication applicable in the geographical area of the UE were used during the collection period, shall include the configured radio parameters for the ProSe direct communication applicable in the geographical area of the UE; and

d) for each application specific data received from upper layers during the collection period, shall include the received application specific data.

Figure 10.3.2.1.2.1 illustrates the interaction of the UE and the ProSe Function CTF (ADF) in the usage information report list sending procedure.

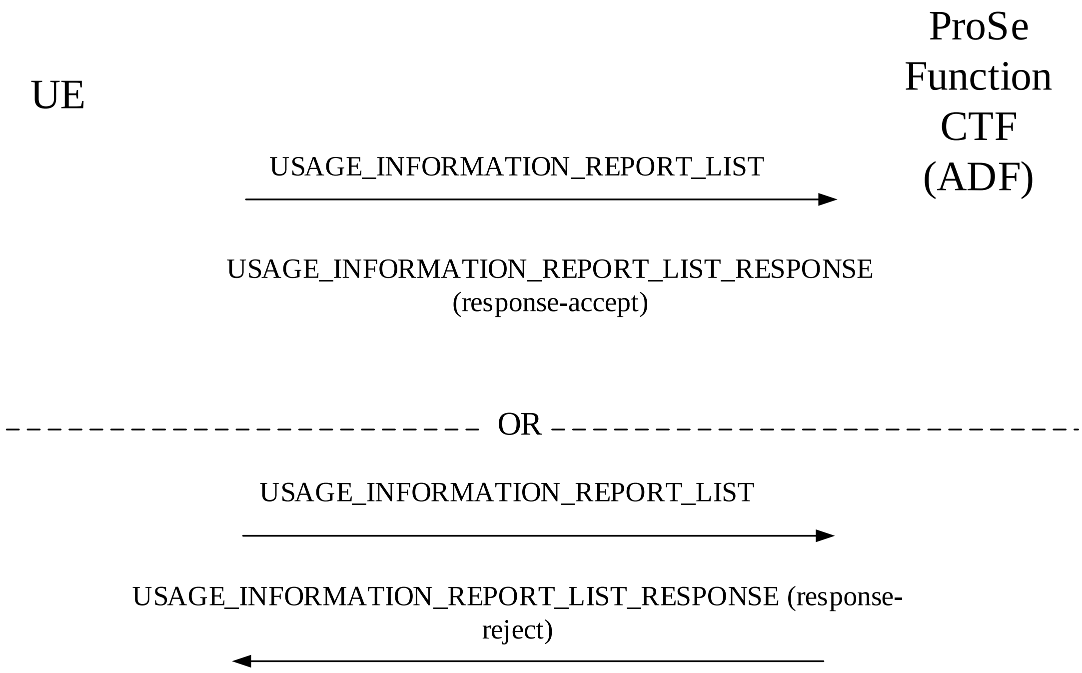

Figure 10.3.2.1.2.1: Usage information report list sending procedure

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

[TS 36.331, clause 5.2.2.25]

Upon receiving *SystemInformationBlockType18*, the UE shall:

1> if *SystemInformationBlockType18* message includes the *commConfig*:

2> if configured to receive sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commRxPool* for sidelink communication monitoring, as specified in 5.10.3;

2> if configured to transmit sidelink communication:

3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commTxPoolNormalCommon* or by *commTxPoolExceptional* for sidelink communication transmission, as specified in 5.10.4;

[TS 36.331, clause 5.10.3]

A UE capable of sidelink communication that is configured by upper layers to receive sidelink communication shall:

...

2> else (i.e. out of coverage on the sidelink carrier):

3> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources that were preconfigured (i.e. *preconfigComm* in *SL-Preconfiguration* defined in 9.3);

NOTE 2: The UE may monitor in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UE's own timing.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication and has related data to be transmitted shall:

...

2> else (i.e. out of coverage on sidelink carrier):

3> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources that were preconfigured i.e. indicated by the first entry in *preconfigComm* in *SL-Preconfiguration* defined in 9.3 and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;

[TS 36.331, clause 5.10.7.1]

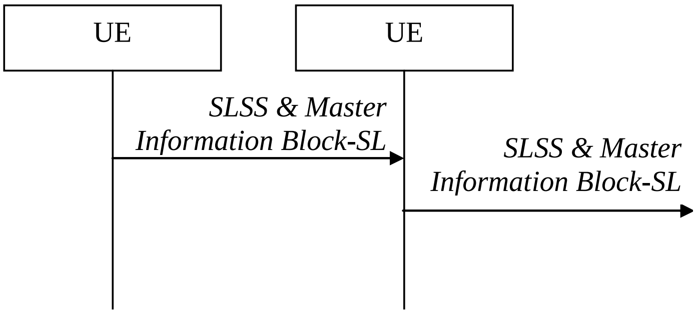

Figure 5.10.7.1-2: Synchronisation information transmission for sidelink communication, out of coverage

...

The purpose of this procedure is to provide synchronisation information to a UE. The synchronisation information concerns a Sidelink Synchronisation Signal (SLSS) for sidelink discovery, while it concerns an SLSS, timing information and some additional configuration parameters (i.e. the *MasterInformationBlock-SL* message) for sidelink communication. A UE transmits synchronisation information either when E-UTRAN configures it to do so by dedicated signalling (i.e. network based), or when not configured by dedicated signalling (i.e. UE based) and E-UTRAN broadcasts (in coverage) or pre-configures a threshold (out of coverage).

The synchronisation information transmitted by the UE may be derived from information/ signals received from E-UTRAN (in coverage) or received from a UE acting as synchronisation reference for the transmitting UE. In the remainder, the UE acting as synchronisation reference is referred to as SyncRef UE.

[TS 36.331, clause 5.10.7.2]

A UE shall, when transmitting sidelink communication in accordance with 5.10.4 and when the following conditions are met:

..

1> else (i.e. out of coverage):

2> if *syncTxThreshOoC* is included in the preconfigured sidelink parameters (i.e. *SL-Preconfiguration* defined in 9.3); and the UE has no selected SyncRef UE or the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];

3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

[TS 36.331, clause 5.10.7.3]

The UE shall select the SLSSID and the subframe in which to transmit SLSS as follows:

...

1> if triggered by sidelink communication:

...

2> else (i.e. out of coverage on sidelink carrier):

3> select the synchronisation reference UE (i.e. SyncRef UE) as defined in 5.10.8;

3> if the UE has a selected SyncRef UE and *inCoverage* in the *MasterInformationBlock-SL* message received from this UE is set to *TRUE*; or

...

4> select the same SLSSID as the SLSSID of the selected SyncRef UE;

4> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3), such that the subframe timing is different from the SLSS of the selected SyncRef UE;

3> else if the UE has a selected SyncRef UE:

4> select the SLSSID from the set defined for out of coverage having an index that is 168 more than the index of the SLSSID of the selected SyncRef UE, see TS 36.211 [21];

4> select the subframe in which to transmit the SLSS according to *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3), such that the subframe timing is different from the SLSS of the selected SyncRef UE;

3> else (i.e. no SyncRef UE selected):

4> randomly select, using a uniform distribution, an SLSSID from the set of sequences defined for out of coverage, see TS 36.211 [21];

4> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* (arbitrary selection between these) included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* defined in 9.3);

[TS 36.331, clause 5.10.7.4]

The UE shall set the contents of the *MasterInformationBlock-SL* message as follows:

...

1> else if the UE has a selected SyncRef UE (as defined in 5.10.8):

2> set *inCoverage* to *FALSE*;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the received *MasterInformationBlock-SL*;

1> else (i.e. no SyncRef UE selected):

2> set *inCoverage* to *FALSE*;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the preconfigured sidelink parameters (i.e. *preconfigGeneral* in *SL-Preconfiguration* defined in 9.3);

1> set *directFrameNumber* and *directSubframeNumber* according to the subframe used to transmit the SLSS, as specified in 5.10.7.3;

1> submit the *MasterInformationBlock-SL* message to lower layers for transmission upon which the procedure ends;

[TS 36.331, clause 5.10.9.1]

The sidelink common control information is carried by a single message, the *MasterInformationBlock-SL* (MIB-SL) message. The MIB-SL includes timing information as well as some configuration parameters and is transmitted via SL-BCH.

The MIB-SL uses a fixed schedule with a periodicity of 40 ms without repetitions. In particular, the MIB-SL is scheduled in subframes indicated by *syncOffsetIndicator* i.e. for which (10*DFN + subframe number) mod 40 = *syncOffsetIndicator*.

The sidelink common control information may change at any transmission i.e. neither a modification period nor a change notification mechanism is used.

A UE configured to receive or transmit sidelink communication shall:

1> if the UE has a selected SyncRef UE, as specified in 5.10.8.2:

2> ensure having a valid version of the *MasterInformationBlock-SL* message of that SyncRefUE:

[TS 36.331, clause 5.10.9.2]

Upon receiving *MasterInformationBlock-SL*, the UE shall:

1> apply the values of *sl-Bandwidth*, *subframeAssignmentSL*, *directFrameNumber* and *directSubframeNumber* included in the received *MasterInformationBlock-SL* message;

19.1.6.3 Test description

19.1.6.3.1 Pre-test conditions

System Simulator:

SS-NW

- Cell 1, operating on the frequency f1 configured in the UE for usage for ProSe Communication, HPLMN (PLMN1 authorised for ProSe Communication, PLMN1 in USIM EF_{PROSE_PLMN}).

- System information combination23 as defined in TS 36.508 [18] clause 4.4.3.1 is transmitted on Cell 1 when active.

SS-UE

- SS-UE1.

- As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device, as well as, transmitting Synchronisation information on the resources which the UE is expected to use for transmission and reception (as specified in the relevant procedure steps in Table 19.1.6.3.2-1).

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.1.6.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Communication when served by E-UTRAN, Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, ProSe Group IP multicast address, relevant information requesting/allowing the submission of Usage Information Reports, etc.).

Table 19.1.6.3.1-1: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°2 (HPLMN ProSe Function) supported.
	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
	Service n°8 (ProSe Usage Information Reporting configuration) supported.
	Service n°9 (UICC ProSe Direct Communication usage information reporting) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.

  - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 9 min (for Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

NOTE: The requirement for authorisation of a second PLMN is not essential for the present TC. It is included simply to allow the same pre-configured SIM to be used for most, if not all, of the ProSe TCs).

Preamble:

- The UE is in state Generic RB Established, UE Test Mode E Activated (State 3A) according to [18] on Cell 1.

19.1.6.3.2 Test procedure sequence

Table 19.1.6.3.2-0 illustrates the downlink power levels and other, if any, changing parameters to be applied for the SS-UEs at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.1.6.3.2-0: Time instances of simulated SS-UE power level and parameter changes

	Parameter	Unit	SS-UE1	Comment
T0	S-RSRP	dBm/15kHz	"Off"	
T1	S-RSRP	dBm/15kHz	-79	The power levels of the SS-UE are set so that upon S-RSRP measurement by the UE the result is NOT below the value of *syncTxThreshOoC (SL-Preconfiguration*).
T2	S-RSRP	dBm/15kHz	-85	The power levels of the SS-UE are set so that upon S-RSRP measurement by the UE the result is below the value of *syncTxThreshOoC (SL-Preconfiguration*).
T3	S-RSRP	dBm/15kHz	-79	The power levels of the SS-UE are set so that upon S-RSRP measurement by the UE the result is NOT below the value of *syncTxThreshOoC (SL-Preconfiguration*).

Table 19.1.6.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS-NW sends UPDATE UE LOCATION INFORMATION message which provides location data different to the location area pre-configured in the UE for prose communication (see TS 36.508 [18], clause 4.9.3.1, $EF_{PROSE\_RADIO\_COM}$).	<--	UPDATE UE LOCATION INFORMATION	-	-
2	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
3	SS-NW Configures Cell 1 as "Not suitable "Off" cell".	-	-	-	-
4	Force the UE upper layer application to request continuous transmission of sidelink communication (a maximum of 100 Bytes per communication "message"). NOTE: This can be done e.g. via a MMI command. Note that the max of 100 Bytes is not a 3GPP requirement rather it is requested only for the purpose of facilitating the test case specification.	-	-	-	-
4A	Wait for 5 sec to allow the UE to start transmission.	-	-	-	-
5	Check: Does the UE transmit sidelink communication data over the PC5 interface in the next 3 transmission periods in accordance with the resources pre-configured for usage when "Out of coverage"?	-->	-	1	F
6	SS configures: SS-NW Cell 1 as "Serving cell".	-	-	-	-
6A	Void	-	-	-	-
7-10A	Steps 1 - 4 from the generic test procedure for UE registration, UE Test Mode Activated (State 2A) defined in TS 36.508 [18] subclause 4.5.2A take place.	-	-	-	-
-	EXCEPTION: In parallel to the event described in steps 11 – 11N1 the events described in Table 19.1.6.3.2-2 take place	-	-	-	-
11-11N1	Steps 5 - 19 from the generic test procedure for UE Registration, UE Test Mode Activated (State 2A) defined in TS 36.508 [18] subclause 4.5.2A take place.	-	-	-	-
12	The SS-NW sends UPDATE UE LOCATION INFORMATION message for area 1 (see TS 36.508 [18], clause 4.9.3.1, $EF_{PROSE\_RADIO\_COM}$).	<--	UPDATE UE LOCATION INFORMATION	-	-
13	Close UE Test Loop with bit E0 in UE test loop mode E LB setup IE set to one and bring UE into state Loopback Activated (State 4). NOTE: The loop is closed here and used towards the end of the test sequence to allow that most of the time the UE is kept out of coverage and is not moving often between in and out of coverage.	<--	CLOSE UE TEST LOOP	-	-
14	The UE responds with CLOSE UE TEST LOOP COMPLETE.	-->	CLOSE UE TEST LOOP COMPLETE	-	-
14A	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
15-15Ab1	Void.	-	-	-	-
16	SS-NW configures: SS-NW	-	-	-	-

	Cell 1 as "Not suitable "Off" cell"				
17	Wait for 5 sec to allow the UE to adjust to the cell changes and "recognise" it is out of coverage.	-	-	-	-
17A	Force the UE upper layer application to request continuous transmission of sidelink communication (a maximum of 100 Bytes per communication "message"). NOTE: Although the UE is expected to transmit continuously, only the STCH PDCP SDU packets which need to be checked are shown explicitly in the step sequence.	-	-	-	-
17B	Wait for 5 sec to allow the UE to start transmission.	-	-	-	-
-	EXCEPTION: Steps 17C - 17D are repeated 3 times.	-	-	-	-
17C	Check: Does the UE transmit SLSS in accordance with the information provided in s*yncTxThreshOoC* included in the preconfigured sidelink parameters (*SL-Preconfiguration*) in the next transmission period? UE shall - select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* (arbitrary selection between these) included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration*). NOTE: UE does not have a selected SyncRef UE and therefore shall use timing based on the UE's own timing.	-->	SLSS	3	P
17D	Check: Does the UE transmit *MasterInformationBlock-SL* message in the same subframe as the SLSS in step 19?	-->	*MasterInformationBlock-SL*	3	P
18	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources pre-configured for usage when "Out of coverage"? NOTE 1: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict. NOTE 2: UE does not have a selected SyncRef UE and therefore shall use timing based on the UE's own timing.	-->	*STCH PDCP SDU packet*	2	P
19-21	Void.				
22	SS configures: SS-UE1 in accordance with " T1" defined in Table 19.1.6.3.2-0. SS-UE1 continuously transmits SLSS and *MasterInformationBlock-SL* message in the same subframe as the SLSS. SLSS-ID is set to 101, syncOffsetIndicator is set to 3. the SLSS transmitted is NOT part of the set defined for out of coverage in the UE *inCoverage* in the *MasterInformationBlock-SL* message set to *TRUE*.	<--	SLSS *MasterInformationBlock-SL*	-	-

	Note: The power levels of the SS-UE1 are set so that upon S-RSRP measurement by the UE the result is NOT below the value of *syncTxThreshOoC (SL-Preconfiguration*).				
23	Wait for 1 sec to allow time for the UE to select the SS-UE1 for SyncRef UE.	-	-	-	-
-	EXCEPTION: Step 24 is repeated until one completed STCH PDCP SDU packet is received.	-	-	-	-
24	Check: Does the UE transmit in the next 60 sec one STCH PDCP SDU packet of sidelink communication data over the PC5 interface in accordance with the resources pre-configured for usage when "Out of coverage" and the information provided by the SyncRef UE (SS-UE1)? NOTE 1: The UE may send multiple packets. The reception of one of them is sufficient for achieving the Pass verdict.	-->	*STCH PDCP SDU packet*	4	P

19.1.8 ProSe Direct Communication/Security Aspects / Release of PDN Connection used to receive MIKEY Messages/ Correct Key Request Message/ MIKEY Verification Message

19.1.8.1 Test Purpose (TP)

(1)

```
with { UE served by E-UTRAN PLMN supporting ProSe and intending to use One-to-many ProSe direct communication }
ensure that {
  when { the UE received MIKEY message on additional PDN and UE is triggered to initiate deactivation of the additional PDN }
   then { the UE shall not send PDN DISCONNECT REQUEST }
            }
```

(2)

```
with { the UE has informed the ProSe Key Management Function that it no longer requires PGK }
ensure that {
  when { the UE is triggered to initiate deactivation of the additional PDN }
   then { the UE shall send PDN DISCONNECT REQUEST  }
            }
```

19.1.8.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 33.303, clause 6.2.3.3.2.2

[TS 33.303, clause 6.2.3.3.2.2]

…

The UE shall not release the PDN connection used to receive MIKEY messages containing PGKs until the UE has informed the ProSe Key Management Function that it no longer requires PGKs. This is to ensure that the ProSe Key Management Function is aware of the correct UE IP address for the purpose of performing PGK deliveries as specified in clause 6.2.3.3.2.3.

…

19.1.8.3 Test description

19.1.8.3.1 Pre-test conditions

System Simulator:

- Cell 1
- System information combination 23 as defined in TS 36.508 [18] clause 4.4.3.1 is used in E-UTRA Cell 1.

UE:

- The UE is authorised to perform ProSe Direct Communication.
- The UE has pre-configured radio parameters (*preconfigComm*) as defined in TS 36.508 with an associated geographical area and a UICC with all values equal to the default profile given inTS 36.508 [18], section 4.9.3.1 except for those listed in Table 19.1.8.3.1-1.

Table 19.1.8.3.1-1: USIM configuration

USIM field	Priority	Value
$EF_{PROSE\_RADIO\_COM}$		Is present
EF_{UST}		Service 101 is supported
EF_{AD}		UE is authorized to use pre-configured parameters for ProSe
EF_{PROSE_PLMN}		PLMN of Cell 1
EF_{PST}		Service n°3 and service n°6 are supported
EF_{PROSE_POLICY}		Group ID = '0000 0000 0000 0000 0000 0000' [BIN]
		ProSe UE ID = '0000 0000 0000 0000 0000 0001' [BIN]

Preamble:

- The UE is in state Registered, Idle mode (state 2) according to [18].

19.1.8.3.2 Test procedure sequence

Table 19.1.8.3.2-1: Main behaviour

parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area, and, the UE having established one-to-one ProSe direct communication with a remote UE }
ensure that {
  when { UE receives request from upper layers to release a direct link with the peer UE }
    then { UE releases the secure direct link }
            }
```

19.1.9.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.303, clause 5.4.5.1, TS 36.331, clause 5.10.4, TS 24.334, clauses 5.1.1, 10.2.3, 10.4.1A, 10.4.2.1, 10.4.2.2, 10.4.2.4, 10.4.3.2, 10.4.3.4, 10.4.4.2, 10.4.4.4, 10.4.5.1, 10.4.5.3, 10.4.6.1, 10.4.6.2. Unless otherwise stated these are Rel-13 requirements.

[TS 23.303, clause 5.4.5.1]

One-to-one ProSe Direct Communication is realised by establishing a secure layer-2 link over PC5 between two UEs.

Each UE has a Layer-2 ID for unicast communication that is included in the Source Layer-2 ID field of every frame that it sends on the layer-2 link and in the Destination Layer-2 ID of every frame that it receives on the layer-2 link.

NOTE: Conflicts between Destination Layer-2 ID for unicast and one-to-many communication will be resolved by RAN WG2.

The UE needs to ensure that the Layer-2 ID for unicast communication is at least locally unique. To that effect the UE should be prepared to handle Layer-2 ID conflicts with adjacent UEs using unspecified mechanisms (e.g. self-assign a new Layer-2 ID for unicast communication when a conflict is detected).

The layer-2 link for one-to-one ProSe Direct Communication is identified by the combination of the Layer-2 IDs of the two UEs. This means that the UE can engage in multiple layer-2 links for one-to-one ProSe Direct Communication using the same Layer-2 ID.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery and ProSe direct communication, in a particular PLMN or when not served by

E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 10.4.1A]

The UE shall be authorised for one-to-one ProSe direct communication and obtain the ProSe direct communication policy parameters based on the service authorisation procedure as specified in clause 5 before initiating or participating in any PC5 Signalling Protocol procedures for one-to-one ProSe direct communication.

The UE shall select the radio resources for one-to-one ProSe direct communication as described for one-to-many ProSe direct communication in subclauses 10.2.1, 10.2.2 and 10.2.3.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit non-relay related sidelink communication and has related data to be transmitted or a UE capable of relay related sidelink communication that is configured by upper layers to transmit relay related sidelink communications and satisfies the conditions for relay related sidelink communication specified in this section shall:

...

2> else (i.e. out of coverage on sidelink carrier):

3> if *priorityList* is included for the entries of *preconfigComm* in *SL-Preconfiguration* defined in 9.3:

...

3> else:

4> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources that were preconfigured i.e. indicated by the first entry in *preconfigComm* in *SL-Preconfiguration* defined in 9.3 and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;

[TS 24.334, clause 10.2.3]

When the UE is not served by E-UTRAN, the UE shall select the radio parameters to be used for ProSe direct communication as follows:

- if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, the UE shall select the radio parameters associated with that geographical area; or

- in all other cases, the UE shall not initiate ProSe direct communication.

NOTE 1: It is out of scope of the present specification to define how the UE can locate itself in a specific Geographical Area. When the UE is in coverage of a 3GPP RAT it can for example use information derived from the serving PLMN. When the UE is not in coverage of a 3GPP RAT it can use other techniques as determined by local regulations.

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

[TS 24.334, clause 10.4.2.1]

If the direct link setup is for isolated one-to-one ProSe direct communication, i.e. when none of the two UEs is a ProSe UE-to-network relay, both UEs are required to have fetched in advance the public key of the KMS (Key Management

Server), and a set of credentials associated with the UE's identity (as defined in IETF RFC 6507 [39] and IETF RFC 6508 [40]), as specified by 3GPP TS 33.303 [6].

[TS 24.334, clause 10.4.2.2]

The initiating UE shall meet the following pre-conditions before initiating this procedure:

- a request from upper layers to establish a direct link with the target UE is received and there is no existing link between the initiating UE and that target UE;
- the link layer identifier for the initiating UE (i.e., Layer 2 ID used for unicast communication) is available (e.g. pre-configured or self-assigned);
- the link layer identifier for the target UE (i.e., Layer 2 ID used for unicast communication) is available to the initiating UE (e.g., pre-configured or obtained via ProSe direct discovery); and
- the initiating UE is either authorised for ProSe direct communication in the serving PLMN, or has a valid authorization for ProSe direct communication when not served by E-UTRAN.

The initiating UE initiates the direct link setup procedure by generating a DIRECT_COMMUNICATION_REQUEST message with:

- the User Info set to:
  - the initiating UE’s User Info received from upper layers if the target UE is not a ProSe UE-to-network relay UE;

  ...
- an IP Address Config IE set to one of the following values:
  - "DHCPv4 Server" if only IPv4 address allocation mechanism is supported by the initiating UE, i.e., acting as a DHCPv4 Server;
  - "IPv6 Router" if only IPv6 address allocation mechanism is supported by the initiating UE, i.e., acting as an IPv6 Router;
  - "DHCPv4 Server & IPv6 Router" if both IPv4 and IPv6 address allocation mechanisms are supported by the initiating UE; or
  - "address allocation not supported" if neither IPv4 nor IPv6 address allocation mechanism is supported by the initiating UE;
- a Link Local IPv6 Address IE formed locally based on IETF RFC 4862 [15] if the IP Address Config IE is set to "address allocation not supported" and the link is setup for isolated one-to-one communication;

NOTE 1: the UE can reuse a Link Local IPv6 IP address for multiple isolated one-to-one communication links.

- a Maximum Inactivity Period IE to indicate the maximum inactivity period of the requesting UE over this direct link;

NOTE 2: The value of Maximum Inactivity Period IE can be calculated based on UE's local settings, such as keepalive timer T4102 (see 10.4.3), retransmission timer T4101 (see 10.4.3), and maximum number of allowed retransmissions for DIRECT_COMMUNICATION_KEEPALIVE message.

- a Nonce_1 IE set to the 128-bit nonce value generated by the initiating UE for the purpose of session key establishment over this direct link;
- a UE Security Capabilities IE set to indicate the list of algorithms that the initiating UE supports for the security establishment of this direct link;
- an MSB of $K_{D\text{-sess}}$ ID IE set to the most significant 8 bits of the $K_{D\text{-sess}}$ ID; and
- Optionally, a K_D ID IE set to the known ID of K_D which was previously established if the initiating UE has an existing K_D with the target UE.

If the direct link setup is for isolated one-to-one ProSe direct communication, the DIRECT_COMMUNICATION_REQUEST message shall also include the following parameters:

- the Signature IE set to the ECCSI signature calculated with the following information elements, as specified in 3GPP TS 33.303 [6]:
  - User Info; and
  - Nonce_1.

...

After the DIRECT_COMMUNICATION_REQUEST message is generated, the initiating UE shall pass this message to the lower layers for transmission along with the initiating UE's Layer 2 ID (for unicast communication) and the target UE's Layer 2 ID (for unicast communication), and start timer T4100. The UE shall not send a new DIRECT_COMMUNICATION_REQUEST message to the same target UE while timer T4100 is running.

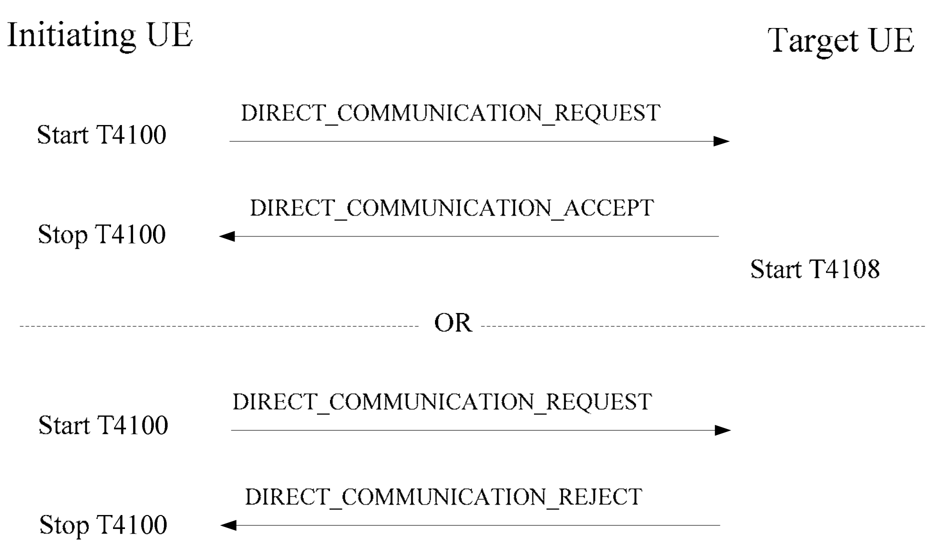

Figure 10.4.2.2.1: Direct link setup procedure

[TS 24.334, clause 10.4.5.1]

Security association for a direct link between two ProSe-Enabled UEs is established during the direct link setup procedure or direct link rekeying procedure with the exchange of message contents related to direct security mode establishment. After successful completion of the direct security mode control procedure, the selected security algorithms and keys are used to integrity protect and cipher all PC5 Signalling messages exchanged between the UEs; and are also used to cipher all data plane traffic exchanged between the UEs.

[TS 24.334, clause 10.4.5.3]

Upon receipt of the DIRECT_SECURITY_MODE_COMMAND message, the peer UE shall check whether the security mode command can be accepted or not. This is done by performing the integrity check of the message and by checking that the received UE security capabilities have not been altered compared to the latest values that the peer UE sent to the commanding UE in the DIRECT_COMMUNICATION_REQUEST or DIRECT_REKEYING_REQUEST message.

In order to check the integrity, the peer UE needs to create the security context as described in 3GPP TS 33.303 [6]. If the MSB of K_D ID were included in the DIRECT_SECURITY_MODE_COMMAND message then the peer UE shall take one of the following two actions:

- If performing isolated one-to-one ProSe direct communication, the peer UE shall first check the signature included in the SIGN IE of the DIRECT SECURITY MODE COMMAND and then obtain the new K_D from the Encrypted Payload IE; or

...

If MSB of K_D ID was not included in the DIRECT_SECURITY_MODE_COMMAND, then the peer UE shall use either the existing K_D indicated by the K_D ID included in the DIRECT_COMMUNICATION_REQUEST or the currently used one.

The peer UE shall then derive the $K_{D\text{-sess}}$ based on the KD-$_{sess}$ ID in the same way as the commanding UE. Finally the peer UE shall use the algorithms indicated in the Chosen Algorithms IE.

If the DIRECT_SECURITY_MODE_COMMAND message can be accepted, the peer UE shall send a DIRECT_SECURITY_MODE_COMPLETE message ciphered and integrity protected with the new security context. The DIRECT_SECURITY_MODE_COMPLETE message shall include the 16 least significant bits of the K_D ID if the initiating UE included the MSB of K_D ID in the DIRECT_SECURITY_MODE_COMMAND message.

From this time onward the peer UE shall protect all signalling messages and user data with the new security context.

[TS 24.334, clause 10.4.2.4]

Upon receipt of the DIRECT_COMMUNICATION_ACCEPT message, the initiating UE shall stop timer T4100. From this time onward the initiating UE shall use the established link for all one-to-one communication (including additional PC5 Signalling messages) to the target UE.

[TS 24.334, clause 10.4.6.1]

The IP address configuration procedure is performed after the establishment of the direct link to enable IP connectivity between the UEs at each end of the direct link.

[TS 24.334, clause 10.4.6.2]

When neither of the two UEs on the direct link acts as a ProSe UE-to-network relay, the two UEs shall select the IP version (IPv4 or IPv6) to be used based on the following rules:

...

- if the target UE in the direct link setup procedure has indicated "address allocation not supported" in the IP Address Config IE and the initiating UE has indicated "DHCPv4 Server", "IPv6 Router" or "DHCPv4 Server & IPv6 Router" in the IP Address Config IE, then the target UE shall:
  a) initiate the IPv4 address configuration with DHCPv4 procedure acting as a DHCP client, if the initiating UE has indicated "DHCPv4 Server";
  b) initiate the IPv6 address configuration with IPv6 stateless address auto-configuration acting as an IPv6 host if the initiating UE has indicated "IPv6 Router"; and
  c) choose either IP version and initiate the corresponding IP address configuration procedure as a client or host, if the other UE has indicated "DHCPv4 Server & IPv6 Router"; and
- if both of the UEs has indicated "address allocation not supported" in the IP Address Config IE, then the UEs shall use IPv6 link-local addresses formed locally as defined in RFC 4862 [15].

[TS 24.334, clause 10.4.3.2]

The requesting UE manages a keepalive timer T4102 and a keepalive counter for this procedure. The keepalive timer T4102 is used to trigger the periodic initiation of the procedure. It is started or restarted whenever the UE receives a PC5 Signalling message or PC5 user plane data from the peer UE over this link. The keepalive counter is set to an initial value of zero after link establishment.

The requesting UE may initiate the procedure if:

- a request from upper layers to check the viability of the direct link is received; or
- the keepalive timer T4102 for this link expires.

The requesting UE initiates the procedure by stopping timer T4102 if it is still running and generating a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link. Optionally, the initiating UE may include a Maximum Inactivity Period IE to indicate the maximum inactivity period of the requesting UE over this direct link. When a remote UE sends DIRECT_COMMUNICATION_KEEPALIVE message to the ProSe UE-to-network relay UE, this IE shall be included.

After the DIRECT_COMMUNICATION_KEEPALIVE message is generated, the requesting UE shall pass this message to the lower layers for transmission along with the requesting UE's Layer 2 ID (for unicast communication) and the peer UE's Layer 2 ID (for unicast communication), and start retransmission timer T4101.

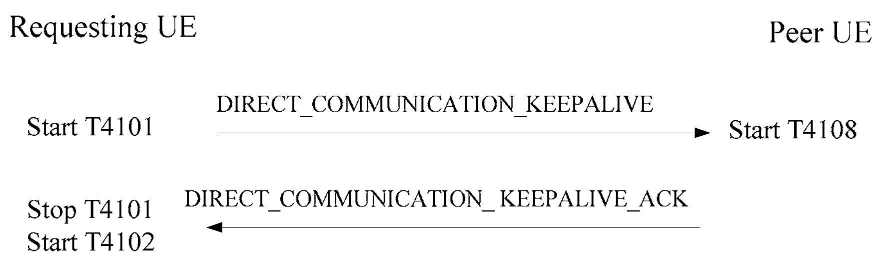

Figure 10.4.3.2.1: Direct link keepalive procedure

[TS 24.334, clause 10.4.3.4]

Upon receiving a DIRECT_COMMUNICATION_KEEPALIVE_ACK message, the requesting UE shall stop retransmission timer T4101, start keepalive timer T4102 and increment the keepalive counter for this link.

[TS 24.334, clause 10.4.4.2]

The releasing UE shall initiate the procedure if:

- a request from upper layers to release a direct link with the peer UE which uses a known Layer 2 ID (for unicast communication) is received and there is an existing link between those two UEs; or

...

The releasing UE initiates the direct link release procedure by generating a DIRECT_COMMUNICATION_RELEASE message with a Release Reason IE indicating one of the following cause values:

#1 Direct Communication to peer UE no longer needed;

...

After the DIRECT_COMMUNICATION_RELEASE message is generated, the releasing UE shall pass this message to the lower layers for transmission along with the releasing UE's Layer 2 ID (for unicast communication) and the peer UE's Layer 2 ID (for unicast communication). The releasing UE shall release the direct link locally if the release reason is #3 "Direct connection is not available any more". Otherwise, the releasing UE shall start timer T4103.

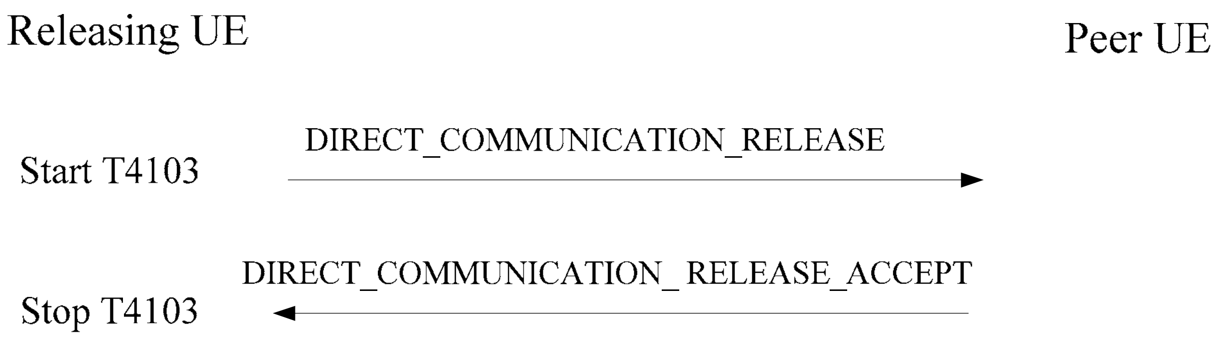

Figure 10.4.4.2.1: Direct link release procedure

[TS 24.334, clause 10.4.4.4]

Upon receipt of the DIRECT_COMMUNICATION_RELEASE_ACCEPT message, the releasing UE shall stop timer T4103. From this time onward the releasing UE shall no longer send or receive any messages via this link.

19.1.9.3 Test description

19.1.9.3.1 Pre-test conditions

System Simulator:

SS-UE

- SS-UE1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device.

GNSS simulator (optional).

NOTE: For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". This can be done by usage of a GNSS simulator, or some suitable MMI action.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.1.9.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, etc.).

Table 19.1.9.3.1-1: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.
$EF_{PROSE\_RADIO\_COM}$	b2=1 indicates that the UE is authorised to perform one-to-one ProSe direct communication when not served by E-UTRAN.

- For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". If this is not done by using n GNSS simulator then the UE needs to be preconfigured via a suitable MMI action.

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.1.9.3.2 Test procedure sequence

Table 19.1.9.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power up the UE.	-	-	-	-
2	Wait for 15 sec to allow the UE to establish that it is out of coverage and initiate scanning the frequency pre-set for ProSe communication for any activities.	-	-	-	-
3	Make the UE initiate one-to-one ProSe direct communication with the remote UE preconfigured in the USIM (ProSe Layer-2 Group ID).	-	-	-	-
4	Check: Does the UE send a DIRECT_COMMUNICATION_REQUEST message, IP Address Config IE set to "address allocation not supported"?	-->	DIRECT_COMMUNICATION_REQUEST	1	P
5	SS-UE1 sends a DIRECT_SECURITY_MODE_COMMAND message.	<--	DIRECT_SECURITY_MODE_COMMAND	-	-
6	Check: Does the UE send a DIRECT_SECURITY_MODE_COMPLETE message ciphered and integrity protected with the new security context?	-->	DIRECT_SECURITY_MODE_COMPLETE	2	P
7	SS-UE1 sends a DIRECT_COMMUNICATION_ACCEPT message.	<--	DIRECT_COMMUNICATION_ACCEPT	-	-
-	EXCEPTION: After the communication is established, an IP address configuration procedure is performed depending on what the UE has indicated in the IP Address Config IE (if it is not "address allocation not supported") in the DIRECT_COMMUNICATION_REQUEST message, and, the SS-UE1 itself indicating "address allocation not supported" in the DIRECT_COMMUNICATION_ACCEPT message.	-	-	-	-
8	Start timer T4102=px_ProSe_T4102_keepalive_value. NOTE: The SS shall not send any direct communication data (neither PC5 Signalling message nor PC5 user plane data) until the event in step 9 takes place to ensure that the UE does not re-start timer T4102.	-	-	-	-
9	Timer T4102 expires	-	-	-	-
10	Check: Does the UE send a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link=0?	-->	DIRECT_COMMUNICATION_KEEPALIVE	3	P
11	SS-UE1 sends a DIRECT_COMMUNICATION_KEEPALIVE_ACK message.	<--	DIRECT_COMMUNICATION_KEEPALIVE_ACK	-	-
12	Make the UE release the one-to-one ProSe	-	-	-	-

	direct communication with the remote UE.				
13	Check: Does the UE send a DIRECT_COMMUNICATION_RELEASE message with a Release Reason IE indicating 'Direct Communication to peer UE no longer needed'?	-->	DIRECT_COMMUNICATION_RELEASE	4	P
14	SS-UE1 sends a DIRECT_COMMUNICATION_RELEASE_ACCEPT message.	<--	DIRECT_COMMUNICATION_RELEASE_ACCEPT	-	-

19.1.10 ProSe Direct Communication/Pre-configured authorisation / UE out of coverage on the frequency used for sidelink communication / Isolated one-to-one ProSe direct communication / Success/Direct link keepalive/Release upon User request / MT

19.1.10.1 Test Purpose (TP)

(1)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area }
ensure that {
  when { UE receives a request for the establishment of one-to-one ProSe direct communication from a
remote UE }
    then { UE request the establishment of Security association for the requested for a direct link
by sending DIRECT SECURITY MODE COMMAND message unciphered and integrity protected with the new
security context }
            }
```

(2)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area, and, the UE having requested establishment of Security association for the requested for a
direct link }
ensure that {
  when { UE receives a DIRECT_SECURITY_MODE_COMPLETE message from the remote UE }
    then { UE sends a DIRECT_COMMUNICATION_ACCEPT message and considers the establishment of one-to-
one ProSe direct communication completed }
            }
```

(3)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area, and, the UE having established one-to-one ProSe direct communication with a remote UE }
ensure that {
  when { UE receives a DIRECT_COMMUNICATION_KEEPALIVE message including a Maximum Inactivity Period
IE as part of a Direct link keepalive procedure }
    then { UE responds with a DIRECT_COMMUNICATION_KEEPALIVE_ACK message }
            }
```

(4)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
```

```
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area, and, the UE having established one-to-one ProSe direct communication with a remote UE, and,
having set timer T4108 as result of a Direct link keepalive procedure }
ensure that {
  when { UE gets involved in a communication with the remote UE }
    then { UE restarts timer T4108, and, when timer T4108 expires without any communication the UE
either initiate its own keepalive procedure to check the link or releases the secure direct link
with the release reason #3 "Direct connection is not available any more" }
            }
```

(5)

```
with { UE being authorized for performing ProSe Direct Communication being provisioned with Radio
parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE
out of coverage on the frequency used for sidelink communication and within the pre-set geographical
area, and, the UE having established one-to-one ProSe direct communication with a remote UE }
ensure that {
  when { UE receives request from upper layers to release a direct link with the peer UE }
    then { UE releases the secure direct link }
            }
```

19.1.10.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.303, clause 5.4.5.1, TS 36.331, clause 5.10.4, TS 24.334, clauses 5.1.1, 10.2.3, 10.4.1A, 10.4.2.1, 10.4.2.3, 10.4.3.2, 10.4.3.3, 10.4.3.4, 10.4.3.5.2, 10.4.4.2, 10.4.4.4, 10.4.5.1, 10.4.5.2, 10.4.5.4, 10.4.6.1, 10.4.6.2. Unless otherwise stated these are Rel-13 requirements.

[TS 23.303, clause 5.4.5.1]

One-to-one ProSe Direct Communication is realised by establishing a secure layer-2 link over PC5 between two UEs.

Each UE has a Layer-2 ID for unicast communication that is included in the Source Layer-2 ID field of every frame that it sends on the layer-2 link and in the Destination Layer-2 ID of every frame that it receives on the layer-2 link.

NOTE: Conflicts between Destination Layer-2 ID for unicast and one-to-many communication will be resolved by RAN WG2.

The UE needs to ensure that the Layer-2 ID for unicast communication is at least locally unique. To that effect the UE should be prepared to handle Layer-2 ID conflicts with adjacent UEs using unspecified mechanisms (e.g. self-assign a new Layer-2 ID for unicast communication when a conflict is detected).

The layer-2 link for one-to-one ProSe Direct Communication is identified by the combination of the Layer-2 IDs of the two UEs. This means that the UE can engage in multiple layer-2 links for one-to-one ProSe Direct Communication using the same Layer-2 ID.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery and ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 10.4.1A]

The UE shall be authorised for one-to-one ProSe direct communication and obtain the ProSe direct communication policy parameters based on the service authorisation procedure as specified in clause 5 before initiating or participating in any PC5 Signalling Protocol procedures for one-to-one ProSe direct communication.

The UE shall select the radio resources for one-to-one ProSe direct communication as described for one-to-many ProSe direct communication in subclauses 10.2.1, 10.2.2 and 10.2.3.

[TS 36.331, clause 5.10.4]

A UE capable of sidelink communication that is configured by upper layers to transmit non-relay related sidelink communication and has related data to be transmitted or a UE capable of relay related sidelink communication that is configured by upper layers to transmit relay related sidelink communications and satisfies the conditions for relay related sidelink communication specified in this section shall:

...

2> else (i.e. out of coverage on sidelink carrier):

3> if *priorityList* is included for the entries of *preconfigComm* in *SL-Preconfiguration* defined in 9.3:

...

3> else:

4> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources that were preconfigured i.e. indicated by the first entry in *preconfigComm* in *SL-Preconfiguration* defined in 9.3 and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;

[TS 24.334, clause 10.2.3]

When the UE is not served by E-UTRAN, the UE shall select the radio parameters to be used for ProSe direct communication as follows:

- if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, the UE shall select the radio parameters associated with that geographical area; or

- in all other cases, the UE shall not initiate ProSe direct communication.

NOTE 1: It is out of scope of the present specification to define how the UE can locate itself in a specific Geographical Area. When the UE is in coverage of a 3GPP RAT it can for example use information derived from the serving PLMN. When the UE is not in coverage of a 3GPP RAT it can use other techniques as determined by local regulations.

Before initiating ProSe direct communication, the UE shall check with lower layers whether the selected radio parameters can be used in the current location without causing interference to other cells as specified in 3GPP TS 36.331 [12], and:

- if the lower layers indicate that the usage would not cause any interference, the UE shall initiate ProSe direct communication; or

[TS 24.334, clause 10.4.2.1]

If the direct link setup is for isolated one-to-one ProSe direct communication, i.e. when none of the two UEs is a ProSe UE-to-network relay, both UEs are required to have fetched in advance the public key of the KMS (Key Management Server), and a set of credentials associated with the UE's identity (as defined in IETF RFC 6507 [39] and IETF RFC 6508 [40]), as specified by 3GPP TS 33.303 [6].

[TS 24.334, clause 10.4.2.3]

Upon receiving a DIRECT_COMMUNICATION_REQUEST message, the target UE shall store the pair of Layer 2 IDs (for unicast communication) used in the transport of this message provided by the lower layers and associate them with a direct link context.

The target UE then checks the User Info IE included in the DIRECT_COMMUNICATION_REQUEST message and determines whether this request can be accepted or not. Then, the target UE examines the IP Address Config IE to see whether there is at least one common IP address configuration option supported by both the initiating UE and the target UE. If the above check is successful, the target UE shall invoke the direct security mode control procedure as specified in subclause 10.4.5 to establish a security association between the target UE and the initiating UE. Only after the completion of link authentication procedure and a successful establishment of the security association, the target UE shall send a DIRECT_COMMUNICATION_ACCEPT message to the initiating UE.

The target UE shall include an IP Address Config IE set to one of the following values:

- "DHCPv4 Server" if only IPv4 address allocation mechanism is supported by the target UE and the target UE is able to act as DHCP server;
- "IPv6 Router" if only IPv6 address allocation mechanism is supported by the target UE and the target UE is able to act as IPv6 Router;
- "DHCPv4 Server & IPv6 Router" if both IPv4 and IPv6 address allocation mechanisms are supported by the target UE; or
- "address allocation not supported" if neither IPv4 nor IPv6 address allocation is supported by the target UE.

If the IP Address Config IE is set to "address allocation not supported" and the received DIRECT_COMMUNICATION_REQUEST message included a Link Local IPv6 Address IE, the target UE shall include a Link Local IPv6 Address IE set to the link-local IPv6 address formed locally.

NOTE: the UE can reuse a Link Local IPv6 IP address for multiple isolated one-to-one communication links.

[TS 24.334, clause 10.4.5.1]

Security association for a direct link between two ProSe-Enabled UEs is established during the direct link setup procedure or direct link rekeying procedure with the exchange of message contents related to direct security mode establishment. After successful completion of the direct security mode control procedure, the selected security algorithms and keys are used to integrity protect and cipher all PC5 Signalling messages exchanged between the UEs; and are also used to cipher all data plane traffic exchanged between the UEs.

[TS 24.334, clause 10.4.5.2]

A commanding UE may initiate the direct security mode control procedure in response to receiving a DIRECT_COMMUNICATION_REQUEST or a DIRECT_REKEYING_REQUEST message.

...

To initiate this procedure, the commanding UE shall either identify an existing K_D based on the K_D ID included in the DIRECT_COMMUNICATION_REQUEST or DIRECT_REKEYING_REQUEST message, or derive a new K_D if it either does not share a known K_D with the peer UE or wishes to derive a new K_D, as specified in 3GPP TS 33.303 [6]. In the latter case, the commanding UE shall generate the MSB of K_D ID to ensure that the resultant K_D ID will be unique in the commanding UE. Then, it shall generate a LSB of $K_{D\text{-sess}}$ ID such that the $K_{D\text{-sess}}$ ID formed by combining with the MSB of $K_{D\text{-sess}}$ ID (received in the DIRECT_COMMUNICATION_REQUEST or DIRECT_REKEYING_REQUEST that triggered the direct security mode procedure) is unique within the commanding UE.

Following this, the commanding UE shall generate a 128-bit Nonce_2 value. With K_D, Nonce_2 and Nonce_1 received in the DIRECT_COMMUNICATION_REQUEST or DIRECT_REKEYING_REQUEST message, the commanding UE shall derive $K_{D\text{- sess}}$ as specified in 3GPP TS 33.303 [6].

Then, the UE shall construct a DIRECT_SECURITY_MODE_COMMAND message with the following:

- Nonce_2 IE set to Nonce_2;
- the LSB of $K_{D\text{-sess}}$ ID IE set to indicate the least significant 8-bits of $K_{D\text{-sess}}$ ID;
- the UE Security Capabilities IE set to the UE Security Capabilities received in the DIRECT_COMMUNICATION_REQUEST message or DIRECT_REKEYING_REQUEST; and
- the Chosen Algorithms IE set to the algorithms to be used for ciphering and integrity protection.

...

If the DIRECT_SECURITY_MODE_COMMAND message is used for isolated one-to-one ProSe direct communication, then the commanding UE shall include the following additional parameters in the DIRECT_SECURITY_MODE_COMMAND message in order to create a new K_D:

- the User Info IE set to the User Info received from upper layers;
- the MSB of K_D ID IE set to the MSB of K_D ID of the new K_D; and

- the Signature IE set to the ECCSI signature value calculated with the following information elements, as specified in 3GPP TS 33.303 [6]:

  - User Info;

  - Nonce_1; and

  - the Encrypted Payload IE set to the SAKKE payload generated as specified in 3GPP TS 33.303 [6].

The commanding UE shall select the integrity protection and ciphering algorithms that will be used and include these choices in the Chosen algorithms IE in the DIRECT SECURITY MODE COMMAND message. The UE shall include the received UE security capabilities that was present in the DIRECT_COMMUNICATION_REQUEST or a DIRECT_REKEYING_REQUEST message that triggered the DIRECT SECURITY MODE COMMAND message.

The commanding UE shall send the DIRECT SECURITY MODE COMMAND message unciphered, but shall integrity protect the message with the new security context. After sending the DIRECT_SECURITY_MODE_COMMAND message, the commanding UE shall start timer T4111 (see figure 10.4.5.2.1).

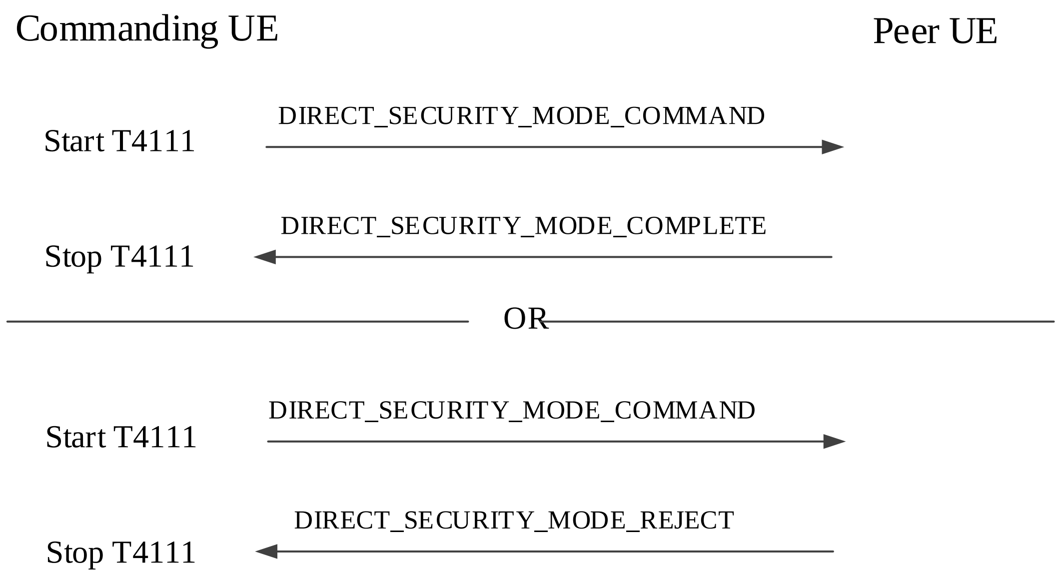

Figure 10.4.5.2.1: Direct Security mode control procedure

[TS 24.334, clause 10.4.5.4]

Upon receipt of the DIRECT_SECURITY_MODE_COMPLETE message, the commanding UE shall stop timer T4111. If an LSB of K_D ID IE was included in the message, the commanding UE uses this and the MSB of K_D ID it previously sent to form the K_D ID of the new K_D. From this time onwards the commanding UE shall protect all signalling messages and user data with the new security context.

[TS 24.334, clause 10.4.6.1]

The IP address configuration procedure is performed after the establishment of the direct link to enable IP connectivity between the UEs at each end of the direct link.

[TS 24.334, clause 10.4.6.2]

When neither of the two UEs on the direct link acts as a ProSe UE-to-network relay, the two UEs shall select the IP version (IPv4 or IPv6) to be used based on the following rules:

- if the target UE in the direct link setup procedure (see subclause 10.4.2) has indicated "DHCPv4 Server" in the IP Address Config IE, then the initiating UE in the direct link setup procedure (see subclause 10.4.2) shall initiate the IPv4 address configuration with DHCPv4 procedure acting as a DHCP client;

- if the target UE in the direct link setup procedure has indicated "IPv6 Router" in the IP Address Config IE , then the initiating UE in the direct link setup procedure shall initiate the IPv6 address configuration with IPv6 stateless address auto-configuration acting as an IPv6 host;
- if the target UE in the direct link setup procedure has indicated "DHCPv4 Server & IPv6 Router" in the IP Address Config IE, then the initiating UE in the direct link setup procedure shall choose either IP version and initiate the address configuration procedure, acting as a client or host;
- if the target UE in the direct link setup procedure has indicated "address allocation not supported" in the IP Address Config IE and the initiating UE has indicated "DHCPv4 Server", "IPv6 Router" or "DHCPv4 Server & IPv6 Router" in the IP Address Config IE, then the target UE shall:
    a) initiate the IPv4 address configuration with DHCPv4 procedure acting as a DHCP client, if the initiating UE has indicated "DHCPv4 Server";
    b) initiate the IPv6 address configuration with IPv6 stateless address auto-configuration acting as an IPv6 host if the initiating UE has indicated "IPv6 Router"; and
    c) choose either IP version and initiate the corresponding IP address configuration procedure as a client or host, if the other UE has indicated "DHCPv4 Server & IPv6 Router"; and
- if both of the UEs has indicated "address allocation not supported" in the IP Address Config IE, then the UEs shall use IPv6 link-local addresses formed locally as defined in RFC 4862 [15].

[TS 24.334, clause 10.4.3.2]

The requesting UE manages a keepalive timer T4102 and a keepalive counter for this procedure. The keepalive timer T4102 is used to trigger the periodic initiation of the procedure. It is started or restarted whenever the UE receives a PC5 Signalling message or PC5 user plane data from the peer UE over this link. The keepalive counter is set to an initial value of zero after link establishment.

The requesting UE may initiate the procedure if:

- a request from upper layers to check the viability of the direct link is received; or
- the keepalive timer T4102 for this link expires.

The requesting UE initiates the procedure by stopping timer T4102 if it is still running and generating a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link. Optionally, the initiating UE may include a Maximum Inactivity Period IE to indicate the maximum inactivity period of the requesting UE over this direct link. When a remote UE sends DIRECT_COMMUNICATION_KEEPALIVE message to the ProSe UE-to-network relay UE, this IE shall be included.

After the DIRECT_COMMUNICATION_KEEPALIVE message is generated, the requesting UE shall pass this message to the lower layers for transmission along with the requesting UE's Layer 2 ID (for unicast communication) and the peer UE's Layer 2 ID (for unicast communication), and start retransmission timer T4101.

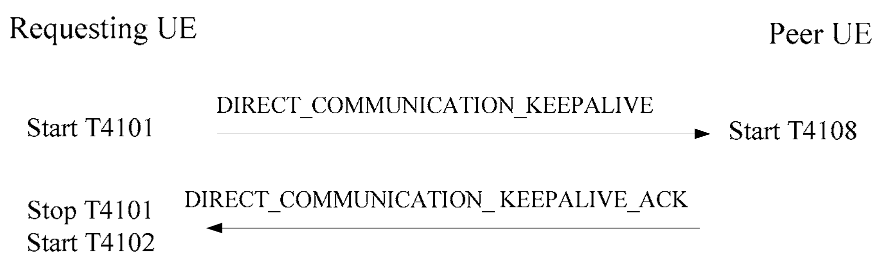

Figure 10.4.3.2.1: Direct link keepalive procedure

[TS 24.334, clause 10.4.3.3]

Upon receiving a DIRECT_COMMUNICATION_KEEPALIVE message, the peer UE shall respond with a DIRECT_COMMUNICATION_KEEPALIVE_ACK message including the Keepalive Counter IE set to the same value as that received in the DIRECT_COMMUNICATION_KEEPALIVE message.

If a Maximum Inactivity Period IE is included in the DIRECT_COMMUNICATION_KEEPALIVE message, the peer UE shall stop the inactivity timer T4108 if it is running, and restart the timer T4108 with the value provided in the IE, If any communication activity occurs in this direct link before the timer T4108 expires, the UE shall stop the timer T4108 and reset it with the initial value.

[TS 24.334, clause 10.4.3.4]

Upon receiving a DIRECT_COMMUNICATION_KEEPALIVE_ACK message, the requesting UE shall stop retransmission timer T4101, start keepalive timer T4102 and increment the keepalive counter for this link.

[TS 24.334, clause 10.4.3.5.2]

If the inactivity timer T4108 expires, if the peer UE is a ProSe UE-to-network relay UE, it shall initiate the direct link release procedure specified in 10.4.4 with the release reason #3 "Direct connection is not available any more". Otherwise, the peer UE may:

A) initiate is own keepalive procedure to check the link; or

B) initiate the direct link release procedure specified in 10.4.4 with the release reason #3 "Direct connection is not available any more".

Whether the UE chooses A or B is left to UE implementation.

[TS 24.334, clause 10.4.4.2]

The releasing UE shall initiate the procedure if:

- a request from upper layers to release a direct link with the peer UE which uses a known Layer 2 ID (for unicast communication) is received and there is an existing link between those two UEs; or

...

The releasing UE initiates the direct link release procedure by generating a DIRECT_COMMUNICATION_RELEASE message with a Release Reason IE indicating one of the following cause values:

#1 Direct Communication to peer UE no longer needed;

...

After the DIRECT_COMMUNICATION_RELEASE message is generated, the releasing UE shall pass this message to the lower layers for transmission along with the releasing UE's Layer 2 ID (for unicast communication) and the peer UE's Layer 2 ID (for unicast communication). The releasing UE shall release the direct link locally if the release reason is #3 "Direct connection is not available any more". Otherwise, the releasing UE shall start timer T4103.

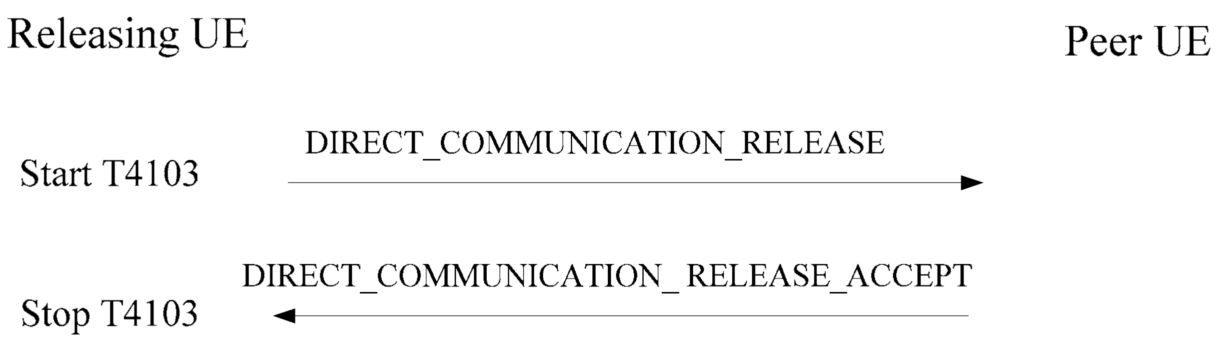

Figure 10.4.4.2.1: Direct link release procedure

[TS 24.334, clause 10.4.4.4]

Upon receipt of the DIRECT_COMMUNICATION_RELEASE_ACCEPT message, the releasing UE shall stop timer T4103. From this time onward the releasing UE shall no longer send or receive any messages via this link.

19.1.10.3 Test description

19.1.10.3.1 Pre-test conditions

System Simulator:

SS-UE

- SS-UE1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device.

GNSS simulator (optional).

NOTE: For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". This can be done by usage of an GNSS simulator, or some suitable MMI action.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.1.10.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, etc.).

Table 19.1.10.3.1-1: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.
$EF_{PROSE\_RADIO\_COM}$	b2=1 indicates that the UE is authorised to perform one-to-one ProSe direct communication when not served by E-UTRAN.

- For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". If this is not done by using n GNSS simulator then the UE needs to be preconfigured via a suitable MMI action.

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.1.10.3.2 Test procedure sequence

Table 19.1.10.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power up the UE.	-	-	-	-
2	Wait for 15 sec to allow the UE to establish that it is out of coverage and initiate scanning the frequency pre-set for ProSe	-	-	-	-

	communication for any activities.				
3	SS-UE1 sends a DIRECT_COMMUNICATION_REQUEST message, IP Address Config IE set to "address allocation not supported".	<--	DIRECT_COMMUNICATION_REQUEST	-	-
4	Check: Does the UE send a DIRECT_SECURITY_MODE_COMMAND message unciphered but integrity protected with the new security context?	-->	DIRECT_SECURITY_MODE_COMMAND	1	P
5	SS-UE1 sends a DIRECT_SECURITY_MODE_COMPLETE message ciphered and integrity protected with the new security context.	<--	DIRECT_SECURITY_MODE_COMPLETE	-	-
6	Check: Does the UE send a DIRECT_COMMUNICATION_ACCEPT message?	-->	DIRECT_COMMUNICATION_ACCEPT	2	P
-	EXCEPTION: After the communication is established, an IP address configuration procedure is performed depending on what the UE has indicated in the IP Address Config IE (if it is not "address allocation not supported") in the DIRECT_COMMUNICATION_REQUEST message, and, the SS-UE1 itself indicating "address allocation not supported" in the DIRECT_COMMUNICATION_ACCEPT message.	-	-	-	-
7	SS-UE1 sends a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link=0, and a Maximum Inactivity Period IE.	<--	DIRECT_COMMUNICATION_KEEPALIVE	-	-
8	Does the UE send a DIRECT_COMMUNICATION_KEEPALIVE_ACK message including the Keepalive Counter IE set to the same value as that received in the DIRECT_COMMUNICATION_KEEPALIVE message?	-->	DIRECT_COMMUNICATION_KEEPALIVE_ACK	3	P
9	Wait 1/2 T4108 sec (=the value of the Maximum Inactivity Period IE sent in the DIRECT_COMMUNICATION_KEEPALIVE message).	-	-	-	-
10	SS-UE1 sends a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link=0, and not including the Maximum Inactivity Period IE. NOTE: Upon receiving the message the UE is expected to restart timer T4108.	<--	DIRECT_COMMUNICATION_KEEPALIVE	-	-
11	Does the UE send a DIRECT_COMMUNICATION_KEEPALIVE_ACK message including the Keepalive Counter IE set to the same value as that received in the DIRECT_COMMUNICATION_KEEPALIVE message?	-->	DIRECT_COMMUNICATION_KEEPALIVE_ACK	3	P
12	Start timer T4108=the value set in Maximum Inactivity Period IE send in the DIRECT_COMMUNICATION_KEEPALIVE message in step 6. NOTE: The SS shall not sent any direct communication data (neither PC5 Signalling message nor PC5 user plane data) until the event in step 14 takes place to ensure that the UE does not re-start timer T4108.	-	-	-	-

13	Timer T4108 expires.	-	-	-	-
-	EXCEPTION: Steps 14a1 to 14b2 describe behaviour that depends on UE implementation; the "lower case letter" identifies a step sequence that depends on how the UE reacts upon timer T4108 expiry.	-	-	-	-
14a1	Check: Does the UE send a DIRECT_COMMUNICATION_KEEPALIVE message with a Keepalive Counter IE that contains the value of the keepalive counter for this link=0?	-->	DIRECT_COMMUNICATION_KEEPALIVE	4	P
14a2	SS-UE1 sends a DIRECT_COMMUNICATION_KEEPALIVE_ACK message.	<--	DIRECT_COMMUNICATION_KEEPALIVE_ACK	-	-
14a3	Make the UE release the one-to-one ProSe direct communication with the remote UE.	-	-	-	-
14a4	Check: Does the UE send a DIRECT_COMMUNICATION_RELEASE message with a Release Reason IE indicating 'Direct connection is not available any more'?	-->	DIRECT_COMMUNICATION_RELEASE	5	P
14a5	SS-UE1 sends a DIRECT_COMMUNICATION_RELEASE_ACCEPT message	<--	DIRECT_COMMUNICATION_RELEASE_ACCEPT	-	-
14b1	Check: Does the UE send a DIRECT_COMMUNICATION_RELEASE message with a Release Reason IE indicating 'Direct Communication to peer UE no longer needed'?	-->	DIRECT_COMMUNICATION_RELEASE	4	P
14b2	SS-UE1 sends a DIRECT_COMMUNICATION_RELEASE_ACCEPT message.	<--	DIRECT_COMMUNICATION_RELEASE_ACCEPT	-	-

19.2 ProSe Direct discovery

19.2.1 ProSe Direct Discovery Monitoring/Pre-configured authorisation / Monitoring / Handling of validity timers / Utilisation of the resources of different cells/PLMNs

19.2.1.1 Test Purpose (TP)

(1)

```
with { UE supporting ProSe direct discovery monitoring }
ensure that {
  when { UE performs Attach procedure, or, Normal tracking area updating procedure }
    then { UE announces its ProSe capabilities }
            }
```

(2)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and
PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is NOT transmitting
SystemInformationBlockType19 }
ensure that {
  when { UE is triggered by an upper layer application to perform ProSe direct discovery monitoring
corresponding to a ProSe Application ID and the UE has no valid Discovery Filters corresponding to
the requested ProSe Application ID for that upper layer application }
    then { UE does not initiate Monitoring request procedure }
            }
```

(3)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and
PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting
SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on
the two PLMNs/frequencies }
ensure that {
  when { UE is triggered by an upper layer application to perform ProSe direct discovery monitoring
corresponding to a ProSe Application ID and the UE has no valid Discovery Filters corresponding to
the requested ProSe Application ID for that upper layer application }
    then { UE successfully completes a Monitoring request procedure including the transmission of
SidelinkUEInformation message indicating it is interested in sidelink discovery reception }
            }
```

(4)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and
PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting
SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on
the two PLMNs/frequencies, and, UE has successfully completed Monitoring request procedure, and, the
TTL timer T4002 associated with the Discovery Filter allocated during the procedure has not expired
}
ensure that {
  when { UE is monitoring for ProSe Announcements in the assigned resources on Cell1/f1/PLMN1 }
    then { UE is able to receive messages announced over the PC5 in the assigned resources in
Cell1/f1/PLMN1 }
            }
```

(5)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and
PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting
SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on
the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell1/f1/PLMN1, and, the
TTL timer T4002 associated with the Discovery Filter has not expired }
ensure that {
  when { there is a match event of one of the ProSe Application Codes received from the lower
layers, and the UE does not have a corresponding ProSe Application ID already locally stored }
    then { the UE successfully performs a Match report procedure }
            }
```

(6)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell1/f1/PLMN1, and, the TTL timer T4002 associated with the Discovery Filter has not expired, and, UE having successfully performed a Match report procedure }
ensure that {
  when { UE has a locally stored mapping for the ProSe Application Code that resulted in the match event, but the match report refresh timer T4006 of the ProSe Application Code has expired }
    then { the UE initiates the match report procedure }
            }
```

(7)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell1/f1/PLMN1, and, the TTL timer T4002 associated with the Discovery Filter has not expired, and, the UE having successfully performed a Match report procedure }
ensure that {
  when { UE has a locally stored mapping for the ProSe Application Code that resulted in the match event, but the validity timer T4004 of the ProSe Application Code has expired }
    then { the UE initiates the match report procedure }
            }
```

(8)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and PLMN2) operating on the same frequency, and, UE attached to Cell1/f1/PLMN1 which is transmitting SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell1/f1/PLMN1, and, the TTL timer T4002 associated with the Discovery Filter has not expired }
ensure that {
  when { UE moves to a new Cell2/f1/PLMN1 which is transmitting SystemInformationBlockType19 }
    then { the UE continues successful monitoring without initiating a new Monitoring request procedure, and, is able to receive messages announced over the PC5 in the assigned resources in Cell2/f1/PLMN1 }
            }
```

(9)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and PLMN2) operating on the same frequency, and, UE attached to Cell2/f1/PLMN1 which is transmitting SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell2/f1/PLMN1, and, the TTL timer T4002 associated with the Discovery Filter has not expired }
ensure that {
  when { UE moves to a new Cell4/f1/PLMN2 (new PLMN)authorized for ProSe Direct Discovery Monitoring and transmitting SystemInformationBlockType19 providing Direct Discovery monitoring resources on the serving cell }
    then { the UE initiates and successfully completes a new Monitoring request procedure, and, is able to receive messages announced over the PC5 in the assigned resources in Cell4/f1/PLMN2 }
            }
```

(10)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and PLMN2) operating on the same frequency, and, UE attached to Cell4/f1/PLMN2 which is transmitting SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements on Cell1/f1/PLMN1, and, the TTL timer T4002 associated with the Discovery Filter has not expired, and, monitoring for announcements on the resources of Cell4/f1/PLMN2 }
ensure that {
  when { TTL timer T4002 expires }
    then { the UE initiates and successfully completes a new Monitoring request procedure, and, is able to receive messages announced over the PC5 in the assigned resources in Cell4/f1/PLMN2 }
            }
```

(11) Void

(12) Void

(13)

```
with { UE being authorized for performing ProSe Direct Discovery Monitoring on two PLMNs (PLMN1 and
PLMN2) operating on the same frequency, and, UE attached to Cell4/f1/PLMN2 which is transmitting
SystemInformationBlockType19 indicating the provision of Direct Discovery monitoring resources on
the two PLMNs/frequencies, and, UE monitoring for ProSe Announcements, and, the TTL timer T4002
associated with the Discovery Filter allocated during the most recent Monitoring request procedure
has not expired }
ensure that {
  when { UE moves to a new Cell11/f1/PLMN3 transmitting SystemInformationBlockType19 however UE is
not authorized for ProSe Direct Discovery Monitoring on PLMN3 }
    then { the UE does not initiate Monitoring request procedure, and, does not monitor for messages
announced over the PC5 in the assigned resources in Cell11/f1/PLMN3 }
            }
```

19.2.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.303, clause 5.3.1.1, TS 24.301, clauses 5.5.1.2.2, 5.5.3.2.2, 6.1.1, TS 24.334, clauses 5.1.1, 5.1.2, 6.2.3.2, 6.2.3.4, 6.2.4.2, 6.2.4.4, TS 36.331, clauses 5.2.2.4, 5.2.2.26, 5.10.2.1, 5.10.2.2, 5.10.2.3, 5.10.5. Unless otherwise stated these are Rel-12 requirements.

[TS 23.303, clause 5.3.1.1]

The UE can act as "announcing UE" only in the band designated by the serving PLMN but may act as a "monitoring" UE also in the resources of the serving PLMN and Local PLMNs.

ProSe-enabled UEs which have obtained authorization to participate in ProSe Direct Discovery procedures shall not continue in participating in ProSe Direct Discovery procedures as soon as they detect loss of E-UTRA coverage in the serving PLMN.

[TS 24.301, clause 5.5.1.2.2]

If the UE supports ProSe direct discovery, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct discovery bit to "ProSe direct discovery supported" in the UE network capability IE of the ATTACH REQUEST message.

[TS 24.301, clause 5.5.3.2.2]

The UE in state EMM-REGISTERED shall initiate the tracking area updating procedure by sending a TRACKING AREA UPDATE REQUEST message to the MME,

...

b) when the periodic tracking area updating timer T3412 expires;

...

If the UE has to request resources for ProSe direct discovery or Prose direct communication (see 3GPP TS 36.331 [22]), then the UE shall set the "active" flag to 1 in the TRACKING AREA UPDATE REQUEST message.

...

For all cases except case b, if the UE supports ProSe direct communication, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct communication bit to "ProSe direct communication supported" in the UE network capability IE of the TRACKING AREA UPDATE REQUEST message.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

2) transferred between the UE and the ProSe Function over the PC3 interface with the ProSe Direct Services Provisioning Management Object or the ProSe Public Safety Direct Services Provisioning Management Object as specified in 3GPP TS 24.333 [9].

...

The service authorisation provided by the ProSe Function of the HPLMN for ProSe direct discovery contains a list of PLMNs in which the UE is authorised to use ProSe direct discovery.

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 6.1.1]

The UE and ProSe Function shall use HTTP 1.1 as specified in IETF RFC 7230 [18] and IETF RFC 7231 [19] as the transport protocol for ProSe messages over the PC3 interface. The ProSe messages described here shall be included in the body of either an HTTP request message or an HTTP response message. The following rules apply:

- The UE initiates ProSe transactions with an HTTP request message containing the PC3 request(s);

- The ProSe Function responds to the requests with an HTTP response message containing the PC3 response(s) for the PC3 request(s); and

- HTTP POST methods are used for PC3 direct discovery procedures.

Optionally, the operator can configure the UE with configuration parameters for establishment of the PDN connection for reaching the HPLMN ProSe Function. If the UE is configured with the configuration parameter for establishment of the PDN connection for reaching the HPLMN ProSe Function (see 3GPP TS 24.333 [9]):

a) if a PDN connection for reaching the HPLMN ProSe Function is not established yet, the UE shall establish the PDN connection for reaching the HPLMN ProSe Function according to the UE configuration and shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function; and

b) if a PDN connection for reaching the HPLMN ProSe Function is already established (e.g. either due to other ProSe feature or due to other application), the UE shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function;

[TS 24.334, clause 6.2.3.2]

Before initiating the monitor request procedure, the UE is configured with the data structure of the ProSe Application IDs it wants to monitor. This step is performed using mechanisms that are out of scope of 3GPP.

If the UE is authorised to perform ProSe direct discovery monitoring in at least one PLMN, it shall initiate a monitor request procedure:

a) when the UE is triggered by an upper layer application to perform ProSe direct discovery monitoring corresponding to a ProSe Application ID and the UE has no valid Discovery Filters corresponding to the requested ProSe Application ID for that upper layer application; or

b) when the TTL timer T4002 assigned by the ProSe Function to a Discovery Filter has expired and the request from upper layers to monitor that ProSe Application ID is still in place.

NOTE 1: To ensure service continuity if the UE needs to keep monitoring the same Discovery Filter, the UE can initiate the monitor request procedure before the TTL timer T4002 assigned by the ProSe Function for a Discovery Filter expires.

The UE initiates the monitor request procedure by sending a DISCOVERY_REQUEST message with a new transaction ID, the ProSe Application ID set to the ProSe Application ID received from upper layers, the command set to "monitor", the UE identity set to the UE's IMSI, and the Application Identity set to the Application Identity of the upper layer application that requested the monitoring.

NOTE 2: A UE can include one or multiple transactions in one DISCOVERY_REQUEST message for one or more ProSe Application IDs, and receive corresponding <response-monitor> element or <response-reject> element in the DISCOVERY_RESPONSE message for each respective transaction. In the following description of the monitor request procedure, only one transaction is included.

Figure 6.2.3.2.1 illustrates the interaction between the UE and the ProSe Function in the monitor request procedure.

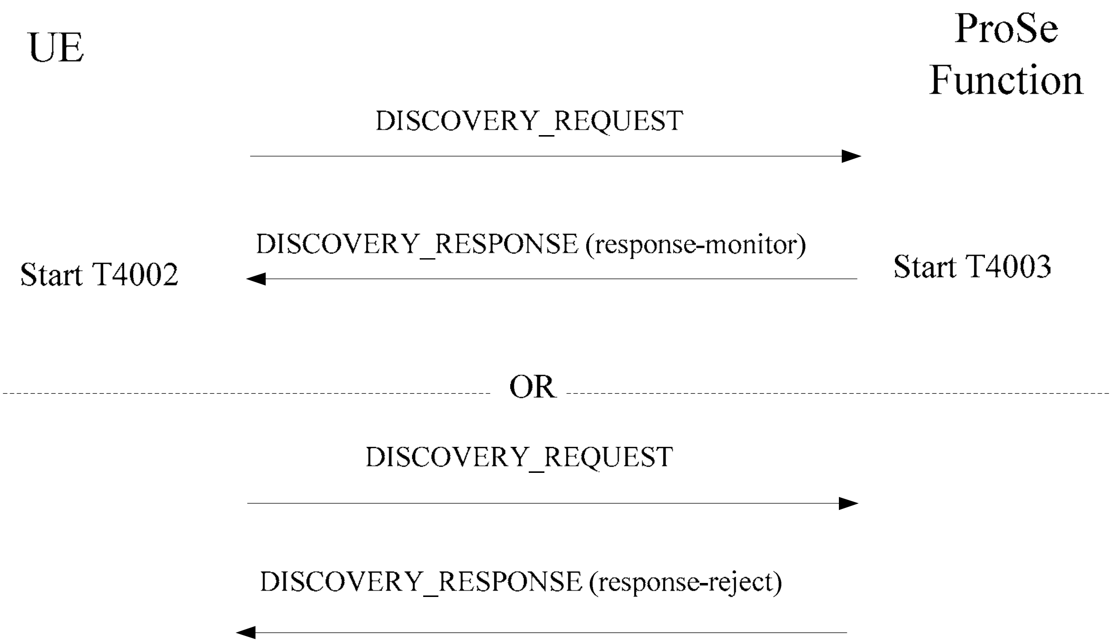

Figure 6.2.3.2.1: Monitor request procedure

[TS 24.334, clause 6.2.3.4]

Upon receipt of the DISCOVERY_RESPONSE message, if the transaction ID contained in the <response-monitor> element matches the value sent by the UE in a DISCOVERY_REQUEST message with the command set to "monitor", the UE shall, for each Discovery Filter assigned by the ProSe Function, stop TTL timer T4002 if running and start TTL timer T4002 with the received value. Otherwise the UE shall discard the DISCOVERY_RESPONSE message and shall not perform the procedures below.

The UE may perform monitor for discovery messages received over the PC5 interface as described below.

For a ProSe Application ID requested by the monitoring UE, the ProSe Function may have assigned one or more Discovery Filters. The UE should apply all assigned Discovery Filters to its monitoring operation. Using these Discovery Filters may result in a match event. In case of a match event, the UE shall consider that the ProSe Application ID it seeks to monitor has been discovered. A match event is defined as follows:

There is a match event when, for any of the ProSe Application Masks in a Discovery Filter, the output of a bitwise AND operation between the ProSe Application Code contained in the received PC5_DISCOVERY message and the ProSe Application Mask, matches the output of a bitwise AND operation between the ProSe Application Mask and the ProSe Application Code contained in the same Discovery Filter.

NOTE: A ProSe Application Mask with all bits set to "1" is assigned by the ProSe Function for full matching.

The UE may instruct the lower layers to start monitoring if all of the following conditions are met:

- the UE is currently authorized to perform monitoring in at least one PLMN;
- the UE has obtained at least one Discovery Filter and their respective TTL timer T4002(s) have not expired; and
- a request from upper layers to monitor for the ProSe Application ID associated with an authorised Application Identity is still in place.

If the UE is in EMM-CONNECTED mode, the monitoring UE shall also trigger the corresponding procedure in lower layers as specified in 3GPP TS 36.331 [12].

During the monitoring operation, the UE receives all PC5_DISCOVERY messages and associated UTC times from the lower layers.

During the monitoring operation, if one of the above conditions is no longer met, the UE may instruct the lower layers to stop monitoring. When the UE stops monitoring, if the UE is in EMM-CONNECTED mode, the UE shall trigger the corresponding procedure in lower layers as specified in 3GPP TS 36.331 [12].

[TS 24.334, clause 6.2.4.2]

The UE shall meet the following pre-conditions before initiating this procedure:

- a request from upper layers to monitor for the ProSe Application ID, which resulted in the matched ProSe Application Code, is still in place;
- the lower layers have provided a "Monitored PLMN ID" value, and UTC time information, along with the discovery message containing a ProSe Application Code; and
- the TTL timer T4002 associated with the Discovery Filter, which resulted in a match event of the ProSe Application Code, has not expired.

If the UE is authorised to perform ProSe direct discovery monitoring in the monitored PLMN, it should initiate a match report procedure:

a) when there is a match event of one of the ProSe Application Codes received from the lower layers, and the UE does not have a corresponding ProSe Application ID already locally stored;

b) when the UE has a locally stored mapping for the ProSe Application Code that resulted in a match event, but the validity timer T4004 of the ProSe Application Code has expired; or

c) when the UE has a locally stored mapping for the ProSe Application Code that resulted in a match event, but the match report refresh timer T4006 of the ProSe Application Code has expired.

The UE initiates the match report procedure by sending a MATCH_REPORT message with a new transaction ID and shall set the message contents as follows:

- the UE shall set the ProSe Application Code to the ProSe Application Code for which there was a match event;
- the UE shall set the UE identity to the UE's IMSI;
- the UE shall set the UTC-based counter as follows:
    - the 28 most significant bits of the UTC-based counter shall be set to the 28 most significant bits of the UTC time provided by the lower layers for the PC5_DISCOVERY message that contained the ProSe Application Code for which there was a match event encoded as specified in subclause 12.2.2.18; and
    - the 4 least significant bits of the UTC-based counter shall be set to the 4 least significant bits of the UTC-based counter contained in the PC5_DISCOVERY message that contained the ProSe Application Code for which there was a match event, as specified in 3GPP TS 33.303 [6];

- the UE shall set the MIC to the MIC of the PC5_DISCOVERY message that contained the ProSe Application Code for which there was a match event;

- the UE shall set the Monitored PLMN ID to the PLMN ID of the PLMN where the PC5_DISCOVERY message was received, as provided by the lower layers;

- if the UE was roaming when the match event occurred, the UE shall set the VPLMN ID to the PLMN ID of the PLMN in which the UE was registered when the match event occurred; and

- the UE shall set the Metadata Flag to indicate whether or not it wishes to receive metadata information associated with the ProSe Application ID in the MATCH_REPORT_ACK message from the ProSe Function.

NOTE 1: A UE can include one or multiple transactions in one MATCH_REPORT message for different ProSe Application Codes, and receive corresponding <match-ack> element or <match-reject> element in the MATCH_REPORT_ACK message for each respective transaction. In the following description of match report procedure, only one transaction is included.

NOTE 2: The value of the Metadata Flag is determined through an indication from upper layers in the original request to monitor for a ProSe Application ID.

Figure 6.2.4.2.1 illustrates the interaction between the UE and the ProSe Function in the match report procedure.

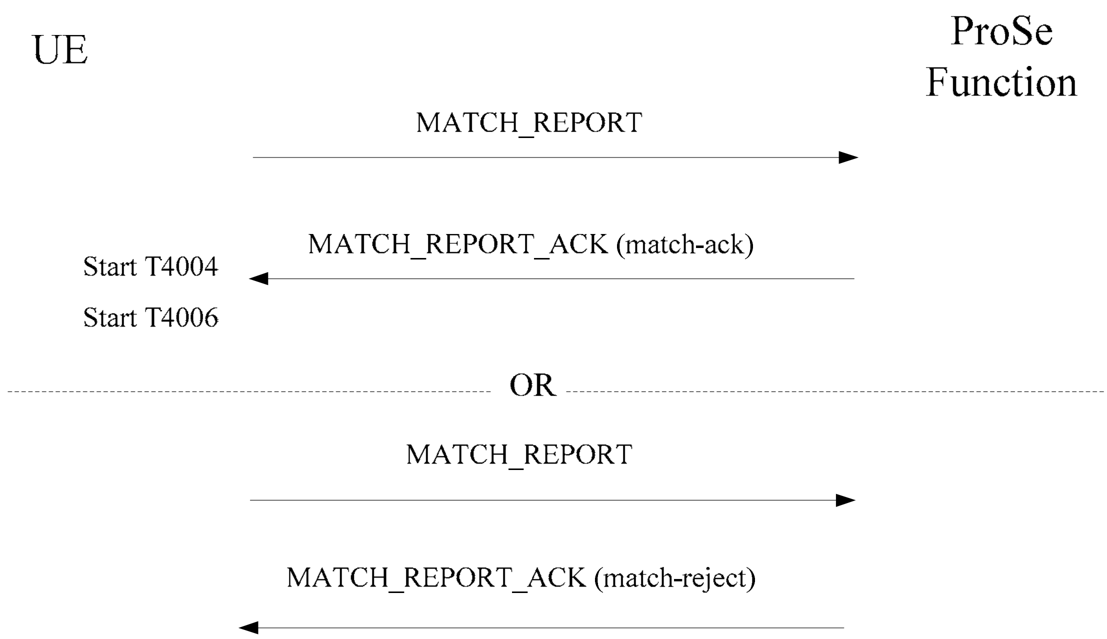

Figure 6.2.4.2.1: Match report procedure

[TS 24.334, clause 6.2.4.4]

Upon receipt of the MATCH_REPORT_ACK message, if the transaction ID contained in the <match-ack> element matches the value sent by the UE in a MATCH_REPORT message, the UE shall store the mapping between the ProSe Application Code and ProSe Application ID locally, start timers T4004 and T4006, and may inform the upper layers of this match of the ProSe Application ID. Otherwise the UE shall discard the MATCH_REPORT_ACK message.

Upon receipt of the MATCH_REPORT_ACK message, if the transaction ID contained in the <match-reject> element matches the value sent by the UE in a MATCH_REPORT message and if the received PC3 Control Protocol cause value is #5 "Invalid MIC", as specified in subclause 6.2.4.5, the UE shall stop timer T4004 if it is running.

NOTE 1: It is an implementation specific choice whether the UE informs the upper layers every time a ProSe Application ID triggers a match event, or only the first time this match occurs.

NOTE 2: The UE can also inform the upper layers if a ProSe Application ID is no longer matched, because the validity timer T4004 of the corresponding ProSe Application Code expires.

NOTE 3: The UE can also inform the upper layers if a ProSe Application ID is no longer matched, because the validity timer T4004 of the corresponding ProSe Application Code is stopped upon receiving MATCH_REPORT_ACK message with a <match-reject> element with PC3 Control Protocol cause value #5 "Invalid MIC".

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink discovery and is configured by upper layers to receive or transmit sidelink discovery announcements on the primary frequency:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

2> for each of the one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19* and for which the UE is configured by upper layers to receive sidelink discovery announcements on:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType19*;

[TS 36.331, clause 5.2.2.26]

Upon receiving *SystemInformationBlockType19*, the UE shall:

1> if *SystemInformationBlockType19* message includes the *discConfig*:

2> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discRxPool* for sidelink discovery monitoring, as specified in 5.10.5;

[TS 36.331, clause 5.10.2.1]

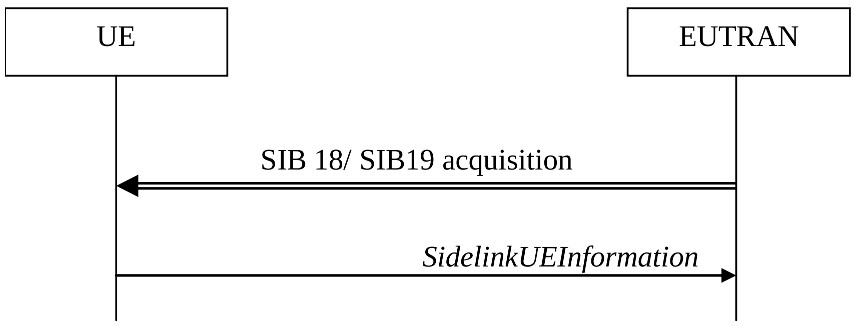

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

...

Upon initiating the procedure, the UE shall:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType19* for the PCell;

2> if configured by upper layers to receive sidelink discovery announcements on a serving frequency or on one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19*:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *discRxInterest*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it is interested in sidelink discovery reception in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discRxInterest*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it is no longer interested in sidelink discovery reception in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

2> if configured by upper layers to receive sidelink discovery announcements on a serving frequency or one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19*:

3> include *discRxInterest*;

...

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.5]

A UE capable of sidelink discovery that is configured by upper layers to monitor sidelink discovery announcements shall:

1> for each frequency the UE is configured to monitor sidelink discovery announcements on, prioritising the frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19*:

2> configure lower layers to monitor sidelink discovery announcements using the pool of resources indicated by *discRxPool* in *SystemInformationBlockType19* without affecting normal operation i.e. receive during idle periods or by using a spare receiver;

NOTE 1: The requirement not to affect normal UE operation also applies for the acquisition of sidelink discovery related system and synchronisation information from inter-frequency cells.

NOTE 2: The UE is not required to monitor all pools simultaneously.

NOTE 3: It is up to UE implementation to decide whether a cell is sufficiently good to be used to monitor sidelink discovery announcements.

19.2.1.3 Test description

19.2.1.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.2.1.3.1-1.

NOTE: The test only requires 2 cells to be active at any one instant.

Table 19.2.1.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	HPLMN (PLMN1)
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_MON} PLMN2: PLMN2 in USIM EF_{PROSE_MON} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_MON}; MNC=03. Note 2: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 24 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all cells when SystemInformationBlockType19 is transmitted. In all other cases System information combination 1 as defined in TS 36.508 [18] clause 4.4.3.1 shall be used.

- *SystemInformationBlockType19* is transmitted on all cells when they are active unless otherwise stated; the sidelink related resources in each instance are specified in the specific message content.

SS-UE

- SS-UE 1.
    - As defined in TS 36.508 [18], configured and operating for/as ProSe Direct Discovery Announcing on the resources provided by different cells (as specified in the relevant procedure steps in Table 19.2.1.3.2-1)

UE:

- ProSe related configuration

The UE is equipped with a USIM containing values shown in Table 19.2.1.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Discovery Monitoring).

Table 19.2.1.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°1 (ProSe direct discovery parameters) supported
	Service n°4 (ProSe Direct Discovery monitoring radio parameters) supported
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage

Depending on implementation, a Rel-12 UE may not support USIM settings for ProSe Direct Discovery Monitoring (pc_disc_public_safety=FALSE, i.e. ProSe Discovery for Public Safety not supported) . Such UEs are expected to provide means for pre-configuring the PLMNs which are authorised for ProSe Direct Discovery Monitoring (e.g. via MMI). The values specified for EF_{PROSE_MON} in TS 36.508 [18], section 4.9.3.1 shall be preconfigured.

- For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 7 min (For Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).

- The UE is configured with the data structure of the ProSe Application ID (px_ProSeMonApplicationIdentity1) it wants to monitor (This step is performed using UE implementation dependent mechanisms, e.g. MMI command, or, may be pre-loaded in the UE).
- A number of arbitrarily chosen ProSe Application IDs are provided during the test. The UE shall have no knowledge of them before the test is started.
- The UE has no valid Discovery Filters corresponding to the configured ProSe Application ID (px_ProSeMonApplicationIdentity1) nor to any other possibly pre-loaded ProSe Application IDs (this is to ensure that the provided during the test ProSe Application Codes are not known to the UE).

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.2.1.3.2 Test procedure sequence

Table 19.2.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS configures: SS-NW - Cell 1 as the "Serving cell". - Cell 2 as the "Non-suitable “Off” cell". - Cell 4 as the "Non-suitable “Off” cell". - Cell 11 as the "Non-suitable “Off” cell". Cell 1 **does not** transmit *SystemInformationBlockType19*.	-	-	-	-
2	The UE is switched on.	-	-	-	-

19.2.2 ProSe Direct Discovery Announcing/Pre-configured authorisation / Announcing and SLSS transmission in RRC_IDLE / Handling of validity timers / Utilisation of the resources of different cells/PLMNs

19.2.2.1 Test Purpose (TP)

(1)

```
with { UE supporting ProSe direct discovery announcing }
ensure that {
  when { UE performs Attach procedure, or, Normal tracking area updating procedure }
    then { UE announces its ProSe capabilities }
            }
```

(2)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is NOT broadcasting *SystemInformationBlockType19* }
ensure that {
  when { UE is triggered by an upper layer application to announce a ProSe Application ID and the UE has no valid corresponding ProSe Application Code for that upper layer application }
    then { UE does not initiate Announce request procedure }
            }

(3)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* but not indicating the provision of resources for sidelink discovery announcement on the serving PLMN }
ensure that {
  when { UE is triggered by an upper layer application to announce a ProSe Application ID and the UE has no valid corresponding ProSe Application Code for that upper layer application }
    then { UE initiates and successfully completes an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements }
            }

(4)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE is in RRC_IDLE, and, UE is configured with *discTxResources* set to *ue-Selected* and *poolSelection* within *poolToAddModList* is set to *rsrpBased* }
    then { UE is able to transmit the sidelink discovery announcement using the assigned/configured resources in Cell1/f1/PLMN1 selecting for the transmission an entry of *discTxPoolCommon* for which RSRP measurement of the serving is in-between *threshLow* and *threshHigh* }
            }

(5)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE moves to RRC_IDLE on a new Cell2/f1/PLMN1 which provides resources for sidelink discovery announcements (*poolSelection* provided in the *SystemInformationBlockType19/discTxPoolCommon* is NOT set to *rsrpBasedUE*) }
    then { UE does not initiate a new Announce request procedure, **and**, is able to transmit sidelink discovery announcements using the assigned/configured resources in Cell2/f1/PLMN1 }
            }

(6)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell2/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE moves to a new Cell4/f1/PLMN2 authorized for ProSe Direct Discovery Announcing and broadcasting *SystemInformationBlockType19* indicating the provision of Direct Discovery announcing resources on the serving PLMNs }
    then { UE initiates and successfully completes an Announce request procedure }

}

(7)

with { UE capable of SLSS transmission, **and**, being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE is in RRC_IDLE, **and**, *networkControlledSyncTx* is not configured, and, *syncTxThreshIC* is included in *SystemInformationBlockType19*, and, the RSRP measurement of the serving cell is below the value of *syncTxThreshIC* }
then { UE transmits SLSS }
}

(8)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { timer T4000 expires }
then { UE initiates and successfully completes an Announce request procedure }
}

(9) Void

(10) Void

(11)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE moves to a new Cell11/f1/PLMN3 broadcasting *SystemInformationBlockType19* providing resources for sidelink discovery announcements, **and**, the UE is not authorized for ProSe Direct Discovery announcing on this PLMN }
then { the UE does not initiate Announce request procedure, **and**, does not announce over the PC5 in the assigned resources in Cell11/f1/PLMN3 }
}

19.2.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.303, clause 5.3.1.1, TS 24.301, clauses 5.5.1.2.2, 5.5.3.2.2, 5.6.1.1, TS 24.334, clauses 5.1.1, 5.1.2, 6.1.1, 6.2.2.2, 6.2.2.4, TS 36.331, clauses 5.2.2.4, 5.2.2.26, 5.3.3.1a, 5.10.2.1, 5.10.2.2, 5.10.2.3, 5.10.6, 5.10.7.1, 5.10.7.2, 5.10.7.3. Unless otherwise stated these are Rel-12 requirements.

[TS 23.303, clause 5.3.1.1]

The UE can act as "announcing UE" only in the band designated by the serving PLMN but may act as a "monitoring" UE also in the resources of the serving PLMN and Local PLMNs.

ProSe-enabled UEs which have obtained authorization to participate in ProSe Direct Discovery procedures shall not continue in participating in ProSe Direct Discovery procedures as soon as they detect loss of E-UTRA coverage in the serving PLMN.

[TS 24.301, clause 5.5.1.2.2]

If the UE supports ProSe direct discovery, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct discovery bit to "ProSe direct discovery supported" in the UE network capability IE of the ATTACH REQUEST message.

[TS 24.301, clause 5.5.3.2.2]

The UE in state EMM-REGISTERED shall initiate the tracking area updating procedure by sending a TRACKING AREA UPDATE REQUEST message to the MME,

...

b) when the periodic tracking area updating timer T3412 expires;

...

If the UE has to request resources for ProSe direct discovery or Prose direct communication (see 3GPP TS 36.331 [22]), then the UE shall set the "active" flag to 1 in the TRACKING AREA UPDATE REQUEST message.

...

For all cases except case b, if the UE supports ProSe direct discovery, then the UE shall set the ProSe bit to "ProSe supported" and set the ProSe direct discovery bit to "ProSe direct discovery supported" in the UE network capability IE of the TRACKING AREA UPDATE REQUEST message.

[TS 24.301, clause 5.6.1.1]

The purpose of the service request procedure is to transfer the EMM mode from EMM-IDLE to EMM-CONNECTED mode and establish the radio and S1 bearers when user data or signalling is to be sent. Another purpose of this procedure is to invoke MO/MT CS fallback or 1xCS fallback procedures.

This procedure is used when:

...

- the UE has to request resources for ProSe direct discovery or Prose direct communication.

...

The UE shall invoke the service request procedure when:

...

l) the UE in EMM-IDLE mode has to request resources for ProSe direct discovery or Prose direct communication (see 3GPP TS 36.331 [22]).

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

2) transferred between the UE and the ProSe Function over the PC3 interface with the ProSe Direct Services Provisioning Management Object or the ProSe Public Safety Direct Services Provisioning Management Object as specified in 3GPP TS 24.333 [9].

...

The service authorisation provided by the ProSe Function of the HPLMN for ProSe direct discovery contains a list of PLMNs in which the UE is authorised to use ProSe direct discovery.

...

The UE discovers the IP address of the ProSe Functions of the HPLMN as specified in subclause 5.1.2.

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 6.1.1]

The UE and ProSe Function shall use HTTP 1.1 as specified in IETF RFC 7230 [18] and IETF RFC 7231 [19] as the transport protocol for ProSe messages over the PC3 interface. The ProSe messages described here shall be included in the body of either an HTTP request message or an HTTP response message. The following rules apply:

- The UE initiates ProSe transactions with an HTTP request message containing the PC3 request(s);

- The ProSe Function responds to the requests with an HTTP response message containing the PC3 response(s) for the PC3 request(s); and

- HTTP POST methods are used for PC3 direct discovery procedures.

Optionally, the operator can configure the UE with configuration parameters for establishment of the PDN connection for reaching the HPLMN ProSe Function. If the UE is configured with the configuration parameter for establishment of the PDN connection for reaching the HPLMN ProSe Function (see 3GPP TS 24.333 [9]):

a) if a PDN connection for reaching the HPLMN ProSe Function is not established yet, the UE shall establish the PDN connection for reaching the HPLMN ProSe Function according to the UE configuration and shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function; and

b) if a PDN connection for reaching the HPLMN ProSe Function is already established (e.g. either due to other ProSe feature or due to other application), the UE shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function;

[TS 24.334, clause 6.2.2.2]

Before initiating the announce request procedure, the UE is configured with the data structure of the ProSe Application IDs appropriate for its HPLMN. This step is performed using mechanisms out of scope of 3GPP.

If the UE is authorised to perform ProSe direct discovery announcing in the registered PLMN, it shall initiate an announce request procedure:

a) when the UE is triggered by an upper layer application to announce a ProSe Application ID and the UE has no valid corresponding ProSe Application Code for that upper layer application;

b) when the validity timer T4000 assigned by the ProSe Function to a ProSe Application Code has expired and the request from upper layers to announce the ProSe Application ID corresponding to that ProSe Application Code is still in place; or

c) when the UE selects a new PLMN while announcing a ProSe Application Code and the UE is authorised for ProSe direct discovery announcing in the new PLMN.

When the UE selects a new PLMN while announcing a ProSe Application Code and the UE is not yet authorised for ProSe direct discovery announcing in the new PLMN, the UE shall initiate an announce request procedure only after the UE is authorised for ProSe direct discovery announcing in the new PLMN.

NOTE 1: To ensure service continuity if the UE needs to keep announcing a ProSe Application Code corresponding to the same ProSe Application ID, the UE can initiate the announce request procedure before the TTL timer T4000 assigned by the ProSe Function for a Prose Application Code expires.

The UE initiates the announce request procedure by sending a DISCOVERY_REQUEST message with a new transaction ID, the ProSe Application ID set to the ProSe Application ID received from upper layers, the command set to "announce", the UE identity set to the UE's IMSI, and the Application Identity set to the Application Identity of the upper layer application that requested the announcing.

NOTE 2: A UE can include one or multiple transactions in one DISCOVERY_REQUEST message for different ProSe Application IDs, and receive corresponding <response-announce> element or <response-reject> element in a DISCOVERY_RESPONSE message for each respective transaction. In the following description of the announce request procedure, only one transaction is included.

Figure 6.2.2.2.1 illustrates the interaction of the UE and the ProSe Function in the announce request procedure.

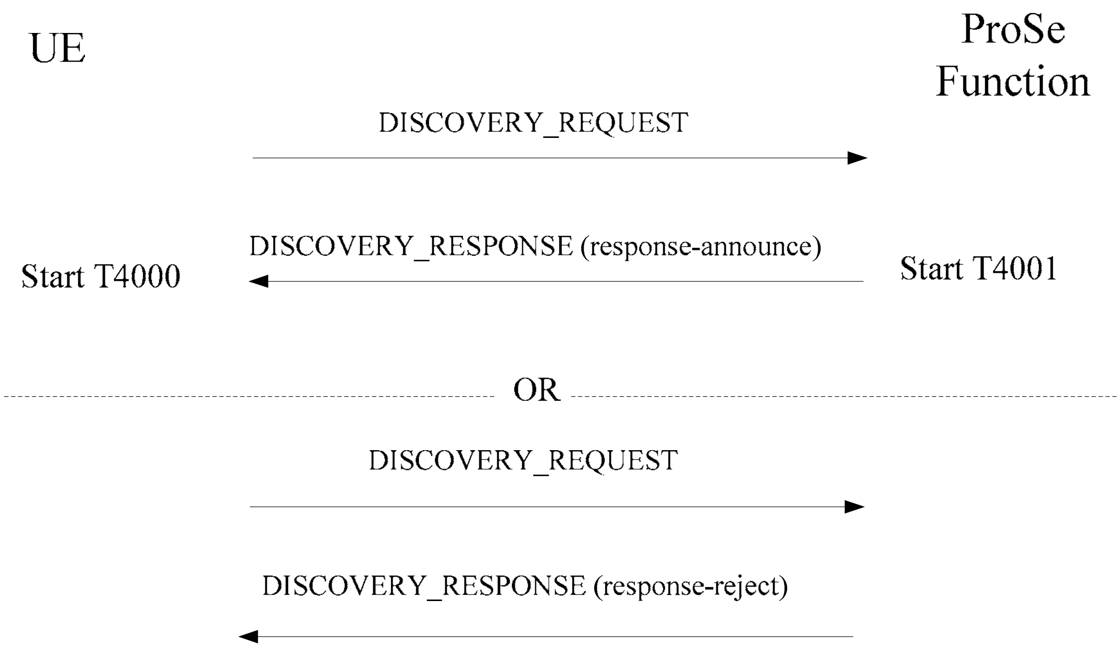

Figure 6.2.2.2.1: Announce request procedure

[TS 24.334, clause 6.2.2.4]

Upon receipt of the DISCOVERY_RESPONSE message, if the transaction ID contained in the <response-announce> element matches the value sent by the UE in a DISCOVERY_REQUEST message with the command set to "announce", the UE shall, for each ProSe Application Code received in the DISCOVERY_RESPONSE message, stop the validity timer T4000 if running and start the validity timer T4000 with the received value. Otherwise the UE shall discard the DISCOVERY_RESPONSE message and shall not perform the procedures below.

The UE may perform direct discovery announcing as described below.

The UE requests the parameters from the lower layers for Prose direct discovery announcing (see 3GPP TS 36.331 [12]). The UE shall perform direct discovery announcing only if the lower layers indicate that ProSe direct discovery is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct discovery announcing as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. The UE shall obtain the UTC time for the next discovery transmission opportunity for ProSe direct discovery from the lower layers.

If a valid UTC time is obtained, the UE shall generate the UTC-based counter corresponding to this UTC time as specified in subclause 12.2.2.18, and then use the UTC-based counter to compute the MIC field for the PC5_DISCOVERY message as described in 3GPP TS 33.303 [6].

The UE shall use the ProSe Application Code received in the DISCOVERY_RESPONSE message, along with the MIC and the four least significant bits of the UTC-based counter, in order to construct a PC5_DISCOVERY message, according to the format defined in subclause 11.2.5.

The UE then passes the PC5_DISCOVERY message to the lower layers for transmission if:

- the UE is currently authorised to perform direct discovery announcing in the registered PLMN;
- the validity timer T4000 for the allocated ProSe Application Code has not expired; and
- a request from upper layers to announce the ProSe Application ID associated with both the ProSe Application Code and the authorised Application Identity is still in place.

The UE shall ensure that it keeps on passing PC5_DISCOVERY messages to the lower layers for transmission until the validity timer T4000 of the ProSe Application Code expires. How this is achieved is left up to UE implementation.

During the announcing operation, if one of the above conditions is no longer met, the UE may instruct the lower layers to stop announcing. When the UE stops announcing, if the lower layers indicate that the UE is required to send a discovery indication to the eNodeB and the UE is in EMM-CONNECTED mode, the UE shall trigger the corresponding procedure in lower layers as specified in 3GPP TS 36.331 [12].

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink discovery and is configured by upper layers to receive or transmit sidelink discovery announcements on the primary frequency:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

[TS 36.331, clause 5.2.2.26]

Upon receiving *SystemInformationBlockType19*, the UE shall:

1> if *SystemInformationBlockType19* message includes the *discConfig*:

...

2> if *SystemInformationBlockType19* message includes the *discTxPoolCommon*; and the UE is in RRC_IDLE:

3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxPoolCommon* for sidelink discovery announcement, as specified in 5.10.6;

[TS 36.331, clause 5.3.3.1a]

For sidelink discovery an RRC connection is initiated only in the following case:

1> if configured by upper layers to transmit sidelink discovery announcements:

2> if *SystemInformationBlockType19* is broadcast by the cell on which the UE camps: and if the valid version of *SystemInformationBlockType19* does not include *discTxPoolCommon*;

NOTE: Upper layers initiate an RRC connection. The interaction with NAS is left to UE implementation.

[TS 36.331, clause 5.10.2.1]

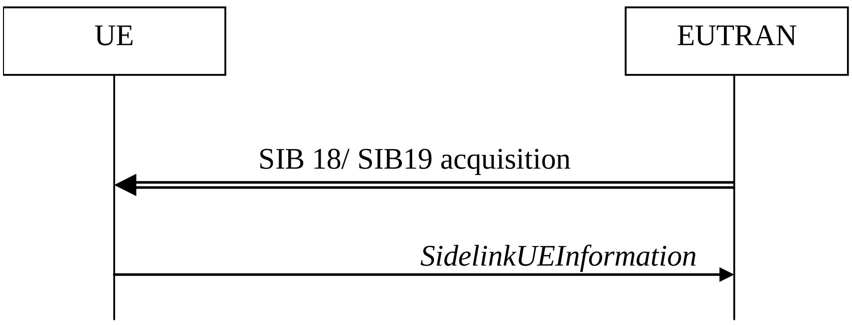

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

NOTE 1: A UE in RRC_IDLE that is configured to transmit sidelink communication/ discovery announcements, while *SystemInformationBlockType18*/ *SystemInformationBlockType19* does not include the resources for transmission (in normal conditions), initiates connection establishment in accordance with 5.3.3.1a.

Upon initiating the procedure, the UE shall:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType19* for the PCell;

...

2> if the UE is configured by upper layers to transmit sidelink discovery announcements:

3> if the UE did not transmit a *SidelinkUEInformation* message since entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *discTxResourceReq*; or if the sidelink discovery announcement resources required by the UE have changed (i.e. resulting in a change of *discTxResourceReq*) since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink discovery announcement resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discTxResourceReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it does no longer require sidelink discovery announcement resources in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

...

2> if the UE is configured by upper layers to transmit sidelink discovery announcements:

3> include *discTxResourceReq* and set it to indicate the number of discovery messages for sidelink discovery announcement(s) for which it requests E-UTRAN to assign dedicated resources;

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.6]

A UE capable of sidelink discovery that is configured by upper layers to transmit sidelink discovery announcements shall:

NOTE 1: In case the configured resources are insufficient it is up to UE implementation to decide which sidelink discovery announcements to transmit.

1> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable as defined in TS 36.304 [4]:

...

2> else if T300 is not running (i.e. UE in RRC_IDLE, announcing via serving cell):

3> if *SystemInformationBlockType19* of the serving cell includes *discTxPoolCommon*:

4> if *poolSelection* is set to *rsrpBased*:

5> select an entry of *discTxPoolCommon* for which RSRP measurement of the serving cell is in-between *threshLow* and *threshHigh*;

4> else:

5> randomly select, using a uniform distribution, an entry of *discTxPoolCommon*;

4> configure lower layers to transmit the sidelink discovery announcement using the selected pool of resources;

NOTE 2: When performing resource pool selection based on RSRP, the UE uses the latest results of the available measurements used for cell reselection evaluation in RRC_IDLE/ for measurement report triggering evaluation in RRC_CONNECTED, which are performed in accordance with the performance requirements specified in TS 36.133 [16].

[TS 36.331, clause 5.10.7.1]

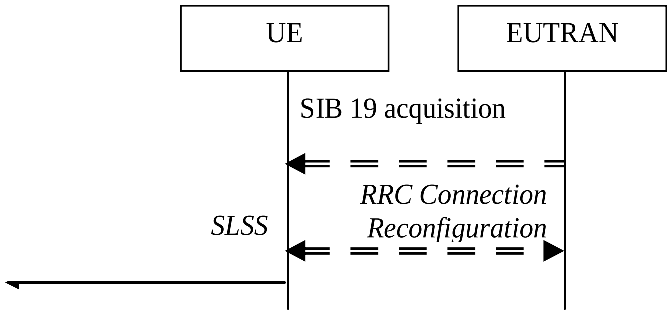

Figure 5.10.7.1-3: Synchronisation information transmission for sidelink discovery

The purpose of this procedure is to provide synchronisation information to a UE. The synchronisation information concerns a Sidelink Synchronisation Signal (SLSS) for sidelink discovery, while it concerns an SLSS, timing information and some additional configuration parameters (i.e. the *MasterInformationBlock-SL* message) for sidelink communication. A UE transmits synchronisation information either when E-UTRAN configures it to do so by dedicated signalling (i.e. network based), or when not configured by dedicated signalling (i.e. UE based) and E-UTRAN broadcasts (in coverage) or pre-configures a threshold (out of coverage).

The synchronisation information transmitted by the UE may be derived from information/ signals received from E-UTRAN (in coverage) or received from a UE acting as synchronisation reference for the transmitting UE. In the remainder, the UE acting as synchronisation reference is referred to as SyncRef UE.

[TS 36.331, clause 5.10.7.2]

A UE capable of SLSS transmission shall, when transmitting sidelink discovery announcements in accordance with 5.10.6 and when the following conditions are met:

1> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable as defined in TS 36.304 [4]:

...

2> if *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType19*; and the RSRP measurement of the serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is below the value of *syncTxThreshIC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21], unless the UE uses the selected subframe for regular uplink transmission;

[TS 36.331, clause 5.10.7.3]

The UE shall select the SLSSID and the subframe in which to transmit SLSS as follows:

1> if triggered by sidelink discovery announcement:

2> select the SLSSID included in the entry of *discSyncConfig* included in the received *SystemInformationBlockType19,* that includes *txParameters*;

2> use *syncOffsetIndicator* corresponding to the selected SLSSID;

2> for each pool used for the transmission of discovery announcements (each corresponding to the selected SLSSID):

3> if a subframe indicated by *syncOffsetIndicator* corresponds to the first subframe of the discovery transmission pool;

4> select the concerned subframe;

3> else

4> select the subframe indicated by *syncOffsetIndicator* that precedes and which, in time domain, is nearest to the first subframe of the discovery transmission pool;

19.2.2.3 Test description

19.2.2.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.2.2.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instant.

Table 19.2.2.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	HPLMN (PLMN1)
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_ANN} PLMN2: PLMN2 in USIM EF_{PROSE_ANN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_ANN}; MNC=03. Note 2: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 24 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells when *SystemInformationBlockType19* is transmitted. In all other cases System information combination 1 as defined in TS 36.508 [18] clause 4.4.3.1 shall be used.

- *SystemInformationBlockType19* is transmitted on all cells when they are active unless otherwise stated; the sidelink related resources in each instance are specified in the specific message content.

SS-UE

- SS-UE 1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Discovery Monitoring on the resources which the UE is expected to use for transmission (as specified in the relevant procedure steps in Table 19.2.2.3.2-1).

UE:

- ProSe related configuration
  - The UE is equipped with a USIM containing values shown in Table 19.2.2.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Discovery Announcing).

Table 19.2.2.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°1 (ProSe direct discovery parameters) supported
	Service n°5 (ProSe Direct Discovery announcing radio parameters) supported
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage

Depending on implementation, a Rel-12 UE may not support USIM settings for ProSe Direct Discovery Announcing (pc_disc_public_safety=FALSE, i.e. ProSe Discovery for Public Safety not supported) . Such UEs are expected to provide means for pre-configuring the PLMNs which are authorised for ProSe Direct Discovery Announcing (e.g. via MMI). The values specified for EF_{PROSE_ANN} in TS 36.508 [18], section 4.9.3.1 shall be preconfigured.

  - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 5min (For Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).
  - The UE is configured with the data structure of the ProSe Application ID (px_ProSeAnnApplicationIdentity1) it wants to announce (This step is performed using UE implementation dependent mechanisms, e.g. MMI command, or, may be pre-loaded in the UE).
  - The UE has no valid ProSe Application Code corresponding to the configured ProSe Application ID (px_ProSeAnnApplicationIdentity1).

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.2.2.3.2 Test procedure sequence

Table 19.2.2.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.2.2.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11	Comments
T0	Cell-specific RS EPRE	dBm/15kHz	-85	"Off"	"Off"	"Off"	Note 1
T1	Cell-specific RS EPRE	dBm/15kHz	"Off"	-85	"Off"	"Off"	

T2	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-79	"Off"	
T3	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-87	"Off"	Note 2
T4	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	"Off"	-79	
Note 1: The Cell power is set to satisfy the *SystemInformationBlockType19* pool settings (*discTxPoolCommon* set to *rsrpBasedUE*) Note 2: The Cell power is set to ensure that the RSRP measurement is below the value of *syncTxThreshIC* included in *SystemInformationBlockType19*.							

Table 19.2.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS configures: SS-NW Cell 1 **does not** broadcast *SystemInformationBlockType19*.	-	-	-	-
2	The UE is switched on.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 1.	-	-	-	-
3	Check: Does the UE announce its ProSe direct discovery capabilities? The Generic test procedure for 'UE Registration, UE Test Mode Activated (State 2A)' defined in TS 36.508 [18] clause 4.5.2A takes place.	-	-	1	P
4	Force the UE upper layer application corresponding to ProSe Application ID px_ProSeAnnApplicationIdentity1 to initiate continuous ProSe direct discovery announcing. NOTE: Although the UE is expected to transmit continuously, only the PC5_DISCOVERY messages which need to be checked are shown explicitly in the step sequence.	-	-	-	-
5	Check: Does the generic test procedure for 'Communication with the ProSe Function' with the condition ANNOUNCE/MONITOR REQUEST defined in TS 36.508 [18] subclause 4.5A.22 take place (UE performs Announce request procedure) in the next 5s?	-	-	2	F
6	SS-NW starts broadcasting *SystemInformationBlockType19* on Cell 1, no resources for Announcing are provided at this moment of time.	-	-	-	-
7	Wait for 2 modification periods to allow for the UE to obtain the new version of the *SystemInformationType19*.	-	-	-	-
8	Force the UE upper layer application corresponding to ProSe Application ID px_ProSeAnnApplicationIdentity1 to initiate continuous ProSe direct discovery announcing.	-	-	-	-
9	Check: Does the generic test procedure for 'Communication with the ProSe Function' with the condition ANNOUNCE/MONITOR REQUEST defined in TS 36.508 [18] subclause 4.5A.22 take place (UE performs Announce request procedure)?	-	-	3	P
10	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
11	SS-NW modifies the transmitted *SystemInformationBlockType19* on Cell 1 to provide resources for Direct discovery announcing, the *poolSelection* provided in the	-	-	-	-

	discTxPoolCommon is set to *rsrpBasedUE*.				
12	Wait for 2 modification periods to allow for the UE to obtain the new version of the *SystemInformationType19*.	-	-	-	-
-	EXCEPTION: Step 13 is repeated 3 times .	-	-	-	-
13	Check: Does the UE transmit in the next transmission period a PC5_DISCOVERY message containing the ProSe Application Code (provided in the DISCOVERY_RESPONSE in step 9) and utilising the resources configured in the *SystemInformationType19 transmitted on the serving cell*? NOTE: The UE uses for the transmission the DiscResourcePool entry in *discTxPoolCommon* for which RSRP measurement of the serving cell is in-between the set for that pool *threshLow* and *threshHigh (SystemInformationType19/discTxPoolCommon/ SL-DiscResourcePool-r12[1])*.	-->	PC5_DISCOVERY	4	P
14	Check: Does the UE transmit in the next3 transmission periods a PC5_DISCOVERY message containing the ProSe Application Code (provided in the DISCOVERY_RESPONSE in step 9) and utilising the resources configured in the *SystemInformationType19 transmitted on the serving cell*? NOTE: The UE uses for the transmission the DiscResourcePool entry in *discTxPoolCommon* for which RSRP measurement of the serving cell is NOT in-between the set in that pool *threshLow* and *threshHigh (SystemInformationType19/discTxPoolCommon/ SL-DiscResourcePool-r12[2])*.	-->	PC5_DISCOVERY	4	F
15	The SS configures: SS-NW Cell 1 and Cell 2 parameters according to the row "T1" in table 19.2.2.3.2-0. Cell 2 broadcasts *SystemInformationBlockType19* with the *poolSelection* provided in the *discTxPoolCommon* is NOT set to *rsrpBasedUE*.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 2.	-	-	-	-
16	Check: Does the generic test procedure for 'Communication with the ProSe Function' with the condition ANNOUNCE/MONITOR REQUEST defined in TS 36.508 [18] subclause 4.5A.22A take place (UE performs Announce request procedure) in the next 5 sec?	-	-	5	F
-	EXCEPTION: Step 17 is repeated 3 times .	-	-	-	-
17	Check: Does the UE transmit in the next transmission period a PC5_DISCOVERY message containing the ProSe Application Code (provided in the DISCOVERY_RESPONSE in step 9) and utilising the resources configured in the *SystemInformationType19 transmitted on the serving cell*(2 transmission pools; the pool to be used for transmission is to be chosen by the UE randomly)?	-->	PC5_DISCOVERY	5	P

18	The SS configures: SS-NW Cell 2 and Cell 4 parameters according to the row "T 2" in table 19.2.2.3.2-0.. Cell 4 broadcasts *SystemInformationBlockType19* providing different resources for Announcing than those provided on Cell 2. In addition to all other settings the *syncTxThreshIC* is included in the *SystemInformationBlockType19* Note: The Power level of Cell 4 is such that it is ensured that the RSRP measurement of the serving cell is NOT below the value of *syncTxThreshIC* included in *SystemInformationBlockType19*.	-	-	-	-
-	EXCEPTION: The following events unless otherwise stated are to be observed in Cell 4.	-	-	-	-
19	Check: Does the UE announce its ProSe direct discovery capabilities? The Generic test procedure for 'Tracking area updating procedure' defined in TS 36.508 [18] clause 4.5A.2 takes place.	-	-	1	P
20	Check: Does the generic test procedure for 'Communication with the ProSe Function' with the condition ANNOUNCE/MONITOR REQUEST defined in TS 36.508 [18] subclause 4.5A.22A take place (UE performs Announce request procedure)?	-	-	6	P
21	SS-NW starts a timer=T4000 (the value of T4000 is provided in the DISCOVERY_RESPONSE message sent in the procedure taking place in step 20; the expiry of this timer takes place in step 25)	-	-	-	-
22	The SS-NW releases the connection.	<--	*RRCConnectionRelease*	-	-
-	EXCEPTION: Step 23 is repeated 3 times .	-	-	-	-
23	Check: Does the UE transmit in the next transmission period a PC5_DISCOVERY message containing the ProSe Application Code (provided in the DISCOVERY_RESPONSE in step 18) and utilising the resources configured in the *SystemInformationType19* transmitted on the serving cell *(SystemInformationType19/discTxPoolCommon/ SL-DiscResourcePool-r12[2])*?	-->	PC5_DISCOVERY	6	P
-	EXCEPTION: Steps 24a1 - 24a3 describe behaviour that depends on UE capabilities; the "lower case letter" identifies a step sequence that take place if the UE is capable of SLSS transmission.	-	-	-	-
24a1	IF pc_discSLSS THEN Check: Does the UE transmit SLSS in the next3transmission periods? NOTE: The Power level of Cell 4 is such that it is ensured that the RSRP measurement of the serving cell is NOT below the value of *syncTxThreshIC* included in *SystemInformationBlockType19*.	-	SLSS	7	F
24a2	The SS configures: SS-NW Cell 4 parameters according to the row "T 3" in table 19.2.2.3.2-0. Note: RSRP measurement of Cell 4 (the serving cell) is below the value of	-	-	-	-

	syncTxThreshIC included in *SystemInformationBlockType19*.				
-	EXCEPTION: Step 24a3 is repeated 3 times.	-	-	-	-

19.2.3 ProSe Direct Discovery Announcing/Pre-configured authorisation / Announcing and SLSS transmission in RRC_CONNECTED / RRC connection reconfiguration with/without the *mobilityControlInfo* / RRC connection re-establishment

19.2.3.1 Test Purpose (TP)

(1)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE is in RRC_CONNECTED, **and**, UE is configured with *discTxResources* set to *scheduled* }
    then { UE is able to transmit the sidelink discovery announcement using the assigned/configured resources in Cell1/f1/PLMN1 }
            }

(2)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE is in RRC_CONNECTED, **and**, UE is configured with *discTxResources* set to *ue-Selected* and *poolSelection* within *poolToAddModList* is set to *rsrpBased* }
    then { UE is able to transmit the sidelink discovery announcement using the assigned/configured resources in Cell1/f1/PLMN1 selecting for the transmission an entry of *poolToAddModList* for which the RSRP measurement of the PCell, after applying the layer 3 filter defined by *quantityConfig* is in-between *threshLow* and *threshHigh* }
            }

(3)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message not including the *mobilityControlInfo* which includes the *sl-DiscConfig* and *discTxResources* set to *release* }
    then { UE release the resources allocated for sidelink discovery announcement previously assigned/configured in Cell1/f1/PLMN1 by *discTxResources* from the next discovery period, as defined by *discPeriod*, and, UE re-starts announcing when resources become available }
            }

(3A)

with { UE being authorised for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE receives a request from upper layers to stop sidelink discovery announcement }
    then { the UE transmits a *SidelinkUEInformation* message indicating it does no longer require sidelink discovery announcement resources, and, stops sidelink discovery announcement on Cell1/f1/PLMN1 }
            }

(4)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo* and *sl-DiscConfig* less than 1 sec after the UE transmitted a *SidelinkUEInformation* message including *discRxInterest* on Cell1/f1/PLMN1, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell2/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* }
    then { UE does not initiate a new Announce request procedure, **and**, transmits a *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, and, is able to transmit sidelink discovery announcements using the assigned/configured resources in Cell2/f1/PLMN1 }
            }

(5)

with { UE being authorised for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell2/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE detects radio link failure >1 sec after the UE transmitted a *SidelinkUEInformation* message including *discRxInterest* on Cell2/f1/PLMN1, **and**, UE completes RRC connection re-establishment on Cell1/f1/PLMN1 }
    then { UE does not initiate a new Announce request procedure, **and**, does not transmit a *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, continue announcing on Cell1/f1/PLMN1 }
            }

(6)

with { UE being authorised for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell1/f1/PLMN1 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo* (handover), **and**, MAC successfully completes the random access procedure to the targeted PCell Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* }
then { UE initiates and successfully completes an Announce request procedure including the transmission of SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery announcements }
}

(7)

with { UE capable of SLSS transmission, **and**, being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE is in RRC_CONNECTED, **and**, *networkControlledSyncTx* is configured and set to *on* }
then { UE transmits SLSS }
}

(8)

with { UE capable of SLSS transmission, **and**, being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE is in RRC_CONNECTED, **and**, *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType19,* and, the RSRP measurement of the serving cell is below the value of *syncTxThreshIC* }
then { UE transmits SLSS }
}

(9)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell4/f1/PLMN2 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements, **and**, the timer T4000 associated with the ProSe Application Code allocated during the procedure has not expired }
ensure that {
when { UE receives *RRCConnectionReconfiguration* message including *mobilityControlInfo*, **and**, MAC successfully completes the random access procedure to the targeted PCell Cell11/f1/PLMN3 which is broadcasting *SystemInformationBlockType19* }
then { UE does not initiates an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of transmission resources for sidelink discovery announcements **and**, does not announce over the PC5 in the assigned resources in Cell11/f1/PLMN3 }
}

(10)

with { UE being authorized for performing ProSe Direct Discovery Announcing in two PLMNs (PLMN1 and PLMN2) operating on the same frequency, **and**, UE attached to Cell11/f1/PLMN3 which is broadcasting *SystemInformationBlockType19* indicating the provision of resources for sidelink discovery announcement on the serving PLMN, **and**, UE has previously successfully completed an Announce request procedure including the transmission of *SidelinkUEInformation* message to request assignment of

```
transmission resources for sidelink discovery announcements, and, the timer T4000 associated with
the ProSe Application Code allocated during the procedure has not expired }
ensure that {
  when { UE receives RRCConnectionReconfiguration message including mobilityControlInfo, and, MAC
successfully completes the random access procedure to the targeted PCell Cell1/f1/PLMN1 which is NOT
broadcasting SystemInformationBlockType19 }
    then { UE does not initiates an Announce request procedure including the transmission of
SidelinkUEInformation message to request assignment of transmission resources for sidelink discovery
announcements and, does not announce over the PC5 in the assigned resources in Cell1/f1/PLMN1 }
            }
```

19.2.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.303, clause 5.3.1.1, TS 24.334, clauses 5.1.1, 5.1.2, 6.1.1, 6.2.2.2, 6.2.2.4, TS 36.331, clauses 5.2.2.4, 5.3.3.1a, 5.3.5.3, 5.3.5.4, 5.3.7.5, 5.3.10.15, 5.10.2.1, 5.10.2.2, 5.10.2.3, 5.10.6, 5.10.7.1, 5.10.7.2, 5.10.7.3. Unless otherwise stated these are Rel-12 requirements.

[TS 23.303, clause 5.3.1.1]

The UE can act as "announcing UE" only in the band designated by the serving PLMN but may act as a "monitoring" UE also in the resources of the serving PLMN and Local PLMNs.

ProSe-enabled UEs which have obtained authorization to participate in ProSe Direct Discovery procedures shall not continue in participating in ProSe Direct Discovery procedures as soon as they detect loss of E-UTRA coverage in the serving PLMN.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery announcing or ProSe direct discovery monitoring or both, and to use ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

2) transferred between the UE and the ProSe Function over the PC3 interface with the ProSe Direct Services Provisioning Management Object or the ProSe Public Safety Direct Services Provisioning Management Object as specified in 3GPP TS 24.333 [9].

...

The service authorisation provided by the ProSe Function of the HPLMN for ProSe direct discovery contains a list of PLMNs in which the UE is authorised to use ProSe direct discovery.

...

The UE discovers the IP address of the ProSe Functions of the HPLMN as specified in subclause 5.1.2.

[TS 24.334, clause 5.1.2]

The IP address of the ProSe function in the HPLMN may be pre-configured in the UE and in this case, the UE may use the pre-configured IP address. Alternatively, the FQDN of the ProSe Function in the HPLMN may be self-constructed by the UE, i.e. derived from the PLMN ID of the HPLMN. The UE may perform DNS lookup as specified in IETF RFC 1035 [10].

[TS 24.334, clause 6.1.1]

The UE and ProSe Function shall use HTTP 1.1 as specified in IETF RFC 7230 [18] and IETF RFC 7231 [19] as the transport protocol for ProSe messages over the PC3 interface. The ProSe messages described here shall be included in the body of either an HTTP request message or an HTTP response message. The following rules apply:

- The UE initiates ProSe transactions with an HTTP request message containing the PC3 request(s);

- The ProSe Function responds to the requests with an HTTP response message containing the PC3 response(s) for the PC3 request(s); and

- HTTP POST methods are used for PC3 direct discovery procedures.

Optionally, the operator can configure the UE with configuration parameters for establishment of the PDN connection for reaching the HPLMN ProSe Function. If the UE is configured with the configuration parameter for establishment of the PDN connection for reaching the HPLMN ProSe Function (see 3GPP TS 24.333 [9]):

a) if a PDN connection for reaching the HPLMN ProSe Function is not established yet, the UE shall establish the PDN connection for reaching the HPLMN ProSe Function according to the UE configuration and shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function; and

b) if a PDN connection for reaching the HPLMN ProSe Function is already established (e.g. either due to other ProSe feature or due to other application), the UE shall send the HTTP request message via the PDN connection for reaching the HPLMN ProSe Function;

[TS 24.334, clause 6.2.2.2]

Before initiating the announce request procedure, the UE is configured with the data structure of the ProSe Application IDs appropriate for its HPLMN. This step is performed using mechanisms out of scope of 3GPP.

If the UE is authorised to perform ProSe direct discovery announcing in the registered PLMN, it shall initiate an announce request procedure:

a) when the UE is triggered by an upper layer application to announce a ProSe Application ID and the UE has no valid corresponding ProSe Application Code for that upper layer application;

b) when the validity timer T4000 assigned by the ProSe Function to a ProSe Application Code has expired and the request from upper layers to announce the ProSe Application ID corresponding to that ProSe Application Code is still in place; or

c) when the UE selects a new PLMN while announcing a ProSe Application Code and the UE is authorised for ProSe direct discovery announcing in the new PLMN.

When the UE selects a new PLMN while announcing a ProSe Application Code and the UE is not yet authorised for ProSe direct discovery announcing in the new PLMN, the UE shall initiate an announce request procedure only after the UE is authorised for ProSe direct discovery announcing in the new PLMN.

NOTE 1: To ensure service continuity if the UE needs to keep announcing a ProSe Application Code corresponding to the same ProSe Application ID, the UE can initiate the announce request procedure before the TTL timer T4000 assigned by the ProSe Function for a Prose Application Code expires.

The UE initiates the announce request procedure by sending a DISCOVERY_REQUEST message with a new transaction ID, the ProSe Application ID set to the ProSe Application ID received from upper layers, the command set to "announce", the UE identity set to the UE's IMSI, and the Application Identity set to the Application Identity of the upper layer application that requested the announcing.

NOTE 2: A UE can include one or multiple transactions in one DISCOVERY_REQUEST message for different ProSe Application IDs, and receive corresponding <response-announce> element or <response-reject> element in a DISCOVERY_RESPONSE message for each respective transaction. In the following description of the announce request procedure, only one transaction is included.

Figure 6.2.2.2.1 illustrates the interaction of the UE and the ProSe Function in the announce request procedure.

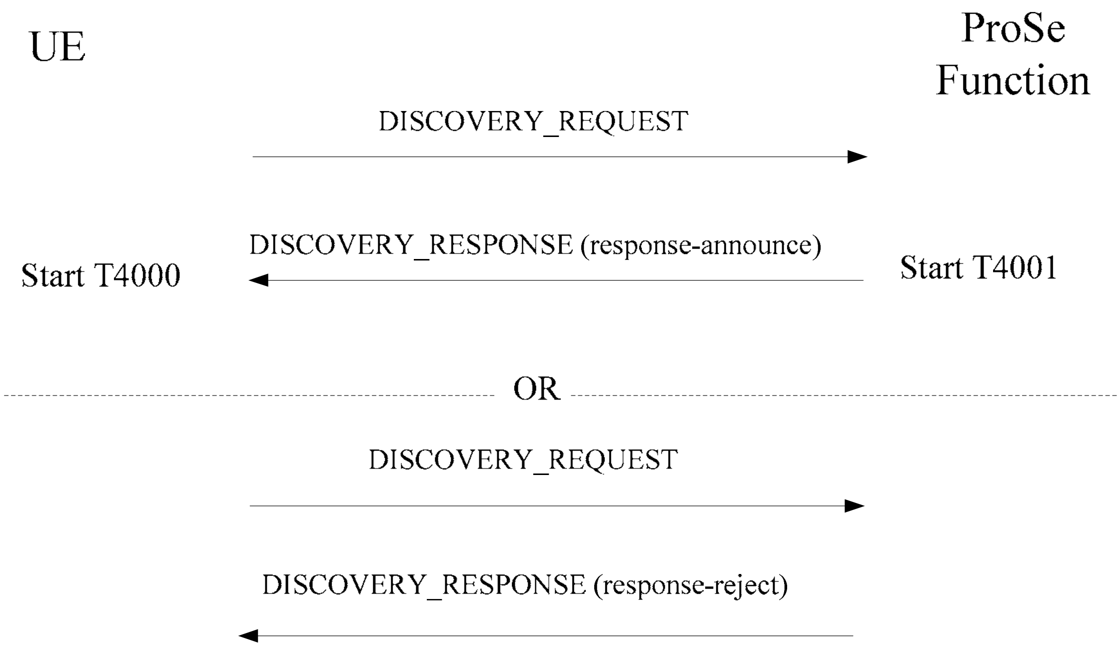

Figure 6.2.2.2.1: Announce request procedure

[TS 24.334, clause 6.2.2.4]

Upon receipt of the DISCOVERY_RESPONSE message, if the transaction ID contained in the <response-announce> element matches the value sent by the UE in a DISCOVERY_REQUEST message with the command set to "announce", the UE shall, for each ProSe Application Code received in the DISCOVERY_RESPONSE message, stop the validity timer T4000 if running and start the validity timer T4000 with the received value. Otherwise the UE shall discard the DISCOVERY_RESPONSE message and shall not perform the procedures below.

The UE may perform direct discovery announcing as described below.

The UE requests the parameters from the lower layers for Prose direct discovery announcing (see 3GPP TS 36.331 [12]). The UE shall perform direct discovery announcing only if the lower layers indicate that ProSe direct discovery is supported by the network. If the UE in EMM-IDLE mode has to request resources for ProSe direct discovery announcing as specified in 3GPP TS 36.331 [12], the UE shall perform a service request procedure or tracking area update procedure as specified in 3GPP TS 24.301 [11]. The UE shall obtain the UTC time for the next discovery transmission opportunity for ProSe direct discovery from the lower layers.

If a valid UTC time is obtained, the UE shall generate the UTC-based counter corresponding to this UTC time as specified in subclause 12.2.2.18, and then use the UTC-based counter to compute the MIC field for the PC5_DISCOVERY message as described in 3GPP TS 33.303 [6].

The UE shall use the ProSe Application Code received in the DISCOVERY_RESPONSE message, along with the MIC and the four least significant bits of the UTC-based counter, in order to construct a PC5_DISCOVERY message, according to the format defined in subclause 11.2.5.

The UE then passes the PC5_DISCOVERY message to the lower layers for transmission if:

- the UE is currently authorised to perform direct discovery announcing in the registered PLMN;
- the validity timer T4000 for the allocated ProSe Application Code has not expired; and
- a request from upper layers to announce the ProSe Application ID associated with both the ProSe Application Code and the authorised Application Identity is still in place.

The UE shall ensure that it keeps on passing PC5_DISCOVERY messages to the lower layers for transmission until the validity timer T4000 of the ProSe Application Code expires. How this is achieved is left up to UE implementation.

During the announcing operation, if one of the above conditions is no longer met, the UE may instruct the lower layers to stop announcing. When the UE stops announcing, if the lower layers indicate that the UE is required to send a discovery indication to the eNodeB and the UE is in EMM-CONNECTED mode, the UE shall trigger the corresponding procedure in lower layers as specified in 3GPP TS 36.331 [12].

[TS 36.331, clause 5.2.2.4]

1> if the UE is capable of sidelink discovery and is configured by upper layers to receive or transmit sidelink discovery announcements on the primary frequency:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

[TS 36.331, clause 5.3.3.1a]

For sidelink discovery an RRC connection is initiated only in the following case:

1> if configured by upper layers to transmit sidelink discovery announcements:

2> if *SystemInformationBlockType19* is broadcast by the cell on which the UE camps: and if the valid version of *SystemInformationBlockType19* does not include *discTxPoolCommon*;

NOTE: Upper layers initiate an RRC connection. The interaction with NAS is left to UE implementation.

[TS 36.331, clause 5.3.5.3]

If the *RRCConnectionReconfiguration* message does not include the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

...

1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:

2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;

...

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission using the new configuration, upon which the procedure ends;

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

...

1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:

2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;

...

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;

1> if MAC successfully completes the random access procedure:

...

2> if *SystemInformationBlockType19* is broadcast by the target PCell; and the UE transmitted a *SidelinkUEInformation* message including *discRxInterest* or *discTxResourceReq* during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*:

3> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.3.7.5]

NOTE 1: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> stop timer T301;

1> consider the current cell to be the PCell;

1> re-establish PDCP for SRB1;

1> re-establish RLC for SRB1;

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10;

1> resume SRB1;

...

1> if *SystemInformationBlockType19* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message including *discRxInterest* or *discTxResourceReq* during the last 1 second preceding detection of radio link failure:

2> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;

[TS 36.331, clause 5.3.10.15]

The UE shall:

...

1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig*:

2> if *discTxResources* is included and set to *setup*:

3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxResources* for sidelink discovery announcement, as specified in 5.10.6;

2> else if *discTxResources* is included and set to *release*:

3> from the next discovery period, as defined by *discPeriod*, release the resources allocated for sidelink discovery announcement previously configured by *discTxResources*;

[TS 36.331, clause 5.10.2.1]

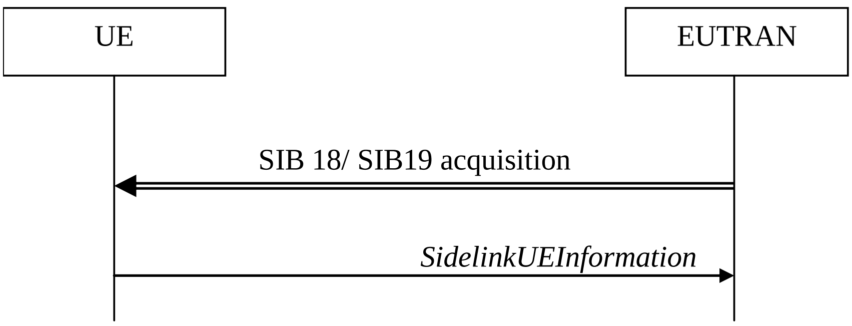

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements.

[TS 36.331, clause 5.10.2.2]

A UE capable of sidelink communication or discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19*. A UE capable of sidelink communication or discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements.

NOTE 1: A UE in RRC_IDLE that is configured to transmit sidelink communication/ discovery announcements, while *SystemInformationBlockType18*/ *SystemInformationBlockType19* does not include the resources for transmission (in normal conditions), initiates connection establishment in accordance with 5.3.3.1a.

Upon initiating the procedure, the UE shall:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType19* for the PCell;

...

2> if the UE is configured by upper layers to transmit sidelink discovery announcements:

3> if the UE did not transmit a *SidelinkUEInformation* message since entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *discTxResourceReq*; or if the sidelink discovery announcement resources required by the UE have changed (i.e. resulting in a change of *discTxResourceReq*) since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink discovery announcement resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discTxResourceReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it does no longer require sidelink discovery announcement resources in accordance with 5.10.2.3;

[TS 36.331, clause 5.10.2.3]

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

...

1> if *SystemInformationBlockType19* is broadcast by the PCell:

...

2> if the UE is configured by upper layers to transmit sidelink discovery announcements:

3> include *discTxResourceReq* and set it to indicate the number of discovery messages for sidelink discovery announcement(s) for which it requests E-UTRAN to assign dedicated resources;

The UE shall submit the *SidelinkUEInformation* message to lower layers for transmission.

[TS 36.331, clause 5.10.6]

A UE capable of sidelink discovery that is configured by upper layers to transmit sidelink discovery announcements shall:

NOTE 1: In case the configured resources are insufficient it is up to UE implementation to decide which sidelink discovery announcements to transmit.

1> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable as defined in TS 36.304 [4]:

2> if the UE is in RRC_CONNECTED (i.e. PCell is used for sidelink discovery announcement):

3> if the UE is configured with *discTxResources* set to *scheduled*:

4> configure lower layers to transmit the sidelink discovery announcement using the assigned resources indicated by *scheduled* in *discTxResources*;

3> else if the UE is configured with *discTxPoolDedicated* (i.e. *discTxResources* set to *ue-Selected*):

4> if *poolSelection* within *poolToAddModList* is set to *rsrpBased*:

5> select an entry of *poolToAddModList* for which the RSRP measurement of the PCell, after applying the layer 3 filter defined by *quantityConfig* as specified in 5.5.3.2 , is in-between *threshLow* and *threshHigh*;

4> else:

5> randomly select, using a uniform distribution, an entry of *poolToAddModList*;

4> configure lower layers to transmit the sidelink discovery announcement using the selected pool of resources:

[TS 36.331, clause 5.10.7.1]

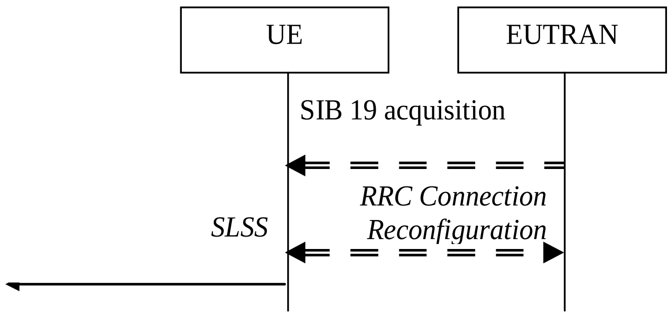

Figure 5.10.7.1-3: Synchronisation information transmission for sidelink discovery

The purpose of this procedure is to provide synchronisation information to a UE. The synchronisation information concerns a Sidelink Synchronisation Signal (SLSS) for sidelink discovery, while it concerns an SLSS, timing information and some additional configuration parameters (i.e. the *MasterInformationBlock-SL* message) for sidelink communication. A UE transmits synchronisation information either when E-UTRAN configures it to do so by dedicated signalling (i.e. network based), or when not configured by dedicated signalling (i.e. UE based) and E-UTRAN broadcasts (in coverage) or pre-configures a threshold (out of coverage).

The synchronisation information transmitted by the UE may be derived from information/ signals received from E-UTRAN (in coverage) or received from a UE acting as synchronisation reference for the transmitting UE. In the remainder, the UE acting as synchronisation reference is referred to as SyncRef UE.

[TS 36.331, clause 5.10.7.2]

A UE capable of SLSS transmission shall, when transmitting sidelink discovery announcements in accordance with 5.10.6 and when the following conditions are met:

1> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable as defined in TS 36.304 [4]:

2> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*; or

2> if *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType19*; and the RSRP measurement of the serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is below the value of *syncTxThreshIC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21], unless the UE uses the selected subframe for regular uplink transmission;

[TS 36.331, clause 5.10.7.3]

The UE shall select the SLSSID and the subframe in which to transmit SLSS as follows:

1> if triggered by sidelink discovery announcement:

2> select the SLSSID included in the entry of *discSyncConfig* included in the received *SystemInformationBlockType19*, that includes *txParameters*;

2> use *syncOffsetIndicator* corresponding to the selected SLSSID;

2> for each pool used for the transmission of discovery announcements (each corresponding to the selected SLSSID):

3> if a subframe indicated by *syncOffsetIndicator* corresponds to the first subframe of the discovery transmission pool;

4> select the concerned subframe;

3> else

4> select the subframe indicated by *syncOffsetIndicator* that precedes and which, in time domain, is nearest to the first subframe of the discovery transmission pool;

19.2.3.3 Test description

19.2.3.3.1 Pre-test conditions

System Simulator:

SS-NW

- 4 cells with parameters defined in Table 19.2.3.3.1-1.

NOTE: The test only requires at maximum 2 cells to be active at any one instant.

Table 19.2.3.3.1-1: Cell parameters values

Cell	Frequency	PLMN
1	f1	HPLMN (PLMN1)
2	f1	HPLMN (PLMN1)
4	f1	PLMN2
11	f1	PLMN3
Note 1: PLMN1: PLMN1 in USIM EF_{PROSE_ANN} PLMN2: PLMN2 in USIM EF_{PROSE_ANN} PLMN3: MCC = MCC of PLMN1 in USIM EF_{PROSE_ANN}; MNC=03. Note 2: A single frequency has been chosen for all PLMNs to allow the TC to be applicable even for UEs supporting a single band which comprises a single frequency.		

- System information combination 24 as defined in TS 36.508 [18] clause 4.4.3.1 is used in all active cells.

SS-UE

- SS-UE 1.

- As defined in TS 36.508 [18], configured and operating for/as ProSe Direct Discovery Monitoring on the resources which the UE is expected to use for transmission (as specified in the relevant procedure steps in Table 19.2.3.3.2-1).

UE:

- ProSe related configuration
  - The UE is equipped with a USIM containing values shown in Table 19.2.3.3.1-2, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. 2 PLMNs are authorised for ProSe Direct Discovery Announcing).

Table 19.2.3.3.1-2: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°1 (ProSe direct discovery parameters) supported
	Service n°5 (ProSe Direct Discovery announcing radio parameters) supported
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage

Depending on implementation, a Rel-12 UE may not support USIM settings for ProSe Direct Discovery Announcing (pc_disc_public_safety=FALSE, i.e. ProSe Discovery for Public Safety not supported) . Such UEs are expected to provide means for pre-configuring the PLMNs which are authorised for ProSe Direct Discovery Announcing (e.g. via MMI). The values specified for EF_{PROSE_ANN} in TS 36.508 [18], section 4.9.3.1 shall be preconfigured.

  - For each PLMN a timer T4005 is assigned long enough not to expire before the TC is completed, e.g. 5min (For Rel-12 this timer cannot be set in the USIM, it is expected that the UE shall provide means for setting the timer e.g. via MMI).
  - The UE is configured with the data structure of the ProSe Application ID (px_ProSeAnnApplicationIdentity1) it wants to announce (This step is performed using UE implementation dependent mechanisms, e.g. MMI command, or, may be pre-loaded in the UE).
  - The UE has no valid ProSe Application Code corresponding to the configured ProSe Application ID (px_ProSeAnnApplicationIdentity1).

Preamble:

- The UE is in state Generic Radio Bearer Established (State 3) according to TS 36.508 [18] on Cell 1.

19.2.3.3.2 Test procedure sequence

Table 19.2.3.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1" ... "Tn" are to be applied subsequently. The exact instants on which these values shall be applied are described elsewhere in the present clause.

Table 19.2.3.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Cell 4	Cell 11
T0	Cell-specific RS EPRE	dBm/15k Hz	-85	-91	"Off"	"Off"
T1	Cell-specific RS EPRE	dBm/15k Hz	-85	-77	"Off"	"Off"
T2	Cell-specific RS EPRE	dBm/15k Hz	-85	"Off"	"Off"	"Off"
T3	Cell-specific RS EPRE	dBm/15k Hz	-85	"Off"	-77	"Off"
T4	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	-87	"Off"

T5	Cell-specific RS EPRE	dBm/15k Hz	"Off"	"Off"	"Off"	-79
T6	Cell-specific RS EPRE	dBm/15k Hz	-79	"Off"	"Off"	-85

19.2.6 One-to-many ProSe direct communication/Pre-configured authorisation/Off-network / ProSe Direct Discovery for public safety use / Announcing UE procedure for group member discovery

19.2.6.1 Test Purpose (TP)

(1)

```
with { ProSe-enabled public safety UE being authorized for performing ProSe Direct Communication
being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a
geographical area, and, UE out of coverage on the frequency used for sidelink communication and
within the pre-set geographical area }
ensure that {
  when { When the UE is triggered by an upper layer application to announce availability in a
discovery group }
    then { UE continuously announces its availability in the discovery group to other ProSe-enabled
public safety UEs applying full protection on the discovery messages over PC5 utilising DUSK), DUCK
and DUIK }
            }
```

19.2.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 10A.2.1, 10A.2.1A, 10A.2.6.1, 10A.2.6.2, TS 33.303, clauses 6.6.3.1, 6.6.3.2, 6.6.7. Unless otherwise stated these are Rel-13 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery and ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured

service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 10A.2.1]

The following procedures are defined for the ProSe direct discovery for public safety use:

...

- announcing UE procedure for group member discovery;

- monitoring UE procedure for group member discovery;

...

Each ProSe-enabled Public Safety UE needs to obtain the security parameters from the ProSe Key Management Function before participating in ProSe direct discovery for public safety use, as specified in 3GPP TS 33.303 [6]. For each given Relay Service Code in UE-to-network relay discovery or Discovery Group ID in group member discovery, the ProSe Key Management Function (PKMF) will provide the following in the security parameters:

- PSDK (Public Safety Discovery Key) and the associated Expiry Time for this PSDK;

- configurations to signal which combination of keys to be used for the discovery process; and

- optionally, if DUCK is to be used, an indication of which PC5_DISCOVERY message fields shall be protected by the DUCK.

After receiving the PSDK from the PKMF for the relay service or discovery group, the UE shall use it to derive specific DUIK, DUCK and DUSK needed to protect the ProSe direct discovery messages for the corresponding public safety use, as specified in 3GPP TS 33.303 [6].

[TS 24.334, clause 10A.2.1A]

The UE shall select the radio resource parameters to be used for ProSe direct discovery as follows:

...

- when the UE is not served by E-UTRAN or when the UE is served by E-UTRAN and intends to use the provisioned ProSe radio resources (i.e. carrier frequency):

  1) if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, then the UE shall search for a cell with any PLMN operating the selected provisioned radio resources (i.e. carrier frequency) associated with that geographical area, and:

     ...

     iii) if the UE does not find any such cell in any PLMN, then the UE shall use the provisioned radio resource parameters; or

  2) else the UE shall not initiate ProSe direct discovery.

[TS 24.334, clause 10A.2.6.1]

The purpose of the announcing UE procedure for group member discovery is to enable a ProSe-enabled public safety UE to announce availability in a discovery group to other ProSe-enabled public safety UEs, upon a request from upper layers as defined in 3GPP TS 23.303 [2].

[TS 24.334, clause 10A.2.6.2]

The UE is authorised to perform the announcing UE procedure for group member discovery if:

a) the following is true:

   1) the UE is not served by E-UTRAN, is authorised to perform ProSe direct discovery for public safety use announcing when the UE is not served by E-UTRAN as specified in clause 5, and is configured with the radio parameters to be used for ProSe direct discovery for public safety use when not served by E-UTRAN;

...

Figure 10A.2.6.2.1 illustrates the interaction of the UEs in the announcing UE procedure for group member discovery.

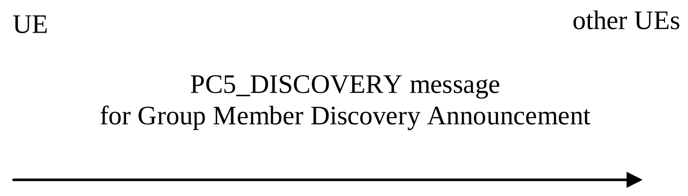

Figure 10A.2.6.2.1: Announcing UE procedure for group member discovery

When the UE is triggered by an upper layer application to announce availability in a discovery group, if the UE is authorised to perform the announcing UE procedure for group member discovery, then the UE:

...

b) shall obtain a valid UTC time for the discovery transmission from the lower layers and generate the UTC-based counter corresponding to this UTC time as specified in subclause 12.2.2.18;

c) shall generate a PC5_DISCOVERY message for Group Member Discovery Announcement according to subclause 11.2.5.1. In the PC5_DISCOVERY message for Group Member Discovery Announcement, the UE:

   1) shall set the ProSe UE ID to the Layer 2 ID used for unicast communication configured in clause 5;

   2) shall set the Announcer Info parameter to the User Info ID for the group member discovery parameter, configured in clause 5;

   3) shall set the Discovery Group ID parameter to the Discovery Group ID parameter identifying the discovery group to be announced, configured in clause 5; and

   4) shall set the UTC-based counter LSB parameter to include the eight least significant bits of the UTC-based counter;

d) shall apply the DUIK, DUSK, or DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message for whichever security mechanism(s) configured to be applied, e.g., integrity protection, message scrambling or confidentiality protection of one or more above parameters, as specified in 3GPP TS 33.303 [6]; and

e) shall pass the resulting PC5_DISCOVERY message for Group Member Discovery Announcement to the lower layers for transmission over the PC5 interface with an indication that the message is for public safety use.

The UE shall ensure that it keeps on passing the same PC5_DISCOVERY message and the indication that the message is for public safety use to the lower layers for transmission until the UE is triggered by an upper layer application to stop announcing availability in a discovery group, or until the UE stops being authorised to perform the announcing UE procedure for group member discovery. How this is achieved is left up to UE implementation.

[TS 33.303, clause 6.6.3.1]

There are two types of ProSe Public Safety Discovery described in TS 23.303 [2]: Relay Discovery (including the additional Discovery messages) and Group Member Discovery. The security measures for both of these are identical and are reusing the following aspects:

- the key provisioning mechanism that ProSe one-to-many communication uses, whereby a root key is fetched (the PGK – see subclause 6.2.3.1 of the present specification) along with associated security information; and

- the mechanisms defined for restricted discovery in terms of protecting the discovery messages over the air (see subclause 6.1.3.4.3 of the present specification with the needed DUIK, DUCK and DUSKs derived from the root key). It is optional to support scrambling for Public Safety Discovery.

Like open and restricted discovery, ProSe Public Safety Discovery also uses a UTC-based counter (see step 9 in clause 6.1.3.3) to provide freshness for the protection of the restricted discovery message on the PC5 interface. The parameters CURRENT_TIME and MAX_OFFSET are also provided to the UE from the PKMF to ensure that the obtained UTC-based counter is sufficiently close to real time to protect against replays.

[TS 33.303, clause 6.6.3.2]

The Public Safety Discovery Key (PSDK) is the root key that is used for the protection of the Pubic Safety Discovery messages. It is identified by an 8-bit PSDK ID and each PSDK is associated with one or more Relay Service Codes and/or Discovery Group IDs. This association is achieved by allocating a 24-bit Key Type ID to the Relay Service Codes (RSCs) and Discovery Group IDs during the Key Request/Key Response procedure. The Key Type ID is also included in the MIKEY message, so a delivered PSDK can be associated with the correct RSCs and/or Discovery Group IDs.

NOTE: The allocation of RSC and/or Discovery Group ID to a particular Key Type ID is specific to a UE and does not need to be common across all UEs.

When the PSDKs are provided to the UE, they shall be provided with an Expiry Time. The Expiry Time of the PSDK needs to be set such that the keys for later periods have a longer expiration period. Each PSDKs for each Key Type ID shall be associated with a different Expiry Time value.

All expired PSDK, except the most recently expired of the PSDK(s), should be deleted.

Public Safety discovery also uses the PMK and PMK ID for the MIKEY messages as described in subclauses 6.2.3.1 and 6.2.3.2 of the present specification.

[TS 33.303, clause 6.6.7]

The protection of ProSe Public Safety Discovery Message over PC5 is very similar to that of Restricted Discovery. When sending and receiving a discovery message, the UE uses the PSDK that has not expired (using the time in the UTC based counter associated with the discovery slot to check expiry) and has the earliest expiration time to derive the needed subkeys for the security of that message.

In order to protect the discovery messages over PC5, the UE first calculates the necessary (as indicated in the security meta-data) DUSK, DUCK and DUIK for the particular discovery using the appropriate PSDK. To this end, a KDF is used to derive each of the keys indicated in the security meta-data, as follows:

- If the security meta-data indicates a DUSK should be used, then the UE derives the DUSK from the PSDK using a KDF as in Annex A.8.

- If the security meta-data indicates a DUCK should be used, and an Encrypted_bits_mask is included, then the UE derives the DUCK from the PSDK using a KDF as in Annex A.8

If the security meta-data indicates a DUIK should be used, then the UE derives the DUIK from the PSDK using a KDF as in Annex A.8.

...

A sending UE then follows subclause 6.1.3.4.3.2, while a receiving UE follows subclause 6.1.3.4.3.3 except that it never sends the discovery message to the ProSe Function for MIC checking.

19.2.6.3 Test description

19.2.6.3.1 Pre-test conditions

System Simulator:

SS-UE

- SS-UE1.

- As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device.

GNSS simulator (optional).

NOTE: For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". This can be done by usage of a GNSS simulator, or some suitable MMI action.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.2.6.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, etc.).

Table 19.2.6.3.1-1: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.
$EF_{PROSE\_RADIO\_ANN}$	FFS: b1=1 indicates that the UE is authorised to perform ProSe direct discovery model A announcing when not served by E-UTRAN. b2=0 indicates that the UE is not authorised to perform ProSe direct discovery model B discoverer operation when not served by E-UTRAN b2=1 indicates that the UE is authorised to perform ProSe direct discovery model B discoverer operation when not served by E-UTRAN.
$EF_{PROSE\_RADIO\_MON}$	FFS: b1=1 indicates that the UE is authorised to perform ProSe direct discovery model A monitoring when not served by E-UTRAN. b2=0 indicates that the UE is not authorised to perform ProSe direct discovery model B discoveree operation when not served by E-UTRAN b2=1 indicates that the UE is authorised to perform ProSe direct discovery model B discoveree operation when not served by E-UTRAN.
EF_{PROSE_POLICY}	FFS
EF_{PROSE_GC}	FFS: ProSe Layer-2 Group ID PTK ID Counter
$EF_{PROSE\_RELAY\_DISCOVERY}$	FFS: The UE is preconfigured with PSDK, Bitmask of keys: b1=1 indicates that DUSK is to be used b2=1 indicates that DUCK is to be used b3=1 indicates that DUIK is to be used and DUCK encryption bitmask
$EF_{PROSE\_GM\_DISCOVERY}$	FFS

  - The UE has a Public Safety Discovery Key (PSDK) with not expired validity timer allowing for the calculation of the various keys needed for applying protection on the discovery messages over PC5

(Discovery User Scrambling Key (DUSK), Discovery User Confidentiality Key (DUCK) and Discovery User Integrity Key (DUIK)).

- For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". If this is not done by using n GNSS simulator then the UE needs to be preconfigured via a suitable MMI action.

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.2.6.3.2 Test procedure sequence

Table 19.2.6.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power up the UE.	-	-	-	-
2	Force the UE upper layer application corresponding to ProSe Application ID px_ProSeAnnApplicationIdentity2 to initiate continuous announcing availability in a discovery group. NOTE: Although the UE is expected to transmit continuously, only the PC5_DISCOVERY messages which need to be checked are shown explicitly in the step sequence.	-	-	-	-
-	EXCEPTION: Step 3 is repeated 10 times.	-	-	-	-
3	Check: Does the UE transmit in the next transmission period a PC5_DISCOVERY message for Group Member Discovery Announcement applying DUIK, DUSK, and DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message?	-->	PC5_DISCOVERY	1	P

(1)

```
with { ProSe-enabled public safety UE being authorized for performing ProSe Direct Communication being provisioned with Radio parameters for when the UE is "not served by E-UTRAN" associated with a geographical area, and, UE out of coverage on the frequency used for sidelink communication and within the pre-set geographical area }
ensure that {
  when { When the UE is triggered by an upper layer application to solicit proximity of other UEs in a discovery group }
    then { UE performs a Discoverer UE procedure for group member discovery applying full protection on the discovery messages over PC5 utilising DUSK), DUCK and DUIK }
            }
```

19.2.7.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 10A.2.1, 10A.2.1A, 10A.2.8.1, 10A.2.8.2, TS 33.303, clauses 6.6.3.1, 6.6.3.2, 6.6.7. Unless otherwise stated these are Rel-13 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery and ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 10A.2.1]

The following procedures are defined for the ProSe direct discovery for public safety use:

...

- discoverer UE procedure for group member discovery;

- discoveree UE procedure for group member discovery;

...

Each ProSe-enabled Public Safety UE needs to obtain the security parameters from the ProSe Key Management Function before participating in ProSe direct discovery for public safety use, as specified in 3GPP TS 33.303 [6]. For each given Relay Service Code in UE-to-network relay discovery or Discovery Group ID in group member discovery, the ProSe Key Management Function (PKMF) will provide the following in the security parameters:

- PSDK (Public Safety Discovery Key) and the associated Expiry Time for this PSDK;

- configurations to signal which combination of keys to be used for the discovery process; and

- optionally, if DUCK is to be used, an indication of which PC5_DISCOVERY message fields shall be protected by the DUCK.

After receiving the PSDK from the PKMF for the relay service or discovery group, the UE shall use it to derive specific DUIK, DUCK and DUSK needed to protect the ProSe direct discovery messages for the corresponding public safety use, as specified in 3GPP TS 33.303 [6].

[TS 24.334, clause 10A.2.1A]

The UE shall select the radio resource parameters to be used for ProSe direct discovery as follows:

...

- when the UE is not served by E-UTRAN or when the UE is served by E-UTRAN and intends to use the provisioned ProSe radio resources (i.e. carrier frequency):

    1) if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, then the UE shall search for a cell with any PLMN operating the selected provisioned radio resources (i.e. carrier frequency) associated with that geographical area, and:

        ...

        iii) if the UE does not find any such cell in any PLMN, then the UE shall use the provisioned radio resource parameters; or

    2) else the UE shall not initiate ProSe direct discovery.

[TS 24.334, clause 10A.2.8.1]

The purpose of the discoverer UE procedure for group member discovery is to enable a ProSe-enabled public safety UE to solicit proximity of other ProSe-enabled public safety UEs in a discovery group, upon a request from upper layers as defined in 3GPP TS 23.303 [2].

[TS 24.334, clause 10A.2.8.2]

The UE is authorised to perform the discoverer UE procedure for group member discovery if:

a) the following is true:

   1) the UE is not served by E-UTRAN, is authorised to perform ProSe direct discovery for public safety use discoverer operation when the UE is not served by E-UTRAN as specified in clause 5, and is configured with the radio parameters to be used for ProSe direct discovery for public safety use when not served by E-UTRAN;

   ...

Figure 10A.2.8.2.1 illustrates the interaction of the UEs in the discoverer UE procedure for group member discovery.

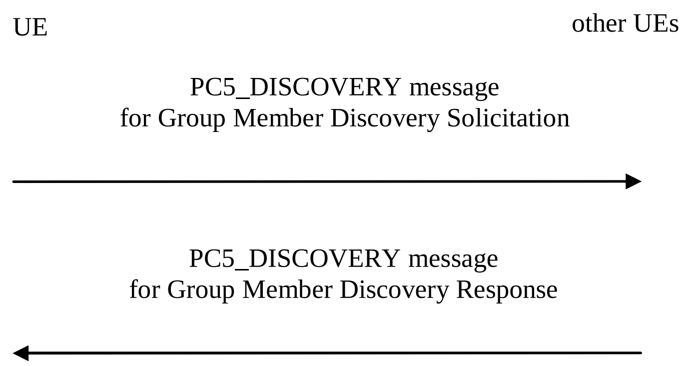

Figure 10A.2.8.2.1: Discoverer UE procedure for group member discovery

When the UE is triggered by an upper layer application to solicit proximity of other UEs in a discovery group, and if the UE is authorised to perform the discoverer UE procedure for group member discovery, then the UE:

...

b) shall obtain a valid UTC time for the discovery transmission from the lower layers and generate the UTC-based counter corresponding to this UTC time as specified in subclause 12.2.2.18;

c) shall generate a PC5_DISCOVERY message for Group Member Discovery Solicitation according to subclause 11.2.5.1. In the PC5_DISCOVERY message for Group Member Discovery Solicitation, the UE:

   1) shall set the Discoverer Info parameter to the User Info ID for the group member discovery parameter, configured in clause 5;

   2) shall set the Discovery Group ID parameter to the Discovery Group ID parameter identifying the discovery group to be solicited, configured in clause 5;

   3) shall set either the Target User Info parameter or the Target Group Info parameter according to the target information provided by the upper layer application; and

   4) shall set the UTC-based counter LSB parameter to include the eight least significant bits of the UTC-based counter;

d) shall apply the DUIK, DUSK, or DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message for whichever security mechanism(s) configured to be applied, e.g. integrity protection, message scrambling or confidentiality protection of one or more above parameters, as specified in 3GPP TS 33.303 [6]; and

e) shall pass the resulting PC5_DISCOVERY message for Group Member Discovery Solicitation to the lower layers for transmission over the PC5 interface with an indication that the message is for public safety use.

The UE shall ensure that it keeps on passing the same PC5_DISCOVERY message to the lower layers for transmission with an indication that the message is for public safety use until the UE is triggered by an upper layer application to stop soliciting proximity of other UEs in a discovery group, or until the UE stops being authorised to perform the discoverer UE procedure for group member discovery. How this is achieved is left up to UE implementation.

Upon reception of a PC5_DISCOVERY message for Group Member Discovery Response according to subclause 11.2.5.1, for the target Discovery Group ID of the discovery group to be discovered, the UE shall use the associated DUSK, if configured, and the UTC-based counter obtained during the monitoring operation to unscramble the PC5_DISCOVERY message as described in 3GPP TS 33.303 [6]. Then, if a DUCK is configured, the UE shall use the DUCK and the UTC-based counter to decrypt the configured message-specific confidentiality-protected portion, as described in 3GPP TS 33.303 [6]. Finally, if a DUIK is configured, the UE shall use the DUIK and UTC-based counter to verify the MIC field in the unscrambled PC5_DISCOVERY message for Group Member Discovery Response.

Then if the Discovery Group ID parameter of the PC5_DISCOVERY message for Group Member Discovery Response is the same as the Discovery Group ID parameter of the PC5_DISCOVERY message for Group Member Discovery Solicitation, the UE shall consider that other UE in the discovery group the UE seeks to discover has been discovered.

[TS 33.303, clause 6.6.3.1]

There are two types of ProSe Public Safety Discovery described in TS 23.303 [2]: Relay Discovery (including the additional Discovery messages) and Group Member Discovery. The security measures for both of these are identical and are reusing the following aspects:

- the key provisioning mechanism that ProSe one-to-many communication uses, whereby a root key is fetched (the PGK – see subclause 6.2.3.1 of the present specification) along with associated security information; and

- the mechanisms defined for restricted discovery in terms of protecting the discovery messages over the air (see subclause 6.1.3.4.3 of the present specification with the needed DUIK, DUCK and DUSKs derived from the root key). It is optional to support scrambling for Public Safety Discovery.

Like open and restricted discovery, ProSe Public Safety Discovery also uses a UTC-based counter (see step 9 in clause 6.1.3.3) to provide freshness for the protection of the restricted discovery message on the PC5 interface. The parameters CURRENT_TIME and MAX_OFFSET are also provided to the UE from the PKMF to ensure that the obtained UTC-based counter is sufficiently close to real time to protect against replays.

[TS 33.303, clause 6.6.3.2]

The Public Safety Discovery Key (PSDK) is the root key that is used for the protection of the Pubic Safety Discovery messages. It is identified by an 8-bit PSDK ID and each PSDK is associated with one or more Relay Service Codes and/or Discovery Group IDs. This association is achieved by allocating a 24-bit Key Type ID to the Relay Service Codes (RSCs) and Discovery Group IDs during the Key Request/Key Response procedure. The Key Type ID is also included in the MIKEY message, so a delivered PSDK can be associated with the correct RSCs and/or Discovery Group IDs.

NOTE: The allocation of RSC and/or Discovery Group ID to a particular Key Type ID is specific to a UE and does not need to be common across all UEs.

When the PSDKs are provided to the UE, they shall be provided with an Expiry Time. The Expiry Time of the PSDK needs to be set such that the keys for later periods have a longer expiration period. Each PSDKs for each Key Type ID shall be associated with a different Expiry Time value.

All expired PSDK, except the most recently expired of the PSDK(s), should be deleted.

Public Safety discovery also uses the PMK and PMK ID for the MIKEY messages as described in subclauses 6.2.3.1 and 6.2.3.2 of the present specification.

[TS 33.303, clause 6.6.7]

The protection of ProSe Public Safety Discovery Message over PC5 is very similar to that of Restricted Discovery. When sending and receiving a discovery message, the UE uses the PSDK that has not expired (using the time in the UTC based counter associated with the discovery slot to check expiry) and has the earliest expiration time to derive the needed subkeys for the security of that message.

In order to protect the discovery messages over PC5, the UE first calculates the necessary (as indicated in the security meta-data) DUSK, DUCK and DUIK for the particular discovery using the appropriate PSDK. To this end, a KDF is used to derive each of the keys indicated in the security meta-data, as follows:

- If the security meta-data indicates a DUSK should be used, then the UE derives the DUSK from the PSDK using a KDF as in Annex A.8.

- If the security meta-data indicates a DUCK should be used, and an Encrypted_bits_mask is included, then the UE derives the DUCK from the PSDK using a KDF as in Annex A.8

If the security meta-data indicates a DUIK should be used, then the UE derives the DUIK from the PSDK using a KDF as in Annex A.8.

...

A sending UE then follows subclause 6.1.3.4.3.2, while a receiving UE follows subclause 6.1.3.4.3.3 except that it never sends the discovery message to the ProSe Function for MIC checking.

19.2.7.3 Test description

19.2.7.3.1 Pre-test conditions

System Simulator:

SS-UE

- SS-UE1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device.

GNSS simulator (optional).

NOTE: For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". This can be done by usage of a GNSS simulator, or some suitable MMI action.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.2.7.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, etc.).

```

19.2.8.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.334, clauses 5.1.1, 10A.2.1, 10A.2.1A, 10A.2.9.1, 10A.2.9.2, TS 33.303, clauses 6.6.3.1, 6.6.3.2, 6.6.7. Unless otherwise stated these are Rel-13 requirements.

[TS 24.334, clause 5.1.1]

The service authorisation for ProSe direct discovery and ProSe direct communication determines whether the UE is authorised to use ProSe direct discovery and ProSe direct communication, in a particular PLMN or when not served by E-UTRAN. In this release of the specification, ProSe direct communication is supported only for Public Safety ProSe-enabled UE. The service authorisation is either:

1) pre-configured in the UE. The pre-configured service authorisation may be stored in the ME, or in the USIM as specified in 3GPP TS 31.102 [17], or in both the ME and the USIM. If both the ME and the USIM contain the same parameters, the values stored in the USIM shall take precedence. The UE shall not use the pre-configured service authorisation if the contents of the USIM indicate that the UE is not authorised to use them (see 3GPP TS 31.102 [17]); or

[TS 24.334, clause 10A.2.1]

The following procedures are defined for the ProSe direct discovery for public safety use:

...

- discoverer UE procedure for group member discovery;
- discoveree UE procedure for group member discovery;

...

Each ProSe-enabled Public Safety UE needs to obtain the security parameters from the ProSe Key Management Function before participating in ProSe direct discovery for public safety use, as specified in 3GPP TS 33.303 [6]. For each given Relay Service Code in UE-to-network relay discovery or Discovery Group ID in group member discovery, the ProSe Key Management Function (PKMF) will provide the following in the security parameters:

- PSDK (Public Safety Discovery Key) and the associated Expiry Time for this PSDK;
- configurations to signal which combination of keys to be used for the discovery process; and
- optionally, if DUCK is to be used, an indication of which PC5_DISCOVERY message fields shall be protected by the DUCK.

After receiving the PSDK from the PKMF for the relay service or discovery group, the UE shall use it to derive specific DUIK, DUCK and DUSK needed to protect the ProSe direct discovery messages for the corresponding public safety use, as specified in 3GPP TS 33.303 [6].

[TS 24.334, clause 10A.2.1A]

The UE shall select the radio resource parameters to be used for ProSe direct discovery as follows:

...

- when the UE is not served by E-UTRAN or when the UE is served by E-UTRAN and intends to use the provisioned ProSe radio resources (i.e. carrier frequency):
  1) if the UE can determine itself located in a geographical area, and the UE is provisioned with radio parameters for the geographical area, then the UE shall search for a cell with any PLMN operating the selected provisioned radio resources (i.e. carrier frequency) associated with that geographical area, and:

     ...

     iii) if the UE does not find any such cell in any PLMN, then the UE shall use the provisioned radio resource parameters; or
  2) else the UE shall not initiate ProSe direct discovery.

[TS 24.334, clause 10A.2.9.1]

The purpose of the discoveree UE procedure for group member discovery is to enable a ProSe-enabled public safety UE to respond to solicitation from other ProSe-enabled public safety UEs on proximity in a discovery group, upon a request from upper layers as defined in 3GPP TS 23.303 [2].

[TS 24.334, clause 10A.2.9.2]

The UE is authorised to perform the discoveree UE procedure for group member discovery if:

a) the following is true:
   1) the UE is not served by E-UTRAN, is authorised to perform ProSe direct discovery for public safety use discoveree operation when the UE is not served by E-UTRAN as specified in clause 5, and is configured with the radio parameters to be used for ProSe direct discovery for public safety use when not served by E-UTRAN;

   ...

Figure 10A.2.9.2.1 illustrates the interaction of the UEs in the Discoveree UE procedure for group member discovery.

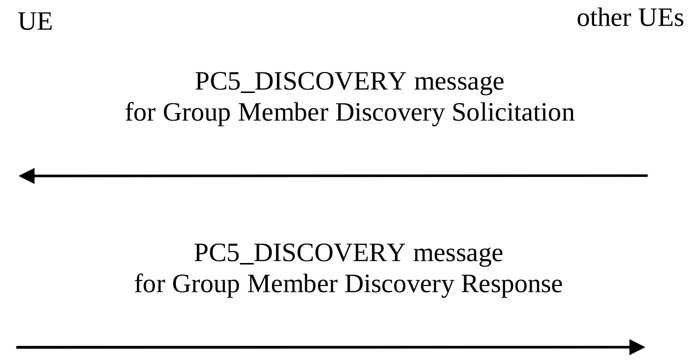

Figure 10A.2.9.2.1: Discoveree UE procedure for group member discovery

When the UE is triggered by an upper layer application to start responding to solicitation on proximity of a UE in a discovery group, and if the UE is authorised to perform the discoveree UE procedure for group member discovery, then the UE:

...

b) shall instruct the lower layers to start monitoring for PC5_DISCOVERY messages with an indication that the message is for public safety use.

Upon reception of a PC5_DISCOVERY message for Group Member Discovery Solicitation according to subclause 11.2.5.1, for the Discovery Group ID of the discovery group which the UE is configured to respond for, the UE shall use the associated DUSK, if configured, and the UTC-based counter obtained during the monitoring operation to unscramble the PC5_DISCOVERY message as described in 3GPP TS 33.303 [6]. Then, if a DUCK is configured, the UE shall use the DUCK and the UTC-based counter to decrypt the configured message-specific confidentiality protected portion, as described in 3GPP TS 33.303 [6]. Finally, if a DUIK is configured, the UE shall use the DUIK and UTC-based counter to verify the MIC field in the unscrambled PC5_DISCOVERY message for Group Member Discovery Solicitation.

Then, if:

- the Discovery Group ID parameter of the received PC5_DISCOVERY message is the same as a Discovery Group ID parameter configured as specified in clause 5 for the discovery group;
- the Target User Info parameter is not included in the received PC5_DISCOVERY message or the Target User Info parameter of the received PC5_DISCOVERY message is the same as the User Info ID for the group member discovery parameter specified in clause 5; and
- the Target Group Info parameter is not included in the received PC5_DISCOVERY message or the Target Group Info parameter of the received PC5_DISCOVERY message is the same as the identifier of the targeted group provided by the upper layer application (e.g. ProSe Layer-2 Group ID of the ProSe direct communication service authorisation specified in clause 5);

the UE:

a) shall obtain a valid UTC time for the discovery transmission from the lower layers and generate the UTC-based counter corresponding to this UTC time as specified in subclause 12.2.2.18;

b) shall generate a PC5_DISCOVERY message for Group Member Discovery Response according to subclause 11.2.5.1. In the PC5_DISCOVERY message for Group Member Discovery Response, the UE:

   1) shall set the ProSe UE ID to the Layer 2 ID used for unicast communication, configured in clause 5;

2) shall set the Discoveree Info parameter to the User Info ID for the group member discovery parameter, configured in clause 5;

3) shall set the Discovery Group ID parameter to the Discovery Group ID parameter of the PC5_DISCOVERY message for Group Member Discovery Solicitation; and

4) shall set the UTC-based counter LSB parameter to include the eight least significant bits of the UTC-based counter;

c) shall apply the DUIK, DUSK, or DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message for whichever security mechanism(s) configured to be applied, e.g. integrity protection, message scrambling or confidentiality protection of one or more above parameters, as specified in 3GPP TS 33.303 [6]; and

d) shall pass the resulting PC5_DISCOVERY message for Group Member Discovery Response with an indication that the message is for public safety use to the lower layers for transmission over the PC5 interface.

[TS 33.303, clause 6.6.3.1]

There are two types of ProSe Public Safety Discovery described in TS 23.303 [2]: Relay Discovery (including the additional Discovery messages) and Group Member Discovery. The security measures for both of these are identical and are reusing the following aspects:

- the key provisioning mechanism that ProSe one-to-many communication uses, whereby a root key is fetched (the PGK – see subclause 6.2.3.1 of the present specification) along with associated security information; and

- the mechanisms defined for restricted discovery in terms of protecting the discovery messages over the air (see subclause 6.1.3.4.3 of the present specification with the needed DUIK, DUCK and DUSKs derived from the root key). It is optional to support scrambling for Public Safety Discovery.

Like open and restricted discovery, ProSe Public Safety Discovery also uses a UTC-based counter (see step 9 in clause 6.1.3.3) to provide freshness for the protection of the restricted discovery message on the PC5 interface. The parameters CURRENT_TIME and MAX_OFFSET are also provided to the UE from the PKMF to ensure that the obtained UTC-based counter is sufficiently close to real time to protect against replays.

[TS 33.303, clause 6.6.3.2]

The Public Safety Discovery Key (PSDK) is the root key that is used for the protection of the Pubic Safety Discovery messages. It is identified by an 8-bit PSDK ID and each PSDK is associated with one or more Relay Service Codes and/or Discovery Group IDs. This association is achieved by allocating a 24-bit Key Type ID to the Relay Service Codes (RSCs) and Discovery Group IDs during the Key Request/Key Response procedure. The Key Type ID is also included in the MIKEY message, so a delivered PSDK can be associated with the correct RSCs and/or Discovery Group IDs.

NOTE: The allocation of RSC and/or Discovery Group ID to a particular Key Type ID is specific to a UE and does not need to be common across all UEs.

When the PSDKs are provided to the UE, they shall be provided with an Expiry Time. The Expiry Time of the PSDK needs to be set such that the keys for later periods have a longer expiration period. Each PSDKs for each Key Type ID shall be associated with a different Expiry Time value.

All expired PSDK, except the most recently expired of the PSDK(s), should be deleted.

Public Safety discovery also uses the PMK and PMK ID for the MIKEY messages as described in subclauses 6.2.3.1 and 6.2.3.2 of the present specification.

[TS 33.303, clause 6.6.7]

The protection of ProSe Public Safety Discovery Message over PC5 is very similar to that of Restricted Discovery. When sending and receiving a discovery message, the UE uses the PSDK that has not expired (using the time in the UTC based counter associated with the discovery slot to check expiry) and has the earliest expiration time to derive the needed subkeys for the security of that message.

In order to protect the discovery messages over PC5, the UE first calculates the necessary (as indicated in the security meta-data) DUSK, DUCK and DUIK for the particular discovery using the appropriate PSDK. To this end, a KDF is used to derive each of the keys indicated in the security meta-data, as follows:

- If the security meta-data indicates a DUSK should be used, then the UE derives the DUSK from the PSDK using a KDF as in Annex A.8.

- If the security meta-data indicates a DUCK should be used, and an Encrypted_bits_mask is included, then the UE derives the DUCK from the PSDK using a KDF as in Annex A.8

If the security meta-data indicates a DUIK should be used, then the UE derives the DUIK from the PSDK using a KDF as in Annex A.8.

...

A sending UE then follows subclause 6.1.3.4.3.2, while a receiving UE follows subclause 6.1.3.4.3.3 except that it never sends the discovery message to the ProSe Function for MIC checking.

19.2.8.3 Test description

19.2.8.3.1 Pre-test conditions

System Simulator:

SS-UE

- SS-UE1.
  - As defined in TS 36.508 [18], configured for and operating as ProSe Direct Communication transmitting and receiving device.

GNSS simulator (optional).

NOTE: For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". This can be done by usage of a GNSS simulator, or some suitable MMI action.

UE:

- ProSe related configuration
  - The UE is authorised to perform ProSe Direct Communication; The UE is equipped with a USIM containing values shown in Table 19.2.8.3.1-1, and, relevant to each of the supported services values as specified in TS 36.508 [18], section 4.9.3.1 (e.g. Direct Communication Radio Parameters and geographical area when UE is "not served by E-UTRAN", ProSe Layer-2 Group ID, etc.).

Table 19.2.8.3.1-1: USIM Configuration

USIM field	Value
EF_{UST}	Service n°101 (ProSe) supported.
EF_{PST}	Service n°3 (ProSe Direct Communication radio parameters) supported.
	Service n°6 (ProSe policy parameters) supported.
	Service n°7 (ProSe group counter) supported.
EF_{AD}	b3=1: the ME is authorized to use the parameters stored in the USIM or in the ME for ProSe services for Public Safety usage.
$EF_{PROSE\_RADIO\_ANN}$	FFS: b1=1 indicates that the UE is authorised to perform ProSe direct discovery model A announcing when not served by E-UTRAN. b2=0 indicates that the UE is not authorised to perform ProSe direct discovery model B discoverer operation when not served by E-UTRAN b2=1 indicates that the UE is authorised to perform ProSe direct discovery model B discoverer operation when not served by E-UTRAN.

$EF_{PROSE\_RADIO\_MON}$	FFS: b1=1 indicates that the UE is authorised to perform ProSe direct discovery model A monitoring when not served by E-UTRAN. b2=0 indicates that the UE is not authorised to perform ProSe direct discovery model B discoveree operation when not served by E-UTRAN b2=1 indicates that the UE is authorised to perform ProSe direct discovery model B discoveree operation when not served by E-UTRAN.
EF_{PROSE_POLICY}	FFS
EF_{PROSE_GC}	FFS: ProSe Layer-2 Group ID PTK ID Counter
$EF_{PROSE\_RELAY\_DISCOVERY}$	FFS: The UE is preconfigured with PSDK, Bitmask of keys: b1=1 indicates that DUSK is to be used b2=1 indicates that DUCK is to be used b3=1 indicates that DUIK is to be used and DUCK encryption bitmask
$EF_{PROSE\_GM\_DISCOVERY}$	FFS

- The UE has a Public Safety Discovery Key (PSDK) with not expired validity timer allowing for the calculation of the various keys needed for applying protection on the discovery messages over PC5 (Discovery User Scrambling Key (DUSK), Discovery User Confidentiality Key (DUCK) and Discovery User Integrity Key (DUIK)).

- For operation in off-network environment, it shall be ensured that after the UE is powered up it considers the geographical area as being one of the geographical areas set in the USIM for operation when UE is "not served by E-UTRAN". If this is not done by using n GNSS simulator then the UE needs to be preconfigured via a suitable MMI action.

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

19.2.8.3.2 Test procedure sequence

Table 19.2.8.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power up the UE.	-	-	-	-
2	Wait for 15 sec to allow the UE to establish that it is out of coverage and initiate scanning the frequency pre-set for ProSe communication for any activities.	-	-	-	-
3	SS sets WaitForMessageCounter=1	-	-	-	-
-	EXCEPTION: Steps 4-5b1 are repeated until WaitForMessageCounter=11 OR the event described in step 5a1 takes place.	-	-	-	-
4	SS-UE1 transmits in the next transmission period a PC5_DISCOVERY message for Group Member Discovery Solicitation applying DUIK, DUSK, and DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message. WaitForMessageCounter=WaitForMessageCounter+1	<--	PC5_DISCOVERY	-	-
-	EXCEPTION: Steps 5a1-5b1 describe events which depend on the UE behaviour; the "lower case letter" identifies a step sequence that take place if the UE transmit or not in the next transmission period a PC5_DISCOVERY	-	-	-	-

	message.				
5a1	Check: Does the UE transmit in the next transmission period a PC5_DISCOVERY message for Group Member Discovery Response applying DUIK, DUSK, and DUCK with the associated Encrypted Bitmask, along with the UTC-based counter to the PC5_DISCOVERY message and including the target Discovery Group ID of the discovery group to be discovered in step 4?	-->	PC5_DISCOVERY	1	P

20.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.003 clause 19.4.2.9.2, TS 24.302 clauses 4.4.3, 7.2.1 and 7.2.2.1, TS 23.402 clauses 4.5.4.2 and 8.2.2 and TS 24.229 clause R.2.2.1.

[Rel-13, TS 23.003, clause 19.4.2.9.2]

The ePDG Fully Qualified Domain Name (ePDG FQDN) contains an Operator Identifier that shall uniquely identify the PLMN where the ePDG is located. The ePDG FQDN is composed of seven labels. The last three labels shall be "pub.3gppnetwork.org". The third and fourth labels together shall uniquely identify the PLMN. The first two labels shall be "epdg.epc". The result of the ePDG FQDN will be:

"epdg.epc.mnc<MNC>.mcc<MCC>.pub.3gppnetwork.org"

[Rel-13, TS 24.302, clause 7.2.2.1]

Once the ePDG has been selected, the UE shall initiate the IPsec tunnel establishment procedure using the IKEv2 protocol as defined in IETF RFC 5996 and 3GPP TS 33.402.

The UE shall send an IKE_SA_INIT request message to the selected ePDG in order to setup an IKEv2 security association. Upon receipt of an IKE_SA_INIT response, the UE shall send an IKE_AUTH request message to the ePDG, including:

- The type of IP address (IPv4 address or IPv6 prefix or both) that needs to be configured in an IKEv2 CFG_REQUEST Configuration Payload. If the UE requests for both IPv4 address and IPv6 prefix, the UE shall send two configuration attributes in the CFG_REQUEST Configuration Payload: one for the IPv4 address and the other for the IPv6 prefix;
- The "IDr" payload, containing the APN in the Identification Data, for non-emergency session establishment. For emergency session establishment, the UE shall format the "IDr" payload according to subclause 7.2.5. The UE shall set the ID Type field of the "IDr" payload to ID_FQDN as defined in IETF RFC 5996 [28]. The UE indicates a request for the default APN by omitting the "IDr" payload, which is in accordance with IKEv2 protocol as defined in IETF RFC 5996 [28]; and
- The "IDi" payload containing the NAI.

…

After the successful authentication with the 3GPP AAA server, the UE receives from the ePDG an IKE_AUTH response message containing a single CFG_REPLY Configuration Payload including the assigned remote IP address information (IPv4 address or IPv6 prefix) as described in subclause 7.4.1.

…

During the IKEv2 authentication and security association establishment, following the UE's initial IKE_AUTH request message to the ePDG, if the UE subsequently receives an IKE_AUTH response message from the ePDG containing the

EAP-Request/AKA-Challenge, after verifying the received authentication parameters and successfully authenticating the ePDG as specified in 3GPP TS 33.402, the UE shall send a new IKE_AUTH request message to the ePDG including the EAP-Response/AKA-Challenge. In addition, the UE shall provide the requested mobile device identity if available, as specified in subclause 7.2.6.

[Rel-13, TS 23.402, clause 4.5.4.2]

When the UE attempts to construct an FQDN for selecting an ePDG in a certain PLMN-x (either a VPLMN or the HPLMN), then the UE shall construct one of the following FQDN formats:

- Operator Identifier FQDN: The UE constructs the FQDN by using the PLMN-x ID as the Operator Identifier.

- Tracking/Location Area Identity FQDN: The UE constructs the FQDN by using the identity of the Tracking Area/Location Area it is located in (i.e. based on PLMN-x ID and TAC/LAC). The Tracking/Location Area Identity FQDN is used to support location-specific ePDG selection within a PLMN.

The ePDG FQDN formats are specified in TS 23.003.

The UE selects one of the above FQDN formats as follows:

a) If the UE attempts to select an ePDG in the registered PLMN and the UE is configured to use for this PLMN the Tracking/Location Area Identity FQDN as defined in point 2) of clause 4.5.4.3; and

b) the UE knows the TAI/LAI of the area the UE it is located in (e.g. the TAI/LAI from the most recent Attach or TAU/LAU),

then the UE constructs a Tracking/Location Area Identity FQDN. Otherwise the UE constructs the Operator Identifier FQDN.

[Rel-13, TS 24.302, clause 4.4.3]

An ePDG Fully Qualified Domain Name (ePDG FQDN) is either provisioned by the home operator or constructed by UE in either the Operator Identifier FQDN format or the Tracking/Location Area Identity FQDN format as described in subclause 4.5.4.2 of 3GPP TS 23.402, and used as input to the DNS mechanism for ePDG selection.

The detailed format of this ePDG FQDN is specified in 3GPP TS 23.003.

[Rel-13, TS 24.302, clause 7.2.1]

The UE performs ePDG selection based on the ePDG configuration information configured by the home operator in the UE either via H-ANDSF or via USIM or via implementation specific means. The ePDG configuration information may consist of home ePDG identifier or ePDG selection information or both:

- when configured via H-ANDSF, the ePDG configuration information is provisioned in ePDG node under Home Network Preference as specified in 3GPP TS 24.312; and

- when configured via USIM, the ePDG configuration information is provisioned in EF_{ePDGId} and $EF_{ePDGSelection}$ files as specified in 3GPP TS 31.102.

NOTE 1: Implementation specific means apply only if the configurations via H-ANDSF and USIM are not present.

The UE shall support the implementation of standard DNS mechanisms in order to retrieve the IP address(es) of the ePDG. The input to the DNS query is an ePDG FQDN as specified in subclause 4.4.3 and in 3GPP TS 23.003.

[Rel-13, TS 33.402, clause 8.2.2]

The tunnel end point in the network is the ePDG. As part of the tunnel establishment attempt the use of a certain APN is requested. When a new attempt for tunnel establishment is performed by the UE the UE shall use IKEv2 as specified in RFC 5996 [30]. The authentication of the UE in its role as IKEv2 initiator terminates in the 3GPP AAA Server. The UE shall send EAP messages over IKEv2 to the ePDG. The ePDG shall extract the EAP messages received from the UE over IKEv2, and send them to the 3GPP AAA Server. The UE shall use the Configuration Payload of IKEv2 to obtain the Remote IP address.

The EAP-AKA message parameters and procedures regarding authentication are omitted. Only decisions and processes relevant to the use of EAP-AKA within IKEv2 are explained.

The message flow for the full authentication is depicted in the Figure 8.2.2-1.

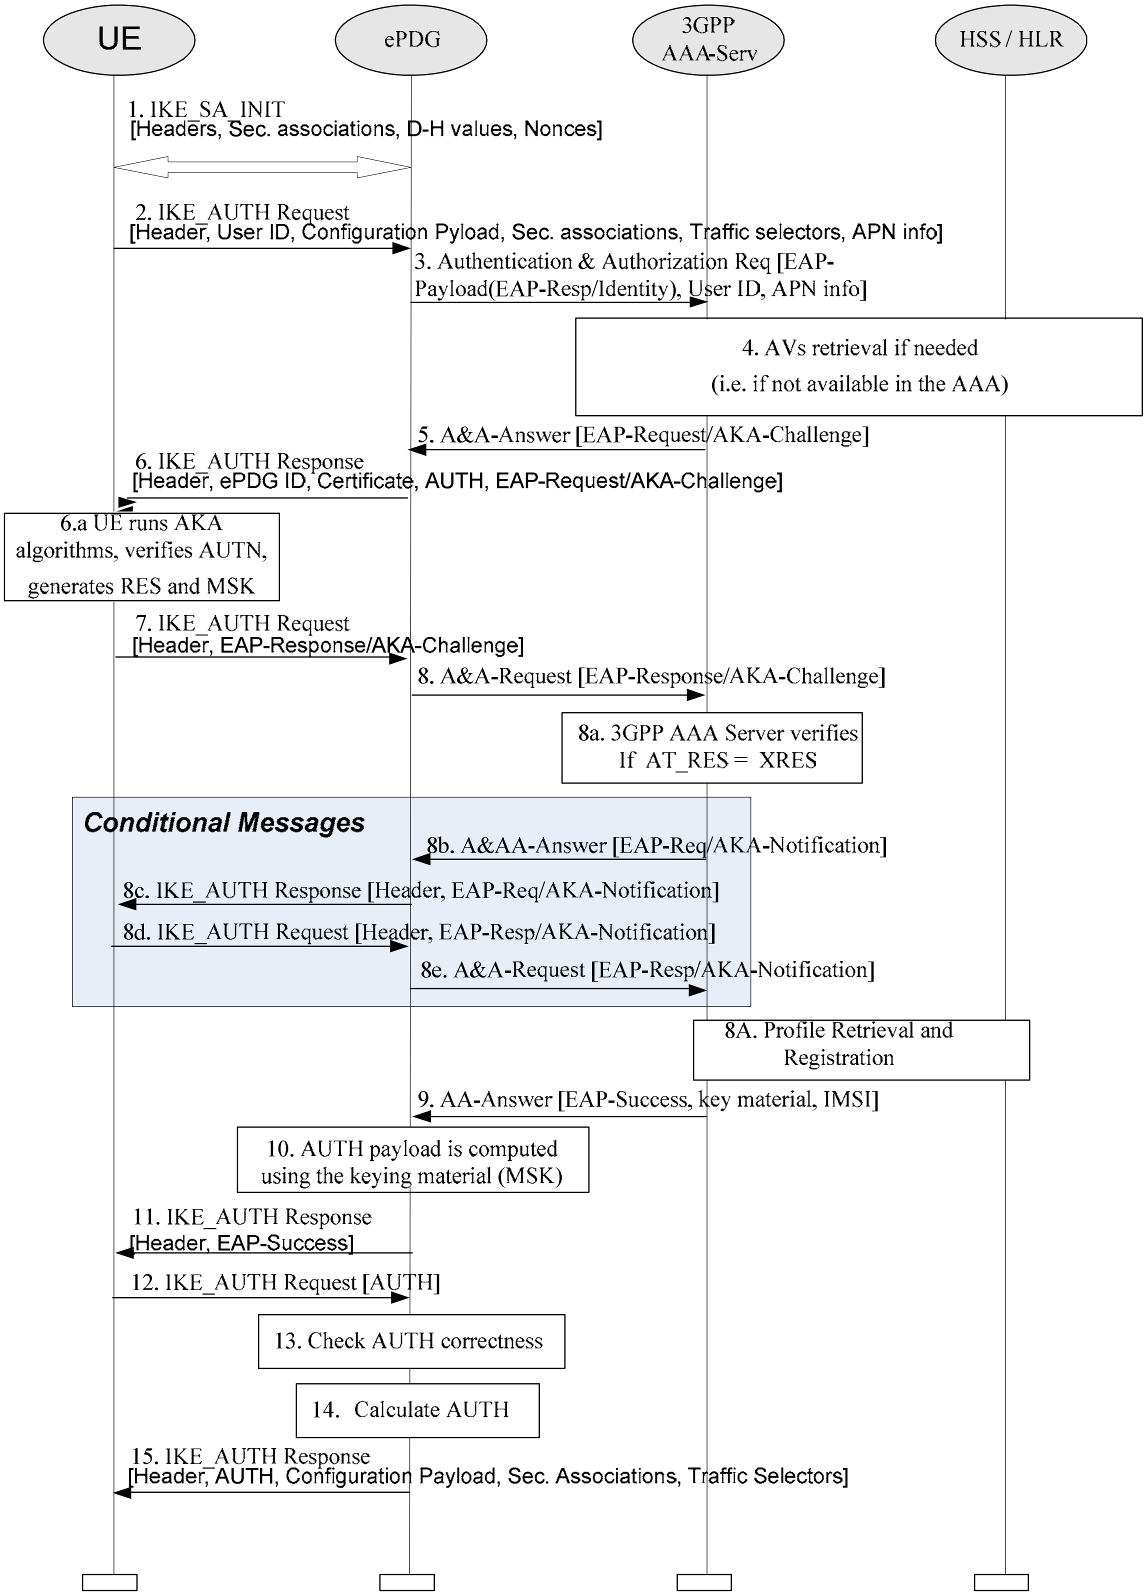

Figure 8.2.2-1: Tunnel full authentication and authorization

As the UE and ePDG generate nonces as input to derive the encryption and authentication keys in IKEv2, replay protection is provided. For this reason, there is no need for the 3GPP AAA Server to request the user identity again using the EAP-AKA specific methods (as specified in RFC 4187 [7]), because the 3GPP AAA Server is certain that no intermediate node has modified or changed the user identity.

1. The UE and the ePDG exchange the first pair of messages, known as IKE_SA_INIT, in which the ePDG and UE negotiate cryptographic algorithms, exchange nonces and perform a Diffie_Hellman exchange.

2. The UE sends the user identity (in the IDi payload) and the APN information (in the IDr payload) in this first message of the IKE_AUTH phase, and begins negotiation of child security associations. The UE omits the AUTH parameter in order to indicate to the ePDG that it wants to use EAP over IKEv2. The user identity shall be compliant with Network Access Identifier (NAI) format specified in TS 23.003 [8], containing the IMSI or the pseudonym, as defined for EAP-AKA in RFC 4187 [7]). The UE shall send the configuration payload (CFG_REQUEST) within the IKE_AUTH request message to obtain an IPv4 and/or IPV6 home IP Address and/or a Home Agent Address.

3. The ePDG sends the Authentication and Authorization Request message to the 3GPP AAA Server, containing the user identity and APN. The UE shall use the NAI as defined in accordance with clause 19.3 of 3GPP TS 23.003 [8], the 3GPP AAA server shall identify based on the realm part of the NAI that combined authentication and authorization is being performed for tunnel establishment with an ePDG which allows only EAP-AKA (and not an I-WLAN PDG as defined in TS 33.234 [9], which would allow also EAP-SIM). The different Diameter application IDs will help the 3GPP AAA Server distinguish among authentications for trusted access, as specified in clause 6 of the present document (which requires EAP-AKA' authentication), and authentications for tunnel setup in EPS (which allows only EAP-AKA).

4. The 3GPP AAA Server shall fetch the authentication vectors from HSS/HLR (if these parameters are not available in the 3GPP AAA Server). The 3GPP AAA Server shall lookup the IMSI of the authenticated user based on the received user identity (root NAI or pseudonym) and include the EAP-AKA as requested authentication method in the request sent to the HSS. The HSS shall then generate authentication vectors with AMF separation bit = 0 and send them back to the 3GPP AAA server.

5. The 3GPP AAA Server initiates the authentication challenge. The user identity is not requested again.

6. The ePDG responds with its identity, a certificate, and sends the AUTH parameter to protect the previous message it sent to the UE (in the IKE_SA_INIT exchange). The EAP message received from the 3GPP AAA Server (EAP-Request/AKA-Challenge) is included in order to start the EAP procedure over IKEv2.

7. The UE checks the authentication parameters and responds to the authentication challenge. The IKE_AUTH request message includes the EAP message (EAP-Response/AKA-Challenge) containing UE’s response to the authentication challenge.

8. The ePDG forwards the EAP-Response/AKA-Challenge message to the 3GPP AAA Server.

8.a The AAA checks, if the authentication response is correct.

8.b-e If dynamic IP mobility selection is executed embedded to the authentication and authorization, the selected mobility mode is sent to the user in an AKA-Notification request, over Diameter A&A answer and IKE_AUTH message. The UE responds to this over IKEv2 and the ePDG forwards the response to the 3GPP AAA Server.

8A. The 3GPP AAA Server shall initiate the Subscriber Profile Retrieval and 3GPP AAA Server registration to the HSS. The 3GPP AAA Server checks in user's subscription if he/she is authorized for non-3GPP access.

9. When all checks are successful, the 3GPP AAA Server sends the final Authentication and Authorization Answer (with a result code indicating success) including the relevant service authorization information, an EAP success and the key material to the ePDG. This key material shall consist of the MSK generated during the authentication process. When the SWm and SWd interfaces between ePDG and 3GPP AAA Server are implemented using Diameter, the MSK shall be encapsulated in the EAP-Master-Session-Key-AVP, as defined in RFC 4072 [10].

10. The MSK shall be used by the ePDG to generate the AUTH parameters in order to authenticate the IKE_SA_INIT phase messages, as specified for IKEv2 in RFC 5996 [30]. These two first messages had not been authenticated before as there was no key material available yet. According to RFC 5996 [30], the shared secret generated in an EAP exchange (the MSK), when used over IKEv2, shall be used to generated the AUTH parameters.

11. The EAP Success/Failure message is forwarded to the UE over IKEv2.

12. The UE shall take its own copy of the MSK as input to generate the AUTH parameter to authenticate the first IKE_SA_INIT message. The AUTH parameter is sent to the ePDG.

13. The ePDG checks the correctness of the AUTH received from the UE. At this point the UE is authenticated. In case S2b is used, PMIP signalling between ePDG and PDN GW can now start, as specified in TS 23.402 [5]. The ePDG continues with the next step in the procedure described here only after successful completion of the PMIP binding update procedure.

14. The ePDG calculates the AUTH parameter which authenticates the second IKE_SA_INIT message. The ePDG shall send the assigned Remote IP address in the configuration payload (CFG_REPLY).

15 The AUTH parameter is sent to the UE together with the configuration payload, security associations and the rest of the IKEv2 parameters and the IKEv2 negotiation terminates.

[Rel-13, TS 24.229, clause R.2.2.1]

Prior to communication with the IM CN subsystem:

…

a) the UE establishes an IP-CAN bearer for SIP signalling as follows:

…

b) the UE shall acquire a P-CSCF address(es).

…

The methods for P-CSCF discovery are:

…

IV. Obtain P-CSCF address(es) using signalling for access to the EPC via WLAN.

If the UE attaches to the EPC via S2b using untrusted WLAN IP access, the UE shall request P-CSCF IPv4 address(es), P-CSCF IPv6 address(es) or both using the P_CSCF_IP4_ADDRESS attribute, the P_CSCF_IP6_ADDRESS attribute or both in the CFG_REQUEST configuration payload as described in 3GPP TS 24.302 [8U]. The network can provide the UE with the P-CSCF IPv4 address(es), P-CSCF IPv6 address(es) or both using the P_CSCF_IP4_ADDRESS attribute, the P_CSCF_IP6_ADDRESS attribute or both in the CFG_REPLY configuration payload as described in 3GPP TS 24.302 [8U]. If the UE receives multiple P-CSCF IPv4 or IPv6 addresses, the UE shall assume that the list is ordered top-down with the first P-CSCF address within the CFG_REPLY configuration payload as the P-CSCF address having the highest preference and the last P-CSCF address within the CFG_REPLY configuration payload as the P-CSCF address having the lowest preference.

20.2.3 Test description

20.2.3.1 Pre-test conditions

System Simulator:

- WLAN Cell 27 according to Table 4.4.8-1 in [18].

UE:

- None

20.3 UE initiated disconnection

20.3.1 Test Purpose (TP)

(1)

```
with { UE has an established tunnel }
ensure that {
  when { UE initiate disconnection }
    then { UE transmits an INFORMATIONAL Request message containing the delete payload }
          }
```

20.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.302 clause 7.2.4.1.

[Rel-13, TS 24.302, clause 7.2.4.1]

The UE shall use the procedures defined in the IKEv2 protocol (see IETF RFC 5996 [28]) to disconnect an IPsec tunnel to the ePDG. The UE shall close the incoming security associations associated with the tunnel and instruct the ePDG to do the same by sending the INFORMATIONAL request message including a "DELETE" payload. The DELETE payload shall contain either:

i) Protocol ID set to "1" and no subsequent Security Parameters Indexes (SPIs) in the payload. This indicates closing of IKE security association, and implies the deletion of all IPsec ESP security associations that were negotiated within the IKE security association; or

ii) Protocol ID set to "3" for ESP. The Security Parameters Indexes included in the payload shall correspond to the particular incoming ESP security associations at the UE for the given tunnel in question.

20.3.3 Test description

20.3.3.1 Pre-test conditions

System Simulator:

- WLAN Cell 27 according to Table 4.4.8-1 in [18].

UE:

- None

Preamble:

- The UE has an established tunnel according to table 4.5A.23.3-1 in [18].

20.4 ePDG initiated disconnection

20.4.1 Test Purpose (TP)

(1)

```
with { UE has an established tunnel }
ensure that {
  when { UE receives an INFORMATIONAL Request message including a delete payload }
    then { UE transmits an INFORMATIONAL Response message }
            }
```

20.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 24.302 clause 7.2.4.2.

[Rel-13, TS 24.302, clause 7.2.4.2]

On receipt of the INFORMATIONAL request message including "DELETE" payload, indicating that the ePDG is attempting tunnel disconnection, the UE shall:

i) Close all security associations identified within the DELETE payload (these security associations correspond to outgoing security associations from the UE perspective). If no security associations were present in the DELETE payload, and the protocol ID was set to "1", the UE shall close the IKE security association, and all IPsec ESP security associations that were negotiated within it towards the ePDG; and

ii) The UE shall delete the incoming security associations corresponding to the outgoing security associations identified in the "DELETE" payload.

The UE shall send an INFORMATIONAL response message. If the INFORMATIONAL request message contained a list of security associations, the INFORMATIONAL response message shall contain a list of security associations deleted in step (ii) above.

If the UE is unable to comply with the INFORMATIONAL request message, the UE shall send INFORMATION response message with either:

i) A NOTIFY payload of type "INVALID_SPI", for the case that it could not identify one or more of the Security Parameters Indexes in the message from the ePDG; or

ii) A more general NOTIFY payload type. This payload type is implementation dependent.

If the INFORMATIONAL request message including the DELETE payload contains the REACTIVATION_REQUESTED_CAUSE Notify payload, the UE shall re-establish the IPsec Tunnel for the corresponding PDN connection after its release. The coding of the P-CSCF_RESELECTION_SUPPORT Notify payload is described in subclause 8.2.9.6.

NOTE: For an IMS PDN connection, the re-establishment of the IPSec tunnel is part of the "Re-establishment of the IP-CAN used for SIP signalling procedure" specified in 3GPP TS 24 229 [67] subclause R.2.2.1B.

20.4.3 Test description

21 SC-PTM in LTE

21.1 SC-MCCH Information Acquisition

(…)

21.1.1 SC-MCCH information acquisition/ UE is switched on

21.1.1.1 Test Purpose (TP)

(1)

```
with { UE in switched off state and interested to receive MBMS services via SC-MRB }
ensure that {
  when { UE is switched on }
    then { acquire the SCPTM-Configuration message at the next repetition period }
            }
```

21.1.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.8a.2.2 and 5.8a.2.3.

[TS 36.331, clause 5.8a.2.2]

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period.

Unless explicitly stated otherwise in the procedural specification, the SC-MCCH information acquisition procedure overwrites any stored SC-MCCH information, i.e. delta configuration is not applicable for SC-MCCH information and the UE discontinues using a field if it is absent in SC-MCCH information unless explicitly specified otherwise.

[TS 36.331, clause 5.8a.2.3]

A SC-PTM capable UE shall:

…

1> if the UE enters a cell broadcasting *SystemInformationBlockType20*:

2> acquire the *SCPTM-Configuration* message at the next repetition period;

…

21.1.1.3 Test description

21.1.4 SC-MCCH information acquisition/ UE is receiving an SC-PTM service

21.1.4.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC IDLE state }
ensure that {
  when { UE is receiving an SC-PTM service }
    then { UE shall start acquiring the SCPTMConfiguration message that corresponds with the service
that is being received, from the beginning of each modification period }
            }
```

21.1.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.8a.2.2 and 5.8a.2.3.

[TS 36.331, clause 5.8a.2.2]

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period.

Unless explicitly stated otherwise in the procedural specification, the SC-MCCH information acquisition procedure overwrites any stored SC-MCCH information, i.e. delta configuration is not applicable for SC-MCCH information and the UE discontinues using a field if it is absent in SC-MCCH information unless explicitly specified otherwise.

[TS 36.331, clause 5.8a.2.3]

An SC-PTM capable UE shall:

…

1> if the UE is receiving an MBMS service via an SC-MRB:

2> start acquiring the *SCPTMConfiguration* message from the beginning of each modification period.

…

21.1.4.3 Test description

21.1.4.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell 1.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.1.5 SC-MCCH information acquisition/ UE is not receiving SC-PTM data

21.1.5.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC IDLE state and interested to receive SC-PTM services }
ensure that {
  when { UE is not receiving an SC-PTM service and receives SC-MCCH information change notification
}
    then { UE shall start acquiring the SCPTMConfiguration message from the subframe where the
change notification was received }
            }
```

21.1.5.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.8a.2.2 and 5.8a.2.3.

[TS 36.331, clause 5.8a.2.2]

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period.

Unless explicitly stated otherwise in the procedural specification, the SC-MCCH information acquisition procedure overwrites any stored SC-MCCH information, i.e. delta configuration is not applicable for SC-MCCH information and the UE discontinues using a field if it is absent in SC-MCCH information unless explicitly specified otherwise.

[TS 36.331, clause 5.8a.2.3]

An SC-PTM capable UE shall:

1> if the procedure is triggered by an SC-MCCH information change notification:

2> start acquiring the *SCPTMConfiguration* message from the subframe where the change notification was received;

NOTE 1: The UE continues using the previously received SC-MCCH information until the new SC-MCCH information has been acquired.

21.1.5.3 Test description

21.1.5.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 0.

21.1.6 SC-MCCH information acquisition / Enhanced Coverage

21.1.6.1 Test Purpose (TP)

(1)

```
with { Enhanced Coverage Capable UE in E-UTRAN RRC IDLE state }
ensure that {
  when { UE is receiving SC-PTM service }
    then { { UE shall start acquiring the SCPTMConfiguration message at the start of the next
modification period upon receiving a notification that the SC-MCCH information that corresponds with
the service that is being received is about to be changed }
            }
```

21.1.6.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clauses 5.8a.1.3 and 5.8.2.

[TS 36.331, clause 5.8a.1.3]

…

When the network changes (some of) the SC-MCCH information for start of new MBMS service(s) transmitted using SC-PTM, it notifies BL UEs, UEs in CE or NB-IoT UEs about the change in every PDCCH which schedules the first SC-MCCH in a repetition period in the current modification period. The notification is transmitted with 1 bit. The bit, when set to '1', indicates the start of new MBMS service(s), see TS 36.212 [22, 5.3.3.1.14 & 6.4.3.3]. Upon receiving a change notification, a BL UE, UE in CE or NB-IoT UE interested to receive MBMS services transmitted using SC-PTM acquires the new SC-MCCH information scheduled by the PDCCH. The BL UE, UE in CE or NB-IoT UE applies the previously acquired SC-MCCH information until the BL UE, UE in CE or NB-IoT UE acquires the new SC-MCCH information.

…

[TS 36.331, clause 5.8.2]

…

The UE applies the SC-MCCH information acquisition procedure to acquire the SC-PTM control information that is broadcast by the E-UTRAN. The procedure applies to SC-PTM capable UEs that are in RRC_IDLE. This procedure also applies to SC-PTM capable UEs that are in RRC_CONNECTED except for BL UEs, UEs in CE or NB-IoT UEs.

…

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT) (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE, except for BL UE, UE in CE or NB-IoT UE, that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB may apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service.

…

A SC-PTM capable UE shall:

1> if the procedure is triggered by an SC-MCCH information change notification and the UE has no ongoing MBMS service:

2> except for a BL UE, UE in CE or NB-IoT UE, start acquiring the *SCPTMConfiguration* message from the subframe in which the change notification was received;

2> for a BL UE, UE in CE or NB-IoT UE, acquire the *SCPTMConfiguration* message scheduled by the PDCCH in which the change notification was received;

NOTE 1: The UE continues using the previously received SC-MCCH information until the new SC-MCCH information has been acquired.

1> if the UE enters a cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT):

2> acquire the *SCPTMConfiguration* message at the next repetition period;

1> if the UE is receiving an MBMS service via an SC-MRB:

2> except for BL UE, UE in CE or NB-IoT UE, start acquiring the *SCPTMConfiguration* message from the beginning of each modification period;

2> a BL UE, UE in CE or NB-IoT UE shall start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed;

2> a BL UE, UE in CE or NB-IoT UE may start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service;

…

21.1.6.3 Test description

21.1.6.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell 1.
- SCPTMConfiguration-BR as defined in TS 36.508[18] table 4.6.1-18b is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting Enhanced Coverage and SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.1.6.3.2 Test procedure sequence

21.1.7 SC-MCCH information acquisition / Enhanced Coverage / Paging precedence

21.1.7.1 Test Purpose (TP)

(1)

```
with { Enhanced Coverage Capable UE in E-UTRAN RRC IDLE state and is receiving an SC-PTM service }
ensure that {
  when { UE is paged }
    then { UE responds to paging }
            }
```

21.1.7.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 36.304 cl. 6.2.

[TS 36.304, clause 6.2]

A UE, except for BL UE or UE in enhanced coverage or NB-IoT UE, interested to receive MBMS services provided using MBSFN transmission shall apply the MCCH information acquision procedure as specified in [3] to receive the MCCH information upon entering the corresponding MBSFN area and upon receiving a notification that the MCCH information has changed. A UE interested to receive MBMS services provided using MBSFN transmission identifies if a service that it is interested to receive is started or ongoing by receiving the MCCH information, and then receives a MTCH corresponding to the identified service.

A UE interested to receive MBMS services provided using SC-PTM transmission shall apply the SC-MCCH information acquisition procedure as specified in [3] to receive the SC-MCCH information upon entering a new cell and upon receiving a notification that the SC-MCCH information has changed. A UE interested to receive MBMS services provided using SC-PTM transmission identifies if a service that it is interested to receive is started or ongoing by receiving the SC-MCCH information, and then receives a SC-MTCH configured using the SC-MRB establishment procedure in [3] and using the DL-SCH reception and SC-PTM DRX procedure as specified in [30].

For BL UE or UE in enhanced coverage or NB-IoT UE interested to receive MBMS services provided using SC-PTM transmission, in case of conflict, reception of paging or establishment of a RRC connection for Mobile Terminated Call and Mobile Originated Signalling takes precedence over SC-PTM reception.

21.1.7.3 Test description

21.1.7.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 1 and 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- SCPTMConfiguration-BR as defined in TS 36.508[18] table 4.6.1-18b is transmitted on SC-MCCH

UE:

- E-UTRAN UE supporting Enhanced Coverage and SC-PTM services

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A-CE) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.2 DRX operation

21.2.1 DRX operation / Parameters configured by RRC

21.2.1.1 Test Purpose (TP)

(1)

```
with { UE in CONNECTED mode }
ensure that {
  when { SC-MTCH-SchedulingCycle is configured and [(SFN * 10) + subframe number] modulo (SC-MTCH-SchedulingCycle) = SC-MTCH-SchedulingOffset }
    then { UE starts the OnDurationTimerSCPTM and monitors the PDCCH for OnDurationTimerSCPTM PDCCH-subframes }
            }
```

(2)

```
with { UE in CONNECTED mode }
ensure that {
  when { SC-MTCH-SchedulingCycle is configured and a new DL transmission is indicated on the PDCCH during Active Time }
    then { UE starts or restarts the Drx-InactivityTimerSCPTM and monitors the PDCCH for Drx-InactivityTimerSCPTM PDCCH sub-frames starting from the next PDCCH sub-frame of the PDCCH sub-frame where the DL new transmission was indicated }
            }
```

21.2.1.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 3.1 and 5.7a.

[TS 36.321, clause 3.1]

Active Time: Time related to DRX operation, as defined in subclause 5.7, during which the UE monitors the PDCCH in PDCCH-subframes.

...

DRX Cycle: Specifies the periodic repetition of the On Duration followed by a possible period of inactivity (see figure 3.1-1 below).

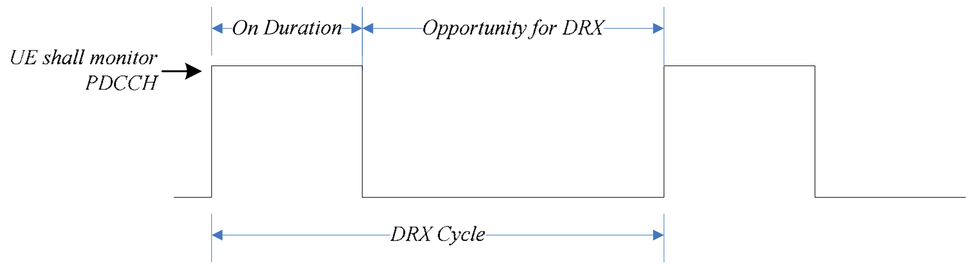

Figure 3.1-1: DRX Cycle

drx-InactivityTimer: Specifies the number of consecutive PDCCH-subframe(s) after successfully decoding a PDCCH indicating an initial UL or DL user data transmission for this UE.

...

drxStartOffset: Specifies the subframe where the DRX Cycle starts.

...

onDurationTimer: Specifies the number of consecutive PDCCH-subframe(s) at the beginning of a DRX Cycle.

PDCCH-subframe: For FDD UE operation, this represents any subframe; for TDD, only downlink subframes and subframes including DwPTS.

[TS 36.321, clause 5.7a]

Each G-RNTI of the MAC entity may be configured by RRC with a DRX functionality that controls the UE's PDCCH monitoring activity for this G-RNTI as specified in [8]. When in RRC_IDLE or RRC_CONNECTED, if DRX is configured, the MAC entity is allowed to monitor the PDCCH for this G-RNTI discontinuously using the DRX operation specified in this subclause; otherwise the MAC entity monitors the PDCCH for this G-RNTI continuously. For each G-RNTI of the MAC entity, RRC controls its DRX operation by configuring the timers *onDurationTimerSCPTM*, *drx-InactivityTimerSCPTM*, the *SC-MTCH-SchedulingCycle* and the value of the *SC-MTCH-SchedulingOffset*. The DRX operation specified in this subclause is performed independently for each G-RNTI and independently from the DRX operation specified in subclause 5.7.

When DRX is configured for a G-RNTI, the Active Time includes the time while:

- *onDurationTimerSCPTM* or *drx-InactivityTimerSCPTM* is running.

When DRX is configured for a G-RNTI as specified in [8], the MAC entity shall for each subframe for this G-RNTI:

- if [(SFN * 10) + subframe number] modulo (*SC-MTCH-SchedulingCycle*) = *SC-MTCH-SchedulingOffset*:
  - start *onDurationTimerSCPTM*.
- during the Active Time, for a PDCCH-subframe:
  - monitor the PDCCH;
  - if the PDCCH indicates a DL transmission:
- start or restart *drx-InactivityTimerSCPTM*.

21.2.1.3 Test description

21.2.1.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell 1.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.2.1.3.2 Test procedure sequence

For FDD, *NormalSF*(current SFN,current subframe number,y)=y; For TDD, *NormalSF*(current SFN,current subframe number,y) counts the minimum number of normal subframes needed to cover y number of PDCCH-subframes until next PDCCH-subframe available, starting from current subframe number on current SFN. For example at step 1, *drxStartOffset* can point to UL or DL subframe for TDD. If it points to a UL subframe, *NormalSF*(current SFN,current subframe number,0) counts the number of normal subframes until reach the first DL/special subframe available. If *drxStartOffset* points to a DL subframe, *NormalSF*(current SFN,current subframe number,0)=0.

For example at step 12, assuming *SC-MTCH-SchedulingOffset* points to subframe number 0 at frame number A, *NormalSF*(A, 0, *onDurationTimer+drx-InactivityTimer-1*) is added, which counts 18 PDCCH-subframes/30 normal subframes in this case. The current subframe becomes subframe number 0 at frame number A+3.

Table 21.2.1.3.2-1: Main Behaviour

St	Procedure	Message Sequence		TP	Verdict
		U – S	Message		
1	SS transmits updated *SCPTMConfiguration* to configure specific DRX parameters, from the beginning of next modification period MPa.	<--	*SCPTMConfiguration*	-	-
2	Wait for a period equal to the SC-MCCH modification period for the UE to receive *SCPTMConfiguration* message

InactivityTimerSCPTM PDCCH sub-frames starting from the next PDCCH sub-frame of the PDCCH sub-frame
where the DL new transmission was indicated }
            }
```

21.2.2.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 3.1 and 5.7a.

[TS 36.321, clause 3.1]

Active Time: Time related to DRX operation, as defined in subclause 5.7, during which the UE monitors the PDCCH in PDCCH-subframes.

...

DRX Cycle: Specifies the periodic repetition of the On Duration followed by a possible period of inactivity (see figure 3.1-1 below).

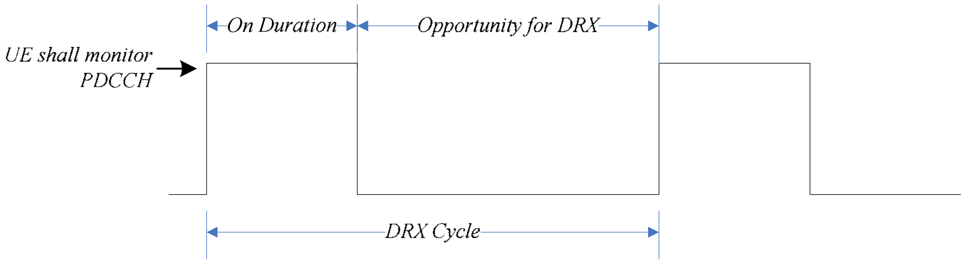

Figure 3.1-1: DRX Cycle

drx-InactivityTimer: Specifies the number of consecutive PDCCH-subframe(s) after successfully decoding a PDCCH indicating an initial UL or DL user data transmission for this UE.

...

drxStartOffset: Specifies the subframe where the DRX Cycle starts.

...

onDurationTimer: Specifies the number of consecutive PDCCH-subframe(s) at the beginning of a DRX Cycle.

PDCCH-subframe: For FDD UE operation, this represents any subframe; for TDD, only downlink subframes and subframes including DwPTS.

[TS 36.321, clause 5.7a]

Each G-RNTI and, for NB-IoT UEs, BL UEs or UEs in enhanced coverage, each SC-RNTI of the MAC entity may be configured by RRC with a DRX functionality that controls the UE's PDCCH monitoring activity for this G-RNTI and SC-RNTI as specified in [8]. When in RRC_IDLE or RRC_CONNECTED, if DRX is configured, the MAC entity is allowed to monitor the PDCCH for this G-RNTI or SC-RNTI discontinuously using the DRX operation specified in this subclause; otherwise the MAC entity monitors the PDCCH for this G-RNTI or SC-RNTI continuously. For each G-RNTI or SC-RNTI of the MAC entity, RRC controls its DRX operation by configuring the timers *onDurationTimerSCPTM*, *drx-InactivityTimerSCPTM*, the *SCPTM-SchedulingCycle* and the value of the *SCPTM-SchedulingOffset* for G-RNTI and for SC-RNTI. The DRX operation specified in this subclause is performed independently for each G-RNTI and SC-RNTI and independently from the DRX operation specified in subclause 5.7.

When DRX is configured for a G-RNTI or for SC-RNTI, the Active Time includes the time while:

- *onDurationTimerSCPTM* or *drx-InactivityTimerSCPTM* is running.

When DRX is configured for a G-RNTI or for SC-RNTI as specified in [8], the MAC entity shall for each subframe for this G-RNTI:

- if [(H-SFN * 10240 + SFN * 10) + subframe number] modulo (*SCPTM-SchedulingCycle*) = *SCPTM-SchedulingOffset*:
  - start *onDurationTimerSCPTM*.
- during the Active Time, for a PDCCH-subframe:
  - monitor the PDCCH;
  - if the PDCCH indicates a DL transmission:
    - if the UE is a BL UE or a UE in enhanced coverage:
      - start or re-start the *drx-InactivityTimerSCPTM* in the subframe containing the last repetition of the corresponding PDSCH reception.
    - if the UE is an NB-IoT UE:
      - stop *onDurationTimerSCPTM*;

- stop *drx-InactivityTimerSCPTM*;
- start the *drx-InactivityTimerSCPTM* in the first subframe of the next PDCCH occasion following the subframe containing the last repetition of the corresponding PDSCH reception.

- else:
  - start or restart *drx-InactivityTimerSCPTM*.

NOTE: If H-SFN is not configured its value is set to 0 in the calculation of the starting subframe.

21.2.2.3 Test description

21.2.2.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell 1.
- SCPTMConfiguration-BR as defined in TS 36.508[18] table 4.6.1-18b is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting Enhanced Coverage and SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.2.2.3.2 Test procedure sequence

For FDD, *NormalSF*(current SFN,current subframe number,y)=y; For TDD, *NormalSF*(current SFN,current subframe number,y) counts the minimum number of normal subframes needed to cover y number of PDCCH-subframes until next PDCCH-subframe available, starting from current subframe number on current SFN. For example at step 1, *SCPTM-SchedulingOffset* can point to UL or DL subframe for TDD. If it points to a UL subframe, *NormalSF*(current SFN,current subframe number,0) counts the number of normal subframes until reach the first DL/special subframe available. If *SCPTM-SchedulingOffset* points to a DL subframe, *NormalSF*(current SFN,current subframe number,0)=0.

For example at step 12, assuming *SCPTM-SchedulingOffset* points to subframe number 0 at frame number A, *NormalSF*(A, 0, *onDurationTimerSCPTM +drx-InactivityTimerSCPTM -1*) is added, which counts 18 PDCCH-subframes/30 normal subframes in this case. The current subframe becomes subframe number 0 at frame number A+3.

Table 21.2.2.3.2-1: Main Behaviour

21.3 SC-PTM Service Continuity

21.3.1 Cell reselection to intra-frequency cell to continue SC-PTM service reception

21.3.1.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC IDLE state with ongoing SC-PTM reception on a cell broadcasting SIB15
indicating the MBMS SAI and SIB20 indicating SCPTMConfiguration associated with the ongoing SC-PTM
service for the frequency of the cell }
ensure that {
  when { an intra-frequency neighbour cell providing the SC-PTM service and an inter-frequency
neighbour cell not providing the SC-PTM service becomes better than the serving cell }
    then { UE performs cell reselection to the intra-frequency cell even if the inter-frequency cell
is better and continues SC-PTM reception }
            }
```

21.3.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 5.2.4.1 and TS 36.331, clause 5.2.2.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.304, clause 5.2.4.1]

Absolute priorities of different E-UTRAN frequencies or inter-RAT frequencies may be provided to the UE in the system information, in the *RRCConnectionRelease* message, or by inheriting from another RAT at inter-RAT cell (re)selection. In the case of system information, an E-UTRAN frequency or inter-RAT frequency may be listed without providing a priority (i.e. the field *cellReselectionPriority* is absent for that frequency). If priorities are provided in dedicated signalling, the UE shall ignore all the priorities provided in system information. If UE is in *camped on any cell* state, UE shall only apply the priorities provided by system information from current cell, and the UE preserves priorities provided by dedicated signalling and *deprioritisationReq* received in *RRCConnectionReject* unless specified otherwise. When the UE in *camped normally* state, has only dedicated priorities other than for the current frequency, the UE shall consider the current frequency to be the lowest priority frequency (i.e. lower than any of the network configured values). While the UE is camped on a suitable CSG cell, the UE shall always consider the current frequency to be the highest priority frequency (i.e. higher than any of the network configured values), irrespective of any other priority value allocated to this frequency if that cell can be accessed in normal coverage. If the UE capable of sidelink communication is configured to perform sidelink communication and can only perform the sidelink communication while camping on a frequency, the UE may consider that frequency to be the highest priority.

NOTE: The prioritization among the frequencies which UE considers to be the highest priority frequency is left to UE implementation.

If the UE is capable either of MBMS Service Continuity or of SC-PTM reception and is receiving or interested to receive an MBMS service and can only receive this MBMS service while camping on a frequency on which it is provided, the UE may consider that frequency to be the highest priority during the MBMS session [2] as long as the two following conditions are fulfilled:

1) Either:

- the UE is capable of MBMS service continuity and the reselected cell is broadcasting SIB13; or

- the UE is capable of SC-PTM reception and the reselected cell is broadcasting SIB20;

2) Either:

- SIB15 of the serving cell indicates for that frequency one or more MBMS SAIs included in the MBMS User Service Description (USD) [22] of this service; or

- SIB15 is not broadcast in the serving cell and that frequency is included in the USD of this service.

If the UE is capable either of MBMS Service Continuity or of SC-PTM reception and is receiving or interested to receive an MBMS service provided on a downlink only MBMS frequency, the UE may consider cell reselection candidate frequencies at which it can not receive the MBMS service to be of the lowest priority during the MBMS session [2], as long as the above mentioned condition 1) is fulfilled for the cell on the MBMS frequency which the UE monitors and as long as the above mentioned condition 2) is fulfilled for the serving cell.

NOTE: An example scenario in which the previous down-prioritisation may be needed concerns the case the MBMS frequency is a downlink only carrier on which camping is not possible, while the UE can only receive this MBMS frequency when camping on a subset of cell reselection candidate frequencies.

...

[TS 36.331, clause 5.2.2.4]

The UE shall:

1> apply the specified BCCH configuration defined in 9.1.1.1;

1> if the procedure is triggered by a system information change notification:

2> if the UE uses an idle DRX cycle longer than the modification period:

3> start acquiring the required system information, as defined in 5.2.2.3, from the next eDRX acquisition period boundary;

2> else

3> start acquiring the required system information, as defined in 5.2.2.3, from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received system information until the new system information has been acquired.

1> if the UE is in RRC_IDLE and enters a cell for which the UE does not have stored a valid version of the system information required in RRC_IDLE, as defined in 5.2.2.3:

2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_IDLE, as defined in 5.2.2.3;

…

1> if the UE is interested to receive MBMS services:

2> if the UE is capable of MBMS reception as specified in 5.8:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType13* is present and the UE does not have stored a valid version of this system information block:

4> acquire SystemInformationBlockType13;

2> if the UE is capable of SC-PTM reception as specified in 5.8a:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType20* is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType20*;

2> if the UE is capable of MBMS Service Continuity:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType15* is present and the UE does not have stored a valid version of this system information block:

4> acquire SystemInformationBlockType15;

…

The UE may apply the received SIBs immediately, i.e. the UE does not need to delay using a SIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 6: While attempting to acquire a particular SIB, if the UE detects from *schedulingInfoList* that it is no longer present, the UE should stop trying to acquire the particular SIB.

21.3.1.3 Test description

21.3.1.3.1 Pre-test conditions

System Simulator:

- 3 E-UTRA cells with the same PLMN. Cell 1 and Cell 11 are intra-frequency cells. Cell 3 is inter-frequency cell to Cell 1 and Cell 11. Cell 1 "Serving cell", Cell 11 and Cell 3 are "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1 and Cell 11.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 3.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 1 and Cell 11.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Loopback Activated (State 4) according to [18] in Cell 1 (serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration* on.

21.3.1.3.2 Test procedure sequence

Table 21.3.1.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.1.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 11	Cell 3	Remark
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	-91	
T1	Cell-specific RS EPRE	dBm/15kHz	-91	-85	-79	The power level values are assigned to satisfy $R_{Cell\ 1} < R_{Cell\ 11} < R_{Cell\ 3}$.

Table 21.3.1.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits a *Paging* message including a *systemInfoModification* for Cell1 and Cell 11.	<--	*Paging*	-	-
2	From the beginning of the next modification period the SS starts broadcast of *SystemInformationBlockType15* including mbms-SAI-IntraFreqList-r11 indicating MBMS SAI=1 according to system information combination 27 on Cell 1 and Cell 11.	<--	*SystemInformationBlockType15*	-	-

21.3.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 5.2.4.1 and TS 36.331, clause 5.2.2.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.304, clause 5.2.4.1]

Absolute priorities of different E-UTRAN frequencies or inter-RAT frequencies may be provided to the UE in the system information, in the *RRCConnectionRelease* message, or by inheriting from another RAT at inter-RAT cell (re)selection. In the case of system information, an E-UTRAN frequency or inter-RAT frequency may be listed without providing a priority (i.e. the field *cellReselectionPriority* is absent for that frequency). If priorities are provided in dedicated signalling, the UE shall ignore all the priorities provided in system information. If UE is in *camped on any cell* state, UE shall only apply the priorities provided by system information from current cell, and the UE preserves priorities provided by dedicated signalling and *deprioritisationReq* received in *RRCConnectionReject* unless specified otherwise. When the UE in *camped normally* state, has only dedicated priorities other than for the current frequency, the UE shall consider the current frequency to be the lowest priority frequency (i.e. lower than any of the network configured values). While the UE is camped on a suitable CSG cell, the UE shall always consider the current frequency to be the highest priority frequency (i.e. higher than any of the network configured values), irrespective of any other priority value allocated to this frequency if that cell can be accessed in normal coverage. If the UE capable of sidelink communication is configured to perform sidelink communication and can only perform the sidelink communication while camping on a frequency, the UE may consider that frequency to be the highest priority.

NOTE: The prioritization among the frequencies which UE considers to be the highest priority frequency is left to UE implementation.

If the UE is capable either of MBMS Service Continuity or of SC-PTM reception and is receiving or interested to receive an MBMS service and can only receive this MBMS service while camping on a frequency on which it is provided, the UE may consider that frequency to be the highest priority during the MBMS session [2] as long as the two following conditions are fulfilled:

1) Either:

- the UE is capable of MBMS service continuity and the reselected cell is broadcasting SIB13; or

- the UE is capable of SC-PTM reception and the reselected cell is broadcasting SIB20;

2) Either:

- SIB15 of the serving cell indicates for that frequency one or more MBMS SAIs included in the MBMS User Service Description (USD) [22] of this service; or

- SIB15 is not broadcast in the serving cell and that frequency is included in the USD of this service.

If the UE is capable either of MBMS Service Continuity or of SC-PTM reception and is receiving or interested to receive an MBMS service provided on a downlink only MBMS frequency, the UE may consider cell reselection candidate frequencies at which it can not receive the MBMS service to be of the lowest priority during the MBMS session [2], as long as the above mentioned condition 1) is fulfilled for the cell on the MBMS frequency which the UE monitors and as long as the above mentioned condition 2) is fulfilled for the serving cell.

NOTE: An example scenario in which the previous down-prioritisation may be needed concerns the case the MBMS frequency is a downlink only carrier on which camping is not possible, while the UE can only receive this MBMS frequency when camping on a subset of cell reselection candidate frequencies.

...

[TS 36.331, clause 5.2.2.4]

The UE shall:

1> apply the specified BCCH configuration defined in 9.1.1.1;

1> if the procedure is triggered by a system information change notification:

2> if the UE uses an idle DRX cycle longer than the modification period:

3> start acquiring the required system information, as defined in 5.2.2.3, from the next eDRX acquisition period boundary;

2> else

3> start acquiring the required system information, as defined in 5.2.2.3, from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received system information until the new system information has been acquired.

1> if the UE is in RRC_IDLE and enters a cell for which the UE does not have stored a valid version of the system information required in RRC_IDLE, as defined in 5.2.2.3:

2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_IDLE, as defined in 5.2.2.3;

…

1> if the UE is interested to receive MBMS services:

2> if the UE is capable of MBMS reception as specified in 5.8:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType13* is present and the UE does not have stored a valid version of this system information block:

4> acquire SystemInformationBlockType13;

2> if the UE is capable of SC-PTM reception as specified in 5.8a:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType20* is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType20*;

2> if the UE is capable of MBMS Service Continuity:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType15* is present and the UE does not have stored a valid version of this system information block:

4> acquire SystemInformationBlockType15;

…

The UE may apply the received SIBs immediately, i.e. the UE does not need to delay using a SIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 6: While attempting to acquire a particular SIB, if the UE detects from *schedulingInfoList* that it is no longer present, the UE should stop trying to acquire the particular SIB.

21.3.2.3 Test description

21.3.2.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 23 are inter-frequency cells. Cell 1 is "Serving cell" and Cell 23 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 23.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 23.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1 (serving cell).
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration* .

21.3.2.3.2 Test procedure sequence

Table 21.3.2.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. ```
with { Enhanced Coverage Capable UE in E-UTRAN RRC IDLE state on a cell broadcasting SIB15 and
interested to receive a SC-PTM service }
ensure that {
  when { a suitable inter-frequency neighbour cell is broadcasting SIB20 }
    then { UE performs cell reselection to the inter-frequency cell using QoffsetSCPTM and starts SC-
PTM reception }
            }
```

21.3.2c.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 5.2.4.6 and 5.2.4.7. Unless otherwise stated these are Rel-14 requirements.

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{meas,s} + Q_{Hyst} - \text{Qoffset}_{temp} + \text{Qoffset}_{SCPTM}$$

$$R_n = Q_{meas,n} - \text{Qoffset} - \text{Qoffset}_{temp} + \text{Qoffset}_{SCPTM}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $\text{Qoffset}_{s,n}$, if $\text{Qoffset}_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Except for NB-IoT, equals to $\text{Qoffset}_{s,n}$ plus $\text{Qoffset}_{frequency}$, if $\text{Qoffset}_{s,n}$ is valid, otherwise this equals to $\text{Qoffset}_{frequency}$. For NB-IoT equals to $\text{QoffsetDedicated}_{frequency}$ for any frequency other than the frequency of the dedicated frequency offset, if $\text{QoffsetDedicated}_{frequency}$ is valid, otherwise this equals to $\text{Qoffset}_{frequency}$ (if $\text{QoffsetDedicated}_{frequency}$ is valid $\text{Qoffset}_{frequency}$ is not used).
Qoffset_{temp}	Offset temporarily applied to a cell as specified in [3]
Qoffset_{SCPTM}	Offset temporarily applied to an SC-PTM frequency as specified below. The offset is applied to all cells on the SC-PTM frequency. If Qoffset_{SCPTM} is valid, Qoffset for inter-frequency neighbour cells is not used.

If the NB-IoT UE or UE in enhanced coverage is capable of SC-PTM reception and is receiving or interested to receive an MBMS service and can only receive this MBMS service while camping on a frequency on which it is provided (SC-PTM frequency), the UE considers Qoffset_{SCPTM} to be valid during the MBMS session [2] as long as the following condition is fulfilled:

Either:

- SIB15 (or SIB15-NB) of the serving cell indicates for that frequency one or more MBMS SAIs included in the MBMS User Service Description (USD) [22] of this service; or

- SIB15 (or SIB15-NB) is not broadcast in the serving cell and that frequency is included in the USD of this service.

NOTE: UE should search for a higher ranked cell on another frequency for cell reselection as soon as possible after the UE stops using $Qoffset_{SCPTM}$.

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

When the UE uses infinite dBs for $Qoffset_{SCPTM}$, the UE shall use $Qoffset_{SCPTM}$ zero and rank the cells on the SC-PTM frequency(ies) only first. If the UE cannot find a suitable cell on an SC-PTM frequency, the UE shall rank the cells on all frequencies.

...

[TS 36.331, clause 5.2.4.6a]

Ranking as defined in sub-clause 5.2.4.6 is applied for intra-frequency and inter-frequency cell reselection (irrespective of configured frequency priorities, if any) while the UE is in enhanced coverage.

[TS 36.331, clause 5.2.4.7]

Cell reselection parameters are broadcast in system information and are read from the serving cell as follows:

…

$Qoffset_{scptm}$

This specifies the offset to be used for cell re-selection for SC-PTM service reception for BL UE, UE in enhanced coverage and NB-IoT UE. The same offset is applicable to all frequencies providing MBMS services via SC-PTM.

…

21.3.2c.3 Test description

21.3.2c.3.1 Pre-test conditions

Same as test case 21.3.2 with the following differences:

- Cell 1 and Cell 3 support CE.

21.3.3 Handover to inter-frequency cell to start SC-PTM service reception

21.3.3.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC_Connected state AND on a cell broadcasting SIB15 and interested to receive
a SC-PTM service }
ensure that {
  when { SIB15 indicates that the SC-PTM service is available on a frequency of an inter-frequency
neighbour cell }
    then { UE transmits a MBMSInterestIndication message indicating interest in SC-PTM reception on
the frequency }
            }
```

(2)

```
with { UE in E-UTRAN RRC_Connected state AND having transmitted a MBMSInterestIndication message
indicating interest in SC-PTM reception on a frequency of an inter-frequency neighbour cell }
ensure that {
  when { 1s after the UE has transmitted the MBMSInterestIndication message the UE receives
RRCConnectionReconfiguration message including a mobilityControlInfo indicating the E-UTRAN
frequency of the inter-frequency neighbour cell }
    then { UE performs inter-frequency handover and starts SC-PTM reception }
            }
```

21.3.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.5.4, 5.8.5.2, 5.8.5.3, 5.8.5.3a and 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

1> stop timer T310, if running;

1> stop timer T312, if running;

1> start timer T304 with the timer value set to *t304,* as included in the *mobilityControlInfo*;

1> stop timer T370, if running;

1> if the *carrierFreq* is included:

 2> consider the target PCell to be one on the frequency indicated by the *carrierFreq* with a physical cell identity indicated by the *targetPhysCellId*;

…

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;

1> if MAC successfully completes the random access procedure:

 …

 2> if *SystemInformationBlockType15* is broadcast by the PCell:

  3> if the UE has transmitted a *MBMSInterestIndication* message during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*:

   4> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

   4> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;

4> determine the set of MBMS services of interest in accordance with 5.8.5.3a;

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

[TS 36.331, clause 5.8.5.2]

An MBMS or SC-PTM capable UE in RRC_CONNECTED may initiate the procedure in several cases including upon successful connection establishment, upon entering or leaving the service area, upon session start or stop, upon change of interest, upon change of priority between MBMS reception and unicast reception or upon change to a PCell broadcasting *SystemInformationBlockType15*.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType15* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

2> if the UE did not transmit an *MBMSInterestIndication* message since last entering RRC_CONNECTED state; or

2> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType15*:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

2> else:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, has changed since the last transmission of the *MBMSInterestIndication* message; or

3> if the prioritisation of reception of all indicated MBMS frequencies compared to reception of any of the established unicast bearers has changed since the last transmission of the *MBMSInterestIndication* message:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

NOTE: The UE may send an *MBMSInterestIndication* even when it is able to receive the MBMS services it is interested in i.e. to avoid that the network allocates a configuration inhibiting MBMS reception.

3> else if *SystemInformationBlockType20* is broadcast by the PCell:

4> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType20*; or

4> if the set of MBMS services of interest determined in accordance with 5.8.5.3a is different from *mbms-Services* included in the last transmission of the *MBMSInterestIndication* message;

5> initiate the transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4.

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

[TS 36.331, clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.3.3 Test description

21.3.3.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 3 are inter-frequency cells. Cell 1 is "Serving cell" and Cell 3 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 3.
- *SCPTMConfiguration* as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 3.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Loopback Activated (State 4) according to [18] in Cell 1 (serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.

21.3.3.3.2 Test procedure sequence

Table 21.3.3.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.3.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 3	Remark
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy exit condition for event A3 (M3 < M1).
T1	Cell-specific RS EPRE	dBm/15kHz	-85	-79	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy entry condition for event A3 (M3 > M1).

Table 21.3.3.3.2-2: Main behaviour

21.3.3a Handover to inter-band cell to start SC-PTM service reception

21.3.3a.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC_Connected state AND on a cell broadcasting SIB15 and interested to receive
a SC-PTM service }
ensure that {
  when { SIB15 indicates that the SC-PTM service is available on a frequency of a neighbour cell on
a different frequency band }
    then { UE transmits a MBMSInterestIndication message indicating interest in SC-PTM reception on
the frequency }
            }
```

(2)

```
with { UE in E-UTRAN RRC_Connected state AND having transmitted a MBMSInterestIndication message
indicating interest in SC-PTM reception on a frequency of a neighbour cell on a different frequency
band }
ensure that {
  when { 1s after the UE has transmitted the MBMSInterestIndication message the UE receives
RRCConnectionReconfiguration message including a mobilityControlInfo indicating the E-UTRAN
frequency of the inter-band neighbour cell }
    then { UE performs inter-band handover and starts SC-PTM reception }
            }
```

21.3.4 Handover to intra-frequency cell to continue SC-PTM service reception

21.3.4.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_Connected state with ongoing SC-PTM reception }
ensure that {
  when { UE receives RRCConnectionReconfiguration message including a mobilityControlInfo for intra
frequency neighbour cell providing SC-PTM service }
    then { UE performs intra_frequency handover and continues to receive SC-PTM service }
            }
```

21.3.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.5.4, 5.8.5.2, 5.8.5.3, 5.8.5.3a and 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

1> stop timer T310, if running;

1> stop timer T312, if running;

1> start timer T304 with the timer value set to *t304*, as included in the *mobilityControlInfo*;

1> stop timer T370, if running;

1> if the *carrierFreq* is included:

2> consider the target PCell to be one on the frequency indicated by the *carrierFreq* with a physical cell identity indicated by the *targetPhysCellId*;

…

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;

1> if MAC successfully completes the random access procedure:

…

2> if *SystemInformationBlockType15* is broadcast by the PCell:

3> if the UE has transmitted a *MBMSInterestIndication* message during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*:

4> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

4> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;

4> determine the set of MBMS services of interest in accordance with 5.8.5.3a;

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

[TS 36.331, clause 5.8.5.2]

An MBMS or SC-PTM capable UE in RRC_CONNECTED may initiate the procedure in several cases including upon successful connection establishment, upon entering or leaving the service area, upon session start or stop, upon change of interest, upon change of priority between MBMS reception and unicast reception or upon change to a PCell broadcasting *SystemInformationBlockType15*.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType15* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

2> if the UE did not transmit an *MBMSInterestIndication* message since last entering RRC_CONNECTED state; or

2> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType15*:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

2> else:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, has changed since the last transmission of the *MBMSInterestIndication* message; or

3> if the prioritisation of reception of all indicated MBMS frequencies compared to reception of any of the established unicast bearers has changed since the last transmission of the *MBMSInterestIndication* message:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

NOTE: The UE may send an *MBMSInterestIndication* even when it is able to receive the MBMS services it is interested in i.e. to avoid that the network allocates a configuration inhibiting MBMS reception.

3> else if *SystemInformationBlockType20* is broadcast by the PCell:

4> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType20*; or

4> if the set of MBMS services of interest determined in accordance with 5.8.5.3a is different from *mbms-Services* included in the last transmission of the *MBMSInterestIndication* message;

5> initiate the transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4.

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

[TS 36.331, clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.4.3 Test description

21.3.4.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 2 are intra-frequency cells. Cell 1 is "Serving cell" and Cell 2 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1 and Cell 2.
- *SCPTMConfiguration* as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 1 and Cell 2.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in Loopback Activated (State 4) according to [18] in Cell 1 (serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.

21.3.4.3.2 Test procedure sequence

Table 21.3.4.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.4.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Remark
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy exit condition for event A3 (M2 < M1).
T1	Cell-specific RS EPRE	dBm/15kHz	-85	-79	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy entry condition for event A3 (M2 > M1).

Table 21.3.4.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits a *Paging* message including a *systemInfoModification* for Cell1 and Cell 2.	<--	*Paging*	-	-
2	From the beginning of the next modification period the SS starts broadcast of *SystemInformationBlockType15* according to System information combination 27 as defined in TS 36.508[18] clause 4.4.3.1 on Cell 1 and	<--	*SystemInformationBlockType15*	-	-

	Cell 2. *SystemInformationBlockType15* on Cell 1 and Cell 2 is including mbms-SAI-IntraFreq list for the frequency of Cell 1 and Cell 2 indicating MBMS SAI=1.				
3	The UE transmits *MBMSInterestIndication* message.	-->	*MBMSInterestIndication*	-	-
-	Exception; Step 4 is repeated 5 times.	-	-	-	-
4	The SS transmits 2 MBMS Packets on the SC-MTCH.	<--	MBMS Packets	-	-
5	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message.	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
6	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
7	Check: Is the number of reported MBMS Packets received on the MTCH in step 6 greater than zero? (Note: This verifies that UE is receiving active SC-PTM reception on Cell 1 before Intra-frequency handover to Cell 2.)	-	-	-	-
8	The SS transmits an *RRCConnectionReconfiguration* message to setup intra frequency measurement on Cell 1.	<--	*RRCConnectionReconfiguration*	-	-
9	The UE transmits an *RRCConnectionReconfigurationComplete* message on Cell 1 to confirm the setup of intra frequency measurement.	-->	*RRCConnectionReconfigurationComplete*	-	-
10	The SS changes Cell 1 and Cell 2 level according to the row "T1" in table 21.3.4.3.2-1.	-	-	-	-
11	The UE transmits a *MeasurementReport* message to report event A3 on Cell 1 with the measured RSRP, RSRQ value for Cell 2.	-->	*MeasurementReport*	-	-
12	The SS transmits an *RRCConnectionReconfiguration* message on Cell 1 to order the UE to perform intra-frequency handover to Cell 2.	<--	*RRCConnectionReconfiguration*	-	-
13	The UE transmits an *RRCConnectionReconfigurationComplete* message on Cell 2.	-->	*RRCConnectionReconfigurationComplete*	-	-
14	Wait for a period equal to the SC-MCCH repetition period for the UE to receive *SCPTMConfiguration* message on Cell 2.	-	-	-	-
-	Exception; Step 15 is repeated 5 times. .	-	-	-	-
15	The SS transmits 2 MBMS Packets on the SC-MTCH.	<--	MBMS Packets	-	-
16	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message.	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
17	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
18	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 17 greater than the number of reported in step 6? Note: This verifies that UE has performed intra-frequency handover to Cell 2 providing the SC-PTM service and continue SC-PTM reception.	-	-	1	P

21.3.5 Conditional retransmission of MBMS Interest Indication after handover

21.3.5.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC_Connected state AND SystemInformationBlockType15 and
SystemInformationBlockType20 have been acquired by the UE AND the UE has transmitted a
MBMSInterestIndication message on the Pcell }
ensure that {
  when { UE receives a RRCConnectionReconfiguration message including mobilityControlInfo less than
1 second after the last transmission of an MBMSInterestIndication message AND UE has completed the
intra frequency handover procedure }
    then { UE should re-transmit a MBMSInterestIndication message }
            }
```

21.3.5.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.5.4, 5.8.5.3 and 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.5.4]

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

1> stop timer T310, if running;

1> stop timer T312, if running;

1> start timer T304 with the timer value set to *t304*, as included in the *mobilityControlInfo*;

1> stop timer T370, if running;

1> if the *carrierFreq* is included:

2> consider the target PCell to be one on the frequency indicated by the *carrierFreq* with a physical cell identity indicated by the *targetPhysCellId*;

…

1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;

1> if MAC successfully completes the random access procedure:

…

2> if *SystemInformationBlockType15* is broadcast by the PCell:

3> if the UE has transmitted a *MBMSInterestIndication* message during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*:

4> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

4> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;

4> determine the set of MBMS services of interest in accordance with 5.8.5.3a;

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.5.3 Test description

21.3.5.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 2 are intra-frequency cells. Cell 1 is "Serving cell" and Cell 2 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 27 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1 and Cell 2.

- *SCPTMConfiguration* as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 1 and Cell 2.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in state Registered, Idle Mode (state 2) on Cell 1 according to [18].

21.3.5.3.2 Test procedure sequence

Table 21.3.5.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.5.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Remark
T0	Cell-specific RS EPRE	dBm/15k Hz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy exit condition for event A3 (M2 < M1).
T1	Cell-specific RS EPRE	dBm/15k Hz	-85	-79	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy entry condition for event A3 (M2 > M1).

21.3.6 MBMS Interest Indication retransmission after returning from cell not broadcasting SIB15

21.3.6.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_Connected state AND is receiving SC-PTM service and having transmitted a
MBMSInterestIndication message }
ensure that {
  when { UE performs handover to a PCell not broadcasting SystemInformationBlockType15 followed by a
handover to a PCell broadcasting SystemInformationBlockType15 }
    then { UE transmits a MBMSInterestIndication message }
           }
```

21.3.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clauses 5.8.5.2, 5.8.5.3, 5.8.5.3a and 5.8.5.4.

[TS 36.331 clause 5.8.5.2]

An MBMS or SC-PTM capable UE in RRC_CONNECTED may initiate the procedure in several cases including upon successful connection establishment, upon entering or leaving the service area, upon session start or stop, upon change of interest, upon change of priority between MBMS reception and unicast reception or upon change to a PCell broadcasting *SystemInformationBlockType15*.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType15* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

2> if the UE did not transmit an *MBMSInterestIndication* message since last entering RRC_CONNECTED state; or

2> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType15*:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

[TS 36.331 clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331 clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

[TS 36.331 clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.6.3 Test description

21.3.6.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN (PLMN1), Cell 1 and Cell 2 are intra-frequency cells. Cell 1 is a SC-PTM cell and Cell 2 is a non-SC-PTM cell.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- System information combination 1 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 2.

- *SCPTMConfiguration* as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in state Generic RB Established, Test Mode Activated (state 3A) according to [18] in Cell 1 (serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID=1.
- The UE is made aware that the SC-PTM service is active.

21.3.6.3.2 Test procedure sequence

Table 21.3.6.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T0", "T1" and "T2" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.6.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2	Remark
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy exit condition for event A3 (M1 > M2).
T1	Cell-specific RS EPRE	dBm/15kHz	-91	-85	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy entry condition for event A3 (M2 > M1).
T2	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 2 (M2) satisfy entry condition for event A3 (M1 > M2).

21.3.7 MBMS Interest Indication retransmission after returning from cell not broadcasting SIB20

21.3.7.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_Connected state with ongoing SC-PTM service AND having transmitted a
MBMSInterestIndication message }
ensure that {
  when { UE performs handover to a Pcell not broadcasting SystemInformationBlockType20 followed by a
handover to a Pcell broadcasting SystemInformationBlockType20 }
    then { UE transmits a MBMSInterestIndication message }
            }
```

21.3.7.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.8.5.2, 5.8.5.3, 5.8.5.3a and 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.8.5.2]

An MBMS or SC-PTM capable UE in RRC_CONNECTED may initiate the procedure in several cases including upon successful connection establishment, upon entering or leaving the service area, upon session start or stop, upon change of interest, upon change of priority between MBMS reception and unicast reception or upon change to a PCell broadcasting *SystemInformationBlockType15*.

Upon initiating the procedure, the UE shall:

1> if *SystemInformationBlockType15* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

2> if the UE did not transmit an *MBMSInterestIndication* message since last entering RRC_CONNECTED state; or

2> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType15*:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

2> else:

3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, has changed since the last transmission of the *MBMSInterestIndication* message; or

3> if the prioritisation of reception of all indicated MBMS frequencies compared to reception of any of the established unicast bearers has changed since the last transmission of the *MBMSInterestIndication* message:

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

NOTE: The UE may send an *MBMSInterestIndication* even when it is able to receive the MBMS services it is interested in i.e. to avoid that the network allocates a configuration inhibiting MBMS reception.

3> else if *SystemInformationBlockType20* is broadcast by the PCell:

4> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType20*; or

4> if the set of MBMS services of interest determined in accordance with 5.8.5.3a is different from *mbms-Services* included in the last transmission of the *MBMSInterestIndication* message;

5> initiate the transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4.

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

[TS 36.331, clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.7.3 Test description

21.3.7.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 3 are inter-frequency cells. Cell 1 is "Serving cell" and Cell 3 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- System information combination 18 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 3.
- *SCPTMConfiguration* as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 1.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in state Generic RB Established (state 3) on Cell 1 according to [18].
- The UE is made interested in receiving a SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.

21.3.7.3.2 Test procedure sequence

Table 21.3.7.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" and "T2" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.7.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 3	Remark
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy exit condition for event A3 (M1 > M3).
T1	Cell-specific RS EPRE	dBm/15kHz	-91	-85	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy entry condition for event A3 (M3 > M1).
T2	Cell-specific RS EPRE	dBm/15kHz	-85	-91	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy entry condition for event A3 (M1 > M3).

21.3.8 MBMS Interest Indication after Radio Link Failure

21.3.8.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC_Connected stated AND SystemInformationBlockType15 and
SystemInformationBlockType20 have been acquired by the UE }
ensure that {
  when { the UE detects a radio link failure less than 1 second after the last transmission of an
MBMSInterestIndication message }
   then { the UE should re-transmits a MBMSInterestIndication message }
            }
```

21.3.8.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.7.5, 5.8.5.3, 5.8.5.3a and 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.7.5]

The UE shall:

…

1> if *SystemInformationBlockType15* is broadcast by the PCell:

2> if the UE has transmitted an *MBMSInterestIndication* message during the last 1 second preceding detection of radio link failure:

3> ensure having a valid version of *SystemInformationBlockType15* for the PCell;

3> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;

3> determine the set of MBMS services of interest in accordance with 5.8.5.3a;

3> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

[TS 36.331, clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.8.3 Test description

21.3.8.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells with the same PLMN. Cell 1 and Cell 2 are intra-frequency cells. Cell 1 is "Serving cell" and Cell 2 is "Non-suitable cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA Cell 1 and Cell 2.
- SCPTMConfiguration as defined in TS 36.508[18] table 4.6.1-18a is transmitted on SC-MCCH on Cell 1 and Cell 2.

UE:

- E-UTRAN UE supporting SC-PTM services.

Preamble:

- UE is in state Generic RB Established (state 3) on Cell 1 according to [18].
- The UE is made interested in receiving a SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.

21.3.8.3.2 Test procedure sequence

Table 21.3.8.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while row marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.8.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 2
T0	Cell-specific RS EPRE	dBm/15kHz	-85	-115
T1	Cell-specific RS EPRE	dBm/15kHz	“Off”	-85

21.3.9 Continued SC-PTM service reception after E-UTRAN release of unicast bearer

21.3.9.1 Test Purpose (TP)

(1)

```
with { UE in RRC Connected state on a SC-PTM cell and is prioritising MBMS service over unicast data
}
ensure that {
  when { UE receives the SystemInformationBlockType15 message broadcasted on the SC-PTM cell }
    then { UE transmits an MBMSInterestIndication message including the mbms-Priority IE indicating
that UE prioritises reception of MBMS frequencies above reception of any of the unicast bearers }
            }
```

(2)

```
with { UE in E-UTRA RRC_Connected state with a unicast bearer configured AND is receiving SC-PTM
service }
ensure that {
  when { UE receives a RRCConnectionReconfiguration message to release the unicast bearer }
    then { UE accepts the release of the unicast bearer and continues to receive MBMS service }
            }
```

21.3.9.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clause 5.8.5.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331 clause 5.8.5.4]

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:

2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;

2> if *SystemInformationBlockType20* is broadcast by the PCell:

3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

21.3.9.3 Test description

21.3.9.3.1 Pre-test conditions

System Simulator:

- 1 E-UTRA Cell 1 is "Serving cell" as defined in TS 36.508 Table 6.2.2.1-1.
- System information combination 25 as defined in TS 36.508 [18] clause 4.4.3.1 is used in E-UTRA Cell 1.
- *SCPTMConfiguration* message as defined in TS 36.508 [18] Table 4.6.1-18a is transmitted on Cell 1.

UE:

- The UE is supporting SC-PTM services.

Preamble:

- UE is in state Loopback Activated (State 4) with UE TEST LOOP MODE F on Cell 1 according to [18].
- The UE has one dedicated EPS bearer (DRB2) established.
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.
- The UE is configured to prioritise reception of MBMS frequencies above reception of any unicast bearers.
- The UE is made aware that the SC-PTM service is active.

21.3.9.3.2 Test procedure sequence

Table 21.3.9.3.2-1: Main behaviour

21.3.10.1.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC CONNECTED state on a SC-PTM capable cell broadcasting SIB15 and interested
to receive a SC-PTM service}
ensure that {
  when { SIB15 indicates that the MBMS service is available on a frequency on an inter-frequency
neighbour cell within the UE signalled supportedBandCombination capabilities }
    then { UE starts SC-PTM reception on the Non-Serving neighbour cell }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state with ongoing SC-PTM reception on a Non-Serving neighbour
cell }
```

```
ensure that {
  when { UE receives an RRCConnectionReconfiguration message containing sCellToAddModList with a
SCell addition of the Non-Serving cell with ongoing SC-PTM reception and UE adds the new SCell,
configures lower layers to consider the SCell to be in deactivated state and sends an
RRCConnectionReconfigurationComplete message }
    then { UE continues SC-PTM reception on the new SCell }
            }
```

21.3.10.1.2 Conformance requirements

References: The conformance requirements covered in the current TC is specified in: TS 36.306, clause 4.3.5.2 and TS 36.331, clause 5.8.5.3. Unless otherwise stated these are Rel-13 requirements.

[TS 36.306, clause 4.3.5.2]

This field defines the carrier aggregation, MIMO and MBMS reception capabilities (via MBSFN or SC-PTM) supported by the UE for configurations with inter-band, intra-band non-contiguous, intra-band contiguous carrier aggregation and without carrier aggregation. For each band in a band combination the UE provides the supported CA bandwidth classes and the corresponding MIMO capabilities for downlink. The UE also has to provide the supported uplink CA bandwidth class and the corresponding MIMO capability for at least one band in the band combination. Applicability of provisioning uplink CA bandwidth class for each band in the band combinations is defined in TS 36.101 [6]. A MIMO capability applies to all carriers of a bandwidth class of a band in a band combination. For bandwidth classes that include multiple component carriers (i.e. bandwidth classes B, C, D and so on), the UE may also indicate a separate MIMO capability that applies to each individual carrier of a bandwidth class of a band in a band combination.

(...)

The UE that supports MBMS reception via MBSFN shall support MBMS reception via MBSFN on the PCell of MCG, and it may indicate support for MBMS reception via MBSFN on configured SCells (*mbms-SCell*) and for any cell that may be additionally configured as an SCell (*mbms-NonServingCell*) according to this field. The UE that supports MBMS reception via SC-PTM shall support MBMS reception via SC-PTM on the PCell of MCG, and it may indicate support for MBMS reception via SC-PTM on configured SCells (*scptm-SCell*) and for any cell that may be additionally configured as an SCell (*scptm-NonServingCell*) according to this field. The UE shall apply the system information acquisition and change monitoring procedure relevant for MBMS operation for these cells.

The UE indicating more than one frequency in the *MBMSInterestIndication* message as specified in TS 36.331 [5] shall support simultaneous reception of MBMS (via MBSFN or SC-PTM) on the indicated frequencies when the frequencies of the configured serving cells and the indicated frequencies belong to at least one band combination.

(...)

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH.

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

21.3.10.1.3 Test Description

21.3.10.1.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells. Cell 1 is the PCell and Cell3 is an inactive SCell to be added according to [18] cl. 6.3.4.
- SCPTMConfiguration message as defined in TS 36.508 [18] Table 4.6.1-18a is transmitted on Cell 3.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 3.

UE:

- The UE is configured to receive MBMS services.
- The UE has in the signalled IE “supportedBandCombination” indicated support of the CA configuration for the frequency of Cell 1.
- The UE is capable to receiving SCPTM on SCell.
- The UE is capable to receiving SCPTM on NonServingCell.

Preamble:

- UE is in state Loopback Activated (State 4) with UE TEST LOOP MODE F on Cell 1 according to [18].
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.
- The UE is made aware that the MBMS service is active.

21.3.10.1.3.2 Test procedure sequence

Table 21.3.10.1.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while the configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 21.3.10.1.3.2-2.

Table 21.3.10.1.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Cell 1	Cell 3	Remark
T0	Cell-specific RS EPRE	dBm/15k Hz	-85	Off	The power level values are such that camping on Cell 1 is guarantee.

T1	Cell-specific RS EPRE	dBm/15kHz	-85	-79	The power level values are such that measurement results for Cell 1 (M1) and Cell 3 (M3) satisfy entry condition for event A3 (M3 > M1).

Table 21.3.10.1.3.2-2: Main behaviour

21.3.11 CA / Start SC-PTM reception on SCell / Continue SC-PTM reception on Non-Serving after SCell release

21.3.11.1 CA / Start SC-PTM reception on SCell / Continue SC-PTM reception on Non-Serving after SCell release / Intra-band Contiguous CA

21.3.11.1.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC CONNECTED state with PCell and SCell activate and both broadcasting SIB15
and UE is interested to receive a SC-PTM service}
ensure that {
  when { SIB15 indicates that the MBMS service is available on the frequency of the SCell }
    then { UE starts SC-PTM reception on the Scell }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state with active PCell and SCell and ongoing SC-PTM reception on
the SCell }
ensure that {
  when { UE receives an RRCConnectionReconfiguration message containing sCellToReleaseList with a
sCellIndex equalling to the current UE SCell configuration with ongoing SC-PTM reception and UE
releases the SCell and sends an RRCConnectionReconfigurationComplete message }
    then { UE continues SC-PTM reception on the former SCell (now Non-Serving cell) }
            }
```

21.3.11.1.2 Conformance requirements

References: The conformance requirements covered in the current TC is specified in: TS 36.306, clause 4.3.5.2 and TS 36.331, clause 5.8.5.3 and 5.8.5.3a. Unless otherwise stated these are Rel-13 requirements.

[TS 36.306, clause 4.3.5.2]

This field defines the carrier aggregation, MIMO and MBMS reception capabilities (via MBSFN or SC-PTM) supported by the UE for configurations with inter-band, intra-band non-contiguous, intra-band contiguous carrier aggregation and without carrier aggregation. For each band in a band combination the UE provides the supported CA bandwidth classes and the corresponding MIMO capabilities for downlink. The UE also has to provide the supported uplink CA bandwidth class and the corresponding MIMO capability for at least one band in the band combination. Applicability of provisioning uplink CA bandwidth class for each band in the band combinations is defined in TS 36.101 [6]. A MIMO capability applies to all carriers of a bandwidth class of a band in a band combination. For bandwidth classes that include multiple component carriers (i.e. bandwidth classes B, C, D and so on), the UE may also indicate a separate MIMO capability that applies to each individual carrier of a bandwidth class of a band in a band combination.

(...)

The UE that supports MBMS reception via MBSFN shall support MBMS reception via MBSFN on the PCell of MCG, and it may indicate support for MBMS reception via MBSFN on configured SCells (*mbms-SCell*) and for any cell that may be additionally configured as an SCell (*mbms-NonServingCell*) according to this field. The UE that supports MBMS reception via SC-PTM shall support MBMS reception via SC-PTM on the PCell of MCG, and it may indicate support for MBMS reception via SC-PTM on configured SCells (*scptm-SCell*) and for any cell that may be additionally configured as an SCell (*scptm-NonServingCell*) according to this field. The UE shall apply the system information acquisition and change monitoring procedure relevant for MBMS operation for these cells.

The UE indicating more than one frequency in the *MBMSInterestIndication* message as specified in TS 36.331 [5] shall support simultaneous reception of MBMS (via MBSFN or SC-PTM) on the indicated frequencies when the frequencies of the configured serving cells and the indicated frequencies belong to at least one band combination.

(...)

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH.

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. [9, Annex J.1]

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

21.3.11.1.3 Test Description

21.3.11.1.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells. Cell 1 is the PCell, Cell3 is an inactive SCell to be added, according to [18] cl. 6.3.4.
- SCPTMConfiguration message as defined in TS 36.508 [18] Table 4.6.1-18a is transmitted on Cell 3.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 3.

UE:

- The UE is configured to receive MBMS services.
- The UE has in the signalled IE “supportedBandCombination” indicated support of the CA configuration for the frequency of Cell 1.
- The UE is capable to receiving SCPTM on SCell.
- The UE is capable to receiving SCPTM on NonServingCell.

Preamble:

- UE is in state Loopback Activated (State 4) with UE TEST LOOP MODE F on Cell 1 according to [18].
- The UE is made interested in receiving SC-PTM service with MBMS Service ID=1 as broadcasted in *SCPTMConfiguration*.
- The UE is made aware that the MBMS service is active.

21.3.11.1.3.2 Test procedure sequence

Table 21.3.11.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U – S	Message		
1	The SS transmits an *RRCConnectionReconfiguration* message containing a *sCellToAddModList* with Cell 3 as SCell addition.	<--	*RRCConnectionReconfiguration*	-	-
2	The UE transmits an *RRCConnectionReconfigurationComplete* message	-->	*RRCConnectionReconfigurationComplete*	-	-
3	The SS transmits a Paging message including a systemInfoModification for Cell1.	<--	*Paging*	-	-
4	From the beginning of the next modification period the SS starts broadcast of *SystemInformationBlockType15* according to system information combination 18 as defined in TS 36.508[18] clause 4.4.3.1 on Cell 1 and according to system information combination 28 as defined in TS 36.508[18] clause 4.4.3.1 on Cell 3. *SystemInformationBlockType15* on Cell 1 is including mbms-SAI-InterFreqList-r11 list for the frequency of Cell 3 indicating MBMS SAI=1. *SystemInformationBlockType15* on Cell 3 is including mbms-SAI-IntraFreq-r11 list	<--	*SystemInformationBlockType15*	-	-

	indicating MBMS SAI=1.				
5	The UE transmits an *MBMSInterestIndication* message.	-->	*MBMSInterestIndication*	-	-
6	Wait for a period equal to the SC-MCCH repetition period for the UE to receive *SCPTMConfiguration* message	-	-	-	-
-	Exception; Step 7 is repeated 5 times	-	-	-	-
7	The SS transmits 2 MBMS Packets on the SC-MTCH	<--	MBMS Packets	-	-
8	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message on Cell 1.	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
9	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
10	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 9 greater than zero? (Note: This verifies that UE has received MBMS packets on the SCell providing the MBMS service and started SC-PTM reception)	-	-	1	P
11	The SS transmits an *RRCConnectionReconfiguration* message containing a *sCellToReleaseList* with SCell release of Cell 3.	<--	*RRCConnectionReconfiguration*	-	-
12	The UE transmits an *RRCConnectionReconfigurationComplete* message	-->	*RRCConnectionReconfigurationComplete*	-	-
-	Exception; Step 13 is repeated 5 times	-	-	-	-
13	The SS transmits 2 MBMS Packets on the SC-MTCH.	<--	MBMS Packets	-	-
14	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message on Cell 1	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
15	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
16	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 15 greater than the number reported in step 9? (Note: This verifies that UE continue to receive MBMS packets on Cell 3 after being released as SCell and becoming a Non-Serving cell)	-	-	2	P

21.3.12.1.2 Conformance requirements

References: The conformance requirements covered in the current TC is specified in: TS 36.306, clause 4.3.5.2 and TS 36.331, clauses 5.8.5.3 and 5.8.5.3a. Unless otherwise stated these are Rel-13 requirements.

[TS 36.306, clause 4.3.5.2]

This field defines the carrier aggregation, MIMO and MBMS reception capabilities (via MBSFN or SC-PTM) supported by the UE for configurations with inter-band, intra-band non-contiguous, intra-band contiguous carrier aggregation and without carrier aggregation. For each band in a band combination the UE provides the supported CA bandwidth classes and the corresponding MIMO capabilities for downlink. The UE also has to provide the supported uplink CA bandwidth class and the corresponding MIMO capability for at least one band in the band combination. Applicability of provisioning uplink CA bandwidth class for each band in the band combinations is defined in TS 36.101 [6]. A MIMO capability applies to all carriers of a bandwidth class of a band in a band combination. For bandwidth classes that include multiple component carriers (i.e. bandwidth classes B, C, D and so on), the UE may also indicate a separate MIMO capability that applies to each individual carrier of a bandwidth class of a band in a band combination.

(...)

The UE that supports MBMS reception via MBSFN shall support MBMS reception via MBSFN on the PCell of MCG, and it may indicate support for MBMS reception via MBSFN on configured SCells (*mbms-SCell*) and for any cell that may be additionally configured as an SCell (*mbms-NonServingCell*) according to this field. The UE that supports MBMS reception via SC-PTM shall support MBMS reception via SC-PTM on the PCell of MCG, and it may indicate support for MBMS reception via SC-PTM on configured SCells (*scptm-SCell*) and for any cell that may be additionally configured as an SCell (*scptm-NonServingCell*) according to this field. The UE shall apply the system information acquisition and change monitoring procedure relevant for MBMS operation for these cells.

The UE indicating more than one frequency in the *MBMSInterestIndication* message as specified in TS 36.331 [5] shall support simultaneous reception of MBMS (via MBSFN or SC-PTM) on the indicated frequencies when the frequencies of the configured serving cells and the indicated frequencies belong to at least one band combination.

(...)

[TS 36.331, clause 5.8.5.3]

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see 3GPP TS 36.300 [9] or 3GPP TS 26.346 [57].

2> for at least one of these MBMS sessions *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB for the concerned session. I.e. the UE does not verify if the session is indicated on MCCH.

2> the UE is capable of simultaneously receiving the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 3: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 4: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 5: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

[TS 36.331, clause 5.8.5.3a]

The UE shall:

1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:

2> the UE is SC-PTM capable; and

2> the UE is receiving or interested to receive this service via an SC-MRB; and

2> one session of this service is ongoing or about to start; and

2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

21.3.12.1.3 Test Description

21.3.12.1.3.1 Pre-test conditions

System Simulator:

- 2 E-UTRA cells. Cell 1 is the PCell, Cell3 is an inactive SCell to be added according to [18] cl. 6.3.4.
- SCPTMConfiguration message as defined in TS 36.508 [18] Table 4.6.1-18a is transmitted on Cell 1.
- System information combination 26 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 1.
- System information combination 3 as defined in TS 36.508[18] clause 4.4.3.1 is used in Cell 3.

UE:

- The UE is configured to receive MBMS services.
- The UE has in the signalled IE “supportedBandCombination” indicated support of the CA configuration for the frequency of Cell 1.
- The UE is capable to receiving SCPTM on SCell.

Preamble:

- UE is in state Loopback Activated (State 4) with UE TEST LOOP MODE F on Cell 1 according to [18].
- The UE is made interested in receiving a MBMS service with MBMS Service ID=1 associated with the MBMS SAI (1) broadcasted in *SCPTMConfiguration*.

- The UE is made aware that the MBMS service is active.

21.3.12.1.3.2 Test procedure sequence

Table 21.3.12.1.3.2-1 illustrates the downlink power levels to be applied for Cell 1 at various time instants of the test execution. Row marked "T0" denotes the conditions after the preamble, while rows marked "T1" and "T2" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 21.3.12.1.3.2-1: Power levels

	Parameter	Unit	Cell 1	Cell 3	Remark
T0	Cell-specific RS EPRE	dBm/15 kHz	-70	-96	Power level for Cell 1 is such that *Ms > Thresh + Hys*
T1			-96	-70	Power level for Cell 1 is such that entry condition for event A2 is satisfied *Ms + Hys < Thresh*
T2			-70	-96	Power level for Cell 3 is such that exit condition for event A2 is satisfied *Ms > Thresh + Hys*
Note: The total tolerance used is the sum of downlink signal level uncertainty (TS 36.508 clause 6.2.2.1) and absolute UE measurement accuracy (TS 36.133 clause 9).					

Table 21.3.12.1.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U – S	Message		
1	The SS transmits an *RRCConnectionReconfiguration* message containing a *sCellToAddModList* with Cell 3 as SCell addition on Cell 1.	<--	*RRCConnectionReconfiguration*	-	-
2	The UE transmits an *RRCConnectionReconfigurationComplete* message	-->	*RRCConnectionReconfigurationComplete*	-	-
3	The SS transmits a Paging message including a systemInfoModification for Cell1.	<--	*Paging*	-	-
4	From the beginning of the next modification period the SS starts broadcast of *SystemInformationBlockType15* according to system information combination 28 as defined in TS 36.508[18] clause 4.4.3.1 on Cell 1 and according to system information combination 18 as defined in TS 36.508[18] clause 4.4.3.1 on Cell 3. *SystemInformationBlockType15* on Cell 1 is including mbms-SAI-IntraFreqList-r11 list indicating MBMS SAI=1. *SystemInformationBlockType15* on Cell 3 is including mbms-SAI-InterFreqList-r11 list for the frequency of Cell 1 indicating MBMS SAI=1.	<--	*SystemInformationBlockType15*	-	-
5	The UE transmits a *MBMSInterestIndication* message.	-->	*MBMSInterestIndication*	-	-
6	Wait for a period equal to the SC-MCCH modification period for the UE to receive *SCPTMConfiguration* message	-	-	-	-
-	Exception; Step 7 is repeated 5 times	-	-	-	-
7	The SS transmits 2 MBMS Packets on the SC-MTCH.	<--	MBMS Packets	-	-
8	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message on Cell 1.	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
9	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
10	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 9 greater than zero?	-	-	1	P

	(Note: This verifies that UE has received MBMS packets on the PCell providing the MBMS service and started SC-PTM reception)				
11	SS transmits an *RRCConnectionReconfiguration* message including *measConfig* to setup intra LTE measurement and reporting for event A2 on Cell 1.	<--	*RRCConnectionReconfiguration*	-	-
12	The UE transmits an *RRCConnectionReconfigurationComplete* message.	-->	*RRCConnectionReconfigurationComplete*	-	-
13	SS re-adjusts the cell-specific reference signal level according to row "T1" in table 21.3.12.1.3.2-1.	-	-	-	-
14	UE transmits a *MeasurementReport* message to report event A2 for Cell 1	-->	*MeasurementReport*	-	-
15	The SS transmits an *RRCConnectionReconfiguration* message containing to reconfigure the PCell as SCell and the SCell as PCell	<--	*RRCConnectionReconfiguration*	-	-
16	The UE transmits an *RRCConnectionReconfigurationComplete* message	-->	*RRCConnectionReconfigurationComplete*	-	-
17	Wait for a period equal to the SC-MCCH modification period for the UE to receive *SCPTMConfiguration* message on SCell (Cell 1)	-	-	-	-
-	Exception; Step 18 is repeated 5 times	-	-	-	-
18	The SS transmits 2 MBMS Packets on the SC-MTCH.	<--	MBMS Packets.	-	-
19	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message on Cell 3.	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
20	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
21	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 16 greater than the number reported in step 9? (Note: This verifies that UE continue to receive MBMS packets on Cell 1 after being reconfigured as SCell)	-	-	2	P
22	SS transmits an *RRCConnectionReconfiguration* message on Cell 3 including *measConfig* to setup intra LTE measurement and reporting for event A2 on Cell 3.	<--	*RRCConnectionReconfiguration*	-	-
23	The UE transmits an *RRCConnectionReconfigurationComplete* message.	-->	*RRCConnectionReconfigurationComplete*	-	-
24	SS re-adjusts the cell-specific reference signal level according to row "T2" in table 21.3.12.1.3.2-1.	-	-	-	-
25	UE transmits a *MeasurementReport* message to report event A2 for Cell 3	-->	*MeasurementReport*	-	-
26	The SS transmits an *RRCConnectionReconfiguration* message containing to reconfigure the PCell as SCell and the SCell as PCell	<--	*RRCConnectionReconfiguration*	-	-
27	The UE transmits an *RRCConnectionReconfigurationComplete* message	-->	*RRCConnectionReconfigurationComplete*	-	-
28	Wait for a period equal to the SC-MCCH modification period for the UE to receive *SCPTMConfiguration* message on PCell (Cell 1)	-	-	-	-
-	Exception: Step 29 is repeated 5 times				
29	The SS transmits 2 MBMS Packets on the SC-	<--	MBMS Packets.	-	-

	MTCH on Cell 1.				
30	The SS transmits an UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST message on Cell 1	<--	UE TEST LOOP MODE F SCPTM PACKET COUNTER REQUEST	-	-
31	UE responds with UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE.	-->	UE TEST LOOP MODE F SCPTM PACKET COUNTER RESPONSE	-	-
32	Check: Is the number of reported MBMS Packets received on the SC-MTCH in step 31 greater than the number reported in step 20? (Note: This verifies that UE continues to receive MBMS packets on Cell 1 after being reconfigured as PCell)	-	-	3	P

21.3.12.1.3.3 Specific message contents

Table 21.3.12.1.3.3-0: Conditions for specific message contents in Tables 21.3.12.1.3.3-4, 21.3.12.1.3.3-5, 21.3.12.1.3.3-6, 21.3.12.1.3.3-9, 21.3.12.1.3.3-13, 21.3.12.1.3.3-14 21.3.12.1.3.3-15, 21.3.12.1.3.3-16, 21.3.12.1.3.3-18, 21.3.12.1.3.3-22, 21.3.12.1.3.3-23 21.3.12.1.3.3-24 and 21.3.12.1.3.3-25

Condition	Explanation
Uplink_CA	The UE supports carrier aggregation in UL under the test band.
Band > 64	This condition applies if the band number is bigger than 64.

Same as test case 21.3.12.1 with the following differences:

- Cells configuration: Cell 10 replaces Cell 3.

21.3.13 SC-PTM Stop Indication / Enhanced Coverage

21.3.13.1 Test Purpose (TP)

(1)

```
with { Enhanced Coverage Capable UE receiving SC-PTM service }
ensure that {
  when { SC-PTM Stop Indication MAC control element associated with a G-RNTI is received }
    then { UE stops  monitoring the PDCCH for this G-RNTI }
        }
```

21.3.13.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 5.21, 6.1.3.12 and 6.2.1

[TS 36.321, clause 5.21]

For NB-IoT UEs, BL UEs or UEs in enhanced coverage, the eNB may transmit the SC-PTM Stop Indication MAC control element to the MAC entity to indicate that the transmission of SC-MTCH associated with a G-RNTI is stopped as described in subclause 6.1.3.12.

Upon reception of the SC-PTM Stop Indication MAC control element associated with a G-RNTI, the MAC entity shall:

- stop monitoring the PDCCH for this G-RNTI;
- indicate to upper layers that the associated MBMS session is stopped.

[TS 36.321, clause 6.1.3.12]

The SC-PTM Stop Indication MAC control element is applicable to NB-IoT UEs and BL UEs or UEs in enhanced coverage and indicates that the SC-MTCH transmission for a specific G-RNTI is stopped. It is identified by a MAC PDU subheader with LCID as specified in table 6.2.1-1.

It has a fixed size of zero bits.

[TS 36.321, clause 6.2.1]

…

The MAC header and subheaders are octet aligned.

Table 6.2.1-1: Values of LCID for DL-SCH

Codepoint/Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011-01111	Reserved
10000	Extended logical channel ID field
10001	Reserved
10010	Activation/Deactivation of PDCP Duplication
10011	Hibernation (1 octet)
10100	Hibernation (4 octets)
10101	Activation/Deactivation of CSI-RS
10110	Recommended bit rate
10111	SC-PTM Stop Indication
11000	Activation/Deactivation (4 octets)
11001	SC-MCCH, SC-MTCH (see note)
11010	Long DRX Command
11011	Activation/Deactivation (1 octet)
11100	UE Contention Resolution Identity
11101	Timing Advance Command
11110	DRX Command
11111	Padding
NOTE: Both SC-MCCH and SC-MTCH cannot be multiplexed with other logical channels in the same MAC PDU except for Padding and SC-PTM Stop Indication	

Table 6.2.1-1a: Values of eLCID for DL-SCH

Codepoint	Index	LCID values
000000-000110	32-38	Identity of the logical channel
000111-111111	39-95	Reserved

For NB-IoT only the following LCID values for DL-SCH are applicable: CCCH, Identity of the logical channel, SC-PTM Stop Indication, SC-MCCH/SC-MTCH, UE Contention Resolution Identity, Timing Advance Command, DRX Command and Padding.

…

21.3.13.3 Test description

21.3.13.3.1 Pre-test conditions

System Simulator:

- Cell 1.
- System information combination 25 as defined in TS 36.508[18] clause 4.4.3.1 is used in E-UTRA cell 1.
- SCPTMConfiguration-BR as defined in TS 36.508[18] table 4.6.1-18b is transmitted on SC-MCCH in Cell 1.

UE:

- E-UTRAN UE supporting Enhanced Coverage and SC-PTM services.

Preamble:

- UE is in Registered, Idle mode, Test Mode Activated (State 2A) according to [18] in Cell 1(serving cell) with the UE TEST LOOP MODE F.
- The UE is made interested in receiving SC-PTM service in the PLMN of Cell 1 with MBMS Service ID 1.

21.3.13.3.2 Test procedure sequence

Table 21.3.13.3.2-1: Main Behaviour

22 NB-IoT

22.1 General

22.1.1 NB-IoT / Control Plane CIoT EPS optimisation for EPS services

22.1.1.0 Test Scope

The following features relevant to Control Plane CIoT EPS optimisation for EPS are verified in the present TC:

Module 1 (M1): Attach for Control Plane CIoT EPS optimisation for EPS services with/without SMS-only

sT01 Attach for Control Plane CIoT EPS optimisation for EPS services with/without SMS-only

sT02 UE identification (IMSI)

sT03 UE authentication

sT04 Security mode control procedure

- PDN handling during attach

  sT05 EMM-REGISTERED without PDN connection

  sT06 EMM-REGISTERED with PDN connection

    - IP and none-IP PDN

    - Header compression configuration negotiation (if requested by the UE for IP data)

    - RB establishment (SRB only)

- RRC

  sT07 RRC Connection establishment

  sT08 Void

  sT09 UE Connection release

Module 2 (M2): UE and Network transmission of user data via the control plane (non-SMS service)

sT10 UE transmission of user data via the control plane in EMM-IDLE and EMM-CONNECTED

sT11 UE reception of Network transmission of user data via the control plane in EMM-IDLE and EMM-CONNECTED

sT12 PDN handling in the case of EMM-REGISTERED without PDN connection

    - IP and none-IP PDN

    - Header compression configuration negotiation (if requested by the UE for IP data)

    - RB establishment (SRB only)

    - PDN release

sT13- Serving PLMN rate control

sT14 APN rate control

sT22 EPS bearer context modification

- RRC

sT16 Paging

sT17 RRC Connection establishment

Module 3 (M3): UE and Network transmission of SMS via the control plane

sT18 UE transmission of SMS via the control plane in EMM-IDLE and EMM-CONNECTED

sT19 UE reception of Network transmission of SMS via the control plane in EMM-IDLE and EMM-CONNECTED

- RRC

sT20 Paging

sT17 RRC Connection establishment

sT21, sT23, sT24 Void

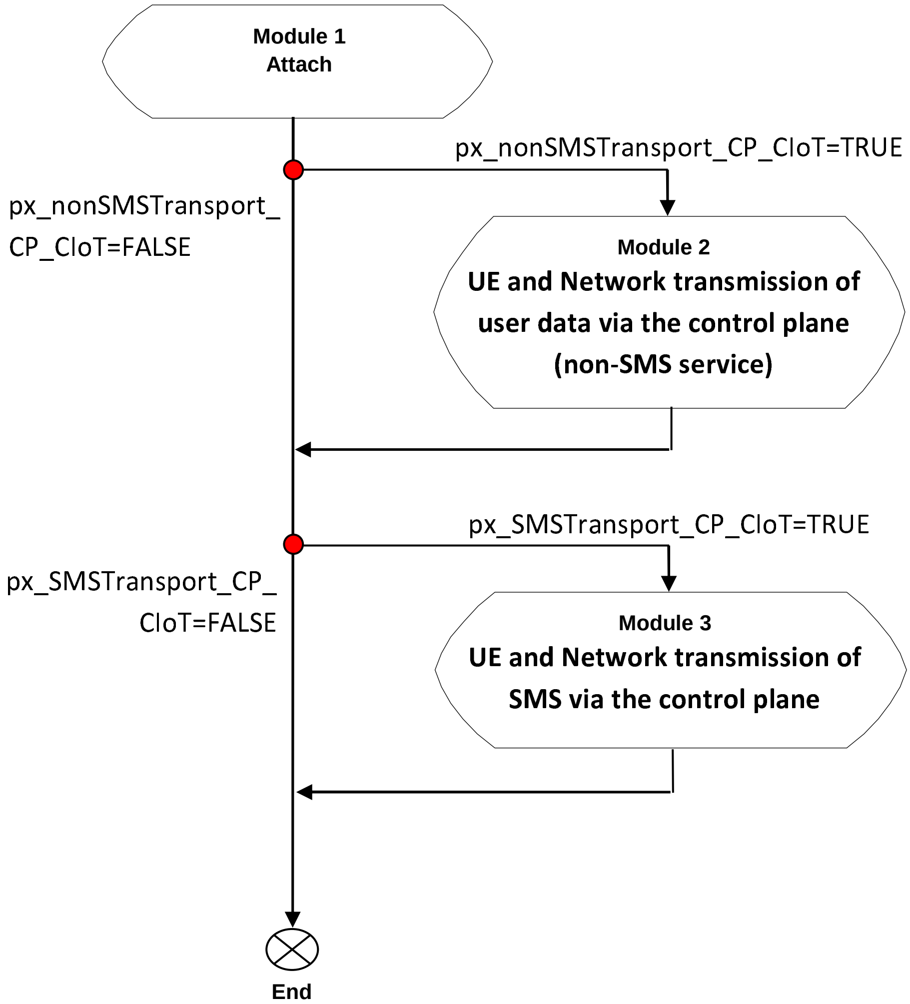

Figure 22.1.1.0-1: TC structure

22.1.1.1 Test Purpose (TP)

(1) sT01, sT05, sT06, sT07, sT09

```
with { the UE in EMM-DEREGISTERED/RRC-IDLE }
ensure that {
```

```
  when { UE finds a cell which provides access by NB-IoT RAT and supports attach without PDN }
    then { the UE establishes RRC connection, and, successfully performs an attach procedure for
Control Plane CIoT EPS optimisation (with or without PDN establishment depending on the UE support
of Attach without PDN), and, releases the RRC connection when requested by the Network }
            }
```

(2) sT02, sT03, sT04

```
with { the UE in EMM-DEREGISTERED/RRC-CONNECTED }
ensure that {
  when { the UE is performing an attach procedure (Control Plane CIoT EPS optimisation only) }
    then { the UE performs successfully an Identity request procedure initiated by the network
requesting the UE's IMSI and provides the requested identity }
    then { the UE performs successfully an Authentication procedure initiated by the network and
establishes correct EPS security context }
    then { the UE performs successfully a Security mode control procedure }
            }
```

(3) sT12

```
with { the UE in RRC-CONNECTED, and, the UE needs to establish one or more PDNs (Control Plane CIoT
EPS optimisation) }
ensure that {
  when { the UE supports PDN type non-IP }
    then { the UE performs successfully an UE requested PDN connectivity procedure with PDN type
non-IP }
  when { the UE supports PDN type IP }
    then { the UE performs successfully an UE requested PDN connectivity procedure with PDN type IP,
including Header compression configuration negotiation (if supported) }
            }
```

(4) sT12

```
with { the UE supporting attach without PDN, and, in EMM-REGISTERED/RRC-CONNECTED, and, the UE
having established one or more PDNs for the purposes of user data transmission as part of Control
Plane CIoT EPS optimisation }
ensure that {
  when { there is no need for transmission of user data }
    then { the UE successfully performs a UE requested PDN disconnect procedure, or, accepts a
Network requested PDN disconnect procedure otherwise, and, releases all EPS bearer contexts
established towards all active PDNs }
            }
```

(5) sT11, sT12, sT17, sT22

```
with { the UE in RRC-IDLE after attaching with Control Plane CIoT EPS optimisation for EPS services
}
ensure that {
  when { UE has user data to send via the control plane }
    then { the UE initiates a Service request procedure for EPS services with Control Plane CIoT EPS
optimization by sending a CONTROL PLANE SERVICE REQUEST message (rules for ciphering of the initial
NAS message apply )
  when { UE has already a PDN established }
    then { the UE incorporates ESM DATA TRANSPORT message carrying the user data in the CONTROL
PLANE SERVICE REQUEST message (rules for ciphering of the initial NAS message apply) }
  when { UE does not have a PDN established }
    then { the UE performs successfully one or more (if supported) UE requested PDN connectivity
procedure(s) with PDN type non-IP/IP before submitting ESM DATA TRANSPORT message }
  when { UE, while in RRC-CONNECTED, has user data to send via the control plane }
    then { the UE sends one or more ESM DATA TRANSPORT message(s) including the user data to be sent
in the User data container IE }
  when { UE performs Control Plane data transfer whenever this is needed }
    then { the UE obeys the local serving PLMN rate control }
            }
```

(6) sT13, sT14, sT22

```
with { the UE in RRC-IDLE after attaching with Control Plane CIoT EPS optimisation for EPS services
}
ensure that {
  when { UE performs Control Plane data transfer whenever this is needed }
    then { the UE obeys the local serving PLMN rate control, and, when supported the APN rate
control provided through EPS bearer context modification }
            }
```

(7) sT10, sT12, sT16, sT17

```
with { the UE in RRC-IDLE after attaching with Control Plane CIoT EPS optimisation for EPS services
}
ensure that {
  when { the Network has user data to send via the control plane, and, has executed a Paging for EPS
services procedure }
    then { the UE successfully completes RRC connection establishment together with Service request
procedure for EPS services with Control Plane CIoT EPS optimization }
  when { UE does not have a PDN established }
    then { the UE performs successfully one or more (if supported) UE requested PDN connectivity
procedure(s) with PDN type non-IP/IP }
  when { UE has a PDN established }
    then { is able to receive user data sent via ESM DATA TRANSPORT message }
            }
```

(8) sT18, sT17

```
with { the UE RRC-IDLE after attaching with Control Plane CIoT EPS optimisation for EPS services,
"SMS-only" included }
ensure that {
  when { UE has SMS messages to send }
    then { the UE initiates a Service request procedure for EPS services with Control Plane CIoT EPS
optimization by sending a CONTROL PLANE SERVICE REQUEST message and including the first SMS message
encapsulated it the NAS message container IE, and, every subsequent SMS message included in a UPLINK
NAS TRANSPORT message sent as part of a UE initiated transport of NAS messages procedure }
  when { UE, while in RRC-CONNECTED, has SMS messages to send }
    then { the UE sends one or more UPLINK NAS TRANSPORT message(s) including the SMS }
            }
```

22.1.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.3.1.4, 5.3.3.3, 5.3.3.4, 5.6.3.3; TS 24.301, clauses 5.3.15, 5.5.1.1, 5.5.1.2.2, 5.6.1.1, 5.6.1.2.2, 5.6.2.2.1.1, 5.6.3.1, 5.6.3.2, 5.6.3.3, 6.2A, 6.3.8, 6.3.9, 6.4.1.3, 6.4.3.3, 6.5.1.2, 6.5.2.1, 6.6.4.2. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.1.4]

In NB-IoT, during the RRC connection establishment procedure, SRB1bis is established implicitly with SRB1. SRB1bis uses the logical channel identity defined in 9.1.2a, with the same configuration as SRB1 but no PDCP entity. SRB1bis is used until security is activated. The RRC messages to activate security (command and successful response) are sent over SRB1 being integrity protected and ciphering is started after completion of the procedure. Once security is activated, new RRC messages shall be transmitted using SRB1. A NB-IoT UE that only supports the Control Plane CIoT EPS optimisation (see TS 24.301 [35]) only establishes SRB1bis.

A NB-IoT UE only supports 0, 1 or 2 DRBs, depending on its capability. A NB-IoT UE that only supports the Control Plane CIoT EPS optimisation ([24.301]) does not need to support any DRBs and associated procedures.

[TS 36.331, clause 5.3.3.3]

The UE shall set the contents of *RRCConnectionRequest* message as follows:

1> set the *ue-Identity* as follows:

2> if upper layers provide an S-TMSI:

3> set the *ue-Identity* to the value received from upper layers;

2> else:

3> draw a random value in the range 0 .. 2^{40}-1 and set the *ue-Identity* to this value;

NOTE 1: Upper layers provide the S-TMSI if the UE is registered in the TA of the current cell.

1> if the UE supports *mo-VoiceCall* establishment cause and UE is establishing the RRC connection for mobile originating MMTEL voice and *SystemInformationBlockType2* includes *voiceServiceCauseIndication*:

2> set the *establishmentCause* to *mo-VoiceCall*;

1> else:

2> set the *establishmentCause* in accordance with the information received from upper layers;

1> if the UE is a NB-IoT UE:

2> if the UE supports multi-tone transmission, include *multiToneSupport*;

2> if the UE supports multi-carrier operation, include *multiCarrierSupport*;

The UE shall submit the *RRCConnectionRequest* message to lower layers for transmission.

[TS 36.331, clause 5.3.3.4]

1> set the content of *RRCConnectionSetupComplete* message as follows:

...

2> set the *selectedPLMN-Identity* to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]) from the PLMN(s) included in the *plmn-IdentityList* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB* in NB-IoT);

...

2> if the UE supports CIoT EPS optimisation(s):

3> if the UE is establishing the RRC connection for mobile originating signalling:

4> include pc_AttachWithoutPDN-*Connectivity* if received from upper layers;

4> for NB-IoT, include *up-CIoT-EPS-Optimisation* if received from upper layers;

...

2> set the *dedicatedInfoNAS* to include the information received from upper layers;

...

2> submit the *RRCConnectionSetupComplete* message to lower layers for transmission, upon which the procedure ends;

[TS 36.331, clause 5.6.3.3]

The UE shall:

1> for NB-IoT, set the contents of *UECapabilityInformation* message as follows:

2> include the UE Radio Access Capability Parameters within the *ue-Capability-Container*;

2> include *ue-RadioPagingInfo*;

2> submit the *UECapabilityInformation* message to lower layers for transmission, upon which the procedure ends;

[TS 24.301, clause 5.3.15]

CIoT EPS optimizations provide improved support of small data and SMS transfer. A UE supporting CIoT EPS optimizations can request the use of CIoT EPS optimizations during an attach or tracking area updating procedure to indicate the CIoT network behaviour the UE can support and prefer to use (see 3GPP TS 23.401 [10]). The UE may indicate the support for control plane CIoT EPS optimization, user plane CIoT EPS optimization, EMM-REGISTERED without PDN connection, S1-U data transfer and header compression (see subclause 9.9.3.34). The UE may also request to use SMS transfer without combined attach procedure during the attach procedure. Furthermore, the UE may, separately from the indication of support, indicate preference for control plane CIoT EPS optimization or user plane CIoT EPS optimization (see subclause 9.9.3.0B). The indication of preference is also considered as the request to use.

The UE can be in NB-S1 mode or WB-S1 mode when requesting the use of CIoT EPS optimizations during an attach or tracking area updating procedure. A UE in NB-S1 mode always indicates support for control plane CIoT EPS optimization. A UE in NB-S1 mode can also request SMS transfer without combined procedure by using the normal attach or tracking area updating procedure (see subclause 5.5.1 and 5.5.3).

In NB-S1 mode, the UE, when requesting the use of CIoT EPS optimization, does not:

- request an attach for emergency bearer services procedure;
- request an attach procedure for initiating a PDN connection for emergency bearer services with attach type not set to "EPS emergency attach"; or
- indicate voice domain preference and UE's usage setting.

The network does not indicate to the UE support of emergency bearer services when the UE is in NB-S1 mode (see subclause 5.5.1.2.4 and 5.5.3.2.4).

The control plane CIoT EPS optimization enables support of efficient transport of user data (IP, non-IP) or SMS messages over control plane via the MME without triggering data radio bearer establishment. The support of control plane CIoT EPS optimization is mandatory for the network in NB-S1 mode and optional in WB-S1 mode. Optional header compression of IP data can be applied to IP PDN type PDN connections that are configured to support header compression.

The user plane CIoT EPS optimization enables support for change from EMM-IDLE mode to EMM-CONNECTED mode without the need for using the service request procedure (see subclause 5.3.1.3).

If the UE indicates support of EMM-REGISTERED without PDN connection in the attach request, the UE may include an ESM DUMMY MESSAGE instead of a PDN CONNECTIVITY REQUEST message as part of the attach procedure. If the EMM-REGISTERED without PDN connection is supported by the network, the UE and the network can at any time release all the PDN connections and the UE still remains EPS attached.

NOTE: For both the UE and the network, the term "EMM-REGISTERED without PDN connection" is equivalent to the term "EPS attach without PDN connectivity" as specified in 3GPP TS 23.401 [10].

In NB-S1 mode, if the UE indicates "SMS only" during a normal attach or tracking area updating procedure, the MME supporting CIoT EPS optimisations provides SMS so that the UE is not required to perform a combined attach or tracking area updating procedure.

If the UE supports user plane CIoT EPS optimization, it shall also support S1-U data transfer.

If the UE indicates support for one or more CIoT EPS optimizations and the network supports one or more CIoT EPS optimizations and decides to accept the attach or tracking area update request, the network indicates the supported CIoT EPS optimizations to the UE per TAI list when accepting the UE request. Network indication of support is interpreted by the UE as the acceptance to use the respective feature. After completion of the attach or tracking area updating procedure, the UE and the network can then use the accepted CIoT EPS optimizations for the transfer of user data (IP, non-IP and SMS).

...

Broadcast system information may provide information about support of CIoT EPS optimizations (see 3GPP TS 36.331 [22]). At reception of new broadcast system information, the lower layers deliver it to the EMM layer in the UE. The information provided by lower layers is per PLMN and used by the UE to determine whether certain CIoT EPS optimizations are supported in the cell.

The UE shall not request CIoT EPS optimizations which are indicated as not supported.

If the UE only supports EMM-REGISTERED without PDN connection, i.e. the UE cannot request PDN connectivity during the attach procedure, this CIoT EPS optimization is not indicated as supported for the PLMN in the broadcast system information, and the UE has to perform an attach or tracking area updating procedure, the UE shall perform a PLMN selection procedure according to 3GPP TS 23.122 [6].

In NB-S1 mode, when the UE requests the lower layer to establish a RRC connection and the UE requests the use of EMM-REGISTERED without PDN connection or user plane CIoT EPS optimization, the UE shall pass an indication of the requested CIoT EPS optimizations to the lower layers.

In WB-S1 mode, when the UE requests the lower layer to establish a RRC connection and the UE requests the use of EMM-REGISTERED without PDN connection, control plane CIoT EPS optimization or user plane CIoT EPS optimization, the UE shall pass an indication of the requested CIoT EPS optimizations to the lower layers.

[TS 24.301, clause 5.5.1.1]

The attach procedure is used for three purposes:

- by a UE in PS mode of operation to attach for EPS services only;

...

- by a UE supporting NB-S1 mode only in PS mode of operation to attach for EPS services and "SMS only"; or

...

With a successful attach procedure in NB-S1 mode, a context is established for the UE in the MME. If the attach request included information to request PDN connectivity, a default bearer is also established between the UE and the PDN.

If EMM-REGISTERED without PDN connection is supported by the UE and the MME, a default bearer need not be requested by the UE during the attach procedure. If EMM-REGISTERED without PDN connection is not supported by the UE or the MME, then the UE shall request establishment of a default bearer.

During the attach procedure with default bearer establishment, the UE may also obtain the home agent IPv4 or IPv6 address or both.

[TS 24.301, clause 5.5.1.2.2]

In state EMM-DEREGISTERED, the UE initiates the attach procedure by sending an ATTACH REQUEST message to the MME, starting timer T3410 and entering state EMM-REGISTERED-INITIATED (see example in figure 5.5.1.2.2.1). If timer T3402 is currently running, the UE shall stop timer T3402. If timer T3411 is currently running, the UE shall stop timer T3411.

...

If the UE supports NB-S1 mode or Non-IP PDN type, then the UE shall support the extended protocol configuration options IE.

If the UE supports the extended protocol configuration options IE, then the UE shall set the ePCO bit to "extended protocol configuration options supported" in the UE network capability IE of the ATTACH REQUEST message.

If the UE is in NB-S1 mode, then the UE shall set the control plane CIoT EPS optimization bit to "control plane CIoT EPS optimization supported" in the UE network capability IE of the ATTACH REQUEST message.

If the UE is in NB-S1 mode, supports NB-S1 mode only, and requests to attach for EPS services and "SMS only", the UE shall indicate the SMS only requested bit to "SMS only" in the additional update type IE and shall set the EPS attach type IE to "EPS attach" in the ATTACH REQUEST message.

If the UE supports CIoT EPS optimizations, it shall indicate in the UE network capability IE of the ATTACH REQUEST message whether it supports EMM-REGISTERED without PDN connection.

...

If EMM-REGISTERED without PDN connection is not supported by the UE or the MME, or if the UE wants to request PDN connection with the attach procedure, the UE shall send the ATTACH REQUEST message together with a PDN CONNECTIVITY REQUEST message contained in the ESM message container IE.

If EMM-REGISTERED without PDN connection is supported by the UE and the MME, and the UE does not want to request PDN connection with the attach procedure, the UE shall send the ATTACH REQUEST message together with an ESM DUMMY MESSAGE contained in the ESM message container information element.

[TS 24.301, clause 5.6.1.1]

The purpose of the service request procedure is to transfer the EMM mode from EMM-IDLE to EMM-CONNECTED mode. If the UE is not using EPS services with control plane CIoT EPS optimization, this procedure is used to establish the radio and S1 bearers when user data or signalling is to be sent. If the UE is using EPS services with control plane CIoT EPS optimization, this procedure can be used for UE initiated transfer of user data via the control plane. Another purpose of this procedure is to invoke MO/MT CS fallback or 1xCS fallback procedures.

This procedure is used when:

- the network has downlink signalling pending;
- the UE has uplink signalling pending;
- the UE or the network has user data pending and the UE is in EMM-IDLE mode;

...

The UE shall invoke the service request procedure when:

a) the UE in EMM-IDLE mode receives a paging request with CN domain indicator set to "PS" from the network;

b) the UE, in EMM-IDLE mode, has pending user data to be sent;

c) the UE, in EMM-IDLE mode, has uplink signalling pending;

...

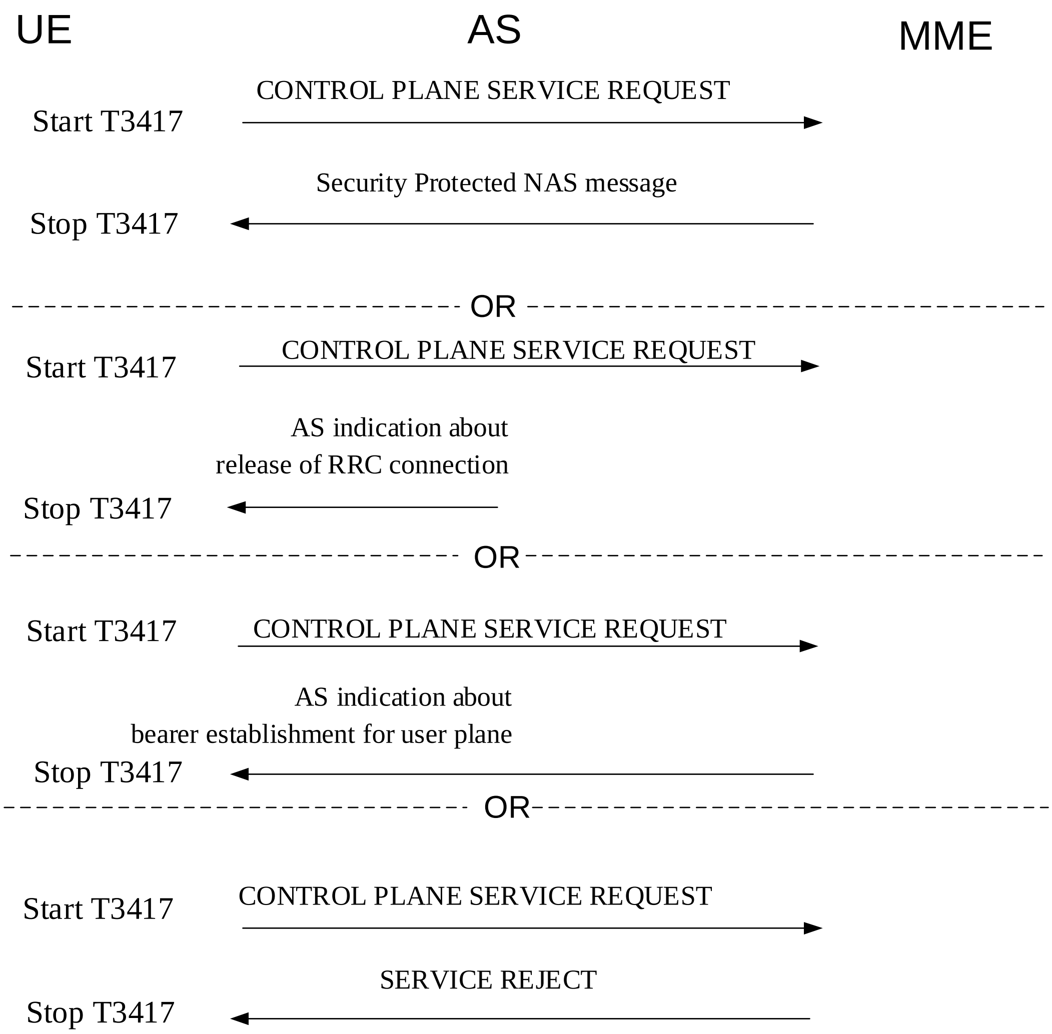

Figure 5.6.1.1.2: Service request procedure (part 2)

NOTE 1: Security protected NAS message: this could be e.g. a SECURITY MODE COMMAND, SERVICE ACCEPT, or ESM DATA TRANSPORT message.

NOTE 2: AS indications (indications from lower layers) are results of procedures triggered by MME in service request procedure. Triggered procedures could be e.g. an RRC connection release procedure or RRC connection reconfiguration procedure (see 3GPP TS 36.331 [22]).

[TS 24.301, clause 5.6.1.2.2]

The UE shall send a CONTROL PLANE SERVICE REQUEST message, start T3417 and enter the state EMM-SERVICE-REQUEST-INITIATED.

For case a in subclause 5.6.1.1, the Control plane service type of the CONTROL PLANE SERVICE REQUEST message shall indicate "mobile terminating request". The UE may include the ESM DATA TRANSPORT message. The UE shall not include any ESM message other than ESM DATA TRANSPORT message.

For case b in subclause 5.6.1.1,

- if the UE has pending IP or non-IP user data that is to be sent via the control plane radio bearers, the Control plane service type of the CONTROL PLANE SERVICE REQUEST message shall indicate "mobile originating request". The UE shall include an ESM DATA TRANSPORT message in the ESM message container IE.

For cases b and m in subclause 5.6.1.1,

- if the UE has pending IP or non-IP user data that is to be sent via the control plane radio bearers, the Control plane service type of the CONTROL PLANE SERVICE REQUEST message shall indicate "mobile originating request". The UE shall include an ESM DATA TRANSPORT message in the ESM message container IE; and

- if the UE has pending IP or non-IP user data that is to be sent via the user plane radio bearers, the UE shall set the "active" flag in the Control plane service type IE to 1. The UE may include the ESM DATA TRANSPORT message for PDN connection established with Control plane only indication. The UE shall not include any ESM message other than ESM DATA TRANSPORT message.

For case c in subclause 5.6.1.1, the UE shall set the Control plane service type of the CONTROL PLANE SERVICE REQUEST message to "mobile originating request". If the CONTROL PLANE SERVICE REQUEST message is:

- for sending SMS, the UE shall include the SMS message in the NAS message container IE and shall not include any ESM message container IE in the CONTROL PLANE SERVICE REQUEST message; and

- for sending signalling different from SMS, the UE shall not include any ESM message container or NAS message container IE in the CONTROL PLANE SERVICE REQUEST message.

[TS 24.301, clause 5.6.2.2.1.1]

Upon reception of a paging indication, if control plane CIoT EPS optimization is used by the UE, the UE shall stop the timer T3346, if running, and shall additionally:

- initiate a service request procedure as specified in subclause 5.6.1.2.2 if the UE is in the EMM-IDLE mode without suspend indication; or

- proceed the behaviour as specified in subclause 5.3.1.3 if the UE is in the EMM-IDLE mode with suspend indication.

NOTE 2: If the UE is in the EMM-IDLE mode without suspend indication and has an uplink user data to be sent to the network using control plane CIoT EPS optimization when receiving the paging indication, the UE can piggyback the uplink user data during the service request procedure initiated to respond to the paging, as specified in subclause 5.6.1.2.2.

[TS 24.301, clause 5.6.3.1]

The purpose of the transport of NAS messages procedure is to carry SMS messages in an encapsulated form between the MME and the UE. The procedure may be initiated by the UE or the network and can only be used when the UE is attached for EPS services and non-EPS services or for EPS services and "SMS only", and the UE is in EMM-CONNECTED mode.

NOTE 1: If the UE is in EMM-IDLE mode and is using EPS services with control plane CIoT EPS optimization, the UE transports the first SMS message by encapsulating it in the NAS message container IE in the Control Plane Service Request message.

NOTE 2: When the UE is using EPS services with control plane CIoT EPS optimization, the network can initiate downlink transport of NAS messages procedure even if the UE does not have any PDN connections established.

[TS 24.301, clause 5.6.3.2]

Upon request from the SMS entity to send an SMS message, the EMM entity in the UE initiates the procedure by sending an UPLINK NAS TRANSPORT message including the SMS message in the NAS message container IE.

NOTE: When the UE is using for EPS services with control plane CIoT EPS optimization, the UE can initiate uplink transport of NAS messages procedure even if the UE does not any PDN connections established.

[TS 24.301, clause 5.6.3.3]

The network initiates the procedure by sending a DOWNLINK NAS TRANSPORT message. When receiving the DOWNLINK NAS TRANSPORT message, the EMM entity in the UE shall forward the contents of the NAS message container IE to the SMS entity.

NOTE: When the UE is using for EPS services with control plane CIoT EPS optimization, the network can initiate downlink transport of NAS messages procedure even if the UE does not any PDN connections established.

[TS 24.301, clause 6.2A]

The UE and the MME may support robust header compression (ROHC) framework (see IETF RFC 4495 [37]) for IP header compression if control plane CIoT EPS optimization is supported for PDN connections of IP PDN type. If IP header compression for control plane CIoT EPS optimization is supported, the ROHC profiles defined in 3GPP TS 36.323 [38] shall then be supported. The ROHC configuration is negotiated and established during the UE requested PDN connectivity procedure as specified in subclause 6.5.1. Both the UE and the MME indicate whether IP header compression for control plane CIoT EPS optimization is supported during attach and tracking area updating procedures (see subclauses 5.5.1 and 5.5.3). The ROHC configuration can be re-negotiated by using the UE requested bearer resource modification procedure or the EPS bearer context modification procedure as specified in subclauses 6.4.3 and 6.5.4.

[TS 24.301, clause 6.3.8]

Serving PLMN rate control enables the serving PLMN to protect its MME and the signalling radio bearers in the E-UTRAN from load generated by NAS messages with user data over control plane. The MME can inform the UE of any local serving PLMN rate control during the default EPS bearer context activation procedure (see subclause 6.4.1). The UE shall limit the rate at which it generates uplink NAS messages with user data over control plane to comply with the serving PLMN policy provided by the network. The indicated rate in a NAS procedure applies to the PDN connection the NAS procedure corresponds to, and the indicated rate is valid until a new value is indicated or the PDN connection is released.

Serving PLMN rate control is applicable for PDN connections established for control plane CIoT EPS optimization only.

[TS 24.301, clause 6.3.9]

APN rate control controls the maximum number of uplink user data messages sent by the UE in a time interval for the APN in accordance with 3GPP TS 23.401 [10]. The UE shall limit the rate at which it generates uplink user data messages to comply with the APN rate control policy. The NAS shall provide the indicated rates to upper layers for enforcement. The indicated rate in a NAS procedure applies to the APN the NAS procedure corresponds to, and the indicated rate is valid until a new value is indicated or the last PDN connection using this APN is released.

[TS 24.301, clause 6.4.1.3]

Upon receipt of the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message, if the UE provided an APN for the establishment of the PDN connection, the UE shall stop timer T3396 if it is running for the APN provided by the UE. If the UE did not provide an APN for the establishment of the PDN connection and the request type was different from "emergency", the UE shall stop the timer T3396 associated with no APN if it is running. If the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message was received in response to a request for an emergency PDN connection, the UE shall not stop the timer T3396 associated with no APN if it is running. For any case, the UE shall then send an ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT message and enter the state BEARER CONTEXT ACTIVE. When the default bearer is activated as part of the attach procedure, the UE shall send the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT message together with ATTACH COMPLETE message. When the default bearer is activated as the response to the stand-alone PDN CONNECTIVITY REQUEST message, the UE shall send the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT message alone.

...

If the UE receives a serving PLMN rate control IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message, the UE shall store the serving PLMN rate control IE value and use the stored serving PLMN rate control value as the maximum allowed limit of uplink User data container IEs included in ESM DATA TRANSPORT messages for the corresponding PDN connection in accordance with 3GPP TS 23.401 [10]. If the UE has a previously stored serving PLMN rate control value, the UE shall replace the stored serving PLMN rate control value with the received serving PLMN rate control IE value.

If the UE receives an APN rate control parameters container in the protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message, the UE shall store the APN rate control parameters value and use the stored APN rate control parameters value as the maximum allowed limit of uplink user data related to the APN indicated in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message in accordance with

3GPP TS 23.401 [10]. If the UE has a previously stored APN rate control parameters value for this APN, the UE shall replace the stored APN rate control parameters value for this APN with the received APN rate control parameters value.

If the UE receives non-IP Link MTU parameter or IPv4 Link MTU parameter of the protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message, the UE shall pass the received Non-IP Link MTU or IPv4 Link MTU to the upper layer.

NOTE: The Non-IP Link MTU and IPv4 Link MTU size correspond to the maximum length of user data container that can be sent in the ESM DATA TRANSPORT message and to the maximum length of user data that can be sent via S1-U interface.

[TS 24.301, clause 6.4.3.3]

Upon receipt of the MODIFY EPS BEARER CONTEXT REQUEST message, if the UE provided an APN for the establishment of the PDN connection, the UE shall stop timer T3396, if it is running for the APN provided by the UE. If the UE did not provide an APN for the establishment of the PDN connection and the request type was different from "emergency", the UE shall stop the timer T3396 associated with no APN if it is running. If the MODIFY EPS BEARER CONTEXT REQUEST message was received for an emergency PDN connection, the UE shall not stop the timer T3396 associated with no APN if it is running. For any case, the UE shall then check the received TFT before taking it into use and send a MODIFY EPS BEARER CONTEXT ACCEPT message to the MME.

...

If the UE receives an APN rate control parameters container in the protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message, the UE shall store the APN rate control parameters value and use the stored APN rate control parameters value as the maximum allowed limit of uplink user data related to the corresponding APN in accordance with 3GPP TS 23.401 [10]. If the UE has a previously stored APN rate control parameters value for this APN, the UE shall replace the stored APN rate control parameters value for this APN with the received APN rate control parameters value.

Upon receipt of the MODIFY EPS BEARER CONTEXT ACCEPT message, the MME shall stop the timer T3486 and enter the state BEARER CONTEXT ACTIVE.

[TS 24.301, clause 6.5.1.2]

In order to request connectivity to a PDN, the UE shall send a PDN CONNECTIVITY REQUEST message to the MME, start timer T3482 and enter the state PROCEDURE TRANSACTION PENDING (see example in figure 6.5.1.2.1).

When the PDN CONNECTIVITY REQUEST message is sent together with an ATTACH REQUEST message, the UE shall not start timer T3482 and shall not include the APN.

NOTE 1: If the UE needs to provide protocol configuration options which require ciphering or provide an APN, or both, during the attach procedure, the ESM information transfer flag is included in the PDN CONNECTIVITY REQUEST. The MME then at a later stage in the PDN connectivity procedure initiates the ESM information request procedure in which the UE can provide the MME with protocol configuration options or APN or both.

...

In order to request connectivity to a PDN using the default APN, the UE includes the access point name IE in the PDN CONNECTIVITY REQUEST message or, when applicable, in the ESM INFORMATION RESPONSE message, according to the following conditions:

- if use of a PDN using the default APN requires PAP/CHAP, then the UE should include the Access point name IE; and

- in all other conditions, the UE need not include the Access point name IE.

In order to request connectivity to an additional PDN using a specific APN, the UE shall include the requested APN in the PDN CONNECTIVITY REQUEST message.

In the PDN type IE the UE shall either indicate the IP version capability of the IP stack associated with the UE or non IP as specified in subclause 6.2.2.

If the PDN type value of the PDN type IE is set to IPv4 or IPv6 or IPv4v6 and the UE indicates "Control plane CIoT EPS optimization supported" in the UE network capability IE of the ATTACH REQUEST message, the UE may include the Header compression configuration IE in the PDN CONNECTIVITY REQUEST message.

The UE shall set the request type to "initial request" when the UE is establishing a new PDN connectivity to a PDN in an attach procedure or in a stand-alone PDN connectivity procedure. The UE shall set the request type to "emergency" when the UE is requesting a new PDN connectivity for emergency bearer services. The UE shall set the request type to "handover" when the connectivity to a PDN is established upon handover from a non-3GPP access network and the UE was connected to that PDN before the handover to the 3GPP access network, or when the UE initiates the procedure to add 3GPP access to the PDN connection which is already established over WLAN.

NOTE 2: For emergency bearer services, the handover from non-3GPP access to E-UTRA is not supported.

If the UE supports DSMIPv6, the UE may include a request for obtaining the IPv6 address and optionally the IPv4 address of the home agent in the Protocol configuration options IE in the PDN CONNECTIVITY REQUEST message. The UE may also include a request for obtaining the IPv6 Home Network Prefix. The UE shall request the IPv6 Home Network Prefix only if the UE has requested the home agent IPv6 address. The requested home agent address(es) and the Home Network Prefix are related to the APN the UE requested connectivity for.

The UE may set the ESM information transfer flag in the PDN CONNECTIVITY REQUEST message to indicate that it has ESM information, i.e. protocol configuration options, APN, or both, that needs to be sent after the NAS signalling security has been activated between the UE and the MME.

...

If the UE supports APN rate control, the UE shall include an APN rate control support indicator in the protocol configuration options IE.

[TS 24.301, clause 6.5.2.1]

The purpose of the UE requested PDN disconnection procedure is for a UE to request disconnection from one PDN. If EMM-REGISTERED without PDN connection is not supported by the UE or the MME, the UE can initiate this procedure to disconnect from any PDN as long as it is connected to at least one other PDN. If EMM-REGISTERED without PDN connection is supported by the UE and the MME, the UE can initiate this procedure to disconnect from any PDN. With this procedure, all EPS bearer contexts established towards this PDN, including the default EPS bearer context, are released.

[TS 24.301, clause 6.6.4.2]

Upon receipt of a request to transfer user data via the control plane, if the UE is in EMM-CONNECTED mode, the UE initiates the procedure by sending the ESM DATA TRANSPORT message including the user data to be sent in the User data container IE. The length of the value part of the User data container IE should not exceed the link MTU size for the respective type of user data (IPv4, IPv6 or Non-IP).

NOTE: The recommended maximum size for link MTU is 1358 octets to prevent fragmentation in the backbone network (see 3GPP TS 23.060 [74]). Depending on the network configuration, setting link MTU size to a value larger than 1358 octets could lead to inefficient core network implementation due to fragmentation.

If the UE is in EMM-IDLE mode, the UE initiates the procedure by sending the ESM DATA TRANSPORT message included in a CONTROL PLANE SERVICE REQUEST message.

Based on information provided by the upper layers, the UE may include a Release assistance indication IE in the ESM DATA TRANSPORT message to inform the network that

1) subsequent to the current uplink data transmission no further uplink or downlink data transmission (e.g. an acknowledgement or response) is expected; i.e. the upper layers indicated that data exchanges have completed with the current UL data transfer; or

2) subsequent to the current uplink data transmission only a single downlink data transmission and no further uplink data transmission is expected; i.e. the upper layers indicated that data exchanges will have completed with the next downlink data transmission.

When receiving the ESM DATA TRANSPORT message, the MME shall identify the PDN connection to the SCEF or to the PDN GW, based on the EPS bearer identity included in message, and forward the contents of the User data container IE accordingly. If the ESM DATA TRANSPORT message includes a Release assistance indication IE, then ESM layer indicates to the EMM layer to initiate release of the NAS signalling connection,

1) if the release assistance indication indicates that no further uplink or downlink data transmission subsequent to the uplink data transmission is expected; or,

2) upon subsequent delivery of the next received downlink data transmission to the UE if the release assistance indication indicates that only a single downlink data transmission and no further uplink data transmission subsequent to the uplink data transmission is expected.

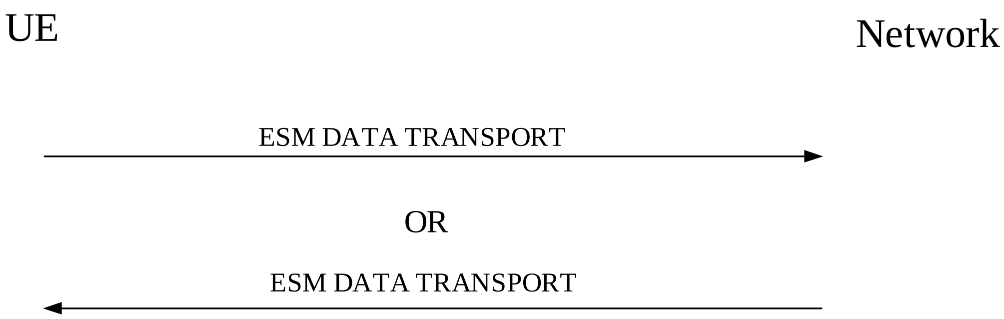

Figure 6.6.4.2.1: Transport of user data via the control plane procedure

22.1.1.3 Test description

22.1.1.3.1 Pre-test conditions

System Simulator:

- Ncell 50, default system information combination.

UE:

None.

Preamble:

- UE is in State 1-NB switched off according to TS 36.508 [18].

22.1.1.3.2 Test procedure sequence

Table 22.1.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict	Module

Octet 1 AER+Uplink time unit	'0000'B	- Additional exception reports at maximum rate reached are not allowed - unrestricted (interval)	
Octets 2-4	'11111111 11111111 11111111'B	- unrestricted Maximum uplink rate (octet 2 to octet 4) is a binary coded representation of the maximum number of messages the UE is restricted to send per time unit. The time unit is indicated in the uplink time unit. If the uplink time unit is set to "unrestricted", the maximum uplink data volume the UE can send is not restricted.

22.1.2 NB-IoT / NTN

22.1.2.1 Test Purpose (TP)

(1)

```
with { UE in EMM-DEREGISTERED/RRC-IDLE and UE finds a cell which provides access by NB-IoT NTN RAT }
ensure that {
  when { UE has no valid GNSS position }
    then { UE shall not establish RRC connection to perform an attach procedure }
            }
```

(2)

```
with { UE in EMM-DEREGISTERED/RRC-IDLE and UE finds a cell which provides access by NB-IoT NTN
allRAT }
ensure that {
  when { Cell broadcasts systemInformationBlockType31-NB and UE has a valid GNSS position }
    then { UE establishes RRC connection, and includes gnss-validityDuration in
RRCConnectionSetupComplete-NB message, and successfully performs an attach procedure }
            }
```

22.1.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.300 clauses 4.12, 23.21.1 and 23.21.6, TS 36.331 clauses 5.2.2.3, 5.2.2.4, 5.3.3.1a and 5.3.3.4. Unless otherwise stated these are Rel-17 requirements.

[TS 36.300, clause 4.12]

E-UTRAN supports radio access over non-terrestrial networks for BL UEs, UEs in enhanced coverage and NB-IoT UEs. Support for non-terrestrial networks encompasses platforms that provide radio access through Geosynchronous orbits (GSO), Non-Geosynchronous Orbit (NGSO), which includes Low-Earth Orbit (LEO) and Medium Earth Orbit (MEO) or High Altitude Platform Systems (HAPS).

The Figure 4.12-1 below illustrates an example of a Non-Terrestrial Network (NTN) providing non-terrestrial access by means of an NTN payload and an NTN Gateway, depicting a service link between the NTN payload and a UE, and a feeder link between the NTN Gateway and the NTN payload.

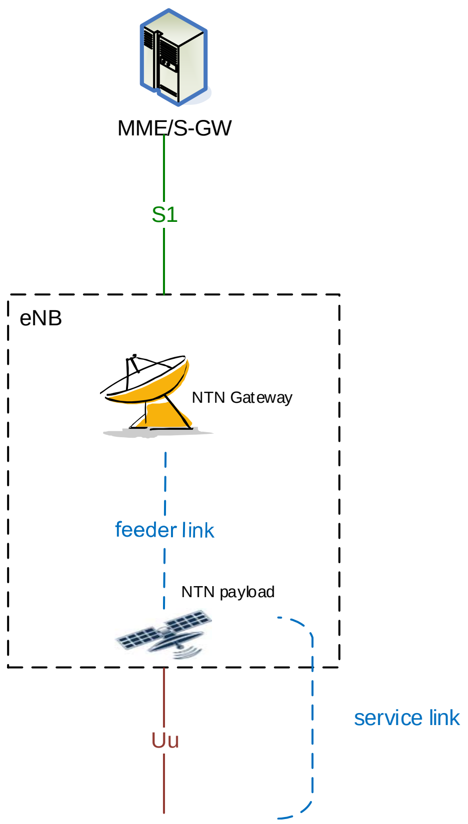

Figure 4.12-1: Overall illustration of an NTN

NOTE: Figure 4.12-1 illustrates an NTN; RAN4 aspects are out of scope.

The NTN payload transparently forwards the radio protocol received from the UE (via the service link) to the NTN Gateway (via the feeder link) and vice-versa. The following connectivity is supported by the NTN payload:

- An eNB may serve multiple NTN payloads;
- An NTN payload may be served by multiple eNBs.

NOTE: In this release, the NTN-payload may change the carrier frequency, before re-transmitting it on the service link, and vice versa (respectively on the feeder link).

For NTN, the following applies in addition to Network entity related Identities as described in clause 8.2:

- A Tracking Area corresponds to a fixed geographical area. Any respective mapping is configured in the RAN;
- A Mapped Cell ID as specified in clause 23.21.5.

Three types of service links are supported:

- Earth-fixed: provisioned by beam(s) continuously covering the same geographical areas all the time (e.g., the case of GSO satellites);
- Quasi-Earth-fixed: provisioned by beam(s) covering one geographic area for a limited period of time and a different geographic area during another period of time (e.g., the case of NGSO satellites generating steerable beams);
- Earth-moving: provisioned by beam(s) whose coverage area slides over the Earth surface (e.g., the case of NGSO satellites generating fixed or non-steerable beams).

With NGSO satellites, the eNB can provide either quasi-Earth-fixed cell coverage or Earth-moving cell coverage, while eNB operating with GSO satellites can provide Earth fixed cell coverage or quasi-Earth-fixed cell coverage.

[TS 36.300, clause 23.21.1]

Support for BL UEs, UEs in enhanced coverage and NB-IoT UEs over Non-Terrestrial Networks (see clause 4.12) is only applicable to E-UTRA connected to EPC. UEs not supporting NTN are barred from accessing an NTN cell.

In NTN, only BL UEs, UEs in enhanced coverage and NB-IoT UEs with GNSS capability are supported in this release of the specification.

To accommodate long propagation delays in NTN, increased timer values and window sizes, or delayed starting times are supported for the physical layer and for higher layers.

UL segmented transmission is supported for UL transmission with repetitions. The UE shall apply UE pre-compensation per segment of UL transmission of PUSCH/PUCCH/PRACH for BL UEs or UEs in enhanced coverage and NPUSCH/NPRACH for NB-IoT UEs from one segment to the next segment.

[TS 36.300, clause 23.21.6]

The Cell Identity, as defined in TS 36.413 [25] and TS 36.423 [42], corresponds to a Mapped Cell ID, irrespective of the orbit of the NTN payload or the types of service links supported in the following cases:

- The Cell Identity indicated by the eNB to the Core Network as part of the User Location Information, or as E-UTRAN CGI in the related S1AP messages;
- The Cell Identity used for Paging Optimization in S1 interface;
- The Cell Identity used for PWS.

For a BL UE or a UE in enhanced coverage, the Cell Identity included within the target identification of the handover messages allows identifying the correct target cell.

The mapping between Mapped Cell ID(s) and geographical area(s) is configured in the RAN and Core Network.

NOTE 1: A specific geographical location may be mapped to multiple Mapped Cell ID(s), and such Mapped Cell IDs may be configured to indicate different geographical areas (e.g. overlapping and/or with different dimensions).

For a BL UE or a UE in enhanced coverage or a NB-IoT UE that supports S1-U data transfer or User Plane CIoT EPS optimisation, the eNB is responsible for constructing the Mapped Cell ID based on the UE location information received from the UE, if available. The mapping may be pre-configured (e.g., depending on operator's policy) or up to implementation.

NOTE 2: As described in TS 23.401 [17], the User Location Information may enable the MME to determine whether the UE is allowed to operate at its present location. Special Mapped Cell IDs or TACs may be used to indicate areas outside the serving PLMN's country.

The eNB reports the broadcasted TAC(s) of the selected PLMN to the MME. In case the eNB knows the UE's location information, the eNB may determine the TAI the UE is currently located in and provide that TAI to the MME.

[TS 36.331, clause 5.2.2.3]

The UE shall:

1> ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:

2> if in RRC_IDLE:

3> if the UE is a NB-IoT UE:

4> the *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* and *SystemInformationBlockType1-NB* as well as *SystemInformationBlockType2-NB* through *SystemInformationBlockType5-NB, SystemInformationBlockType22-NB*;

…

3> the UE is NTN capable:

4> *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT), if scheduled;

[TS 36.331, clause 5.2.2.4]

The UE shall:

…

1> if the UE is NTN capable:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) is present:

3> immediately before establishing, resuming or re-establishing an RRC connection; or

3> if in RRC_CONNECTED and T317 is not running:

4> acquire *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT);

2> if the UE supports discontinuous coverage; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType32* (*SystemInformationBlockType32-NB* in NB-IoT) is present and the UE does not have a valid version of this system information block:

3> acquire *SystemInformationBlockType32* (*SystemInformationBlockType32-NB* in NB-IoT);

[TS 36.331, clause 5.3.3.1d]

If s*ystemInformationBlockType31* (*systemInformationBlockType31-NB* in NB-IoT) is broadcast, a RRC connection is initiated only if the UE has a valid GNSS position.

NOTE: The UE may need to re-acquire the GNSS position before establishing the connection to avoid interruption during the connection.

[TS 36.331, clause 5.3.3.4]

The UE shall:

…

1> set the content of *RRCConnectionSetupComplete* message as follows:

…

2> if the UE is connected to NTN:

3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;

…

1> submit the *RRCConnectionSetupComplete* message to lower layers for transmission;

22.1.2.3 Test description

22.1.2.3.1 Pre-test conditions

System Simulator:

- Ncell 1 as specified in TS 36.508 clause 8.1.4.1.1 is configured.
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The UE's positioning engine (e.g., standalone GNSS receiver) shall be disabled or no UE location is pre-configured.

Preamble:

- The UE is in State 1-NB switched off according to TS 36.508 [18] Table 8.1.5.1-1.

22.1.2.3.2 Test procedure sequence

Table 22.1.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power on the UE.	-	-	-	-
1A	Check: Does the UE send an *RRCConnectionRequest-NB* on Ncell 1 within 6 minutes?	-	-	1	F
1B	Power off the UE.	-	-	-	-
1C	Power on UE and pre-configure the UE location with UE`s positioning engine enabled. (Note 1)	-	-	-	-
2	Check: Does the UE send an *RRCConnectionRequest-NB* on Ncell 1 within 6 minutes?	-->	*RRCConnectionRequest-NB*	2	P
3-14	Steps 3 to 14 of the registration procedure described in TS 36.508 [18] subclause 8.1.5.2.3 are performed on Ncell 1.	-	-	-	-
15	The SS transmits an RRCConnectionRelease-NB message to move to RRC_IDLE state.	<--	*RRCConnectionRelease-NB*	-	-
Note 1: This could be done by use of AT command and the detailed UE location is defined in TS 36.508 [18] Clause 4.13.

22.2 Idle mode operations

22.2.1 NB-IoT / PLMN selection of RPLMN, HPLMN / EHPLMN, UPLMN and OPLMN / Automatic mode

22.2.1.1 Test Purpose (TP)

(1)

```
with { UE in Automatic network selection mode and RPLMN, HPLMN, UPLMN and OPLMN cells available and
UE is fitted with a USIM indicating RPLMN should be selected }
ensure that {
  when { UE is switched on or return to coverage }
    then { UE selects a cell of the RPLMN and UE attempts Tracking area update on the selected cell
and when successfully registered indicates the selected PLMN to the user }
            }
```

(2)

```
with { UE camped on a VPLMN cell and cells of a higher priority PLMN available }
ensure that {
  when { UE higher priority PLMN search timer T expires }
    then { UE selects and camps on a cell of the highest priority PLMN and UE attempts Tracking area
update on the selected cell and when successfully registered indicates the selected PLMN to the user
}
            }
```

(3)

```
with { UE in Automatic network selection mode and HPLMN, UPLMN and OPLMN cells available and UE is
fitted with a USIM with Access Technology data files for each PLMN and there are no equivalent
HPLMNs defined }
ensure that {
  when { UE is switched on or return to coverage }
    then { UE selects a cell of the highest priority PLMN and UE attempts Tracking area update on
the selected cell and when successfully registered indicates the selected PLMN to the user }
            }
```

(4)

```
with { UE camped on a VPLMN cell and cells of a HPLMN available }
ensure that {
  when { UE higher priority PLMN search timer T expires }
    then { UE selects and camps on a cell of HPLMN and UE attempts Tracking area update on the
selected cell and when successfully registered indicates the selected PLMN to the user }
            }
```

22.2.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.122 clauses 4.4.3.1, 4.4.3.1.1 and 4.4.3.3. Unless otherwise stated these are Rel-13 requirements.

[TS 23.122, clause 4.4.3.1]

At switch on, or following recovery from lack of coverage, the MS selects the registered PLMN or equivalent PLMN (if it is available) using all access technologies that the MS is capable of and if necessary (in the case of recovery from lack of coverage, see clause 4.5.2) attempts to perform a Location Registration.

...

If successful registration is achieved, the MS indicates the selected PLMN.

If there is no registered PLMN, or if registration is not possible due to the PLMN being unavailable or registration failure, the MS follows one of the following two procedures depending on its PLMN selection operating mode. At switch on, if the MS provides the optional feature of user preferred PLMN selection operating mode at switch on then this operating mode shall be used.

...

NOTE 1: If successful registration is achieved, then the current serving PLMN becomes the registered PLMN and the MS does not store the previous registered PLMN for later use.

[TS 23.122, clause 4.4.3.1.1]

The MS selects and attempts registration on other PLMN/access technology combinations, if available and allowable, in the following order:

i) either the HPLMN (if the EHPLMN list is not present or is empty) or the highest priority EHPLMN that is available (if the EHPLMN list is present) ;

ii) each PLMN/access technology combination in the "User Controlled PLMN Selector with Access Technology" data file in the SIM (in priority order);

iii) each PLMN/access technology combination in the "Operator Controlled PLMN Selector with Access Technology" data file in the SIM (in priority order);

iv) …

v) ...

When following the above procedure the following requirements apply:

a) …

b) ...

c) In ii and iii, the MS should limit its search for the PLMN to the access technology or access technologies associated with the PLMN in the appropriate PLMN Selector with Access Technology list (User Controlled or Operator Controlled selector list). An MS using a SIM without access technology information storage (i.e. the "User Controlled PLMN Selector with Access Technology" and the "Operator Controlled PLMN Selector with Access Technology" data files are not present) shall instead use the "PLMN Selector" data file, for each PLMN in the "PLMN Selector" data file, the MS shall search for all access technologies it is capable of and shall assume GSM access technology as the highest priority radio access technology.

d) ...

e) ...

f) In i, the MS shall search for all access technologies it is capable of. No priority is defined for the preferred access technology and the priority is an implementation issue, but "HPLMN Selector with Access Technology" data file on the SIM may be used to optimise the procedure.

g) ...

h) ...

NOTE 1: ...

NOTE 2: ...

NOTE 3: High quality signal is defined in the appropriate AS specification.

If successful registration is achieved, the MS indicates the selected PLMN.

[TS 23.122, clause 4.4.3.3]

If the MS is in a VPLMN, the MS shall periodically attempt to obtain service on its HPLMN (if the EHPLMN list is not present or is empty) or one of its EHPLMNs (if the EHPLMN list is present) or a higher priority PLMN/access technology combinations listed in "user controlled PLMN selector" or "operator controlled PLMN selector" by scanning in accordance with the requirements that are applicable to i), ii) and iii) as defined in the Automatic Network Selection Mode in subclause 4.4.3.1.1. In the case that the mobile has a stored "Equivalent PLMNs" list the mobile shall only select a PLMN if it is of a higher priority than those of the same country as the current serving PLMN which are stored in the "Equivalent PLMNs" list. For this purpose, a value of timer T may be stored in the SIM. The interpretation of the stored value depends on the modes supported by the MS:

- For an MS that does not only support any of the following or a combination of NB-S1 mode or GERAN EC-GSM-IoT or Category M1 of E-UTRAN enhanced-MTC mode (as defined in 3GPP TS 36.306 [13]): T is either in the range 6 minutes to 8 hours in 6 minute steps or it indicates that no periodic attempts shall be made. If no value for T is stored in the SIM, a default value of 60 minutes is used for T.

- For an MS that only supports any of the following or a combination of NB-S1 mode or GERAN EC-GSM-IoT or Category M1 of E-UTRAN enhanced-MTC mode (as defined in 3GPP TS 36.306 [13]): T is either in the range 2 hours to 240 hours, using 2 hour steps from 2 hours to 80 hours and 4 hour steps from 84 hours to 240 hours, or it indicates that no periodic attempts shall be made. If no value for T is stored in the SIM, a default value of 72 hours is used.

If the MS is configured with the MinimumPeriodicSearchTimer as specified in 3GPP TS 24.368 [50] or 3GPP TS 31.102 [40], the MS shall not use a value for T that is less than the MinimumPeriodicSearchTimer. If the value stored in the SIM, or the default value for T (when no value is stored in the SIM), is less than the MinimumPeriodicSearchTimer, then T shall be set to the MinimumPeriodicSearchTimer.

The MS can be configured for Fast First Higher Priority PLMN search as specified in 3GPP TS 31.102 [40] or 3GPP TS 24.368 [50]. Fast First Higher Priority PLMN search is enabled if the corresponding configuration parameter is present and set to enabled. Otherwise, Fast First Higher Priority PLMN search is disabled.

The attempts to access the HPLMN or an EHPLMN or higher priority PLMN shall be as specified below:

a) The periodic attempts shall only be performed in automatic mode when the MS is roaming;

b) After switch on a period of at least 2 minutes and at most T minutes shall elapse before the first attempt is made;

c) The MS shall make the following attempts if the MS is on the VPLMN at time T after the last attempt;

d) Periodic attempts shall only be performed by the MS while in idle mode;

e) If the HPLMN (if the EHPLMN list is not present or is empty) or a EHPLMN (if the list is present) or a higher priority PLMN is not found, the MS shall remain on the VPLMN.

f) In steps i), ii) and iii) of subclause 4.4.3.1.1 the MS shall limit its attempts to access higher priority PLMN/access technology combinations to PLMN/access technology combinations of the same country as the current serving VPLMN, as defined in Annex B.

g) ...

h) If the PLMN of the highest priority PLMN/access technology combination available is the current VPLMN, or one of the PLMNs in the "Equivalent PLMNs" list, the MS shall remain on the current PLMN/access technology combination.

22.2.1.3 Test description

22.2.1.3.1 Pre-test conditions

System Simulator:

- Four intra-frequency multi-PLMN Ncells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.2.1.3.1-1.

- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used.

- The PLMNs are identified in the test by the identifiers in Table 22.2.1.3.1-1.

Table 22.2.1.3.1–1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
2	PLMN1	001	11
4	PLMN2	001	21
11	PLMN3	001	31

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is registered to PLMN1 before it is switched off.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.2.1.3.1-2.

Table 22.2.1.3.1–2: USIM configuration

USIM field	Priority	Value	Access Technology Identifier
EF_{IMSI}		The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	
$EF_{PLMNwAcT}$	1 2 3	Default PLMN3 PLMN2 Remaining mandatory entries use default values	Default All specified NB-IoT
$EF_{OPLMNwACT}$	1	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	1	PLMN4	NB-IoT
EF_{UST}		Services 20, 42, 43 and 74 are supported. Service 71 is not supported (there is no EHPLMN list).	
EF_{HPPLMN}		1 (120 minutes)	

Preamble:

- The UE is made to camp on Ncell 2 and then Switched OFF (State 1-NB).

22.2.1.3.2 Test procedure sequence

Table 22.2.1.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked "T1","T2" etc are applied at the points indicated in the Main behaviour description in Table 22.2.1.3.2-2. Cell powers are chosen for a serving cell and a non-suitable "Off" cell as defined in TS 36.508.

Table 22.2.1.3.2-1: Ncell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 2	Ncell 4	Ncell 11	Remarks
T0	NRS EPRE	dBm/15kHz	"Off"	-85	"Off"	"Off"	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1
T1	NRS EPRE	dBm/15kHz	-85	-79	-85	"Off"	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-79	-85	-85	"Off"	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1
T3	NRS EPRE	dBm/15kHz	"Off"	-85	-79	"Off"	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1
T4	NRS EPRE	dBm/15kHz	"Off"	-85	-85	-79	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1

Table 22.2.1.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	SS adjusts Ncell levels according to row T1 of table 22.2.1.3.2-1	-	-	-	-

    then { UE does not reselect to the cell. }
            }
```

22.2.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304 clause 5.1.2.2, TS 23.122 clauses 4.4.3.1 and 4.4.3.1.2.

[TS 36.304 clause 5.1.2.2]

The UE shall scan all RF channels in the E-UTRA bands according to its capabilities to find available PLMNs. On each carrier, the UE shall search for the strongest cell and read its system information, in order to find out which PLMN(s) the cell belongs to. If the UE can read one or several PLMN identities in the strongest cell, each found PLMN (see the PLMN reading in [3]) shall be reported to the NAS as a high quality PLMN (but without the RSRP value),

…

Once the UE has selected a PLMN, the cell selection procedure shall be performed in order to select a suitable cell of that PLMN to camp on.

[TS 23.122, clause 1.2]

Equivalent HPLMN list: To allow provision for multiple HPLMN codes, PLMN codes that are present within this list shall replace the HPLMN code derived from the IMSI for PLMN selection purposes. This list is stored on the USIM and is known as the EHPLMN list. The EHPLMN list may also contain the HPLMN code derived from the IMSI. If the HPLMN code derived from the IMSI is not present in the EHPLMN list then it shall be treated as a Visited PLMN for PLMN selection purposes.

…

[TS 23.122 clause 4.4.3.1]

At switch on, or following recovery from lack of coverage, the MS selects the registered PLMN or equivalent PLMN (if it is available) using all access technologies that the MS is capable of and if necessary (in the case of recovery from lack of coverage, see subclause 4.5.2) attempts to perform a Location Registration.

…

EXCEPTION: At switch on, if the MS is in manual mode and neither registered PLMN nor PLMN that is equivalent to it is available but EHPLMN is available, then instead of performing the manual network selection mode procedure of subclause 4.4.3.1.2 the MS may select and attempt registration on the highest priority EHPLMN. If the EHPLMN list is not available or is empty and the HPLMN is available, then the MS may select and attempt registration on the HPLMN. The MS shall remain in manual mode.

NOTE 1: If successful registration is achieved, then the current serving PLMN becomes the registered PLMN and the MS does not store the previous registered PLMN for later use.

...

[TS 23.122 clause 4.4.3.1.2]

The MS indicates whether there are any PLMNs, which are available using all supported access technologies. This includes PLMNs in the "forbidden PLMNs" list, "forbidden PLMNs for GPRS service" list and PLMNs which only offer services not supported by the MS. An MS which supports GSM COMPACT shall also indicate GSM COMPACT PLMNs (which use PBCCH).

If displayed, PLMNs meeting the criteria above are presented in the following order:

i)- either the HPLMN (if the EHPLMN list is not present or is empty) or, if one or more of the EHPLMNs are available then based on an optional data field on the SIM either only the highest priority available EHPLMN is to be presented to the user or all available EHPLMNs are presented to the user in priority order. If the data field is not present on the SIM, then only the highest priority available EHPLMN is presented;

ii)- PLMN/access technology combinations contained in the " User Controlled PLMN Selector with Access Technology " data file in the SIM (in priority order);

iii)- PLMN/access technology combinations contained in the "Operator Controlled PLMN Selector with Access Technology" data file in the SIM (in priority order);

iv)- other PLMN/access technology combinations with received high quality signal in random order;

v)- other PLMN/access technology combinations in order of decreasing signal quality.

In ii and iii, an MS using a SIM without access technology information storage (i.e. the "User Controlled PLMN Selector with Access Technology" and the "Operator Controlled PLMN Selector with Access Technology" data files are not present) shall instead present the PLMNs contained in the "PLMN Selector" data file in the SIM (in priority order).

In v, requirement h) in subclause 4.4.3.1.1 applies.

In i to v, requirements j), k) in subclause 4.4.3.1.1 apply.

In GSM COMPACT, the non support of voice services shall be indicated to the user.

The HPLMN may provide on the SIM additional information on the available PLMNs. If this information is provided then the MS shall indicate it to the user. This information, provided as free text may include:

- preferred partner,

- roaming agreement status,
- supported services

Furthermore, the MS may indicate whether the available PLMNs are present on the EHPLMN list, the Forbidden list, the User Controlled PLMN List or the Operator Controlled PLMN List. The MS may also indicate that the PLMN is not present on any of these lists.

The user may select his desired PLMN and the MS then initiates registration on this PLMN using the access technology chosen by the user for that PLMN or using the highest priority available access technology for that PLMN, if the associated access technologies have a priority order. (This may take place at any time during the presentation of PLMNs). For such a registration, the MS shall ignore the contents of the "forbidden location areas for roaming", "forbidden tracking areas for roaming", "forbidden location areas for regional provision of service", "forbidden tracking areas for regional provision of service", "forbidden PLMNs for GPRS service" and "forbidden PLMNs" lists.

NOTE 1: It is an MS implementation option whether to indicate access technologies to the user. If the MS does display access technologies, then the access technology selected by the user is only used for initial registration on the selected PLMN. If the MS does not display access technologies, then the access technology chosen for a particular PLMN should be the highest priority available access technology for that PLMN, if the associated access technologies have a priority order, and is only used for initial registration.

Once the UE has registered on a PLMN selected by the user, the UE shall not automatically register on a different PLMN unless:

i) the new PLMN is declared as an equivalent PLMN by the registered PLMN; or

ii) the user selects automatic mode.

If the user does not select a PLMN, the selected PLMN shall be the one that was selected before the PLMN selection procedure started. If no such PLMN was selected or that PLMN is no longer available, then the MS shall attempt to camp on any acceptable cell and enter the limited service state.

NOTE 2: High quality signal is defined in the appropriate AS specification.

22.2.2.3 Test description

22.2.2.3.1 Pre-test conditions

System Simulator:

- Ncells 1, 3, 23 and 13, as specified in TS 36.508 clause 8.1.4.2 are configured as shown in Table 22.2.2.3.1-1.
- System information combination 3 as defined in TS 36.508 clause 8.1.4.3.1.1 is used.

Table 22.2.2.3.1-1: PLMN identifiers

Ncell	PLMN names	MCC	MNC
1	PLMN1 (during TC body); PLMN4 (during preamble)	001; 004	01; 31
3	PLMN2	002	11
23	PLMN3	003	21
13	PLMN4	004	31

UE:

- The UE is in Manual PLMN selection mode.
- Two USIMs containing default values (as per TS 36.508) except for those listed in Table 22.2.2.3.1-2 and Table 22.2.2.3.1-3 will be used.
- The UE is registered to PLMN4 on Ncell 1 with USIM A.

Table 22.2.2.3.1-2: USIM A configuration

USIM field	Priority	Value	Access Technology Identifier

EFEPSLOCI		PLMN4 (set in preamble)	
EFPLMNwAcT		Empty	
EFIMSI		The HPLMN (MCC+MNC) of the IMSI is set to PLMN1.	
EFUST		Service n°71 and n°74 are "available"	
EFEHPLMN	1 2	PLMN2 PLMN1	

Table 22.2.2.3.1-3: USIM B configuration

USIM field	Priority	Value	Access Technology Identifier
EFEPSLOCI		PLMN4	
EFPLMNwAcT		Empty	
EFIMSI		The HPLMN (MCC+MNC) of the IMSI is set to PLMN1.	
EFUST		Service n°74 is "available"	
EFEHPLMN		Empty	

Preamble:

- The UE is in state Switched OFF (State 1-NB) according to TS 36.508.

22.2.2.3.2 Test procedure sequence

Table 22.2.2.3.21-1 shows the cell configurations used during the test. Subsequent configuration marked “T1”, “T2” etc. are applied at the points indicated in the Main behaviour description in Table 22.2.2.3.2-2.

Table 22.2.2.3.2-1: Cell configuration changes over time

22.2.3 NB-IoT / PLMN selection / Periodic reselection / MinimumPeriodicSearchTimer

22.2.3.1 Test Purpose (TP)

(1)

```
with { UE configured with “MinimumPeriodicSearchTimer“ and camped on an VPLMN cell and cells of a
higher priority PLMN available }
ensure that {
  when { the higher priority PLMN search timer T stored in the USIM or the default value for T is
less than the MinimumPeriodicSearchTimer }
 then { T shall be set to the MinimumPeriodicSearchTimer. After the first attempt to the higher
priority PLMN cell is made, the UE shall not use a value for T that is less than the
MinimumPeriodicSearchTimer. When the T expires the UE selects and camps on a cell of the highest
priority PLMN and UE attempts a location registration on the selected cell and when successfully
registered indicates the selected PLMN to the user }
            }
```

22.2.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.122 clauses 4.4.3.1 and 4.4.3.3.1. Unless otherwise stated these are Rel-13 requirements.

[TS 23.122, clause 4.4.3.1]

At switch on, or following recovery from lack of coverage, the MS selects the registered PLMN or equivalent PLMN (if it is available) using all access technologies that the MS is capable of and if necessary (in the case of recovery from lack of coverage, see subclause 4.5.2) attempts to perform a Location Registration.

…

If there is no registered PLMN, or if registration is not possible due to the PLMN being unavailable or registration failure, the MS follows one of the following two procedures depending on its PLMN selection operating mode. At switch on, if the MS provides the optional feature of user preferred PLMN selection operating mode at switch on then this operating mode shall be used. Otherwise, the MS shall use the PLMN selection mode that was used before switching off.

…

NOTE 1: If successful registration is achieved, then the current serving PLMN becomes the registered PLMN and the MS does not store the previous registered PLMN for later use.

[TS 23.122, clause 4.4.3.3.1]

If the MS is in a VPLMN, the MS shall periodically attempt to obtain service on its HPLMN (if the EHPLMN list is not present or is empty) or one of its EHPLMNs (if the EHPLMN list is present) or a higher priority PLMN/access technology combinations listed in "user controlled PLMN selector" or "operator controlled PLMN selector" by scanning in accordance with the requirements that are applicable to i), ii) and iii) as defined in the Automatic Network Selection

Mode in subclause 4.4.3.1.1. In the case that the mobile has a stored "Equivalent PLMNs" list the mobile shall only select a PLMN if it is of a higher priority than those of the same country as the current serving PLMN which are stored in the "Equivalent PLMNs" list. For this purpose, a value of timer T may be stored in the SIM. The interpretation of the stored value depends on the radio capabilities supported by the MS:

For an MS that does not only support any of the following or a combination of EC-GSM-IoT or Category M1 or Category NB1(as defined in 3GPP TS 36.306 [54]): T is either in the range 6 minutes to 8 hours in 6 minute steps or it indicates that no periodic attempts shall be made. If no value for T is stored in the SIM, a default value of 60 minutes is used for T.

For an MS that only supports any of the following or a combination of EC-GSM-IoT or Category M1 or Category NB1(as defined in 3GPP TS 36.306 [54]): T is either in the range 2 hours to 240 hours, using 2 hour steps from 2 hours to 80 hours and 4 hour steps from 84 hours to 240 hours, or it indicates that no periodic attempts shall be made. If no value for T is stored in the SIM, a default value of 72 hours is used.

If the MS is configured with the MinimumPeriodicSearchTimer as specified in 3GPP TS 24.368 [50] or 3GPP TS 31.102 [40], the MS shall not use a value for T that is less than the MinimumPeriodicSearchTimer. If the value stored in the SIM, or the default value for T (when no value is stored in the SIM), is less than the MinimumPeriodicSearchTimer, then T shall be set to the MinimumPeriodicSearchTimer

22.2.3.3 Test description

22.2.3.3.1 Pre-test conditions

System Simulator:

- Three multi-PLMN cells as specified in TS 36.508 clause 8.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.2.3.3.1-1.
- System information combination 3 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used.
- The PLMNs are identified in the test by the identifiers in Table 22.2.3.3.1-1.

Table 22.2.3.3.1–1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is registered to PLMN1 before it is switched off.
- The UE is configured with a value of MinimumPeriodicSearchTimer set to 120 minutes
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.2.3.3.1-2.

Table 22.2.3.3.1–2: USIM configuration

USIM field	Priority	Value	Access Technology Identifier
$EF_{EPSLOCI}$		PLMN1 (See preamble)	
EF_{IMSI}		The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	
$EF_{PLMNwAcT}$	1 2	Default PLMN2 Remaining mandatory entries use default values	Default All specified NB-IoT
$EF_{OPLMNwACT}$	1	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	1	PLMN4	NB-IoT

EF_{UST}		Services 20, 42, 43, 74 and 96 are supported. Service 71 is not supported (there is no EHPLMN list).	
EF_{HPPLMN}		1 [120 minutes]	
$EF_{NASCONFIG}$		MinimumPeriodicSearchTimer set to [120 minutes]	

Preamble:

- The UE is made to camp on Ncell 12 and then Switched OFF (State 1).

22.2.3.3.2 Test procedure sequence

Table 22.2.3.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked “T1”,“T2” etc are applied at the points indicated in the Main behaviour description in Table 22.2.3.3.2-2. Cell powers are chosen for a serving cell and a non-suitable “Off” cell as defined in TS 36.508.

Table 22.2.3.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Remarks
T0	NRS EPRE	dBm/15kHz	“Off”	-85	“Off”	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	“Off”	-85	-85	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-85	-85	-85	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1

Table 22.2.1.3.2-2: Main behaviour

Note 1: Timers in Step 18 and 26 are derived from the value defined by the MinimumPeriodicSearchTimer.					

22.2.3.3.3 Specific message contents

None

22.2.4 NB-IoT / Cell selection / Qrxlevmin and Qqualmin / Serving cell becomes non-suitable (S<0 or barred or Srxlev > 0 and Squal < 0)

22.2.4.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state }
ensure that {
  when { a cell fulfils all requirements for a suitable cell except the cell selection criteria
which are not fulfilled (Srxlev < 0)}
    then { the UE does not consider the cell suitable and no camping on this cell can take place }
            }
```

(2)

```
with { UE in RRC_IDLE state }
ensure that {
  when { a cell fulfils all requirements for a suitable cell except the cell selection criteria
which are not fulfilled (Srxlev > 0 AND Squal < 0)}
    then { the UE does not consider the cell suitable and no camping on this cell can take place }
            }
```

(3)

```
with { UE in RRC_IDLE state }
ensure that {
  when { a cell fulfils all requirements for a suitable cell including the cell selection criteria
for a cell which are also fulfilled (Srxlev > 0 AND Squal > 0)}
   then { the UE considers the cell suitable and camps on it }
            }
```

(4)

```
with { UE in RRC_IDLE state }
ensure that {
  when { the serving cell becomes non-suitable (Srxlev < 0)and there is a suitable neighbour cell
(Srxlev > 0) }
   then { UE selects the suitable neighbour cell }
            }
```

(5)

```
with { UE in RRC_IDLE state }
ensure that {
  when { the serving cell becomes barred and there is a suitable neighbour cell}
   then { UE selects the suitable neighbour cell }
            }
```

(6)

```
with { UE in RRC_IDLE state }
ensure that {
  when { the serving cell becomes non-suitable (Srxlev > 0 and Squal < 0)and there is a suitable
neighbour cell (Srxlev > 0 and Squal > 0) }
   then { UE selects the suitable neighbour cell }
            }
```

22.2.4.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.300, clause 10.1.1.1 and TS 36.304, clause 4.1, 5.1.2.2, 5.2.1, 5.2.3.1, 5.2.3.2a , 5.2.4.6, 5.2.8a and 5.3. Unless otherwise stated these are Rel-13 requirements.1.

[TS 36.300, clause 10.1.1.1]

Cell selection:

- The UE NAS identifies a selected PLMN and equivalent PLMNs;
- The UE searches the E-UTRA frequency bands and for each carrier frequency identifies the strongest cell. It reads cell system information broadcast to identify its PLMN(s):
    - The UE may search each carrier in turn ("initial cell selection") or make use of stored information to shorten the search ("stored information cell selection").
- The UE seeks to identify a suitable cell; if it is not able to identify a suitable cell it seeks to identify an acceptable cell. When a suitable cell is found or if only an acceptable cell is found it camps on that cell and commence the cell reselection procedure:
    - A suitable cell is one for which the measured cell attributes satisfy the cell selection criteria; the cell PLMN is the selected PLMN, registered or an equivalent PLMN; the cell is not barred or reserved and the cell is not part of a tracking area which is in the list of "forbidden tracking areas for roaming";
    - An acceptable cell is one for which the measured cell attributes satisfy the cell selection criteria and the cell is not barred;

[TS 36.304, clause 4.1]

When a UE is switched on, a public land mobile network (PLMN) is selected by NAS. For the selected PLMN, associated RAT(s) may be set [5]. The NAS shall provide a list of equivalent PLMNs, if available, that the AS shall use for cell selection and cell reselection.

With the cell selection, the UE searches for a suitable cell of the selected PLMN and chooses that cell to provide available services, further the UE shall tune to its control channel. This choosing is known as "camping on the cell".

The UE will, if necessary, then register its presence, by means of a NAS registration procedure, in the tracking area of the chosen cell and as outcome of a successful Location Registration the selected PLMN becomes the registered PLMN [5].

[TS 36.304, clause 5.1.2.2]

The UE shall scan all RF channels in the E-UTRA bands according to its capabilities to find available PLMNs. On each carrier, the UE shall search for the strongest cell and read its system information, in order to find out which PLMN(s) the cell belongs to. If the UE can read one or several PLMN identities in the strongest cell, each found PLMN (see the PLMN reading in [3]) shall be reported to the NAS as a high quality PLMN (but without the RSRP value), provided that the following high quality criterion is fulfilled:

1. For an E-UTRAN and NB-IoT cell, the measured RSRP value shall be greater than or equal to -110 dBm.

Found PLMNs that do not satisfy the high quality criterion, but for which the UE has been able to read the PLMN identities are reported to the NAS together with the RSRP value. The quality measure reported by the UE to NAS shall be the same for each PLMN found in one cell.

...

Once the UE has selected a PLMN, the cell selection procedure shall be performed in order to select a suitable cell of that PLMN to camp on.

[TS 36.304, clause 5.2.1]

UE shall perform measurements for cell selection and reselection purposes as specified in [10].

The NAS can control the RAT(s) in which the cell selection should be performed, for instance by indicating RAT(s) associated with the selected PLMN, and by maintaining a list of forbidden registration area(s) and a list of equivalent PLMNs. The UE shall select a suitable cell based on idle mode measurements and cell selection criteria.

In order to speed up the cell selection process, stored information for several RATs may be available in the UE.

When camped on a cell, the UE shall regularly search for a better cell according to the cell reselection criteria. If a better cell is found, that cell is selected. The change of cell may imply a change of RAT. Details on performance requirements for cell reselection can be found in [10].

The NAS is informed if the cell selection and reselection results in changes in the received system information relevant for NAS.

For normal service, the UE shall camp on a suitable cell, tune to that cell's control channel(s) so that the UE can:

- Receive system information from the PLMN; and
  - receive registration area information from the PLMN, e.g., tracking area information; and
  - receive other AS and NAS Information; and
- if registered:
  - receive paging and notification messages from the PLMN; and
  - initiate transfer to connected mode.

[TS 36.304, clause 5.2.3.1]

The UE shall use one of the following two cell selection procedures:

a) Initial Cell Selection

   This procedure requires no prior knowledge of which RF channels are E-UTRA or NB-IoT carriers. The UE shall scan all RF channels in the E-UTRA bands according to its capabilities to find a suitable cell. On each carrier frequency, the UE need only search for the strongest cell. Once a suitable cell is found this cell shall be selected.

[TS 36.304, clause 5.2.3.2a]

The cell selection criterion S is fulfilled when:

Srxlev > 0 AND Squal > 0

where:

$$Srxlev = Q_{rxlevmeas} – Q_{rxlevmin} – Pcompensation - Qoffset_{temp}$$

$$Squal = Q_{qualmeas} – Q_{qualmin} - Qoffset_{temp}$$

where:

Srxlev	Cell selection RX level value (dB)
Squal	Cell selection quality value (dB)
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3] (dB)
$Q_{rxlevmeas}$	Measured cell RX level value (RSRP)
$Q_{qualmeas}$	Measured cell quality value (RSRQ)
$Q_{rxlevmin}$	Minimum required RX level in the cell (dBm)
$Q_{qualmin}$	Minimum required quality level in the cell (dB)
Pcompensation	If the UE supports the *additionalPmax* in the *NS-PmaxList*, if present, in SIB1, SIB3 and SIB5: $\max(P_{EMAX1} – P_{PowerClass}, 0) – (\min(P_{EMAX2}, P_{PowerClass}) – \min(P_{EMAX1}, P_{PowerClass}))$ (dB); else: $\max(P_{EMAX1} – P_{PowerClass}, 0)$ (dB);
P_{EMAX1}, P_{EMAX2}	Maximum TX power level an UE may use when transmitting on the uplink in the cell (dBm) defined as P_{EMAX} in [TS 36.101]. P_{EMAX1} and

	P_{EMAX2} are obtained from the *p-Max* and the *NS-PmaxList* respectively in SIB1, SIB3 and SIB5 as specified in TS 36.331 [3].
$P_{PowerClass}$	Maximum RF output power of the UE (dBm) according to the UE power class as defined in [TS 36.101]

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{meas,s} + Q_{Hyst} - Qoffset_{temp}$$

$$R_n = Q_{meas,n} - Qoffset - Qoffset_{temp}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $Qoffset_{s,n}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Equals to $Qoffset_{s,n}$ plus $Qoffset_{frequency}$, if $Qoffset_{s,n}$ is valid, otherwise and for NB-IoT this equals to $Qoffset_{frequency}$.
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3]

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

[TS 36.304, clause 5.2.8a]

In this state, the UE shall attempt to find a suitable cell of any PLMN to camp on and searching first for a high quality cell, as defined in subclause 5.1.2.2.

The UE, which is not camped on any cell, shall stay in this state until a suitable cell is found.

[TS 36.304, clause 5.3.1]

Cell status and cell reservations are indicated in the *SystemInformationBlockType1* message (or *SystemInformationBlockType1-NB* message) [3] by means of two fields:

- *cellBarred* (IE type: "barred" or "not barred")
  In case of multiple PLMNs indicated in SIB1, this field is common for all PLMNs
- *cellReservedForOperatorUse* (IE type: "reserved" or "not reserved")
  In case of multiple PLMNs indicated in SIB1, this field is specified per PLMN.

When cell status is indicated as "not barred" and "not reserved" for operator use,

- All UEs shall treat this cell as candidate during the cell selection and cell reselection procedures.

When cell status is indicated as "not barred" and "reserved" for operator use for any PLMN,

- UEs assigned to Access Class 11 or 15 operating in their HPLMN/EHPLMN shall treat this cell as candidate during the cell selection and reselection procedures if the field *cellReservedForOperatorUse* for that PLMN set to “reserved”.

- UEs assigned to an Access Class in the range of 0 to 9, 12 to 14 shall behave as if the cell status is "barred" in case the cell is "reserved for operator use" for the registered PLMN or the selected PLMN.

NOTE 1: ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN; ACs 12, 13, 14 are only valid for use in the home country [4].

When cell status "barred" is indicated or to be treated as if the cell status is "barred",

- The UE is not permitted to select/reselect this cell, not even for emergency calls.

- The UE shall select another cell according to the following rule:

- If the cell is to be treated as if the cell status is “barred” due to being unable to acquire the *MasterInformationBlock (*or *MasterInformationBlock-NB),* the *SystemInformationBlockType1 (*or *SystemInformationBlockType1-NB),* or the *SystemInformationBlockType2 (*or *SystemInformationBlockType2-NB)*:

  - the UE may exclude the barred cell as a candidate for cell selection/reselection for up to 300 seconds.

  - the UE may select another cell on the same frequency if the selection criteria are fulfilled.

- else

  - If the cell is a CSG cell:

    - the UE may select another cell on the same frequency if the selection/reselection criteria are fulfilled.

  - else

    - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1 (*or *SystemInformationBlockType1-NB)* message is set to "allowed", the UE may select another cell on the same frequency if re-selection criteria are fulfilled.

      - The UE shall exclude the barred cell as a candidate for cell selection/reselection for 300 seconds.

    - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB*) message is set to "not allowed" the UE shall not re-select a cell on the same frequency as the barred cell;

      - The UE shall exclude the barred cell and the cells on the same frequency as a candidate for cell selection/reselection for 300 seconds.

The cell selection of another cell may also include a change of RAT.

22.2.4.3 Test description

22.2.4.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 2 on frequency f1 but have different tracking areas according to TS 36.508 Table 8.1.4.2-6. Ncell 3 on frequency f2 according to TS 36.508 Table 8.1.4.2-6.

- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used.

- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 10 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- None.

Preamble:

- The UE is in state Switched OFF (state 1) ac-NB cording to [18 TS 36.508].

22.2.4.3.2 Test procedure sequence

Table 22.2.4.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cell at various time instants of the test execution. The exact instants on which these values shall be applied are described in the texts in this clause. Configurations marked "T1" , "T2", "T3" , "T4", "T5" and "T6" are applied at the points indicated in the Main behaviour description in Table 22.2.4.3.2-2

Table 22.2.4.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	NCell 1	Ncell 2	Ncell 3	Remark
T1	Cell-specific NRS EPRE	dBm/15kHz	-95	"Off"	"Off"	The power level value is such to satisfy Srxlev Ncell 1 < 0 but the UE is able to read the PLMN identity
	Qrxlevmin	dBm	-84	-	-	
	Pcompensation	dB	0	-	-	
T2	Cell-specific NRS EPRE	dBm/15kHz	-95	"Off"	"Off"	The power level value is such to satisfy Srxlev Ncell 1 > 0 and Squal Ncell 1 < 0 but the UE is able to read the PLMN identity
	RSRQ	dB	-32	-	-	
	Noc	dBm/15kHz	-75	-	-	
	Qrxlevmin	dBm	-106	-	-	
	Qqualmin	dB	-18	-	-	
	Pcompensation	dB	0	-	-	
T3	Cell-specific NRS EPRE	dBm/15kHz	-65	"Off"	"Off"	The power level is such that Srxlev Ncell 1 > 0 and Squal Ncell 1 > 0
	RSRQ	dB	-5	-	-	
	Noc	dBm/15kHz	-75	-	-	
T4	Cell-specific NRS EPRE	dBm/15kHz	"Off"	-85	"Off"	$Srxlev_{Ncell1} < 0$
	Srxlev*	dB	-	25	-	Ncell 2 becomes the strongest Ncell
T5	Cell-specific NRS EPRE (FDD)	dBm/15kHz	"Off"	-85	-91	$Srxlev_{Ncell\ 2} > 0$, $Srxlev_{Ncell\ 3} > 0$, $R_{Ncell\ 3} < R_{Ncell\ 2}$
	Srxlev* (FDD)	dB	-	25	19	
	Cell-specific NRS EPRE (TDD)	dBm/15kHz	"Off"	-85	-89	
	Srxlev* (TDD)	dB	-	25	21	
	cellBarred (NOTE 3)	-	-	barred	notBarred	Serving Ncell becomes barred
T6	Cell-specific NRS EPRE	dBm/15kHz	"Off"	-85	-97	$Srxlev_{Ncell\ 3} > 0$ and $Squal_{Ncell\ 3} < 0$
	RSRQ	dB	-	-3.28	-26	
	Qrxlevmin	dBm	-	-92	-106	
	Qqualmin	dB	-	-20	-20	
	Pcompensation	dB	-	0	0	
	Srxlev*	dB	-	7	9	Ncell 2 is suitable Ncell

	Squal*	dB	-	16.72	-6	Squal = $Q_{qualmeas} – Q_{qualmin}$
	Noc	dBm/15kHz	-	"Off"	-75	
	cellBarred (NOTE 3)		-	notBarred	notBarred	
NOTE 1: The downlink signal level uncertainty is specified in TS 36.508 section 8.1.3.4.1 NOTE 2: Power level “Off” is defined in TS 36.508 Table 6.2.2.1-1. NOTE 3: E-UTRAN always includes *cellBarred-NTN* and sets *cellBarred* to 'barred' in an NTN cell.

22.2.5 NB-IoT / Intra-frequency Cell reselection / Qhyst, Qoffset, Treselection and Cell-specific reselection parameters

22.2.5.1 Test Purpose (TP)

(1)

```
with { UE in  RRC_IDLE state, and the UE is not in high mobility state }
ensure that {
  when { Qhyst is non-zero or its value changes in system information }
    then { UE reselects the highest ranked cell taking the actual Qhyst value into account }
           }
```

(2)

```
with { UE in  RRC_IDLE state, and the UE is not in high mobility state }
ensure that {
  when { cell reselection criteria are fulfilled during a time interval Treselection }
    then { UE reselects the highest ranked cell }
           }
```

(3)

```
with { UE in  RRC_IDLE state, and the UE is not in high mobility state }
ensure that {
  when { Qoffset is non-zero or its value changes in system information }
    then { UE reselects the highest ranked cell taking the actual Qoffset value into account }
           }
```

(4)

```
with { the UE is in RRC_IDLE and SystemInformationBlockType4-NB contain a cell-specific Qoffset for
a neighbour intra frequency cell }
ensure that {
  when { the neighbour cell has lower power than the serving cell but it is higher ranked due to the
cell-specific Qoffset }
    then { the UE reselects the neighbour cell with cell-specific Qoffset }
           }
```

(5)

```
with { the UE is in RRC_IDLE and SystemInformationBlockType4-NB contain a exclude-listed cell }
ensure that {
  when { a exclude-listed cell becomes higher ranked than the serving cell }
    then { the UE remains camped on the serving cell }
           }
```

(6)

```
with { UE in  RRC_IDLE state, and the UE is not in high mobility state }
ensure that {
  when { SintrasearchP is non-zero in system information }
    then { UE perform measurement and reselects the highest ranked cell upon Srxlev < SintrasearchP
}
           }
```

22.2.5.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.300, clause 10.1.1.2; TS 36.304, clauses 5.2.1, 5.2.4.1, 5.2.4.2a and 5.2.4.6; TS 36.331, clause 6.7.3.1; TS 36.133, clause 4.2.2.4. Unless otherwise stated these are Rel-13 requirements.

[TS 36.300, clause 10.1.1.2]

A UE in RRC_IDLE performs cell reselection. The principles of the procedure are the following:

- The UE makes measurements of attributes of the serving and neighbour cells to enable the reselection process:

- There is no need to indicate neighbouring cells in the serving cell system information to enable the UE to search and measure a cell i.e. E-UTRAN relies on the UE to detect the neighbouring cells;

- For the search and measurement of inter-frequency neighbouring cells, only the carrier frequencies need to be indicated;

- Measurements may be omitted if the serving cell attribute fulfils particular search or measurement criteria.

- Cell reselection identifies the cell that the UE should camp on. It is based on cell reselection criteria which involves measurements of the serving and neighbour cells, except for NB-IoT:

…

For NB-IoT, cell reselection identifies the cell that the UE should camp on. It is based on cell reselection criteria which involve measurements of the serving and neighbour cells as follows:

- Intra-frequency reselection is based on ranking of cells (potentially with cell specific offsets);

- Inter-frequency reselection is based on ranking of frequencies (potentially with frequency specific offsets);

- Blind redirection supported for load balancing.

[TS 36.304, clause 5.2.1]

When camped on a cell, the UE shall regularly search for a better cell according to the cell reselection criteria. If a better cell is found, that cell is selected.

[TS 36.304, clause 5.2.4.1]

The UE shall not consider any exclude-listed cells as candidate for cell reselection.

[TS 36.304, clause 5.2.4.2a]

When evaluating Srxlev and Squal of non-serving cells for reselection purposes, the UE shall use parameters provided by the serving cell.

Following rules are used by the UE to limit needed measurements:

- If the serving cell fulfils Srxlev > $S_{IntraSearchP}$, the UE may choose not to perform intra-frequency measurements.

- Otherwise, the UE shall perform intra-frequency measurements.

- The UE shall apply the following rules for NB-IoT inter-frequencies which are indicated in system information:

  - If the serving cell fulfils Srxlev > $S_{nonIntraSearchP}$, the UE may choose not to perform inter-frequency measurements.

  - Otherwise, the UE shall perform inter-frequency measurements.

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{msas,s} + Q_{Hyst} - Qoffset_{temp}$$

$$R_n = Q_{msas,n} - Q_{offset} - Qoffset_{temp}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $Qoffset_{s,n}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Equals to $Qoffset_{s,n}$ plus $Qoffset_{frequency}$, if $Qoffset_{s,n}$ is valid, otherwise and for NB-IoT this equals to $Qoffset_{frequency}$.
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3]

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

[TS 36.331, clause 6.7.3.1]

The IE SystemInformationBlockType3-NB contains cell re-selection information common for intra-frequency, and inter-frequency cell re-selection as well as intra-frequency cell re-selection information other than neighbouring cell related.

The IE SystemInformationBlockType4-NB contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters.

[TS 36.133, clause 4.2.2.4]

…

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 36.304 within Kcarrier * Tdetect,EUTRAN_Inter if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when Treselection = 0 provided that the reselection criteria is met by a margin of at least 5dB for reselections based on ranking or 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

22.2.5.3 Test description

22.2.5.3.1 Pre-test conditions

System Simulator:

- Ncells 1, 2, and 4 in different tracking areas according to TS 36.508 Table 8.1.4.2-6.
- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used.
- Tcell Offset for Ncell 2 and Ncell 4 is set to same value as Ncell 1.

UE:

None

Preamble:

- UE is in state 3-NB Idle mode on Ncell 1 according to TS 36.508 [18].

22.2.5.3.2 Test procedure sequence

Table 22.2.5.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The exact instants on which these values shall be applied are described in the texts in this clause. Configurations marked "T1", "T2", "T3", "T4", "T5", "T6", "T7", "T8", "T9", "T10" and "T11"are applied at the points indicated in the Main behaviour description in Table 22.2.5.3.2-2.

Table 22.2.5.3.2-1: Time instances of cell power level and parameter change

	Parameter	Unit	Ncell 1	Ncell 2	Ncell 4	Remark

T1	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-91	-85	Off	Ncell 2 becomes stronger than Ncell 1 but Ncell 1 remains the highest ranked one due to $Qhyst_{sCell1}$
	Cell-specific NRS EPRE (TDD)		-89	-85		
T2	$Qhyst_{s}$	dB	0	0	-	$Qhyst_{sCell1}$ change causes Ncell 2 to become highest ranked cell
T3	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-85	-91	Off	Ncell 1 becomes the strongest and highest ranked one
	Cell-specific NRS EPRE (TDD)		-85	-89		
	$Qoffset_{s,n}$	dB	24	0	-	$Qoffset_{s,nCell2}$ remains zero
T4	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-91	-85	Off	Ncell 1 becomes weaker but it remains the highest ranked one due to $Qoffset_{s,nCell1}$
	Cell-specific NRS EPRE (TDD)		-89	-85		
T5	$Qoffset_{s,n}$	dB	0	0	-	Ncell 2 becomes the highest ranked one due to $Qoffset_{s,nCell1}$ change
T6	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-85	-91	Off	Ncell 1 becomes the highest ranked one
	Cell-specific NRS EPRE (TDD)		-85	-89		
	Treselection	s	21	0	-	
T7	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-91	-85	Off	Ncell 2 becomes the highest ranked cell
	Cell-specific NRS EPRE (TDD)		-89	-85		
T8	Cell-specific NRS EPRE	dBm/15 kHz	Off	-91	-85	Ncell 4 has higher power than Ncell 2 but is exclude-listed
T9	Cell-specific NRS EPRE (FDD)	dBm/15 kHz	-91	-85	Off	Ncell 1 becomes the highest ranked one
	Cell-specific NRS EPRE (TDD)		-89	-85		
	Treselection	s	0	0	-	
	$Qoffset_{s,n}$	dB	24	-24	-	
T9 A	Cell-specific NRS EPRE	dBm/15 kHz	-91	-94	Off	Ncell 1 remains highest ranked cell
T10	Cell-specific NRS EPRE	dBm/15 kHz	-85	Off	Off	Only Ncell 1 is on
	$Qoffset_{s,n}$	dB	0	-	-	
T11	Cell-specific NRS EPRE	dBm/15 kHz	-91	-79	Off	Srxlev of Ncell 1 is less than $S_{intrasearchP}$
	$S_{intrasearchP}$	dB	22	22	-	

Table 22.2.5.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
0	Wait for 1 second to allow UE to enter RRC_IDLE state on Ncell 1.	-	-	-	-
1	SS re-adjusts the cell-specific reference signal levels according to row "T1" in table 22.2.5.3.2-1.	-	-	-	-

2	Check: Does the UE send an RRCConnectionRequest-NB on Ncell 2 within the next 10s?	-->	RRCConnectionRequest-NB	1	F
3	SS resets QhystsCell1 according to row "T2" in table 22.2.5.3.2-1.	-	-	-	-
4	The SS transmits a Paging-NB message on Ncell 1 to notify the UE of the system information change. The systemInfoValueTag-r13 / systemInfoValueTag-r15 in the MasterInformationBlock-NB / MasterInformationBlock-TDD-NB is increased on Ncell 1.	<--	Paging-NB	-	-
5	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.5 indicate that the UE is camped on Ncell 2? NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	1	-
6	SS changes Qoffsets,nCell1 according to rows "T3" in table 22.2.5.3.2-1.	-	-	-	-
7	The SS transmits a Paging-NB message on Ncell 2 to notify the UE of the system information change. The systemInfoValueTag-r13 / systemInfoValueTag-r15 in the MasterInformationBlock-NB / MasterInformationBlock-TDD-NB is increased on Ncell 2.	<--	Paging-NB	-	-
8	Wait for 2.1* modification period (Note 1) to allow the new system information to take effect.	-	-	-	-

22.2.6 NB-IoT / Cell reselection using cell status and cell reservations / Access control class 0 to 9

22.2.6.1 Test Purpose (TP)

(1)

```
with { UE camped normally in state RRC_IDLE and UE fitted with a USIM with access class 0..9}
ensure that {
  when { a higher ranked cell is found with cell status "barred" }
    then { UE does not attempt to reselect to the higher ranked cell }
            }
```

(2)

```
with { UE camped normally in state E-UTRA RRC_IDLE and UE fitted with a USIM with access class 0..9}
ensure that {
  when { a higher ranked cell is found "reserved" for Operator use }
    then { UE does not attempt to reselect to the higher ranked cell }
            }
```

22.2.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clauses 5.2.4.4 and 5.3.1.

[TS 36.304, clause 5.2.4.4]

For the highest ranked cell (including serving cell) according to cell reselection criteria specified in subclause 5.2.4.6, for the best cell according to absolute priority reselection criteria specified in subclause 5.2.4.5, the UE shall check if the access is restricted according to the rules in subclause 5.3.1.

If that cell and other cells have to be excluded from the candidate list, as stated in subclause 5.3.1, the UE shall not consider these as candidates for cell reselection. This limitation shall be removed when the highest ranked cell changes.

[TS 36.304, clause 5.3.1]

Cell status and cell reservations are indicated in the *SystemInformationBlockType1* message (or *SystemInformationBlockType1-NB* message) [3] by means of two fields:

- *cellBarred* (IE type: "barred" or "not barred")
  In case of multiple PLMNs indicated in SIB1, this field is common for all PLMNs

- *cellReservedForOperatorUse* (IE type: "reserved" or "not reserved")
  In case of multiple PLMNs indicated in SIB1, this field is specified per PLMN.

When cell status is indicated as "not barred" and "not reserved" for operator use,

- All UEs shall treat this cell as candidate during the cell selection and cell reselection procedures.

When cell status is indicated as "not barred" and "reserved" for operator use for any PLMN,

- ….

- UEs assigned to an Access Class in the range of 0 to 9, 12 to 14 shall behave as if the cell status is "barred" in case the cell is "reserved for operator use" for the registered PLMN or the selected PLMN.

….

When cell status "barred" is indicated or to be treated as if the cell status is "barred",

- The UE is not permitted to select/reselect this cell, not even for emergency calls.

- The UE shall select another cell according to the following rule:

  -If the cell is a CSG cell:

    …

  -else

  - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1 (*or *SystemInformationBlockType1-NB)* message is set to "allowed", the UE may select another cell on the same frequency if re-selection criteria are fulfilled.

    - The UE shall exclude the barred cell as a candidate for cell selection/reselection for 300 seconds.

  - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB*) message is set to "not allowed" the UE shall not re-select a cell on the same frequency as the barred cell;

    - The UE shall exclude the barred cell and the cells on the same frequency as a candidate for cell selection/reselection for 300 seconds.

22.2.6.3 Test description

22.2.6.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting default NAS parameters as indicated in TS 36.508 Table 8.1.4.2-2, except that TAC values use the codes in TS 36.508 Table 8.1.4.2-6.

- SIB 1-NB of Ncell 3 and Ncell 6 indicate cellBarred-r13 = barred.

- Each cell has only a single PLMN identity.
- All cells are high quality.
- The cell power levels are configured as shown in Table 22.2.6.3.1-1.
- System information combination 3 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used in NB-IoT cells.

Table 22.2.6.3.1-1: Cell power configuration

Parameter	Unit	Ncell 1	Ncell 3	Ncell 6	Remarks
NRS-EPRE	dBm/15kHz	-97	-82	-67	S>0 for all cells
Note 1: The default values (including "not present") for all other parameters influencing cell reselection are suitable for this test. The values are defined in TS 36.508 clauses 8.1.4.3.2 and 8.1.4.3.3					

UE:

- The UE is in Automatic PLMN selection mode.

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 1 according to [18].

22.2.6.3.2 Test procedure sequence

Table 22.2.6.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	SS adjusts SIB1-NB of Ncell 3 to indicate cellBarred-r13 = notBarred	-	-	-	-
2	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.5 indicate that the UE is camped on NB-IoT Ncell 3? NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	1	-
3	The SS notifies the UE of change of System Information.	<--	*Paging-NB*	-	-
4	SS adjusts SIB1-NB of Ncell 3 to indicate cellBarred-r13 = barred. (Ncell 3 and Ncell 6 are now both barred).	-	-	-	-
5	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.5 indicate that the UE is camped on NB-IoT Ncell 1? NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	1	-
6	SS adjusts SIB1-NB of both Ncell 3 and Ncell 6: Ncell 3 indicates cellBarred-r13 = notBarred; Ncell 6 indicates cellBarred-r13 = notBarred and cellReservedForOperatorUse-r13 = reserved.	-	-	-	-
7	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.5 indicate that the UE is camped on NB-IoT Ncell 3? NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	2	-
8	The SS notifies the UE of change of System Information.	<--	*Paging-NB*	-	-
9	SS adjusts SIB1-NB of Ncell 3 to indicate cellReservedForOperatorUse-r13 = reserved.	-	-	-	-
10	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.5	-	-	2	-

	indicate that the UE is camped on NB-IoT Ncell 1? NOTE: The UE performs a TAU procedure and the RRC connection is released.				

22.2.6.3.3 Specific message contents

Table 22.2.6.3.3-0: Conditions for specific message contents in Tables 22.2.6.3.3-1, 22.2.6.3.3-2, 22.2.6.3.3-4, 22.2.6.3.3-5 and 22.2.6.3.3-7

22.2.7 NB-IoT / Cell reselection using cell status and cell reservations / Access control class 11 to 15

22.2.7.1 Test Purpose (TP)

(1)

```
with { UE camped normally in state E-UTRA RRC_IDLE and UE fitted with a USIM with access class 0..9
and access classes 11..15 inclusive }
ensure that {
  when { a higher ranked cell is found with cell status "barred" }
    then { UE does not attempt to reselect to the higher ranked cell }
            }
```

(2)

```
with { UE camped normally in state E-UTRA RRC_IDLE and UE fitted with a USIM with access class 0..9
and access classes 11..15 inclusive }
ensure that {
  when { a higher ranked cell is found "reserved" for Operator use }
    then { UE re-selects to the higher ranked cell }
            }
```

22.2.7.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clauses 5.2.4.4 and 5.3.1.

[TS 36.304, clause 5.2.4.4]

For the highest ranked cell (including serving cell) according to cell reselection criteria specified in subclause 5.2.4.6, for the best cell according to absolute priority reselection criteria specified in subclause 5.2.4.5, the UE shall check if the access is restricted according to the rules in subclause 5.3.1.

If that cell and other cells have to be excluded from the candidate list, as stated in subclause 5.3.1, the UE shall not consider these as candidates for cell reselection. This limitation shall be removed when the highest ranked cell changes.

[TS 36.304, clause 5.3.1]

Cell status and cell reservations are indicated in the *SystemInformationBlockType1* message (or *SystemInformationBlockType1-NB* message) [3] by means of two fields:

- *cellBarred* (IE type: "barred" or "not barred")
  In case of multiple PLMNs indicated in SIB1, this field is common for all PLMNs

- *cellReservedForOperatorUse* (IE type: "reserved" or "not reserved")
  In case of multiple PLMNs indicated in SIB1, this field is specified per PLMN.

When cell status is indicated as "not barred" and "not reserved" for operator use,

- All UEs shall treat this cell as candidate during the cell selection and cell reselection procedures.

When cell status is indicated as "not barred" and "reserved" for operator use for any PLMN,

- UEs assigned to Access Class 11 or 15 operating in their HPLMN/EHPLMN shall treat this cell as candidate during the cell selection and reselection procedures if the IE *cellReservedForOperatorUse* for that PLMN set to “reserved”.

- UEs assigned to an Access Class in the range of 0 to 9, 12 to 14 shall behave as if the cell status is "barred" in case the cell is "reserved for operator use" for the registered PLMN or the selected PLMN.

…

When cell status "barred" is indicated or to be treated as if the cell status is "barred",

- The UE is not permitted to select/reselect this cell, not even for emergency calls.

- The UE shall select another cell according to the following rule:

  -If the cell is a CSG cell:

  …

  -else

  - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1 (*or *SystemInformationBlockType1-NB)* message is set to "allowed", the UE may select another cell on the same frequency if re-selection criteria are fulfilled.

    - The UE shall exclude the barred cell as a candidate for cell selection/reselection for 300 seconds.

  - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB*) message is set to "not allowed" the UE shall not re-select a cell on the same frequency as the barred cell;

    - The UE shall exclude the barred cell and the cells on the same frequency as a candidate for cell selection/reselection for 300 seconds.

22.2.7.3 Test description

22.2.7.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting default NAS parameters as indicated in TS 36.508 Table 8.1.4.2-2, except that TAC values use the codes in TS 36.508 Table 8.1.4.2-6.
- SIB 1-NB of Ncell 3 and Ncell 6 indicate cellBarred-r13 = barred.
- Each cell has only a single PLMN identity.
- All cells are high quality.
- The cell power levels are configured as shown in Table 22.2.7.3.1-1.
- System information combination 3 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used in NB-IoT cells.

Table 22.2.7.3.1-1: Cell power configuration

Parameter	Unit	Ncell 1	Ncell 3	Ncell 6	Remarks
NRS-EPRE	dBm/15kHz	-97	-82	-67	S>0 for all cells
Note 1: The default values (including “not present”) for all other parameters influencing cell reselection are suitable for this test. The values are defined in TS 36.508 clauses 8.1.4.3.2 and 8.1.4.3.3					

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those shown in Table 22.2.7.3.1-2.

Table 22.2.7.3.1-2: USIM Configuration

USIM field	Value
EF_{ACC}	Type “B” as defined in TS 34.108 clause 8.3.2.15

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 1 according to [18].

22.2.8 NB-IoT / Cell reselection in shared network environment

22.2.8.1 Test Purpose (TP)

(1)

```
with { the UE is in RRC_Idle and registered on the HPLMN }
ensure that {
  when { a cell of a different PLMN but shared with the HPLMN becomes highest ranked cell }
    then { the UE reselects the cell shared with the HPLMN }
```

22.2.8.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304 clause 5.2.4.2 and TS 23.122 clause 4.4.3. Unless otherwise stated these are Rel-13 requirements.

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{meas,s} + Q_{Hyst} - Qoffset_{temp}$$

$$R_n = Q_{meas,n} - Qoffset - Qoffset_{temp}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $Qoffset_{s,n}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Equals to $Qoffset_{s,n}$ plus $Qoffset_{frequency}$, if $Qoffset_{s,n}$ is valid, otherwise and for NB-IoT this equals to $Qoffset_{frequency}$.
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3]

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

[TS 23.122, clause 4.4.3]

...

When the MS reselects to a cell in a shared network, and the cell is a suitable cell for multiple PLMN identities received on the BCCH or on the EC-BCCH the AS indicates these multiple PLMN identities to the NAS according to 3GPP TS 44.018 [34], 3GPP TS 44.060 [39], 3GPP TS 25.304 [32] and 3GPP TS 36.304 [43]. The MS shall choose one of these PLMNs. If the registered PLMN is available among these PLMNs, the MS shall not choose a different PLMN.

...

22.2.8.3 Test description

22.2.8.3.1 Pre-test conditions

System Simulator:

- Ncell 1 (HPLMN)
- Ncell 2 (primary PLMN: same MCC like HPLMN but different MNC, secondary PLMN: HPLMN)
- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1.

UE:

None.

Preamble:

- UE is in state 3-NB Idle mode on Ncell 1 according to TS 36.508 [18].

22.2.8.3.2 Test procedure sequence

Table 22.2.8.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. Row marked "T0" denotes the conditions after the preamble, while columns marked "T1" is to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 22.2.8.3.2-1: Time instances of cell power level and parameter change

	Parameter	Unit	Ncell 1	Ncell 2	Remark
T0	Cell-specific NRS EPRE	dBm/15 kHz	-85	Off	
T1	Cell-specific NRS EPRE	dBm/15 kHz	-85	-73	The power level values are assigned to satisfy $Srxlev_{Cell\ 2}$ > $Srxlev_{Cell\ 1}$

22.2.9 NB-IoT / Inter-frequency cell reselection

22.2.9.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state }
ensure that {
  when { UE detects both intra-frequency and equal priority inter-frequency neighbour cells and the
inter-frequency cell is the highest ranked cell }
    then { UE reselects the inter-frequency cell }
            }
```

(2)

```
with { UE in  RRC_IDLE state }
ensure that {
  when { SnonintrasearchP is non-zero in system information }
    then { UE perform measurement and reselects the cell which belong to the equal priority inter-
frequency cell upon Srxlev < SnonintrasearchP }
           }
```

(3)

Void

22.2.9.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause5.2.4.2a, 5.2.4.5 and 5.2.4.6. Unless otherwise stated these are Rel-13 requirements.

[TS 36.304, clause 5.2.4.2a]

When evaluating Srxlev and Squal of non-serving cells for reselection purposes, the UE shall use parameters provided by the serving cell.

Following rules are used by the UE to limit needed measurements:

- If the serving cell fulfils Srxlev > $S_{IntraSearchP}$, the UE may choose not to perform intra-frequency measurements.
- Otherwise, the UE shall perform intra-frequency measurements.
- The UE shall apply the following rules for NB-IoT inter-frequencies which are indicated in system information:
    - If the serving cell fulfils Srxlev > $S_{nonIntraSearchP}$, the UE may choose not to perform inter-frequency measurements.
    - Otherwise, the UE shall perform inter-frequency measurements.

[TS 36.304, clause 5.2.4.5]

For NB-IoT inter-frequency cell reselection shall be based on ranking as defined in sub-clause 5.2.4.6.

…

Cell reselection to a cell on an equal priority E-UTRAN frequency shall be based on ranking for Intra-frequency cell reselection as defined in sub-clause 5.2.4.6.

…

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{meas,s} + Q_{Hyst} - Qoffset_{temp}$$

$$R_n = Q_{meas,n} - Qoffset - Qoffset_{temp}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $Qoffset_{s,n}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Equals to $Qoffset_{s,n}$ plus $Qoffset_{frequency}$, if $Qoffset_{s,n}$ is valid, otherwise and for NB-IoT this equals to $Qoffset_{frequency}$.
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3]

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

22.2.9.3 Test description

22.2.9.3.1 Pre-test conditions

System Simulator:

- Ncell 1, Ncell 2 and Ncell 3 have different tracking areas.
- System information combination 3 as defined in TS 36.508 [18] clause 8.1.4.3.1.

UE:

None.

Preamble:

- UE is in state 3-NB Idle mode on Ncell 1 according to TS 36.508 [18].

22.2.9.3.2 Test procedure sequence

Table 22.2.9.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1", "T2" and "T3" is applied at the point indicated in the Main behaviour description in Table 22.2.9.3.2-2.

Table 22.2.9.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 2	Ncell 3	Remark
T0	Cell-specific NRS EPRE	dBm/15kHz	-91	-95	-95	The power level values are set so that Ncell1 > Ncell2 and Ncell3.
T1	Cell-specific NRS EPRE	dBm/15kHz	-91	-85	-73	The power level values are set so that $R_{Ncell1} < R_{Ncell2} < R_{Ncell3}$.
T2	Cell-specific NRS EPRE	dBm/15kHz	-79	Off	-95	Srxlev of Ncell 3 is less than $S_{nonintrasearchP}$

22.2.10 NB-IoT / Cell reselection / MFBI

22.2.10.1 Test Purpose (TP)

(1)

```
with { UE in  RRC_IDLE state }
ensure that {
    when { an equal priority Intra-frequency neighbouring cell which has been included in the multiBandInfoList provided by the serving cell becomes available, and, is better ranked than the serving cell during a time interval TreselectionRAT, and, more than 1 second has elapsed since the UE camped on the current serving cell }
    then { the UE reselects the new cell }
            }
```

(2)

```
with { UE in  RRC_IDLE state }
ensure that {
    when { an equal priority Inter-frequency neighbouring cell which has been included in the multiBandInfoList provided by the serving cell becomes available, and, is better ranked than the serving cell during a time interval TreselectionRAT, and, more than 1 second has elapsed since the UE camped on the current serving cell }
    then { the UE reselects the new cell }
            }
```

22.2.10.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 5.2.4.2a and 5.2.4.6, TS 36.331, clause 5.2.2.7, 5.2.2.12 and 6.7.3.1.

[TS 36.304, clause 5.2.4.2a]

When evaluating Srxlev and Squal of non-serving cells for reselection purposes, the UE shall use parameters provided by the serving cell.

Following rules are used by the UE to limit needed measurements:

- If the serving cell fulfils Srxlev > SIntraSearchP, the UE may choose not to perform intra-frequency measurements
- Otherwise, the UE shall perform intra-frequency measurements.
- The UE shall apply the following rules for NB-IoT inter-frequencies which are indicated in system information:
    - If the serving cell fulfils Srxlev > SnonIntraSearchP, the UE may choose not to perform inter-frequency measurements.
    - Otherwise, the UE shall perform inter-frequency measurements.

[TS 36.304, clause 5.2.4.6]

The cell-ranking criterion R_s for serving cell and R_n for neighbouring cells is defined by:

$$R_s = Q_{meas,s} + Q_{Hyst} - Qoffset_{temp} + Qoffset_{SCPTM}$$

$$R_n = Q_{meas,n} - Qoffset - Qoffset_{temp} + Qoffset_{SCPTM}$$

where:

Q_{meas}	RSRP measurement quantity used in cell reselections.
Qoffset	For intra-frequency: Equals to $Qoffset_{s,n}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to zero. For inter-frequency: Except for NB-IoT, equals to $Qoffset_{s,n}$ plus $Qoffset_{frequency}$, if $Qoffset_{s,n}$ is valid, otherwise this equals to $Qoffset_{frequency}$. For NB-IoT equals to $QoffsetDedicated_{frequency}$ for any frequency other than the frequency of the dedicated frequency offset, if $QoffsetDedicated_{frequency}$ is valid, otherwise this equals to $Qoffset_{frequency}$ (if $QoffsetDedicated_{frequency}$ is valid $Qoffset_{frequency}$ is not used).
$Qoffset_{temp}$	Offset temporarily applied to a cell as specified in [3]
$Qoffset_{SCPTM}$	Offset temporarily applied to an SC-PTM frequency as specified below. The offset is applied to all cells on the SC-PTM frequency. If $Qoffset_{SCPTM}$ is valid, Qoffset for inter-frequency neighbour cells is not used.

The UE shall perform ranking of all cells that fulfil the cell selection criterion S, which is defined in 5.2.3.2 (5.2.3.2a for NB-IoT), but may exclude all CSG cells that are known by the UE not to be CSG member cells.

The cells shall be ranked according to the R criteria specified above, deriving $Q_{meas,n}$ and $Q_{meas,s}$ and calculating the R values using averaged RSRP results.

If a cell is ranked as the best cell the UE shall perform cell reselection to that cell. If this cell is found to be not-suitable, the UE shall behave according to subclause 5.2.4.4.

In all cases, the UE shall reselect the new cell, only if the following conditions are met:

- the new cell is better ranked than the serving cell during a time interval $Treselection_{RAT}$;
- more than 1 second has elapsed since the UE camped on the current serving cell.

[TS 36.331, clause 5.2.2.7]

Upon receiving the *SystemInformationBlockType1-NB*, the UE shall:

1> if the frequency band indicated in the *freqBandIndicator* is part of the frequency bands supported by the UE; or

1> if one or more of the frequency bands indicated in the *multiBandInfoList* are part of the frequency bands supported by the UE:

2> forward the *cellIdentity* to upper layers;

2> forward the *trackingAreaCode* to upper layers;

2> if *attachWithoutPDN-Connectivity* is received for the selected PLMN:

3> forward the a*ttachWithoutPDN-Connectivity* to upper layers;

2> else

3> indicate to upper layers that *attachWithoutPDN-Connectivity* is not present;

2> if, for the frequency band selected by the UE (from *freqBandIndicator* or *multiBandInfoList*), the *freqBandInfo* is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo*:

3> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo*;

3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:

4> apply the *additionalPmax*;

3> else:

4> apply the *p-Max*;

2> else:

3> apply the *additionalSpectrumEmission* in *SystemInformationBlockType2-NB* and the *p-Max*;

1> else:

2> consider the cell as barred in accordance with TS 36.304 [4]; and

2> perform barring as if *intraFreqReselection* is set to *notAllowed*.

[TS 36.331, clause 5.2.2.12]

Upon receiving *SystemInformationBlockType5-NB*, the UE shall:

1> if in RRC_IDLE, or in RRC_CONNECTED while T311 is running:

2> if, for the frequency band selected by the UE (from *multiBandInfoList*) to represent a non-serving NB-IoT carrier frequency, the *freqBandInfo* is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo*:

3> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo*;

3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:

4> apply the *additionalPmax*;

3> else:

4> apply the *p-Max*;

2> else:

3> apply the *p-Max*;

[TS 36.331, clause 6.7.3.1]

SystemInformationBlockType2-NB

The IE SystemInformationBlockType2-NB contains radio resource configuration information that is common for all UEs.

NOTE: UE timers and constants related to functionality for which parameters are provided in another SIB are included in the corresponding SIB.

…

***SystemInformationBlockType2-NB* field descriptions**
multiBandInfoList A list of *additionalSpectrumEmission* i.e. one for each additional frequency band included in *multiBandInfoList* in *SystemInformationBlockType1-NB,* listed in the same order.

…

SystemInformationBlockType5-NB

The IE *SystemInformationBlockType5-NB* contains information relevant only for inter-frequency cell re-selection i.e. information about other NB-IoT frequencies and inter-frequency neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency.

…

***SystemInformationBlockType5-NB* field descriptions**
multiBandInfoList Indicates the list of frequency bands, with the associated *additionalPmax* and *additionalSpectrumEmission* values as defined in TS 36.101 [42, 6.2.4], in addition to the band represented by dl-CarrierFreq for which cell reselection parameters are common.

22.2.10.3 Test description

22.2.10.3.1 Pre-test conditions

System Simulator:

- Ncell 1, Ncell 3, and Ncell 11 have different tracking areas according to TS 36.508 [18] Table 8.1.4.2-1A and are MFBI capable cells.
- Ncell 1 and Ncell 11 belong to the absolute centre frequency which overlaps between bands controlled by IXITs px_MFBI_FrequencyBand and px_OverlappingNotSupportedFrequencyBandMFBI.
- Ncell 3 belongs to another absolute centre frequency which again overlaps between bands controlled by IXITs px_MFBI_FrequencyBand and px_OverlappingNotSupportedFrequencyBandMFBI.
- System information combination 3 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used in NB-IoT inter-frequency multi cell scenario.

UE:

- UE does not support the px_OverlappingNotSupportedFrequencyBand_MFBI band.

Preamble:

- The UE is in state Registered, Idle mode (State 3-NB) on Ncell 1 (serving cell) according to TS 36.508 [18] clause 8.1.5.1

22.2.10.3.2 Test procedure sequence

Table 22.2.10.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configurations marked "T1" and "T2" is applied at the point indicated in the Main
behaviour description in Table 22.2.10.3.2-2.

Table 22.2.10.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 11	Ncell 3	Remarks
T1	NRS EPRE	dBm/15kHz	-85	-79	“Off”	The power level values are set so that Ncell 1 < Ncell 11. (NOTE 1)
T2	NRS EPRE	dBm/15kHz	“Off”	-85	-73	The power level values are set so that Ncell 1 < Ncell 11. (NOTE 1)
Note 1: Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1.

22.2.12 Void

22.2.13 NB-IoT / NTN / Multi-TAC

22.2.13.1 Test Purpose (TP)

(1)

```
with { UE in EMM-REGISTERED/RRC-IDLE and UE finds a cell which provides access by NB-IoT NTN RAT }
ensure that {
  when { systemInformationBlockType1-NB broadcast more than one TAC per PLMN }
    then { UE forwards the trackingAreaList to upper layers for mobility management procedure }
            }
```

22.2.13.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clauses 5.2.2.7 and 6.7.2, TS 24.301 clause 4.11.3. Unless otherwise stated these are Rel-17 requirements.

[TS 36.331, clause 5.2.2.7]

Upon receiving the *SystemInformationBlockType1-NB*, the UE shall:

…

1> else:

2> in the remainder of the procedures use *plmn-IdentityList*, *trackingAreaCode*, *trackingAreaList* and *cellIdentity* for the cell as received in the *cellAccessRelatedInfo*;

1> if the frequency band indicated in the *freqBandIndicator* is part of the frequency bands supported by the UE; or

1> if one or more of the frequency bands indicated in the *multiBandInfoList* are part of the frequency bands supported by the UE:

2> forward the *cellIdentity* to upper layers;

2> forward the *trackingAreaCode* to upper layers;

2> forward the *trackingAreaList* to upper layers, if present;

[TS 36.331, clause 6.7.2]

trackingAreaList A list of tracking area codes for the PLMN listed. For the first entry in *plmn-IdentityList-v1700*: If this field is present, the list of tracking area codes include the tracking area code in *trackingAreaCode-r13* and the tracking area codes in *trackingAreaList*. If this field is absent, only *trackingAreaCode-r13* applies. For other entries in *plmn-IdentityList-v1700*: If this field is present, the list of tracking area codes include the tracking area codes in *trackingAreaList*. If this field is absent, the list of tracking area codes of the preceding entry in *plmn-IdentityList-v1700* applies. The total number of signalled tracking area codes across all PLMNs cannot be more than *maxTAC-NB-r17*.

[TS 24.301, clause 4.11.3]

When a UE camps on a satellite E-UTRAN cell, the UE may receive multiple TACs from the lower layers. The UE shall construct TAIs from the multiple TACs (i.e. concatenate the identity of the current PLMN and each of the TACs) and select a TAI as follows:

a) if at least one TAI belongs to the TAI list of the UE, the UE shall select a TAI which belongs to the TAI list. If there are multiple TAIs which belong to the TAI list the UE shall consider each of these TAIs equal and:

- if the UE can determine a TAI which represents the best the tracking area of the UE's geographical location, the UE shall select a TAI which represents the best the tracking area of the UE's geographical location; and

- otherwise, the UE shall select a TAI in an implementation-specific way.

…

The UE shall consider the selected TAI as the current TAI. The UE shall select a TAI as described above when:

a) the UE receives multiple TACs from the lower layers; or

b) the UE has received multiple TACs from the lower layers upon starting to camping on the current cell and the TAI list, the list of "forbidden tracking areas for roaming", or the list of "forbidden tracking areas for regional provision of service" is updated.

22.2.13.3 Test description

22.2.13.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 11 as specified in TS 36.508 [18] clause 8.1.4.1.2 are configured.

- System information combination 9 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used for both cells.

UE:

- The UE is in Automatic PLMN selection mode.
- The pre-configured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble:

- The UE is in State 3-NB Registered, Idle Mode on Ncell 1 according to TS 36.508 [18].

22.2.13.3.2 Test procedure sequence

Table 22.2.13.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 22.2.13.3.2-2. Cell powers are chosen for a serving cell and a non-suitable "Off" cell as defined in TS 36.508 [18].

Table 22.2.13.3.2-1: Ncell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 11	Remarks
T0	NRS EPRE	dBm/15kHz	-85	"Off"	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1
T1	NRS EPRE	dBm/15kHz	"Off"	-85	Power level "Off" is defined in TS 36.508 Table 6.2.2.1-1

22.2.14 NB-IoT / SENSE/ PLMN selection of RPLMN, HPLMN, UPLMN, OPLMN and Other PLMN / Automatic mode

22.2.14.1 Test Purpose (TP)

(1)

```
with { UE in Automatic network selection mode and RPLMN, HPLMN, UPLMN ,OPLMN cells available and
signal level enhanced network selection is applicable }
ensure that {
  when { UE is switched on }
    then { UE selects a cell of a PLMN, if received signal quality of this PLMN is equal to or
greater than the "Operator controlled signal threshold per access technology" stored in the USIM }
            }
```

(2)

```
with { UE camped on a VPLMN cell and cells of a higher priority PLMN available, received signal
quality of the highest priority PLMN is lower than the "Operator controlled signal threshold per
access technology" stored in the USIM and received signal quality of the second highest priority
```

```
PLMN is equal to or greater than the "Operator controlled signal threshold per access technology""
stored in the USIM }
ensure that {
  when { higher priority PLMN search timer T expires }
    then { UE selects and camps on a cell of the second highest priority PLMN }
            }
```

(3)

```
with { UE in Automatic network selection mode and HPLMN, OPLMN and Other PLMN cells available but
the received signal quality from none of the candidate PLMN(s) or PLMN/access technology
combination(s) is equal to or greater than the "Operator controlled signal threshold per access
technology" stored in the USIM }
ensure that {
  when { UE returns to coverage }
    then { UE stops applying signal level enhanced network selection and selects a cell of the
highest priority PLMN }
            }
```

22.2.14.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.122 clauses 4.4.3.1, 4.4.3.1.1 and 4.4.3.3.1. Unless otherwise stated these are Rel-18 requirements.

[TS 23.122, clause 4.4.3.1]

a) if

- signal level enhanced network selection is not applicable (see clause 3.11); or
- the MS has stopped applying signal level enhanced network selection according to requirement v) of clause 4.4.3.1.1;

then the MS selects the registered PLMN or equivalent PLMN (if it is available) using all access technologies that the MS is capable of without considering the "Operator controlled signal threshold per access technology" stored in the USIM; or

b) if:

- signal level enhanced network selection is applicable (see clause 3.11); and
- the received signal quality from a candidate PLMN/access technology combination comprising of a registered PLMN or an equivalent PLMN (if it is available) is equal to or greater than the "Operator controlled signal threshold per access technology" of the access technology configured in the USIM.

the MS shall select the registered PLMN or equivalent PLMN (if it is available) and the access technology for which the received signal quality is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM. If for the registered PLMN or equivalent PLMN there are two or more access technologies for which the received signal quality is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM, it is up to implementation which access technology is selected by the MS.

[TS 23.122, clause 4.4.3.1.1]

When following the above procedure the following requirements apply:

…

v) In i), ii), iii), and v), if:

- signal level enhanced network selection is applicable (see clause 3.11); and
- the received signal quality of the candidate PLMN/access technology combination is lower than the threshold value indicated for the access technology in the "Operator controlled signal threshold per access technology" stored in the USIM.

the MS shall not consider the PLMN(s) in i) and PLMN/access technology combination(s) in ii), iii) and v) as selection candidate. If the received signal quality from none of the candidate PLMN(s) or PLMN/access technology combination(s) is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM, the MS shall stop applying signal level enhanced network selection and repeat the network selection procedure as specified in clause 4.4.3.1.

[TS 23.122, clause 4.4.3.3.1]

The attempts to access the HPLMN or an EHPLMN or higher priority PLMN shall be as specified below:

…

j) In steps i), ii) and iii) of clause 4.4.3.1.1, if signal level enhanced network selection is applicable (see clause 3.11 and step d) of clause 4.4.3.5), the MS shall only select a PLMN, if the received signal quality of the candidate PLMN/access technology combination is equal to or greater than the "Operator controlled signal threshold per access technology".

[TS 23.122, clause 3.11]

Signal level enhanced network selection is optionally supported by the home operator.

Signal level enhanced network selection applies only to NB-IoT, GERAN EC-GSM-IoT and Category M1 or M2 of E-UTRA. An MS supporting any, or a combination, of NB-IoT, GERAN EC-GSM-IoT and Category M1 or M2 of E-UTRA shall apply signal level enhanced network selection if the following conditions are fulfilled:

1) The MS is in automatic PLMN selection mode;

2) The MS supports the "Operator controlled signal threshold per access technology" as specified in 3GPP TS 22.011 [19];

3) The MS is configured for using signal level enhanced network selection as specified in 3GPP TS 24.368 [50];

4) The MS is configured for using signal level enhanced network selection as specified in 3GPP TS 31.102 [40]; and

5) The "Operator controlled signal threshold per access technology" is configured in the USIM as specified in 3GPP TS 31.102 [40].

NOTE 1: The usage of the "Operator controlled signal threshold per access technology" is intended only for IoT stationary devices (see 3GPP TS 22.011 [19]).

NOTE 2: "Operator controlled signal threshold per access technology" is not expected to be supported by non-IoT devices.

The HPLMN can configure the MS with an "Operator controlled signal threshold per access technology" stored in the USIM (see 3GPP TS 31.102 [40]), which consists of one or more entries, each containing:

a) a home operator controlled signal threshold; and

b) an access technology.

The "Operator controlled signal threshold per access technology" is specific for a certain access technology and when applicable, applies to all allowable PLMNs with the corresponding access technology combination.

22.2.14.3 Test description

22.2.14.3.1 Pre-test conditions

System Simulator:

- Four multi-PLMN Ncells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.2.14.3.1-1.

- The PLMNs are identified in the test by the identifiers in Table 22.2.14.3.1-1.

Table 22.2.14.3.1-1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01

12	PLMN1	001	11
13	PLMN2	001	21
3	PLMN3	001	31

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is registered to PLMN1 before it is switched off.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.2.14.3.1-2.
- The UE is configured for using SENSE as specified in 3GPP TS 24.368 which could be done by MMI or AT command.

Table 22.2.14.3.1-2: USIM configuration

USIM field	Priority	Value	Access Technology Identifier
EF_{IMSI}		The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	
$EF_{PLMNwAcT}$	1	PLMN1 Remaining mandatory entries use default values	NB-IoT
$EF_{OPLMNwACT}$	1	PLMN2 Remaining defined entries use default values	NB-IoT
$EF_{HPLMNwAcT}$	1	PLMN4	NB-IoT
EF_{UST}		Services 20, 42, 43, 74 and 148 are supported. Service 71 is not supported (there is no EHPLMN list).	
EF_{HPPLMN}		1 (2 hours)	
EF_{OCST}		1(SENSE enabled by operator) 58'H(Operator controlled signal threshold for NB-IoT is -91dBm)	NB-IoT

Preamble:

- The UE is made to camp on Ncell 12 and then Switched OFF (State 1-NB).

22.2.14.3.2 Test procedure sequence

Table 22.2.14.3.2-1 shows the Ncell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked "T1", "T2" etc are applied at the points indicated in the Main behaviour description in Table 22.2.14.3.2-2. Cell powers are chosen for a serving cell and a non-suitable "Off" cell as defined in TS 36.508 Table 6.2.2.1-1.

Table 22.2.14.3.2-1: Ncell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Ncell 3	Remarks

22.2.15.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.122 clauses 4.4.3.1. Unless otherwise stated these are Rel-18 requirements.

[TS 23.122, clause 4.4.3.1]

EXCEPTION: As an alternative option to this, if the MS is in automatic network selection mode and it finds coverage of an EHPLMN, the MS may register to that EHPLMN and not return to the registered PLMN or equivalent PLMN. If the EHPLMN list is not present or is empty, and the HPLMN is available, the MS may register on the HPLMN and not return to the registered PLMN or equivalent PLMN. The operator shall be able to control by SIM configuration whether an MS that supports this option is permitted to perform this alternative behaviour. If signal level enhanced network selection is applicable (see clause 3.11), the MS may register to that EHPLMN or HPLMN only over an access technology for which the received signal quality is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM.

…

22.2.15.3 Test description

22.2.15.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.2.15.3.1-1.

- The PLMNs are identified in the test by the identifiers in Table 22.2.15.3.1-1.

Table 22.2.15.3.1-1: PLMN identifiers

PLMN/access technology combinations are lower than the "Operator controlled signal threshold per
access technology" }
    then { UE stops applying signal level enhanced network selection and selects a cell of the
highest priority PLMN after higher priority PLMN search timer T expires. }
            }
```

22.2.16.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 23.122 clauses 4.4.3.1, 4.4.3.5. Unless otherwise stated these are Rel-18 requirements.

[TS 23.122, clause 4.4.3.1]

a) if

- signal level enhanced network selection is not applicable (see clause 3.11); or

- the MS has stopped applying signal level enhanced network selection according to requirement v) of clause 4.4.3.1.1;

then the MS selects the registered PLMN or equivalent PLMN (if it is available) using all access technologies that the MS is capable of without considering the "Operator controlled signal threshold per access technology" stored in the USIM; or

b) if:

- signal level enhanced network selection is applicable (see clause 3.11); and

- the received signal quality from a candidate PLMN/access technology combination comprising of a registered PLMN or an equivalent PLMN (if it is available) is equal to or greater than the "Operator controlled signal threshold per access technology" of the access technology configured in the USIM.

the MS shall select the registered PLMN or equivalent PLMN (if it is available) and the access technology for which the received signal quality is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM. If for the registered PLMN or equivalent PLMN there are two or more access technologies for which the received signal quality is equal to or greater than the "Operator controlled signal threshold per access technology" stored in the USIM, it is up to implementation which access technology is selected by the MS.

[TS 23.122, clause 4.4.3.5]

If signal level enhanced network selection is applicable (see clause 3.11) and the received signal quality of registered PLMN observed over an averaging window is lower than the "Operator controlled signal threshold per access technology" the MS shall periodically attempt to obtain service on an allowable PLMN/access technology combination for which the received signal quality of the candidate PLMN/access technology combination is equal to or greater than the "Operator controlled signal threshold per access technology" in accordance with the requirements that are applicable to i), ii), iii), iv) and v) as defined in the Automatic Network Selection Mode in clause 4.4.3.1.1. For this purpose, the value of the timer T_{SENSE} is configured with an MS implementation specific value with a minimum value of 2 min and a maximum value set to the value applicable for timer T as defined in clause 4.4.3.3.1.1.

The averaging window shall be shorter than the value of the timer T_{SENSE}.

…

The attempts to obtain service on an allowable PLMN shall be as specified below:

a) The periodic attempts shall only be performed in automatic mode, and not while the MS is attached for emergency bearer services, is registered for emergency services, has a PDN connection for emergency bearer services or has a PDU session for emergency services.

b) When the MS detects that the received signal quality of the current cell of the registered PLMN is below the "Operator controlled signal threshold per access technology" either upon registration or any time later, the MS shall start timer $T_{SENSE,}$ if not already running.

c) If upon expiry of timer T_{SENSE} the received signal quality of the registered PLMN observed over an averaging window is equal to or greater than the "Operator controlled signal threshold per access technology" the MS shall stay on the current selected PLMN. If timer T defined in clause 4.4.3.3.1.1 expires while timer T_{SENSE} is running and the received signal quality of registered PLMN observed over an averaging window is lower than the "Operator controlled signal threshold per access technology", the MS shall stop timer T_{SENSE} and shall perform the actions defined in this clause instead of the action defined for timer T expiry defined in clause 4.4.3.3.1.1.

d) If the received signal quality of the registered PLMN and all other available and allowable PLMN/access technology combinations are lower than the "Operator controlled signal threshold per access technology", the MS shall stop applying signal level enhanced network selection and repeat the network selection procedure as specified in clause 4.4.3.3.1.1.

e) The attempts shall only be performed by the MS while in idle mode or 5GMM-CONNECTED mode with RRC inactive indication (see 3GPP TS 24.501 [64]).

…

g) The MS shall limit its attempts to access allowable PLMN/access technology combinations of the same country as the current serving VPLMN, as defined in Annex B.

EXCEPTION: If the MS is in a VPLMN through satellite NG-RAN access or satellite E-UTRAN access with a shared MCC, the MS may attempt to access higher priority PLMN/access technology combinations irrespective of their MCC values.

EXCEPTION: If the MS is in a VPLMN through non-satellite access, the MS may attempt to access higher priority PLMNs with a shared MCC with satellite NG-RAN access technology or satellite E-UTRAN access technology.

22.2.16.3 Test description

22.2.16.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.2.16.3.1-1.
- The PLMNs are identified in the test by the identifiers in Table 22.2.16.3.1-1.

Table 22.2.16.3.1-1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is registered to PLMN1 before it is switched off.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.2.16.3.1-2.
- The UE is configured for using SENSE as specified in 3GPP TS 24.368 which could be done by MMI or AT command.

Table 22.2.16.3.1-2: USIM configuration

USIM field	Priority	Value	Access Technology Identifier
EF_{IMSI}		The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	SS adjusts Ncell levels according to row T1 of table 22.2.16.3.2-1	-	-	-	-
2	Power on the UE.	-	-	-	-
3	Check: Does the UE send an *RRCConnectionRequest-NB* on Ncell 1?	-->	*RRCConnectionRequest-NB*	1	P
4-15	Steps 3 to 14 of the registration procedure described in TS 36.508 subclause 8.1.5.2.3 are performed on Ncell 1. NOTE: The UE performs registration and the RRC connection is released.	-	-	-	-
16	SS adjusts Ncell levels according to row T2 of table 22.2.16.3.2-1	-	-	-	-
17	Check: Does the UE send an *RRCConnectionRequest-NB* on Ncell 13 before 132mins (Note 1, Note 3) from power on?	-->	*RRCConnectionRequest-NB*	2	P
18-22	Steps 2 to 6 of the generic test procedure in TS 36.508 subclause 8.1.5A.5 are performed on Ncell 13. NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	-	-
23	SS adjusts Ncell levels according to row T3 of table 22.2.16.3.2-1	-	-	-	-
24	Check: Does the UE send an *RRCConnectionRequest-NB* on Ncell 1 after 2min but before 132mins (Note 2, Note 3) from power on?	-->	*RRCConnectionRequest-NB*	3	P

25-29	Steps 2 to 6 of the generic test procedure in TS 36.508 subclause 8.1.5A.5 are performed on Ncell 1. NOTE: The UE performs a TAU procedure and the RRC connection is released.	-	-	-	-
Note 1: The received signal quality of registered PLMN observed over an averaging window is lower than the "Operator controlled signal threshold per access technology", and UE shall periodically attempt to obtain service on an allowable PLMN/access technology combination for which the received signal quality of the candidate PLMN/access technology combination is equal to or greater than the "Operator controlled signal threshold per access technology" (Refer to TS 23.122 Rel-18). T_{SENSE} is between 120s to T, and averaging window is shorter than T_{SENSE}. Hence, UE attempt to PLMN search before T expire. T is the high priority PLMN search timer defined by EF_{HPPLMN}. Note 2: Following attempts to access the HPLMN/EHPLMN/higher priority PLMN in VPLMN is operator specific setting (Refer to TS 23.122 Rel-12). Hence, window between 120s to T+Tolerance is being used, where the high priority PLMN search timer T defined by EF_{HPPLMN}. Note 3: Tolerance of 12min is added to allow time for the UE to find the proper PLMN

            }
```

22.3.1.1.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 5.1.1, 5.1.2, 5.1.3, 5.1.4, 5.1.5, 5.4.5a, 6.1.3.10.

[TS 36.321, clause 5.1.1]

The Random Access procedure described in this subclause is initiated by a PDCCH order, by the MAC sublayer itself or by the RRC sublayer. Random Access procedure on an SCell shall only be initiated by a PDCCH order. If a MAC entity receives a PDCCH transmission consistent with a PDCCH order [5] masked with its C-RNTI, and for a specific Serving Cell, the MAC entity shall initiate a Random Access procedure on this Serving Cell. For Random Access on the SpCell a PDCCH order or RRC optionally indicate the *ra-PreambleIndex* and the *ra-PRACH-MaskIndex*, except for NB-IoT where the subcarrier index is indicated; and for Random Access on an SCell, the PDCCH order indicates the *ra-PreambleIndex* with a value different from 000000 and the *ra-PRACH-MaskIndex*. For the pTAG preamble transmission on PRACH and reception of a PDCCH order are only supported for SpCell. If the UE is an NB-IoT UE and is configured with a non-anchor carrier, perform the Random Access procedure on the anchor carrier.

Before the procedure can be initiated, the following information for related Serving Cell is assumed to be available for UEs other than NB-IoT UEs, BL UEs or UEs in enhanced coverage [8], unless explicitly stated otherwise:

- the available set of PRACH resources for the transmission of the Random Access Preamble, *prach-ConfigIndex*.
- the groups of Random Access Preambles and the set of available Random Access Preambles in each group (SpCell only):

  The preambles that are contained in Random Access Preambles group A and Random Access Preambles group B are calculated from the parameters *numberOfRA-Preambles* and *sizeOfRA-PreamblesGroupA*:

  If *sizeOfRA-PreamblesGroupA* is equal to *numberOfRA-Preambles* then there is no Random Access Preambles group B. The preambles in Random Access Preamble group A are the preambles 0 to *sizeOfRA-PreamblesGroupA* – 1 and, if it exists, the preambles in Random Access Preamble group B are the preambles *sizeOfRA-PreamblesGroupA* to *numberOfRA-Preambles* – 1 from the set of 64 preambles as defined in [7].

- if Random Access Preambles group B exists, the thresholds, *messagePowerOffsetGroupB* and *messageSizeGroupA*, the configured UE transmitted power of the Serving Cell performing the Random Access Procedure, $P_{CMAX,\,c}$ [10], and the offset between the preamble and Msg3, *deltaPreambleMsg3*, that are required for selecting one of the two groups of Random Access Preambles (SpCell only).
- the RA response window size *ra-ResponseWindowSize*.
- the power-ramping factor *powerRampingStep*.
- the maximum number of preamble transmission *preambleTransMax*.
- the initial preamble power *preambleInitialReceivedTargetPower*.
- the preamble format based offset DELTA_PREAMBLE (see subclause 7.6).
- the maximum number of Msg3 HARQ transmissions *maxHARQ-Msg3Tx* (SpCell only).
- the Contention Resolution Timer *mac-ContentionResolutionTimer* (SpCell only).

NOTE: The above parameters may be updated from upper layers before each Random Access procedure is initiated.

The following information for related Serving Cell is assumed to be available before the procedure can be initiated for NB-IoT UEs, BL UEs or UEs in enhanced coverage [8]:

- …
- if the UE is a NB-IoT UE:
  - the available set of PRACH resources supported in the Serving Cell, *nprach-ParametersList*.
  - for random access resource selection and preamble transmission:
    - a PRACH resource is mapped into an enhanced coverage level.

- each PRACH resource contains a set of *nprach-NumSubcarriers* subcarriers which can be partitioned into one or two groups for single/multi-tone Msg3 transmission by *nprach-SubcarrierMSG3-RangeStart*. Each group is referred to as a Random Access Preamble group below in the procedure text.

  - a subcarrier is identified by the subcarrier index in the range: [*nprach-SubcarrierOffset*, *nprach-SubcarrierOffset* + *nprach-NumSubcarriers* -1]

  - each subcarrier of a Random Access Preamble group corresponds to a Random Access Preamble.

- when the subcarrier index is explicitly sent from the eNB as part of a PDCCH order *ra-PreambleIndex* shall be set to the signalled subcarrier index.

- the mapping of the PRACH resources into enhanced coverage levels is determined according to the following:

  - the number of enhanced coverage levels is equal to one plus the number of RSRP thresholds present in *RSRP-ThresholdsPrachInfoList*.

  - each enhanced coverage level has one PRACH resource present in *nprach-ParametersList*.

  - enhanced coverage levels are numbered from 0 and the mapping of PRACH resources to enhanced coverage levels are done in increasing *numRepetitionsPerPreambleAttempt* order.

- the criteria to select PRACH resources based on RSRP measurement per enhanced coverage level supported in the Serving Cell *rsrp-ThresholdsPrachInfoList*.

- the maximum number of preamble transmission attempts per enhanced coverage level supported in the Serving Cell *maxNumPreambleAttemptCE*.

- the number of repetitions required for preamble transmission per attempt for each enhanced coverage level supported in the Serving Cell *numRepetitionPerPreambleAttempt*.

- the configured UE transmitted power of the Serving Cell performing the Random Access Procedure, $P_{CMAX, c}$ [10].

- the RA response window size *ra-ResponseWindowSize* and the Contention Resolution Timer *mac-ContentionResolutionTimer* (SpCell only) per enhanced coverage level supported in the Serving Cell.

- the power-ramping factor *powerRampingStep*.

- the maximum number of preamble transmission *preambleTransMax-CE*.

- the initial preamble power *preambleInitialReceivedTargetPower*.

- the preamble format based offset DELTA_PREAMBLE (see subclause 7.6). For NB-IoT the DELTA_PREAMBLE is set to 0.

The Random Access procedure shall be performed as follows:

- Flush the Msg3 buffer;

- set the PREAMBLE_TRANSMISSION_COUNTER to 1;

- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:

  - set the PREAMBLE_TRANSMISSION_COUNTER_CE to 1;

  - if the starting enhanced coverage level, or for NB-IoT the initial number of PRACH repetitions, has been indicated in the PDCCH order which initiated the Random Access procedure, or if the starting enhanced coverage level has been provided by upper layers:

    - the MAC entity considers itself to be in that enhanced coverage level regardless of the measured RSRP;

  - else:

- if the RSRP threshold of enhanced coverage level 3 is configured by upper layers in *rsrp-ThresholdsPrachInfoList* and the measured RSRP is less than the RSRP threshold of enhanced coverage level 3 and the UE is capable of enhanced coverage level 3 then:
  - the MAC entity considers to be in enhanced coverage level 3;
- else if the RSRP threshold of enhanced coverage level 2 configured by upper layers in *rsrp-ThresholdsPrachInfoList* and the measured RSRP is less than the RSRP threshold of enhanced coverage level 2 and the UE is capable of enhanced coverage level 2 then:
  - the MAC entity considers to be in enhanced coverage level 2;
- else if the measured RSRP is less than the RSRP threshold of enhanced coverage level 1 as configured by upper layers in *rsrp-ThresholdsPrachInfoList* then:
  - the MAC entity considers to be in enhanced coverage level 1;
- else:
  - the MAC entity considers to be in enhanced coverage level 0;

- set the backoff parameter value to 0 ms;
- for the RN, suspend any RN subframe configuration;
- proceed to the selection of the Random Access Resource (see subclause 5.1.2).

NOTE: There is only one Random Access procedure ongoing at any point in time in a MAC entity. If the MAC entity receives a request for a new Random Access procedure while another is already ongoing in the MAC entity, it is up to UE implementation whether to continue with the ongoing procedure or start with the new procedure.

[TS 36.321, clause 5.1.2]

The Random Access Resource selection procedure shall be performed as follows:

- …
- else, for NB-IoT, if *ra-PreambleIndex* (Random Access Preamble) and PRACH resource have been explicitly signalled:
  - the PRACH resource is that explicitly signalled;
  - if the *ra-PreambleIndex* signalled is not 000000:
    - the Random Access Preamble is set to *nprach-SubcarrierOffset* + (*ra-PreambleIndex* modulo *nprach-NumSubcarriers*), where *nprach-SubcarrierOffset* and *nprach-NumSubcarriers* are parameters in the currently used PRACH resource.
  - else:
    - select the Random Access Preamble group according to the PRACH resource and the support for multi-tone Msg3 transmission.
    - randomly select a Random Access Preamble within the selected group.
- else the Random Access Preamble shall be selected by the MAC entity as follows:
  - If Msg3 has not yet been transmitted, the MAC entity shall, for NB-IoT UEs, BL UEs or UEs in enhanced coverage:
    - expect for NB-IoT, select the Random Access Preambles group and the PRACH resource corresponding to the selected enhanced coverage level;
    - for NB-IoT, select the PRACH resource corresponding to the selected enhanced coverage level, and select the Random Access Preambles group corresponding to the PRACH resource and the support for multi-tone Msg3 transmission;

  - …
  - except for NB-IoT, set PRACH Mask Index to 0.
- determine the next available subframe containing PRACH permitted by the restrictions given by the *prach-ConfigIndex* (except for NB-IoT), the PRACH Mask Index (except for NB-IoT, see subclause 7.3), physical layer timing requirements [2] and in case of NB-IoT, the subframes occupied by PRACH resources related to a higher enhanced coverage level (a MAC entity may take into account the possible occurrence of measurement gaps when determining the next available PRACH subframe);
- if the transmission mode is TDD and the PRACH Mask Index is equal to zero:
  - …
- else:
  - determine a PRACH within the determined subframe in accordance with the requirements of the PRACH Mask Index, if any.
- for NB-IoT UEs, BL UEs or UEs in enhanced coverage, select the *ra-ResponseWindowSize* and *mac-ContentionResolutionTimer* corresponding to the selected enhanced coverage level and PRACH.
- proceed to the transmission of the Random Access Preamble (see subclause 5.1.3).

[TS 36.321, clause 5.1.3]

The random-access procedure shall be performed as follows:

- set PREAMBLE_RECEIVED_TARGET_POWER to *preambleInitialReceivedTargetPower* + DELTA_PREAMBLE + (PREAMBLE_TRANSMISSION_COUNTER – 1) * *powerRampingStep*;
- if the UE is a BL UE or a UE in enhanced coverage:
  - the PREAMBLE_RECEIVED_TARGET_POWER is set to: PREAMBLE_RECEIVED_TARGET_POWER - 10 * log10(*numRepetitionPerPreambleAttempt*);
- if NB-IoT:
  - for enhanced coverage level 0, the PREAMBLE_RECEIVED_TARGET_POWER is set to: PREAMBLE_RECEIVED_TARGET_POWER - 10 * log10(*numRepetitionPerPreambleAttempt*)
  - for other enhanced coverage levels, the PREAMBLE_RECEIVED_TARGET_POWER is set corresponding to the max UE output power;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
  - instruct the physical layer to transmit a preamble with the number of repetitions required for preamble transmission corresponding to the selected preamble group (i.e., *numRepetitionPerPreambleAttempt*) using the selected PRACH corresponding to the selected enhanced coverage level, corresponding RA-RNTI, preamble index or for NB-IoT subcarrier index, and PREAMBLE_RECEIVED_TARGET_POWER.
- else:
  - instruct the physical layer to transmit a preamble using the selected PRACH, corresponding RA-RNTI, preamble index and PREAMBLE_RECEIVED_TARGET_POWER.

[TS 36.321, clause 5.1.4]

Once the Random Access Preamble is transmitted and regardless of the possible occurrence of a measurement gap or a Sidelink Discovery Gap for Transmission or a Sidelink Discovery Gap for Reception, the MAC entity shall monitor the PDCCH of the SpCell for Random Access Response(s) identified by the RA-RNTI defined below, in the RA Response window which starts at the subframe that contains the end of the preamble transmission [7] plus three subframes and has length *ra-ResponseWindowSize*. If the UE is a BL UE or a UE in enhanced coverage, RA Response window starts at the subframe that contains the end of the last preamble repetition plus three subframes and has length *ra-ResponseWindowSize* for the corresponding coverage level. If the UE is an NB-IoT UE, in case the number of NPRACH repetitions is greater than or equal to 64, RA Response window starts at the subframe that contains the end of the last preamble repetition plus 41 subframes and has length *ra-ResponseWindowSize* for the corresponding coverage level, and in case the number of NPRACH repetitions is less than 64, RA Response window starts at the subframe that contains the end of the last preamble repetition plus 4 subframes and has length *ra-ResponseWindowSize* for the corresponding coverage level.

…

For NB-IoT UEs, the RA-RNTI associated with the PRACH in which the Random Access Preamble is transmitted, is computed as:

RA-RNTI=1+ floor(SFN_id/4)

where SFN_id is the index of the first radio frame of the specified PRACH.

The MAC entity may stop monitoring for Random Access Response(s) after successful reception of a Random Access Response containing Random Access Preamble identifiers that matches the transmitted Random Access Preamble.

- If a downlink assignment for this TTI has been received on the PDCCH for the RA-RNTI and the received TB is successfully decoded, the MAC entity shall regardless of the possible occurrence of a measurement gap or a Sidelink Discovery Gap for Transmission or a Sidelink Discovery Gap for Reception:
  - if the Random Access Response contains a Backoff Indicator subheader:
    - set the backoff parameter value as indicated by the BI field of the Backoff Indicator subheader and Table 7.2-1, except for NB-IoT where the value from Table 7.2-2 is used.
  - else, set the backoff parameter value to 0 ms.
  - if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble (see subclause 5.1.3), the MAC entity shall:
    - consider this Random Access Response reception successful and apply the following actions for the serving cell where the Random Access Preamble was transmitted:
      - process the received Timing Advance Command (see subclause 5.2);
      - indicate the *preambleInitialReceivedTargetPower* and the amount of power ramping applied to the latest preamble transmission to lower layers (i.e., (PREAMBLE_TRANSMISSION_COUNTER – 1) * *powerRampingStep*);
      - process the received UL grant value and indicate it to the lower layers;
    - if *ra-PreambleIndex* was explicitly signalled and it was not 000000 (i.e., not selected by MAC):
      - consider the Random Access procedure successfully completed.
    - else, if the Random Access Preamble was selected by the MAC entity:
      - set the Temporary C-RNTI to the value received in the Random Access Response message no later than at the time of the first transmission corresponding to the UL grant provided in the Random Access Response message;
      - if this is the first successfully received Random Access Response within this Random Access procedure:
        - if the transmission is not being made for the CCCH logical channel, indicate to the Multiplexing and assembly entity to include a C-RNTI MAC control element in the subsequent uplink transmission;
        - obtain the MAC PDU to transmit from the "Multiplexing and assembly" entity and store it in the Msg3 buffer.

NOTE: When an uplink transmission is required, e.g., for contention resolution, the eNB should not provide a grant smaller than 56 bits (or 88 bits for NB-IoT) in the Random Access Response.

NOTE: If within a Random Access procedure, an uplink grant provided in the Random Access Response for the same group of Random Access Preambles has a different size than the first uplink grant allocated during that Random Access procedure, the UE behaviour is not defined.

If no Random Access Response is received within the RA Response window, or if none of all received Random Access Responses contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble, the Random Access Response reception is considered not successful and the MAC entity shall:

- if the notification of power ramping suspension has not been received from lower layers:
  - increment PREAMBLE_TRANSMISSION_COUNTER by 1;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
  - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax-CE* + 1:
    - if the Random Access Preamble is transmitted on the SpCell:
      - indicate a Random Access problem to upper layers;
      - if NB-IoT:
        - consider the Random Access procedure unsuccessfully completed;
- else:
  - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax* + 1:
    - if the Random Access Preamble is transmitted on the SpCell:
      - indicate a Random Access problem to upper layers;
    - if the Random Access Preamble is transmitted on an SCell:
      - consider the Random Access procedure unsuccessfully completed.
- if in this Random Access procedure, the Random Access Preamble was selected by MAC:
  - based on the backoff parameter, select a random backoff time according to a uniform distribution between 0 and the Backoff Parameter Value;
  - delay the subsequent Random Access transmission by the backoff time;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
  - increment PREAMBLE_TRANSMISSION_COUNTER_CE by 1;
  - if PREAMBLE_TRANSMISSION_COUNTER_CE = *maxNumPreambleAttemptCE* for the corresponding enhanced coverage level + 1:
    - reset PREAMBLE_TRANSMISSION_COUNTER_CE;
    - consider to be in the next enhanced coverage level, if it is supported by the Serving Cell and the UE, otherwise stay in the current enhanced coverage level;
    - select the Random Access Preambles group, *ra-ResponseWindowSize*, *mac-ContentionResolutionTimer*, and PRACH resource corresponding to the selected enhanced coverage level;
    - if the UE is an NB-IoT UE:
      - if the Random Access Procedure was initiated by a PDCCH order:
- consider the PRACH resource corresponding to the selected enhanced coverage level as explicitly signalled;
- proceed to the selection of a Random Access Resource (see subclause 5.1.2).

[TS 36.321, clause 5.1.5]

Contention Resolution is based on either C-RNTI on PDCCH of the SpCell or UE Contention Resolution Identity on DL-SCH. If the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage, the MAC entity shall use the *mac-ContentionResolutionTimer* for the corresponding enhanced coverage level if it exists.

Once Msg3 is transmitted, the MAC entity shall:

- start *mac-ContentionResolutionTimer* and restart *mac-ContentionResolutionTimer* at each HARQ retransmission;
- regardless of the possible occurrence of a measurement gap or Sidelink Discovery Gap for Reception, monitor the PDCCH until *mac-ContentionResolutionTimer* expires or is stopped;
- if notification of a reception of a PDCCH transmission is received from lower layers, the MAC entity shall:
  - if the C-RNTI MAC control element was included in Msg3:
    - if the Random Access procedure was initiated by the MAC sublayer itself or by the RRC sublayer and the PDCCH transmission is addressed to the C-RNTI and contains an UL grant for a new transmission; or
    - if the Random Access procedure was initiated by a PDCCH order and the PDCCH transmission is addressed to the C-RNTI:
      - consider this Contention Resolution successful;
      - stop *mac-ContentionResolutionTimer*;
      - discard the Temporary C-RNTI;
      - if the UE is an NB-IoT UE and is configured with a non-anchor carrier:
        - the UL grant or DL assignment contained in the PDCCH transmission on the anchor carrier is valid only for the non-anchor carrier.
      - consider this Random Access procedure successfully completed.
  - else if the CCCH SDU was included in Msg3 and the PDCCH transmission is addressed to its Temporary C-RNTI:
    - if the MAC PDU is successfully decoded:
      - stop *mac-ContentionResolutionTimer*;
      - if the MAC PDU contains a UE Contention Resolution Identity MAC control element; and
      - if the UE Contention Resolution Identity included in the MAC control element matches the 48 first bits of the CCCH SDU transmitted in Msg3:
        - consider this Contention Resolution successful and finish the disassembly and demultiplexing of the MAC PDU;
        - set the C-RNTI to the value of the Temporary C-RNTI;
        - discard the Temporary C-RNTI;
        - consider this Random Access procedure successfully completed.
      - else
        - discard the Temporary C-RNTI;
        - consider this Contention Resolution not successful and discard the successfully decoded MAC PDU.
- if *mac-ContentionResolutionTimer* expires:
  - discard the Temporary C-RNTI;
  - consider the Contention Resolution not successful.

- if the Contention Resolution is considered not successful the MAC entity shall:
    - flush the HARQ buffer used for transmission of the MAC PDU in the Msg3 buffer;
    - if the notification of power ramping suspension has not been received from lower layers:
        - increment PREAMBLE_TRANSMISSION_COUNTER by 1;
    - if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
        - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax-CE* + 1:
            - indicate a Random Access problem to upper layers.
            - if NB-IoT:
                - consider the Random Access procedure unsuccessfully completed;
    - else:
        - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax* + 1:
            - indicate a Random Access problem to upper layers.
    - based on the backoff parameter, select a random backoff time according to a uniform distribution between 0 and the Backoff Parameter Value;
    - delay the subsequent Random Access transmission by the backoff time;
    - proceed to the selection of a Random Access Resource (see subclause 5.1.2).

[TS 36.321, clause 5.4.5a]

The Data Volume and Power Headroom reporting procedure is only applicable for NB-IoT UEs and is used to provide the serving eNB with information about the amount of data available for transmission in the UL buffers associated with the MAC entity, and to provide the serving eNB with information about the difference between the nominal UE maximum transmission power and the estimated transmission power for UL-SCH transmission for the Serving Cell. The reporting is done using the DPR MAC control element, which is sent in Msg3 together with a CCCH SDU.

[TS 36.321, clause 6.1.3.10]

The Data Volume and Power Headroom Report (DPR) MAC control element is identified by the MAC PDU subheader used for the CCCH MAC SDU, as specified in table 6.2.1-2. It does not add any additional subheader and is always placed before the CCCH MAC SDU.

It has a fixed size and consists of a single octet defined as follows (figure 6.1.3.10-1):

- Data Volume (DV): The Data Volume field identifies the total amount of data available across all logical channels and of data not yet associated with a logical channel after all MAC PDUs for the TTI have been built. The amount of data is indicated in number of bytes. It shall include all data that is available for transmission in the RLC layer, in the PDCP layer, and in the RRC layer; the definition of what data shall be considered as available for transmission is specified in [3], [4] and [8] respectively. The size of the RLC and MAC headers are not considered in the buffer size computation. The length of this field is 4 bits. The values taken by the Data Volume field are shown in Table 6.1.3.10-1;
- Power Headroom (PH): This field indicates the power headroom level. The length of the field is 2 bits. The reported PH and the corresponding power headroom levels are shown in Table 6.1.3.10-2 below (the corresponding measured values in dB can be found in [9]);
- R: reserved bit, set to "0".

22.3.1.1.3 Test description

22.3.1.1.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- UE is in state Registered, Idle Mode (state 3-NB) according to [18] in Ncell 1.

22.3.1.1.3.2 Test procedure sequence

Table 22.3.1.1.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the Ncells at various time instants of the test execution. Row marked "T0" denotes the initial conditions after preamble, while columns marked "T1, T2 and T3" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 22.3.1.1.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Remark
T0	NRS-EPRE	dBm/15kHz	-70	The power level values are such that enhanced coverage level 0
T1	NRS-EPRE	dBm/15kHz	-90	The power level values are such that UE is in enhanced coverage level 1
T2	NRS-EPRE	dBm/15kHz	-110	The power level values are such that enhanced coverage level 2

Table 22.3.1.1.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
-	Exception: Steps 0-17E are repeated once for each time instant specified in table 22.3.1.1.3.2-1 by applying the Ncell 1 power level as per time instance.	-	-	-	-
0	The SS waits 15s to allow time to the UE to measure Ncell power level.				
1	The SS transmits a Paging message including a matched identity.	<--	MAC PDU (Paging)	-	-
-	Exception: Steps 2, 4, 6, 9 & 13 is repeated for numRepetitionsPerPreambleAttempt-r13 times configured for corresponding CE level	-	-	-	-
2	Check: Does the UE transmit a preamble on NPRACH? NOTE: The RACH preamble is calculated based on same nprach-ParametersList-r13 parameters for corresponding CE level defined in *SystemInformationBlockType2-NB*	-->	NPRACH Preamble	1,2,3	P
3	The SS transmits Random Access Response with RAPID different to the transmitted Preamble in step 2, including T-CRNTI and not including Back off Indicator sub header.	<--	Random Access Response	-	-
4	Check: Does the UE transmit same preamble group as step 2 on NPRACH?	-->	NPRACH Preamble	1,2,3,5	P
5	The SS transmits a MAC PDU addressed to UE RA-RNTI, containing multiple RAR's but none of the MAC sub headers contains a matching RAPID	<--	Random Access Response	-	-
6	Check: Does the UE transmit same preamble group as step 2 on NPRACH?	-->	NPRACH Preamble	1,2,3,6	P

7	The SS transmits a MAC PDU addressed to UE RA-RNTI, containing multiple RAR's one of the MAC sub headers contains a matching RAPID	<--	Random Access Response	-	-
8	The UE transmits an *RRCConnectionRequest-NB* message including Data Volume and Power Headroom Report (DPR) MAC control element.	-->	MAC PDU (*RRCConnectionRequest-NB*)	7	P
9	Check: Does the UE transmit same preamble group as step 2 on NPRACH?	-->	NPRACH Preamble	1,2, 3,8	P
10	The SS transmits a MAC PDU addressed to UE RA-RNTI, containing multiple RAR's one of the MAC sub headers contains a matching RAPID	<--	Random Access Response	-	-
11	Check: Does the UE transmits an *RRCConnectionRequest-NB* message including Data Volume and Power Headroom Report (DPR) MAC control element.	-->	MAC PDU (*RRCConnectionRequest-NB*)	7	P

22.3.1.2 NB-IoT / Correct Handling of DL MAC PDU / Assignment / HARQ process / TimeAlignmentTimer expiry

22.3.1.2.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE receives downlink assignment on the NPDCCH with a C-RNTI unknown by the UE and data is available in the associated subframe }
    then { UE does not send any HARQ feedback on the HARQ process }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE receives downlink assignment on the NPDCCH for the UE’s C-RNTI and receives a MAC PDU containing an single AMD PDU with no padding in the associated TTI in repetitions as per DL_REPETITION_NUMBER }
    then { UE sends a HARQ feedback }
            }
```

(3)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE receives a MAC PDU containing multiple MAC SDUs each containing an AMD PDU and no padding }
    then { UE successfully decodes the MAC PDU and forwards the AMD PDUs to higher layer }
            }
```

(4)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
   when{ UE is receiving RLC PDUs in MAC PDUs with padding greater than 2 bytes }
    then { UE acknowledges reception of the RLC PDUs }
            }
```

(5)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE is receiving RLC PDUs in MAC PDUs with padding equal to or less than 2 bytes }
    then { UE acknowledges reception of the RLC PDUs }
            }
```

(6)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { SS is transmitting a MAC control Timing Advance PDU with padding equal to or less than 2 bytes and no Data MAC PDU sub-headers followed by transmitting a RLC PDU }
    then { UE acknowledges reception of the RLC PDU using the new Timing Advance }
            }
```

(7)

```
with { UE in E-UTRA RRC_CONNECTED state and timeAlignmentTimer has expired }
ensure that {
  when { SS sends downlink assignment on the NPDCCH with a C-RNTI assigned to UE and data is
available in the associated subframe }
    then { UE does not send any HARQ feedback on the HARQ process }
            }
```

(8)

```
with { UE in E-UTRA RRC_CONNECTED state and timeAlignmentTimer has expired }
ensure that {
  when { SS sends uplink grant on the NPDCCH with a C-RNTI assigned to UE }
    then { UE does not send any MAC PDU }
            }
```

(9)

```
with { UE in E-UTRA RRC_CONNECTED state and timeAlignmentTimer has expired }
 ensure that {
   when { SS sends NPDCCH order to the C-RNTI assigned to UE }
     then { UE sends a prach preamble given in the NPDCCH Order }
             }
```

22.3.1.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.321 clauses: 5.3.1, 5.3.2.1, 5.3.2.2., 6.1.2 & 6.2.1

[TS 36.321, clause 5.1.2]

- else, for NB-IoT, if *ra-PreambleIndex* (Random Access Preamble) and PRACH resource have been explicitly signalled:
  - the PRACH resource is that explicitly signalled;
  - if the *ra-PreambleIndex* signalled is not 000000:
    - the Random Access Preamble is set to *nprach-SubcarrierOffset* + (*ra-PreambleIndex* modulo *nprach-NumSubcarriers*), where *nprach-SubcarrierOffset* and *nprach-NumSubcarriers* are parameters in the currently used PRACH resource.

[TS 36.321, clause 5.1.4]

For NB-IoT UEs, the RA-RNTI associated with the PRACH in which the Random Access Preamble is transmitted, is computed as:

RA-RNTI=1+ floor(SFN_id/4)

where SFN_id is the index of the first radio frame of the specified PRACH.

The MAC entity may stop monitoring for Random Access Response(s) after successful reception of a Random Access Response containing Random Access Preamble identifiers that matches the transmitted Random Access Preamble.

- If a downlink assignment for this TTI has been received on the PDCCH for the RA-RNTI and the received TB is successfully decoded, the MAC entity shall regardless of the possible occurrence of a measurement gap or a Sidelink Discovery Gap for Transmission or a Sidelink Discovery Gap for Reception:
  - if the Random Access Response contains a Backoff Indicator subheader:
    - set the backoff parameter value as indicated by the BI field of the Backoff Indicator subheader and Table 7.2-1, except for NB-IoT where the value from Table 7.2-2 is used.
  - else, set the backoff parameter value to 0 ms.
  - if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble (see subclause 5.1.3), the MAC entity shall:

- consider this Random Access Response reception successful and apply the following actions for the serving cell where the Random Access Preamble was transmitted:
  - process the received Timing Advance Command (see subclause 5.2);
  - indicate the *preambleInitialReceivedTargetPower* and the amount of power ramping applied to the latest preamble transmission to lower layers (i.e., (PREAMBLE_TRANSMISSION_COUNTER – 1) * *powerRampingStep*);
  - process the received UL grant value and indicate it to the lower layers;
- if *ra-PreambleIndex* was explicitly signalled and it was not 000000 (i.e., not selected by MAC):
  - consider the Random Access procedure successfully completed.

[TS 36.321, clause 5.3.1]

Downlink assignments transmitted on the PDCCH indicate if there is a transmission on a DL-SCH for a particular MAC entity and provide the relevant HARQ information.

When the MAC entity has a C-RNTI, Semi-Persistent Scheduling C-RNTI, or Temporary C-RNTI, the MAC entity shall for each TTI during which it monitors PDCCH and for each Serving Cell:

- if a downlink assignment for this TTI and this Serving Cell has been received on the PDCCH for the MAC entity's C-RNTI, or Temporary C-RNTI:
  - if this is the first downlink assignment for this Temporary C-RNTI:
    - consider the NDI to have been toggled.
  - if the downlink assignment is for the MAC entity's C-RNTI and if the previous downlink assignment indicated to the HARQ entity of the same HARQ process was either a downlink assignment received for the MAC entity's Semi-Persistent Scheduling C-RNTI or a configured downlink assignment:
    - consider the NDI to have been toggled regardless of the value of the NDI.
  - indicate the presence of a downlink assignment and deliver the associated HARQ information to the HARQ entity for this TTI.

[TS 36.321, clause 5.3.2.1]

There is one HARQ entity at the MAC entity for each Serving Cell which maintains a number of parallel HARQ processes. Each HARQ process is associated with a HARQ process identifier. The HARQ entity directs HARQ information and associated TBs received on the DL-SCH to the corresponding HARQ processes (see subclause 5.3.2.2).

The number of DL HARQ processes per HARQ entity is specified in [2], clause 7.

When the physical layer is configured for downlink spatial multiplexing [2], one or two TBs are expected per TTI and they are associated with the same HARQ process. Otherwise, one TB is expected per TTI.

For NB-IoT UEs or BL UEs or UEs in enhanced coverage, the parameter DL_REPETITION_NUMBER provides the number of transmissions repeated in a bundle. For each bundle, DL_REPETITION_NUMBER is set to a value provided by lower layers. Within a bundle, after the initial (re)transmission, DL_REPETITION_NUMBER-1 HARQ retransmissions follow. The HARQ feedback is transmitted for the bundle and a downlink assignment corresponding to a new transmission or a retransmission of the bundle is received after the last repetition of the bundle. A retransmission of a bundle is also a bundle.

In addition to the broadcast HARQ process, NB-IoT has one DL HARQ process.

The MAC entity shall:

- If a downlink assignment has been indicated for this TTI:
  - allocate the TB(s) received from the physical layer and the associated HARQ information to the HARQ process indicated by the associated HARQ information.
- If a downlink assignment has been indicated for the broadcast HARQ process:

  - allocate the received TB to the broadcast HARQ process.

NOTE: In case of BCCH and BR-BCCH a dedicated broadcast HARQ process is used.

[TS 36.321, clause 5.3.2.2]

For each TTI where a transmission takes place for the HARQ process, one or two (in case of downlink spatial multiplexing) TBs and the associated HARQ information are received from the HARQ entity.

For each received TB and associated HARQ information, the HARQ process shall:

- if the NDI, when provided, has been toggled compared to the value of the previous received transmission corresponding to this TB; or
- if the HARQ process is equal to the broadcast process and if this is the first received transmission for the TB according to the system information schedule indicated by RRC; or
- if this is the very first received transmission for this TB (i.e. there is no previous NDI for this TB):
  - consider this transmission to be a new transmission.
- else:
  - consider this transmission to be a retransmission.

The MAC entity then shall:

- if this is a new transmission:
  - attempt to decode the received data.
- else if this is a retransmission:
  - if the data for this TB has not yet been successfully decoded:
    - combine the received data with the data currently in the soft buffer for this TB and attempt to decode the combined data.
- if the data which the MAC entity attempted to decode was successfully decoded for this TB; or
- if the data for this TB was successfully decoded before:
  - if the HARQ process is equal to the broadcast process:
    - deliver the decoded MAC PDU to upper layers.
  - else if this is the first successful decoding of the data for this TB:
    - deliver the decoded MAC PDU to the disassembly and demultiplexing entity.
  - generate a positive acknowledgement (ACK) of the data in this TB.
- else:
  - replace the data in the soft buffer for this TB with the data which the MAC entity attempted to decode.
  - generate a negative acknowledgement (NACK) of the data in this TB.
- if the HARQ process is associated with a transmission indicated with a Temporary C-RNTI and the Contention Resolution is not yet successful (see subclause 5.1.5); or
- if the HARQ process is equal to the broadcast process; or
- if the *timeAlignmentTimer*, associated with the TAG containing the serving cell on which the HARQ feedback is to be transmitted, is stopped or expired:
  - do not indicate the generated positive or negative acknowledgement to the physical layer.

- else:
    - indicate the generated positive or negative acknowledgement for this TB to the physical layer.

The MAC entity shall ignore NDI received in all downlink assignments on PDCCH for its Temporary C-RNTI when determining if NDI on PDCCH for its C-RNTI has been toggled compared to the value in the previous transmission.

NOTE: When the MAC entity is configured with more than one serving cell, UE behaviours for storing data to the soft buffer is specified in [2].

NOTE: If the MAC entity receives a retransmission with a TB size different from the last valid TB size signalled for this TB, the UE behaviour is left up to UE implementation.

[TS 36.321, clause 6.1.2]

A MAC PDU consists of a MAC header, zero or more MAC Service Data Units (MAC SDU), zero, or more MAC control elements, and optionally padding; as described in Figure 6.1.2-3.

Both the MAC header and the MAC SDUs are of variable sizes.

A MAC PDU header consists of one or more MAC PDU subheaders; each subheader corresponds to either a MAC SDU, a MAC control element or padding.

A MAC PDU subheader consists of the five or six header fields R/F2/E/LCID/(F)/L but for the last subheader in the MAC PDU and for fixed sized MAC control elements. The last subheader in the MAC PDU and subheaders for fixed sized MAC control elements consist solely of the four header fields R/F2/E/LCID. A MAC PDU subheader corresponding to padding consists of the four header fields R/F2/E/LCID.

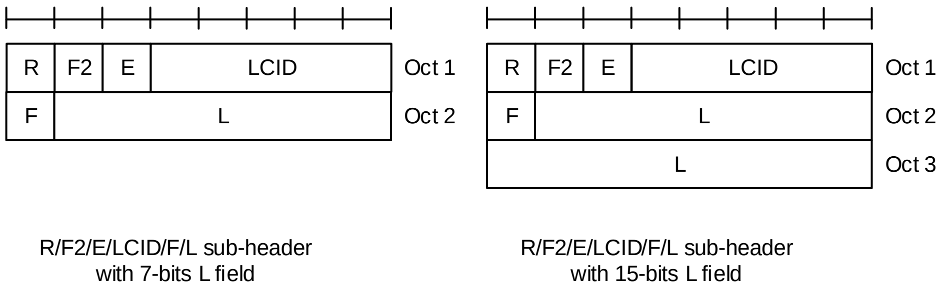

Figure 6.1.2-1: R/F2/E/LCID/F/L MAC subheader

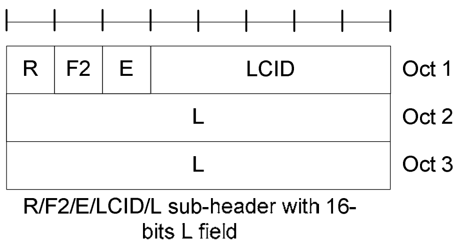

Figure 6.1.2-1a: R/F2/E/LCID/L MAC subheader

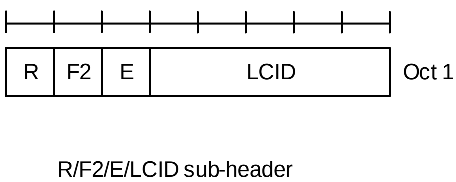

Figure 6.1.2-2: R/F2/E/LCID MAC subheader

MAC PDU subheaders have the same order as the corresponding MAC SDUs, MAC control elements and padding.

MAC control elements are always placed before any MAC SDU.

Padding occurs at the end of the MAC PDU, except when single-byte or two-byte padding is required. Padding may have any value and the MAC entity shall ignore it. When padding is performed at the end of the MAC PDU, zero or more padding bytes are allowed.

When single-byte or two-byte padding is required, one or two MAC PDU subheaders corresponding to padding are placed at the beginning of the MAC PDU before any other MAC PDU subheader.

A maximum of one MAC PDU can be transmitted per TB per MAC entity. A maximum of one MCH MAC PDU can be transmitted per TTI.

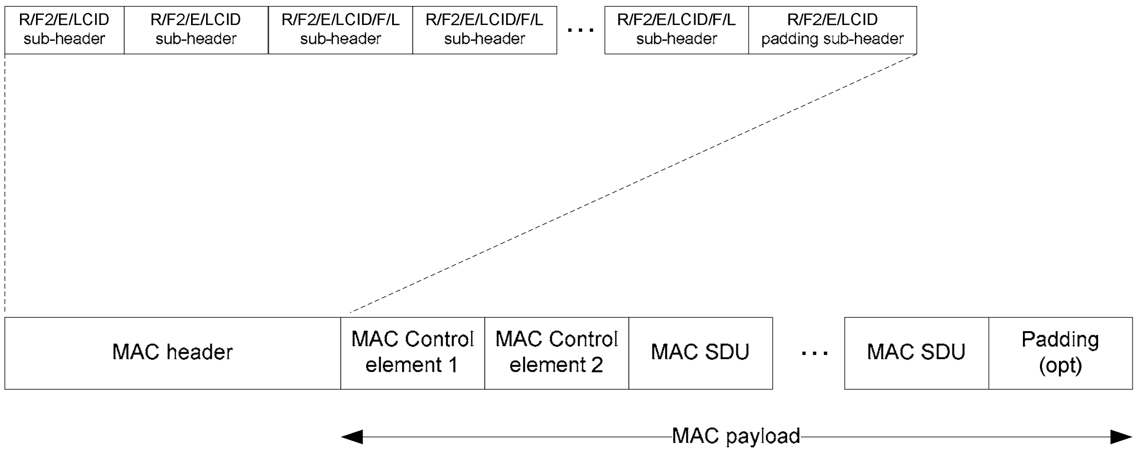

Figure 6.1.2-3: Example of MAC PDU consisting of MAC header, MAC control elements, MAC SDUs and padding

[TS 36.321, clause 6.2.1]

The MAC header is of variable size and consists of the following fields:

- LCID: The Logical Channel ID field identifies the logical channel instance of the corresponding MAC SDU or the type of the corresponding MAC control element or padding as described in tables 6.2.1-1, 6.2.1-2 and 6.2.1-4 for the DL-SCH, UL-SCH and MCH respectively. There is one LCID field for each MAC SDU, MAC control element or padding included in the MAC PDU. In addition to that, one or two additional LCID fields are included in the MAC PDU, when single-byte or two-byte padding is required but cannot be achieved by padding at the end of the MAC PDU. A UE of Category 0 [12] shall indicate CCCH using LCID "01011", otherwise the UE shall indicate CCCH using LCID "00000". The LCID field size is 5 bits;

- L: The Length field indicates the length of the corresponding MAC SDU or variable-sized MAC control element in bytes. There is one L field per MAC PDU subheader except for the last subheader and subheaders corresponding to fixed-sized MAC control elements. The size of the L field is indicated by the F field and F2 field;

- F: The Format field indicates the size of the Length field as indicated in table 6.2.1-3. There is one F field per MAC PDU subheader except for the last subheader and subheaders corresponding to fixed-sized MAC control elements and except for when F2 is set to 1. The size of the F field is 1 bit. If the F field is included; if the size of the MAC SDU or variable-sized MAC control element is less than 128 bytes, the value of the F field is set to 0, otherwise it is set to 1;

- F2: The Format2 field indicates the size of the Length field as indicated in table 6.2.1-3. There is one F2 field per MAC PDU subheader. The size of the F2 field is 1 bit. If the size of the MAC SDU or variable-sized MAC control element is larger than 32767 bytes, and if the corresponding subheader is not the last subheader, the value of the F2 field is set to 1, otherwise it is set to 0.

- E: The Extension field is a flag indicating if more fields are present in the MAC header or not. The E field is set to "1" to indicate another set of at least R/F2/E/LCID fields. The E field is set to "0" to indicate that either a MAC SDU, a MAC control element or padding starts at the next byte;

- R: Reserved bit, set to "0".

The MAC header and subheaders are octet aligned.

Table 6.2.1-1: Values of LCID for DL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011-10111	Reserved
11000	Activation/Deactivation (4 octets)
11001	SC-MCCH, SC-MTCH (see note)
11010	Long DRX Command
11011	Activation/Deactivation (1 octet)
11100	UE Contention Resolution Identity
11101	Timing Advance Command
11110	DRX Command
11111	Padding
NOTE: Both SC-MCCH and SC-MTCH cannot be multiplexed with other logical channels in the same MAC PDU except for Padding.	

For NB-IoT only the following LCID values for DL-SCH are applicable: CCCH, Identity of the logical channel, UE Contention Resolution Identity, Timing Advance Command, DRX Command and Padding.

Table 6.2.1-2: Values of LCID for UL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011	CCCH
01100-10101	Reserved
10110	Truncated Sidelink BSR
10111	Sidelink BSR
11000	Dual Connectivity Power Headroom Report
11001	Extended Power Headroom Report
11010	Power Headroom Report
11011	C-RNTI
11100	Truncated BSR
11101	Short BSR
11110	Long BSR
11111	Padding

For NB-IoT only the following LCID values for UL-SCH are applicable: CCCH (LCID "00000"), Identity of the logical channel, C-RNTI, Short BSR and Padding.

Table 6.2.1-3: Values of F and F2 fields

Index of F2	Index of F	Size of Length field (in bits)
0	0	7
	1	15
1	-	16

Table 6.2.1-4: Values of LCID for MCH

Index	LCID values
00000	MCCH (see note)
00001-11100	MTCH

11101	Reserved
11110	MCH Scheduling Information or Extended MCH Scheduling Information
11111	Padding
NOTE: If there is no MCCH on MCH, an MTCH could use this value.	

22.3.1.2.3 Test description

22.3.1.2.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- *RRC-Connection-Setup-NB* (preamble: Table 8.1.5.2.3-1, step 3 [18]) using parameters as specified in Table 22.3.1.2.3.3-1

UE:

None.

Preamble

- UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G and configured to return no data in UL according to [18] in Ncell 1.

22.3.1.2.3.2 Test procedure sequence

Table 22.3.1.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	SS transmits a downlink assignment to a C-RNTI different from the C-RNTI assigned to the UE on NPDCCH and transmits in the indicated downlink assignment a RLC PDU in a MAC PDU on NPDSCH.	<--	(NPDCCH (unknown C-RNTI)) MAC PDU	-	-
2	Check: Does the UE send any HARQ ACK on PUCCH?	-->	HARQ ACK/NACK	1	F
3	The SS transmits DCI N1 with Irep=2 resulting in 4 repetitions. The SS transmits a MAC PDU containing a MAC SDU with a RLC SDU of 38 bytes in an AMD PDU(SN=X+1) with polling field 'P' set to '1' and repeats it in the next 3 consecutive TTIs; the SS shall generate a CRC error for each transmission causing the UE to send a NACK (NOTE 1, 2, 4)	<--	NPDCCH (DCI N1)) MAC PDU (R/R/E/LCID MAC sub-header (E='0', LCID= '0011'), 40 bytes MAC SDU)	-	-
4	Check: Does the UE send HARQ NACK NPDSCH?	-->	HARQ NACK	2	P
-	EXCEPTION: Step 5 shall be repeated till HARQ ACK is received at step 6 (NOTE 11).	-	-	-	-
5	The SS indicates retransmissions on NPDCCH by transmitting DCI N1 with Irep=1 and NDI same as step 3 and transmits the same MAC PDU like step 3.		NPDCCH (DCI N1)) MAC PDU (R/R/E/LCID MAC sub-header (E='0', LCID= '0011'), 40 bytes MAC SDU)		
-	EXCEPTION: HARQ NACK from the UE should be allowed at step 6 (NOTE 11).	-	-	-	-
6	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	2	P
7	The SS allocates an UL grant for UE to send the RLC status PDU (NOTE 3)	-	-	-	-
8	Check: Does the UE transmit a MAC PDU containing an RLC STATUS PDU	-->	MAC PDU (RLC STATUS PDU (ACK_SN 'X+2'))	2	P

	acknowledging the reception of the AMD PDU in step 3?				
9	The SS transmits DCI N1 with Irep=3 resulting in 8 repetitions. The SS transmits three MAC SDUs each containing a RLC SDU of 18, 19 or 21 bytes in an AMD PDU (SN=X+2 to X+4) with the polling field ‘P’ set to ‘1’ in the last AMD PDU and repeats it in the next 7 consecutive TTIs. (NOTE 1, 2, 5)	<--	NPDCCH (DCI N1)) MAC PDU (2 x R/R/E/LCID/L MAC sub-header (E=’1’, LCID=‘0011’, F=’0’, L=’11’), R/R/E/LCID MAC sub-header (E=’0’, LCID=‘0011’), 19 bytes MAC SDU, 19 bytes MAC SDU, 21 bytes MAC SDU	-	-
10	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	3	P
11	In the third (next for NTN) NPDCCH period bundle after the transmission at step 9 the SS allocates an UL grant for the UE to send the RLC status PDU (NOTE 3, NOTE 4)	-	-	-	-
12	Check: Does the UE transmit a MAC PDU containing an RLC STATUS PDU acknowledging the reception of the AMD PDUs in step 5?	-->	MAC PDU (RLC STATUS PDU (ACK_SN ‘X+5’))	3	P
13	The SS transmits DCI N1 with Irep=4 resulting in 16 repetitions. The SS transmits a MAC PDU containing an RLC SDU in an AMD PDU with polling field ‘P’ set to ‘1’and repeats it in the next 15 consecutive TTIs. (NOTE 1, 2, 6)	<--	NPDCCH (DCI N1)) MAC PDU(AMD PDU, 7-byte padding)	-	-
14	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	4	P
15	In the third (next for NTN) NPDCCH period bundle after the transmission at step 13 the SS allocates an UL grant for the UE to send the RLC status PDU (NOTE 3, NOTE 4)	-	-	-	-
16	Check: Does the UE transmit an RLC STATUS PDU with ACK_SN field equal to X+6?	-->	RLC STATUS PDU (ACK_SN ‘X+6’)	4	P
17	The SS transmits DCI N1 with Irep=5 resulting in 32 repetitions. The SS transmits a MAC PDU containing an RLC SDU in an AMD PDU with polling field ‘P’ set to ‘1’ and repeats it in the next 31 consecutive TTIs. (NOTE 1, 2, 7)	<--	NPDCCH (DCI N1)) MACPDU(AMD PDU, one byte padding)	-	-
18	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	5	P
19	In the third (next for NTN) NPDCCH period bundle after the transmission at step 17 the SS allocates an UL grant for the UE to send the RLC status PDU (NOTE 3,NOTE 4)	-	-	-	-
20	Check: Does the UE transmit an RLC STATUS PDU with ACK_SN field equal to X+7?	-->	MAC PDU(RLC STATUS PDU (ACK_SN =X+7))	5	P
21	The SS transmits a Timing Advance Command without any additional padding (i.e. TBS=16). Start Timer_1 = Time Alignment timer value. The Timing Advance Command indicates a T_A index of 31 resulting in no change of timing advance (see TS 36.213 clause 4.2.3)	<--	NPDCCH (DCI N1)) MAC Control PDU (Timing Advance)	-	-
22	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	6	P
23	The SS waits for 39 (4 for NTN) NPDCCH period bundles. (NOTE 8, NOTE 4)	-	-	-	-
24	In the 40^{th} (5th for NTN) NPDCCH period bundle after the transmission at step 21 the SS transmit another Timing Advance MAC PDU (8 bits) with 1-byte padding (i.e. TBS=24). Restart Timer_1 = Time Alignment timer value The Timing Advance Command indicates a T_A	<--	MAC Control Element (Timing Advance) + 1-byte padding	-	-

	index of 63 resulting in new timing advance to be applied at step 30. (NOTE 8,NOTE 4)				
25	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	6	P
26	The SS waits for 55 (6 for NTN) NPDCCH period bundles. (NOTE 9, NOTE 4)	-	-	-	-
27	In the 56th (7th for NTN)NPDCCH period bundle after the transmission at step 24 the SS transmits MAC PDU containing one RLC SDU in an AMD PDU with polling field 'P' set to '1'. (NOTE 9, NOTE 4)	<--	MAC PDU(AMD PDU (SN=X+7, P=1))	-	-
28	Check: Does the UE send HARQ ACK NPDSCH?	-->	HARQ ACK	6	P
29	In the 58th (8th for NTN)NPDCCH period bundle after the transmission at step 24 the SS allocates an UL grant for UE to send the RLC status PDU. (NOTE 3, NOTE 4)	-	-	-	-
30	Check: Does the UE transmit an RLC STATUS PDU acknowledging the reception of the RLC PDU in step 27 with new Timing Advance?	-->	MAC PDU(RLC STATUS PDU (ACK_SN =X+8))	6	P
31	Wait for *timeAlignmentTimer* to expire in UE	-	-	-	-
32	In the 88th (9th for NTN) NPDCCH period bundle after the transmission at step 21 SS transmits a downlink assignment to C-RNTI assigned to the UE on NPDCCH and transmits in the indicated downlink assignment a RLC PDU with polling field 'P' set to '0' in a MAC PDU on NPDSCH. (NOTE 10, NOTE 13, NOTE 4)	<--	(NPDCCH (C-RNTI)) MAC PDU	-	-
33	Check: Does the UE send any HARQ ACK on PUCCH?	-->	HARQ ACK/NACK	7	F
34	In the 90th (10th for NTN) NPDCCH period bundle after the transmission at step 24 the SS allocates an UL grant for the UE. (NOTE 3, NOTE 4)	-	-	-	-
35	Check: Does the UE transmit any UL MAC PDU?	-->	MAC PDU	8	F
36	The SS transmits a NPDCCH order to C-RNTI assigned to the UE on NPDCCH	<--	NPDCCH order (sub-carrier index := 13)	-	-
37	Check: Does the UE transmit a preamble on NPRACH with RAPID corresponding to subcarrier index provided in step 36?	-->	NPRACH Preamble	9	P
38	The SS transmits a MAC PDU addressed to UE RA-RNTI, containing a matching RAPID. (NOTE 12)	<--	Random Access Response	-	-
39	C-RNTI based contention resolution happens and causes the UE to be UL synchronised again. (NOTE 12)	-	-	-	-

NOTE 1: RLC SDU with size n contains a DLInformationTransfer-NB with ESM_DATA_TRANSPORT:
18 or 26 bits DLInformationTransfer-NB(PER encode: '0000000000'B + 8 bits (length of DedicatedInfoNAS <= 127 bytes) or 16 bits length (128 bytes <= length of DedicatedInfoNAS < 16383 bytes))
1/2 byte Protocol discriminator (SECURITY PROTECTED NAS MESSAGE)
1/2 byte Security header type (SECURITY PROTECTED NAS MESSAGE)
4 bytes Message authentication code (SECURITY PROTECTED NAS MESSAGE)
1 byte Sequence number (SECURITY PROTECTED NAS MESSAGE)
1/2 byte Protocol discriminator (ESM_DATA_TRANSPORT)
1/2 byte EPS bearer identity (ESM_DATA_TRANSPORT)
1 byte Procedure transaction identity (ESM_DATA_TRANSPORT)
1 byte ESM data transport message identity (ESM_DATA_TRANSPORT)
2 bytes length indicator of the user data container (ESM_DATA_TRANSPORT)
N bytes User data container contents (UL RLC SDU)

	6 bits Aligned bits (*PER encode*) n = N+14 or N+15 bytes DL RLC SDU
NOTE 2:	The RLC SQN X is the last SQN used on SRB1bis before start of the test sequence.
NOTE 3:	NPDCCH period is 64ms according to TS 36.508 Table 8.1.6.3-3 [18].
NOTE 4:	MAC PDU at step 3 and 5: 1 byte R/R/E/LCID MAC SDU sub-header 40 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 38 bytes RLC SDU) ⇒ TBS= 328 (I_{SF}=1, I_{TBS}=10)
NOTE 5:	MAC PDU at step 9: 4 bytes 2 x R/R/E/LCID/L MAC SDU sub-header 1 byte R/R/E/LCID MAC SDU sub-header 18 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 16 bytes RLC SDU) 19 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 17 bytes RLC SDU) 21 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 19 bytes RLC SDU) ⇒ TBS= 504 (I_{SF}=2, I_{TBS}=10)
NOTE 6:	MAC PDU at step 13: 2 bytes R/R/E/LCID/L MAC SDU sub-header 1 byte R/F2/E/LCID padding sub-header 18 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 16 bytes RLC SDU) 7 bytes padding ⇒ TBS= 224 (I_{SF}=1, I_{TBS}=7)
NOTE 7:	MAC PDU at step 17: 1 byte R/F2/E/LCID padding sub-header 1 byte R/R/E/LCID MAC SDU sub-header 16 bytes MAC SDU containing RLC AMD PDU (2 bytes AMD header, 14 bytes RLC SDU) ⇒ TBS= 144 (I_{SF}=0, I_{TBS}=10)
NOTE 8:	With an NPDCCH period of 64ms 40 NPDCCH periods are 2.56s i.e. the transmission at step 23 happens at about 50% of Timer_1 expiry (5.12s).
NOTE 9:	With an NPDCCH period of 64ms 56 NPDCCH periods are 3.584s i.e. the transmission at step 27 happens at about 70% of Timer_1 expiry (5.12s).
NOTE 10:	With an NPDCCH period of 64ms 88 NPDCCH periods are 5.632s corresponding to Timer_1 + 10%.
NOTE 11:	UE soft combiner implementation should have sufficient retransmissions to be able to successfully decode the data in its soft buffer.
NOTE 12:	The value of T-CRNTI and CRNTI are different at step 38/39.
NOTE 13:	The DL RLC Sequence number is incremented after step 32.
NOTE 14:	NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.1.3 NB-IoT / Correct Handling of UL MAC PDU / Assignment / HARQ process / Padding

22.3.1.3.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives for a TTI an uplink grant with valid C-RNTI }
    then { UE transmits UL MAC PDU repetitions as per UL_REPETITION_NUMBER }
           }
```

(2)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an UL Grant with toggled NDI, redundancy version = 0 in DCI format and has data
available for transmission}
    then { UE transmits a new MAC PDU in repetitions as per UL_REPETITION_NUMBER using redundancy
versions alternating between 0,2 for each repetition}
           }
```

(3)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an UL Grant with un toggled NDI and redundancy version = 1 in DCI format }
    then { UE retransmits the  MAC PDU in repetitions as per UL_REPETITION_NUMBER using redundancy
versions alternating between 2,0 for each repetition }
           }
```

(4)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE inserts a R/R/E/LCID field in the MAC header and there is a subsequent R/R/E/LCID field
to be inserted }
    then { UE sets E field to 1 }
           }
```

(5)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE inserts a R/R/E/LCID field in the MAC header and a MAC SDU or a MAC control element
starts at the next byte }
    then { UE sets E field to 0 }
           }
```

(6)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE inserts the last MAC sub-header in the MAC PDU }
    then { UE inserts a MAC sub-header consist solely of the four header fields R/R/E/LCID }
           }
```

(7)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE is to transmit a MAC PDU with padding exceeding 2 bytes }
    then { UE inserts the last MAC sub-header as a padding MAC subheader consisting solely of the
four header fields R/R/E/LCID with LCID set to Padding and Padding goes to the end of the MAC PDU }
           }
```

(8)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE is to transmit a MAC PDU with single-byte padding and there is a data MAC PDU sub-header present }
    then { UE is inserting padding MAC PDU subheader before any other MAC PDU sub-header }
           }
```

(9)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE is to transmit a MAC PDU with two-byte padding and there is a data MAC PDU sub-header }
    then { UE is inserting two padding MAC PDU subheaders before any other MAC PDU sub-header or one padding MAC PDU subheader as a last MAC PDU subheader }
           }
```

22.3.1.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.321, clause 5.4.1, 5.4.2.1, 5.4.2.2, 6.1.2, 6.2.1. Unless otherwise stated these are Rel-13 requirements.

[TS 36.321, clause 5.4.1]

In order to transmit on the UL-SCH the MAC entity must have a valid uplink grant (except for non-adaptive HARQ retransmissions) which it may receive dynamically on the PDCCH or in a Random Access Response or which may be configured semi-persistently. To perform requested transmissions, the MAC layer receives HARQ information from lower layers. When the physical layer is configured for uplink spatial multiplexing, the MAC layer can receive up to two grants (one per HARQ process) for the same TTI from lower layers.

If the MAC entity has a C-RNTI, a Semi-Persistent Scheduling C-RNTI, or a Temporary C-RNTI, the MAC entity shall for each TTI and for each Serving Cell belonging to a TAG that has a running *timeAlignmentTimer* and for each grant received for this TTI:

- if an uplink grant for this TTI and this Serving Cell has been received on the PDCCH for the MAC entity's C-RNTI or Temporary C-RNTI; or
- if an uplink grant for this TTI has been received in a Random Access Response:
  - if the uplink grant is for MAC entity's C-RNTI and if the previous uplink grant delivered to the HARQ entity for the same HARQ process was either an uplink grant received for the MAC entity's Semi-Persistent Scheduling C-RNTI or a configured uplink grant:
    - consider the NDI to have been toggled for the corresponding HARQ process regardless of the value of the NDI.
  - deliver the uplink grant and the associated HARQ information to the HARQ entity for this TTI.
- else, if this Serving Cell is the SpCell and if an uplink grant for this TTI has been received for the SpCell on the PDCCH of the SpCell for the MAC entity's Semi-Persistent Scheduling C-RNTI:
  - if the NDI in the received HARQ information is 1:
    - consider the NDI for the corresponding HARQ process not to have been toggled;
    - deliver the uplink grant and the associated HARQ information to the HARQ entity for this TTI.
  - else if the NDI in the received HARQ information is 0:
    - if PDCCH contents indicate SPS release:
      - clear the configured uplink grant (if any).
    - else:
      - store the uplink grant and the associated HARQ information as configured uplink grant;

        - initialise (if not active) or re-initialise (if already active) the configured uplink grant to start in this TTI and to recur according to rules in subclause 5.10.2;
        - if UL HARQ operation is asynchronous, set the HARQ Process ID to the HARQ Process ID associated with this TTI;
        - consider the NDI bit for the corresponding HARQ process to have been toggled;
        - deliver the configured uplink grant and the associated HARQ information to the HARQ entity for this TTI.

- else, if this Serving Cell is the SpCell and an uplink grant for this TTI has been configured for the SpCell:
    - if UL HARQ operation is asynchronous, set the HARQ Process ID to the HARQ Process ID associated with this TTI;
    - consider the NDI bit for the corresponding HARQ process to have been toggled;
    - deliver the configured uplink grant, and the associated HARQ information to the HARQ entity for this TTI.

NOTE: The period of configured uplink grants is expressed in TTIs.

NOTE: If the MAC entity receives both a grant in a Random Access Response and a grant for its C-RNTI or Semi persistent scheduling C-RNTI requiring transmissions on the SpCell in the same UL subframe, the MAC entity may choose to continue with either the grant for its RA-RNTI or the grant for its C-RNTI or Semi persistent scheduling C-RNTI.

NOTE: When a configured uplink grant is indicated during a measurement gap and indicates an UL-SCH transmission during a measurement gap, the MAC entity processes the grant but does not transmit on UL-SCH. When a configured uplink grant is indicated during a Sidelink Discovery gap for reception and indicates an UL-SCH transmission during a Sidelink Discovery gap for transmission with a SL-DCH transmission, the MAC entity processes the grant but does not transmit on UL-SCH.

For configured uplink grants, the HARQ Process ID associated with this TTI is derived from the following equation for asynchronous UL HARQ operation:

HARQ Process ID = [floor(CURRENT_TTI/*semiPersistSchedIntervalUL*)] modulo *numberOfConfUlSPS-Processes*,

where CURRENT_TTI=[(SFN * 10) + subframe number] and it refers to the subframe where the first transmission of a bundle takes place.

[TS 36.321, clause 5.4.2.1]

There is one HARQ entity at the MAC entity for each Serving Cell with configured uplink, which maintains a number of parallel HARQ processes allowing transmissions to take place continuously while waiting for the HARQ feedback on the successful or unsuccessful reception of previous transmissions.

The number of parallel HARQ processes per HARQ entity is specified in [2], clause 8. NB-IoT has one UL HARQ process.

When the physical layer is configured for uplink spatial multiplexing [2], there are two HARQ processes associated with a given TTI. Otherwise there is one HARQ process associated with a given TTI.

At a given TTI, if an uplink grant is indicated for the TTI, the HARQ entity identifies the HARQ process(es) for which a transmission should take place. It also routes the received HARQ feedback (ACK/NACK information), MCS and resource, relayed by the physical layer, to the appropriate HARQ process(es).

In asynchronous HARQ operation, a HARQ process is associated with a TTI based on the received UL grant except for UL grant in RAR. Except for NB-IoT, each asynchronous HARQ process is associated with a HARQ process identifier. For UL transmission with UL grant in RAR, HARQ process identifier 0 is used. HARQ feedback is not applicable for asynchronous UL HARQ.

When TTI bundling is configured, the parameter TTI_BUNDLE_SIZE provides the number of TTIs of a TTI bundle. TTI bundling operation relies on the HARQ entity for invoking the same HARQ process for each transmission that is part of the same bundle. Within a bundle HARQ retransmissions are non-adaptive and triggered without waiting for feedback from previous transmissions according to TTI_BUNDLE_SIZE. The HARQ feedback of a bundle is only received for the last TTI of the bundle (i.e. the TTI corresponding to TTI_BUNDLE_SIZE), regardless of whether a transmission in that TTI takes place or not (e.g. when a measurement gap occurs). A retransmission of a TTI bundle is also a TTI bundle. TTI bundling is not supported when the MAC entity is configured with one or more SCells with configured uplink.

Uplink HARQ operation is asynchronous for NB-IoT UEs, BL UEs or UEs in enhanced coverage except for the repetitions within a bundle.

For NB-IoT UEs, BL UEs or UEs in enhanced coverage, the parameter UL_REPETITION_NUMBER provides the number of transmission repetitions within a bundle. For each bundle, UL_REPETITION_NUMBER is set to a value provided by lower layers. Bundling operation relies on the HARQ entity for invoking the same HARQ process for each transmission that is part of the same bundle. Within a bundle HARQ retransmissions are non-adaptive and are triggered without waiting for feedback from previous transmissions according to UL_REPETITION_NUMBER. An uplink grant corresponding to a new transmission or a retransmission of the bundle is only received after the last repetition of the bundle. A retransmission of a bundle is also a bundle.

TTI bundling is not supported for RN communication with the E-UTRAN in combination with an RN subframe configuration.

For transmission of Msg3 during Random Access (see subclause 5.1.5) TTI bundling does not apply. For NB-IoT UEs, BL UEs or UEs in enhanced coverage, uplink repetition bundling is used for transmission of Msg3.

For each TTI, the HARQ entity shall:

- identify the HARQ process(es) associated with this TTI, and for each identified HARQ process:
  - if an uplink grant has been indicated for this process and this TTI:
    - if the received grant was not addressed to a Temporary C-RNTI on PDCCH and if the NDI provided in the associated HARQ information has been toggled compared to the value in the previous transmission of this HARQ process; or
    - if the uplink grant was received on PDCCH for the C-RNTI and the HARQ buffer of the identified process is empty; or
    - if the uplink grant was received in a Random Access Response:
      - if there is a MAC PDU in the Msg3 buffer and the uplink grant was received in a Random Access Response:
        - obtain the MAC PDU to transmit from the Msg3 buffer.
      - else:
        - obtain the MAC PDU to transmit from the "Multiplexing and assembly" entity;
      - deliver the MAC PDU and the uplink grant and the HARQ information to the identified HARQ process;
      - instruct the identified HARQ process to trigger a new transmission.
    - else:
      - deliver the uplink grant and the HARQ information (redundancy version) to the identified HARQ process;
      - instruct the identified HARQ process to generate an adaptive retransmission.
  - else, if the HARQ buffer of this HARQ process is not empty:
    - instruct the identified HARQ process to generate a non-adaptive retransmission.

When determining if NDI has been toggled compared to the value in the previous transmission the MAC entity shall ignore NDI received in all uplink grants on PDCCH for its Temporary C-RNTI.

[TS 36.321, clause 5.4.2.2]

Each HARQ process is associated with a HARQ buffer.

For synchronous HARQ, each HARQ process shall maintain a state variable CURRENT_TX_NB, which indicates the number of transmissions that have taken place for the MAC PDU currently in the buffer, and a state variable HARQ_FEEDBACK, which indicates the HARQ feedback for the MAC PDU currently in the buffer. When the HARQ process is established, CURRENT_TX_NB shall be initialized to 0.

The sequence of redundancy versions is 0, 2, 3, 1. The variable CURRENT_IRV is an index into the sequence of redundancy versions. This variable is up-dated modulo 4. For BL UEs or UEs in enhanced coverage see subclause 8.6.1 in [2] for the sequence of redundancy versions and redundancy version determination. For NB-IoT UEs see subclause 16.5.1.2 in [2] for the sequence of redundancy versions and redundancy version determination.

For NB-IoT UEs, BL UEs or UEs in enhanced coverage for UL_REPETITION_NUMBER for Mode B operation, the same redundancy version is used multiple times before cycling to the next redundancy version as specified in Subclause 16.5.1.2, 8.6.1 and 7.1.7.1 in [2].

New transmissions are performed on the resource and with the MCS indicated on PDCCH or Random Access Response. Adaptive retransmissions are performed on the resource and, if provided, with the MCS indicated on PDCCH. Non-adaptive retransmission is performed on the same resource and with the same MCS as was used for the last made transmission attempt.

For synchronous HARQ, the MAC entity is configured with a maximum number of HARQ transmissions and a maximum number of Msg3 HARQ transmissions by RRC: *maxHARQ-Tx* and *maxHARQ-Msg3Tx* respectively. For transmissions on all HARQ processes and all logical channels except for transmission of a MAC PDU stored in the Msg3 buffer, the maximum number of transmissions shall be set to *maxHARQ-Tx*. For transmission of a MAC PDU stored in the Msg3 buffer, the maximum number of transmissions shall be set to *maxHARQ-Msg3Tx*.

When the HARQ feedback is received for this TB, the HARQ process shall:

- set HARQ_FEEDBACK to the received value.

If the HARQ entity requests a new transmission, the HARQ process shall:

- if UL HARQ operation is synchronous:
    - set CURRENT_TX_NB to 0;
    - set HARQ_FEEDBACK to NACK;
    - set CURRENT_IRV to 0;
- store the MAC PDU in the associated HARQ buffer;
- store the uplink grant received from the HARQ entity;
- generate a transmission as described below.

If the HARQ entity requests a retransmission, the HARQ process shall:

- if UL HARQ operation is synchronous:
    - increment CURRENT_TX_NB by 1;
- if the HARQ entity requests an adaptive retransmission:
    - store the uplink grant received from the HARQ entity;
    - set CURRENT_IRV to the index corresponding to the redundancy version value provided in the HARQ information;
    - if UL HARQ operation is synchronous:
        - set HARQ_FEEDBACK to NACK;
    - generate a transmission as described below.
- else if the HARQ entity requests a non-adaptive retransmission:

- if UL HARQ operation is asynchronous or HARQ_FEEDBACK = NACK:
  - generate a transmission as described below.

NOTE: When receiving a HARQ ACK alone, the MAC entity keeps the data in the HARQ buffer.

NOTE: When no UL-SCH transmission can be made due to the occurrence of a measurement gap or a Sidelink Discovery Gap for Transmission, no HARQ feedback can be received and a non-adaptive retransmission follows.

NOTE: For asynchronous HARQ operation, UL retransmissions are triggered only by adaptive retransmission grants, except for retransmissions within a bundle.

To generate a transmission, the HARQ process shall:

- if the MAC PDU was obtained from the Msg3 buffer; or
- if Sidelink Discovery Gaps for Transmission are not configured by upper layers, and there is no measurement gap at the time of the transmission and, in case of retransmission, the retransmission does not collide with a transmission for a MAC PDU obtained from the Msg3 buffer in this TTI; or
- if Sidelink Discovery Gaps for Transmission are configured by upper layers, and there is no measurement gap at the time of the transmission and, in case of retransmission, the retransmission does not collide with a transmission for a MAC PDU obtained from the Msg3 buffer, and there is no Sidelink Discovery Gap for Transmission in this TTI; or
- if Sidelink Discovery Gaps for Transmission are configured by upper layers, and there is no measurement gap at the time of the transmission and, in case of retransmission, the retransmission does not collide with a transmission for a MAC PDU obtained from the Msg3 buffer, and there is a Sidelink Discovery Gap for Transmission, and there is no configured grant for transmission on SL-DCH in this TTI:
  - instruct the physical layer to generate a transmission according to the stored uplink grant with the redundancy version corresponding to the CURRENT_IRV value;
  - increment CURRENT_IRV by 1;
  - if UL HARQ operation is synchronous and there is a measurement gap or Sidelink Discovery Gap for Reception at the time of the HARQ feedback reception for this transmission and if the MAC PDU was not obtained from the Msg3 buffer:
    - set HARQ_FEEDBACK to ACK at the time of the HARQ feedback reception for this transmission.

After performing above actions, if UL HARQ operation is synchronous the HARQ process then shall:

- if CURRENT_TX_NB = maximum number of transmissions – 1:
  - flush the HARQ buffer;

[TS 36.321, clause 6.1.2]

A MAC PDU consists of a MAC header, zero or more MAC Service Data Units (MAC SDU), zero, or more MAC control elements, and optionally padding; as described in Figure 6.1.2-3.

Both the MAC header and the MAC SDUs are of variable sizes.

A MAC PDU header consists of one or more MAC PDU subheaders; each subheader corresponds to either a MAC SDU, a MAC control element or padding.

A MAC PDU subheader consists of the five or six header fields R/F2/E/LCID/(F)/L but for the last subheader in the MAC PDU and for fixed sized MAC control elements. The last subheader in the MAC PDU and subheaders for fixed sized MAC control elements consist solely of the four header fields R/F2/E/LCID. A MAC PDU subheader corresponding to padding consists of the four header fields R/F2/E/LCID.

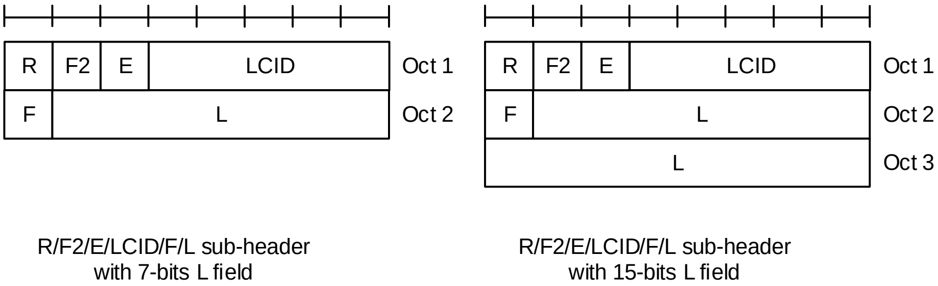

Figure 6.1.2-1: R/F2/E/LCID/F/L MAC subheader

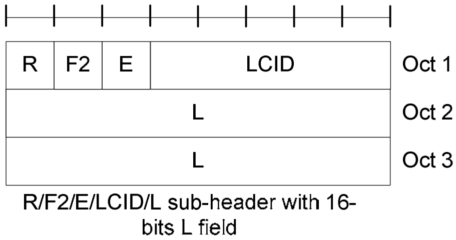

Figure 6.1.2-1a: R/F2/E/LCID/L MAC subheader

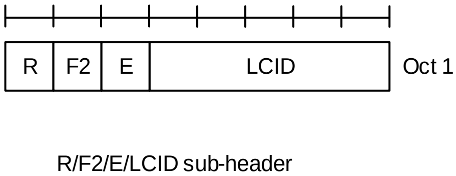

Figure 6.1.2-2: R/F2/E/LCID MAC subheader

MAC PDU subheaders have the same order as the corresponding MAC SDUs, MAC control elements and padding.

MAC control elements are always placed before any MAC SDU.

Padding occurs at the end of the MAC PDU, except when single-byte or two-byte padding is required. Padding may have any value and the MAC entity shall ignore it. When padding is performed at the end of the MAC PDU, zero or more padding bytes are allowed.

When single-byte or two-byte padding is required, one or two MAC PDU subheaders corresponding to padding are placed at the beginning of the MAC PDU before any other MAC PDU subheader.

A maximum of one MAC PDU can be transmitted per TB per MAC entity. A maximum of one MCH MAC PDU can be transmitted per TTI.

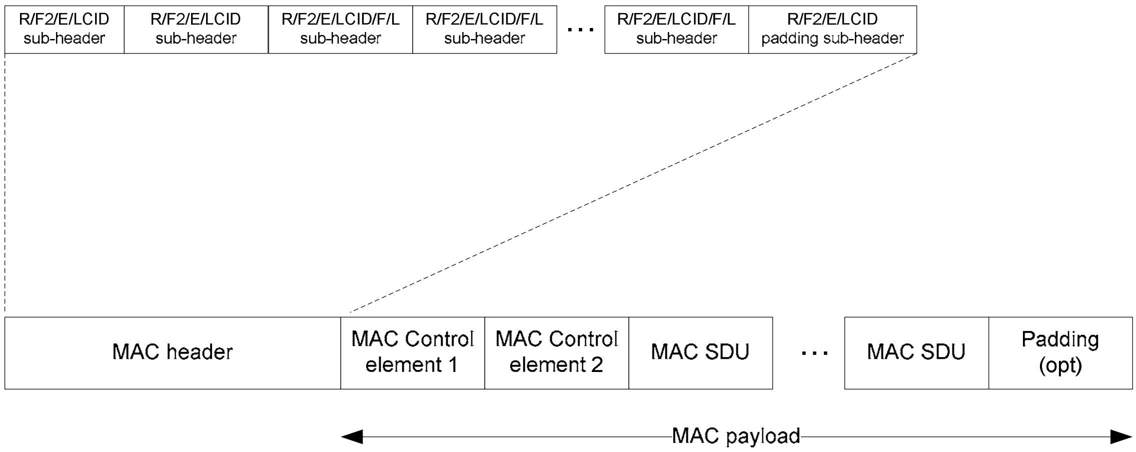

Figure 6.1.2-3: Example of MAC PDU consisting of MAC header, MAC control elements, MAC SDUs and padding

[TS 36.321, clause 6.2.1]

The MAC header is of variable size and consists of the following fields:

- LCID: The Logical Channel ID field identifies the logical channel instance of the corresponding MAC SDU or the type of the corresponding MAC control element or padding as described in tables 6.2.1-1, 6.2.1-2 and 6.2.1-4 for the DL-SCH, UL-SCH and MCH respectively. There is one LCID field for each MAC SDU, MAC control element or padding included in the MAC PDU. In addition to that, one or two additional LCID fields are included in the MAC PDU, when single-byte or two-byte padding is required but cannot be achieved by padding at the end of the MAC PDU. A UE of Category 0 [12] shall indicate CCCH using LCID "01011", otherwise the UE shall indicate CCCH using LCID "00000". The LCID field size is 5 bits;

- L: The Length field indicates the length of the corresponding MAC SDU or variable-sized MAC control element in bytes. There is one L field per MAC PDU subheader except for the last subheader and subheaders corresponding to fixed-sized MAC control elements. The size of the L field is indicated by the F field and F2 field;

- F: The Format field indicates the size of the Length field as indicated in table 6.2.1-3. There is one F field per MAC PDU subheader except for the last subheader and subheaders corresponding to fixed-sized MAC control elements and except for when F2 is set to 1. The size of the F field is 1 bit. If the F field is included; if the size of the MAC SDU or variable-sized MAC control element is less than 128 bytes, the value of the F field is set to 0, otherwise it is set to 1;

- F2: The Format2 field indicates the size of the Length field as indicated in table 6.2.1-3. There is one F2 field per MAC PDU subheader. The size of the F2 field is 1 bit. If the size of the MAC SDU or variable-sized MAC control element is larger than 32767 bytes, and if the corresponding subheader is not the last subheader, the value of the F2 field is set to 1, otherwise it is set to 0.

- E: The Extension field is a flag indicating if more fields are present in the MAC header or not. The E field is set to "1" to indicate another set of at least R/F2/E/LCID fields. The E field is set to "0" to indicate that either a MAC SDU, a MAC control element or padding starts at the next byte;

- R: Reserved bit, set to "0".

The MAC header and subheaders are octet aligned.

Table 6.2.1-1: Values of LCID for DL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011-10111	Reserved
11000	Activation/Deactivation (4 octets)

11001	SC-MCCH, SC-MTCH (see note)
11010	Long DRX Command
11011	Activation/Deactivation (1 octet)
11100	UE Contention Resolution Identity
11101	Timing Advance Command
11110	DRX Command
11111	Padding
NOTE: Both SC-MCCH and SC-MTCH cannot be multiplexed with other logical channels in the same MAC PDU except for Padding	

For NB-IoT only the following LCID values for DL-SCH are applicable: CCCH, Identity of the logical channel, UE Contention Resolution Identity, Timing Advance Command, DRX Command and Padding.

Table 6.2.1-2: Values of LCID for UL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011	CCCH
01100-10101	Reserved
10110	Truncated Sidelink BSR
10111	Sidelink BSR
11000	Dual Connectivity Power Headroom Report
11001	Extended Power Headroom Report
11010	Power Headroom Report
11011	C-RNTI
11100	Truncated BSR
11101	Short BSR
11110	Long BSR
11111	Padding

For NB-IoT only the following LCID values for UL-SCH are applicable: CCCH (LCID "00000"), Identity of the logical channel, C-RNTI, Short BSR and Padding.

Table 6.2.1-3: Values of F and F2 fields:

Index of F2	Index of F	Size of Length field (in bits)
0	0	7
	1	15
1	-	16

Table 6.2.1-4: Values of LCID for MCH

Index	LCID values
00000	MCCH (see note)
00001-11100	MTCH
11101	Reserved
11110	MCH Scheduling Information or Extended MCH Scheduling Information
11111	Padding
NOTE: If there is no MCCH on MCH, an MTCH could use this value.	

22.3.1.3.3 Test description

22.3.1.3.3.1 Pre-test conditions

System Simulator:

- NCell 1.

UE:

- None.

Preamble:

- The UE shall be in State 2B-NB with test loop mode G (CP CIoT Optimisation) according to TS 36.508 [18].

22.3.1.3.3.2 Test procedure sequence

NOTE: In the Table 22.3.1.3.3.2-1 the LCID='00011' maps to SIB1bis in CP mode.

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as:

- UL SQN n maps to SQN X+n MOD 1024 &
- DL SQN n maps to SQN Y+n MOD 1024.

Table 22.3.1.3.3.2-1: Main Behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits a MAC PDU containing RLC PDU with polling field 'P' set to '0' and an RLC SDU	<--	MAC PDU(RLC SN=0)	-	-
2	The SS shall schedule UL grants at the beginning of the next 10 NPDCCH bundle, allowing the UE to return the RLC SDU as received in step 1, on NPDCCH, but with the C-RNTI different from the C-RNTI assigned to the UE.(Note 8)	<--	(UL Grant (unknown C-RNTI))	-	-
3	Check: Does the UE transmit a MAC PDU corresponding to grant in step 2?	-->	MAC PDU	1	F
4	SS transmits one UL Grant, allowing the UE to return the RLC SDU as received in step 1, on NPDCCH with the C-RNTI assigned to the UE.	<--	(UL Grant (C-RNTI))	-	-
5	Check: Does the UE transmit a MAC PDU corresponding to grant in step 4?	-->	MAC PDU(RLC SN=0)	1	P
6	SS transmits an RLC STATUS PDU to acknowledge correctly received data。	<--	RLC STATUS PDU(RLC SN=1)	-	-
7	The SS Transmits a MAC PDU containing RLC PDU with polling field 'P' set to '0' and an RLC SDU of 16 bytes	<--	MAC PDU(RLC SN=1)	-	-
8	In the third NPDCCH period bundle after DL transmission of step 7 the SS allocates one UL Grant of size 208 bits (Note 7), sufficient for one RLC SDU to be loop backed in slots within a repetition, and NDI indicates new transmission, and redundancy version = 0. (Note 8)	<--	Uplink Grant	-	-
9	Check: Does the UE transmit a MAC PDU including one RLC SDU, with redundancy version alternating between 0, 2 for each repetition? (Note 1)	-->	MAC PDU(RLC SN=1)	2	P
10	The SS allocates one UL Grant of size 208 bits (Note 7), sufficient for one RLC SDU to be loop backed in slots within a repetition, and	<--	Uplink Grant		

	NDI is the same with which in step 8, and redundancy version = 1.				
11	Check: Does the UE retransmit the MAC PDU in step 9, with redundancy version alternating between 2, 0 for each repetition? (Note 1)	-->	MAC PDU(RLC SN=1)	3	P
12	SS transmits an RLC STATUS PDU to acknowledge correctly received data.	<--	RLC STATUS PDU(RLC SN=2)	-	-
13	The SS Transmits a MAC PDU containing RLC PDU with polling field ‘P’ set to '1' and an RLC SDU of 15 bytes	<--	MAC PDU(RLC SN=2)	-	-
14	In the third NPDCCH period bundle after DL transmission of step 13 the SS allocates one UL Grant of size 176 bits. (Note 2, Note 8)	<--	(UL grant)	-	-
15	Check: Does the UE return a MAC PDU of length 176 bits containing two MAC sub-headers where the first MAC sub-header have the Expansion bit ‘E’ set to ‘1’ and the second MAC sub-header has the Expansion bit ‘E’ set to ‘0’ and no length field? (Note 3)	-->	MAC PDU (MAC sub-header (E=’1’, LCID=’00011’, L=’ 17’), MAC sub-header (E=’0’, LCID=’00011’, no Length field present), AMD PDU(RLC SN=2), Status PDU) Or MAC PDU (MAC sub-header (E=’1’, LCID=’00011’, L=’ 2’), MAC sub-header (E=’0’, LCID=’00011’, no Length field present), Status PDU, AMD PDU(RLC SN=2))	4,5,6	P
16	SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU(RLC SN=3)	-	-
17	Void				
18	The SS transmits a MAC PDU containing RLC PDU with polling field ‘P’ set to '0' and an RLC SDU of 8 bytes	<--	MAC PDU(RLC SN=3)	-	-
19	In the third NPDCCH period bundle after DL transmission of step 18 the SS transmits one uplink grant of size 176 bits. (Note 4, Note 8)	<--	(UL grant)	-	-
20	Check: Does the UE transmit a MAC PDU with a MAC SDU of length 10 bytes and where the last MAC sub-header has the Extension field ‘E’ set to ‘0’ and the Logical Channel ID field ‘LCID’ set to ‘11111’?	-->	MAC PDU (BSR sub-header, MAC SDU sub-header, Padding MAC sub-header (E=’0’, LCID=’11111’),Short BSR, MAC SDU(RLC SN=3), padding)	7	P
20A	SS transmits an RLC STATUS PDU to acknowledge correctly received data.	<--	RLC STATUS PDU(RLC SN=4)		
21	The SS transmits a MAC PDU containing RLC PDU with polling field ‘P’ set to '0' and an RLC SDU of 11 bytes	<--	MAC PDU(RLC SN=4)	-	-
22	In the third NPDCCH period bundle after DL transmission of step 21 the SS transmits one uplink grant of size 120 bits. (Note 5, Note 8)	<--	(UL grant)	-	-
23	Check: Does the UE transmit a MAC PDU with a MAC SDU of length 13 bytes and with a padding MAC sub-header, with Extension field ‘E’ is set to ‘1’ and the Logical Channel ID field ‘LCID’ is set to ‘11111’, inserted before the MAC SDU sub-header?	-->	MAC PDU (Padding MAC-sub-header (E=’1’, LCID=’11111’), MAC SDU sub-header, MAC SDU)(RLC SN=4)	8	P
23A	SS transmits an RLC STATUS PDU to acknowledge correctly received data.	<--	RLC STATUS PDU(RLC SN=5)		
24	The SS transmits a MAC PDU containing RLC PDU with polling field ‘P’ set to '0' and an RLC SDU of 8 bytes	<--	MAC PDU(RLC SN=5)	-	-
25	In the third NPDCCH period bundle after DL transmission of step 24 the SS transmits one uplink grant of size 120 bits. (Note 6, Note 8)	<--	(UL grant)	-	-
26	Check: Does the UE transmit a MAC PDU with two padding MAC sub-headers, with Extension field ‘E’ is set to ‘1’ and the Logical Channel ID	-->	MAC PDU (Padding MAC-sub-header#1 (E=’1’, LCID=’11111’), Padding MAC-	9	P

	field 'LCID' is set to '11111', inserted before the BSR sub-header and the MAC SDU sub-header. Or a MAC PDU with BSR sub-header with Extension field 'E' is set to '1' and MAC SDU sub-header (R/R/E/LCID/F/L) inserted before the Padding MAC sub-header?		sub-header#2 (E='1', LCID='11111'), BSR sub-header, MAC SDU sub-header, Short BSR, MAC-SDU(RLC SN=5)) Or MAC PDU(BSR sub-header, MAC SDU sub-header, Padding MAC-sub-header(E='0', LCID='11111'), Short BSR, MAC-SDU(RLC SN=5))		
27	SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU(RLC SN=6)		

NOTE 1: Transmission of a UL MAC PDU with a specific redundancy version by the UE is implicitly tested by receiving the UL MAC PDU correctly at SS.
NOTE 2: UL grant of 176 bits (I_{TBS}=3, I_{RU}=2, see TS 36.213 Table 16.5.1.2-2) is chosen to enable UE to transmit two MAC SDUs, one of size 17 and one of size 2 bytes, in a MAC PDU (15 bytes RLC SDU + 2 bytes AMD PDU header + 2 bytes RLC Status PDU + 2 bytes MAC sub-header (7 bit LI) + one byte MAC sub-header (R/R/E/LCID) = 22 bytes = 176 bits).
NOTE 3: MAC SDUs can come in any order
NOTE 4: UL grant of 176 bits (I_{TBS}=3, I_{RU}=2, see TS 36.213 Table 16.5.1.2-2) is chosen such that the MAC PDU padding will be larger than 2 bytes. RLC SDU size is 8 bytes, size of AMD PDU header is 2 bytes, size of MAC header is 4 bytes (2 bytes for MAC SDU sub-header using 7-bit LI, 1 byte for BSR sub-header and 1 byte for padding MAC sub-header) and size of Short BSR is 1 byte, equals to 120 bits (15 bytes) and resulting into 56 bits padding.
NOTE 5: UL grant of 120 bits (I_{TBS}=0, I_{RU}=4, see TS 36.213 Table 16.5.1.2-2) is chosen such that the MAC PDU padding will be a single byte. RLC SDU size is 11 bytes, size of AMD PDU header is 2 bytes and size of MAC header is 1 byte for MAC SDU sub-header, equals to 112 bits (14 bytes) and resulting into 1 single byte padding.
NOTE 6: UL grant of 120 bits (I_{TBS}=0, I_{RU}=4, see TS 36.213 Table 16.5.1.2-2) is chosen such that the MAC PDU padding will be equal to 2 bytes. RLC SDU size is 8 bytes, size of AMD PDU header is 2 bytes, size of MAC header is 4 bytes (1 bytes for MAC SDU sub-header, 1 byte for Short BSR sub-header and 2 bytes for padding MAC sub-header) and size of Short BSR is 1 byte, equals to 120 bits (15 bytes) and resulting no padding at the end of the MAC PDU.
NOTE 7: UL grant of 208 bits (I_{TBS}=4, I_{RU}=2, see TS 36.213 Table 16.5.1.2-2) is chosen. RLC SDU size is 16 bytes, size of AMD PDU header is 2 bytes and MAC header is 4 bytes (2 bytes MAC sub-header (7 bit LI), 1 byte for BSR sub-header and 1 byte for padding MAC sub-header) and size of Short BSR is 1 byte, equals to 23 bytes = 184 bits
NOTE 8: NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.1.3.3.3 Specific message contents

Table 22.3.1.3.3.3-1: Void

22.3.1.4 NB-IoT / Correct handling of MAC control information / Buffer status

22.3.1.4.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UL data arrives in the UE transmission buffer and no BSR has been triggered }
    then { UE triggers a regular BSR and Reports a Short Buffer Status Reporting (BSR) }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
   when{RETX_BSR_TIMER expires and UE has pending data for transmission }
    then { UE transmits a random access preamble }
            }
```

(3)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { a Regular BSR has been triggered and UE has pending data for transmission and UE has only
resources to send either BSR report or partial data }
    then { UE transmits the BSR report }
            }
```

(4)

```
with { UE in E-UTRA RRC_CONNECTED state }
 ensure that {
   when { a Regular BSR has been triggered and UE has pending data for transmission and UE has only
UL resources to send all pending data available for transmission, but UL grant is not sufficient to
additionally accommodate the BSR MAC control element}
     then { UE cancels the triggered BSR report and transmits the UL data}
             }
```

(5)

```
with { UE in E-UTRA RRC_CONNECTED state }
 ensure that {
   when { a Regular BSR has been triggered and UE has pending data for transmission and UE has UL
resources to send all pending data including BSR }
     then { UE transmits the UL data and reports buffer status reporting (BSR) that indicates there
is no more data in the buffer}
             }
```

(6)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE transmits a MAC PDU and the number of padding bits is equal to or larger than the size
of a Short BSR plus its subheader and the UE has available data for transmission form in the TTI
where the BSR is transmitted }
    then { UE triggers padding BSR and reports a Short BSR }
            }
```

(7)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { periodicBSR-Timer expires and UE has buffered data in a TTI }
    then { UE triggers a Periodic BSR and reports Short BSR and restarts the periodicBSR-Timer}
            }
```

22.3.1.4.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clause 5.4.3.1, 5.4.5, 6.1.2, 6.1.3.1 and 6.2.1. Unless otherwise stated these are Rel-13 requirements.

[TS 36.321 clause 5.4.3.1]

For the Logical Channel Prioritization procedure, the MAC entity shall take into account the following relative priority in decreasing order:

- MAC control element for C-RNTI or data from UL-CCCH;
- MAC control element for BSR, with exception of BSR included for padding;
- MAC control element for PHR, Extended PHR, or Dual Connectivity PHR;
- MAC control element for Sidelink BSR, with exception of Sidelink BSR included for padding;
- data from any Logical Channel, except data from UL-CCCH;
- MAC control element for BSR included for padding;
- MAC control element for Sidelink BSR included for padding.

NOTE: When the MAC entity is requested to transmit multiple MAC PDUs in one TTI, steps 1 to 3 and the associated rules may be applied either to each grant independently or to the sum of the capacities of the grants. Also the order in which the grants are processed is left up to UE implementation. It is up to the UE implementation to decide in which MAC PDU a MAC control element is included when MAC entity is requested to transmit multiple MAC PDUs in one TTI. When the UE is requested to generate MAC PDU(s) in two MAC entities in one TTI, it is up to UE implementation in which order the grants are processed.

[TS 36.321 clause 5.4.5]

The Buffer Status reporting procedure is used to provide the serving eNB with information about the amount of data available for transmission in the UL buffers associated with the MAC entity. RRC controls BSR reporting by configuring the three timers *periodicBSR-Timer*, *retxBSR-Timer* and *logicalChannelSR-ProhibitTimer* and by, for each logical channel, optionally signalling *logicalChannelGroup* which allocates the logical channel to an LCG [8].

For the Buffer Status reporting procedure, the MAC entity shall consider all radio bearers which are not suspended and may consider radio bearers which are suspended.

For NB-IoT the Long BSR is not supported and all logical channels belong to one LCG.

A Buffer Status Report (BSR) shall be triggered if any of the following events occur:

- UL data, for a logical channel which belongs to a LCG, becomes available for transmission in the RLC entity or in the PDCP entity (the definition of what data shall be considered as available for transmission is specified in [3] and [4] respectively) and either the data belongs to a logical channel with higher priority than the priorities of the logical channels which belong to any LCG and for which data is already available for transmission, or there is no data available for transmission for any of the logical channels which belong to a LCG, in which case the BSR is referred below to as "Regular BSR";
- UL resources are allocated and number of padding bits is equal to or larger than the size of the Buffer Status Report MAC control element plus its subheader, in which case the BSR is referred below to as "Padding BSR";
- *retxBSR-Timer* expires and the MAC entity has data available for transmission for any of the logical channels which belong to a LCG, in which case the BSR is referred below to as "Regular BSR";
- *periodicBSR-Timer* expires, in which case the BSR is referred below to as "Periodic BSR".

For Regular BSR:

- if the BSR is triggered due to data becoming available for transmission for a logical channel for which *logicalChannelSR-ProhibitTimer* is configured by upper layers:
  - start or restart the *logicalChannelSR-ProhibitTimer*;
- else:
  - if running, stop the *logicalChannelSR-ProhibitTimer*.

For Regular and Periodic BSR:

- if more than one LCG has data available for transmission in the TTI where the BSR is transmitted: report Long BSR;
- else report Short BSR.

For Padding BSR:

- if the number of padding bits is equal to or larger than the size of the Short BSR plus its subheader but smaller than the size of the Long BSR plus its subheader:
  - if more than one LCG has data available for transmission in the TTI where the BSR is transmitted: report Truncated BSR of the LCG with the highest priority logical channel with data available for transmission;
  - else report Short BSR.

- else if the number of padding bits is equal to or larger than the size of the Long BSR plus its subheader, report Long BSR.

If the Buffer Status reporting procedure determines that at least one BSR has been triggered and not cancelled:

- if the MAC entity has UL resources allocated for new transmission for this TTI:
  - instruct the Multiplexing and Assembly procedure to generate the BSR MAC control element(s);
  - start or restart *periodicBSR-Timer* except when all the generated BSRs are Truncated BSRs;
  - start or restart *retxBSR-Timer*.
- else if a Regular BSR has been triggered and *logicalChannelSR-ProhibitTimer* is not running:
  - if an uplink grant is not configured or the Regular BSR was not triggered due to data becoming available for transmission for a logical channel for which logical channel SR masking (*logicalChannelSR-Mask*) is setup by upper layers:
    - a Scheduling Request shall be triggered.

A MAC PDU shall contain at most one MAC BSR control element, even when multiple events trigger a BSR by the time a BSR can be transmitted in which case the Regular BSR and the Periodic BSR shall have precedence over the padding BSR.

The MAC entity shall restart *retxBSR-Timer* upon indication of a grant for transmission of new data on any UL-SCH.

All triggered BSRs shall be cancelled in case the UL grant(s) in this TTI can accommodate all pending data available for transmission but is not sufficient to additionally accommodate the BSR MAC control element plus its subheader. All triggered BSRs shall be cancelled when a BSR is included in a MAC PDU for transmission.

The MAC entity shall transmit at most one Regular/Periodic BSR in a TTI. If the MAC entity is requested to transmit multiple MAC PDUs in a TTI, it may include a padding BSR in any of the MAC PDUs which do not contain a Regular/Periodic BSR.

All BSRs transmitted in a TTI always reflect the buffer status after all MAC PDUs have been built for this TTI. Each LCG shall report at the most one buffer status value per TTI and this value shall be reported in all BSRs reporting buffer status for this LCG.

NOTE: A Padding BSR is not allowed to cancel a triggered Regular/Periodic BSR, except for NB-IoT. A Padding BSR is triggered for a specific MAC PDU only and the trigger is cancelled when this MAC PDU has been built.

[TS 36.321 clause 6.1.2]

A MAC PDU consists of a MAC header, zero or more MAC Service Data Units (MAC SDU), zero, or more MAC control elements, and optionally padding; as described in Figure 6.1.2-3.

Both the MAC header and the MAC SDUs are of variable sizes.

A MAC PDU header consists of one or more MAC PDU subheaders; each subheader corresponds to either a MAC SDU, a MAC control element or padding.

A MAC PDU subheader consists of the five or six header fields R/F2/E/LCID/(F)/L but for the last subheader in the MAC PDU and for fixed sized MAC control elements. The last subheader in the MAC PDU and subheaders for fixed sized MAC control elements consist solely of the four header fields R/F2/E/LCID. A MAC PDU subheader corresponding to padding consists of the four header fields R/F2/E/LCID.

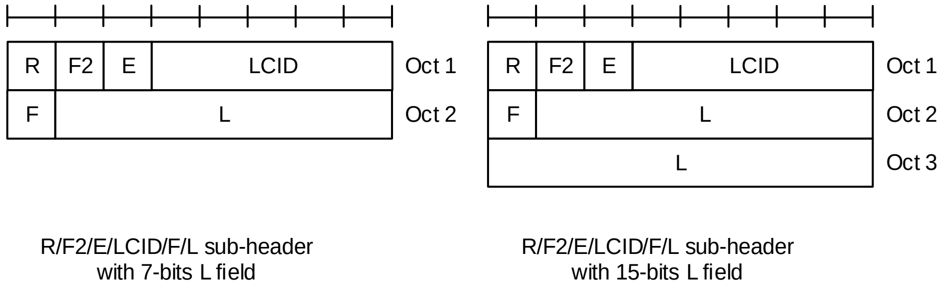

Figure 6.1.2-1: R/F2/E/LCID/F/L MAC subheader

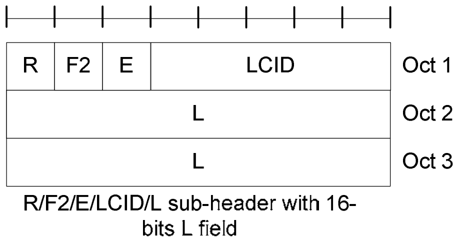

Figure 6.1.2-1a: R/F2/E/LCID/L MAC subheader

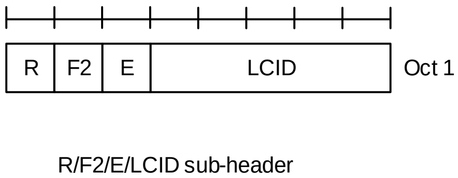

Figure 6.1.2-2: R/F2/E/LCID MAC subheader

MAC PDU subheaders have the same order as the corresponding MAC SDUs, MAC control elements and padding.

MAC control elements are always placed before any MAC SDU.

Padding occurs at the end of the MAC PDU, except when single-byte or two-byte padding is required. Padding may have any value and the MAC entity shall ignore it. When padding is performed at the end of the MAC PDU, zero or more padding bytes are allowed.

When single-byte or two-byte padding is required, one or two MAC PDU subheaders corresponding to padding are placed at the beginning of the MAC PDU before any other MAC PDU subheader.

A maximum of one MAC PDU can be transmitted per TB per MAC entity. A maximum of one MCH MAC PDU can be transmitted per TTI.

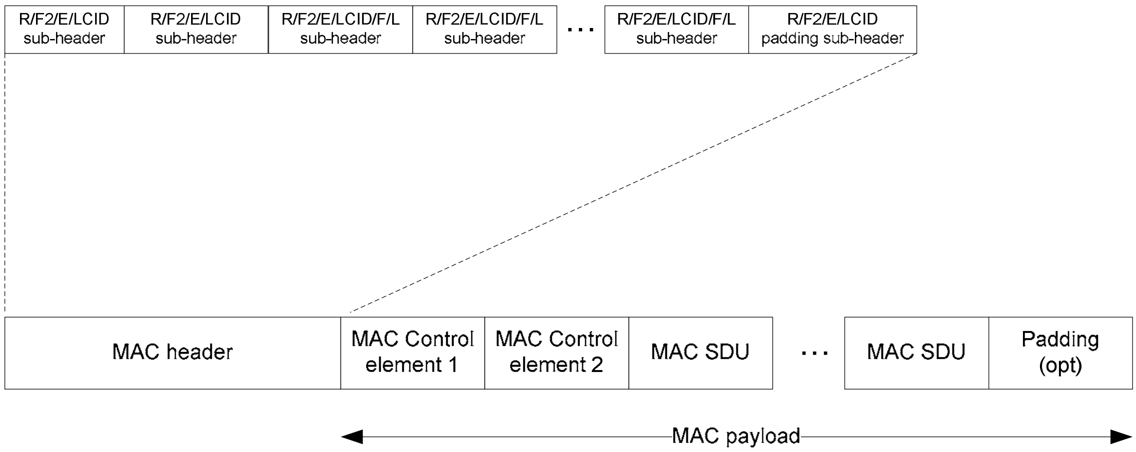

Figure 6.1.2-3: Example of MAC PDU consisting of MAC header, MAC control elements, MAC SDUs and padding

[TS 36.321 clause 6.1.3.1]

Buffer Status Report (BSR) MAC control elements consist of either:

- Short BSR and Truncated BSR format: one LCG ID field and one corresponding Buffer Size field (figure 6.1.3.1-1); or

- Long BSR format: four Buffer Size fields, corresponding to LCG IDs #0 through #3 (figure 6.1.3.1-2).

The BSR formats are identified by MAC PDU subheaders with LCIDs as specified in table 6.2.1-2.

The fields LCG ID and Buffer Size are defined as follow:

- LCG ID: The Logical Channel Group ID field identifies the group of logical channel(s) which buffer status is being reported. The length of the field is 2 bits;

- Buffer Size: The Buffer Size field identifies the total amount of data available across all logical channels of a logical channel group after all MAC PDUs for the TTI have been built. The amount of data is indicated in number of bytes. It shall include all data that is available for transmission in the RLC layer and in the PDCP layer; the definition of what data shall be considered as available for transmission is specified in [3] and [4] respectively. The size of the RLC and MAC headers are not considered in the buffer size computation. The length of this field is 6 bits. If *extendedBSR-Sizes* is not configured, the values taken by the Buffer Size field are shown in Table 6.1.3.1-1. If *extendedBSR-Sizes* is configured, the values taken by the Buffer Size field are shown in Table 6.1.3.1-2.

[TS 36.321 clause 6.2.1]

The MAC header and subheaders are octet aligned.

Table 6.2.1-1: Values of LCID for DL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011-10111	Reserved
11000	Activation/Deactivation (4 octets)
11001	SC-MCCH, SC-MTCH (see note)
11010	Long DRX Command
11011	Activation/Deactivation (1 octet)
11100	UE Contention Resolution Identity
11101	Timing Advance Command
11110	DRX Command
11111	Padding
NOTE: Both SC-MCCH and SC-MTCH cannot be multiplexed with other logical channels in the same MAC PDU except for Padding	

For NB-IoT only the following LCID values for DL-SCH are applicable: CCCH, Identity of the logical channel, UE Contention Resolution Identity, Timing Advance Command, DRX Command and Padding.

Table 6.2.1-2: Values of LCID for UL-SCH

Index	LCID values
00000	CCCH
00001-01010	Identity of the logical channel
01011	CCCH
01100-10101	Reserved
10110	Truncated Sidelink BSR
10111	Sidelink BSR
11000	Dual Connectivity Power Headroom Report
11001	Extended Power Headroom Report
11010	Power Headroom Report
11011	C-RNTI
11100	Truncated BSR
11101	Short BSR
11110	Long BSR
11111	Padding

For NB-IoT only the following LCID values for UL-SCH are applicable: CCCH (LCID "00000"), Identity of the logical channel, C-RNTI, Short BSR and Padding.

Table 6.2.1-3: Values of F and F2 fields:

Index of F2	Index of F	Size of Length field (in bits)
0	0	7
	1	15
1	-	16

Table 6.2.1-4: Values of LCID for MCH

Index	LCID values
00000	MCCH (see note)
00001-11100	MTCH
11101	Reserved
11110	MCH Scheduling Information or Extended MCH Scheduling Information
11111	Padding
NOTE: If there is no MCCH on MCH, an MTCH could use this value.	

22.3.1.4.3 Test description

22.3.1.4.3.1 Pre-test conditions

System Simulator:

- Ncell 1
- RRC Connection Setup (preamble: Table 8.1.5.2.3-1, step 3 [18]) using parameters as specified in Table 22.3.1.4.3.3-1

UE:

None.

Preamble:

- The UE is in Loopback Activated State 2B-NB with test loop mode G according to [18] on Ncell 1.

22.3.1.4.3.2 Test procedure sequence

Table 22.3.1.4.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Void	-	-	-	-
2	The SS transmits a MAC PDU containing two RLC SDUs of RLC UL SDU size 10 bytes. (Note 0)	<--	MAC PDU (2 RLC SDUs)	-	-
3	In the third (next for NTN) NPDCCH period bundle after DL transmission of step 2 the SS allocates an UL Grant of 32 bits. (Note 1, Note 8)	<--	(UL Grant, 32 bits)	-	-
4	Check: Does the UE transmit a Short BSR with 'Buffer size' field set to value '6' or bigger? (Note 2)	-->	MAC PDU (MAC Short BSR (Buffer Size='6' or bigger))	1,3	P
5	Wait for retxBSR-Timer expiry on UE side.	-	-	-	-
5A	Check: Does the UE transmit a preamble on NPRACH?	-->	NPRACH Preamble	2	P
5B	The SS transmits a Random Access Response containing a matching RAPID. (Note 7)	<--	Random Access Response	-	-
5C	The UE transmit a MAC PDU containing C-RNTI, BSR and a portion of loop backed first RLC SDU. (Note 2a)	-->	MAC PDU(C-RNTI, MAC Short BSR(Buffer Size='4' or bigger), portion of loop backed first RLC SDU)	-	-
6	The SS allocates an UL Grant of 176 bits before mac-ContentionResolutionTimer expiry. (Notes 2b, 7)	<--	(UL Grant, 176 bits)	-	-

7A	SS transmits an RLC STATUS PDU to acknowledge correctly received data.	<--	RLC STATUS PDU (ACK_SN=1)	-	-

8	The SS transmits a MAC PDU containing one RLC UL SDU of size 10 bytes. (Note 0)	<--	MAC PDU (1 RLC SDU)	-	-
9	In the third (next for NTN) NPDCCH period bundle after DL transmission of step 8 the SS allocates an UL Grant of 32 bits. (Note 1, Note 8)	<--	(UL Grant, 32 bits)	-	-
10	Check: Does the UE transmit a Short BSR with Buffer size#1' field set to value '1' or bigger? (Note 2)	-->	MAC PDU (MAC Short BSR (Buffer Size='1' or bigger))	3	P
10A	In the third (next for NTN) NPDCCH period bundle after the transmission at step 9 the SS allocates an UL Grant of 104 bits. (Note 2c, Note 8)	<--	(UL Grant, 104 bits)	-	-
10B	Check: Does the UE transmit a MAC PDU including the RLC SDU sent at step 8? (Note 2c)	-->	MAC PDU (SDU subheader, RLC AMD PDU with header, 1 RLC SDU)	-	-
10C	SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU (ACK_SN=2)	-	-
11	The SS transmits a MAC PDU containing three RLC UL SDUs of size 10 bytes. (Note 0)	<--	MAC PDU (3 RLC SDUs)	-	-
12	In the third (next for NTN) NPDCCH period bundle after the transmission at step 11 the SS allocates an UL Grant of 296 bits. (Note 3, Note 8)	<--	(UL Grant, 296 bits)	-	-
13	Check: Does the UE transmit a MAC PDU including three RLC SDUs and not including any BSR? (Note 3)	-->	MAC PDU (padding, SDU subheader, RLC AMD PDU with header, 2 LIs, 3 RLC SDUs)	4	P
14	SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU (ACK_SN=3)	-	-
15	The SS transmits a MAC PDU containing two MAC SDUs, the first containing a 8 byte RLC UL SDU and the second containing a 7 byte RLC UL SDU. (Note 0)	<--	MAC PDU	-	-
16	In the third (next for NTN) NPDCCH period bundle after DL transmission of step 15 the SS allocates an uplink grant of size 256 bits. (Note 4, Note 8)	<--	(UL grant, 256 bits)	-	-
17	Check: Does the UE return a MAC PDU of length 256 bits including 2 RLC SDUs, Padding and Short BSR with Buffer size(s) set to '0'? (Note 4)	-->	MAC PDU (Short BSR subheader, SDU subheader, padding subheader, short BSR, RLC AMD PDU with header, 1 LI, 2 RLC SDUs, padding)	5	P
18	SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU (ACK_SN=4)	-	-
19	The SS transmits a MAC PDU including an RLC SDU of RLC UL SDU size 12 bytes. (Note 0)	<--	MAC PDU	-	-
20	In the third (next for NTN) NPDCCH period bundle after DL transmission of step 19 the SS transmits an uplink grant of size 136 bits. (Note 4a, Note 8)	<--	(UL grant, 136 bits)	-	-
21	Check: Does UE transmit a MAC PDU containing an RLC SDU and with a Short BSR indicating pending data ('Buffer size' field = '0') for 'LCG ID' field set to '0'? (Note 4a)	-->	MAC PDU (Short BSR header, Short BSR(LCG ID='00', Buffer size='0'), MAC SDU)	6	P
21A	SS transmits an RLC STATUS PDU to acknowledge correctly received data.	<--	RLC STATUS PDU (ACK_SN=3)		
21B	The SS transmits an RRCConnectionRelease-NB message.	<--	RRC: *RRCConnectionRelease-NB*		
21C	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed	-	-	-	-
22	The SS transmits a MAC PDU containing an RLC PDU, which contains 1 RLC UL SDU of size 14 bytes. (Note 0)	<--	MAC PDU (RLC PDU)	-	-
23	The SS sends an uplink grant of size 32 bits.	<--	(UL grant, 32 bits)	-	-

24	The UE transmits a short BSR report. (Note 6)	-->	MAC PDU (Short BSR header, Short BSR(LCG ID='00', Buffer size index > 0))	-	-
-	EXCEPTION: Steps 25 to 27 shall be repeated two times (Note 5).	-	-	-	-
25	Wait for periodicBSR-Timer expiry.	-	-	-	-
26	In the next NPDCCH period bundle after periodicBSR -Timer expiry the SS sends an uplink grant of size 32 bits (Note 1, Note 8)	-	(UL Grant, 32 bits)	-	-
27	Check: Does UE transmit a MAC PDU containing a Short BSR with 'LCG ID' field set to '00' and Buffer Size Index > 0?	-->	MAC PDU (Short BSR header, Short BSR(LCG ID='00', Buffer Size index > 0))	7	P

Note 0: RLC SDU with size n contains a DLInformationTransfer-NB with ESM_DATA_TRANSPORT:
18 or 26 bits DLInformationTransfer-NB(PER encode: '0000000000'B + 8 bits (length of DedicatedInfoNAS <= 127 bytes) or 16 bits length (128 bytes <= length of DedicatedInfoNAS < 16383 bytes))
1/2 byte Protocol discriminator (SECURITY PROTECTED NAS MESSAGE)
1/2 byte Security header type (SECURITY PROTECTED NAS MESSAGE)
4 bytes Message authentication code (SECURITY PROTECTED NAS MESSAGE)
1 byte Sequence number (SECURITY PROTECTED NAS MESSAGE)
1/2 byte Protocol discriminator (ESM_DATA_TRANSPORT)
1/2 byte EPS bearer identity (ESM_DATA_TRANSPORT)
1 byte Procedure transaction identity (ESM_DATA_TRANSPORT)
1 byte ESM data transport message identity (ESM_DATA_TRANSPORT)
2 bytes length indicator of the user data container (ESM_DATA_TRANSPORT)
N bytes User data container contents (UL RLC SDU)
6 bits Aligned bits (PER encode)
n = N+14 or N+15 bytes DL RLC SDU

Note 1: 32 bits enables UE to transmit a MAC PDU with a MAC BSR header and a Short BSR (1 bytes).

Note 2: UE triggers a Short BSR of type "Regular BSR" to report buffer status for one LCG for that TTI. The UE should not send any of the received RLC SDUs (segmented) due to Regular BSR has higher priority than U-plane logical channels.

Note 2a: 88 bits for msg3 enable UE to transmit the CRNTI, BSR and user data (received in step 2), where 3 bytes belong first RLC SDU with FI=01 in its AMD PUD header, in a MAC PDU with
3 bytes MAC subheader: 1 byte CRNTI, 1 byte BSR, 1 byte SDU subheader
3 bytes MAC CE: 2 bytes CRNTI, 1 byte BSR
5 bytes MAC SDU: AMD PDU with 2 bytes header and a portion of 1 RLC SDU (3 bytes)
⇒ 11 bytes (TBS = 88)

Note 2b: The UE has 17 bytes of user data (received in step 2) in the transmission buffer, where 17 bytes belong RLC SDU with FI=10 in its AMD PUD header. 176 bits enables UE to transmit the user data in a MAC PDU with
1 byte MAC subheader: 1 byte SDU subheader
21 bytes MAC SDU: AMD PDU with 4 bytes header and a portion of 1 RLC SDU (7 bytes) and 1 RLC SDUs (10 bytes)
⇒ 22 bytes (TBS = 176)Note 2c: The UE has 10 bytes of user data (received in step 8) in the transmission buffer. 104 bits enables UE to transmit the user data in a MAC PDU with
1 byte MAC subheader: 1 byte SDU subheader
12 bytes MAC SDU: AMD PDU with 2 bytes header and 1 RLC SDU (10 bytes)
⇒ 13 bytes (TBS =104)

Note 3: The UE has 30 bytes of user data (received in steps 11) in the transmission buffer. 296 bits enables UE to transmit the user data in a MAC PDU with
2 bytes MAC subheader: 1 byte padding, 1 byte SDU subheader
35 bytes MAC SDU: AMD PDU with 5 bytes header (2 LIs) and 3 RLC SDUs (10 bytes each)
⇒ 37 bytes (TBS = 296)

Note 4: The UE has 15 bytes of user data (received in steps 15) in the transmission buffer. 256 bits enables UE to transmit the user data in a MAC PDU with
4 bytes MAC subheader (1 byte BSR subheader, 2 bytes SDU subheader, 1 byte paddingr)
1 byte short BSR
19 bytes MAC SDU: AMD PDU with 4 bytes header (1 LI) and 2 RLC SDUs (7 and 8 bytes)
8 bytes padding
⇒ 32 bytes (TBS=256).

Note 4a: The UE has 12 bytes of user data (received in steps 19) in the transmission buffer. 136 bits enables UE to transmit the user data in a MAC PDU with
2 bytes MAC subheader: 1 byte BSR subheader, 1 byte SDU subheader
1 byte short BSR
14 bytes MAC SDU: AMD PDU with 2 byte header and 12 bytes RLC SDU
⇒ 17 bytes (TBS=136).

Note 5:	One short BSR due to first expiry of *periodicBSR-Timer* and one short BSR due to second expire of *periodicBSR-Timer*.
Note 6:	The UE starts periodicBSR-Timer.
Note 7:	The value of T-CRNTI and CRNTI are different at step 5B/6.
Note 8:	NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.1.5 NB-IoT / DRX operation / DRX cycle configured / Parameters configured by RRC / DRX command MAC control element reception

22.3.1.5.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
```

```
  when { DRX cycle is configured and [(SFN * 10) + subframe number] modulo (DRX-Cycle) =
drxStartOffset-r13 }
    then { UE starts the OnDurationTimer-r13 and monitors the NPDCCH for OnDurationTimer-r13 NPDCCH
subframes }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { DRX cycle is configured and a new DL transmission is indicated on the NPDCCH during Active
Time }
    then { After expiry of the HARQ RTT timer the UE starts or restarts the Drx-InactivityTimer-r13
and monitors the NPDCCH for Drx-InactivityTimer-r13 NPDCCH periods }
            }
```

(3)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { DRX cycle is configured and when a HARQ RTT Timer expires and the data in the soft buffer
of the corresponding HARQ process has not been successfully decoded }
    then { UE starts the drx-RetransmissionTimer-r13 for the corresponding HARQ process and monitors
the NPDCCH for drx-RetransmissionTimer-r13 consecutive NPDCCH periods  }
            }
```

(4)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { DRX cycle is configured and an uplink grant for a pending HARQ retransmission can occur in
this NPDCCH period }
    then { UE monitors the NPDCCH in this period }
```

(5)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { DRX cycle is configured and a DRX Command MAC control element is received }
    then { UE successfully decodes the MAC control PDU }
            }
```

22.3.1.5.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clause 3.1 and 5.7.

[TS 36.321, clause 3.1]

Active Time: Time related to DRX operation, as defined in subclause 5.7, during which the MAC entity monitors the PDCCH.

…

DRX Cycle: Specifies the periodic repetition of the On Duration followed by a possible period of inactivity (see figure 3.1-1 below).

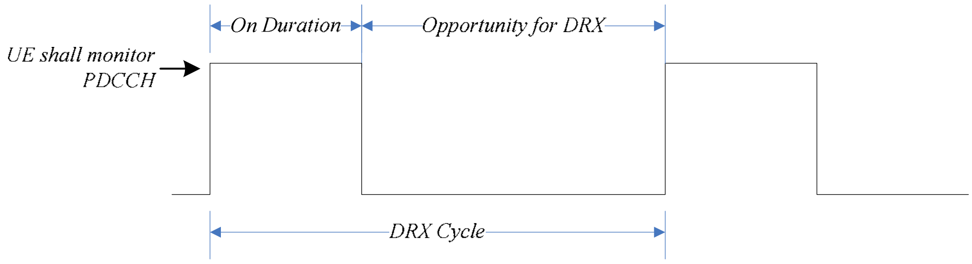

Figure 3.1-1: DRX Cycle

drx-InactivityTimer: Except for NB-IoT, it specifies the number of consecutive PDCCH-subframe(s) after the subframe in which a PDCCH indicates an initial UL, DL or SL user data transmission for this MAC entity. For NB-IoT, it specifies the number of consecutive PDCCH-subframe(s) after the subframe in which the HARQ RTT timer or UL HARQ RTT timer expires.

drx-RetransmissionTimer: Specifies the maximum number of consecutive PDCCH-subframe(s) until a DL retransmission is received.

drxShortCycleTimer: Specifies the number of consecutive subframe(s) the MAC entity shall follow the Short DRX cycle.

drxStartOffset: Specifies the subframe where the DRX Cycle starts.

drx-ULRetransmissionTimer: Specifies the maximum number of consecutive PDCCH-subframe(s) until a grant for UL retransmission is received.

…

HARQ RTT Timer: This parameter specifies the minimum amount of subframe(s) before a DL HARQ retransmission is expected by the MAC entity.

…

onDurationTimer: Specifies the number of consecutive PDCCH-subframe(s) at the beginning of a DRX Cycle.

PDCCH: Refers to the PDCCH [7], EPDCCH (in subframes when configured), MPDCCH [2], for an RN with R-PDCCH configured and not suspended, to the R-PDCCH or, for NB-IoT to the NPDCCH.

PDCCH period (pp): Refers to the interval between the start of two consecutive PDCCH occasions and depends on the currently used PDCCH search space [2]. A PDCCH occasion is the start of a search space and is defined by subframe k0 as specified in section 16.6 of [2]. For an NB-IoT UE, if a timer duration is configured by upper layers in units of a PDCCH period, the calculation of number of PDCCH-subframes for the timer is done by multiplying the number of PDCCH periods with *npdcch-NumRepetitions-RA* when the UE uses the common search space or by *npdcch-NumRepetitions* when the UE uses the UE specific search space.

PDCCH-subframe: Refers to a subframe with PDCCH. For a MAC entity not configured with any TDD serving cell(s), this represents any subframe; for a MAC entity configured with at least one TDD serving cell, if a MAC entity is capable of simultaneous reception and transmission in the aggregated cells, this represents the union over all serving cells of downlink subframes and subframes including DwPTS of the TDD UL/DL configuration indicated by *tdd-Config* [8], except serving cells that are configured with *schedulingCellId* [8]; otherwise, this represents the subframes where the SpCell is configured with a downlink subframe or a subframe including DwPTS of the TDD UL/DL configuration indicated by *tdd-Config* [8].
For RNs with an RN subframe configuration configured and not suspended, in its communication with the E-UTRAN, this represents all downlink subframes configured for RN communication with the E-UTRAN.
For SC-PTM reception on a FDD cell, this represents any subframe of the cell except MBSFN subframes; for SC-PTM reception on a TDD cell, this represents the downlink subframes and subframes including DwPTS of the TDD UL/DL configuration indicated by *tdd-Config* [8] of the cell except MBSFN subframes.

…

UL HARQ RTT Timer: This parameter specifies the minimum amount of subframe(s) before a UL HARQ retransmission grant is expected by the MAC entity.

[TS 36.321, clause 5.7]

The MAC entity may be configured by RRC with a DRX functionality that controls the UE's PDCCH monitoring activity for the MAC entity's C-RNTI, TPC-PUCCH-RNTI, TPC-PUSCH-RNTI, Semi-Persistent Scheduling C-RNTI (if configured), eIMTA-RNTI (if configured), SL-RNTI (if configured), and CC-RNTI (if configured). When in RRC_CONNECTED, if DRX is configured, the MAC entity is allowed to monitor the PDCCH discontinuously using the DRX operation specified in this subclause; otherwise the MAC entity monitors the PDCCH continuously. When using DRX operation, the MAC entity shall also monitor PDCCH according to requirements found in other subclauses of this specification. RRC controls DRX operation by configuring the timers *onDurationTimer*, *drx-InactivityTimer*, *drx-RetransmissionTimer* (one per DL HARQ process except for the broadcast process), *drx-ULRetransmissionTimer* (one per asynchronous UL HARQ process), the *longDRX-Cycle*, the value of the *drxStartOffset* and optionally the *drxShortCycleTimer* and *shortDRX-Cycle*. A HARQ RTT timer per DL HARQ process (except for the broadcast process) and UL HARQ RTT Timer per asynchronous UL HARQ process is also defined (see subclause 7.7).

When a DRX cycle is configured, the Active Time includes the time while:

- *onDurationTimer* or *drx-InactivityTimer* or *drx-RetransmissionTimer* or *drx-ULRetransmissionTimer* or *mac-ContentionResolutionTimer* (as described in subclause 5.1.5) is running; or

- a Scheduling Request is sent on PUCCH and is pending (as described in subclause 5.4.4); or

- an uplink grant for a pending HARQ retransmission can occur and there is data in the corresponding HARQ buffer for synchronous HARQ process; or

- a PDCCH indicating a new transmission addressed to the C-RNTI of the MAC entity has not been received after successful reception of a Random Access Response for the preamble not selected by the MAC entity (as described in subclause 5.1.4).

When DRX is configured, the MAC entity shall for each subframe:

- if a HARQ RTT Timer expires in this subframe:
  - if the data of the corresponding HARQ process was not successfully decoded:
    - start the *drx-RetransmissionTimer* for the corresponding HARQ process;
  - if NB-IoT, start or restart the *drx-InactivityTimer*.
- if an UL HARQ RTT Timer expires in this subframe:
  - start the *drx-ULRetransmissionTimer* for the corresponding HARQ process.
  - if NB-IoT, start or restart the *drx-InactivityTimer*.
- if a DRX Command MAC control element or a Long DRX Command MAC control element is received:
  - stop *onDurationTimer*;
  - stop *drx-InactivityTimer*.
- if *drx-InactivityTimer* expires or a DRX Command MAC control element is received in this subframe:
  - if the Short DRX cycle is configured:
    - start or restart *drxShortCycleTimer*;
    - use the Short DRX Cycle.
  - else:
    - use the Long DRX cycle.
- if *drxShortCycleTimer* expires in this subframe:

- use the Long DRX cycle.

- if a Long DRX Command MAC control element is received:
  - stop *drxShortCycleTimer*;
  - use the Long DRX cycle.
- If the Short DRX Cycle is used and [(SFN * 10) + subframe number] modulo (*shortDRX-Cycle*) = (*drxStartOffset*) modulo (*shortDRX-Cycle*); or
- if the Long DRX Cycle is used and [(SFN * 10) + subframe number] modulo (*longDRX-Cycle*) = *drxStartOffset*:
  - if NB-IoT:
    - if neither HARQ RTT Timer nor UL HARQ RTT Timer is running, start *onDurationTimer*.
  - else:
    - start onDurationTimer.
- during the Active Time, for a PDCCH-subframe, if the subframe is not required for uplink transmission for half-duplex FDD UE operation, and if the subframe is not a half-duplex guard subframe [7] and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception, and for NB-IoT if the subframe is not required for uplink transmission or downlink reception other than on PDCCH; or
- during the Active Time, for a subframe other than a PDCCH-subframe and for a UE capable of simultaneous reception and transmission in the aggregated cells, if the subframe is a downlink subframe indicated by a valid eIMTA L1 signalling for at least one serving cell not configured with *schedulingCellId* [8] and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception; or
- during the Active Time, for a subframe other than a PDCCH-subframe and for a UE not capable of simultaneous reception and transmission in the aggregated cells, if the subframe is a downlink subframe indicated by a valid eIMTA L1 signalling for the SpCell and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception:
  - monitor the PDCCH;
  - if the PDCCH indicates a DL transmission or if a DL assignment has been configured for this subframe:
    - if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
      - start the HARQ RTT Timer for the corresponding HARQ process in the subframe containing the last repetition of the corresponding PDSCH reception;
    - else:
      - start the HARQ RTT Timer for the corresponding HARQ process;
    - stop the *drx-RetransmissionTimer* for the corresponding HARQ process.
  - if the PDCCH indicates an UL transmission for an asynchronous HARQ process:
    - start the UL HARQ RTT Timer for the corresponding HARQ process in the subframe containing the last repetition of the corresponding PUSCH transmission;
    - except for NB-IoT, stop the *drx-ULRetransmissionTimer* for the corresponding HARQ process.
  - if the PDCCH indicates a new transmission (DL, UL or SL):
    - except for NB-IoT, start or restart *drx-InactivityTimer*.
  - if the PDCCH indicates a transmission (DL, UL) for a NB-IoT UE:
    - stop *drx-InactivityTimer*, *drx-ULRetransmissionTimer* and *onDurationTimer*.

- in current subframe n, if the MAC entity would not be in Active Time considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received and Scheduling Request sent until and including subframe n-5 when evaluating all DRX Active Time conditions as specified in this subclause, type-0-triggered SRS [2] shall not be reported.
- if CQI masking (*cqi-Mask*) is setup by upper layers:
    - in current subframe n, if *onDurationTimer* would not be running considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received until and including subframe n-5 when evaluating all DRX Active Time conditions as specified in this subclause, CQI/PMI/RI/PTI/CRI on PUCCH shall not be reported.
- else:
    - in current subframe n, if the MAC entity would not be in Active Time considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received and Scheduling Request sent until and including subframe n-5 when evaluating all DRX Active Time conditions as specified in this subclause, CQI/PMI/RI/PTI/CRI on PUCCH shall not be reported.

Regardless of whether the MAC entity is monitoring PDCCH or not, the MAC entity receives and transmits HARQ feedback and transmits type-1-triggered SRS [2] when such is expected.

NOTE: The same Active Time applies to all activated serving cell(s).

NOTE: In case of downlink spatial multiplexing, if a TB is received while the HARQ RTT Timer is running and the previous transmission of the same TB was received at least N subframes before the current subframe (where N corresponds to the HARQ RTT Timer), the MAC entity should process it and restart the HARQ RTT Timer.

NOTE: The BL UE and the UE in enhanced coverage waits until the last subframe of the configured MPDCCH search space before executing the next specified action.

22.3.1.5.3 Test description

22.3.1.5.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- RRC Connection Setup (preamble: Table 8.1.5.2.3-1, step 3 [18]) using parameters as specified in Table 22.3.1.5.3.3-1

UE:

None.

Preamble:

- UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G and configured to return no data in UL according to [18] in Ncell 1.

22.3.1.5.3.2 Test procedure sequence

DRX parameters and search space parameters according to Table 22.3.1.5.3.3-1 result in periods as shown in the table below

Table 22.3.1.5.3.2-1: DRX parameters and search space parameters

Period/Timer	NPDCCH periods	Duration (ms)
NPDCCH period	1	256 (R_{max} * G)
DRX cycle	16	16 * 256 = 4096
On Duration	4	1024
Opportunity for DRX	12	3076
drx-InactivityTimer	4	1024

drx-RetransmissionTimer	6	1536
drx-ULRetransmissionTimer	24	6144

In the following figures illustrate timing for the different test purposes; NPDCCH periods are marked in

- green for DL transmission (no CRC error)
- red for DL transmission (CRC error)
- yellow for DL transmission of MAC DRX command CE
- blue for UL transmission

The relevant timer/period for the test purpose is marked in light yellow.

NPDCCH period	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Table 22.3.1.5.3.2-1: Main Behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	In the first NPDCCH period of the next DRX On Duration the SS schedules the DL transmission of a MAC PDU in the first search space candidate of the search space.	<--	MAC PDU	-	-
2	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 1?	-->	HARQ ACK	1	P
3	In the last NPDCCH period of the next DRX On Duration the SS schedules DL transmission of a MAC PDU in the last search space candidate of the search space.	<--	MAC PDU	-	-
4	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 3?	-->	HARQ ACK	1	P
5	Four NPDCCH periods after the transmission at step 3 the SS schedules the DL transmission of a MAC PDU in the last search space candidate of the search space. Note: Four NPDCCH periods is the duration of the drx-InactivityTimer	<--	MAC PDU	-	-
6	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 5?	-->	HARQ ACK	2	P
7	In the last NPDCCH period of the next DRX On Duration the SS schedules the DL transmission of a MAC PDU in the last search space candidate of the search space; the SS shall generate a CRC error for this transmission causing the UE to send a NACK but the SS shall not perform any retransmissions.	<--	Invalid MAC PDU	-	-
8	Check: Does the UE transmit a HARQ NACK for the DL MAC PDU in Step 7?	-->	HARQ NACK	1	P
9	In the next NPDCCH period the SS schedules the DL transmission of a (new) MAC PDU in the first search space candidate of the search space. Note: The NDI of the corresponding DCI indicates a new transmission	<--	MAC PDU	-	-
10	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 9?	-->	HARQ ACK	3	P
11	In the last NPDCCH period of the next DRX On Duration the SS schedules the DL transmission of a MAC PDU in the last search space candidate of the search space; the SS shall generate a CRC error for this transmission causing the UE to send a NACK but the SS shall not perform any retransmissions.	<--	Invalid MAC PDU	-	-
12	Check: Does the UE transmit a HARQ NACK for the DL MAC PDU in Step 11?	-->	HARQ NACK	1	P
13	Six NPDCCH periods after the transmission at step 11 the SS schedules the DL transmission of a (new) MAC PDU in the last search space candidate of the search space. Note 1: Six NPDCCH periods is the duration of the drx-RetransmissionTimer Note 2: The NDI of the corresponding DCI indicates a new transmission	<--	MAC PDU	-	-
14	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 13?	-->	HARQ ACK	3	P
15	In the last NPDCCH period of the next DRX On Duration the SS allocates an UL grant for UE in the last search space candidate of the search space.	<--	UL grant on PDCCH	-	-
16	Check: Does the UE transmit a Buffer Status Report on the UL indicating an empty buffer?	-->	Buffer Status Report MAC control element	-	-

17	24 NPDCCH periods after the transmission at step 15 the SS schedules the DL transmission of a MAC PDU in the last search space candidate of the search space. Note: 26 NPDCCH periods is the duration of the drx-ULRetransmissionTimer	<--	MAC PDU	-	-
18	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 17?	-->	HARQ ACK	4	P
19	In the third NPDCCH period of the next DRX On Duration the SS schedules the DL transmission of a MAC PDU in the first search space candidate of the search space; the SS shall generate a CRC error for this transmission causing the UE to send a NACK but the SS shall not perform any retransmissions.	<--	Invalid MAC PDU	-	-
20	Check: Does the UE transmit a HARQ NACK for the DL MAC PDU in Step 19?	-->	HARQ NACK	5	P
21	In the next NPDCCH period after the MAC PDU at step 19 was sent the SS schedules the DL transmission of a MAC PDU containing a DRX MAC Control element in the first search space candidate of the search space. Note 1: MAC PDU in step 19 causes drx-InactivityTimer and onDurationTimer to be stopped at the UE and the UE starts the HARQ RTT. Note 2: Expiry of HARQ RTT timer at the end of the NPDCCH period causes start of drx-RetransmissionTimer and drx-InactivityTimer. Note 3: The NDI of the corresponding DCI indicates a new transmission.	<--	MAC PDU(DRX MAC Control element)	-	-
22	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 21? Note: The UE sends the HARQ when it has successfully decoded the MAC PDU containing the DRX MAC Control element	-->	HARQ ACK	5	P
23-30	Void			-	-

22.3.1.5a NB-IoT / NTN / DRX / (UL)HARQ RTT

22.3.1.5a.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED mode with long DRX cycle configured }
ensure that {
  when { a UL HARQ RTT Timer expires in this subframe }
    then { UE starts the drx-ULRetransmissionTimer-r13 for the corresponding HARQ process and
monitors the PDCCH for drx-ULRetransmissionTimer-r13 consecutive NPDCCH-subframes }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED mode with long DRX cycle configured }
ensure that {
  when { a HARQ RTT Timer expires in this subframe and the data in the soft buffer of the
corresponding HARQ process was not successfully decoded }
    then { UE starts the drx-RetransmissionTimer-r13 for the corresponding HARQ process and monitors
the PDCCH for drx-RetransmissionTimer-r13 consecutive NPDCCH-subframes }
            }            }
```

22.3.1.5a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.321 clauses 3.1, 5.7, 7.7 and Annex C; TS 36.331 clause 6.3.1. Unless otherwise stated these are Rel-17 requirements.

[TS 36.321, clause 3.1]

drx-InactivityTimer: Except for NB-IoT UEs, BL UEs or UEs in enhanced coverage, it specifies the number of consecutive PDCCH-subframe(s) after the subframe in which a PDCCH indicates an initial UL, DL or SL user data transmission for this MAC entity. For NB-IoT UEs, it specifies the number of consecutive PDCCH-subframe(s) after the subframe in which the HARQ RTT timer or UL HARQ RTT timer expires. For BL UEs or UEs in enhanced coverage, it specifies the number of consecutive PDCCH-subframe(s) following the subframe containing the last repetition of the PDCCH reception that indicates an initial UL or DL user data transmission for this MAC entity.

drx-RetransmissionTimer: Specifies the maximum number of consecutive PDCCH-subframe(s) until a DL retransmission is received.

…

drx-ULRetransmissionTimer: Specifies the maximum number of consecutive PDCCH-subframe(s) until a grant for UL retransmission or the HARQ feedback is received.

…

HARQ RTT Timer: This parameter specifies the minimum amount of subframe(s) before a DL assignment for HARQ retransmission is expected by the MAC entity.

…

UE-eNB RTT: For non-terrestrial networks, the sum of the UE's Timing Advance value (see TS 36.211 [7], clause 8.1) and *k_Mac in units of subframe, not rounded or truncated toward an integer number of subframes*.

UL HARQ RTT Timer: This parameter specifies the minimum amount of subframe(s) before a UL HARQ retransmission grant is expected by the MAC entity.

[TS 36.321, clause 5.7]

The MAC entity may be configured by RRC with a DRX functionality that controls the UE's PDCCH monitoring activity for the MAC entity's C-RNTI, TPC-PUCCH-RNTI, TPC-PUSCH-RNTI, Semi-Persistent Scheduling C-RNTI (if configured), UL Semi-Persistent Scheduling V-RNTI (if configured), eIMTA-RNTI (if configured), SL-RNTI (if configured), SL-V-RNTI (if configured), CC-RNTI (if configured), SRS-TPC-RNTI (if configured), and AUL C-RNTI (if configured). When in RRC_CONNECTED, if DRX is configured, the MAC entity is allowed to monitor the PDCCH discontinuously using the DRX operation specified in this clause; otherwise the MAC entity monitors the PDCCH continuously. When using DRX operation, the MAC entity shall also monitor PDCCH according to requirements found in other clauses of this specification. RRC controls DRX operation by configuring the timers *onDurationTimer*, *drx-InactivityTimer*, *drx-RetransmissionTimer* (for HARQ processes scheduled using 1ms TTI, one per DL HARQ process except for the broadcast process), *drx-RetransmissionTimerShortTTI* (for HARQ processes scheduled using short TTI, one per DL HARQ process), *drx-ULRetransmissionTimer* (for HARQ processes scheduled using 1ms TTI, one per asynchronous UL HARQ process), *drx-ULRetransmissionTimerShortTTI* (for HARQ processes scheduled using short TTI, one per asynchronous UL HARQ process), the *longDRX-Cycle*, the value of the *drxStartOffset* and optionally the *drxShortCycleTimer* and *shortDRX-Cycle*. A HARQ RTT timer per DL HARQ process (except for the broadcast process) and UL HARQ RTT Timer per asynchronous UL HARQ process is also defined (see clause 7.7).

When a DRX cycle is configured, the Active Time includes the time while:

- *onDurationTimer* or *drx-InactivityTimer* or *drx-RetransmissionTimer* or *drx-RetransmissionTimerShortTTI* or *drx-ULRetransmissionTimer* or *drx-ULRetransmissionTimerShortTTI* or *mac-ContentionResolutionTimer* (as described in clause 5.1.5) is running; or
- a Scheduling Request is sent on PUCCH/SPUCCH and is pending (as described in clause 5.4.4). If this Serving Cell is part of a non-terrestrial network, the Active Time is started after the Scheduling Request transmission that is performed when the SR_COUNTER is 0 for all the SR configurations with pending SR(s) plus the UE-eNB RTT; or
- an uplink grant for a pending HARQ retransmission can occur and there is data in the corresponding HARQ buffer for synchronous HARQ process; or
- a PDCCH indicating a new transmission addressed to the C-RNTI of the MAC entity has not been received after successful reception of a Random Access Response for the preamble not selected by the MAC entity (as described in clause 5.1.4) ; or
- *mpdcch-UL-HARQ-ACK-FeedbackConfig* is configured and repetitions within a bundle are being transmitted according to UL_REPETITION_NUMBER. If this Serving Cell is part of a non-terrestrial network, the Active Time starts after the first repetition within the bundle plus the UE-eNB RTT when repetitions within the bundle are being transmitted.

When DRX is configured, the MAC entity shall for each subframe:

- if a HARQ RTT Timer expires in this subframe:
    - if the data of the corresponding HARQ process was not successfully decoded:

- start the *drx-RetransmissionTimer* or *drx-RetransmissionTimerShortTTI* for the corresponding HARQ process;
- if NB-IoT:
  - if lower layers had indicated multiple TBs were scheduled for the associated expired HARQ RTT Timer:
    - start or restart *drx-InactivityTimer* when all HARQ RTT Timers have expired;
  - else:
    - start or restart the *drx-InactivityTimer*.
- if an UL HARQ RTT Timer expires in this subframe:
  - start the *drx-ULRetransmissionTimer* or *drx-ULRetransmissionTimerShortTTI* for the corresponding HARQ process.
  - if NB-IoT:
    - if lower layers had indicated multiple TBs were scheduled for the associated expired HARQ RTT Timer:
      - start or restart *drx-InactivityTimer* when all HARQ RTT Timers have expired;
    - else:
      - start or restart the *drx-InactivityTimer*.
- if a DRX Command MAC control element or a Long DRX Command MAC control element is received:
  - stop *onDurationTimer*;
  - stop *drx-InactivityTimer*.
- if *drx-InactivityTimer* expires or a DRX Command MAC control element is received in this subframe:
  - if the Short DRX cycle is configured:
    - start or restart *drxShortCycleTimer*;
    - use the Short DRX Cycle.
  - else:
    - use the Long DRX cycle.
- if *drxShortCycleTimer* expires in this subframe:
  - use the Long DRX cycle.
- if a Long DRX Command MAC control element is received:
  - stop *drxShortCycleTimer*;
  - use the Long DRX cycle.
- If the Short DRX Cycle is used and [(SFN * 10) + subframe number] modulo (*shortDRX-Cycle*) = (*drxStartOffset*) modulo (*shortDRX-Cycle*); or
- if the Long DRX Cycle is used and [(SFN * 10) + subframe number] modulo (*longDRX-Cycle*) = *drxStartOffset*:
  - if NB-IoT:
    - if there is at least one HARQ process for which neither HARQ RTT Timer nor UL HARQ RTT Timer is running, start *onDurationTimer*.
  - else:
    - start onDurationTimer.

- during the Active Time, for a PDCCH-subframe, if the subframe is not required for uplink transmission for half-duplex FDD UE operation, and if the subframe is not a half-duplex guard subframe, as specified in TS 36.211 [7], and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception, and for NB-IoT if the subframe is not required for uplink transmission or downlink reception other than on PDCCH; or

- during the Active Time, for a subframe other than a PDCCH-subframe and for a UE capable of simultaneous reception and transmission in the aggregated cells, if the subframe is a downlink subframe indicated by a valid eIMTA L1 signalling for at least one serving cell not configured with *schedulingCellId*, as specified in TS 36.331 [8] and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception; or

- during the Active Time, for a subframe other than a PDCCH-subframe and for a UE not capable of simultaneous reception and transmission in the aggregated cells, if the subframe is a downlink subframe indicated by a valid eIMTA L1 signalling for the SpCell and if the subframe is not part of a configured measurement gap and if the subframe is not part of a configured Sidelink Discovery Gap for Reception:

  - monitor the PDCCH;

  - if the PDCCH indicates a DL transmission or if a DL assignment has been configured for this subframe:

    - if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:

      - if lower layers have indicated scheduling of transmission of multiple TBs:

        - start the HARQ RTT Timers for all HARQ processes corresponding to the scheduled TBs in the subframe containing the last repetition of the PDSCH corresponding to the last scheduled TB;

      - else:

        - start the HARQ RTT Timer for the corresponding HARQ process in the subframe containing the last repetition of the corresponding PDSCH reception;

    - else:

      - start the HARQ RTT Timer for the corresponding HARQ process;

    - stop the *drx-RetransmissionTimer* or *drx-RetransmissionTimerShortTTI* for the corresponding HARQ process.

    - if NB-IoT, stop *drx-ULRetransmissionTimer* for all UL HARQ processes.

  - if the PDCCH indicates an UL transmission for an asynchronous HARQ process or if an UL grant has been configured for an asynchronous HARQ process for this subframe, or if the PDCCH indicates an UL transmission for an autonomous HARQ process or;

  - if the uplink grant is a configured grant for the MAC entity's AUL C-RNTI and if the corresponding PUSCH transmission has been performed in this subframe:

    - if *mpdcch-UL-HARQ-ACK-FeedbackConfig* is not configured:

      - if lower layers have indicated scheduling of transmission of multiple TBs:

        - start the UL HARQ RTT Timers for all scheduled HARQ processes in the subframe containing the last repetition of the PUSCH corresponding to the last scheduled TB;

      - else:

        - start the UL HARQ RTT Timer for the corresponding HARQ process in the subframe containing the last repetition of the corresponding PUSCH transmission;

      - stop the *drx-ULRetransmissionTimer* or *drx-ULRetransmissionTimerShortTTI* for the corresponding HARQ process;

    - if *mpdcch-UL-HARQ-ACK-FeedbackConfig* is configured and an UL HARQ-ACK feedback has not been received on PDCCH until the last repetition of the corresponding PUSCH transmission:

        - start or restart the *drx-ULRetransmissionTimer* for the corresponding HARQ process in the subframe containing the last repetition of the corresponding PUSCH transmission;

    - if NB-IoT, stop *drx-RetransmissionTimer* for all DL HARQ processes.

  - if the PDCCH indicates a new transmission (DL, UL or SL):

    - except for an NB-IoT UE configured with a single DL and UL HARQ process and when PDCCH indicates the transmission is not for multiple TBs:

      - start or restart *drx-InactivityTimer*.

  - if the PDCCH indicates a transmission (DL, UL) for an NB-IoT UE:

    - if the NB-IoT UE is configured with a single DL and UL HARQ process; or

    - if the PDCCH indicates the transmission is for multiple TBs:

      - stop *drx-Inactivity*Timer.

    - stop *onDurationTimer.*

  - if the PDCCH indicates an UL HARQ-ACK feedback for an asynchronous UL HARQ process for a UE configured with *mpdcch-UL-HARQ-ACK-FeedbackConfig*:

    - if the lower layer had indicated scheduling of transmission of multiple TBs:

      - stop *drx-ULRetransmissionTimer* for the corresponding UL HARQ process(es).

    - else if the PUSCH transmission is completed:

      - stop *drx-ULRetransmissionTimer* for all UL HARQ processes.

  - if the PDCCH indicates HARQ feedback for one or more HARQ processes for which UL HARQ operation is autonomous:

    - stop the *drx-ULRetransmissionTimer* for the corresponding HARQ process(es).

- in current subframe n, if the MAC entity would not be in Active Time considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received and Scheduling Request sent until and including subframe n-5 when evaluating all DRX Active Time conditions as specified in this clause, type-0-triggered SRS, as specified in TS 36.213 [2], shall not be reported.

- if CQI masking (*cqi-Mask*) is setup by upper layers:

  - in current TTI n, if *onDurationTimer* would not be running considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received until and including TTI n-5 when evaluating all DRX Active Time conditions as specified in this clause, CQI/PMI/RI/PTI/CRI on PUCCH shall not be reported.

- else:

  - in current TTI n, if the MAC entity would not be in Active Time considering grants/assignments/DRX Command MAC control elements/Long DRX Command MAC control elements received and Scheduling Request sent until and including TTI n-5 when evaluating all DRX Active Time conditions as specified in this clause, CQI/PMI/RI/PTI/CRI on PUCCH shall not be reported.

For NB-IoT, *onDurationTimer* may start within a PDCCH period and end within a PDCCH period. The UE shall monitor NPDCCH during these partial PDCCH periods while *onDurationTimer* is running.

Regardless of whether the MAC entity is monitoring PDCCH or not, the MAC entity receives and transmits HARQ feedback and transmits type-1-triggered SRS, as specified in TS 36.213 [2], when such is expected. The MAC entity monitors PDCCH addressed to CC-RNTI for a PUSCH trigger B, as specified in TS 36.213 [2], on the corresponding SCell even if the MAC entity is not in Active Time. when such is expected.

When the BL UE or the UE in enhanced coverage or NB-IoT UE receives PDCCH, the UE executes the corresponding action specified in this clause in the subframe following the subframe containing the last repetition of the PDCCH reception where such subframe is determined by the starting subframe and the DCI subframe repetition number field in the PDCCH specified in TS 36.213 [2], unless explicitly stated otherwise.

NOTE 1: The same Active Time applies to all activated serving cell(s).

NOTE 2: In case of downlink spatial multiplexing, if a TB is received while the HARQ RTT Timer is running and the previous transmission of the same TB was received at least N subframes before the current subframe (where N corresponds to the HARQ RTT Timer), the MAC entity should process it and restart the HARQ RTT Timer.

NOTE 3: The MAC entity does not consider PUSCH trigger B, as specified in TS 36.213 [2], to be an indication of a new transmission.

NOTE 4: For NB-IoT, for operation in FDD mode, and for operation in TDD mode with a single HARQ process, DL and UL transmissions will not be scheduled in parallel, i.e. if a DL transmission has been scheduled an UL transmission will not be scheduled until HARQ RTT Timer of the DL HARQ process has expired (and vice versa).

[TS 36.321, clause 7.7]

For each serving cell, in case of FDD configuration not configured with *subframeAssignment-r15* and in case of Frame Structure Type 3 configuration on the serving cell which carries the HARQ feedback for this serving cell the HARQ RTT Timer is set to 8 subframes. For each serving cell, in case of TDD configuration or FDD with *subframeAssignment-r15* configured on the serving cell which carries the HARQ feedback for this serving cell the HARQ RTT Timer is set to k + 4 subframes, where k is the interval between the downlink transmission and the transmission of associated HARQ feedback, as indicated in clauses 10.1 and 10.2 of TS 36.213 [2], and for an RN configured with *rn-SubframeConfig*, as specified in TS 36.331 [8] and not suspended, as indicated in Table 7.5.1-1 of TS 36.216 [11].

For each serving cell, for HARQ processes scheduled using Short Processing Time (TS 36.331 [8]) the HARQ RTT is set to 6 subframes for FDD and Frame Structure Type 3 and set to k + 3 subframes for TDD, where k is the interval between the downlink transmission and the transmission of associated HARQ feedback, as indicated in clauses 10.1 and 10.2 of TS 36.213 [2].

For each serving cell, for HARQ processes scheduled using short TTI (TS 36.331 [8]) the HARQ RTT is set to 8 TTIs if the TTI length is one slot or if *proc-Timeline* is set to n+4 set1, to 12 TTIs if *proc-Timeline* is set to n+6 set1 or n+6 set2 and to 16 TTIs if *proc-Timeline* is set to n+8 set2 for FDD and Frame Structure Type 3.

For TDD short TTI the HARQ RTT is set to k + 4 TTIs, where k is the interval between the downlink transmission and the transmission of associated HARQ feedback, as indicated in clauses 10.1 and 10.2 of TS 36.213 [2].

…

For NB-IoT, when single TB is scheduled by PDCCH or when multiple TBs are scheduled for the interleaved case when HARQ-ACK bundling is configured the HARQ RTT Timer is set to k+3+N subframes plus RTToffset + deltaPDCCH, where k is the interval between the last subframe of the downlink transmission and the first subframe of the associated HARQ feedback transmission and N is the transmission duration in subframes of the associated HARQ feedback, and deltaPDCCH is the interval starting from the subframe following the last subframe of the associated HARQ feedback transmission plus 3 subframes plus RTToffset to the first subframe of the next PDCCH occasion.

For NB-IoT, when multiple TBs are scheduled by PDCCH for the non-interleaved case or for the interleaved case when HARQ-ACK bundling is not configured, the HARQ RTT Timer is set to k+2*N+1 subframes plus RTToffset + deltaPDCCH where k is the interval between the last subframe of the downlink transmission and the first subframe of the first HARQ feedback transmission and N is the transmission duration in subframes of the associated HARQ feedback, and deltaPDCCH is the interval starting from the subframe following the last subframe of the last HARQ feedback transmission plus 1 subframe plus RTToffset to the first subframe of the next PDCCH occasion.

Except for NB-IoT and for HARQ processes scheduled using Short Processing Time and for short TTI, UL HARQ RTT Timer length is set to 4 subframes plus RTToffset for FDD and Frame Structure Type 3, and set to $k_{ULHARQRTT}$ subframes plus RTToffset for TDD, where $k_{ULHARQRTT}$ equals to the k_{PHICH} value indicated in Table 9.1.2-1 of TS 36.213 [2] if the UE is not configured with upper layer parameter *symPUSCH-UpPts* for the serving cell, otherwise the k_{PHICH} value is indicated in Table 9.1.2-3.

For NB-IoT, when single TB is scheduled by PDCCH the UL HARQ RTT timer length is set to 4 subframes plus RTToffset +deltaPDCCH, where deltaPDCCH is the interval starting from the subframe following the last subframe of the PUSCH transmission plus 3 subframes plus RTToffset to the first subframe of the next PDCCH occasion.

For NB-IoT, when multiple TBs are scheduled by PDCCH the UL HARQ RTT timer length is set to 1 subframe plus RTToffset +deltaPDCCH, where deltaPDCCH is the interval starting from the subframe following the last subframe of the PUSCH transmission plus 1 subframe plus RTToffset to the first subframe of the next PDCCH occasion.

For HARQ processes scheduled using Short Processing Time (TS 36.331 [8]), the UL HARQ RTT Timer length is set to 3 subframes for FDD and for Frame Structure Type 3, and set to $k_{ULHARQRTT}$ subframes for TDD, where $k_{ULHARQRTT}$ equals the value indicated in Table 7.7-1 and Table 7.7-2.

For HARQ processes scheduled using short TTI (TS 36.331 [8]), the UL HARQ RTT Timer length is set to 8 TTIs if the TTI length is one slot or if *proc-Timeline* is set to n+4 set1, to 12 TTIs if *proc-Timeline* is set to n+6 set1 or n+6 set2 and to 16 TTIs if *proc-Timeline* is set to n+8 set2 for FDD and Frame Structure Type 3. For TDD short TTI the UL HARQ RTT is set to $k_{ULHARQRTT}$ TTIs, where $k_{ULHARQRTT}$ equals the value indicated in Table 7.7-3, Table 7.7-4 and Table 7.7-5.

…

NOTE 1: RTToffset = 0 in terrestrial networks and RTToffset = UE-eNB RTT in Non-terrestrial networks.

NOTE 2: DLoffset = 0 in terrestrial networks and DLoffset = Koffset + k-Mac in Non-terrestrial networks where Koffset is defined in TS 36.213 [2], clause 4.2.3.

[TS 36.321, Annex C]

When a DRX timer is set to a value of X, and n denotes the subframe in which the related event is triggered according to the clause 5.7, the intended behaviours of each DRX timer are presented in the Table C-1 below:

Table C-1: Intended UE behaviour for DRX timers

DRX Timers	Intended UE behaviour ([x, y] means including subframe x and y)
drx-InactivityTimer	The MAC entity monitors PDCCH in PDCCH-subframes during the subframes [n+1, n+m]. The MAC entity starts or restarts drxShortCycleTimer, and uses Short DRX Cycle in the subframe n+m+1, if configured.
drx-InactivityTimerSCPTM	The MAC entity monitors PDCCH in PDCCH-subframes during the subframes [n+1, n+m].
mac-ContentionResolutionTimer or mac-ContentionResolutionTimer for the corresponding enhanced coverage level, if it exists	The MAC entity monitors PDCCH in PDCCH-subframes during the subframes [n+1, n+X].
drx-RetransmissionTimer or drx-ULRetransmissionTimer	The MAC entity monitors PDCCH in PDCCH-subframes during the subframes [n, n+m-1].
onDurationTimer or onDurationTimerSCPTM	The MAC entity monitors PDCCH in PDCCH-subframes during the subframes [n, n+m-1].
drxShortCycleTimer	The MAC entity uses the Short DRX Cycle during the subframes [n, n+X-1]. The MAC entity starts to use the Long DRX Cycle in the subframe n+X.
HARQ RTT Timer	The MAC entity starts drx-RetransmissionTimer in the subframe n+X, if needed.
UL HARQ RTT Timer	The MAC entity starts drx-ULRetransmissionTimer in the subframe n+X, if needed.
NOTE 1: For FDD, m is equal to X; for TDD, m is equal to the minimum number of subframes so that X PDCCH-subframes are included during the subframes [x, y]. NOTE 2: A MAC entity configured with eIMTA monitors PDCCH in some subframe(s) in addition to PDCCH-subframes, as specified in clause 5.7. NOTE 3: For BL UE or UE in enhanced coverage, m is equal to the minimum number of subframes so that X PDCCH-subframes are included during the subframes [x, y].	

For drx-InactivityTimerSCPTM, drx-InactivityTimer, drx-RetransmissionTimer and drx-ULRetransmissionTimer, if X=0, the timer does not make the MAC entity to monitor the PDCCH.

The intended UE behaviours in Table C-1 are not applicable for NB-IoT.

For NB-IoT, the intended UE behaviour regarding setting the HARQ RTT Timer is shown in Figure C-1 and for the UL HARQ RTT Timer is shown in Figure C-2.

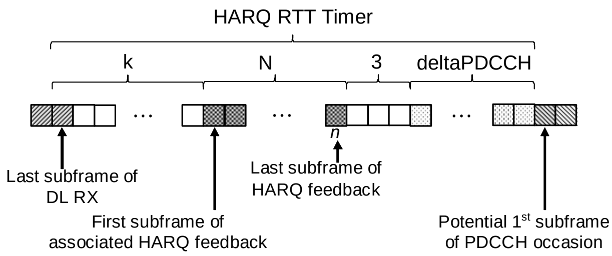

Figure C-1: Setting the HARQ RTT Timer for NB-IoT

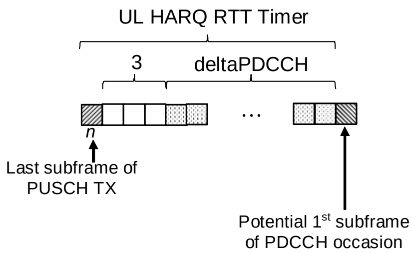

Figure C-2: Setting the UL HARQ RTT Timer for NB-IoT

NOTE: UE-eNB RTT is taken into account when calculating the *(UL) HARQ RTT timer*.

[TS 36.331, clause 6.3.1]

k-Mac

Scheduling offset used when downlink and uplink frame timing are not aligned at the eNB, see TS 36.213 [23]. Unit in ms.

If the field if absent, the UE uses the (default) value of 0.

22.3.1.5a.3 Test description

22.3.1.5a.3.1 Pre-test conditions

System Simulator:

- Ncell 1 is configured according to Table 8.1.4.2-1 in TS 36.508 [18].
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The preconfigured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble

- The UE is in state 2B-NB with test loop mode G according to TS 36.508 [18] clause 8.1.5.1 in Ncell 1.

22.3.1.5a.3.2 Test procedure sequence

DRX parameters and search space parameters according to Table 22.3.1.5a.3.3-1 result in periods as shown in the table below

Table 22.3.1.5a.3.2-1: DRX parameters and search space parameters

Period/Timer	NPDCCH periods	Duration (ms)
NPDCCH period	1	256 (R_{max} * G)
DRX cycle	16	16 * 256 = 4096
On Duration	4	1024
Opportunity for DRX	12	3076
drx-InactivityTimer	4	1024
drx-RetransmissionTimer	6	1536
drx-ULRetransmissionTimer	24	6144

Table 22.3.1.5a.3.2-2: Main Behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	In the first NPDCCH period of the next DRX On Duration the SS schedules the DL transmission of a MAC PDU in the first search space candidate of the search space.	<--	MAC PDU	-	-
1A	The UE transmit a HARQ ACK for the DL MAC PDU in Step 1.	-->	HARQ ACK	-	-
2	In the last NPDCCH period of the next DRX On Duration the SS allocates an UL grant for UE in the last search space candidate of the search space.	<--	Uplink Grant	-	-
3	The UE loops back the MAC PDU.	-->	MAC PDU	-	-
4	In the NPDCCH sub frame when the drx-uLRetransmissionTimer-r13 for MAC PDU in Step 3 is still running, the SS transmits UL grant for the retransmission of the MAC PDU in step 3, and NDI is the same with which in step 2, and redundancy version = 1. i.e. UL HARQ RTT + *drx-uLRetransmissionTimer-r13 - x* subframes after step 3 (x is between 0 and 20 the difference between On duration and UL Retransmission timer) (Note 5)	<--	UL Grant(DCI 0) with untoggled NDI	-	-
5	Void.	-	-	-	-
6	Check: Does the UE loop back the MAC PDU?	-->	MAC PDU	1	P
6A	The SS transmits an RLC STATUS PDU to acknowledge received data.	<--	RLC STATUS PDU	-	-
-	The SS stops allocating UL Grant.	-	-	-	-
7-10	Void.	-	-	-	-
11	In the last NPDCCH period when onDurationTimer-r13 is running, SS schedules the DL transmission of a MAC PDU in the last search space candidate and generates a CRC error causing the UE to send a NACK, but not perform any retransmissions.	<--	Invalid MAC PDU	-	-
12	The UE transmits a HARQ NACK for the DL MAC PDU in Step 11.	-->	HARQ NACK	-	-
13	In the next NPDCCH period the SS schedules the DL transmission of a (new) MAC PDU in the first search space candidate. Note: The NDI of the corresponding DCI indicates a new transmission. (Note 5)	<--	MAC PDU	-	-
14	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 13?	-->	HARQ ACK	2	P
15	In the last NPDCCH period when onDurationTimer-r13 is running, SS schedules	<--	Invalid MAC PDU	-	-

	the DL re-transmission of thea MAC PDU in the last search space candidate and generates a CRC error causing the UE to send a NACK, but not perform any retransmissions.				
16	The UE transmits a HARQ NACK for the DL MAC PDU in Step 15.	-->	HARQ NACK	-	-
17	Six NPDCCH periods after step 16 the SS schedules the DL transmission of MAC PDU in the last search space candidate. Note 1: Six NPDCCH periods is the duration of the drx-RetransmissionTimer-r13. (Note 5)	<--	MAC PDU	-	-
18	Check: Does the UE transmit a HARQ ACK for the DL MAC PDU in Step 17?	-->	HARQ ACK	2	P
19	The SS starts allocating UL Grant	-	-	-	-
20	The UE loops back the MAC PDU.	-->	MAC PDU	-	-
21	The SS transmits an RLC STATUS PDU to acknowledge received data.	<--	RLC STATUS PDU	-	-
Note 1: Invalid MAC PDU is a MAC PDU that fails the CRC check. Note 2: Void. Note 3: Timer tolerances for the MAC DRX related timers measured in subframes or NPDCCH subframes is 0. These timers are: drx-InactivityTimer, drx-RetransmissionTimer, drx-ULRetransmissionTimer, HARQ RTT Timer and UL HARQ RTT Timer. Note 4: The drx-InactivityTimer is started in the next NPDCCH sub-frame of the NPDCCH sub-frame where DL new transmission is indicated. Note 5: UE-eNB RTT, which is the UE's Timing Advance value in units of subframe, not rounded or truncated toward an integer number of subframes is added to the (UL) HARQ RTT Timer.

22.3.1.6 NB-IoT / DL-SCH / UL-SCH transport block size selection / DCI format N1/ N0

22.3.1.6.1 Test Purpose (TP)

(1)

with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
when { UE on NPDCCH receives DCI format N1 indicating a resource assignment corresponding to I_{SF} number of subframes and a modulation and coding scheme I_{MCS} }
then { UE decodes the received transport block of size corresponding to the read I_{SF} and I_{MCS} **and** forwards it to higher layers }
}

(2)

with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
when { UE has pending data for transmission and receives a Resource Block Assignment corresponding to N_{RU} number of subframes and a modulation and coding scheme I_{MCS} for NPUSCH scheduling }
then { UE transmits MAC PDU on NPUSCH on the granted resources using a transport block size corresponding to the read N_{RU} and I_{MCS} }

22.3.1.6.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.212, clause 6.4.3.1, 6.4.3.2; TS 36.213, clauses 16.4.3.1, 16.4.1.5, 16.4.1.5.1; and TS 36.306 clause 4.1C.

[TS 36.212, clause 6.4.3.1]

DCI format N0 is used for the scheduling of NPUSCH in one UL cell.

The following information is transmitted by means of the DCI format N0:

- Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1
- Subcarrier indication – 6 bits as defined in section 16.5.1.1 of [3]
- Resource assignment – 3 bits as defined in section 16.5.1.2 of [3]
- Scheduling delay – 2 bits as defined in section 16.5.1 of [3]
- Modulation and coding scheme – 4 bits as defined in section 16.5.1.2 of [3]
- Redundancy version – 1 bit as defined in section 16.5.1.2 of [3]

- Repetition number – 3 bits as defined in section 16.5.1.2 of [3]
- New data indicator – 1 bit
- DCI subframe repetition number – 2 bits as defined in section 16.6 in [3]

[TS 36.212, clause 6.4.3.2]

DCI format N1 is used for the scheduling of one NPDSCH codeword in one cell and random access procedure initiated by a NPDCCH order. The DCI corresponding to a NPDCCH order is carried by NPDCCH.

The following information is transmitted by means of the DCI format N1:

- Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1
- NPDCCH order indicator – 1 bit

Format N1 is used for random access procedure initiated by a NPDCCH order only if NPDCCH order indicator is set to '1', format N1 CRC is scrambled with C-RNTI, and all the remaining fields are set as follows:

- Starting number of NPRACH repetitions – 2 bits as defined in section 16.3.1 of [3]
- Subcarrier indication of NPRACH – 6 bits as defined in section 16.3.1 of [3]
- All the remaining bits in format N1 are set to one

Otherwise,

- Scheduling delay – 3 bits as defined in section 16.4.1 of [3]
- Resource assignment – 3 bits as defined in section 16.4.1.3 of [3]
- Modulation and coding scheme – 4 bits as defined in section 16.4.1.5 of [3]
- Repetition number – 4 bits as defined in section 16.4.1.3 of [3]
- New data indicator – 1 bit
- HARQ-ACK resource – 4 bits as defined in section 16.4.2 of [3].
- DCI subframe repetition number – 2 bits as defined in section 16.6 in [3]

When the format N1 CRC is scrambled with a RA-RNTI, then the following fields among the fields above are reserved:

- New data indicator
- HARQ-ACK resource

If the number of information bits in format N1 is less than that of format N0, zeros shall be appended to format N1 until the payload size equals that of format N0.

[TS 36.306, clause 4.1C]

The field *ue-Category-NB* defines a combined uplink and downlink capability in NB-IoT. The parameters set by the UE Category are defined in subclause 4.2. Tables 4.1C-1 and 4.1C-2 define the downlink and, respectively, uplink physical layer parameter values for each UE Category.

Table 4.1C-1: Downlink physical layer parameter values set by the field *ue-Category-NB*

UE Category	Maximum number of DL-SCH transport block bits received within a TTI	Maximum number of bits of a DL-SCH transport block received within a TTI	Total number of soft channel bits
Category NB1	680	680	2112

Table 4.1C-2: Uplink physical layer parameter values set by the field *ue-Category-NB*

UE Category	Maximum number of UL-SCH transport block bits transmitted within a TTI	Maximum number of bits of an UL-SCH transport block transmitted within a TTI
Category NB1	1000	1000

[TS 36.213, clause 16.4.1.3]

The resource allocation information in DCI format N1, N2 (paging) for NPDSCH indicates to a scheduled UE

- a number of subframes (N_{SF}) determined by the resource assignment field (I_{SF}) in the corresponding DCI according to Table 16.4.1.3-1.
- a repetition number (N_{Rep}) determined by the repetition number field (I_{Rep}) in the corresponding DCI according to Table 16.4.1.3-2.

Table 16.4.1.3-1: Number of subframes (N_{SF}) for NPDSCH

9	256
10	384
11	512
12	768
13	1024
14	1536
15	2048

The number of repetitions for the NPDSCH carrying *SystemInformationBlockType1-NB* is determined based on the parameter *schedulingInfoSIB1* configured by higher-layers and according to Table 16.4.1.3-3.

[TS 36.213, clause 16.4.1.5]

The UE shall use modulation order, $Q_m = 2$.

To determine the transport block size in the NPDSCH, the UE shall first,

- if NPDSCH carries SystemInformationBlockType1-NB
  - set I_{TBS} to the value of the parameter schedulingInfoSIB1 configured by higher-layers
- otherwise
  - read the 4-bit "modulation and coding scheme" field (I_{MCS}) in the DCI and set $I_{\mathrm{TBS}} = I_{\mathrm{MCS}}$.

and second,

- if NPDSCH carries SystemInformationBlockType1-NB
  - use subclause 16.4.1.5.2 for determining its transport block size.
- otherwise,
  - read the 3-bit "resource assignment" field (I_{SF}) in the DCI and determine its TBS by the procedure in subclause 16.4.1.5.1.

The NDI as signalled on NPDCCH, and the TBS, as determined above, shall be delivered to higher layers.

[TS 36.213, clause 16.4.1.5.1]

The TBS is given by the (I_{TBS} , I_{SF}) entry of Table 16.4.1.5.1-1. For the value of the higher layer parameter *operationModeInfo* set to '00' or '01', $0 \le I_{\mathrm{TBS}} \le 10$.

Table 16.4.1.5.1-1: Transport block size (TBS) table

10	144	328	504	680				
11	176	376	584					
12	208	440	680					

[TS 36.213, clause 16.5.1.1]

The resource allocation information in uplink DCI format N0 for NPUSCH transmission indicates to a scheduled UE

- a set of contiguously allocated subcarriers (n_{sc}) of a resource unit determined by the Subcarrier indication field in the corresponding DCI,
- a number of resource units (N_{RU}) determined by the resource assignment field in the corresponding DCI according to Table 16.5.1.1-2,
- a repetition number (N_{Rep}) determined by the repetition number field in the corresponding DCI according to Table 16.5.1.1-3.

The subcarrier spacing Δf of NPUSCH transmission is determined by the uplink subcarrier spacing field in the Narrowband Random Access Response Grant according to subclause 16.3.3.

For NPUSCH transmission with subcarrier spacing $\Delta f = 3.75\,\text{kHz}$, $n_{\text{sc}} = I_{sc}$ where I_{sc} is the subcarrier indication field in the DCI. $I_{sc} = 48, 49, \ldots, 63$ is reserved.

For NPUSCH transmission with subcarrier spacing $\Delta f = 15\,\text{kHz}$, the subcarrier indication field (I_{sc}) in the DCI determines the set of contiguously allocated subcarriers (n_{sc}) according to Table 16.5.1.1-1.

Table 16.5.1.1-1: Allocated subcarriers for NPUSCH with $\Delta f = 15\,\text{kHz}$

Subcarrier indication field (I_{sc})	Set of Allocated subcarriers (n_{sc})
0 – 11	I_{sc}
12-15	$3(I_{sc} - 12) + \{0,1,2\}$
16-17	$6(I_{sc} - 16) + \{0,1,2,3,4,5\}$
18	$\{0,1,2,3,4,5,6,7,8,9,10,11\}$
19-63	Reserved

1	2
2	4
3	8
4	16
5	32
6	64
7	128

[TS 36.213, clause 16.5.1.2]

To determine the modulation order, redundancy version and transport block size for the NPUSCH, the UE shall first

- read the “modulation and coding scheme” field (I_{MCS}) in the DCI, and
- read the “redundancy version” field (rv_{DCI}) in the DCI, and
- read the "resource assignment" field (I_{RU}) in the DCI, and
- compute the total number of allocated subcarriers ($N_{\text{sc}}^{\text{RU}}$), number of resource units (N_{RU}), and repetition number (N_{Rep}) according to subclause 16.5.1.1.

The UE shall use modulation order, $Q_m = 2$ if $N_{\text{sc}}^{\text{RU}} > 1$. The UE shall use I_{MCS} and Table 16.5.1.2-1 to determine the modulation order to use for NPUSCH if $N_{\text{sc}}^{\text{RU}} = 1$.

Table 16.5.1.2-1: Modulation and TBS index table for NPUSCH with $N_{\text{sc}}^{\text{RU}} = 1$

MCS Index I_{MCS}	Modulation Order Q_m	TBS Index I_{TBS}
0	1	0
1	1	2
2	2	1
3	2	3
4	2	4
5	2	5
6	2	6
7	2	7
8	2	8
9	2	9
10	2	10

NPUSCH is transmitted in N consecutive NB-IoT UL slots, n_i , $i=0,1,\ldots,N-1$. The redundancy version $rv_{\text{idx}}(j)$ of the NPUSCH transmission in j^{th} block of B consecutive NB-IoT UL slots n_i ,

$i = jB + b,\ b = 0,1,\ldots,B-1,\ j = 0,1,\ldots,\frac{N_{\text{Rep}}}{L} - 1,\quad B = LN_{\text{RU}}N_{\text{slots}}^{UL}$ is determined by, $rv_{\text{idx}}(j) = 2 \cdot \text{mod}\left(rv_{\text{DCI}} + j,\ 2\right)$, where $L = 1$ if $N_{\text{sc}}^{\text{RU}} = 1$, $L = \min\left(4, \left\lceil N_{\text{Rep}} / 2 \right\rceil\right)$ otherwise. Portion of NPUSCH codeword with $rv_{\text{idx}}(j)$ as defined in clause 6.3.2 in [4] mapped to slot $\left\lfloor \frac{b}{L} \right\rfloor$ of allocated N_{RU} resource unit(s) is transmitted in NB-IoT UL slots n_i

$i = jB + L\left\lfloor \frac{b}{L} \right\rfloor + l,\ l = 0,1,\ldots,L-1$. for $\Delta f = 3.75kHz$ and $i = jB + 2L\left\lfloor \frac{b}{2L} \right\rfloor + 2l + \text{mod}(\left\lfloor \frac{b}{L} \right\rfloor,\quad 2), l = 0,1,\ldots L-1$ for $\Delta f = 15kHz$.

The UE shall use (I_{TBS} , I_{RU}) and Table 16.5.1.2-2 to determine the TBS to use for the NPUSCH. I_{TBS} is given in Table 16.5.1.2.1-1 if $N_{\text{sc}}^{\text{RU}} = 1$, $I_{\text{TBS}} = I_{\text{MCS}}$ otherwise.

Table 16.5.1.2-2: Transport block size (TBS) table for NPUSCH

The NDI as signalled on NPDCCH, and the RV and TBS, as determined above, shall be delivered to higher layers.

22.3.1.6.3 Test description

22.3.1.6.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* using parameters as specified in TS 36.508 [18] Table 8.1.4.3.2-1 with condition "Standalone"
  NOTE: According to TS 36.213 [30] clause 16.4.1.5.1 for Inband Operation Mode I_{TBS} is restricted to $0 \le I_{TBS} \le 10$ i.e. I_{SF}/I_{MCS} combinations with I_{MCS} = 11, 12 could not be tested

UE:

None.

Preamble:

- UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G and according to [18] in Ncell 1.

22.3.1.6.3.2 Test procedure sequence

Table 22.3.1.6.3.2-3: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U – S	Message		
1	Void.	-	-	-	-
-	EXCEPTION: Steps 1 to 8 are repeated as per table 22.3.1.6.3.2-2 with values of I_{SF}, DL I_{MCS}, I_{RU} and UL I_{MCS}	-	-	-	-

2	SS looks up for TBS_{UL} in table 22.3.1.6.3.2-1 as per the execution counter	-	-	-	-
-	EXCEPTION: Steps 3 to 6 are performed for TBS_{UL}>56	-	-	-	-
3	SS creates one UL RLC SDU of size TBS_{UL}, embeds it in an ESM DATA TRANSPORT and DLInformationTransfer-NB and splits the resulting DL RLC SDU into three RLC AMD PDUs (if TBSDL < 100 bits) or two equal sized RLC AMD PDUs (if TBSDL > 100 bits) (NOTE 1)	-	-	-	-
3A	SS gets current timing and NPDCCH period *N* is the next NPDCCH period bundle which can be used by the SS for a DL transmission. (NOTE 3)	-	-	-	-
4	At NPDCCH period bundle *N+1* the SS sends a DCI format N1 and a MAC PDU containing an RLC AMD PDU with polling field 'P' set to '0' and containing the 1st AMD PDU of the RLC SDU created at step 3. (NOTE 3)	<--	DCI N1 format with I_{SF}, DL I_{MCS} MAC PDU with 1st AMD PDU of the DL RLC SDU	-	-
4A	IF TBS_{DL} < 100 bits At NPDCCH period bundle *N+2* the SS sends a DCI format N1 and a MAC PDU containing an RLC AMD PDU with polling field 'P' set to '0' and containing the 2nd AMD PDU of the RLC SDU created at step 3. (NOTE 3)	<--	DCI N1 format with I_{SF}, DL I_{MCS} MAC PDU with 2nd AMD PDU of the DL RLC SDU	-	-
4B	At NPDCCH period bundle *N+i* the SS sends a DCI format N1 and a MAC PDU containing an RLC AMD PDU with polling field 'P' set to '1' and containing the last AMD PDU of the RLC SDU created at step 3. Where i=3 if TBS_{DL} < 100 bits, otherwise i=2. (NOTE 2, (NOTE 3))	<--	DCI N1 format with I_{SF}, DL I_{MCS} MAC PDU with last AMD PDU of the DL RLC SDU	-	-
5	In the NPDCCH period bundle *N+3 (N+1 for NTN)* after the transmission at step 4B the SS allocates an uplink grant for the UL TBS according to 22.3.1.6.3.2-2. (NOTE3)	<--	(UL Grant) DCI N0 format with I_{RU} and UL I_{MCS}	-	-
6	CHECK: Does UE return an RLC SDU with the same content as created and embedded in the ESM DATA TRANSPORT at step 3 using the Resource unit Assignment and modulation and coding scheme as configured by the SS in step 5?	-->	MAC PDU containing RLC STATUS PDU and RLC AMD PDU with UL RLC SDU	1,2	P
7	The SS transmits an RLC STATUS PDU to acknowledge correctly received data	<--	RLC STATUS PDU	-	-
8	Void.			-	-
NOTE 1: DL RLC SDU with size n contains a *DLInformationTransfer-NB* with ESM_DATA_TRANSPORT:18 or 26 bits *DLInformationTransfer-NB (PER encode: '0000000000'B + 8 bits (length of DedicatedInfoNAS <= 127 bytes) or 16 bits length (128 bytes <= length of DedicatedInfoNAS < 16383 bytes))* 1/2 byte Protocol discriminator (SECURITY PROTECTED NAS MESSAGE)					

1/2 byte	Security header type (SECURITY PROTECTED NAS MESSAGE)
4 bytes	Message authentication code (SECURITY PROTECTED NAS MESSAGE)
1 byte	Sequence number (SECURITY PROTECTED NAS MESSAGE)
1/2 byte	Protocol discriminator (ESM_DATA_TRANSPORT)
1/2 byte	EPS bearer identity (ESM_DATA_TRANSPORT)
1 byte	Procedure transaction identity (ESM_DATA_TRANSPORT)
1 byte	ESM data transport message identity (ESM_DATA_TRANSPORT)
2 bytes	length indicator of the user data container (ESM_DATA_TRANSPORT)
N bytes	User data container contents (UL RLC SDU)
6 bits	Aligned bits (*PER encode*)
n = N+14 or N+15 bytes	DL RLC SDU
⇒ to achieve the maximum TBS in UL (1000 bits) the DL RLC SDU needs to be segmented	

NOTE 2: setting of the poll bit causes the UE to insert an RLC Status PDU in the UL message of step 6

NOTE 3: NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.1.6.3.3 Specific message contents

None.

22.3.1.6a NB-IoT / DL-SCH / UL-SCH transport block size selection / DCI format N1 / N0 / Category NB2

22.3.1.6a.1 Test Purpose (TP)

Same as 22.3.1.6.

22.3.1.6a.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.212, clause 6.4.3.1, 6.4.3.2; TS 36.213, clauses 16.4.3.1, 16.4.1.5, 16.4.1.5.1; and TS 36.306 clause 4.1C.

[TS 36.212, clause 6.4.3.1]

DCI format N0 is used for the scheduling of NPUSCH in one UL cell.

The following information is transmitted by means of the DCI format N0:

- Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1
- Subcarrier indication – 6 bits as defined in section 16.5.1.1 of [3]
- Resource assignment – 3 bits as defined in section 16.5.1.2 of [3]
- Scheduling delay – 2 bits as defined in section 16.5.1 of [3]
- Modulation and coding scheme – 4 bits as defined in section 16.5.1.2 of [3]
- Redundancy version – 1 bit as defined in section 16.5.1.2 of [3]
- Repetition number – 3 bits as defined in section 16.5.1.2 of [3]
- New data indicator – 1 bit
- DCI subframe repetition number – 2 bits as defined in section 16.6 in [3]
- HARQ process number – 1 bit. This field can only be present if 2 HARQ processes are configured and the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

[TS 36.212, clause 6.4.3.2]

DCI format N1 is used for the scheduling of one NPDSCH codeword in one cell, random access procedure initiated by a NPDCCH order, and notifying SC-MCCH change. The DCI corresponding to a NPDCCH order is carried by NPDCCH.

The following information is transmitted by means of the DCI format N1:

- If the format N1 CRC is scrambled by C-RNTI or RA-RNTI:
  - Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1
  - NPDCCH order indicator – 1 bit
- Else if the format N1 CRC is scrambled by a G-RNTI:
  - Information for SC-MCCH change notification – 2 bits as defined in section 5.8a of [6]

Format N1 is used for random access procedure initiated by a NPDCCH order only if NPDCCH order indicator is set to '1', format N1 CRC is scrambled with C-RNTI, and all the remaining fields are set as follows:

- Starting number of NPRACH repetitions – 2 bits as defined in section 16.3.2 of [3]
- Subcarrier indication of NPRACH – 6 bits as defined in section 16.3.2 of [3]
- Carrier indication of NPRACH – 4 bits as defined in section 16.3.2 of [3]. This field is only present if *ul-ConfigList* is configured and the UE indicates the *multiCarrier-NPRACH* capability.
- All the remaining bits in format N1 are set to one

Otherwise,

- Scheduling delay – 3 bits as defined in section 16.4.1 of [3]
- Resource assignment – 3 bits as defined in section 16.4.1.3 of [3]
- Modulation and coding scheme – 4 bits as defined in section 16.4.1.5 of [3]
- Repetition number – 4 bits as defined in section 16.4.1.3 of [3]
- New data indicator – 1 bit
- HARQ-ACK resource – 4 bits as defined in section 16.4.2 of [3].
- DCI subframe repetition number – 2 bits as defined in section 16.6 in [3]
- HARQ process number – 1 bit. This field can only be present if 2 HARQ processes are configured and the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

When the format N1 CRC is scrambled with a RA-RNTI or a G-RNTI, then the following fields among the fields above are reserved for RA-RNTI and not present for G-RNTI:

- New data indicator
- HARQ-ACK resource

If the number of information bits in format N1 is less than that of format N0 and the format N1 CRC is not scrambled by G-RNTI, zeros shall be appended to format N1 until the payload size equals that of format N0.

[TS 36.306, clause 4.1C]

The field *ue-Category-NB* defines a combined uplink and downlink capability in NB-IoT. The parameters set by the UE Category are defined in subclause 4.2. Tables 4.1C-1 and 4.1C-2 define the downlink and, respectively, uplink physical layer parameter values for each UE Category. A UE indicating Category NB2 shall also indicate Category NB1.

Table 4.1C-1: Downlink physical layer parameter values set by the field *ue-Category-NB*

UE Category	Maximum number of DL-SCH transport block bits received within a TTI	Maximum number of bits of a DL-SCH transport block received within a TTI	Total number of soft channel bits
Category NB1	680	680	2112
Category NB2	2536	2536	6400

Table 4.1C-2: Uplink physical layer parameter values set by the field *ue-Category-NB*

UE Category	Maximum number of UL-SCH transport block bits transmitted within a TTI	Maximum number of bits of an UL-SCH transport block transmitted within a TTI
Category NB1	1000	1000
Category NB2	2536	2536

[TS 36.213, clause 16.4.1.3]

The resource allocation information in DCI format N1, N2 (paging) for NPDSCH indicates to a scheduled UE

- a number of subframes (N_{SF}) determined by the resource assignment field (I_{SF}) in the corresponding DCI according to Table 16.4.1.3-1.

- a repetition number (N_{Rep}) determined by the repetition number field (I_{Rep}) in the corresponding DCI according to Table 16.4.1.3-2.

Table 16.4.1.3-1: Number of subframes (N_{SF}) for NPDSCH

I_{SF}	N_{SF}
0	1
1	2
2	3
3	4
4	5
5	6
6	8
7	10

3	8
4	16
5	32
6	64
7	128
8	192
9	256
10	384
11	512
12	768
13	1024
14	1536
15	2048

The number of repetitions for the NPDSCH carrying *SystemInformationBlockType1-NB* is determined based on the parameter *schedulingInfoSIB1* configured by higher-layers and according to Table 16.4.1.3-3.

[TS 36.213, clause 16.4.1.5]

The UE shall use modulation order, $Q_m = 2$.

To determine the transport block size in the NPDSCH, the UE shall first,

- if NPDSCH carriers SystemInformationBlockType1-NB
  - set I_{TBS} to the value of the parameter schedulingInfoSIB1 configured by higher-layers
- otherwise
  - read the 4-bit "modulation and coding scheme" field (I_{MCS}) in the DCI and set $I_{\mathrm{TBS}} = I_{\mathrm{MCS}}$.

and second,

- if NPDSCH carriers SystemInformationBlockType1-NB
  - use Subclause 16.4.1.5.2 for determining its transport block size.
- otherwise,
  - read the 3-bit "resource assignment" field (I_{SF}) in the DCI and determine its TBS by the procedure in Subclause 16.4.1.5.1.

For a NPDCCH UE-specific search space, if the UE is configured with higher layer parameter *twoHARQ-ProcessesConfig*

- the NDI and HARQ process ID as signalled on NPDCCH, and the TBS, as determined above, shall be delivered to higher layers,

otherwise

- the NDI as signalled on NPDCCH, and the TBS, as determined above, shall be delivered to higher layers. HARQ process ID of 0 shall be assumed.

[TS 36.213, clause 16.4.1.5.1]

The TBS is given by the (I_{TBS} , I_{SF}) entry of Table 16.4.1.5.1-1. For the value of the higher layer parameter *operationModeInfo* set to '00' or '01', $0 \le I_{\mathrm{TBS}} \le 10$.

Table 16.4.1.5.1-1: Transport block size (TBS) table

I_{TBS}	I_{SF}							
	0	**1**	**2**	**3**	**4**	**5**	**6**	**7**

13	224	488	744	1032	1256	1544	2024	2536

[TS 36.213, clause 16.5.1.1]

The resource allocation information in uplink DCI format N0 for NPUSCH transmission indicates to a scheduled UE

- a set of contiguously allocated subcarriers (n_{sc}) of a resource unit determined by the Subcarrier indication field in the corresponding DCI,
- a number of resource units (N_{RU}) determined by the resource assignment field in the corresponding DCI according to Table 16.5.1.1-2,
- a repetition number (N_{Rep}) determined by the repetition number field in the corresponding DCI according to Table 16.5.1.1-3.

The subcarrier spacing Δf of NPUSCH transmission is determined by the uplink subcarrier spacing field in the Narrowband Random Access Response Grant according to Subclause 16.3.3.

For NPUSCH transmission with subcarrier spacing $\Delta f = 3.75\,\text{kHz}$, $n_{\text{sc}} = I_{sc}$ where I_{sc} is the subcarrier indication field in the DCI. $I_{sc} = 48,49,\ldots,63$ is reserved.

For NPUSCH transmission with subcarrier spacing $\Delta f = 15\,\text{kHz}$, the subcarrier indication field (I_{sc}) in the DCI determines the set of contiguously allocated subcarriers (n_{sc}) according to Table 16.5.1.1-1.

Table 16.5.1.1-1: Allocated subcarriers for NPUSCH with $\Delta f = 15\,\text{kHz}$

Subcarrier indication field (I_{sc})	Set of Allocated subcarriers (n_{sc})
0 – 11	I_{sc}
12-15	$3(I_{sc} - 12) + \{0,1,2\}$
16-17	$6(I_{sc} - 16) + \{0,1,2,3,4,5\}$
18	$\{0,1,2,3,4,5,6,7,8,9,10,11\}$
19-63	Reserved

Table 16.5.1.1-2: Number of resource units (N_{RU}) for NPUSCH

2	4
3	8
4	16
5	32
6	64
7	128

[TS 36.213, clause 16.5.1.2]

To determine the modulation order, redundancy version and transport block size for the NPUSCH, the UE shall first

- read the "modulation and coding scheme" field (I_{MCS}) in the DCI, and
- read the "redundancy version" field (rv_{DCI}) in the DCI, and
- read the "resource assignment" field (I_{RU}) in the DCI, and
- compute the total number of allocated subcarriers ($N_{\mathrm{sc}}^{\mathrm{RU}}$), number of resource units (N_{RU}), and repetition number (N_{Rep}) according to Subclause 16.5.1.1.

The UE shall use modulation order, $Q_m = 2$ if $N_{\mathrm{sc}}^{\mathrm{RU}} > 1$. The UE shall use I_{MCS} and Table 16.5.1.2-1 to determine the modulation order to use for NPUSCH if $N_{\mathrm{sc}}^{\mathrm{RU}} = 1$.

Table 16.5.1.2-1: Modulation and TBS index table for NPUSCH with $N_{\mathrm{sc}}^{\mathrm{RU}} = 1$

MCS Index I_{MCS}	Modulation Order Q_m	TBS Index I_{TBS}
0	1	0
1	1	2
2	2	1
3	2	3
4	2	4
5	2	5
6	2	6
7	2	7
8	2	8
9	2	9
10	2	10

NPUSCH is transmitted in N consecutive NB-IoT UL slots, n_i , $i=0,1,\ldots,N-1$. The redundancy version $rv_{\mathrm{idx}}(j)$ of the NPUSCH transmission in j^{th} block of B consecutive NB-IoT UL slots n_i ,

$i = jB + b,\ b = 0,1,\ldots,B-1,\ j = 0,1,\ldots,\frac{N_{\mathrm{Rep}}}{L} - 1,\quad B = LN_{\mathrm{RU}}N_{\mathrm{slots}}^{UL}$ is determined by, $rv_{\mathrm{idx}}(j) = 2 \cdot \mathrm{mod}\left(rv_{\mathrm{DCI}} + j,\ 2\right)$, where $L = 1$ if $N_{\mathrm{sc}}^{\mathrm{RU}} = 1$, $L = \min\left(4, \left\lceil N_{\mathrm{Rep}} / 2 \right\rceil\right)$ otherwise. Portion of NPUSCH codeword with $rv_{\mathrm{idx}}(j)$ as defined in clause 6.3.2 in [4] mapped to slot $\left\lfloor \frac{b}{L} \right\rfloor$ of allocated N_{RU} resource unit(s) is transmitted in NB-IoT UL slots n_i

$i = jB + L\left\lfloor \frac{b}{L} \right\rfloor + l,\ l = 0,1,\ldots,L-1$ for $\Delta f = 3.75kHz$ and $i = jB + 2L\left\lfloor \frac{b}{2L} \right\rfloor + 2l + \mathrm{mod}(\left\lfloor \frac{b}{L} \right\rfloor,\quad 2), l = 0,1,\ldots L-1$ for $\Delta f = 15kHz$

The UE shall use (I_{TBS} , I_{RU}) and Table 16.5.1.2-2 to determine the TBS to use for the NPUSCH. I_{TBS} is given in Table 16.5.1.2-1 if $N_{\mathrm{sc}}^{\mathrm{RU}} = 1$, $I_{\mathrm{TBS}} = I_{\mathrm{MCS}}$ otherwise.

Table 16.5.1.2-2: Transport block size (TBS) table for NPUSCH

13	224	488	744	1032	1256	1544	2024	2536

For a NPDCCH UE-specific search space, if the UE is configured with higher layer parameter *twoHARQ-ProcessesConfig*

- the NDI and HARQ process ID as signalled on NPDCCH, and the RV and TBS, as determined above, shall be delivered to higher layers,

otherwise

- the NDI as signalled on NPDCCH, and the RV and TBS, as determined above, shall be delivered to higher layers.

22.3.1.6a.3 Test description

22.3.1.6a.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* using parameters as specified in TS 36.508 [18] Table 8.1.4.3.2-1 with condition "Standalone"
  NOTE: According to TS 36.213 [30] clause 16.4.1.5.1 for Inband Operation Mode I_{TBS} is restricted to $0 \leq I_{TBS} \leq 10$ i.e. I_{SF}/I_{MCS} combinations with I_{MCS} = 11, 12 could not be tested

UE:

None.

Preamble:

- UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G and according to [18] in Ncell 1.

22.3.1.6a.3.2 Test procedure sequence

Table 22.3.1.6a.3.2-1: RLC SDU size used as test data

UE Category	TBS_{UL} [bits]	UL RLC SDU size [bits]

None.

22.3.1.7 NB-IoT / RACH Procedure / Contention free random access (CFRA)

22.3.1.7.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state and ra-CFRA-Config is configured and timeAlignmentTimer has
expired }
ensure that {
  when { SS sends NPDCCH order to the C-RNTI assigned to UE and ra-PreambleIndex signalled is not
000000 }
```

```
    then { UE sends a prach preamble calculated by given ra-PreambleIndex in the NPDCCH Order and
parameters in currently used PRACH resource }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state and ra-CFRA-Config is configured, has transmitted PRACH
Preamble after reception of PDCCH order with ra-PreambleIndex not set to 000000 }
ensure that {
  when { UE receives a Random Access response containing a RAPID corresponding to the UE in RA
Response window }
   then { UE considers the Random Access procedure successfully completed }
            }
```

22.3.1.7.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clause 5.1.1, 5.1.2, 5.1.4; TS 36.312, clause 6.4.3.2.

[TS 36.321, clause 5.1.1]

The Random Access procedure described in this subclause is initiated by a PDCCH order, by the MAC sublayer itself or by the RRC sublayer. Random Access procedure on an SCell shall only be initiated by a PDCCH order. If a MAC entity receives a PDCCH transmission consistent with a PDCCH order [5] masked with its C-RNTI, and for a specific Serving Cell, the MAC entity shall initiate a Random Access procedure on this Serving Cell. For Random Access on the SpCell a PDCCH order or RRC optionally indicate the *ra-PreambleIndex* and the *ra-PRACH-MaskIndex*, except for NB-IoT where the subcarrier index is indicated; and for Random Access on an SCell, the PDCCH order indicates the *ra-PreambleIndex* with a value different from 000000 and the *ra-PRACH-MaskIndex*. For the pTAG preamble transmission on PRACH and reception of a PDCCH order are only supported for SpCell. If the UE is an NB-IoT UE, the Random Access procedure is performed on the anchor carrier or one of the non-anchor carriers for which PRACH resource has been configured in system information.

…

The following information for related Serving Cell is assumed to be available before the procedure can be initiated for NB-IoT UEs, BL UEs or UEs in enhanced coverage [8]:

…

- for NB-IoT, the use of contention free random access *ra-CFRA-Config*.

[TS 36.321, clause 5.1.2]

The Random Access Resource selection procedure shall be performed as follows:

- For BL UEs or UEs in enhanced coverage, select the PRACH resource set corresponding to the selected enhanced coverage level.
- If, except for NB-IoT, *ra-PreambleIndex* (Random Access Preamble) and *ra-PRACH-MaskIndex* (PRACH Mask Index) have been explicitly signalled and *ra-PreambleIndex* is not 000000:
    - the Random Access Preamble and the PRACH Mask Index are those explicitly signalled;
- else, for NB-IoT, if *ra-PreambleIndex* (Random Access Preamble) and PRACH resource have been explicitly signalled:
    - the PRACH resource is that explicitly signalled;
    - if the *ra-PreambleIndex* signalled is not 000000:
        - if *ra-CFRA-Config* is configured:
            - the Random Access Preamble is set to nprach-SubcarrierOffset + nprach-NumCBRA-StartSubcarriers + (ra-PreambleIndex modulo (nprach-NumSubcarriers - nprach-NumCBRA-StartSubcarriers)), where nprach-SubcarrierOffset, nprach-NumCBRA-StartSubcarriers and nprach-NumSubcarriers are parameters in the currently used PRACH resource.

- else:
    - the Random Access Preamble is set to *nprach-SubcarrierOffset* + (*ra-PreambleIndex* modulo *nprach-NumSubcarriers*), where *nprach-SubcarrierOffset* and *nprach-NumSubcarriers* are parameters in the currently used PRACH resource.
- else:
    - select the Random Access Preamble group according to the PRACH resource and the support for multi-tone Msg3 transmission. A UE supporting multi-tone Msg3 shall only select the single-tone Msg3 Random Access Preambles group if there is no multi-tone Msg3 Random Access Preambles group.
    - randomly select a Random Access Preamble within the selected group.
- else the Random Access Preamble shall be selected by the MAC entity as follows:

…

[TS 36.321, clause 5.1.4]

The MAC entity may stop monitoring for Random Access Response(s) after successful reception of a Random Access Response containing Random Access Preamble identifiers that matches the transmitted Random Access Preamble.

- If a downlink assignment for this TTI has been received on the PDCCH for the RA-RNTI and the received TB is successfully decoded, the MAC entity shall regardless of the possible occurrence of a measurement gap or a Sidelink Discovery Gap for Transmission or a Sidelink Discovery Gap for Reception, and regardless of the prioritization of V2X sidelink communication described in subclause 5.14.1.2.2:
    - if the Random Access Response contains a Backoff Indicator subheader:
        - set the backoff parameter value as indicated by the BI field of the Backoff Indicator subheader and Table 7.2-1, except for NB-IoT where the value from Table 7.2-2 is used.
    - else, set the backoff parameter value to 0 ms.
    - if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble (see subclause 5.1.3), the MAC entity shall:
        - consider this Random Access Response reception successful and apply the following actions for the serving cell where the Random Access Preamble was transmitted:
            - process the received Timing Advance Command (see subclause 5.2);
            - indicate the *preambleInitialReceivedTargetPower* and the amount of power ramping applied to the latest preamble transmission to lower layers (i.e., (PREAMBLE_TRANSMISSION_COUNTER – 1) * *powerRampingStep*);
            - if the SCell is configured with *ul-Configuration-r14*, ignore the received UL grant otherwise process the received UL grant value and indicate it to the lower layers;
        - if, except for NB-IoT, *ra-PreambleIndex* was explicitly signalled and it was not 000000 (i.e., not selected by MAC):
            - consider the Random Access procedure successfully completed.
        - else if, the UE is an NB-IoT UE, *ra-PreambleIndex* was explicitly signalled and it was not 000000 (i.e., not selected by MAC) and *ra-CFRA-Config* is configured:
            - consider the Random Access procedure successfully completed.
            - the UL grant provided in the Random Access Response message is valid only for the configured carrier.
        - else:
            - if the Random Access Preamble was selected by the MAC entity; or

- if the UE is an NB-IoT UE, the *ra-PreambleIndex* was explicitly signalled and it was not 000000 and *ra-CFRA-Config* is not configured:
    - set the Temporary C-RNTI to the value received in the Random Access Response message no later than at the time of the first transmission corresponding to the UL grant provided in the Random Access Response message;
    - if this is the first successfully received Random Access Response within this Random Access procedure:
        - if the transmission is not being made for the CCCH logical channel, indicate to the Multiplexing and assembly entity to include a C-RNTI MAC control element in the subsequent uplink transmission;
        - obtain the MAC PDU to transmit from the "Multiplexing and assembly" entity and store it in the Msg3 buffer.

NOTE: When an uplink transmission is required, e.g., for contention resolution, the eNB should not provide a grant smaller than 56 bits (or 88 bits for NB-IoT) in the Random Access Response.

NOTE: If within a Random Access procedure, an uplink grant provided in the Random Access Response for the same group of Random Access Preambles has a different size than the first uplink grant allocated during that Random Access procedure, the UE behaviour is not defined.

[TS 36.312, clause 6.4.3.2]

DCI format N1 is used for the scheduling of one NPDSCH codeword in one cell, random access procedure initiated by a NPDCCH order, and notifying SC-MCCH change. The DCI corresponding to a NPDCCH order is carried by NPDCCH.

The following information is transmitted by means of the DCI format N1:

- If the format N1 CRC is scrambled by C-RNTI or RA-RNTI:
    - Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1
    - NPDCCH order indicator – 1 bit
- Else if the format N1 CRC is scrambled by a G-RNTI:
    - Information for SC-MCCH change notification – 2 bits as defined in section 5.8a of [6]

Format N1 is used for random access procedure initiated by a NPDCCH order only if NPDCCH order indicator is set to '1', format N1 CRC is scrambled with C-RNTI, and all the remaining fields are set as follows:

- Starting number of NPRACH repetitions – 2 bits as defined in section 16.3.2 of [3]
- Subcarrier indication of NPRACH – 6 bits as defined in section 16.3.2 of [3]
- Carrier indication of NPRACH – 4 bits as defined in section 16.3.2 of [3]. This field is only present if *ul-ConfigList* is configured and the UE indicates the *multiCarrier-NPRACH* capability.
- All the remaining bits in format N1 are set to one

Otherwise,

- Scheduling delay – 3 bits as defined in section 16.4.1 of [3]
- Resource assignment – 3 bits as defined in section 16.4.1.3 of [3]
- Modulation and coding scheme – 4 bits as defined in section 16.4.1.5 of [3]
- Repetition number – 4 bits as defined in section 16.4.1.3 of [3]
- New data indicator – 1 bit

- HARQ-ACK resource – 4 bits as defined in section 16.4.2 of [3].
- DCI subframe repetition number – 2 bits as defined in section 16.6 in [3]
- HARQ process number – 1 bit. This field can only be present if 2 HARQ processes are configured and the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

When the format N1 CRC is scrambled with a RA-RNTI or a G-RNTI, then the following fields among the fields above are reserved for RA-RNTI and not present for G-RNTI:

- New data indicator
- HARQ-ACK resource

If the number of information bits in format N1 is less than that of format N0 and the format N1 CRC is not scrambled by G-RNTI, zeros shall be appended to format N1 until the payload size equals that of format N0.

22.3.1.7.3 Test description

22.3.1.7.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- The UE shall be in Connected Mode State 2-NB according to TS 36.508 [18].

22.3.1.7.3.2 Test procedure sequence

22.3.1.8 NB-IoT / RACH Procedure / Non-anchor carrier

22.3.1.8.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_IDLE state and SystemInformationBlockType22-NB with IE nprach-
ParametersList-r14 is broadcast }
ensure that {
  when { UE has need to send a CCCH UL MAC PDU and UE is in enhanced coverage level 0}
    then { UE transmits a random access preamble repeated numRepetitionsPerPreambleAttempt from
Random Access Preambles group using the non-anchor NPRACH resource corresponding to enhanced
coverage level 0}
          }
```

22.3.1.8.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 5.1.1.

[TS 36.321, clause 5.1.1]

…

- if the UE is an NB-IoT UE:
  - the available set of PRACH resources supported in the Serving Cell on the anchor carrier, *nprach-ParametersList*, and on the non-anchor carriers, in *ul-ConfigList*.
  - for EDT, the available set of PRACH resources associated with EDT on anchor carrier, *nprach-ParametersList-EDT*, and on the non-anchor carriers, in *ul-ConfigList*.
  - for random access resource selection and preamble transmission:
    - a PRACH resource is mapped into an enhanced coverage level.
    - each PRACH resource contains a set of *nprach-NumSubcarriers* subcarriers which can be partitioned into one or two groups for single/multi-tone Msg3 transmission by *nprach-SubcarrierMSG3-RangeStart* and *nprach-NumCBRA-StartSubcarriers* as specified in TS 36.211 [7, 10.1.6.1]. Each group is referred to as a Random Access Preamble group below in the procedure text.
      - a subcarrier is identified by the subcarrier index in the range: [*nprach-SubcarrierOffset*, *nprach-SubcarrierOffset* + *nprach-NumSubcarriers* -1]
      - each subcarrier of a Random Access Preamble group corresponds to a Random Access Preamble.
    - when the subcarrier index is explicitly sent from the eNB as part of a PDCCH order *ra-PreambleIndex* shall be set to the signalled subcarrier index.
  - the mapping of the PRACH resources into enhanced coverage levels is determined according to the following:
    - the number of enhanced coverage levels is equal to one plus the number of RSRP thresholds present in *rsrp-ThresholdsPrachInfoList*.
    - each enhanced coverage level has one anchor carrier PRACH resource present in *nprach-ParametersList* and zero or one PRACH resource for each non-anchor carrier signalled in *ul-ConfigList*.
    - for EDT, each enhanced coverage level has zero or one anchor carrier PRACH resource present in *nprach-ParametersList-EDT* and zero or one PRACH resource for each non-anchor carrier signalled in *ul-ConfigList*.
    - enhanced coverage levels are numbered from 0 and the mapping of PRACH resources to enhanced coverage levels are done in increasing *numRepetitionsPerPreambleAttempt* order.
    - when multiple carriers provide PRACH resources for the same enhanced coverage level, the UE will randomly select one of them using the following selection probabilities:
      - the selection probability of the anchor carrier PRACH resource for the given enhanced coverage level, *nprach-ProbabilityAnchor*, is given by the corresponding entry in *nprach-ProbabilityAnchorList*
      - the selection probability is equal for all non-anchor carrier PRACH resources and the probability of selecting one PRACH resource on a given non-anchor carrier is (1- *nprach-ProbabilityAnchor*)/(number of non-anchor NPRACH resources)

22.3.1.8.3 Test description

22.3.1.8.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

  NB-IoT Operation Mode set to standalone

- System information combination 6 as defined in TS 36.508[18] clause 8.1.4.3.1.1.

22.3.1.9 NB-IoT / Correct HARQ process / 2 HARQ processes

22.3.1.9.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state and twoHARQ-ProcessesConfig configured }
ensure that {
  when { the UE receives MAC PDUs for 2 HARQ processes and results in successful decode }
    then { the UE transmits ACKs for the corresponding HARQ processes }
           }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state and twoHARQ-ProcessesConfig configured }
ensure that {
  when { UE receives uplink grants on NPDCCH for 2 HARQ processes respectively }
    then { UE transmits uplink MAC PDUs on the resources indicated by the UL grants addressed to the
corresponding HARQ processes }
           }
```

22.3.1.9.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 5.3.2.1and clauses 5.4.2.1.

[TS 36.321, clause 5.3.2.1]

…

In addition to the broadcast HARQ process, NB-IoT has one or two DL HARQ processes.

[TS 36.321, clause 5.4.2.1]

There is one HARQ entity at the MAC entity for each Serving Cell with configured uplink, which maintains a number of parallel HARQ processes allowing transmissions to take place continuously while waiting for the HARQ feedback on the successful or unsuccessful reception of previous transmissions.

The number of parallel HARQ processes per HARQ entity is specified in [2], clause 8. NB-IoT has one or two UL HARQ processes.

22.3.1.9.3 Test description

22.3.1.9.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- The UE shall be in State 2B-NB with test loop mode G (CP CIoT Optimisation) according to TS 36.508 [18].

22.3.1.9.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as:

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024.

Table 22.3.1.9.3.2-1: Main behaviour

22.3.1.10 NB-IoT / RACH Procedure / Early contention resolution

22.3.1.10.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_IDLE state }
ensure that {
  when { UE has sent a CCCH UL MAC PDU with earlyContentionResolution is set to TRUE and UE receive
a PDCCH transmission addressed to its Temporary C-RNTI contains a UE Contention Resolution Identity
MAC control element matches the 48 first bits of the CCCH SDU transmitted in Msg3}
    then { UE considers this Contention Resolution successful }
           }
```

22.3.1.10.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.300, clause 10.1.5.1; TS 36.321, clauses 5.1.5, TS 36.331, clauses 5.3.3.3.

[TS 36.300, clause 10.1.5.1]

Contention Resolution on DL:

- Early contention resolution shall be used i.e. eNB does not wait for NAS reply before resolving contention;
- For NB-IoT, for initial access, RRC connection resume procedure and RRC Connection Re-establishment procedure, eNB may transmit MAC PDU containing the UE contention resolution identity MAC control element without RRC response message;

NOTE: In Release 13, NB-IoT UEs do not support the MAC PDU containing the UE contention resolution identity MAC control element without RRC response message for initial access, RRC connection resume procedure and RRC Connection Re-establishment procedure.

- Not synchronised with message 3;
- HARQ is supported;
- Addressed to:
  - The Temporary C-RNTI on PDCCH for initial access and after radio link failure;
  - The C-RNTI on PDCCH for UE in RRC_CONNECTED.
- HARQ feedback is transmitted only by the UE which detects its own UE identity, as provided in message 3, echoed in the Contention Resolution message;

- For initial access, RRC Connection Re-establishment procedure and EDT for Control Plane CIoT EPS Optimizations, no segmentation is used (RLC-TM).

[TS 36.321, clause 5.1.5]

Contention Resolution is based on either C-RNTI on PDCCH of the SpCell or UE Contention Resolution Identity on DL-SCH.

Once Msg3 is transmitted, the MAC entity shall:

- except for a BL UE or a UE in enhanced coverage, or an NB-IoT UE, start *mac-ContentionResolutionTimer* and restart *mac-ContentionResolutionTimer* at each HARQ retransmission;
- for a BL UE or a UE in enhanced coverage, or an NB-IoT UE, start *mac-ContentionResolutionTimer* and restart *mac-ContentionResolutionTimer* at each HARQ retransmission of the bundle in the subframe containing the last repetition of the corresponding PUSCH transmission;
- regardless of the possible occurrence of a measurement gap or Sidelink Discovery Gap for Reception, monitor the PDCCH until *mac-ContentionResolutionTimer* expires or is stopped;
- if notification of a reception of a PDCCH transmission is received from lower layers, the MAC entity shall:
  - if the C-RNTI MAC control element was included in Msg3:
    - if the Random Access procedure was initiated by the MAC sublayer itself or by the RRC sublayer and the PDCCH transmission is addressed to the C-RNTI and contains an UL grant for a new transmission; or
    - if the Random Access procedure was initiated by a PDCCH order and the PDCCH transmission is addressed to the C-RNTI:
      - consider this Contention Resolution successful;
      - stop *mac-ContentionResolutionTimer*;
      - discard the Temporary C-RNTI;
      - if the UE is an NB-IoT UE:
        - the UL grant or DL assignment contained in the PDCCH transmission is valid only for the configured carrier.
      - consider this Random Access procedure successfully completed.
  - else if the CCCH SDU was included in Msg3 and the PDCCH transmission is addressed to its Temporary C-RNTI:
    - if the MAC PDU is successfully decoded:
      - stop *mac-ContentionResolutionTimer*;
      - if the MAC PDU contains a UE Contention Resolution Identity MAC control element; and
      - if the UE Contention Resolution Identity included in the MAC control element matches the 48 first bits of the CCCH SDU transmitted in Msg3:
        - consider this Contention Resolution successful and finish the disassembly and demultiplexing of the MAC PDU;
        - set the C-RNTI to the value of the Temporary C-RNTI;
        - discard the Temporary C-RNTI;
        - consider this Random Access procedure successfully completed.
      - else
        - discard the Temporary C-RNTI;

- consider this Contention Resolution not successful and discard the successfully decoded MAC PDU.

[TS 36.331, clause 5.3.3.3]

The UE shall set the contents of *RRCConnectionRequest* message as follows:

…

1> if the UE is a NB-IoT UE:

2> if the UE supports multi-tone transmission, include *multiToneSupport*;

2> if the UE supports multi-carrier operation, include *multiCarrierSupport*;

2> if the UE supports DL channel quality reporting and *cqi-Reporting* is present in *SystemInformationBlockType2-NB*:

3> set the *cqi-NPDCCH* to include the latest results of the downlink channel quality measurements of the serving cell as specified in TS 36.133 [16];

NOTE 2: The downlink channel quality measurements may use measurement period T1 or T2, as defined in TS 36.133 [16]. In case period T2 is used the RRC-MAC interactions are left to UE implementation.

2> set *earlyContentionResolution* to TRUE;

22.3.1.10.3 Test description

22.3.1.10.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

22.3.1.11 NB-IoT / Scheduling Request / Without HARQ ACK

22.3.1.11.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state and with sr-WithoutHARQ-ACK-Config configured }
ensure that {
  when { PRACH resource for SR configured and UE has UL data available for transmission and UE has
no UL-SCH resources available and sr-ProhibitTimer is not running }
    then { the UE transmits a SR on one valid PRACH resource }
            }
```

22.3.1.11.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.321, clause 5.4.4, TS 36.213, clauses 16.2.1.2.1, 16.5.3 and TS 36.331, clause 5.3.10.18.

[TS 36.321, clause 5.4.4]

The Scheduling Request (SR) is used for requesting UL-SCH resources for new transmission.

When an SR is triggered, it shall be considered as pending until it is cancelled. All pending SR(s) shall be cancelled and sr-ProhibitTimer and ssr-ProhibitTimer shall be stopped when a MAC PDU is assembled and this PDU includes a BSR which contains buffer status up to (and including) the last event that triggered a BSR (see clause 5.4.5), or, if all pending SR(s) are triggered by Sidelink BSR, when a MAC PDU is assembled and this PDU includes a Sidelink BSR which contains buffer status up to (and including) the last event that triggered a Sidelink BSR (see clause 5.14.1.4), or, if all pending SR(s) are triggered by Sidelink BSR, when upper layers configure autonomous resource selection, or when the UL grant(s) can accommodate all pending data available for transmission.

…

As long as one SR is pending, the MAC entity shall for each TTI:

- if no UL-SCH resources are available for a transmission in this TTI:

  …

  - For NB-IoT:

    - if the MAC entity has no valid resource for SR together with acknowledgement of the data in this TTI and no valid PRACH resource for SR configured in any TTI:

      - initiate a Random Access Procedure (see clause 5.1), and cancel all pending SRs in the first subframe containing PRACH for preamble transmission.

    - else:

      - if the MAC entity has valid resource for SR together with acknowledgement of the data in this TTI:

        - instruct the physical layer to signal the SR together with acknowledgement of the data;

- cancel, if any, initiated Random Access Procedure for SR.

- else:

  - if the MAC entity has valid PRACH resource for SR configured in this TTI and *sr-ProhibitTimer* is not running:

    - instruct the physical layer to signal the SR on one valid PRACH resource for SR.

    - start the *sr-ProhibitTimer* in the subframe containing the last repetition of the corresponding SR transmission.

[TS 36.213, clauses 16.2.1.2.1]

If the UE is configured with higher layer parameter *sr-WithoutHARQ-ACK-Config*, the setting of the UE transmit power for SR transmission without HARQ-ACK is defined as follows.

The UE transmit power $P_{\mathrm{SR},c}(i)$ for SR transmission in NB-IoT UL slot *i* for the serving cell c is given by:

$$P_{\mathrm{SR,c}}(i)=\min\begin{Bmatrix}P_{\mathrm{CMAX},c}(i), \\ 10\log_{10}(M_{\mathrm{SR,c}}(i))+P_{\mathrm{O\_SR,c}}+\alpha_{\mathrm{c}}\cdot PL_c\end{Bmatrix} \quad [\mathrm{dBm}]$$

where,

- $P_{\mathrm{CMAX},c}(i)$ is the configured UE transmit power defined in [6] in NB-IoT UL slot *i* for serving cell c.

- $M_{\mathrm{SR,c}}(i)$ is {1/3} for NPRACH format 2 and {1}for NPRACH format 0/1.

- $P_{\mathrm{O\_SR,c}}$ is signalled from higher layers for serving cell c.

- α_{c} is signalled from higher layers for serving cell c.

- PL_c is defined in Subclause 16.2.1.1.1.

[TS 36.213, clause 16.5.3]

If the UE is configured with higher layer parameter *sr-WithoutHARQ-ACK-Config*, the UE is configured with Narrowband Random access channel parameters (NPRACH configuration) for SR transmission by higher layers.

The UE shall, if requested by higher layers for transmitting SR, start transmission of a narrowband random access preamble on the NB-IoT carrier configured in *sr-NPRACH-Resource* at the next available NPRACH resource, unless the transmission would overlap with any subframe(s) of NPDSCH reception. The narrowband preamble is transmitted on the allocated subcarrier and a number of NPRACH repetitions for the associated NPRACH repetition level as indicated by higher layers. The narrowband random access preamble is transmitted with transmission power as determined in subclause 16.2.1.2, commencing on the indicated NPRACH resource.

[TS 36.331, clause 5.3.10.18]

The UE shall:

1> apply *sr-WithHARQ-ACK-Config*, if included;

1> apply *sr-WithoutHARQ-ACK-Config*, if included;

1> apply *sr-SPS-BSR-Config*, if included;

22.3.1.11.3 Test description

22.3.1.11.3.1 Pre-test conditions

System Simulator:

- Ncell 1

UE:

None.

Preamble:

- The UE is in state 2B-NB with test loop mode G according to [18] on Ncell 1.

22.3.1.11.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non-zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as:

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.1.11.3.2-1: Main behaviour

22.3.1.12 NB-IoT / RACH Procedure / Non-anchor carrier / Preamble format 2

22.3.1.12.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_IDLE state and SystemInformationBlockType23-NB with IE nprach-
ParametersListFmt2-r15 is broadcast }
ensure that {
  when { UE has need to send a CCCH UL MAC PDU and UE is in enhanced coverage level 0}
    then { UE transmits a random access preamble repeated numRepetitionsPerPreambleAttempt from
Random Access Preambles group using the non-anchor NPRACH resource corresponding to enhanced
coverage level 0}
           }
```

22.3.1.12.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.321, clauses 5.1.1 and TS 36.331, clauses 5.2.2.4.

[TS 36.321, clause 5.1.1]

…

- if the UE is an NB-IoT UE:
  - the available set of PRACH resources supported in the Serving Cell on the anchor carrier, *nprach-ParametersList*, and on the non-anchor carriers, in *ul-ConfigList*.
  - for EDT, the available set of PRACH resources associated with EDT on anchor carrier, *nprach-ParametersList-EDT*, and on the non-anchor carriers, in *ul-ConfigList*.
  - for random access resource selection and preamble transmission:
    - a PRACH resource is mapped into an enhanced coverage level.
    - each PRACH resource contains a set of *nprach-NumSubcarriers* subcarriers which can be partitioned into one or two groups for single/multi-tone Msg3 transmission by *nprach-SubcarrierMSG3-RangeStart* and *nprach-NumCBRA-StartSubcarriers* as specified in TS 36.211 [7, 10.1.6.1]. Each group is referred to as a Random Access Preamble group below in the procedure text.
      - a subcarrier is identified by the subcarrier index in the range: [*nprach-SubcarrierOffset*, *nprach-SubcarrierOffset* + *nprach-NumSubcarriers* -1]
      - each subcarrier of a Random Access Preamble group corresponds to a Random Access Preamble.
    - when the subcarrier index is explicitly sent from the eNB as part of a PDCCH order *ra-PreambleIndex* shall be set to the signalled subcarrier index.
  - the mapping of the PRACH resources into enhanced coverage levels is determined according to the following:

- the number of enhanced coverage levels is equal to one plus the number of RSRP thresholds present in *rsrp-ThresholdsPrachInfoList*.
- each enhanced coverage level has one anchor carrier PRACH resource present in *nprach-ParametersList* and zero or one PRACH resource for each non-anchor carrier signalled in *ul-ConfigList*.
- for EDT, each enhanced coverage level has zero or one anchor carrier PRACH resource present in *nprach-ParametersList-EDT* and zero or one PRACH resource for each non-anchor carrier signalled in *ul-ConfigList*.
- enhanced coverage levels are numbered from 0 and the mapping of PRACH resources to enhanced coverage levels are done in increasing *numRepetitionsPerPreambleAttempt* order.
- when multiple carriers provide PRACH resources for the same enhanced coverage level, the UE will randomly select one of them using the following selection probabilities:
    - the selection probability of the anchor carrier PRACH resource for the given enhanced coverage level, *nprach-ProbabilityAnchor,* is given by the corresponding entry in *nprach-ProbabilityAnchorList*
    - the selection probability is equal for all non-anchor carrier PRACH resources and the probability of selecting one PRACH resource on a given non-anchor carrier is (1- *nprach-ProbabilityAnchor*)/(number of non-anchor NPRACH resources)

[TS 36.331, clauses 5.2.2.4]

…

1> if the NB-IoT UE supports NPRACH resources using preamble format 2:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType23-NB* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType23-NB*;

…

22.3.1.12.3 Test description

22.3.1.12.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

  NB-IoT Operation Mode set to standalone.

- System information combination 7 as defined in TS 36.508[18] clause 8.1.4.3.1.1.
- *SystemInformationBlockType2-NB* with specific information element contents as defined in Tables 22.3.1.12.3.3-1, 22.3.1.12.3.3-2 and 22.3.1.12.3.3-3, *SystemInformationBlockType22-NB* as specified in Table 22.3.1.12.3.3-4, *SystemInformationBlockType23-NB* as specified in Table 22.3.1.12.3.3-7.

UE:

None.

Preamble:

- UE is in state Registered, Idle Mode (state 3-NB) according to [18] in Ncell 1.

22.3.1.13 NB-IoT / NTN / UE specific TA report / UE specific Koffset

22.3.1.13.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state and ta-Report is configured with value enabled in
SystemInformationBlockType2-NB }
ensure that {
  when { during RRC Connection establishment procedure }
   then { UE performs the Timing Advance reporting procedure }
            }
```

(2)

```
with { UE in RRC_IDLE state and ta-Report is not configured in SystemInformationBlockType2-NB }
ensure that {
  when { RRCConnectionSetup-NB with offsetThresholdTA is received }
```

```
   then { UE performs the Timing Advance reporting procedure }
            }
```

(3)

```
with { UE in RRC_CONNECTED state and k-Offset is broadcasted in SystemInformationBlockType31-NB }
ensure that {
  when { Differential Koffset MAC CE is received }
   then { UE applies received Differential Koffset and performs transmission on NPUSCH  }
            }
```

22.3.1.13.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.331 clauses 5.3.3.2, TS 36.321 clauses 5.4.9, 5.26, 6.1.3.20 and 6.3.1.21. Unless otherwise stated these are Rel-17 requirements.

[TS 36.331, clause 5.3.3.2]

For NB-IoT, upon initiation of the procedure, the UE shall:

…

1> if UE supports timing advance reporting and *ta-Report* is included in *SystemInformationBlockType2-NB*:

2> instruct the associated MAC entity to trigger Timing Advance reporting;

[TS 36.321, clause 5.4.9]

The UE may be configured to report information about UE specific timing advance during a Random Access procedure and in RRC_CONNECTED Mode.

The Timing Advance reporting procedure is used in a non-terrestrial network to provide the eNB with an estimate of the UE's Timing Advance, see T_{TA} in TS 36.211 [7] clause 8.1.

Timing Advance reporting shall be triggered if any of the following events occur:

- if triggered by upper layers;
- upon configuration or reconfiguration of *offsetThresholdTA* by upper layers, if the UE has not previously reported Timing Advance value to current Serving Cell;
- if the variation between current information about Timing Advance and the last reported information about Timing Advance is equal to or larger than *offsetThresholdTA*, if configured.

If the Timing Advance reporting procedure determines that at least one Timing Advance Report has been triggered and not cancelled:

- if the MAC entity has UL resources allocated for new transmission for this TTI, and;
- if the allocated UL resources can accommodate the Timing Advance Report MAC control element plus its subheader, as a result of logical channel prioritization:
  - instruct the Multiplexing and Assembly procedure to generate the Timing Advance report MAC control element as defined in clause 6.1.3.20.

A MAC PDU shall contain at most one Timing Advance Report MAC CE, even when multiple events have triggered a Timing Advance report.

All triggered Timing Advance reports shall be cancelled when a Timing Advance Report MAC CE is included in a MAC PDU for transmission.

[TS 36.321, clause 5.26]

The network may provide and update the Differential Koffset of a Serving Cell in a non-terrestrial network by sending the Differential Koffset MAC CE described in clause 6.1.3.21.

The MAC entity shall:

- if the MAC entity receives a Differential Koffset MAC CE on a Serving Cell:
  - indicate to lower layers the information regarding the Differential Koffset MAC CE.

[TS 36.321, clause 6.1.3.20]

The Timing Advance MAC CE is identified by MAC subheader with LCID as specified in Table 6.2.1-2.

It has a fixed size and consists of a single field defined as follows (Figure 6.1.3.20-1):

- R: Reserved bit, set to 0;
- Timing Advance: The Timing Advance field indicates the least integer number of subframes greater than or equal to the Timing Advance value (see TS 36.211 [7] clause 8.1). The length of the field is 14 bits.

R	R	Timing Advance	Oct 1
Timing Advance			Oct 2

Figure 6.1.3.20-1: Timing Advance MAC CE

[TS 36.321, clause 6.1.3.21]

The Differential Koffset MAC CE is identified by MAC subheader with LCID as specified in Table 6.2.1-1.

It has a fixed size and consists of a single field defined as follows (Figure 6.1.3.21-1):

- R: Reserved bit, set to 0;
- Differential Koffset: This field contains the differential Koffset. The length of the field is 6 bits.

R	R	Differential Koffset	Oct 1

Figure 6.1.3.21-1: Differential Koffset MAC CE

22.3.1.13.3 Test description

22.3.1.13.3.1 Pre-test conditions

System Simulator:

- Ncell 1 is configured according to Table 8.1.4.2-1 and Table 8.1.4.2-2 in TS 36.508 [18].
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The preconfigured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble

- The UE is in state 1-NB according to TS 36.508 [18] clause 8.1.5.1.

22.3.1.13.3.2 Test procedure sequence

22.3.2.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clause 4.2.1.3.2 , 4.2.1.3.3, 5.1.3.1.1, 6.2.1.4, 6.2.2.3, 6.2.2.6 & 7.1. Unless otherwise stated these are Rel-13 requirements.

[TS 36.322, clause 4.2.1.3.2]

When the transmitting side of an AM RLC entity forms AMD PDUs from RLC SDUs, it shall:

- segment and/or concatenate the RLC SDUs so that the AMD PDUs fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity notified by lower layer.

The transmitting side of an AM RLC entity supports retransmission of RLC data PDUs (ARQ):

- if the RLC data PDU to be retransmitted does not fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity notified by lower layer, the AM RLC entity can re-segment the RLC data PDU into AMD PDU segments;

- the number of re-segmentation is not limited.

When the transmitting side of an AM RLC entity forms AMD PDUs from RLC SDUs received from upper layer or AMD PDU segments from RLC data PDUs to be retransmitted, it shall:

- include relevant RLC headers in the RLC data PDU.

[TS 36.322, clause 4.2.1.3.3]

When the receiving side of an AM RLC entity receives RLC data PDUs, it shall:

- detect whether or not the RLC data PDUs have been received in duplication, and discard duplicated RLC data PDUs;

- reorder the RLC data PDUs if they are received out of sequence;

- detect the loss of RLC data PDUs at lower layers and request retransmissions to its peer AM RLC entity;
- reassemble RLC SDUs from the reordered RLC data PDUs and deliver the RLC SDUs to upper layer in sequence.

At the time of RLC re-establishment, the receiving side of an AM RLC entity shall:

- if possible, reassemble RLC SDUs from the RLC data PDUs that are received out of sequence and deliver them to upper layer;
- discard any remaining RLC data PDUs that could not be reassembled into RLC SDUs;
- initialize relevant state variables and stop relevant timers.

[TS 36.322, clause 5.1.3.1.1]

The transmitting side of an AM RLC entity shall prioritize transmission of RLC control PDUs over RLC data PDUs. The transmitting side of an AM RLC entity shall prioritize retransmission of RLC data PDUs over transmission of new AMD PDUs.

The transmitting side of an AM RLC entity shall maintain a transmitting window according to state variables VT(A) and VT(MS) as follows:

- a SN falls within the transmitting window if VT(A) <= SN < VT(MS);
- a SN falls outside of the transmitting window otherwise.

The transmitting side of an AM RLC entity shall not deliver to lower layer any RLC data PDU whose SN falls outside of the transmitting window.

When delivering a new AMD PDU to lower layer, the transmitting side of an AM RLC entity shall:

- set the SN of the AMD PDU to VT(S), and then increment VT(S) by one.

The transmitting side of an AM RLC entity can receive a positive acknowledgement (confirmation of successful reception by its peer AM RLC entity) for a RLC data PDU by the following:

- STATUS PDU from its peer AM RLC entity.

When receiving a positive acknowledgement for an AMD PDU with SN = VT(A), the transmitting side of an AM RLC entity shall:

- set VT(A) equal to the SN of the AMD PDU with the smallest SN, whose SN falls within the range VT(A) <= SN <= VT(S) and for which a positive acknowledgment has not been received yet.
- if positive acknowledgements have been received for all AMD PDUs associated with a transmitted RLC SDU:
  - send an indication to the upper layers of successful delivery of the RLC SDU.

[TS 36.322, clause 6.2.1.4]

AMD PDU consists of a Data field and an AMD PDU header.

AMD PDU header consists of a fixed part (fields that are present for every AMD PDU) and an extension part (fields that are present for an AMD PDU when necessary). The fixed part of the AMD PDU header itself is byte aligned and consists of a D/C, a RF, a P, a FI, an E and a SN. The extension part of the AMD PDU header itself is byte aligned and consists of E(s) and LI(s).

An AM RLC entity is configured by RRC to use either a 10 bit SN or a 16 bit SN. The length of the fixed part of the AMD PDU header is two and three bytes respectively. The default values for SN field length used by an AM RLC entity is 10 bits.

An AMD PDU header consists of an extension part only when more than one Data field elements are present in the AMD PDU, in which case an E and a LI are present for every Data field element except the last. Furthermore, when an AMD PDU header consists of an odd number of LI(s) and the length of the LI field is 11 bits, four padding bits follow after the last LI. The default value for LI field length used by an AM RLC entity is 11 bits.

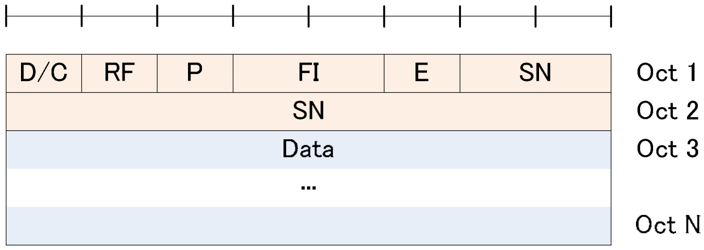

Figure 6.2.1.4-1: AMD PDU with 10 bit SN (length of LI field is 11 bits) (No LI)

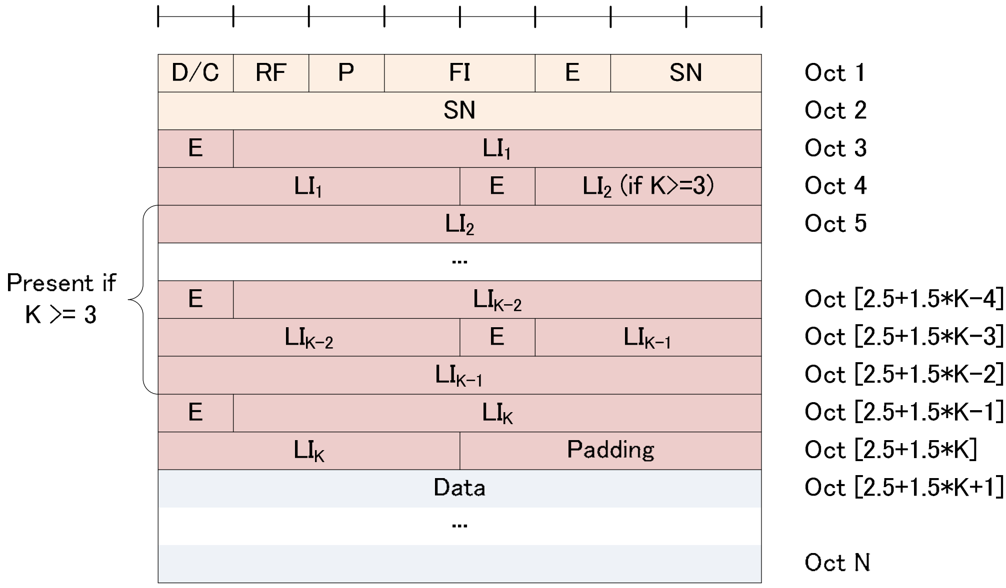
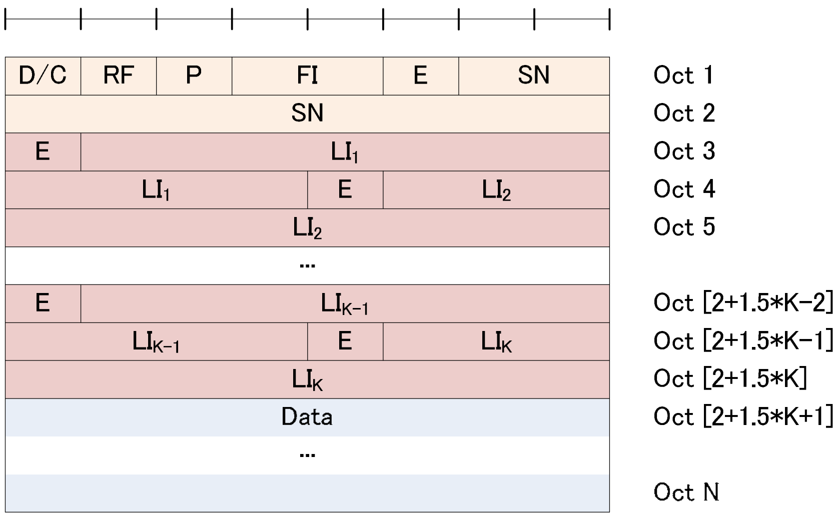


...

Figure 6.2.1.4-2: AMD PDU with 10 bit SN (length of LI field is 11 bits) (Odd number of LIs, i.e. K = 1, 3, 5, …)



...

Figure 6.2.1.4-3: AMD PDU with 10 bit SN (length of LI field is 11 bits) (Even number of LIs, i.e. K = 2, 4, 6, …)

...

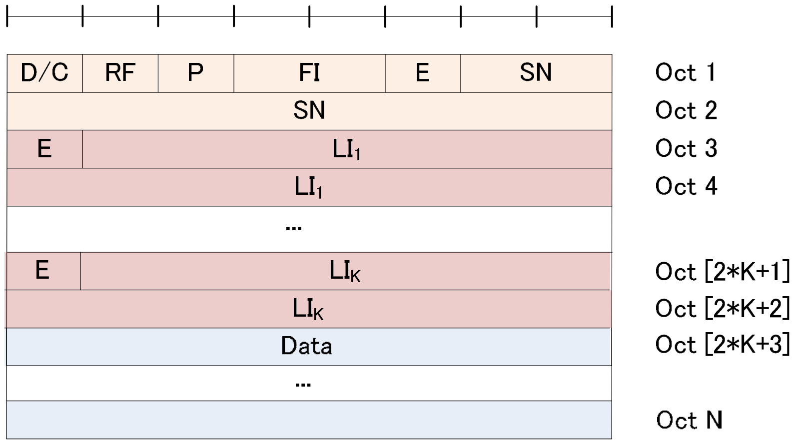


Figure 6.2.1.4-4: AMD PDU with 10 bit SN (length of LI field is 15 bits)

[TS 36.322, clause 6.2.2.3]

Length: 10 bits or 16 bits (configurable) for AMD PDU and AMD PDU segments. 5 bits or 10 bits (configurable) for UMD PDU.

The SN field indicates the sequence number of the corresponding UMD or AMD PDU. For an AMD PDU segment, the SN field indicates the sequence number of the original AMD PDU from which the AMD PDU segment was constructed from. The sequence number is incremented by one for every UMD or AMD PDU.

[TS 36.322, clause 6.2.2.6]

Length: 2 bits.

The FI field indicates whether a RLC SDU is segmented at the beginning and/or at the end of the Data field. Specifically, the FI field indicates whether the first byte of the Data field corresponds to the first byte of a RLC SDU, and whether the last byte of the Data field corresponds to the last byte of a RLC SDU. The interpretation of the FI field is provided in Table 6.2.2.6-1.

Table 6.2.2.6-1: FI field interpretation

Value	Description
00	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
01	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.
10	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
11	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.

[TS 36.322, clause 7.1]

This sub clause describes the state variables used in AM and UM entities in order to specify the RLC protocol. The state variables defined in this subclause are normative.

All state variables and all counters are non-negative integers.

All state variables related to AM data transfer can take values from 0 to 1023 for 10 bit SN or from 0 to 65535 for 16 bit SN. All arithmetic operations contained in the present document on state variables related to AM data transfer are affected by the AM modulus (i.e. final value = [value from arithmetic operation] modulo 1024 for 10 bit SN and 65536 for 16 bit SN).

All state variables related to UM data transfer can take values from 0 to [$2^{[sn\text{-}FieldLength]}$ – 1]. All arithmetic operations contained in the present document on state variables related to UM data transfer are affected by the UM modulus (i.e. final value = [value from arithmetic operation] modulo $2^{[sn\text{-}FieldLength]}$).

AMD PDUs and UMD PDUs are numbered integer sequence numbers (SN) cycling through the field: 0 to 1023 for 10 bit SN and 0 to 65535 for 16 bit SN for AMD PDU and 0 to [$2^{[sn\text{-}FieldLength]}$ – 1] for UMD PDU.

When performing arithmetic comparisons of state variables or SN values, a modulus base shall be used.

VT(A) and VR(R) shall be assumed as the modulus base at the transmitting side and receiving side of an AM RLC entity, respectively. This modulus base is subtracted from all the values involved, and then an absolute comparison is performed (e.g. VR(R) <= SN < VR(MR) is evaluated as [VR(R) – VR(R)] modulo 1024 <= [SN – VR(R)] modulo 1024 < [VR(MR) – VR(R)] modulo 1024).

VR(UH) – UM_Window_Size shall be assumed as the modulus base at the receiving side of an UM RLC entity. This modulus base is subtracted from all the values involved, and then an absolute comparison is performed (e.g. (VR(UH) – UM_Window_Size) <= SN < VR(UH) is evaluated as [(VR(UH) – UM_Window_Size) – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$ <= [SN – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$ < [VR(UH) – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$).

The transmitting side of each AM RLC entity shall maintain the following state variables:

a) VT(A) – Acknowledgement state variable

This state variable holds the value of the SN of the next AMD PDU for which a positive acknowledgment is to be received in-sequence, and it serves as the lower edge of the transmitting window. It is initially set to 0, and is updated whenever the AM RLC entity receives a positive acknowledgment for an AMD PDU with SN = VT(A).

b) VT(MS) – Maximum send state variable

This state variable equals VT(A) + AM_Window_Size, and it serves as the higher edge of the transmitting window.

c) VT(S) – Send state variable

This state variable holds the value of the SN to be assigned for the next newly generated AMD PDU. It is initially set to 0, and is updated whenever the AM RLC entity delivers an AMD PDU with SN = VT(S).

d) POLL_SN – Poll send state variable

This state variable holds the value of VT(S)-1 upon the most recent transmission of a RLC data PDU with the poll bit set to “1”. It is initially set to 0.

The transmitting side of each AM RLC entity shall maintain the following counters:

a) PDU_WITHOUT_POLL – Counter

This counter is initially set to 0. It counts the number of AMD PDUs sent since the most recent poll bit was transmitted.

b) BYTE_WITHOUT_POLL – Counter

This counter is initially set to 0. It counts the number of data bytes sent since the most recent poll bit was transmitted.

c) RETX_COUNT – Counter

This counter counts the number of retransmissions of an AMD PDU (see subclause 5.2.1). There is one RETX_COUNT counter per PDU that needs to be retransmitted.

The receiving side of each AM RLC entity shall maintain the following state variables:

a) VR(R) – Receive state variable

This state variable holds the value of the SN following the last in-sequence completely received AMD PDU, and it serves as the lower edge of the receiving window. It is initially set to 0, and is updated whenever the AM RLC entity receives an AMD PDU with SN = VR(R).

b) VR(MR) – Maximum acceptable receive state variable

This state variable equals VR(R) + AM_Window_Size, and it holds the value of the SN of the first AMD PDU that is beyond the receiving window and serves as the higher edge of the receiving window.

c) VR(X) – *t-Reordering* state variable

This state variable holds the value of the SN following the SN of the RLC data PDU which triggered *t-Reordering*.

d) VR(MS) – Maximum STATUS transmit state variable

This state variable holds the highest possible value of the SN which can be indicated by "ACK_SN" when a STATUS PDU needs to be constructed. It is initially set to 0.

e) VR(H) – Highest received state variable

This state variable holds the value of the SN following the SN of the RLC data PDU with the highest SN among received RLC data PDUs. It is initially set to 0.

Each transmitting UM RLC entity shall maintain the following state variables:

a) VT(US)

This state variable holds the value of the SN to be assigned for the next newly generated UMD PDU. It is initially set to 0, and is updated whenever the UM RLC entity delivers an UMD PDU with SN = VT(US).

Each receiving UM RLC entity shall maintain the following state variables:

a) VR(UR) – UM receive state variable

This state variable holds the value of the SN of the earliest UMD PDU that is still considered for reordering. It is initially set to 0. For RLC entity configured for STCH, it is initially set to the SN of the first received UMD PDU.

b) VR(UX) – UM *t-Reordering* state variable

This state variable holds the value of the SN following the SN of the UMD PDU which triggered *t-Reordering*.

c) VR(UH) – UM highest received state variable

This state variable holds the value of the SN following the SN of the UMD PDU with the highest SN among received UMD PDUs, and it serves as the higher edge of the reordering window. It is initially set to 0. For RLC entity configured for STCH, it is initially set to the SN of the first received UMD PDU.

22.3.2.1.3 Test description

22.3.2.1.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble

- The UE is in state 2B-NB according to [18] the exceptions listed in table 22.3.2.1.3.1-1 with test loop mode G closed.

Table 22.3.2.1.3.1-1: RLC Settings

Parameter	Value
t-PollRetransmit-r13	ms4000

22.3.2.1.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as :

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence	-	-	-	-

}

22.3.2.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clause 5.2.3. Unless otherwise stated these are Rel-13 requirements.

[TS 36.322, clause 5.2.3]

An AM RLC entity sends STATUS PDUs to its peer AM RLC entity in order to provide positive and/or negative acknowledgements of RLC PDUs (or portions of them).

Except for NB-IoT, RRC configures whether or not the status prohibit function is to be used for an AM RLC entity. For NB-IoT, RRC configures whether or not the status reporting due to detection of reception failure of an RLC data PDU is to be used for an AM RLC entity.

Triggers to initiate STATUS reporting include:

- Polling from its peer AM RLC entity:
  - When a RLC data PDU with SN = x and the P field set to “1” is received from lower layer, the receiving side of an AM RLC entity shall:
    - if the PDU is to be discarded as specified in subclause 5.1.3.2.2; or
    - if x < VR(MS) or x >= VR(MR):
      - trigger a STATUS report;
    - else:
      - delay triggering the STATUS report until x < VR(MS) or x >= VR(MR).

NOTE 1: This ensures that the RLC Status report is transmitted after HARQ reordering.

- Detection of reception failure of an RLC data PDU, except for an NB-IoT UE not configured with *enableStatusReportSN-Gap*:
  - The receiving side of an AM RLC entity shall trigger a STATUS report when *t-Reordering* expires.

NOTE 2: The expiry of *t-Reordering* triggers both VR(MS) to be updated and a STATUS report to be triggered, but the STATUS report shall be triggered after VR(MS) is updated.

When STATUS reporting has been triggered, the receiving side of an AM RLC entity shall:

- if *t-StatusProhibit* is not running:
  - at the first transmission opportunity indicated by lower layer, construct a STATUS PDU and deliver it to lower layer;
- else:
  - at the first transmission opportunity indicated by lower layer after *t-StatusProhibit* expires, construct a single STATUS PDU even if status reporting was triggered several times while *t-StatusProhibit* was running and deliver it to lower layer;

When a STATUS PDU has been delivered to lower layer, the receiving side of an AM RLC entity shall:

- start *t-StatusProhibit*.

When constructing a STATUS PDU, the AM RLC entity shall:

- for the AMD PDUs with SN such that VR(R) <= SN < VR(MS) that has not been completely received yet, in increasing SN order of PDUs and increasing byte segment order within PDUs, starting with SN = VR(R) up to the point where the resulting STATUS PDU still fits to the total size of RLC PDU(s) indicated by lower layer:
  - for an AMD PDU for which no byte segments have been received yet::

- include in the STATUS PDU a NACK_SN which is set to the SN of the AMD PDU;
- for a continuous sequence of byte segments of a partly received AMD PDU that have not been received yet:
  - include in the STATUS PDU a set of NACK_SN, SOstart and SOend
- set the ACK_SN to the SN of the next not received RLC Data PDU which is not indicated as missing in the resulting STATUS PDU.

22.3.2.3.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives duplicate AMD PDUs }
    then { UE discards the duplicate AMD PDUs }
            }
```

(2)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an AMD PDU with a SN gap }
    then { UE sends STATUS PDU to request retransmissions of PDUs in the SN gap }
            }
```

(3)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives PDUs within a SN gap }
 then { RLC reassembles and reorders the AMD PDUs and deliver them to the upper layer in sequence }
             }
```

(4)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an AMD PDU or an AMD PDU segment with no LI field }
    then { UE correctly decodes the received AMD PDU or AMD PDU segment }
            }
```

(5)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an AMD PDU or an AMD PDU segment more than one LI field }
```

```
    then { UE correctly decodes the received AMD PDU or AMD PDU segment }
        }
```

22.3.2.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.322, clause 4.2.1.3.3. Unless otherwise stated these are Rel-13 requirements.

[TS 36.322, clause 4.2.1.3.3]

When the receiving side of an AM RLC entity receives RLC data PDUs, it shall:

- detect whether or not the RLC data PDUs have been received in duplication, and discard duplicated RLC data PDUs;
- reorder the RLC data PDUs if they are received out of sequence;
- detect the loss of RLC data PDUs at lower layers and request retransmissions to its peer AM RLC entity;
- reassemble RLC SDUs from the reordered RLC data PDUs and deliver the RLC SDUs to upper layer in sequence.

At the time of RLC re-establishment, the receiving side of an AM RLC entity shall:

- if possible, reassemble RLC SDUs from the RLC data PDUs that are received out of sequence and deliver them to upper layer;
- discard any remaining RLC data PDUs that could not be reassembled into RLC SDUs;

- initialize relevant state variables and stop relevant timers.

[TS 36.322, clause 6.2.2.5]

Length: 11 bits for RLC UM, 11 bits or 15 bits for RLC AM. The length of the LI field for RLC AM is configured by upper layers.

The LI field indicates the length in bytes of the corresponding Data field element present in the RLC data PDU delivered/received by an UM or an AM RLC entity. The first LI present in the RLC data PDU header corresponds to the first Data field element present in the Data field of the RLC data PDU, the second LI present in the RLC data PDU header corresponds to the second Data field element present in the Data field of the RLC data PDU, and so on. The value 0 is reserved.

22.3.2.3.3 Test description

22.3.2.3.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

- None.

Preamble:

- The UE is in state 2B-NB according to [18] the exceptions listed in table 22.3.2.3.3.1-1 with test loop mode G closed.

Table 22.3.2.3.3.1-1: RLC settings

Parameter	Value
t-PollRetransmit-r13	ms4000
enableStatusReportSN-Gap-r13	true

22.3.2.3.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as :

- UL SQN n maps to SQN X+n MOD 1024 &
- DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.3.3.2-1: Main Behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
-	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence. Size of each RLC UL SDU #1 - #3 is PRBS of 256 bits (32 octets), size of each RLC UL SDU #4 - #16 is PRBS of 80 bits (10 octets). The size of the RLC SDUs used in downlink is L.	-	-	-	-

maxRetxThreshold }
then { UE indicates to upper layers that max retransmission has been reached }
         }
```

22.3.2.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clause 4.2.1.3.2, 5.2.1, 6.2.1.4 and 6.2.1.5. Unless otherwise stated these are Rel-13 requirements.

[TS 36.322, clause 4.2.1.3.2]

When the transmitting side of an AM RLC entity forms AMD PDUs from RLC SDUs, it shall:

- segment and/or concatenate the RLC SDUs so that the AMD PDUs fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity notified by lower layer.

The transmitting side of an AM RLC entity supports retransmission of RLC data PDUs (ARQ):

- if the RLC data PDU to be retransmitted does not fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity notified by lower layer, the AM RLC entity can re-segment the RLC data PDU into AMD PDU segments;
- the number of re-segmentation is not limited.

When the transmitting side of an AM RLC entity forms AMD PDUs from RLC SDUs received from upper layer or AMD PDU segments from RLC data PDUs to be retransmitted, it shall:

- include relevant RLC headers in the RLC data PDU.

[TS 36.322, clause 5.2.1]

The transmitting side of an AM RLC entity can receive a negative acknowledgement (notification of reception failure by its peer AM RLC entity) for an AMD PDU or a portion of an AMD PDU by the following:

- STATUS PDU from its peer AM RLC entity.

When receiving a negative acknowledgement for an AMD PDU or a portion of an AMD PDU by a STATUS PDU from its peer AM RLC entity, the transmitting side of the AM RLC entity shall:

- if the SN of the corresponding AMD PDU falls within the range VT(A) <= SN < VT(S):
  - consider the AMD PDU or the portion of the AMD PDU for which a negative acknowledgement was received for retransmission.

When an AMD PDU or a portion of an AMD PDU is considered for retransmission, the transmitting side of the AM RLC entity shall:

- if the AMD PDU is considered for retransmission for the first time:
  - set the RETX_COUNT associated with the AMD PDU to zero;
- else, if it (the AMD PDU or the portion of the AMD PDU that is considered for retransmission) is not pending for retransmission already, or a portion of it is not pending for retransmission already:
  - increment the RETX_COUNT;
- if RETX_COUNT = *maxRetxThreshold*:
  - indicate to upper layers that max retransmission has been reached.

When retransmitting an AMD PDU, the transmitting side of an AM RLC entity shall:

- if the AMD PDU can entirely fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity:
  - deliver the AMD PDU as it is except for the P field (the P field should be set according to sub clause 5.2.2) to lower layer;
- otherwise:
  - segment the AMD PDU, form a new AMD PDU segment which will fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity and deliver the new AMD PDU segment to lower layer.

When retransmitting a portion of an AMD PDU, the transmitting side of an AM RLC entity shall:

- segment the portion of the AMD PDU as necessary, form a new AMD PDU segment which will fit within the total size of RLC PDU(s) indicated by lower layer at the particular transmission opportunity and deliver the new AMD PDU segment to lower layer.

When forming a new AMD PDU segment, the transmitting side of an AM RLC entity shall:

- only map the Data field of the original AMD PDU to the Data field of the new AMD PDU segment;
- set the header of the new AMD PDU segment in accordance with the description in sub clause 6.;
- set the P field according to sub clause 5.2.2.

[TS 36.322, clause 6.2.1.4]

AMD PDU consists of a Data field and an AMD PDU header.

AMD PDU header consists of a fixed part (fields that are present for every AMD PDU) and an extension part (fields that are present for an AMD PDU when necessary). The fixed part of the AMD PDU header itself is byte aligned and consists of a D/C, a RF, a P, a FI, an E and a SN. The extension part of the AMD PDU header itself is byte aligned and consists of E(s) and LI(s).

An AM RLC entity is configured by RRC to use either a 10 bit SN or a 16 bit SN. The length of the fixed part of the AMD PDU header is two and three bytes respectively. The default values for SN field length used by an AM RLC entity is 10 bits.

An AMD PDU header consists of an extension part only when more than one Data field elements are present in the AMD PDU, in which case an E and a LI are present for every Data field element except the last. Furthermore, when an AMD PDU header consists of an odd number of LI(s) and the length of the LI field is 11 bits, four padding bits follow after the last LI. The default value for LI field length used by an AM RLC entity is 11 bits.

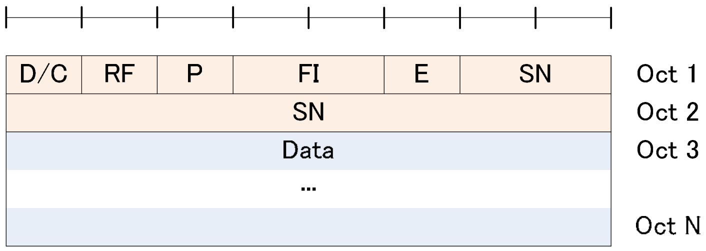

Figure 6.2.1.4-1: AMD PDU with 10 bit SN (length of LI field is 11 bits) (No LI)

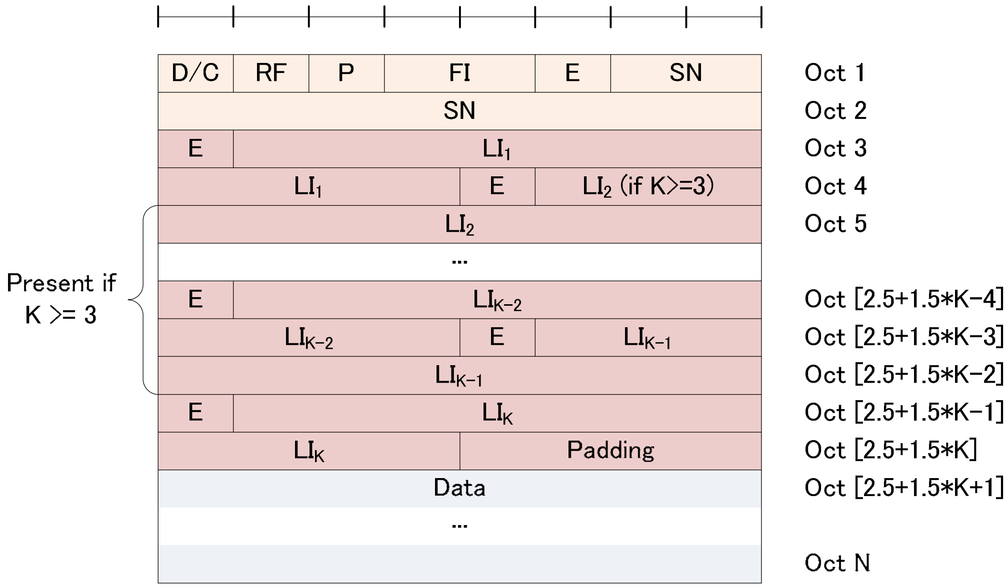

Figure 6.2.1.4-2: AMD PDU with 10 bit SN (length of LI field is 11 bits) (Odd number of LIs, i.e. K = 1, 3, 5, …)

Figure 6.2.1.4-4: AMD PDU with 10 bit SN (length of LI field is 15 bits)

[TS 36.322, clause 6.2.1.5]

AMD PDU segment consists of a Data field and an AMD PDU segment header.

AMD PDU segment header consists of a fixed part (fields that are present for every AMD PDU segment) and an extension part (fields that are present for an AMD PDU segment when necessary). The fixed part of the AMD PDU segment header itself is byte aligned and consists of a D/C, a RF, a P, a FI, an E, a SN, a LSF and a SO. The extension part of the AMD PDU segment header itself is byte aligned and consists of E(s) and LI(s).

AM RLC entity is configured by RRC to use either a 10 bit SN or a 16 bit SN. When a 10 bit SN is used, the SO field is 15 bits, and when a 16 bit SN is used, the SO field is 16 bits. The length of the fixed part of the AMD PDU segment header is four and five bytes respectively. The default values for SN field length and SO field length used by an AM RLC entity are 10 bits and 15 bits, respectively.

An AMD PDU segment header consists of an extension part only when more than one Data field elements are present in the AMD PDU segment, in which case an E and a LI are present for every Data field element except the last. Furthermore, when an AMD PDU segment header consists of an odd number of LI(s) and the length of the LI field is 11 bits, four padding bits follow after the last LI. The default value for LI field length used by an AM RLC entity is 11 bits.

[TS 36.331, clause 5.3.11.3]

The UE shall:

1> upon T310 expiry; or

1> upon T312 expiry; or

1> upon random access problem indication from MCG MAC while neither T300, T301, T304 nor T311 is running; or

1> upon indication from MCG RLC that the maximum number of retransmissions has been reached for an SRB or for an MCG or split DRB:

2> consider radio link failure to be detected for the MCG i.e. RLF;

…

2> if AS security has not been activated:

3> if the UE is a NB-IoT UE:

4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

3> else:

4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

2> else:

3> initiate the connection re-establishment procedure as specified in 5.3.7;

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T322, T325, T330;

1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:

…

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

…

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

22.3.2.4.3 Test description

22.3.2.4.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 11.
- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1 is used.

UE:

None.

Preamble

- The UE is in state 2B-NB on Ncell 1 according to [18] the exceptions listed in table 22.3.2.4.3.1-1 with test loop mode G closed.

Table 22.3.2.4.3.1-1: RLC Settings

Parameter	Value
t-PollRetransmit-r13	ms4000

22.3.2.4.3.2 Test procedure sequence

Table 22.3.2.4.3.2-0 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. The configuration marked “T1” is applied at the points indicated in the Main behaviour description in Table 22.3.2.4.3.2-1.

Table 22.3.2.4.3.2-0: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 11	Remarks
T0	NRS EPRE	dBm/15kHz	-85	“Off”	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	-85	-79	

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU’s in preamble on bearer to be used, then any sequence number ‘n’ in test procedure maps as:

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.4.3.2-1: Main behaviour

St	Procedure	Message Sequence	TP	Verdict

		U - S	Message/PDU/SDU		
0	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence.	-	-	-	-
1	The SS transmits one AMD PDU containing RLC DL SDU#1 in its data field. The SDU includes a PRBS of 400 bits.	<--	AMD PDU#1	-	-
2	In the search space of the 3rd NPDCCH period bundle after the first transmission at step 1 the SS schedules one UL grant (Note 6, Note 8)	<--	(UL grant, 440 bits)	-	-
3	The UE transmits an AMD PDU with the same data contents as received in the corresponding PRBS part of DL PDU#1.	-->	AMD PDU#1 (SN=0)	-	-
4	In the 5th NPDCCH period bundle after the transmission at step 1the SS transmits one AMD PDU containing RLC DL SDU#2 in its data field. The SDU includes a PRBS of 400 bits (Note 8).	<--	AMD PDU#2	-	-
5	In the search space of the 8th NPDCCH period bundle after the first transmission at step 1 the SS schedules one UL grant (Note 6, Note 8)	<--	(UL grant, 440 bits)	-	-
6	The UE transmits an AMD PDU with the same data contents as received in the corresponding PRBS part of DL PDU#2?	-->	AMD PDU#2 (SN=1)	-	-
7	The SS transmits a STATUS PDU. This PDU nacks the AMD PDU with SN=0. NACK_SN=0 and ACK_SN=2.	<--	STATUS PDU	-	-
8	In the 3rd and 4th NPDCCH period bundle after the transmission at step 7 the SS schedules 1 UL grant of size 296 bits (Note 1, Note 4, Note 8)	<--	(UL grants, 296 bits)	-	-
9	Check: Does the UE transmit an AMD PDU segment with SO=0, LSF=0 and the same data contents at the corresponding received positions as in the original AMD PDU?	-->	AMD PDU#1 segment 1 (SN=0)	1,3	P
10	Check: Does the UE transmit an AMD PDU segment with SO=<x>, LSF=1 and the same data contents at the corresponding received positions as in the original AMD PDU? (Note 3, Note 8)	-->	AMD PDU#1 segment 2 (SN=0)	1,3	P
11	The SS transmits a STATUS PDU. This PDU nacks the AMD PDU with SN=0. NACK_SN=0, SOStart=0, SOEnd=<x-1> and ACK_SN=2. (Note 3, Note 5)	<--	STATUS PDU	-	-
12	In the 3rd and 4th NPDCCH period bundle after the transmission at step 11 the SS schedules 1 UL grant of size 208 bits (Note 2) (Note 4, Note 8)	<--	(UL grants, 208 bits)	-	-
13	Check: Does the UE transmit an AMD PDU segment with SO=0, LSF=0 and the same data contents at the corresponding received positions as in the original AMD PDU?	-->	AMD PDU#1 segment 1, 1st part(SN=0)	2,3	P
14	Check: Does the UE transmit an AMD PDU segment with SO=<y>, LSF=0 and the same data contents at the corresponding received positions as in the original AMD PDU? (Note 3)	-->	AMD PDU#1 segment 1, 2nd part (SN=0)	2,3	P
15	The SS transmits a STATUS PDU. This PDU acks the AMD PDUs with SN=0 and SN=1. ACK_SN=2.	<--	STATUS PDU	-	-
16	The SS transmits one AMD PDU containing RLC DL SDU#3 in its data field. The SDU includes a PRBS of 400 bits.	<--	AMD PDU#3	-	-

17	In the search space of the 5th NPDCCH period bundle after the transmission at step 16 the SS schedules one UL grant (Note 6, Note 8)	<--	(UL grant, 440 bits)	-	-
18	The UE transmits an AMD PDU containing the corresponding PRBS part of DL PDU#3 in its data field.	-->	AMD PDU#3 (SN=2)	-	-
-	EXCEPTION: Step 19 to 20 shall be repeated *maxRetxThreshold* times (let i be the loop counter, i=1,…, *maxRetxThreshold*)	-	-	-	-
19	The SS transmits an RLC STATUS PDU. ACK_SN=3 and NACK_SN=2.	<--	STATUS PDU	-	-
19A	In the search space of the ((i +1) * 5)th NPDCCH period bundle after the transmission at step 16 the SS schedules one UL grant (Note 6, Note 8).	<--	(UL grant, 440 bits)	-	-
20	Check: Does the UE retransmit the AMD PDU not yet acknowledged?	-->	AMD PDU#3 (SN=2)	3	P
21	The SS transmits an RLC STATUS PDU. ACK_SN=3 and NACK_SN=2.	<--	STATUS PDU	-	-
21A	The SS changes Ncell 11 levels according to row "T1" in Table 22.3.2.4.3.2-0				
22	Check: Does UE transmit an *RRCConnectionRequest-NB* message ?	-->	RRC: *RRCConnectionRequest-NB*	4-	P -
23 - 26	UE performs TAU procedure based on steps 2 to 5 of Generic test procedure in TS 36.508 subclause 8.1.5A.5 to takes place on Ncell 11.			-	-
27	The SS transmits an *RRCConnectionRelease-NB* message.	<--	RRC: RRCConnectionRelease-NB	-	-

Note 1: UL grant of 296 bits (I_{TBS}=9, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen such that UE will segment into 2 AMD PDUs. MAC PDU of 296 bits=39 bytes fits an AMD PDU payload of >= 25 bytes + 2 bytes AMD PDU header + 2 bytes of segment header + X bytes spare for MAC header and possible RLC STATUS PDU and BSR report.

Note 2: UL grant of 208 bits (I_{TBS}=4, I_{RU} =2, see TS 36.213 Table 16.5.1.2-2) is chosen such that UE will segment into 2 AMD PDUs. MAC PDU of 208 bits=26 bytes fits an AMD PDU payload of >= 13 bytes + 2 bytes AMD PDU header + 2 bytes of segment header + x bytes spare for MAC header and possible RLC STATUS PDU and BSR report.

Note 3: The values x and y depend upon the need of the UE to add RLC STATUS PDU and BSR report. The TBS has been chosen to ensure that the PDUs to be resegmented can be carried in 2 segments.

Note 4: 40 ms gap between transmissions both in DL and UL respectively allows for possible repetitions.

Note 5: As <x> becomes available in step 8 only the transmission in step 10 can only be scheduled afterwards. This requires a 100 ms activation time.

Note 6: UL grant of 440 bits (I_{TBS}=3, I_{RU} =6, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time.

Note 7: Void

Note 8: NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.2.5.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clauses 4.2.1.3.3, 5.1.3.2.1, 5.1.3.2.2, 5.1.3.2.3, 6.2.1.4, 6.2.1.5 and 6.2.2.6.

[TS 36.322, clause 4.2.1.3.3]

When the receiving side of an AM RLC entity receives RLC data PDUs, it shall:

- reorder the RLC data PDUs if they are received out of sequence;
- detect the loss of RLC data PDUs at lower layers and request retransmissions to its peer AM RLC entity;
- reassemble RLC SDUs from the reordered RLC data PDUs and deliver the RLC SDUs to upper layer in sequence.

...

[TS 36.322, clause 5.1.3.2.1]

The receiving side of an AM RLC entity shall maintain a receiving window according to state variables VR(R) and VR(MR) as follows:

- a SN falls within the receiving window if VR(R) <= SN < VR(MR);
- a SN falls outside of the receiving window otherwise.

When receiving a RLC data PDU from lower layer, the receiving side of an AM RLC entity shall:

- either discard the received RLC data PDU or place it in the reception buffer (see sub clause 5.1.3.2.2);
- if the received RLC data PDU was placed in the reception buffer:
    - update state variables, reassemble and deliver RLC SDUs to upper layer and start/stop *t-Reordering* as needed (see sub clause 5.1.3.2.3).

When *t-Reordering* expires, the receiving side of an AM RLC entity shall:

- update state variables and start *t-Reordering* as needed (see sub clause 5.1.3.2.4).

For NB-IoT;

- The receiving side of an RLC entity shall behave such that the timer values of *t-Reordering* and *t-StatusProhibit* are 0.

[TS 36.322, clause 5.1.3.2.2]

When a RLC data PDU is received from lower layer, where the RLC data PDU contains byte segment numbers y to z of an AMD PDU with SN = x, the receiving side of an AM RLC entity shall:

- if x falls outside of the receiving window; or
- if byte segment numbers y to z of the AMD PDU with SN = x have been received before:
  - discard the received RLC data PDU;
- else:
  - place the received RLC data PDU in the reception buffer;
  - if some byte segments of the AMD PDU contained in the RLC data PDU have been received before:
    - discard the duplicate byte segments.

[TS 36.322, clause 5.1.3.2.3]

When a RLC data PDU with SN = x is placed in the reception buffer, the receiving side of an AM RLC entity shall:

- if x >= VR(H)
  - update VR(H) to x+ 1;
- if all byte segments of the AMD PDU with SN = VR(MS) are received:
  - update VR(MS) to the SN of the first AMD PDU with SN > current VR(MS) for which not all byte segments have been received;
- if x = VR(R):
  - if all byte segments of the AMD PDU with SN = VR(R) are received:
    - update VR(R) to the SN of the first AMD PDU with SN > current VR(R) for which not all byte segments have been received;
    - update VR(MR) to the updated VR(R) + AM_Window_Size;
  - reassemble RLC SDUs from any byte segments of AMD PDUs with SN that falls outside of the receiving window and in-sequence byte segments of the AMD PDU with SN = VR(R), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in sequence if not delivered before;
- if *t-Reordering* is running:
  - if VR(X) = VR(R); or
  - if VR(X) falls outside of the receiving window and VR(X) is not equal to VR(MR):
    - stop and reset *t-Reordering*;
- if *t-Reordering* is not running (includes the case *t-Reordering* is stopped due to actions above):
  - if VR (H) > VR(R):
    - start t-Reordering;
    - set VR(X) to VR(H).

[TS 36.322, clause 6.2.1.4]

AMD PDU consists of a Data field and an AMD PDU header.

AMD PDU header consists of a fixed part (fields that are present for every AMD PDU) and an extension part (fields that are present for an AMD PDU when necessary). The fixed part of the AMD PDU header itself is byte aligned and consists of a D/C, a RF, a P, a FI, an E and a SN. The extension part of the AMD PDU header itself is byte aligned and consists of E(s) and LI(s).

…

An AMD PDU header consists of an extension part only when more than one Data field elements are present in the AMD PDU, in which case an E and a LI are present for every Data field element except the last. Furthermore, when an AMD PDU header consists of an odd number of LI(s) and the length of the LI field is 11 bits, four padding bits follow after the last LI. The default value for LI field length used by an AM RLC entity is 11 bits.

…

[TS 36.322, clause 6.2.1.5]

AMD PDU segment consists of a Data field and an AMD PDU segment header.

AMD PDU segment header consists of a fixed part (fields that are present for every AMD PDU segment) and an extension part (fields that are present for an AMD PDU segment when necessary). The fixed part of the AMD PDU segment header itself is byte aligned and consists of a D/C, a RF, a P, a FI, an E, a SN, a LSF and a SO. The extension part of the AMD PDU segment header itself is byte aligned and consists of E(s) and LI(s).

...

An AMD PDU segment header consists of an extension part only when more than one Data field elements are present in the AMD PDU segment, in which case an E and a LI are present for every Data field element except the last. Furthermore, when an AMD PDU segment header consists of an odd number of LI(s) and the length of the LI field is 11 bits, four padding bits follow after the last LI. The default value for LI field length used by an AM RLC entity is 11 bits.

…

[TS 36.322, clause 6.2.2.6]

Length: 2 bits.

The FI field indicates whether a RLC SDU is segmented at the beginning and/or at the end of the Data field. Specifically, the FI field indicates whether the first byte of the Data field corresponds to the first byte of a RLC SDU, and whether the last byte of the Data field corresponds to the last byte of a RLC SDU. The interpretation of the FI field is provided in Table 6.2.2.6-1.

Table 6.2.2.6-1: FI field interpretation

Value	Description
00	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
01	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.
10	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
11	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.

22.3.2.5.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as:

- UL SQN n maps to SQN X+n MOD 1024 &
- DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.5.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
-	Note: In steps 0 to 17 the size of the RLC SDUs used in uplink will be 33 octets. The size of the RLC SDUs used in downlink is L.	-	-	-	-
0	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence	-	-	-	-
1	The SS transmits AMD PDU#1 containing a complete RLC DL SDU#1 (FI field = 00).	<--	AMD PDU#1(SN=0)	-	-
1A	In the search space of the 3rd NPDCCH period bundle after the transmission at step 1 the SS schedules one UL Grant of size 328 bits, sufficient for one RLC UL SDU to be looped back (Note 1, Note 13).	<--	Uplink Grant	-	-
2	Check: Does the UE transmit RLC UL SDU#1?	-->	(RLC UL SDU#1) (SN=0)	1	P
3	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=1)	-	-
4	The SS transmits AMD PDU#2 containing the first segment of RLC DL SDU#2 (FI field = 01).	<--	AMD PDU#2(SN=1)	-	-
5	The SS transmits AMD PDU#3 containing the second segment of RLC DL SDU#2 (FI field = 11).	<--	AMD PDU#3(SN=2)	-	-
6	The SS transmits AMD PDU#4 containing the last segment of RLC DL SDU#2 (FI field = 10).	<--	AMD PDU#4(SN=3)	-	-
6A	In the search space of the 3rd NPDCCH period bundle after the transmission at step 6 the SS schedules one UL Grant of size 328 bits, sufficient for one RLC UL SDU to be looped back (Note 1, Note 13).	<--	Uplink Grant	-	-
7	Check: Does the UE transmit RLC UL SDU#2?	-->	(RLC UL SDU#2) (SN=1)	2,3,4	P
8	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=2)	-	-
9	The *t-PollRetransmit-r13* timer for RLC DL PDU#5 expires and SS assumes that the transmission of AMD PDU#5 containing a complete RLC DL SDU#3 and a complete	-	-	-	-

	RLC DL SDU#4 is failed and consider RLC DL PDU#5 for re-transmission				
10	The SS transmits AMD PDU segment containing a complete RLC DL SDU#3 (FI field = 00).	<--	AMD PDU#5 segment(SN=4)	-	-
10A	In the search space of the 3rd NPDCCH period bundle after the transmission at step 10 the SS schedules one UL Grant of size 392 bits, sufficient for one STATUS PDU and one RLC UL SDU to be looped back (Note 11, Note 13).	<--	Uplink Grant	-	-
11	Check: Does the UE transmit a STATUS PDU with NACK_SN=4 with SOStart=L and SOEnd=32767 (special SOEnd value) and ACK_SN=5 and an AMD PDU containing RLC SDU#3?	-->	(RLC UL SDU#3) (SN=2) STATUS PDU	1	P
12	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=3)	-	-
13	The SS transmits AMD PDU segment containing the first segment of RLC DL SDU#4 (FI field = 01).	<--	AMD PDU#5 segment(SN=4)	-	-
14	The SS transmits AMD PDU segment containing the second segment of RLC DL SDU#4 (FI field = 11).	<--	AMD PDU#5 segment(SN=4)	-	-
15	The SS transmits AMD PDU segment containing the last segment of RLC DL SDU#4 (FI field = 10).	<--	AMD PDU#5 segment(SN=4)	-	-
15A	In the search space of the 3rd NPDCCH period bundle after the transmission at step 15 the SS schedules one UL Grant of size 392 bits, sufficient for one STATUS PDU and one RLC UL SDU to be looped back (Note 12, Note 13).	<--	Uplink Grant	-	-
16	Check: Does the UE transmit a STATUS PDU with ACK_SN=5 and an AMD PDU containing RLC UL SDU#4?	-->	(RLC UL SDU#4) (SN=3) STATUS PDU	2,3, 4	P
17	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=4)	-	-
-	Note: In steps 18 to 51 the size of the RLC SDUs used in uplink will be 16 octets. The size of the RLC SDUs used in downlink is L.	-	-	-	-
18	The SS transmits an AMD PDU containing the first part (8 bytes) of RLC DL SDU#5 in its data field. This PDU is in error (SN falls outside of the receiving window) and is to be discarded by the UE.	<--	AMD PDU#6 (SN=WindowSize+3)	-	-
19	The SS transmits an AMD PDU containing RLC DL SDU#6 (L bytes) in its data field with the P-bit set.	<--	AMD PDU#7 (SN=6, P=1)	-	-
20	In the search space of the 3rd NPDCCH period bundle after the transmission at step 19 the SS schedules one UL Grant of size 72 bits, sufficient for one RLC STATUS PDU (Note 2, Note 13).	<--	Uplink Grant	-	-
21	The UE transmits a STATUS PDU with NACK_SN field indicating missing PDU#5. ACK_SN=7, NACK_SN=5.	-->	STATUS PDU	-	-
22	The SS transmits an AMD PDU segment of AMD PDU#6 (AMD PDU#6 carries RLC DL SDU#5) containing the first 8 bytes of RLC DL SDU#5 in its data field. SO=0 and LSF=0. No header extension part is provided.	<--	AMD PDU#6 (SN=5) segment 1	-	-
23	The SS transmits an AMD PDU segment of AMD PDU#6 (AMD PDU#6 carries RLC DL SDU#5) containing the last L-8 bytes of RLC DL SDU#5 in its data field with the P-bit set. SO=8 and LSF=1. No header extension part is provided.	<--	AMD PDU #6 (SN=5, P=1) segment 2	-	-

24	In the search space of the 3rd NPDCCH period bundle after the transmission at step 23 the SS schedules one UL Grant of size 56 bits, sufficient for one RLC STATUS PDU (Note 3, Note 13).	<--	Uplink Grant	-	-
25	Check: Does the UE transmit a STATUS PDU with ACK_SN=7, thus acknowledging the reception of PDUs with SN=5 and SN=6, and no NACK_SN provided?	-->	STATUS PDU	6	P
25A	In the search space of the next NPDCCH period bundle after the transmission at step 24 the SS schedules one UL Grant of size 328 bits, sufficient for two RLC UL SDUs to be looped back (Note 4, Note 13).	<--	Uplink Grant	-	-
26	Check: Does the UE transmit RLC UL SDU#5 and RLC UL SDU#6?	-->	AMD PDU (RLC UL SDU#5, RLC UL SDU#6) (SN=4)	5	P
27	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=5)	-	-
28	The SS transmits an AMD PDU segment of AMD PDU#8 (AMD PDU#8 carries RLC DL SDU#7 and RLC DL SDU#8) containing the last L-8 bytes of RLC DL SDU#8 in its data field, with the P-bit set. FI=10, SO=(L+8) and LSF=1. No header extension part is provided.	<--	AMD PDU#8 (SN=7, P=1) segment 2	-	-
29	In the search space of the 3rd NPDCCH period bundle after the transmission at step 28 the SS schedules one UL Grant of size 104 bits, sufficient for one RLC STATUS PDU (Note 5, Note 13).	<--	Uplink Grant	-	-
30	The UE transmits a STATUS PDU NACK_SN field for receipt of PDU#8. ACK_SN=8, NACK_SN=7, SOStart=0/SOEnd=L+7.	-->	STATUS PDU	-	-
31	The SS transmits an AMD PDU segment of AMD PDU#8 (AMD PDU#8 carries RLC DL SDU#7 and RLC DL SDU#8) containing RLC DL SDU#7 (L bytes) and the first 8 bytes of SDU#8 in its data field, with the P-bit set. FI=01, SO=0 and LSF=0. Header extension part present: E in fixed part header=1, E in extension part header=0, LI=L.	<--	AMD PDU#8 (SN=7, P=1) segment 1	-	-
32	In the search space of the 3rd NPDCCH period bundle after the transmission at step 31 the SS allocates one UL Grant of size 56 bits, sufficient for one RLC STATUS PDU (Note 3, Note 13).	<--	Uplink Grant	-	-
33	Check: Does the UE transmit a STATUS PDU with ACK_SN=8?	-->	STATUS PDU	7	P
33A	In the search space of the next NPDCCH period bundle after the transmission at step 32 the SS schedules one UL Grant of size 328 bits, sufficient for one RLC UL SDU to be looped back (Note 4, Note 13).	<--	Uplink Grant	-	-
34	Check: Does the UE transmit RLC UL SDU#7 and RLC UL SDU#8?	-->	AMD PDU (RLC UL SDU#7, RLC UL SDU#8) (SN=5)	5,9	P
35	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=6)	-	-
36	The SS transmits an AMD PDU segment of AMD PDU#9 (AMD PDU#9 carries RLC DL SDU#9) containing the first 8 bytes of RLC DL SDU#9 in its data field. SO=0 and LSF=0. No header extension part is provided.	<--	AMD PDU#9 (SN=8) segment 1	-	-
37	The SS transmits an AMD PDU segment of AMD PDU#9 (AMD PDU#9 carries RLC DL SDU#9) containing the first 8 bytes of RLC DL SDU#9 in its data field. SO=0 and LSF=0. No header extension part is provided.	<--	AMD PDU#9 (SN=8) segment 1	-	-

38	The SS transmits an AMD PDU segment of AMD PDU#9 (AMD PDU#9 carries RLC DL SDU#9) containing the last L-8 bytes of RLC DL SDU#9 in its data field, with the P-bit set. SO=8 and LSF=1. No header extension part is provided.	<--	AMD PDU#9 (SN=8, P=1) segment 2	-	-
39	In the search space of the 3rd NPDCCH period bundle after the transmission at step 38 the SS schedules one UL Grant of size 56 bits, sufficient for one RLC STATUS PDU (Note 3, Note 13).	<--	Uplink Grant	-	-
40	Check: Does the UE transmit a STATUS PDU with ACK_SN=9, thus acknowledging the reception of PDUs with SN=4 to SN=8, and no NACK_SN provided?	-->	STATUS PDU	8	P
40A	In the search space of the next NPDCCH period bundle after the transmission at step 39 the SS schedules one UL Grant of size 176 bits, sufficient for one RLC UL SDU to be looped back (Note 6, Note 13).	<--	Uplink Grant	-	-
41	Check: Does the UE transmit RLC UL SDU#9?	-->	(RLC UL SDU#9) (SN=6)	5	P
42	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=7)	-	-
43	The SS transmits an AMD PDU segment of AMD PDU#11 (AMD PDU#11 carries RLC DL SDU#11) containing the last L-8 bytes of RLC DL SDU#11 in its data field, with the P-bit set. This AMD PDU segment is sent with SN=10. SO=8 and LSF=1. No header extension part is provided.	<--	AMD PDU#11 (SN=10, P=1) segment 2	-	-
44	In the search space of the 3rd NPDCCH period bundle after the transmission at step 43 the SS schedules one UL Grant of size 144 bits, sufficient for one RLC STATUS PDU (Note 7, Note 13).	<--	Uplink Grant	-	-
45	Check: Does the UE transmit a STATUS PDU with ACK_SN=11, thus acknowledging the reception of PDUs with SN=4 to SN=10, and NACK_SN=9, E1/E2 field for receipt of PDU#9 and NACK_SN=10, SOStart=0/SOEnd=7 for segment 1 of PDU#11?	-->	STATUS PDU	10	P
46	The SS transmits an AMD PDU segment of AMD PDU#11 (AMD PDU#11 carries RLC DL SDU#11) containing the first 8 bytes of RLC DL SDU#11 in its data field. SO=0 and LSF=0. No header extension part is provided.	<--	AMD PDU#11 (SN=10) segment 1	-	-
47	The SS transmits one AMD PDU containing RLC DL SDU#10 (L bytes) in its data field, with the P-bit set.	<--	AMD PDU#10 (SN=9, P=1)	-	-
48	In the search space of the 3rd NPDCCH period bundle after the transmission at step 47 the SS schedules one UL Grant of size 56 bits, sufficient for one RLC STATUS PDU (Note 3, Note 13).	<--	Uplink Grant	-	-
49	The UE transmits a STATUS PDU with ACK_SN=11, thus acknowledging the reception of PDUs with SN=4 to SN=10, and no NACK_SN provided.	-->	STATUS PDU	-	-
49A	In the search space of the next NPDCCH period bundle after the transmission at step 48 the SS schedules one UL Grant of size 328 bits, sufficient for two RLC UL SDUs to be looped back (Note 4, Note 13).	<--	Uplink Grant	-	-
50	Check: Does the UE transmit RLC UL SDU#10 and RLC UL SDU#11?	-->	AMD PDU (RLC UL SDU#10, RLC UL SDU#11) (SN=7)	6,9	P
51	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=8)	-	-

-	Note: In steps 52 to 62 the size of the RLC SDUs used in uplink will be 10 octets. The size of the RLC SDUs used in downlink is L.	-	-	-	-
52	The SS transmits an AMD PDU segment of AMD PDU#12 (AMD PDU#12 carries RLC DL SDU#12, RLC DL SDU#13 and RLC DL SDU#14) containing the last L-6 bytes of RLC DL SDU#13 and the complete RLC DL SDU#14 (L bytes) in its data field, with the P-bit set. FI=10, SO= L+6 and LSF=1. Header extension part present: E in fixed part header=1, E in extension part header=0, LI=L-6.	<--	AMD PDU#12 (SN=11, P=1) segment 3	-	-
53	In the search space of the 3rd NPDCCH period bundle after the transmission at step 52 the SS schedules one UL Grant of size 104 bits, sufficient for one RLC STATUS PDU (Note 5, Note 13).	<--	Uplink Grant	-	-
54	The UE transmits a STATUS PDU NACK_SN field for receipt of PDU#12. ACK_SN=12, NACK_SN=11, SOStart=0/SOEnd= L+5.	-->	STATUS PDU	-	-
55	The SS transmits an AMD PDU segment of AMD PDU#12 (AMD PDU#12 carries RLC DL SDU#12, RLC DL SDU#13 and RLC DL SDU#14) containing the last L-6 bytes of RLC DL SDU#12 and the first 6 bytes of RLC DL SDU#13 in its data field, with the P-bit set. FI=11, SO=6 and LSF=0. Header extension part present: E in fixed part header=1, E in extension part header=0, LI=L-6.	<--	AMD PDU#12 (SN=11, P=1) segment 2	-	-
56	In the search space of the 3rd NPDCCH period bundle after the transmission at step 55 the SS schedules one UL Grant of size 104 bits, sufficient for one RLC STATUS PDU (Note 5, Note 13).	<--	Uplink Grant	-	-
57	The UE transmits a STATUS PDU NACK_SN field for receipt of PDU#12. ACK_SN=12, NACK_SN=11, SOStart=0/SOEnd=5.	-->	STATUS PDU	11	P
58	The SS transmits an AMD PDU segment of AMD PDU#12 (AMD PDU#12 carries RLC DL SDU#12, RLC DL SDU#13 and SDU#14) containing the first 6 bytes of SDU#12 in its data field, with the P-bit set. FI=01, SO=0 and LSF=0. No header extension part is provided.	<--	AMD PDU#12 (SN=11, P=1) segment 1	-	-
59	In the search space of the 3rd NPDCCH period bundle after the transmission at step 58 the SS schedules one UL Grant of size 56 bits, sufficient for one RLC STATUS PDU (Note 3, Note 13).	<--	Uplink Grant	-	-
60	Check: Does the UE transmit a STATUS PDU with ACK_SN=12, thus acknowledging the reception of PDUs with SN=4 to SN=11, and no NACK_SN provided?	-->	STATUS PDU	11	P
60A	In the search space of the next NPDCCH period bundle after the transmission at step 59 the SS schedules one UL Grant of size 328 bits, sufficient for three RLC UL SDUs to be looped back (Note 8, Note 13).	<--	Uplink Grant	-	-
61	Check: Does the UE transmit RLC UL SDU#12, RLC UL SDU#13 and RLC UL SDU#14?	-->	AMD PDU (RLC UL SDU#12, RLC UL SDU#13, RLC UL SDU#14) (SN=8)	11	P
62	The SS transmits a STATUS PDU.	<--	STATUS PDU (ACK SN=9)	-	-

-	Note: In steps 63 to 93 the size of the RLC SDUs used in uplink will be 32 octets. The size of the RLC SDUs used in downlink is L.	-	-	-	-
63	The SS transmits one AMD PDU containing RLC DL SDU#22 (L bytes) in its data field to the UE. SN=19 indicates the loss of 7 PDUs.	<--	AMD PDU#20 (SN=19)	-	-
64	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#15 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#13, which contained RLC DL SDU#15 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#13 (SN=12) segment 1	-	-
65	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#16 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#14, which contained RLC DL SDU#16 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#14 (SN=13) segment 2	-	-
66	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#17 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#15, which contained RLC DL SDU#17 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#15 (SN=14) segment 1	-	-
67	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#18 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#16, which contained RLC DL SDU#18 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#16 (SN=15) segment 2	-	-
68	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#18 in its data field to the UE. This AMD PDU segment carries part 1of AMD PDU#16, which contained RLC DL SDU#18 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#16 (SN=15) segment 1	-	-
69	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#15 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#13, which contained RLC DL SDU#15 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#13 (SN=12) segment 2	-	-
70	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#16 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#14, which contained RLC DL SDU#16 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#14 (SN=13) segment 1	-	-
71	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#17 in its data field to the UE. This AMD PDU segment carries part 2 of PDU#15, which contained RLC DL SDU#17 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#15 (SN=14) segment 2	-	-
72	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#21 in its data field to the UE. This AMD PDU segment carries part 1 of PDU #19, which contained RLC DL SDU#21 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#19 (SN=18) segment 1	-	-
73	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#20 in its data field to the UE. This AMD PDU segment carries segment 2 of AMD PDU#18, which contained RLC DL SDU#20 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#18 (SN=17) segment 2	-	-
73A	In the search space of the 3rd NPDCCH period bundle after the transmission at step	<--	Uplink Grant	-	-

	73 the SS allocates one UL Grant of size 144 bits, sufficient for one RLC STATUS PDU (Note 9, Note 13).				
73B	Check: Does the UE transmit a Status Report with NACK_SN=16, NACK_SN=17 with SOStart=0 and SOEnd=15, and NACK_SN=18 with SOStart=16 and SOEnd=32767 (special SOEnd value), and ACK_SN=20?	-->	STATUS PDU	13	P
74	In the search space of the next NPDCCH period bundle after the transmission at step 73A the SS schedules four UL Grants of size 296 bits, each one sufficient for one RLC UL SDU to be looped back (Note 10, Note 13).	<--	Uplink Grant	-	-
75	Check: Does the UE transmit an RLC UL SDU containing SDU#15 in its data field?	-->	(RLC UL SDU#15) (SN=9)	12	P
76	Check: Does the UE transmit an RLC UL SDU containing SDU#16 in its data field?	-->	(RLC UL SDU#16) (SN=10)	12	P
77	Check: Does the UE transmit an RLC UL SDU containing SDU#17 in its data field?	-->	(RLC UL SDU#17) (SN=11)	12	P
78	Check: Does the UE transmit an RLC UL SDU containing SDU#18 in its data field?	-->	(RLC UL SDU#18) (SN=12)	12	P
79	The SS transmits an RLC STATUS PDU to the UE. This PDU acks PDUs up to those including SDU#18. ACK_SN=13.	<--	STATUS PDU	-	-
80	Void	-		-	-
81	Void	-		-	-
82	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#21 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#19, which contained RLC DL SDU#21 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#19 (SN=18) segment 2	-	-
83	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#20 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#18, which contained RLC DL SDU#20 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#18 (SN=17) segment 1	-	-
84	The SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#19 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#17, which contained RLC DL SDU#19 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#17 (SN=16) segment 1	-	-
85	In the search space of the 3rd NPDCCH period bundle after the transmission at step 84 the SS schedules one UL Grant of size 104 bits, sufficient for one RLC STATUS PDU (Note 5, Note 13).	<--	Uplink Grant	-	-
86	Check: Does the UE transmit a Status Report with NACK_SN=16 with SOStart=16 and SOEnd=32767 (special SOEnd value), and ACK_SN=20?	-->	STATUS PDU	13	P
87	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#19 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#17, which contained RLC DL SDU#19 (L bytes)in its data field. SO=16 and LSF=1.	<--	AMD PDU#17 (SN=16) segment 2	-	-
88	In the search space of the 3rd NPDCCH period bundle after the transmission at step 87 the SS schedules four UL Grants of size 296 bits, each one sufficient for one RLC UL SDU to be looped back (Note 10, Note 13).	<--	Uplink Grant	-	-
89	Check: Does the UE transmit an RLC UL SDU containing SDU#19 in its data field?	-->	(RLC UL SDU#19) (SN=13)	12	P

90	Check: Does the UE transmit an RLC UL SDU containing SDU#20 in its data field?	-->	(RLC UL SDU#20) (SN=14)	12	P
91	Check: Does the UE transmit an RLC UL SDU containing SDU#21 in its data field?	-->	(RLC UL SDU#21) (SN=15)	12	P
92	Check: Does the UE transmit an RLC UL SDU containing SDU#22 in its data field?	-->	(RLC UL SDU#22) (SN=16)	12	P
93	The SS transmits an RLC STATUS PDU to the UE. This PDU acks PDUs up to those including SDU#21. ACK_SN=17.	<--	STATUS PDU	-	-

Note 1: UL grant of 328 bits (I_{TBS}=10, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 1 byte Padding subheader, 1 byte Short BSR + 35 bytes MAC SDU(2 bytes RLC AMD PDU header + 33 bytes UL RLC SDU) + 1 byte Padding).

Note 2: UL grant of 72 bits (I_{TBS}=2, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and NACK_SN (2 bytes Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 4 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 + 5-bit Padding)).

Note 3: UL grant of 56 bits (I_{TBS}=1, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN (2 bytes Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 2 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 1bit padding)).

Note 4: UL grant of 328 bits (I_{TBS}=10, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 2 bytes Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 36 bytes MAC SDU (4 bytes RLC AMD PDU header + 2*16 UL RLC SDU)).

Note 5: UL grant of 104 bits (I_{TBS}=3, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and NACK_SN (2 bytes Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 8 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend + 7-bit Padding)).

Note 6: UL grant of 176 bits (I_{TBS}=1, I_{RU} =4, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 18 bytes MAC SDU(2 bytes RLC AMD PDU header + 16 UL RLC SDU)).

Note 7: UL grant of 144 bits (I_{TBS}=5, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and 2 NACK_SNs ((1 byte Short BSR subheader + 2 byte MAC SDU subheader + 1 byte Padding subheader + 1 byte Short BSR + 9 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 + (12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend) + 3-bit Padding) + 4 byte Padding) or (2 bytes Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 13 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 2 x (12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend) + 5-bit Padding))).

Note 8: UL grant of 328 bits (I_{TBS}=10, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 1 byte Padding subheader, 1 byte Short BSR + 35 bytes MAC SDU(5 bytes RLC AMD PDU header + 3*10 UL RLC SDU) + 1 byte Padding).

Note 9: UL grant of 144 bits (I_{TBS}=5, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and 3 NACK_SNs (1 byte Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 14 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 +2*(12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend) + 1-bit Padding)).

Note 10: UL grant of 296 bits (I_{TBS}=9, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 34 bytes MAC SDU(2 bytes RLC AMD PDU header + 32 bytes UL RLC SDU)).

Note 11: UL grant of 392 bits (I_{TBS}=8, I_{RU} =2, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Padding subheader + 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 35 bytes MAC SDU(2 bytes RLC AMD PDU header + 33 bytes UL RLC SDU) + 8 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend + 7-bit Padding)).

Note 12: UL grant of 392 bits (I_{TBS}=8, I_{RU} =2, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 2 byte MAC SDU subheader + 1 byte Padding subheader, 1 byte Short BSR + 35 bytes MAC SDU(2 bytes RLC AMD PDU header + 33 bytes UL RLC SDU) + 2 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 1bit padding) + 5 bytes Padding)
Note 13: NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

22.3.2.5.3.3 Specific message contents

None.

22.3.2.6 NB-IoT / UM RLC / Correct use of sequence numbering / Concatenation, segmentation and reassembly / SC-MCCH and SC-MTCH

22.3.2.6.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC IDLE state and receiving an SC-PTM service }
ensure that {
  when { UE receives UMD PDU on SC-MTCH containing a FI field set to 00 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(2)

```
with { UE in E-UTRAN RRC IDLE state and receiving an SC-PTM service }
ensure that {
  when { UE receives UMD PDU on SC-MTCH containing a FI field set to 01 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(3)

```
with { UE in E-UTRAN RRC IDLE state and receiving an SC-PTM service }
ensure that {

```

(7)

```
with { UE in E-UTRAN RRC IDLE state and receiving an SC-PTM service }
ensure that {
  when { UE receives UM PDU on SC-MTCH with Length Indicator value larger than RLC PDU size }
    then { UE discards the RLC PDU }
            }
      }
```

22.3.2.6.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.322, clauses 4.2.1, 5.1.2.2, 6.2.1.3, 6.2.2.6 and 7.2.

[TS 36.322, clause 4.2.1]

The description in this sub clause is a model and does not specify or restrict implementations.

RRC is generally in control of the RLC configuration. For NB-IoT, RRC configurable parameters are specified in *RLC-Config-NB* [5].

…

An RLC entity can be configured to perform data transfer in one of the following three modes: Transparent Mode (TM), Unacknowledged Mode (UM) or Acknowledged Mode (AM). Consequently, an RLC entity is categorized as a TM RLC entity, an UM RLC entity or an AM RLC entity depending on the mode of data transfer that the RLC entity is configured to provide. For NB-IoT, RLC UM is only supported for SC-MCCH and SC-MTCH.

[TS 36.322, clause 5.1.2.2]

The receiving UM RLC entity shall maintain a reordering window according to state variable VR(UH) as follows:

- a SN falls within the reordering window if (VR(UH) – UM_Window_Size) <= SN < VR(UH);
- a SN falls outside of the reordering window otherwise.

When receiving an UMD PDU from lower layer, the receiving UM RLC entity shall:

- either discard the received UMD PDU or place it in the reception buffer (see sub clause 5.1.2.2.2);
- if the received UMD PDU was placed in the reception buffer:
  - update state variables, reassemble and deliver RLC SDUs to upper layer and start/stop *t-Reordering* as needed (see sub clause 5.1.2.2.3);

When *t-Reordering* expires, the receiving UM RLC entity shall:

- update state variables, reassemble and deliver RLC SDUs to upper layer and start *t-Reordering* as needed (see sub clause 5.1.2.2.4).

…

When an UMD PDU with SN = x is received from lower layer, the receiving UM RLC entity shall:

- if VR(UR) < x < VR(UH) and the UMD PDU with SN = x has been received before; or
- if (VR(UH) – UM_Window_Size) <= x < VR(UR):
  - discard the received UMD PDU;
- else:
  - place the received UMD PDU in the reception buffer.

…

When an UMD PDU with SN = x is placed in the reception buffer, the receiving UM RLC entity shall:

- if x falls outside of the reordering window:
  - update VR(UH) to x + 1;
  - reassemble RLC SDUs from any UMD PDUs with SN that falls outside of the reordering window, remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
  - if VR(UR) falls outside of the reordering window:
    - set VR(UR) to (VR(UH) – UM_Window_Size);
- if the reception buffer contains an UMD PDU with SN = VR(UR):
  - update VR(UR) to the SN of the first UMD PDU with SN > current VR(UR) that has not been received;
  - reassemble RLC SDUs from any UMD PDUs with SN < updated VR(UR), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
- if *t-Reordering* is running:
  - if VR(UX) <= VR(UR); or
  - if VR(UX) falls outside of the reordering window and VR(UX) is not equal to VR(UH)::
    - stop and reset *t-Reordering*;
- if *t-Reordering* is not running (includes the case when *t-Reordering* is stopped due to actions above):
  - if VR(UH) > VR(UR):
    - start *t-Reordering*;
    - set VR(UX) to VR(UH).

…

When *t-Reordering* expires, the receiving UM RLC entity shall:

- update VR(UR) to the SN of the first UMD PDU with SN >= VR(UX) that has not been received;
- reassemble RLC SDUs from any UMD PDUs with SN < updated VR(UR), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
- if VR(UH) > VR(UR):
  - start *t-Reordering*;
  - set VR(UX) to VR(UH).

[TS 36.322, clause 6.2.1.3]

…

An UM RLC entity is configured by RRC to use either a 5 bit SN or a 10 bit SN. When the 5 bit SN is configured, the length of the fixed part of the UMD PDU header is one byte. When the 10 bit SN is configured, the fixed part of the UMD PDU header is identical to the fixed part of the AMD PDU header, except for D/C, RF and P fields all being replaced with R1 fields. The extension part of the UMD PDU header is identical to the extension part of the AMD PDU header (regardless of the configured SN size).

…

[TS 36.322, clause 6.2.2.5]

Length: 11 bits for RLC UM, 11 bits or 15 bits for RLC AM. The length of the LI field for RLC AM is configured by upper layers.

The LI field indicates the length in bytes of the corresponding Data field element present in the RLC data PDU delivered/received by an UM or an AM RLC entity. The first LI present in the RLC data PDU header corresponds to the first Data field element present in the Data field of the RLC data PDU, the second LI present in the RLC data PDU header corresponds to the second Data field element present in the Data field of the RLC data PDU, and so on. The value 0 is reserved.

[TS 36.322, clause 6.2.2.6]

Length: 2 bits.

The FI field indicates whether a RLC SDU is segmented at the beginning and/or at the end of the Data field. Specifically, the FI field indicates whether the first byte of the Data field corresponds to the first byte of a RLC SDU, and whether the last byte of the Data field corresponds to the last byte of a RLC SDU. The interpretation of the FI field is provided in Table 6.2.2.6-1.

Table 6.2.2.6-1: FI field interpretation

Value	Description
00	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
01	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.
10	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
11	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.

[TS 36.322, clause 7.2]

a) AM_Window_Size

This constant is used by both the transmitting side and the receiving side of each AM RLC entity to calculate VT(MS) from VT(A), and VR(MR) from VR(R). AM_Window_Size = 512 when a 10 bit SN is used, AM_Window_Size = 32768 when a 16 bit SN is used.

b) UM_Window_Size

This constant is used by the receiving UM RLC entity to define SNs of those UMD PDUs that can be received without causing an advancement of the receiving window. UM_Window_Size = 16 when a 5 bit SN is configured, UM_Window_Size = 512 when a 10 bit SN is configured and UM_Window_Size = 0 when the receiving UM RLC entity is configured for MCCH, MTCH, SC-MCCH, SC-MTCH or STCH for sidelink communication.

22.3.2.6.3 Test description

22.3.2.6.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- System information combination 5 as defined in TS 36.508[18] clause 8.1.4.3.1 is used in Ncell 1.
- SCPTMConfiguration-NB as defined in TS 36.508[18] Table 8.1.6.1-15a is transmitted on SC-MCCH.

UE:

- E-UTRAN NB-IoT UE supporting SC-PTM services.

Preamble:

- UE is in NB-IoT UE Registered, Connected mode, UE Test Mode Activated (State 2A-NB) according to TS 36.508 [18] in Ncell 1(serving cell) with the UE Test Mode Activated.
- The UE is made interested in receiving SC-PTM service in the PLMN of Ncell 1 with MBMS Service ID 1.

22.3.2.6.3.2 Test procedure sequence

Table 22.3.2.6.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits an RRCConnectionRelease-NB message to release RRC connection and move to RRC_IDLE.	<--	*RRC: RRCConnectionRelease-NB*	-	-
2	Wait for a period equal to the SC-MCCH repetition period for the UE to receive *SCPTMConfiguration-NB* message.	-	-	-	-
3	The generic procedures described in TS 36.508 subclause TS 36.508, clause 8.1.5A.2.3 and 8.1.5.2B.3 is performed on Ncell 1 to close UE test loop Mode F.	-	-	-	-

}
```

22.3.2.7.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clause 5.1.3.2.1, 5.1.3.2.3, 5.1.3.2.4, 5.2.3.

[TS 36.322, clause 5.1.3.2.1]

The receiving side of an AM RLC entity shall maintain a receiving window according to state variables VR(R) and VR(MR) as follows:

- a SN falls within the receiving window if VR(R) <= SN < VR(MR);
- a SN falls outside of the receiving window otherwise.

When receiving a RLC data PDU from lower layer, the receiving side of an AM RLC entity shall:

- either discard the received RLC data PDU or place it in the reception buffer (see sub clause 5.1.3.2.2);
- if the received RLC data PDU was placed in the reception buffer:
  - update state variables, reassemble and deliver RLC SDUs to upper layer and start/stop *t-Reordering* as needed (see sub clause 5.1.3.2.3).

When *t-Reordering* expires, the receiving side of an AM RLC entity shall:

- update state variables and start *t-Reordering* as needed (see sub clause 5.1.3.2.4).

For NB-IoT;

- The receiving side of an RLC entity shall behave such that the timer values of *t-Reordering* and *t-StatusProhibit* are 0, if not configured.

[TS 36.322, clause 5.1.3.2.3]

When a RLC data PDU with SN = x is placed in the reception buffer, the receiving side of an AM RLC entity shall:

- if x >= VR(H)
  - update VR(H) to x+ 1;
- if all byte segments of the AMD PDU with SN = VR(MS) are received:
  - update VR(MS) to the SN of the first AMD PDU with SN > current VR(MS) for which not all byte segments have been received;
- if x = VR(R):
  - if all byte segments of the AMD PDU with SN = VR(R) are received:
    - update VR(R) to the SN of the first AMD PDU with SN > current VR(R) for which not all byte segments have been received;
    - update VR(MR) to the updated VR(R) + AM_Window_Size;
  - reassemble RLC SDUs from any byte segments of AMD PDUs with SN that falls outside of the receiving window and in-sequence byte segments of the AMD PDU with SN = VR(R), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in sequence if not delivered before;
- if *t-Reordering* is running:
  - if VR(X) = VR(R); or
  - if VR(X) falls outside of the receiving window and VR(X) is not equal to VR(MR):
    - stop and reset *t-Reordering*;
- if *t-Reordering* is not running (includes the case *t-Reordering* is stopped due to actions above):
  - if VR (H) > VR(R):
    - start *t-Reordering*;
    - set VR(X) to VR(H).

[TS 36.322, clause 5.1.3.2.4]

When *t-Reordering* expires, the receiving side of an AM RLC entity shall:

- update VR(MS) to the SN of the first AMD PDU with SN >= VR(X) for which not all byte segments have been received;
- if VR(H) > VR(MS):
  - start *t-Reordering*;
  - set VR(X) to VR(H).

[TS 36.322, clause 5.2.3]

Triggers to initiate STATUS reporting include:

- Polling from its peer AM RLC entity:
  - When a RLC data PDU with SN = x and the P field set to “1” is received from lower layer, the receiving side of an AM RLC entity shall:

- if the PDU is to be discarded as specified in subclause 5.1.3.2.2; or
- if x < VR(MS) or x >= VR(MR):
  - trigger a STATUS report;
- else:
  - delay triggering the STATUS report until x < VR(MS) or x >= VR(MR).

NOTE 1: This ensures that the RLC Status report is transmitted after HARQ reordering.

- Detection of reception failure of an RLC data PDU, except for an NB-IoT UE not configured with *enableStatusReportSN-Gap*:
  - The receiving side of an AM RLC entity shall trigger a STATUS report when *t-Reordering* expires.

NOTE 2: The expiry of *t-Reordering* triggers both VR(MS) to be updated and a STATUS report to be triggered, but the STATUS report shall be triggered after VR(MS) is updated.

22.3.2.7.3 Test description

22.3.2.7.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble

- The UE is in state 2B-NB according to [18] the exceptions listed in table 22.3.2.7.3.1-1 with test loop mode G closed.
- The HARQ process 0 is used for DL and UL transmissions as default.

Table 22.3.2.7.3.1-1: RLC settings

Parameter	Value
t-PollRetransmit-r13	ms4000
t-Reordering-r14	ms1600-v1310
enableStatusReportSN-Gap-r13	true

22.3.2.7.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU’s in preamble on bearer to be used, then any sequence number ‘n’ in test procedure maps as:

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.7.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
-	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence.	-	-	-	-

	Note: In steps 1 to 25 the size of each RLC UL SDU #1 - #6 is PRBS of 288 bits (36 octets). The size of the RLC SDUs used in downlink is L.				
1	The SS transmits 3 AMD PDUs with SN=0, 1, 2. The SS sets the P field of all the AMD PDUs to 0	<--	AMD PDU#1 (SN=0, P=0) AMD PDU#2 (SN=1, P=0) AMD PDU#3 (SN=2, P=0)	-	-
2	In the search space of the 4th NPDCCH period after the first transmission at step 1 the SS schedules 3 consecutive UL grants with a time spacing of 3 NPDCCH cycles of size 328 bits. (NOTE 1)	<--	(UL grants, 328 bits)	-	-
3	The UE transmits RLC UL SDU#1.	-->	(RLC UL SDU#1)	-	-
4	The UE transmits RLC UL SDU#2.	-->	(RLC UL SDU#2)	-	-
5	The UE transmits RLC UL SDU#3.	-->	(RLC UL SDU#3)	-	-
6	The SS transmits a STATUS PDU	<--	STATUS PDU	-	-
7	The SS starts the UL periodic grant transmission of size 40 bits. (NOTE 2)	-	-	-	-
8	The SS transmits 1 AMD PDUs with SN=4 and P=0. Record time T_A.	<--	AMD PDU#5 (SN=4, P=0)	-	-
9	Check 1: Does the UE transmit a Status Report with NACK_SN=3 and ACK_SN=5? Record time T_B Check 2: (T_B – T_A) = *t-Reordering*? (NOTE 3)	-->	STATUS PDU	1	P
10	The SS stops to allocate any uplink grant.	-	-	-	-
11	In the search space of the 6th NPDCCH period after step 10 the SS transmits 1 AMD PDU with SN=3. The SS sets the P field to 1.	<--	AMD PDU#4 (SN=3, P=1)	-	-
12	In the search space of the 3rd NPDCCH period after the transmission at step 11 the SS schedules 1 UL grant of size 40 bits. (NOTE 2)	<--	(UL grant, 40 bits)	-	-
13	Check: Does the UE transmit a Status Report with no NACK_SN and ACK_SN=5?	-->	STATUS PDU	-	-
14	Starting with the search space of the next NPDCCH period after the transmission at step 12 the SS schedules 2 consecutive UL grants of size 328 bits. (NOTE 1)	<--	(UL grant, 328 bits)	-	-
15	The UE transmits RLC UL SDU#4.	-->	(RLC UL SDU#4)	-	-
16	The UE transmits RLC UL SDU#5.	-->	(RLC UL SDU#5)	-	-
17	The SS transmits a STATUS PDU	<--	STATUS PDU	-	-
18	The SS starts the UL periodic grant transmission of size 40 bits. (NOTE 2)	-	-	-	-
19	In the search space of the 6th NPDCCH period after step 18 the SS transmits an AMD PDU with SN=5 and P=0.	<--	AMD PDU#6 (SN=5, P=0)	-	-
19A	In the search space of the 7th NPDCCH period after step 18 the SS transmits an AMD PDU with SN=7 and P=1.	<--	AMD PDU#8 (SN=7, P=1)	-	-
20	Check: Does the UE transmit a Status Report in next 960 ms?	-->	STATUS PDU	2	F
21	In the search space of the 15th NPDCCH period after the transmission at step 19 the SS transmits an AMD PDU with SN=6 and P=0. NOTE: AMD PDUs with SN 5, 6 and 7 carry RLC SDU #6. (NOTE 4)	<--	AMD PDU#7 (SN=6, P=0)	-	-
22	Check: Does the UE transmit a Status Report with no NACK_SN and ACK_SN=8?	-->	STATUS PDU	2	P
23	The SS stops periodic grant and assigns 1 UL grant of size 328 bits. (NOTE 1)	<--	(UL grant, 328 bits)	-	-
24	The UE transmits RLC SDU#6.	-->	(RLC SDU#6)	-	-
25	The SS transmits a STATUS PDU	<--	STATUS PDU	-	-
-	Note: In steps 26 to 48 the size of the UL RLC SDU #7-#11 used in uplink will be 32 octets.	-	-	-	-

	The size of the RLC SDUs used in downlink is L.				
26	The SS transmits one AMD PDU containing RLC DL SDU#11 (L bytes) in its data field to the UE. SN=12 indicates the loss of 4 PDUs.	<--	AMD PDU#13 (SN=12)	-	-
27	In the search space of the 3rd NPDCCH period after the transmission at step 26 the SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#7 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#9, which contained RLC DL SDU#7 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#9 (SN=8) segment 1	-	-
28	In the search space of the 6th NPDCCH period after the transmission at step 26 the SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#8 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#10, which contained RLC DL SDU#8 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#10 (SN=9) segment 2	-	-
29	In the search space of the 9th NPDCCH period after the transmission at step 26 the SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#7 in its data field to the UE. This AMD PDU segment carries part 2 of AMD PDU#9, which contained RLC DL SDU#7 (L bytes) in its data field. SO=16 and LSF=1.	<--	AMD PDU#9 (SN=8) segment 2	-	-
30	In the search space of the 12th NPDCCH period after the transmission at step 26 the SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#8 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU#10, which contained RLC DL SDU#8 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#10 (SN=9) segment 1	-	-
31	In the search space of the 15th NPDCCH period after the transmission at step 26 the SS transmits one AMD PDU segment containing 16 bytes of RLC DL SDU#10 in its data field to the UE. This AMD PDU segment carries part 1 of AMD PDU #12, which contained RLC DL SDU#10 (L bytes) in its data field. SO=0 and LSF=0.	<--	AMD PDU#12 (SN=11) segment 1	-	-
32	Wait for *t-Reordering* to run out at the UE side. (NOTE 5).				
33	In the search space of the 28th NPDCCH period after the transmission at step 26 the SS allocates one UL Grant of size 104 bits, sufficient for one RLC STATUS PDU (NOTE 5, 6).	<--	Uplink Grant	-	-
34	Check: Does the UE transmit a Status Report with NACK_SN=10, NACK_SN=11 with SOStart=16 and SOEnd=32767 (special SOEnd value), and ACK_SN=13?	-->	STATUS PDU	3	P
35	Starting with the search space of the next NPDCCH period after the transmission at step 33 the SS schedules two consecutive UL Grants of size 296 bits, each one sufficient for one RLC UL SDU to be looped back (NOTE 7).	<--	Uplink Grant	-	-
36	The UE transmits RLC UL SDU#7.	-->	(RLC UL SDU#7)	-	-
37	The UE transmits RLC UL SDU#8.	-->	(RLC UL SDU#8)	-	-
38	The SS transmits a STATUS PDU.	<--	STATUS PDU	-	-
39	The SS transmits one AMD PDU segment containing L-16 bytes of RLC DL SDU#10 in its data field to the UE. This AMD PDU segment	<--	AMD PDU#12 (SN=11) segment 2	-	-

	carries part 2 of AMD PDU#12, which contained RLC DL SDU#10 (L bytes) in its data field. SO=16 and LSF=1.				
40	Wait for t-Reordering to run out at the UE side. (NOTE 5).				
41	In the search space of the 28th NPDCCH period after the transmission at step 39 the SS schedules one UL Grant of size 40 bits, sufficient for one RLC STATUS PDU (NOTE 5, 2).	<--	Uplink Grant	-	-
42	Check: Does the UE transmit a Status Report with NACK_SN=10 and ACK_SN=13?	-->	STATUS PDU	3	P
43	The SS transmits one AMD PDU containing RLC DL SDU#9 (L bytes) in its data field to the UE.	<--	AMD PDU#11 (SN=10)	-	-
44	Starting with the search space of the 3rd NPDCCH period after the transmission at step 43 the SS schedules three consecutive UL Grants of size 296 bits, each one sufficient for one RLC UL SDU to be looped back (NOTE 7).	<--	Uplink Grant	-	-
45	The UE transmits RLC UL SDU#9.	-->	(RLC UL SDU#9)	-	-
46	The UE transmits RLC UL SDU#10.	-->	(RLC UL SDU#10)	-	-
47	The UE transmits RLC UL SDU#11.	-->	(RLC UL SDU#11)	-	-
48	The SS transmits a STATUS PDU.	<--	STATUS PDU	-	-

NOTE 1: UL grant of 328 bits (I_{TBS}=10, I_{RU}=1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time. (MAC subheader: 1 byte Short BSR subheader + 1 byte MAC PDU subheader, 1 byte Short BSR + 38 bytes MAC SDU(16-bit RLC AMD PDU header + 288-bit UL RLC SDU)).

NOTE 2: UL grant of 40 bits (I_{TBS}=3, I_{RU}=0, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and (8-bit short BSR + 2x 8-bit MAC PDU subheader + 4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 1bit padding).

NOTE 3: The Timer tolerances for t-Reordering is the transmission time of periodic grant and AMD PDU with SN=4 + handling time on UE side.

NOTE 4: With an NPDCCH period of 64ms 15 NPDCCH periods are 0.96s i.e. the transmission at step 21 happens at about 60% of t-Reordering expiry (1.6s).

NOTE 5: With an NPDCCH period of 64ms 28 NPDCCH periods are 1.792s i.e. the transmission at step 33/41 happens later than t-Reordering expiry (1.6s) + 10%.

NOTE 6: UL grant of 104 bits (I_{TBS}=3, I_{RU}=1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and 2 NACK_SNs (1 byte Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader + 1 byte Short BSR + 9 bytes RLC Status PDU (4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 12-bit NACK_SN/E1/E2 + (12-bit NACK_SN/E1/E2 + 30-bit SOstart/SOend) + 3-bit Padding)).

NOTE 7: UL grant of 296 bits (I_{TBS}=9, I_{RU}=1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 34 bytes MAC SDU(2 bytes RLC AMD PDU header + 32 bytes UL RLC SDU)).

22.3.2.7a NB-IoT / NTN / AM RLC / Receiver status triggers / extended t-Reordering configured

22.3.2.7a.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state and twoHARQ-ProcessesConfig is set to TRUE }
ensure that {
  when { t-ReorderingExt-r17 is configured }
   then { UE ignores the value signalled by t-Reordering-r14 and uses the extended value t-
ReorderingExt-r17 }
            }
```

22.3.2.7a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.322 clause 5.1.3.2.3, 5.1.3.2.4, 7.1 and TS 36.331 clause 6.7.3. Unless otherwise stated these are Rel-17 requirements.

[TS 36.322, clause 5.1.3.2.3]

When a RLC data PDU with SN = x is placed in the reception buffer, the receiving side of an AM RLC entity shall:

- if *rlc-OutOfOrderDelivery* is configured:
    - if all byte segments of the AMD PDU are received:
        - reassemble the RLC SDU using the byte segments of the AMD PDU, remove RLC headers when doing so and deliver the reassembled RLC SDU to upper layer if not delivered before;
- if x >= VR(H)
    - update VR(H) to x+ 1;
- if all byte segments of the AMD PDU with SN = VR(MS) are received:
    - update VR(MS) to the SN of the first AMD PDU with SN > current VR(MS) for which not all byte segments have been received;
- if x = VR(R):
    - if all byte segments of the AMD PDU with SN = VR(R) are received:
        - update VR(R) to the SN of the first AMD PDU with SN > current VR(R) for which not all byte segments have been received;
        - update VR(MR) to the updated VR(R) + AM_Window_Size;
    - reassemble RLC SDUs from any byte segments of AMD PDUs with SN that falls outside of the receiving window and in-sequence byte segments of the AMD PDU with SN = VR(R), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in sequence if not delivered before;
- if *t-Reordering* is running:
    - if VR(X) = VR(R); or
    - if VR(X) falls outside of the receiving window and VR(X) is not equal to VR(MR):
        - stop and reset *t-Reordering*;

- if *t-Reordering* is not running (includes the case *t-Reordering* is stopped due to actions above):
    - if VR (H) > VR(R):
        - start *t-Reordering*;
        - set VR(X) to VR(H).

[TS 36.322, clause 5.1.3.2.4]

When *t-Reordering* expires, the receiving side of an AM RLC entity shall:

- update VR(MS) to the SN of the first AMD PDU with SN >= VR(X) for which not all byte segments have been received;
- if VR(H) > VR(MS):
    - start *t-Reordering*;
    - set VR(X) to VR(H).

[TS 36.322, clause 7.1]

This sub clause describes the state variables used in AM and UM entities in order to specify the RLC protocol. The state variables defined in this subclause are normative.

All state variables and all counters are non-negative integers.

All state variables related to AM data transfer can take values from 0 to 1023 for 10 bit SN or from 0 to 65535 for 16 bit SN. All arithmetic operations contained in the present document on state variables related to AM data transfer are affected by the AM modulus (i.e. final value = [value from arithmetic operation] modulo 1024 for 10 bit SN and 65536 for 16 bit SN).

All state variables related to UM data transfer can take values from 0 to [$2^{[sn\text{-}FieldLength]}$ – 1]. All arithmetic operations contained in the present document on state variables related to UM data transfer are affected by the UM modulus (i.e. final value = [value from arithmetic operation] modulo $2^{[sn\text{-}FieldLength]}$).

AMD PDUs and UMD PDUs are numbered integer sequence numbers (SN) cycling through the field: 0 to 1023 for 10 bit SN and 0 to 65535 for 16 bit SN for AMD PDU and 0 to [$2^{[sn\text{-}FieldLength]}$ – 1] for UMD PDU.

When performing arithmetic comparisons of state variables or SN values, a modulus base shall be used.

VT(A) and VR(R) shall be assumed as the modulus base at the transmitting side and receiving side of an AM RLC entity, respectively. This modulus base is subtracted from all the values involved, and then an absolute comparison is performed (e.g. VR(R) <= SN < VR(MR) is evaluated as [VR(R) – VR(R)] modulo 1024 <= [SN – VR(R)] modulo 1024 < [VR(MR) – VR(R)] modulo 1024).

VR(UH) – UM_Window_Size shall be assumed as the modulus base at the receiving side of an UM RLC entity. This modulus base is subtracted from all the values involved, and then an absolute comparison is performed (e.g. (VR(UH) – UM_Window_Size) <= SN < VR(UH) is evaluated as [(VR(UH) – UM_Window_Size) – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$ <= [SN – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$ < [VR(UH) – (VR(UH) – UM_Window_Size)] modulo $2^{[sn\text{-}FieldLength]}$).

The transmitting side of each AM RLC entity shall maintain the following state variables:

a) VT(A) – Acknowledgement state variable

This state variable holds the value of the SN of the next AMD PDU for which a positive acknowledgment is to be received in-sequence, and it serves as the lower edge of the transmitting window. It is initially set to 0, and is updated whenever the AM RLC entity receives a positive acknowledgment for an AMD PDU with SN = VT(A).

b) VT(MS) – Maximum send state variable

This state variable equals VT(A) + AM_Window_Size, and it serves as the higher edge of the transmitting window.

c) VT(S) – Send state variable

This state variable holds the value of the SN to be assigned for the next newly generated AMD PDU. It is initially set to 0, and is updated whenever the AM RLC entity delivers an AMD PDU with SN = VT(S).

d) POLL_SN – Poll send state variable

This state variable holds the value of VT(S)-1 upon the most recent transmission of a RLC data PDU with the poll bit set to “1”. It is initially set to 0.

The transmitting side of each AM RLC entity shall maintain the following counters:

a) PDU_WITHOUT_POLL – Counter

This counter is initially set to 0. It counts the number of AMD PDUs sent since the most recent poll bit was transmitted.

b) BYTE_WITHOUT_POLL – Counter

This counter is initially set to 0. It counts the number of data bytes sent since the most recent poll bit was transmitted.

c) RETX_COUNT – Counter

This counter counts the number of retransmissions of an AMD PDU (see subclause 5.2.1). There is one RETX_COUNT counter per PDU that needs to be retransmitted.

The receiving side of each AM RLC entity shall maintain the following state variables:

a) VR(R) – Receive state variable

This state variable holds the value of the SN following the last in-sequence completely received AMD PDU, and it serves as the lower edge of the receiving window. It is initially set to 0, and is updated whenever the AM RLC entity receives an AMD PDU with SN = VR(R).

b) VR(MR) – Maximum acceptable receive state variable

This state variable equals VR(R) + AM_Window_Size, and it holds the value of the SN of the first AMD PDU that is beyond the receiving window and serves as the higher edge of the receiving window.

c) VR(X) – *t-Reordering* state variable

This state variable holds the value of the SN following the SN of the RLC data PDU which triggered *t-Reordering*.

d) VR(MS) – Maximum STATUS transmit state variable

This state variable holds the highest possible value of the SN which can be indicated by “ACK_SN” when a STATUS PDU needs to be constructed. It is initially set to 0.

e) VR(H) – Highest received state variable

This state variable holds the value of the SN following the SN of the RLC data PDU with the highest SN among received RLC data PDUs. It is initially set to 0.

Each transmitting UM RLC entity shall maintain the following state variables:

a) VT(US)

This state variable holds the value of the SN to be assigned for the next newly generated UMD PDU. It is initially set to 0, and is updated whenever the UM RLC entity delivers an UMD PDU with SN = VT(US).

Each receiving UM RLC entity shall maintain the following state variables:

a) VR(UR) – UM receive state variable

This state variable holds the value of the SN of the earliest UMD PDU that is still considered for reordering. It is initially set to 0. For RLC entity configured for STCH, it is initially set to the SN of the first received UMD PDU.

b) VR(UX) – UM *t-Reordering* state variable

This state variable holds the value of the SN following the SN of the UMD PDU which triggered *t-Reordering*.

c) VR(UH) – UM highest received state variable

This state variable holds the value of the SN following the SN of the UMD PDU with the highest SN among received UMD PDUs, and it serves as the higher edge of the reordering window. It is initially set to 0. For RLC entity configured for STCH, it is initially set to the SN of the first received UMD PDU.

[TS 36.331, clause 6.7.3]

t-ReorderingExt Timer for reordering in TS 36.322 [7], in milliseconds. The UE shall use the extended value *t-ReorderingExt-r17*, if present, and ignore the value signalled by *t-Reordering-r14*. E-UTRAN may configure *t-ReorderingExt* only if *twoHARQ-ProcessesConfig* is set to TRUE.

Conditional presence	Explanation
twoHARQ	The field is mandatory present if *twoHARQ-ProcessesConfig* is set to TRUE. Otherwise, the field is not present and, if previously configured, the timer is released.

22.3.2.7a.3 Test description

22.3.2.7a.3.1 Pre-test conditions

System Simulator:

- Ncell 1 is configured according to Table 8.1.4.2-1 and Table 8.1.4.2-2 in TS 36.508 [18].
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The preconfigured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble

- The UE is in state 2B-NB according to TS 36.508 [18] clause 8.1.5.2B with test loop mode G closed.
- The HARQ process 0 is used for DL and UL transmissions as default.

22.3.2.7a.3.2 Test procedure sequence

If the start RLC UL and DL sequence numbers to be used at start of test body are non zero, but X and Y respectively due to transmission/reception of RLC PDU's in preamble on bearer to be used, then any sequence number 'n' in test procedure maps as:

UL SQN n maps to SQN X+n MOD 1024 &

DL SQN n maps to SQN Y+n MOD 1024

Table 22.3.2.7a.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
-	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence. Note: In steps 1 to 8 the size of each RLC UL SDU #1 - #3 is PRBS of 288 bits (36 octets). The size of the RLC SDUs used in downlink is L.	-	-	-	-
1	The SS transmits 3 AMD PDUs with SN=0, 1, 2. The SS sets the P field of all the AMD PDUs to 0	<--	AMD PDU#1 (SN=0, P=0) AMD PDU#2 (SN=1, P=0) AMD PDU#3 (SN=2, P=0)	-	-

2	In the search space of the 4th NPDCCH period bundle after the first transmission at step 1 the SS schedules 3 consecutive UL grants with a time spacing of 1 NPDCCH period bundle of size 328 bits. (NOTE 1) (NOTE 4)	<--	(UL grants, 328 bits)	-	-
3	The UE transmits RLC UL SDU#1.	-->	(RLC UL SDU#1)	-	-
4	The UE transmits RLC UL SDU#2.	-->	(RLC UL SDU#2)	-	-
5	The UE transmits RLC UL SDU#3.	-->	(RLC UL SDU#3)	-	-
6	The SS transmits a STATUS PDU	<--	STATUS PDU	-	-
7	In the search space of the next NPDCCH period bundle The SS transmits 1 AMD PDUs with SN=4 and P=0. Record time TA (NOTE 4)	<--	AMD PDU#5 (SN=4, P=0)	-	-
8	In the next NPDCCH period bundle + 1 NPDCCH period after the transmission at step 7 The SS starts the UL periodic grant transmission of size 40 bits. (NOTE 2, NOTE 4, NOTE 5)	--	-	-	-
9	Check 1: Does the UE transmit a Status Report with NACK_SN=3 and ACK_SN=5? Record time T_B Check 2: (T_B – T_A) = *t-ReorderingExt-r17*? (NOTE 3)	-->	STATUS PDU	1	P
10	The SS stops to allocate any uplink grant.	-	-	-	-
11	In the search space of the next NPDCCH period bundle after step 10 the SS transmits 1 AMD PDU with SN=3. The SS sets the P field to 1. (NOTE 4)	<--	AMD PDU#4 (SN=3, P=1)	-	-
12	In the next NPDCCH period bundle after the transmission at step 11 the SS schedules 1 UL grant of size 40 bits. (NOTE 2) (NOTE 4)	<--	(UL grant, 40 bits)	-	-
13	The UE transmit a Status Report with no NACK_SN and ACK_SN=5.	-->	STATUS PDU	-	-
14	Starting with the search space of the next NPDCCH period bundle after the transmission at step 12 the SS schedules 2 consecutive UL grants with a time spacing of 1 NPDCCH period bundle of size 328 bits. (NOTE 1) (NOTE 4)	<--	(UL grant, 328 bits)	-	-
15	The UE transmits RLC UL SDU#4.	-->	(RLC UL SDU#4)	-	-
16	The UE transmits RLC UL SDU#5.	-->	(RLC UL SDU#5)	-	-
17	The SS transmits a STATUS PDU.	<--	STATUS PDU	-	-

NOTE 1: UL grant of 328 bits (I_{TBS}=10, I_{RU}=1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time. (MAC subheader: 1 byte Short BSR subheader + 1 byte MAC PDU subheader, 1 byte Short BSR + 38 bytes MAC SDU(16-bit RLC AMD PDU header + 288-bit UL RLC SDU)).

NOTE 2: UL grant of 40 bits (I_{TBS}=3, I_{RU}=0, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit a Status Report with ACK_SN and (8-bit short BSR + 2x 8-bit MAC PDU subheader + 4-bit D/C/CPT + 10-bit ACK_SN + 1-bit E1 + 1bit padding).

NOTE 3: The Timer tolerances for t-ReorderingExt is the transmission time of periodic grant and AMD PDU with SN=4 + handling time on UE side.

NOTE 4: NPDCCH period bundle is specified in TS 36.523-3 [20] clause 7A.14.2.

NOTE 5: 1 NPDCCH period is added to ensure that the UL grant is given as early as possible after the expiry of t-ReorderingExt-r17.

22.3.2.8 NB-IoT / UM RLC / Correct use of sequence numbering / Concatenation, segmentation and reassembly / Duplicate detection / User plane

22.3.2.8.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives a 5 bit SN configured UMD PDU containing a FI field set to 00 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(2)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives a 5 bit SN configured UMD PDU containing a FI field set to 01 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(3)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives a 5 bit SN configured UMD PDU containing a FI field set to 11 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(4)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives a 5 bit SN configured UMD PDU containing a FI field set to 10 }
    then { UE correctly decodes the received UMD PDU }
            }
```

(5)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { The UE receives UMD PDUs containing concatenated RLC SDUs}
    then { The UE reassembles the RLC SDUs in accordance with the Framing Info and Length Indicators
indicated in UMD PDUs }
            }
```

(6)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE transmits the first PDU }
    then { UE sets the Sequence Number field equal to 0 if RLC layer was newly established or to the
last used sequence number + 1 }
            }
```

(7)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE transmits subsequent PDUs }
    then { SN incremented by 1 for each PDU transmitted }
            }
```

(8)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { The UE has multiple RLC SDUs in the transmission buffer that fits into the available UMD
PDU size }
    then { The UE concatenates the RLC SDUs in the transmission buffer into one UMD PDU and
transmits it}
            }
```

(9)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { The UE has RLC SDU in the transmission buffer that does not fit into the available UMD PDU
size }
    then { The UE segments the RLC SDU in accordance with the Framing Info and Length Indicators
indicated in UMD PDUs }
            }
```

(10)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives a 5 bit SN configured UM PDU with Length Indicator value larger than RLC PDU
size }
    then { UE discards the RLC PDU }
            }
```

(11)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when {  UE receives duplicate UMD PDUs whose SN is within the reordering window }
    then { UE discards the duplicate UMD PDUs }
            }
```

(12)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives UM PDUs with SN gap and with t-Reordering not configured }
    then { UE delivers them to the upper layer in sequence }
            }
```

22.3.2.8.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.322, clauses 4.2.1, 5.1.2.2.1, 5.1.2.2.2, 5.1.2.2.3, 5.1.2.2.4, 6.2.1.3, 6.2.2.5, 6.2.2.6, 7.2 and TS 36.331, clauses 6.7.3.2.

[TS 36.322, clause 4.2.1]

The description in this sub clause is a model and does not specify or restrict implementations.

RRC is generally in control of the RLC configuration. For NB-IoT, RRC configurable parameters are specified in *RLC-Config-NB* [5].

…

An RLC entity can be configured to perform data transfer in one of the following three modes: Transparent Mode (TM), Unacknowledged Mode (UM) or Acknowledged Mode (AM). Consequently, an RLC entity is categorized as a TM RLC entity, an UM RLC entity or an AM RLC entity depending on the mode of data transfer that the RLC entity is configured to provide.

[TS 36.322, clause 5.1.2.2.1]

The receiving UM RLC entity shall maintain a reordering window according to state variable VR(UH) as follows:

- a SN falls within the reordering window if (VR(UH) – UM_Window_Size) <= SN < VR(UH);
- a SN falls outside of the reordering window otherwise.

When receiving an UMD PDU from lower layer, the receiving UM RLC entity shall:

- either discard the received UMD PDU or place it in the reception buffer (see sub clause 5.1.2.2.2);
- if the received UMD PDU was placed in the reception buffer:
    - update state variables, reassemble and deliver RLC SDUs to upper layer and start/stop *t-Reordering* as needed (see sub clause 5.1.2.2.3);

When *t-Reordering* expires, the receiving UM RLC entity shall:

- update state variables, reassemble and deliver RLC SDUs to upper layer and start *t-Reordering* as needed (see sub clause 5.1.2.2.4).

For NB-IoT:

- The receiving side of an RLC entity shall behave such that the timer value of *t-Reordering* is 0, if not configured.

[TS 36.322, clause 5.1.2.2.2]

When an UMD PDU with SN = x is received from lower layer, the receiving UM RLC entity shall:

- if VR(UR) < x < VR(UH) and the UMD PDU with SN = x has been received before; or
- if (VR(UH) – UM_Window_Size) <= x < VR(UR):
    - discard the received UMD PDU;
- else:
    - place the received UMD PDU in the reception buffer.

[TS 36.322, clause 5.1.2.2.3]

When an UMD PDU with SN = x is placed in the reception buffer, the receiving UM RLC entity shall:

…

- if x falls outside of the reordering window:
  - update VR(UH) to x + 1;
  - reassemble RLC SDUs from any UMD PDUs with SN that falls outside of the reordering window, remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
  - if VR(UR) falls outside of the reordering window:
    - set VR(UR) to (VR(UH) – UM_Window_Size);
- if an UMD PDU with SN = VR(UR) has already been received:
  - update VR(UR) to the SN of the first UMD PDU with SN > current VR(UR) that has not been received;
  - reassemble RLC SDUs from any UMD PDUs with SN < updated VR(UR), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
- if *t-Reordering* is running:
  - if VR(UX) <= VR(UR); or
  - if VR(UX) falls outside of the reordering window and VR(UX) is not equal to VR(UH)::
    - stop and reset *t-Reordering*;
- if *t-Reordering* is not running (includes the case when *t-Reordering* is stopped due to actions above):
  - if VR(UH) > VR(UR):
    - start *t-Reordering*;
    - set VR(UX) to VR(UH).

[TS 36.322, clause 5.1.2.2.4]

When *t-Reordering* expires, the receiving UM RLC entity shall:

- update VR(UR) to the SN of the first UMD PDU with SN >= VR(UX) that has not been received;
- reassemble RLC SDUs from any UMD PDUs with SN < updated VR(UR), remove RLC headers when doing so and deliver the reassembled RLC SDUs to upper layer in ascending order of the RLC SN if not delivered before;
- if VR(UH) > VR(UR):
  - start *t-Reordering*;
  - set VR(UX) to VR(UH).

[TS 36.322, clause 6.2.1.3]

…

Except for NB-IoT, an UM RLC entity is configured by RRC to use either a 5 bit SN or a 10 bit SN. For NB-IoT, an UM RLC entity uses a 5 bit SN. When the 5 bit SN is used, the length of the fixed part of the UMD PDU header is one byte. When the 10 bit SN is used, the fixed part of the UMD PDU header is identical to the fixed part of the AMD PDU header, except for D/C, RF and P fields all being replaced with R1 fields. The extension part of the UMD PDU header is identical to the extension part of the AMD PDU header (regardless of the configured SN size).

…

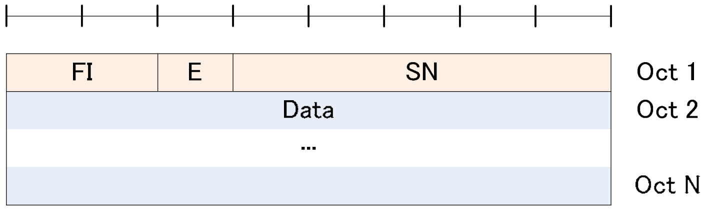

Figure 6.2.1.3-1: UMD PDU with 5 bit SN (No LI)

…

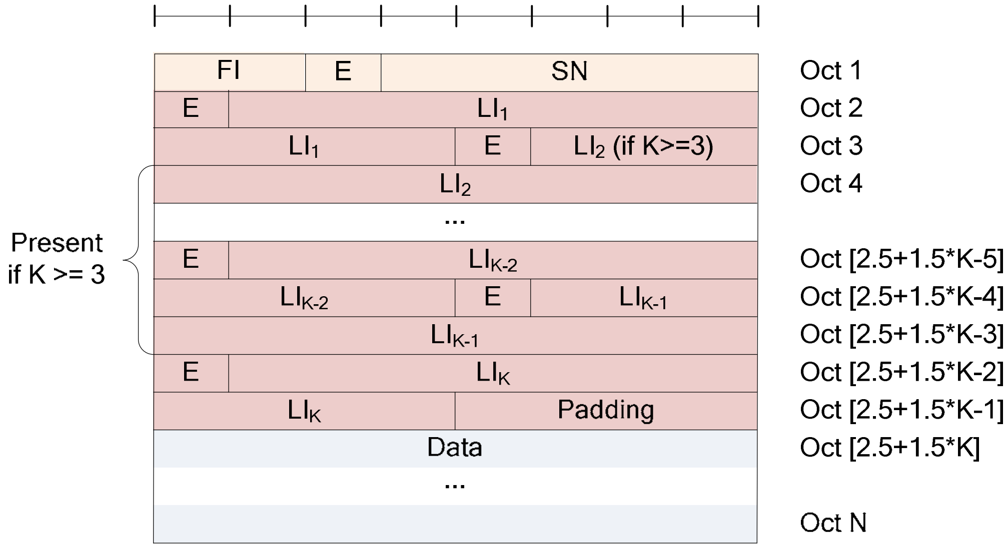

Figure 6.2.1.3-3: UMD PDU with 5 bit SN (Odd number of LIs, i.e. K = 1, 3, 5, …)

[TS 36.322, clause 6.2.2.5]

Length: 11 bits for RLC UM, 11 bits or 15 bits for RLC AM. The length of the LI field for RLC AM is configured by upper layers.

The LI field indicates the length in bytes of the corresponding Data field element present in the RLC data PDU delivered/received by an UM or an AM RLC entity. The first LI present in the RLC data PDU header corresponds to the first Data field element present in the Data field of the RLC data PDU, the second LI present in the RLC data PDU header corresponds to the second Data field element present in the Data field of the RLC data PDU, and so on. The value 0 is reserved.

[TS 36.322, clause 6.2.2.6]

Length: 2 bits.

The FI field indicates whether a RLC SDU is segmented at the beginning and/or at the end of the Data field. Specifically, the FI field indicates whether the first byte of the Data field corresponds to the first byte of a RLC SDU, and whether the last byte of the Data field corresponds to the last byte of a RLC SDU. The interpretation of the FI field is provided in Table 6.2.2.6-1.

Table 6.2.2.6-1: FI field interpretation

Value	Description
00	First byte of the Data field corresponds to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
01	First byte of the Data field corresponds to the first byte of a RLC SDU.

	Last byte of the Data field does not correspond to the last byte of a RLC SDU.
10	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field corresponds to the last byte of a RLC SDU.
11	First byte of the Data field does not correspond to the first byte of a RLC SDU. Last byte of the Data field does not correspond to the last byte of a RLC SDU.

[TS 36.322, clause 7.2]

…

b) UM_Window_Size

This constant is used by the receiving UM RLC entity to define SNs of those UMD PDUs that can be received without causing an advancement of the receiving window. UM_Window_Size = 16 when a 5 bit SN is used, UM_Window_Size = 512 when a 10 bit SN is used and UM_Window_Size = 0 when the receiving UM RLC entity is configured for MCCH, MTCH, SC-MCCH, SC-MTCH or STCH for sidelink communication.

[TS 36.331, clause 6.7.3.2]

The IE *RLC-Config-NB* is used to specify the RLC configuration of SRBs and DRBs.

RLC-Config-NB information element

```
-- ASN1START

RLC-Config-NB-r13 ::=   CHOICE  {
    am                      SEQUENCE {
        ul-AM-RLC-r13               UL-AM-RLC-NB-r13,
        dl-AM-RLC-r13               DL-AM-RLC-NB-r13
    },
    ...,
    um-Bi-Directional-r15       NULL,
    um-Uni-Directional-UL-r15   NULL,
    um-Uni-Directional-DL-r15   NULL
}
```

[TS 36.323, clause 6.2.4]

Figure 6.2.4.1 shows the format of the PDCP Data PDU when a 7 bit SN length is used. This format is applicable for PDCP Data PDUs carrying data from DRBs mapped on RLC UM or in NB-IoT DRBs mapped on RLC AM and on RLC UM.

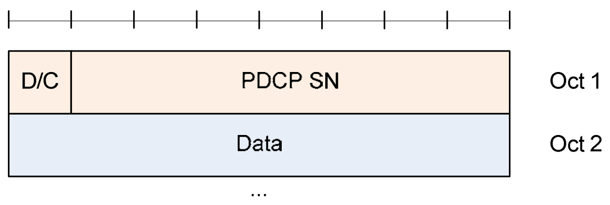

Figure 6.2.4.1: PDCP Data PDU format for DRBs using 7 bit SN

22.3.2.8.3 Test description

22.3.2.8.3.1 Pre-test conditions

System Simulator:

- Ncell 1

UE:

None.

Preamble:

- The UE is in state 3A-NB according to [18] with test loop mode A activated.

22.3.2.8.3.2 Test procedure sequence

Table 22.3.2.8.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
0A-0H	The generic test procedure in TS 36.508 clause 8.1.5A.9 is performed to establish radio bearers with the RLC UM settings in User Plane.	-	-	-	-
0I-0J	The generic test procedures in TS 36.508 clause 8.1.5.2B.3 is performed to close UE test loop Mode A.	-	-	-	-
-	Note: In steps 1 to 9 the size of the RLC SDUs will be 34 octets.	-	-	-	-
1	The SS does not respond to PRACH preambles transmitted by UE for Uplink transmission, but instead allocates the UL C-RNTI grant on NPDCCH when specified in the test sequence.	-	-	-	-

14	In the search space of the 3rd NPDCCH period after the transmission at step 13 the SS schedules three UL Grants of size 176 bits, each one sufficient for one segment of RLC UL SDU to be looped back (Note 3).	-	-	-	-
15	Check: Does UE transmit first part (18 octets) of RLC SDU#5 within UMD PDU with FI field set to ‘01’ and E field in the fixed part set to ‘0’?	-->	(first part of RLC UL SDU#5) (SN=3)	9	P
16	Check: Does UE transmit second part (18 octets) of RLC SDU#5 within an UMD PDU with FI field set to ‘11’and E field in the fixed part set to ‘0’?	-->	(second part of RLC UL SDU#5) (SN=4)	9	P
17	Check: Does UE transmit last part (18 octets) of RLC SDU#5 within an UMD PDU with FI field set to ‘10’and E field in the fixed part set to ‘0’?	-->	(last part of RLC UL SDU#5) (SN=5)	9	P
-	Note: In steps 18 to 25 the size of the RLC SDUs will be 17 octets.	-	-	-	-
18	The SS transmits UMD PDU#7 containing first segment (9 octets) of RLC SDU#6 (FI field = 01).	<--	UMD PDU#7 (SN=6)	-	-
19	In the NPDCCH period following step 18 the SS transmits UMD PDU#8 containing last segment (8 octets) of RLC SDU#6, first segment (9 octets) of RLC SDU#7 and with Length Indicator that points beyond the end of the UMD PDU#8 (FI field = 11).	<--	UMD PDU#8 (SN=7)	-	-
20	In the NPDCCH period following step 19 the SS transmits UMD PDU#9 containing last segment (8 octets) of RLC SDU#7 and a complete RLC SDU#8 (FI field = 10).	<--	UMD PDU#9 (SN=8)	-	-
21	In the search space of the 3rd NPDCCH period after the transmission at step 20 the SS schedules one UL Grant of size 328 bits, sufficient for one RLC UL SDU to be looped back (Note 4).	<--	Uplink Grant	-	-
22	Check: Does the UE transmit an UMD PDU with SN = 6 containing RLC SDU#8?	-->	(RLC UL SDU#8) (SN=6)	10	P
23	The SS transmits UMD PDU#11 containing a complete RLC SDU#9(FI field = 00).	<--	UMD PDU#11 (SN=10)	-	-
24	In the search space of the 3rd NPDCCH period after the transmission at step 23 the SS schedules one UL Grant of size 176 bits, sufficient for one RLC UL SDU to be looped back (Note 5).	<--	Uplink Grant	-	-
25	Check: Does the UE transmit an UMD PDU with SN = 7 containing RLC SDU#9?	-->	(RLC UL SDU#9) (SN=7)	12	P
26	The SS transmits UMD PDU#1 containing a complete RLC SDU#1 (FI field = 00) same as step 2.	<--	UMD PDU#1 (SN=0)	-	-
27	In the search space of the 3rd NPDCCH period after the transmission at step 26 the SS schedules one UL Grant of size 328 bits, sufficient for one RLC UL SDU to be looped back (Note 1).	<--	Uplink Grant	-	-
28	Check: Does the UE transmit an UMD PDU with SN = 0 containing RLC SDU#1 in the next 5s?	-->	(RLC UL SDU#1) (SN=0)	11	F
Note 1: UL grant of 328 bits (I_{TBS}=10, I_{RU}=1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 1 byte Padding subheader, 1 byte Short BSR + 35 bytes MAC SDU(1 byte RLC UMD PDU header + 34 bytes UL RLC SDU) + 1 byte Padding).					

Note 2:	UL grant of 328 bits (I_{TBS}=10, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 37 bytes MAC SDU (3 bytes RLC UMD PDU header + 2*17 bytes UL RLC SDU)).
Note 3:	UL grant of 176 bits (I_{TBS}=1, I_{RU} =4, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 19 bytes MAC SDU(1 byte RLC UMD PDU header + 18 bytes one part of UL RLC SDU)).
Note 4:	UL grant of 328 bits (I_{TBS}=10, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Short BSR subheader + 2 bytes MAC SDU subheader + 1 byte Padding subheader, 1 byte Short BSR + 18 bytes MAC SDU(1 byte RLC UMD PDU header + 17 bytes UL RLC SDU) + 18 bytes Padding).
Note 5:	UL grant of 176 bits (I_{TBS}=1, I_{RU} =4, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time (MAC subheader: 1 byte Padding subheader + 1 byte Short BSR subheader + 1 byte MAC SDU subheader, 1 byte Short BSR + 18 bytes MAC SDU(1 byte RLC UMD PDU header + 17 bytes UL RLC SDU)).

```
with { UE in E-UTRA RRC_CONNECTED state and network decides to use User plane CIoT EPS optimisation
OR S1-U Data Transfer Only based on the UE capability }
ensure that {
  when { UE transmits a PDCP Data SDU on a DRB mapped on AM RLC }
    then { UE increments SN with 1 for each transmitted PDU for SN=0 to Maximum_PDCP_SN }
}
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state and network decides to use User plane CIoT EPS optimisation
OR S1-U Data Transfer Only based on the UE capability }
```

```
ensure that {
  when { UE transmits a PDCP Data SDU on a DRB mapped on AM RLC and, after incrementation,
Next_PDCP_TX_SN is larger than the Maximum_PDCP_SN }
    then { UE sets SN to 0 in the next transmitted PDCP SDU}
}
```

22.3.3.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.323 clause 5.1.1, 5.1.2.2 and 6.2.4.

[TS 36.323, clause 5.1.1]

At reception of a PDCP SDU from upper layers, the UE shall:

- start the discardTimer associated with this PDCP SDU (if configured);

For a PDCP SDU received from upper layers, the UE shall:

- associate the PDCP SN corresponding to Next_PDCP_TX_SN to this PDCP SDU;

NOTE: Associating more than half of the PDCP SN space of contiguous PDCP SDUs with PDCP SNs, when e.g., the PDCP SDUs are discarded or transmitted without acknowledgement, may cause HFN desynchronization problem. How to prevent HFN desynchronization problem is left up to UE implementation.

- perform header compression of the PDCP SDU (if configured) as specified in the subclause 5.5.4;
- perform integrity protection (if applicable), and ciphering (if applicable) using COUNT based on TX_HFN and the PDCP SN associated with this PDCP SDU as specified in the subclause 5.7 and 5.6, respectively;
- increment Next_PDCP_TX_SN by one;
- if Next_PDCP_TX_SN > Maximum_PDCP_SN:
  - set Next_PDCP_TX_SN to 0;
  - increment TX_HFN by one;
- submit the resulting PDCP Data PDU to lower layer.

[TS 36.323, clause 5.1.2.1.2]

For DRBs mapped on RLC AM, when the reordering function is not used, at reception of a PDCP Data PDU from lower layers, the UE shall:

- if received PDCP SN – Last_Submitted_PDCP_RX_SN > Reordering_Window or 0 <= Last_Submitted_PDCP_RX_SN – received PDCP SN < Reordering_Window:
  - if received PDCP SN > Next_PDCP_RX_SN:
    - decipher the PDCP PDU as specified in the subclause 5.6, using COUNT based on RX_HFN - 1 and the received PDCP SN;
  - else:
    - decipher the PDCP PDU as specified in the subclause 5.6, using COUNT based on RX_HFN and the received PDCP SN;
  - perform header decompression (if configured) as specified in the subclause 5.5.5;
  - discard this PDCP SDU;
- else if Next_PDCP_RX_SN – received PDCP SN > Reordering_Window:
  - increment RX_HFN by one;
  - use COUNT based on RX_HFN and the received PDCP SN for deciphering the PDCP PDU;

        - set Next_PDCP_RX_SN to the received PDCP SN + 1;
    - else if received PDCP SN – Next_PDCP_RX_SN >= Reordering_Window:
        - use COUNT based on RX_HFN – 1 and the received PDCP SN for deciphering the PDCP PDU;
    - else if received PDCP SN >= Next_PDCP_RX_SN:
        - use COUNT based on RX_HFN and the received PDCP SN for deciphering the PDCP PDU;
        - set Next_PDCP_RX_SN to the received PDCP SN + 1;
        - if Next_PDCP_RX_SN is larger than Maximum_PDCP_SN:
            - set Next_PDCP_RX_SN to 0;
            - increment RX_HFN by one;
    - else if received PDCP SN < Next_PDCP_RX_SN:
        - use COUNT based on RX_HFN and the received PDCP SN for deciphering the PDCP PDU;
    - if the PDCP PDU has not been discarded in the above:
        - perform deciphering and header decompression (if configured) for the PDCP PDU as specified in the subclauses 5.6 and 5.5.5, respectively;
        - if a PDCP SDU with the same PDCP SN is stored:
            - discard this PDCP SDU;
        - else:
            - store the PDCP SDU;
        - if the PDCP PDU received by PDCP is not due to the re-establishment of lower layers:
            - deliver to upper layers in ascending order of the associated COUNT value:
                - all stored PDCP SDU(s) with an associated COUNT value less than the COUNT value associated with the received PDCP SDU;
                - all stored PDCP SDU(s) with consecutively associated COUNT value(s) starting from the COUNT value associated with the received PDCP SDU;
            - set Last_Submitted_PDCP_RX_SN to the PDCP SN of the last PDCP SDU delivered to upper layers;.
        - else if received PDCP SN = Last_Submitted_PDCP_RX_SN + 1 or received PDCP SN = Last_Submitted_PDCP_RX_SN – Maximum_PDCP_SN:
            - deliver to upper layers in ascending order of the associated COUNT value:
                - all stored PDCP SDU(s) with consecutively associated COUNT value(s) starting from the COUNT value associated with the received PDCP SDU;
            - set Last_Submitted_PDCP_RX_SN to the PDCP SN of the last PDCP SDU delivered to upper layers.

[TS 36.323, clause 6.2.4]

Figure 6.2.4.1 shows the format of the PDCP Data PDU when a 7 bit SN length is used. This format is applicable for PDCP Data PDUs carrying data from DRBs mapped on RLC UM or in NB-IoT DRBs mapped on RLC AM.

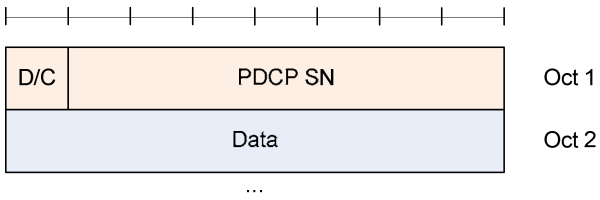

Figure 6.2.4.1: PDCP Data PDU format for DRBs using 7 bit SN

22.3.3.1.3 Test description

22.3.3.1.3.1 Pre-test conditions

System Simulator

- Ncell 1
- SS PDCP set to Transparent Mode

UE:

None.

Preamble

- The UE shall be in state 2B-NB with test loop mode A according to TS 36.508.

      then { UE performs correct UP ciphering function in PDCP entities associated with DRBs }
}
```

22.3.3.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.323, clause 5.6, clause 5.7, clause 5.1.2.2, TS 33.401, clause 5.1.3.2, clause 5.1.4.2 and TS 36.331, clause 6.3.3.

[TS 36.323, clause 5.6]

The ciphering function includes both ciphering and deciphering and is performed in PDCP. For the control plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3) and the MAC-I (see subclause 6.3.4). For the user plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3); ciphering is not applicable to PDCP Control PDUs.

For RNs, for the user plane, in addition to the data part of the PDCP PDU, the MAC-I (see 6.3.4) is also ciphered if integrity protection is configured.

The ciphering algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the ciphering method shall be applied as specified in [6].

The ciphering function is activated by upper layers [3]. After security activation, the ciphering function shall be applied to all PDCP PDUs indicated by upper layers [3] for the downlink and the uplink, respectively.

For downlink and uplink ciphering and deciphering, the parameters that are required by PDCP for ciphering are defined in [6] and are input to the ciphering algorithm. The required inputs to the ciphering function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]).The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3]);
- KEY (the ciphering keys for the control plane and for the user plane are K_{RRCenc} and K_{UPenc}, respectively).

[TS 36.323, clause 5.7]

The integrity protection function includes both integrity protection and integrity verification and is performed in PDCP for PDCP entities associated with SRBs and the SLRB that needs integrity protection. The data unit that is integrity protected is the PDU header and the data part of the PDU before ciphering.

For RNs, the integrity protection function is performed also for PDCP entities associated with DRBs if integrity protection is configured.

The integrity protection algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the integrity protection method shall be applied as specified in [6].

The integrity protection function is activated by upper layers [3]. After security activation, the integrity protection function shall be applied to all PDUs including and subsequent to the PDU indicated by upper layers [3] for the downlink and the uplink, respectively.

NOTE: As the RRC message which activates the integrity protection function is itself integrity protected with the configuration included in this RRC message, this message needs first be decoded by RRC before the integrity protection verification could be performed for the PDU in which the message was received.

For downlink and uplink integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3])
- KEY (K_{RRCint})
- for RNs, KEY (K_{UPint})

For the SLRB that needs integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value and DIRECTION (which value shall be set is specified in [13]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6])
- KEY (PIK)

At transmission, the UE computes the value of the MAC-I field and at reception it verifies the integrity of the PDCP PDU by calculating the X-MAC based on the input parameters as specified above. If the calculated X-MAC corresponds to the received MAC-I, integrity protection is verified successfully.

[TS 36.323, clause 5.1.2.2]

- if integrity verification is not applicable:
  - if received PDCP SN < Next_PDCP_RX_SN:
    - increment RX_HFN by one;
  - set Next_PDCP_RX_SN to the received PDCP SN + 1;
  - if Next_PDCP_RX_SN > Maximum_PDCP_SN:

        - set Next_PDCP_RX_SN to 0;
        - increment RX_HFN by one;
    - deliver the resulting PDCP SDU to upper layer;
- else, if integrity verification is applicable and the integrity verification fails:
    - discard the received PDCP Data PDU;
    - indicate the integrity verification failure to upper layer.

[TS 33.401, clause 5.1.3.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key except Null ciphering algorithm.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Encryption Algorithm (EEA) will be assigned a 4-bit identifier. Currently, the following values have been defined for NAS, RRC and UP ciphering:

"0001_2" 128-EEA1 SNOW 3G based algorithm

"0010_2" 128-EEA2 AES based algorithm

"0011_2" 128-EEA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement EEA0, 128-EEA1 and 128-EEA2 for both RRC signalling ciphering and UP ciphering. UEs and eNBs may implement 128-EEA3 for both RRC signalling ciphering and UP ciphering.

UEs and MMEs shall implement EEA0, 128-EEA1 and 128-EEA2 for NAS signalling ciphering. UEs and MMEs may implement 128-EEA3 for NAS signalling ciphering.

[TS 33.401, clause 5.1.4.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Integrity Algorithm (EIA) will be assigned a 4-bit identifier. Currently, the following values have been defined:

"0000_2" EIA0 Null Integrity Protection algorithm

"0001_2" 128-EIA1 SNOW 3G based algorithm

"0010_2" 128-EIA2 AES based algorithm

"0011_2" 128-EIA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement 128-EIA1 and 128-EIA2 for RRC signalling integrity protection. UEs and eNBs may implement 128-EIA3 for RRC signalling integrity protection.

UEs and MMEs shall implement 128-EIA1 and 128-EIA2 for NAS signalling integrity protection. UEs and MMEs may implement 128-EIA3 for NAS signalling integrity protection.

UEs shall implement EIA0 for integrity protection of NAS and RRC signalling. As specified in clause 5.1.4.1 of this specification, EIA0 is only allowed for unauthenticated emergency calls. EIA0 shall not be used for integrity protection between RN and DeNB.

Implementation of EIA0 in MMEs, RNs and eNBs is optional, EIA0, if implemented, shall be disabled in MMEs, RNs and eNBs in the deployments where support of unauthenticated emergency calling is not a regulatory requirement.

[TS 36.331, clause 6.3.3]

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm (SRBs) and AS ciphering algorithm (SRBs and DRBs). For RNs, the IE *SecurityAlgorithmConfig* is also used to configure AS integrity protection algorithm for DRBs between the RN and the E-UTRAN.

…

Table 22.3.3.2.2-1: *SecurityAlgorithmConfig* field descriptions

cipheringAlgorithm Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.401 [32, 5.1.3.2].
integrityProtAlgorithm Indicates the integrity protection algorithm to be used for SRBs, as specified in TS 33.401 [32, 5.1.4.2]. For RNs, also indicates the integrity protection algorithm to be used for integrity protection-enabled DRB(s).

22.3.3.2.3 Test description

22.3.3.3.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.323, clause 5.6, clause 5.7, clause 5.1.2.2, TS 33.401, clause 5.1.3.2, clause 5.1.4.2 and TS 36.331, clause 6.3.3.

[TS 36.323, clause 5.6]

The ciphering function includes both ciphering and deciphering and is performed in PDCP. For the control plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3) and the MAC-I (see subclause 6.3.4). For the user plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3); ciphering is not applicable to PDCP Control PDUs.

For RNs, for the user plane, in addition to the data part of the PDCP PDU, the MAC-I (see 6.3.4) is also ciphered if integrity protection is configured.

The ciphering algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the ciphering method shall be applied as specified in [6].

The ciphering function is activated by upper layers [3]. After security activation, the ciphering function shall be applied to all PDCP PDUs indicated by upper layers [3] for the downlink and the uplink, respectively.

For downlink and uplink ciphering and deciphering, the parameters that are required by PDCP for ciphering are defined in [6] and are input to the ciphering algorithm. The required inputs to the ciphering function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]).The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3]);
- KEY (the ciphering keys for the control plane and for the user plane are K_{RRCenc} and K_{UPenc}, respectively).

[TS 36.323, clause 5.7]

The integrity protection function includes both integrity protection and integrity verification and is performed in PDCP for PDCP entities associated with SRBs and the SLRB that needs integrity protection. The data unit that is integrity protected is the PDU header and the data part of the PDU before ciphering.

For RNs, the integrity protection function is performed also for PDCP entities associated with DRBs if integrity protection is configured.

The integrity protection algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the integrity protection method shall be applied as specified in [6].

The integrity protection function is activated by upper layers [3]. After security activation, the integrity protection function shall be applied to all PDUs including and subsequent to the PDU indicated by upper layers [3] for the downlink and the uplink, respectively.

NOTE: As the RRC message which activates the integrity protection function is itself integrity protected with the configuration included in this RRC message, this message needs first be decoded by RRC before the integrity protection verification could be performed for the PDU in which the message was received.

For downlink and uplink integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3]);
- KEY (K_{RRCint}).
- for RNs, KEY (K_{UPint})

For the SLRB that needs integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value and DIRECTION (which value shall be set is specified in [13]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]);
- KEY (PIK).

At transmission, the UE computes the value of the MAC-I field and at reception it verifies the integrity of the PDCP PDU by calculating the X-MAC based on the input parameters as specified above. If the calculated X-MAC corresponds to the received MAC-I, integrity protection is verified successfully.

[TS 36.323, clause 5.1.2.2]

- if integrity verification is not applicable:
  - if received PDCP SN < Next_PDCP_RX_SN:
    - increment RX_HFN by one;
  - set Next_PDCP_RX_SN to the received PDCP SN + 1;
  - if Next_PDCP_RX_SN > Maximum_PDCP_SN:
    - set Next_PDCP_RX_SN to 0;
    - increment RX_HFN by one;
  - deliver the resulting PDCP SDU to upper layer;
- else, if integrity verification is applicable and the integrity verification fails:
  - discard the received PDCP Data PDU;
  - indicate the integrity verification failure to upper layer.

[TS 33.401, clause 5.1.3.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key except Null ciphering algorithm.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Encryption Algorithm (EEA) will be assigned a 4-bit identifier. Currently, the following values have been defined for NAS, RRC and UP ciphering:

"0001_2" 128-EEA1 SNOW 3G based algorithm

"0010_2" 128-EEA2 AES based algorithm

"0011_2" 128-EEA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement EEA0, 128-EEA1 and 128-EEA2 for both RRC signalling ciphering and UP ciphering. UEs and eNBs may implement 128-EEA3 for both RRC signalling ciphering and UP ciphering.

UEs and MMEs shall implement EEA0, 128-EEA1 and 128-EEA2 for NAS signalling ciphering. UEs and MMEs may implement 128-EEA3 for NAS signalling ciphering.

[TS 33.401, clause 5.1.4.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Integrity Algorithm (EIA) will be assigned a 4-bit identifier. Currently, the following values have been defined:

"0000_2" EIA0 Null Integrity Protection algorithm

"0001_2" 128-EIA1 SNOW 3G based algorithm

"0010_2" 128-EIA2 AES based algorithm

"0011_2" 128-EIA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement 128-EIA1 and 128-EIA2 for RRC signalling integrity protection. UEs and eNBs may implement 128-EIA3 for RRC signalling integrity protection.

UEs and MMEs shall implement 128-EIA1 and 128-EIA2 for NAS signalling integrity protection. UEs and MMEs may implement 128-EIA3 for NAS signalling integrity protection.

UEs shall implement EIA0 for integrity protection of NAS and RRC signalling. As specified in clause 5.1.4.1 of this specification, EIA0 is only allowed for unauthenticated emergency calls. EIA0 shall not be used for integrity protection between RN and DeNB.

Implementation of EIA0 in MMEs, RNs and eNBs is optional, EIA0, if implemented, shall be disabled in MMEs, RNs and eNBs in the deployments where support of unauthenticated emergency calling is not a regulatory requirement.

[TS 36.331, clause 6.3.3]

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm (SRBs) and AS ciphering algorithm (SRBs and DRBs). For RNs, the IE *SecurityAlgorithmConfig* is also used to configure AS integrity protection algorithm for DRBs between the RN and the E-UTRAN.

…

***SecurityAlgorithmConfig* field descriptions**
cipheringAlgorithm Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.401 [32, 5.1.3.2].
integrityProtAlgorithm Indicates the integrity protection algorithm to be used for SRBs, as specified in TS 33.401 [32, 5.1.4.2]. For RNs, also indicates the integrity protection algorithm to be used for integrity protection-enabled DRB(s).

22.3.3.4.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.323, clause 5.6, clause 5.7, clause 5.1.2.2, TS 33.401, clause 5.1.3.2, clause 5.1.4.2 and TS 36.331, clause 6.3.3.

[TS 36.323, clause 5.6]

The ciphering function includes both ciphering and deciphering and is performed in PDCP. For the control plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3) and the MAC-I (see subclause 6.3.4). For the user plane, the data unit that is ciphered is the data part of the PDCP PDU (see subclause 6.3.3); ciphering is not applicable to PDCP Control PDUs.

For RNs, for the user plane, in addition to the data part of the PDCP PDU, the MAC-I (see 6.3.4) is also ciphered if integrity protection is configured.

The ciphering algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the ciphering method shall be applied as specified in [6].

The ciphering function is activated by upper layers [3]. After security activation, the ciphering function shall be applied to all PDCP PDUs indicated by upper layers [3] for the downlink and the uplink, respectively.

For downlink and uplink ciphering and deciphering, the parameters that are required by PDCP for ciphering are defined in [6] and are input to the ciphering algorithm. The required inputs to the ciphering function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]).The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3]);
- KEY (the ciphering keys for the control plane and for the user plane are K_{RRCenc} and K_{UPenc}, respectively).

[TS 36.323, clause 5.7]

The integrity protection function includes both integrity protection and integrity verification and is performed in PDCP for PDCP entities associated with SRBs and the SLRB that needs integrity protection. The data unit that is integrity protected is the PDU header and the data part of the PDU before ciphering.

For RNs, the integrity protection function is performed also for PDCP entities associated with DRBs if integrity protection is configured.

The integrity protection algorithm and key to be used by the PDCP entity are configured by upper layers [3] and the integrity protection method shall be applied as specified in [6].

The integrity protection function is activated by upper layers [3]. After security activation, the integrity protection function shall be applied to all PDUs including and subsequent to the PDU indicated by upper layers [3] for the downlink and the uplink, respectively.

NOTE: As the RRC message which activates the integrity protection function is itself integrity protected with the configuration included in this RRC message, this message needs first be decoded by RRC before the integrity protection verification could be performed for the PDU in which the message was received.

For downlink and uplink integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value, and DIRECTION (direction of the transmission: set as specified in [6]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]. It will use the value RB identity –1 as in [3]);
- KEY (K_{RRCint}).
- for RNs, KEY (K_{UPint})

For the SLRB that needs integrity protection and verification, the parameters that are required by PDCP for integrity protection are defined in [6] and are input to the integrity protection algorithm. The required inputs to the integrity protection function include the COUNT value and DIRECTION (which value shall be set is specified in [13]). The parameters required by PDCP which are provided by upper layers [3] are listed below:

- BEARER (defined as the radio bearer identifier in [6]);
- KEY (PIK).

At transmission, the UE computes the value of the MAC-I field and at reception it verifies the integrity of the PDCP PDU by calculating the X-MAC based on the input parameters as specified above. If the calculated X-MAC corresponds to the received MAC-I, integrity protection is verified successfully.

[TS 36.323, clause 5.1.2.2]

- if integrity verification is not applicable:
  - if received PDCP SN < Next_PDCP_RX_SN:
    - increment RX_HFN by one;
  - set Next_PDCP_RX_SN to the received PDCP SN + 1;
  - if Next_PDCP_RX_SN > Maximum_PDCP_SN:
    - set Next_PDCP_RX_SN to 0;
    - increment RX_HFN by one;
  - deliver the resulting PDCP SDU to upper layer;
- else, if integrity verification is applicable and the integrity verification fails:
  - discard the received PDCP Data PDU;
  - indicate the integrity verification failure to upper layer.

[TS 33.401, clause 5.1.3.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key except Null ciphering algorithm.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Encryption Algorithm (EEA) will be assigned a 4-bit identifier. Currently, the following values have been defined for NAS, RRC and UP ciphering:

"0001_2" 128-EEA1 SNOW 3G based algorithm

"0010_2" 128-EEA2 AES based algorithm

"0011_2" 128-EEA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement EEA0, 128-EEA1 and 128-EEA2 for both RRC signalling ciphering and UP ciphering. UEs and eNBs may implement 128-EEA3 for both RRC signalling ciphering and UP ciphering.

UEs and MMEs shall implement EEA0, 128-EEA1 and 128-EEA2 for NAS signalling ciphering. UEs and MMEs may implement 128-EEA3 for NAS signalling ciphering.

[TS 33.401, clause 5.1.4.2]

All algorithms specified in this subclause are algorithms with a 128-bit input key.

NOTE: Deviations from the above requirement have to be indicated explicitly in the algorithm identifier list below.

Each EPS Integrity Algorithm (EIA) will be assigned a 4-bit identifier. Currently, the following values have been defined:

"0000_2" EIA0 Null Integrity Protection algorithm

"0001_2" 128-EIA1 SNOW 3G based algorithm

"0010_2" 128-EIA2 AES based algorithm

"0011_2" 128-EIA3 ZUC based algorithm

The remaining values have been reserved for future use.

UEs and eNBs shall implement 128-EIA1 and 128-EIA2 for RRC signalling integrity protection. UEs and eNBs may implement 128-EIA3 for RRC signalling integrity protection.

UEs and MMEs shall implement 128-EIA1 and 128-EIA2 for NAS signalling integrity protection. UEs and MMEs may implement 128-EIA3 for NAS signalling integrity protection.

UEs shall implement EIA0 for integrity protection of NAS and RRC signalling. As specified in clause 5.1.4.1 of this specification, EIA0 is only allowed for unauthenticated emergency calls. EIA0 shall not be used for integrity protection between RN and DeNB.

Implementation of EIA0 in MMEs, RNs and eNBs is optional, EIA0, if implemented, shall be disabled in MMEs, RNs and eNBs in the deployments where support of unauthenticated emergency calling is not a regulatory requirement.

[TS 36.331, clause 6.3.3]

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm (SRBs) and AS ciphering algorithm (SRBs and DRBs). For RNs, the IE *SecurityAlgorithmConfig* is also used to configure AS integrity protection algorithm for DRBs between the RN and the E-UTRAN.

…

Table 22.3.3.4.2-1: *SecurityAlgorithmConfig* field descriptions

cipheringAlgorithm Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.401 [32, 5.1.3.2].
integrityProtAlgorithm Indicates the integrity protection algorithm to be used for SRBs, as specified in TS 33.401 [32, 5.1.4.2]. For RNs, also indicates the integrity protection algorithm to be used for integrity protection-enabled DRB(s).

   then { UE transmits next PDCP Data PDU with SN value 0 }
            }
```

22.3.3.5.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.331 clause 5.3.3.4a and 3GPP TS 36.523 clause 5.2.1.2

[TS 36.331, clause 5.3.3.4a]

Reception of the *RRCConnectionResume* by the UE

1> stop timer T300;

1> restore the PDCP state and re-establish PDCP entities for SRB2 and all DRBs;

1> if *drb-ContinueROHC* is included:

2> indicate to lower layers that stored UE AS context is used and that *drb-ContinueROHC* is configured;

2> continue the header compression protocol context for the DRBs configured with the header compression protocol;

1> else:

2> indicate to lower layers that stored UE AS context is used;

2> reset the header compression protocol context for the DRBs configured with the header compression protocol;

1> discard the stored UE AS context and *resumeIdentity*;

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10;

1> resume SRB2 and all DRBs;

…

[TS 36.323, clause 5.2.1.2]

When upper layers request a PDCP re-establishment, the UE shall:

- reset the header compression protocol for uplink and start with an IR state in U-mode [9] [11] if the DRB is configured with the header compression protocol and *drb-ContinueROHC* is not configured [3];
- set Next_PDCP_TX_SN, and TX_HFN to 0;
- apply the ciphering algorithm and key provided by upper layers during the re-establishment procedure;
- if connected as an RN, apply the integrity protection algorithm and key provided by upper layers (if configured) during the re-establishment procedure;
- for each PDCP SDU already associated with a PDCP SN but for which a corresponding PDU has not previously been submitted to lower layers:
  - consider the PDCP SDUs as received from upper layer;
  - perform transmission of the PDCP SDUs in ascending order of the COUNT value associated to the PDCP SDU prior to the PDCP re-establishment, as specified in the subclause 5.1.1 without restarting the *discardTimer*.

22.3.3.6 NB-IoT / PDCP Discard

22.3.3.6.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
    when { the Discard Timer for a PDCP SDU expires }
      then { UE discards the corresponding PDCP SDU }
            }
```

22.3.3.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: 3GPP TS 36.323 clause 5.9

[TS 36.323, clause 5.4]

When the Discard_Timer expires for a PDCP SDU, or the successful delivery of a PDCP SDU is confirmed by PDCP status report, the UE shall discard the PDCP SDU along with the corresponding PDCP PDU. If the corresponding PDCP PDU has already been submitted to lower layers the discard is indicated to lower layers.

22.3.3.6.3 Test description

22.3.3.6.3.1 Pre-test conditions

System Simulator:

- Ncell 1 according to TS 36.508 [18] Table 8.1.4.2-1A.

UE:

None.

Preamble:

- The UE is in state Loopback Activated for UE test loop mode A (State 2B-NB) on Ncell 1 (serving cell) according to TS 36.508 [18] clause 8.1.5.2A with the exceptions listed in table 22.3.3.6.3.1-1 applicable for the configured AM DRB.

Table 22.3.3.6.3.1-1: PDCP Settings

Parameter	Value
discardTimer-r13	5120 ms

22.3.3.6.3.2 Test procedure sequence

Table 22.3.3.6.2-1: Main behaviour

St	Procedure	Message Sequence	TP	Verdict

		U - S	Message		
1	The SS creates 5 PDCP Data PDUs with 32 bytes of different SDU data each and the Next_PDCP_TX_SN is set to "0".	-	-	-	-
-	EXCEPTION: Step 2 shall be repeated for k=0 to 2 (increment=1) with the below specified PDU sent to the UE: Data PDU#1 for k=0 Data PDU#2 for k=1 Data PDU#3 for k=2	-	-		-
2	The SS sends a PDCP Data PDU via RLC-AM RB with the following content to the UE: D/C field = 1 (PDCP Data PDU) and PDCP SN = k After having sent a PDU, the SS sets Next_PDCP_TX_SN = k+1.	<-	PDCP DATA PDU (SN=k)		-
3	Wait for Discard_Timer to expire. Note: Timer tolerances according to TS 36.508 [18] clause 8.3.7 are applied.	-	-		-
-	EXCEPTION: Step 4 shall be repeated for k=3 to 4 (increment=1) with the below specified PDU sent to the UE: Data PDU#4 for k=3 Data PDU#5 for k=4	-	-		-
4	The SS sends a PDCP Data PDU via RLC-AM RB with the following content to the UE: D/C field = 1 (PDCP Data PDU) and PDCP SN = k After having sent a PDU, the SS set Next_PDCP_TX_SN = k+1.	<-	PDCP DATA PDU (SN=k)		-
5	The SS allocates UL grant of size 296 bits for the next NPDCCH period (Note 3).	-	-		-
6	Check: Does UE transmit a PDCP Data PDU # 4? (Note 2)	->	PDCP Data PDU # 4	1	P
7	Check: Does UE transmit a PDCP Data PDU # 5? (Note 2)	->	PDCP Data PDU # 5	1	P
NOTE 1: Void. NOTE 2: PDCP Data PDU contents are checked to verify that the UL PDU is same as the DL P DU. According to the note in TS 36.323 [38] clause 5.1.1 in case of PDCP SDUs being dicarded it is up to UE implementation which SN to be used and therefore the SN cannot be checked. NOTE 3: UL grant of 296 bits (ITBS=9, I_{RU} =1, see TS 36.213 Table 16.5.1.2-2) is chosen to allow the UE to transmit one PDU at a time. (MAC subheader: 1 byte Padding subheader + 1 byte MAC SDU subheader, 35 bytes MAC SDU(2 bytes RLC AMD PDU header + 1 byte PDCP PDU header + 32 bytes UL RLC SDU))DU.

  when { UE receives a Direct Indication Information message with the bit corresponding to
systemInfoModification-eDRX set to 1}
    then { UE re-acquires and applies the new system information from the next eDRX acquisition
period defined by H-SFN mod 1024 = 0  }
            }
```

22.4.1.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304, clause 7.3, TS 36.331, clauses 5.2.1.3, 5.2.2.4, 5.3.2.3 and 6.7.5. Unless and otherwise stated these are Rel-13 requirements.

[TS 36.304, clause 7.3]

The UE may be configured by upper layers with an extended DRX (eDRX) cycle T_{eDRX}. The UE may operate in extended DRX only if the cell indicates support for eDRX in System Information.

If the UE is configured with a T_{eDRX} cycle of 512 radio frames, it monitors POs as defined in 7.1 with parameter T = 512. Otherwise, a UE configured with eDRX monitors POs as defined in 7.1 (i.e., based on the upper layer configured DRX value and a default DRX value determined in 7.1), during a periodic Paging Time Window (PTW) configured for the UE or until a paging message including the UE's NAS identity is received for the UE during the PTW, whichever is earlier. The PTW is UE-specific and is determined by a Paging Hyperframe (PH), a starting position within the PH (PTW_start) and an ending position (PTW_end). PH, PTW_start and PTW_end are given by the following formulae:

The PH is the H-SFN satisfying the following equation:

H-SFN mod $T_{eDRX,H}$= (UE_ID_H mod $T_{eDRX,H}$), where

- UE_ID_H:

  - 10 most significant bits of the Hashed ID, if P-PRNTI is monitored on PDCCH or MPDCCH

  - 12 most significant bits of the Hashed ID, if P-RNTI is monitored on NPDCCH

IMSI mod 1024

- $T_{eDRX,H}$: eDRX cycle of the UE in Hyper-frames, ($T_{eDRX,H}$ =1, 2, …, 256 Hyper-frames) (for NB-IoT, $T_{eDRX,H}$ =2, …, 1024 Hyper-frames) and configured by upper layers.

PTW_start denotes the first radio frame of the PH that is part the PTW and has SFN satisfying the following equation:

SFN = 256* i_{eDRX}, where

- i_{eDRX} = floor(UE_ID_H /$T_{eDRX,H}$) mod 4

PTW_end is the last radio frame of the PTW and has SFN satisfying the following equation:

SFN = (PTW_start + L*100 - 1) mod 1024, where

- L = Paging Time Window length (in seconds) configured by upper layers

Hashed ID is defined as follows:

Hashed_ID is the Cyclic Redundancy Check value of b_{31}, b_{30}…, b_0 of S-TMSI, computed according to CRC-32 algorithm in [34], and

S-TMSI = <b_{39}, b_{38}, …, b_0> as defined in [35]

[TS 36.331, clause 5.2.1.3]

Change of system information (other than for ETWS, CMAS and EAB parameters and other than for AB parameters for NB-IoT) only occurs at specific radio frames, i.e. the concept of a modification period is used. System information may be transmitted a number of times with the same content within a modification period, as defined by its scheduling. The modification period boundaries are defined by SFN values for which SFN mod *m*= 0, where *m* is the number of radio frames comprising the modification period. The modification period is configured by system information. If H-SFN is provided in *SystemInformationBlockType1-BR*, modification period boundaries for BL UEs and UEs in CE are defined by SFN values for which (H-SFN * 1024 + SFN) mod *m*=0. For NB-IoT, H-SFN is always provided and the modification period boundaries are defined by SFN values for which (H-SFN * 1024 + SFN) mod *m*=0.

To enable system information update notification for RRC_IDLE UEs configured to use a DRX cycle longer than the modification period, an eDRX acquisition period is defined. The boundaries of the eDRX acquisition period are determined by H-SFN values for which H-SFN mod 256 =0. For NB-IoT, the boundaries of the eDRX acquisition period are determined by H-SFN values for which H-SFN mod 1024 =0.

When the network changes (some of the) system information, it first notifies the UEs about this change, i.e. this may be done throughout a modification period. In the next modification period, the network transmits the updated system information. These general principles are illustrated in figure 5.2.1.3-1, in which different colours indicate different system information. Upon receiving a change notification, the UE not configured to use a DRX cycle that is longer than the modification period acquires the new system information immediately from the start of the next modification period. Upon receiving a change notification applicable to eDRX, a UE in RRC_IDLE configured to use a DRX cycle that is longer than the modification period acquires the updated system information immediately from the start of the next eDRX acquisition period. The UE applies the previously acquired system information until the UE acquires the new system information. The possible boundaries of modification for *SystemInformationBlockType1-BR* are defined by SFN values for which SFN mod 512 = 0 except for notification of ETWS/CMAS for which the eNB may change *SystemInformationBlockType1-BR* content at any time. For NB-IoT, the possible boundaries of modification for *SystemInformationBlockType1-NB* are defined by SFN values for which (H-SFN * 1024 + SFN) mod 4096 = 0.

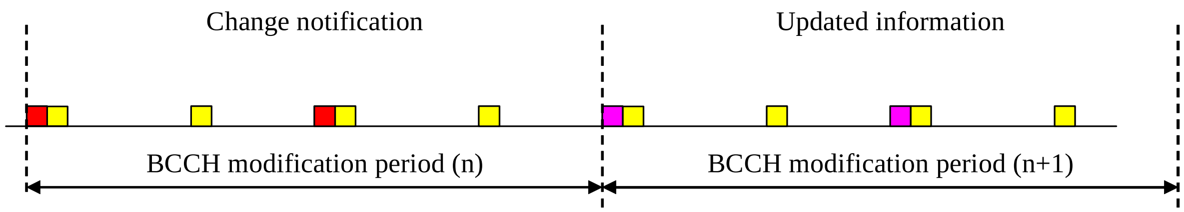

Figure 5.2.1.3-1: Change of system Information

The *Paging* message is used to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about a system information change. If the UE is in RRC_CONNECTED or is not configured to use a DRX cycle longer than the modification period in RRC_IDLE, and receives a *Paging* message including the *systemInfoModification*, it knows that the system information will change at the next modification period boundary. If a UE in RRC_IDLE is configured to use a DRX cycle longer than the modification period, and the notification is received in a *Paging* message including the *systemInfoModification-eDRX*, it acquires the updated system information at the next eDRX acquisition period boundary. Although the UE may be informed about changes in system information, no further details are provided e.g. regarding which system information will change, except if *systemInfoValueTagSI* is received by BL UEs or UEs in CE.

In RRC_CONNECTED, BL UEs or UEs in CE or NB-IoT UEs are not required to acquire system information except when T311 is running or upon handover where the UE is only required to acquire the *MasterInformationBlock* in the target PCell. In RRC_IDLE, E-UTRAN may notify BL UEs or UEs in CE or NB-IoT UEs about SI update, and except for NB-IoT, ETWS and CMAS notification and EAB modification, using Direct Indication information, as specified in 6.6 (or 6.7.5 in NB-IoT) and TS 36.212 [22].

…

For BL UEs or UEs in CE or NB-IoT UEs, the change of specific SI message can additionally be indicated by a SI message specific value tag *systemInfoValueTagSI*. If *systemInfoValueTag* included in the *SystemInformationBlockType1-BR* (or *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* in NB-IoT) is different from the one of the stored system information and if *systemInfoValueTagSI* is included in the *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) for a specific SI message and is different from the stored one, the UE shall consider this specific SI message to be invalid. If only *systemInfoValueTag* is included and is different from the stored one, the BL UE or UE in CE should consider any stored system information except *SystemInformationBlockType10*, *SystemInformationBlockType11*, *SystemInformationBlockType12* and *SystemInformationBlockType14* to be invalid; the NB-IoT UE should consider any stored system information except *SystemInformationBlockType14-NB* to be invalid.

[TS 36.331, clause 5.2.2.4]

The UE shall:

1> apply the specified BCCH configuration defined in 9.1.1.1 or BR-BCCH configuration defined in 9.1.1.8;

1> if the procedure is triggered by a system information change notification:

2> if the UE uses an idle DRX cycle longer than the modification period:

3> start acquiring the required system information, as defined in 5.2.2.3, from the next eDRX acquisition period boundary;

[TS 36.331, clause 5.3.2.3]

Upon receiving the *Paging* message, the UE shall:

1> if in RRC_IDLE, for each of the *PagingRecord*, if any, included in the *Paging* message:

2> if the *ue-Identity* included in the *PagingRecord* matches one of the UE identities allocated by upper layers:

3> forward the *ue-Identity* and, except for NB-IoT, the *cn-Domain* to the upper layers;

1> if the *systemInfoModification* is included; or

1> if the UE is configured with a DRX cycle longer than the modification period and the *systemInfoModification-eDRX* is included:

2> re-acquire the required system information using the system information acquisition procedure as specified in 5.2.2

[TS 36.331, clause 6.7.5]

Direct Indication information is transmitted on NPDCCH using P-RNTI but without associated *Paging-NB* message. Table 6.7.5-1 defines the Direct Indication information, see TS 36.212 [22, 6.4.3.3].

When bit n is set to 1, the UE shall behave as if the corresponding field is set in the *Paging-NB* message, see 5.3.2.3. Bit 1 is the least significant bit.

Table 6.7.5-1: Direct Indication information

Bit	Field in *Direct Indication information*
1	*systemInfoModification*
2	*systemInfoModification-eDRX*
3, 4, 5, 6, 7, 8	Not used, and shall be ignored by UE if received

22.4.1.3 Test description

22.4.1.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- The UE is configured to request the use of eDRX (in the ATTACH REQUEST and TRACKING AREA UPDATE REQUEST messages).

- The UE sends “extended DRX parameters IE” in ATTACH REQUEST message and receives “extended DRX parameters IE” in ATTACH ACCEPT message.- The eDRX value in ATTACH ACCEPT is set to a value such that the eDRX cycle is longer than the System Information Modification period.

- The UE is in state Registered, Idle mode (State 3-NB) according to [18].

22.4.2 NB-IoT / RRC / Paging for connection in idle mode / Multiple paging records / Shared network environment

22.4.2.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state in a cell which has broadcasted SystemInformationBlockType1-NB message
including multiple PLMN identities }
ensure that {
  when { UE receives a Paging-NB message including IE ue-Identity set to the S-TMSI which was
allocated to the UE during registration }
    then { UE successfully establishes the RRC connection }
            }
```

(2)

```
with { UE in RRC_IDLE state which has broadcasted SystemInformationBlockType1-NB message including
multiple PLMN identities }
ensure that {
  when { UE receives a Paging-NB message including multiple paging records with unmatched identities
}
    then { UE does not establish any RRC connection }
            }
```

(3)

```
with { UE in RRC_IDLE state in a cell which has broadcasted SystemInformationBlockType1-NB message
including multiple PLMN identities }
ensure that {
  when { UE receives a Paging-NB message including multiple paging records with only one matched
identity}
    then { UE successfully establishes the RRC connection }
            }
```

22.4.2.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.3.2.3, 5.3.3.2, 5.3.3.3, 5.3.3.4. Unless and otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.2.3]

Upon receiving the *Paging* message, the UE shall:

1> if in RRC_IDLE, for each of the *PagingRecord*, if any, included in the *Paging* message:

2> if the *ue-Identity* included in the *PagingRecord* matches one of the UE identities allocated by upper layers:

3> forward the *ue-Identity* and, except for NB-IoT, the *cn-Domain* to the upper layers;

[TS 36.331, clause 5.3.3.2]

…

For NB-IoT, upon initiation of the procedure, the UE shall:

…

1> if the UE is establishing an RRC connection:

2> initiate transmission of the *RRCConnectionRequest* message in accordance with 5.3.3.3;

[TS 36.331, clause 5.3.3.4]

The UE shall:

…

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10;

1> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo* or inherited from another RAT;

1> stop timer T300;

1> stop timer T302, if running;

1> stop timer T303, if running;

1> stop timer T305, if running;

1> stop timer T306, if running;

1> stop timer T308, if running;

1> perform the actions as specified in 5.3.3.7;

1> stop timer T320, if running;

1> stop timer T350, if running;

1> perform the actions as specified in 5.6.12.4;

1> release *rclwi-Configuration*, if configured, as specified in 5.6.16.2;

1> stop timer T360, if running;

1> enter RRC_CONNECTED;

1> stop the cell re-selection procedure;

1> consider the current cell to be the PCell;

1> set the content of *RRCConnectionSetupComplete* message as follows:

2> if the *RRCConnectionSetup* is received in response to an *RRCConnectionResumeRequest*:

3> if upper layers provide an S-TMSI:

4> set the *s-TMSI* to the value received from upper layers;

2> set the *selectedPLMN-Identity* to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]) from the PLMN(s) included in the *plmn-IdentityList* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB* in NB-IoT);

2> if upper layers provide the 'Registered MME', include and set the *registeredMME* as follows:

3> if the PLMN identity of the 'Registered MME' is different from the PLMN selected by the upper layers:

4> include the *plmnIdentity* in the *registeredMME* and set it to the value of the PLMN identity in the 'Registered MME' received from upper layers;

3> set the *mmegi* and the *mmec* to the value received from upper layers;

2> except for NB-IoT, if upper layers provided the 'Registered MME':

3> include and set the *gummei-Type* to the value provided by the upper layers;

2> if the UE supports CIoT EPS optimisation(s):

3> include a*ttachWithoutPDN-Connectivity* if received from upper layers;

3> include *up-CIoT-EPS-Optimisation* if received from upper layers;

3> except for NB-IoT, include *cp-CIoT-EPS-Optimisation* if received from upper layers;

2> if connecting as an RN:

3> include the *rn-SubframeConfigReq*;

2> set the *dedicatedInfoNAS* to include the information received from upper layers;

…

2> submit the *RRCConnectionSetupComplete* message to lower layers for transmission, upon which the procedure ends;

22.4.2.3 Test description

22.4.2.3.1 Pre-test conditions

System Simulator:

- Ncell 1 (primary PLMN: same MCC like HPLMN but different MNC, secondary PLMN: HPLMN).

UE:

None.

Preamble:

- The UE is in state Registered, Idle mode (State 3-NB) according to [18].

22.4.2.3.2 Test procedure sequence

Table 22.4.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits a *Paging-NB* message including a matched identity	<--	*Paging-NB*	-	-
2	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.2 indicate that the UE successfully responds to Paging for control plane CIoT MT access?	-	-	1	P
3	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*		
4	The SS transmits a *Paging-NB* message including only unmatched identities (incorrect S-TMSI).	<--	*Paging-NB*	-	-
5	Check: Does the NB-IoT UE transmit an *RRCConnectionRequest-NB* message within 10s?	-->	*RRCConnectionRequest-NB*	2	F
6	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.2 indicate that the UE successfully responds to Paging for control plane CIoT MT access?	-	-	3	-
7	The SS transmits an *RRCConnectionRelease-NB* message.	<--	*RRCConnectionRelease-NB*	-	-

            }
```

22.4.4.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clause 5.3.3.14, 5.2.2.4.

[TS 36.331, clause 5.2.2.4]

1> if the UE is a NB-IoT UE connected to EPC and if *ab-Enabled* included in *MasterInformationBlock-NB* / MasterInformationBlock-TDD-NB is set to *TRUE*:

2> not initiate the RRC connection establishment/resume procedure for all access causes except mobile terminating calls until the UE has acquired the *SystemInformationBlockType14-NB*;

[TS 36.331, clause 5.3.3.14]

The UE shall:

1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:

2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:

3> if the *ab-Common* is included in *ab-Param:*

4> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Common*; and

4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Common* is set to *one*:

5> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Common*:

6> consider access to the cell as not barred;

5> else:

6> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Common* is set to *zero*:

NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

7> consider access to the cell as not barred;

6> else:

7> consider access to the cell as barred;

4> else:

5> consider access to the cell as not barred;

22.4.4.3 Test description

22.4.4.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.4.4.3.1–1.

- The PLMNs are identified in the test by the identifiers in Table 22.4.4.3.1–1.

Table 22.4.4.3.1–1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

- System information combination 4 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;

- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 13 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.

- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.4.4.3.1–2.

Table 22.4.4.3.1–2: USIM configuration

USIM field	Value	Access Technology Identifier
EF_{IMSI}	The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	

$EF_{PLMNwAcT}$	PLMN2 Remaining mandatory entries use default values	All specified E-UTRAN
$EF_{OPLMNwACT}$	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	PLMN4	E-UTRAN
EF_{ACC}	Type "A" as defined in TS 34.108 clause 8.3.2.15	

- The UE belong to access class 0

Preamble:

- The UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G on Ncell 13 according to [18]

22.4.4.3.2 Test procedure sequence

Table 22.4.4.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked "T1", "T2" etc are applied at the points indicated in the Main behaviour description in Table 22.4.4.3.2-2. Cell powers are chosen for a serving cell and a non-suitable "Off" cell as defined in TS 36.508 Table 8.3.2.2.1-1.

Table 22.4.4.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Remarks
T0	NRS EPRE	dBm/15kHz	"Off"	"Off"	-85	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	"Off"	-85	-120	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-85	-120	"Off"	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1

Table 22.4.4.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict

36a1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB	-->	NAS: ESM DATA TRANSPORT	-	-
36b1	The SS waits for Timer_1 expiry	-	-	-	-
37	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
38	SS adjusts *MasterInformationBlock-NB* /MasterInformationBlock-TDD-NB of Ncell 1 with ab-Enabled-r13/ ab-Enabled-r15 set to TRUE *and SystemInformationBlockType14-NB* of Ncell 1 with ab-Category set to 'b'	-	-	-	-
39	The SS notifies the UE of change of System Information	<--	*Paging-NB*	-	-
40	Wait for 2.1* modification period (Note 6) to allow the new system information to take effect.	-	-	-	-
41	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed	-	-	-	-
41A	The SS transmits a CLOSE UE TEST LOOP message to close the UE test loop mode for user data transfer (15 sec delay).	<--	RRC: *DLInformationTransfer-NB* TC: CLOSE UE TEST LOOP	-	-
41B	The UE transmits a CLOSE UE TEST LOOP COMPLETE message to confirm that loopback is activated.	-->	RRC: *ULInformationTransfer-NB* TC: CLOSE UE TEST LOOP COMPLETE	-	-

42	The SS transmits one IP packet to the UE embedded in a ESM DATA TRANSPORT and DLInformationTransfer-NB	<--	NAS: ESM DATA TRANSPORT	-	-
43	Wait for 1 s after the IP packet has been transmitted. (Note 1)	-	-	-	-
44	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
45	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 1 with establishmentCause-r13 set to mo-Data?	-->	*RRCConnectionRequest-NB*	4	P
46-48	Steps 2 to 4 of the 'Generic Test Procedure NB-IoT Control Plan CIoT MO user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.3.3 are performed NOTE: The UE will transmit one ESM DATA TRANSPORT message containing loopback data received in step 43.	-	-	-	-
49	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
50	SS adjusts *SystemInformationBlockType14-NB* of Ncell 1 with ab-Category set to ‘a’	-	-	-	-
50 A	Wait for 1.28 seconds (Note 5) to allow the new system information to take effect.	-	-	-	-
51	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed	-	-	8	P
51 A	The SS transmits a CLOSE UE TEST LOOP message to close the UE test loop mode for user data transfer (15 sec delay).	<--	RRC: *DLInformationTransfer-NB* TC: CLOSE UE TEST LOOP	-	-
51 B	The UE transmits a CLOSE UE TEST LOOP COMPLETE message to confirm that loopback is activated.	-->	RRC: *ULInformationTransfer-NB* TC: CLOSE UE TEST LOOP COMPLETE	-	-
52	The SS transmits one IP packet to the UE embedded in a ESM DATA TRANSPORT and DLInformationTransfer-NB	<--	NAS: ESM DATA TRANSPORT	-	-
53	Wait for 1 s after the IP packet has been transmitted. (Note 1)	-	-	-	-
54	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
55	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 1 within 30s?	-->	*RRCConnectionRequest-NB*	5	F
56	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed (Note 4)	-	-	-	-
56 A	The SS starts timer Timer_1 = 8 s	-	-	-	-
-	EXCEPTION: Steps 56Ba1 to 56Bb1 describe a transaction that depends on the UE behaviour; the “lower case letter” identifies a test sequence that takes place if a specific behaviour happens (Note 4)	-	-	-	-
56 Ba 1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB	-->	NAS: ESM DATA TRANSPORT	-	-
56 Bb 1	The SS waits for Timer_1 expiry	-	-	-	-
57	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
Note 1: The 1 second delay is used to secure that the UE have received and forwarded the IP Packet transmitted by the SS to the UE test loop function before the *RRCConnectionRelease-NB* message is sent by the SS. Note 2: A UE may send the pending data sent at step 6					

Note 3:	A UE may send the pending data sent at step 29
Note 4:	A UE may send the pending data sent at step 52
Note 5:	The 1.28 seconds (2* SIB14 schedule periodicity) delay is used to ensure that updated SIB 14 is transmitted.
Note 6:	The wait time of 2.1* modification period is to allow for the network to page the system information change during the next modification period, and update the system information at the subsequent modification period. UE should acquire the updated system information within 90ms of the start of modification period.

22.4.5 NB-IoT / RRC connection establishment / Paging / Access Barring for UE with AC 11 to 15 / ab-Category a, b and c

22.4.5.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state on VPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
broadcasts SystemInformationBlockType14-NB and ab-Category set to c }
ensure that {
  when { UE has user data pending }
    then { UE does not transmit RRC Connection Request-NB message }
            }
```

(2)

```
with { UE in RRC_IDLE state on OPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
broadcasts SystemInformationBlockType14-NB and ab-Category set to c }
ensure that {
  when { UE has user data pending }
```

```
    then { UE transmits RRC Connection Request-NB message }
            }
```

(3)

```
with { UE in RRC_IDLE state on OPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
broadcasts SystemInformationBlockType14-NB and ab-Category set to b }
ensure that {
  when { UE has user data pending }
    then { UE does not transmit RRC Connection Request-NB message }
            }
```

(4)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
broadcasts SystemInformationBlockType14-NB and ab-Category set to b }
ensure that {
  when { UE has user data pending }
    then { UE transmits RRC Connection Request-NB message }
           }
```

(5)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB and broadcasts
SystemInformationBlockType14-NB and ab-Category set to a }
ensure that {
  when { UE has user data pending }
    then { UE does not transmit RRC Connection Request-NB message }
            }
```

(6)

```
with { Access to the cell barred for mo-data because UE belongs to ab-Category ‘c’ and having an
Access Class with a value in the range 11..15 }
ensure that {
  when { UE receives paging }
    then { UE transmits RRC Connection Request-NB message }
            }
```

(7)

```
with { Access to the cell barred for mo-data because UE belongs to ab-Category ‘b’ and having an
Access Class with a value in the range 11..15 }
ensure that {
  when { UE receives paging }
    then { UE transmits RRC Connection Request-NB message }
            }
```

(8)

```
with { Access to the cell barred for mo-data because UE belongs to ab-Category ‘a’ and having an
Access Class with a value in the range 11..15 }
ensure that {
  when { UE receives paging }
    then { UE transmits RRC Connection Request-NB message }
            }
```

(9)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
broadcasts SystemInformationBlockType14-NB with a special access class bitmap different from the
special access class bitmap set in USIM and ab-Category set to a }
ensure that {
  when { UE has user data pending }
    then { UE transmits RRC Connection Request-NB message }
            }
```

22.4.5.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clause 5.3.3.14, 5.2.2.4.

[TS 36.331, clause 5.2.2.4]

1> if the UE is a NB-IoT UE connected to EPC and if *ab-Enabled* included in *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* is set to *TRUE*:

2> not initiate the RRC connection establishment/resume procedure for all access causes except mobile terminating calls until the UE has acquired the *SystemInformationBlockType14-NB*;

[TS 36.331, clause 5.3.3.14]

The UE shall:

1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:

2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:

3> if the *ab-Common* is included in *ab-Param:*

4> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Common*; and

4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Common* is set to *one*:

5> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Common*:

6> consider access to the cell as not barred;

5> else:

6> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Common* is set to *zero*:

NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

7> consider access to the cell as not barred;

6> else:

7> consider access to the cell as barred;

4> else:

5> consider access to the cell as not barred;

22.4.5.3 Test description

22.4.5.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.4.5.3.1–1.
- The PLMNs are identified in the test by the identifiers in Table 22.4.5.3.1–1.

Table 22.4.5.3.1–1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

- System information combination 4 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;
- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 13 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.4.5.3.1–2.

Table 22.4.5.3.1–2: USIM configuration

USIM field	Value	Access Technology Identifier
EF_{IMSI}	The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	
$EF_{PLMNwAcT}$	PLMN2 Remaining mandatory entries use default values	All specified E-UTRAN
$EF_{OPLMNwACT}$	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	PLMN4	E-UTRAN
EF_{ACC}	Type “C” as defined in TS 34.108 clause 8.3.2.15	

- The UE belong to access class 0 and special access class 11 and 15

Preamble:

- The UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G on Ncell 13 according to [18]

22.4.5.3.2 Test procedure sequence

Table 22.4.5.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked “T1”, “T2” etc are applied at the points indicated in the Main behaviour description in Table 22.4.5.3.2-2. Cell powers are chosen for a serving cell and a non-suitable “Off” cell as defined in TS 36.508 Table 8.3.2.2.1-1.

Table 22.4.5.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Remarks
T0	NRS EPRE	dBm/15kHz	“Off”	“Off”	-85	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	“Off”	-85	-120	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-85	-120	“Off”	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1

Table 22.4.5.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
2	SS adjusts *MasterInformationBlock-NB/MasterInformationBlock-TDD-NB* of Ncell 13 with ab-Enabled-r13/ab-Enabled-r15 set to TRUE *and SystemInformationBlockType14-NB* of Ncell 13 with ab-Category set to 'c'	-	-	-	-
3	The SS notifies the UE of change of System Information	<--	*Paging-NB*	-	-
4	Wait for 2.1* modification period (Note 6) to allow the new system information to take effect.	-	-	-	-
5	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed	-	-	6	P
6	The SS transmits one IP packet to the UE embedded in a ESM DATA TRANSPORT and DLInformationTransfer-NB	<--	NAS: ESM DATA TRANSPORT	-	-
7	Wait for 1 s after the IP packet has been transmitted. (Note 1)	-	-	-	-
8	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
9	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 13 within 30s?	-->	*RRCConnectionRequest-NB*	1	F
10	SS adjusts cell levels according to row T1 of table 22.4.5.3.2-1	-	-	-	-
11	Steps 1 to 5 of Generic test procedure in TS 36.508 subclause 8.1.5A.5 takes place on Ncell 12. NOTE: The UE performs a TAU procedure	-	-	-	-
12	The SS starts timer Timer_1 = 8 s	-	-	-	-
-	EXCEPTION: Steps 13a1 to 13b1 describe a transaction that depends on the UE behaviour; the "lower case letter" identifies a test sequence that takes place if a specific behaviour happens (Note 2)	-	-	-	-
13a1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB	-->	NAS: ESM DATA TRANSPORT	-	-
13b1	The SS waits for Timer_1 expiry	-	-	-	-
14	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
15	SS adjusts *MasterInformationBlock-NB/MasterInformationBlock-TDD-NB* of Ncell 12 with ab-Enabled-r13/ab-Enabled-r15 set to TRUE *and SystemInformationBlockType14-NB* of Ncell 12 with ab-Category set to 'c'	-	-	-	-
16	The SS notifies the UE of change of System Information	<--	*Paging-NB*	-	-
17	Wait for 2.1* modification period (Note 6) to allow the new system information to take effect.	-	-	-	-
18	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed	-	-	-	-
18A	The SS transmits a CLOSE UE TEST LOOP message to close the UE test loop mode for user data transfer (15 sec delay).	<--	RRC: *DLInformationTransfer-NB* TC: CLOSE UE TEST LOOP	-	-

18B	The UE transmits a CLOSE UE TEST LOOP COMPLETE message to confirm that loopback is activated.	-->	RRC: *ULInformationTransfer-NB* TC: CLOSE UE TEST LOOP COMPLETE	-	-
19	The SS transmits one IP packet to the UE embedded in a ESM DATA TRANSPORT and DLInformationTransfer-NB	<--	NAS: ESM DATA TRANSPORT	-	-
20	Wait for 1 s after the IP packet has been transmitted. (Note 1)	-	-	-	-

22.4.6 NB-IoT / RRC / Paging for notification of BCCH modification in idle mode / Direct indication for SI update

22.4.6.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state }
ensure that {
  when { UE receives a Direct Indication Information message indicating a systemInfoModification }
```

```
    then { UE re-acquires and applies the new system information and initiates the RRC connection
procedure using the updated NPRACH-ConfigSIB-NB provided in the system information }
          }
```

22.4.6.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 6.7.5, 5.2.2.3, and 5.2.2.4.

[TS 36.331, clause 6.7.5]

Direct Indication information is transmitted on NPDCCH using P-RNTI but without associated *Paging-NB* message. Table 6.7.5-1 defines the Direct Indication information, see TS 36.212 [22, 6.4.3.3].

When bit n is set to 1, the UE shall behave as if the corresponding field is set in the *Paging-NB* message, see 5.3.2.3. Bit 1 is the least significant bit.

Table 6.7.5-1: Direct Indication information

Bit	Field in *Direct Indication information*
1	*systemInfoModification*
2	*systemInfoModification-eDRX*
3, 4, 5, 6, 7, 8	Not used, and shall be ignored by UE if received

[TS 36.331, clause 5.2.2.3]

The UE shall:

1> ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:

2> if in RRC_IDLE:

3> if the UE is a NB-IoT UE:

4> / MasterInformationBlock-TDD-NB the MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB and SystemInformationBlockType1-NB as well as SystemInformationBlockType2-NB through SystemInformationBlockType5-NB, SystemInformationBlockType22-NB;

[TS 36.331, clause 5.2.2.4]

The UE shall:

1> apply the specified BCCH configuration defined in 9.1.1.1 or BR-BCCH configuration defined in 9.1.1.8;

1> if the procedure is triggered by a system information change notification:

2> if the UE uses an idle DRX cycle longer than the modification period:

3> start acquiring the required system information, as defined in 5.2.2.3, from the next eDRX acquisition period boundary;

2> else

3> start acquiring the required system information, as defined in 5.2.2.3, from the beginning of the modification period following the one in which the change notification was received;

The UE may apply the received SIBs immediately, i.e. the UE does not need to delay using a SIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 6: While attempting to acquire a particular SIB, if the UE detects from *schedulingInfoList* that it is no longer present, the UE should stop trying to acquire the particular SIB.

22.4.6.3 Test description

22.4.6.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- The UE is in state Registered, Idle mode (State 3-NB) according to TS 36.508 [18] Table 8.1.5.1-1.

22.4.6.3.2 Test procedure sequence

Table 22.4.6.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Wait for 5 s for the UE to enter RRC_IDLE state.	-	-	-	-
2	The SS changes the NPRACH-ConfigSIB-NB in *SystemInformationBlockType2-NB* and both systemInfoValueTag-r13 in *MasterInformationBlock-NB* and systemInfoValueTagList-r13 / systemInfoValueTagList-r15 in*SystemInformationBlockType1-NB* (see NOTE 1) are increased.	-	-	-	-
3	The SS indicates a *systemInfoModification* using Direct In<--dication Information.		NPDCCH (DCI N2): *Direct Indication*	-	-
4	Wait for 2.1* modification period (Note 2) to allow the new system information to take effect.	-	-	-	-
5	Check: Does the test result of generic test procedure in TS 36.508 subclause 8.1.5A.2 indicate that the UE successfully responds to Paging for control plane CIoT MT access?	-	-	1	-
6	The SS transmits an *RRCConnectionRelease-NB* message.	<--	RRC: *RRCConnectionRelease-NB*	-	-
NOTE 1: The present test case uses the IE type *systemInfoValueTagList-r13* in *SystemInformationBlockType1-NB* on purpose, to provide increased test coverage. NOTE 2: The wait time of 2.1* modification period is to allow for the network to page the system information change during the next modification period, and update the system information at the subsequent modification period. UE should acquire the updated system information within 90ms of the start of modification period.

22.4.7 NB-IoT / RRC connection release with extendedWait / extendedWait ignored / RRC connection establishment / Reject with extendedWait

22.4.7.1 Test Purpose (TP)

(1)

```
with { UE in RRC_Connected state }
ensure that {
  when { UE receives an RRCConnectionRelease-NB message including an IE extendedWaitTime set to non-zero value }
   then { UE does not send RRCConnectionRequest-NB before the extended wait timer is expired }
         }
```

(2)

```
with { UE in RRC_IDLE state and has sent an RRCConnectionRequest-NB message }
ensure that {
  when { UE receives an RRCConnectionReject-NB message including an IE extendedWaitTime set to non-zero value  }
   then { UE ignores the extended wait timer and sends RRCConnectionRequest-NB with cause moData }
            }
```

22.4.7.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in TS 36.331, clauses 5.3.3.8 and 5.3.8.3. Unless and otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.3.8]

The UE shall:

…

1> if the UE is a NB-IoT UE; or

1> if the *extendedWaitTime* is present and the UE supports delay tolerant access:

2> forward the *extendedWaitTime* to upper layers;

…

2> else:

3> inform upper layers about the failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT for mobile originating CS fallback is applicable, upon which the procedure ends;

1> else

2> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT, for mobile originating CS fallback is applicable, upon which the procedure ends.

[TS 24.301, clause 5.3.1.2]

If the UE receives the "Extended wait time" from the lower layers when no attach, tracking area updating or service request procedure is ongoing, the UE shall ignore the "Extended wait time".

[TS 36.331, clause 5.3.8.3]

The UE shall:

1> delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

…

1> else:

2> if the *extendedWaitTime* is present; and

2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:

3> forward the *extendedWaitTime* to upper layers;

…

2> else:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

22.4.7.3 Test description

22.4.7.3.1 Pre-test conditions

System Simulator:

- Ncell 1
- Cell power levels are selected according to [18] so that camping on Ncell 1 is guaranteed.

UE:

None.

Preamble:

- The UE is in state NB-IoT UE Attach, Connected Mode, UE Test Mode Activated (State 2B -NB) on Ncell 1 (serving cell) according to [18].

22.4.7.3.2 Test procedure sequence

Table 22.4.7.3.2-1: Main behaviour

    then { UE does not transmit RRCConnectionRequest-NB message }
            }
```

(6)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 0..9 and with
Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts
SystemInformationBlockType14-NB and ab-BarringForExceptionData is not present in the ab-Common and
ab-Category set to a }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRC Connection Request-NB message }
            }
```

22.4.8.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clause 5.3.3.14. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.3.14]

The UE shall:

1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:

2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:

3> if the *ab-Common* is included in *ab-Param:*

4> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Common*; and

4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Common* is set to *one*:

5> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Common*:

6> consider access to the cell as not barred;

5> else:

6> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Common* is set to *zero*:

NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

7> consider access to the cell as not barred;

6> else:

7> consider access to the cell as barred;

4> else:

5> consider access to the cell as not barred;

22.4.8.3 Test description

22.4.8.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.4.8.3.1–1.
- The PLMNs are identified in the test by the identifiers in Table 22.4.8.3.1–1.

Table 22.4.8.3.1–1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

- System information combination 4 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;
- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 13 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.4.8.3.1–2.

Table 22.4.8.3.1-2: USIM configuration

USIM field	Value	Access Technology Identifier
EF_{UST}	Service 96 is supported	
EF_{IMSI}	The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	

$EF_{PLMNwAcT}$	PLMN2 Remaining mandatory entries use default values	All specified E-UTRAN
$EF_{OPLMNwACT}$	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	PLMN4	E-UTRAN
EF_{ACC}	Type "A" as defined in TS 34.108 clause 8.3.2.15	
EFNASCONFIG	"Exception Data Reporting Allowed is set to 01"	

- The UE belong to access class 0

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 13 according to [18].

22.4.8.3.2 Test procedure sequence

Table 22.4.8.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked "T1", "T2" etc are applied at the points indicated in the Main behaviour description in Table 22.4.8.3.2-2. Cell powers are chosen for a serving cell and a non-suitable "Off" cell as defined in TS 36.508 Table 8.3.2.2.1-1.

Table 22.4.8.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Remarks
T0	NRS EPRE	dBm/15kHz	"Off"	"Off"	-85	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	"Off"	-85	-120	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-85	-120	"Off"	Power level "Off" is defined in TS 36.508 Table 8.3.2.2.1-1

26	Trigger the UE to initiate MO Exception Data	-	-	-	-
26 A	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 1 with establishmentCause-r13 set to mo-ExceptionData?	-->	*RRCConnectionRequest-NB*	6	P
27-27 B	Steps 2 to 4 of the 'Generic Test Procedure NB-IoT Control Plan CIoT MO user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.3.3 are performed. NOTE: The UE will transmit one ESM DATA TRANSPORT message containing user data generated in step 26.	-	-		-
28	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
Note 1: A UE may send the pending data triggered at step 1. Note 2: A UE may send the pending data triggered at step 11. Note 3: A UE may send the pending data triggered at step 21. Note 4: The wait time of 2.1* modification period is to allow for the network to page the system information change during the next modification period, and update the system information at the subsequent modification period. UE should acquire the updated system information within 90ms of the start of modification period.

22.4.9 NB-IoT / RRC connection establishment / Access Barring for UE with AC 11 to 15 / MO exception data / ab-Category a, b and c

22.4.9.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state on VPLMN having an Access Class with a value in the range 11..15 and
with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and
```

```
broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to c }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE does not transmit RRCConnectionRequest-NB message }
          }
```

(2)

```
with { UE in RRC_IDLE state on OPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to c }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRCConnectionRequest-NB message }
          }
```

(3)

```
with { UE in RRC_IDLE state on OPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to b }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE does not transmit RRCConnectionRequest-NB message }
          }
```

(4)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to b }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRCConnectionRequest-NB message }
         }
```

(5)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to a }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE does not transmit RRCConnectionRequest-NB message }
          }
```

(6)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB and ab-BarringForExceptionData is not present in the ab-Common and ab-Category set to a }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRCConnectionRequest-NB message }
          }
```

(7)

```
with { UE in RRC_IDLE state on HPLMN having an Access Class with a value in the range 11..15 and with Access barring enabled in MasterInformationBlock-NB/MasterInformationBlock-TDD-NB and broadcasts SystemInformationBlockType14-NB with a special access class bitmap different from the special access class bitmap set in USIM and ab-BarringForExceptionData is set to TRUE in the ab-Common and ab-Category set to a }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRCConnectionRequest-NB message }
          }
```

22.4.9.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clause 5.3.3.14. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.3.14]

The UE shall:

1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:

2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:

3> if the *ab-Common* is included in *ab-Param:*

4> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Common*; and

4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Common* is set to *one*:

5> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Common*:

6> consider access to the cell as not barred;

5> else:

6> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Common* is set to *zero*:

NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

7> consider access to the cell as not barred;

6> else:

7> consider access to the cell as barred;

4> else:

5> consider access to the cell as not barred;

22.4.9.3 Test description

22.4.9.3.1 Pre-test conditions

System Simulator:

- Three inter-frequency multi-PLMN cells as specified in TS 36.508 clause 8.1.4.1.2 are configured broadcasting PLMNs as indicated in Table 22.4.9.3.1–1.

- The PLMNs are identified in the test by the identifiers in Table 22.4.9.3.1–1.

Table 22.4.9.3.1-1: PLMN identifiers

Ncell	PLMN name	MCC	MNC
1	PLMN4	001	01
12	PLMN1	001	11
13	PLMN2	001	21

- System information combination 4 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;
- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 13 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those listed in Table 22.4.9.3.1–2.

Table 22.4.9.3.1-2: USIM configuration

USIM field	Value	Access Technology Identifier
EF_{UST}	Service 96 is supported	
EF_{IMSI}	The HPLMN (MCC+MNC) of the IMSI is set to PLMN4.	
$EF_{PLMNwAcT}$	PLMN2 Remaining mandatory entries use default values	All specified E-UTRAN
$EF_{OPLMNwACT}$	PLMN1 Remaining defined entries use default values	All specified
$EF_{HPLMNwAcT}$	PLMN4	E-UTRAN
EF_{ACC}	Type “C” as defined in TS 34.108 clause 8.3.2.15	
EFNASCONFIG	“Exception Data Reporting Allowed is set to 01”	

- The UE belongs to access class 0 and special access class 11 and 15.

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 13 according to [18].

22.4.9.3.2 Test procedure sequence

Table 22.4.9.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked “T1”, “T2” etc are applied at the points indicated in the Main behaviour description in Table 22.4.9.3.2-2. Cell powers are chosen for a serving cell and a non-suitable “Off” cell as defined in TS 36.508 Table 8.3.2.2.1-1.

Table 22.4.9.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Ncell 12	Ncell 13	Remarks
T0	NRS EPRE	dBm/15kHz	“Off”	“Off”	-85	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T1	NRS EPRE	dBm/15kHz	“Off”	-85	-120	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1
T2	NRS EPRE	dBm/15kHz	-85	-120	“Off”	Power level “Off” is defined in TS 36.508 Table 8.3.2.2.1-1

Table 22.4.9.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	SS adjusts *MasterInformationBlock-NB/MasterInformationBlock-TDD-NB* of Ncell 13 with ab-Enabled-r13/ab-Enabled-r15 set to	-	-	-	-

	TRUE *and SystemInformationBlockType14-NB* of Ncell 13				
2	The SS notifies the UE of change of System Information	<--	*Paging-NB*	-	-
3	Wait for 2.1* modification period (Note 4) to allow the new system information to take effect.	-	-	-	-
4	Trigger the UE to initiate MO Exception Data	-	-	-	-
5	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 13 within 30s?	-->	*RRCConnectionRequest-NB*	1	F
6	SS adjusts cell levels according to row T1 of table 22.4.9.3.2-1	-	-	-	-
7	Step 1 to 5 of generic test procedure in TS 36.508 subclause 8.1.5A.5 to take place on Ncell 12. NOTE: The UE performs a TAU procedure.	-	-	-	-
7A	The SS starts timer Timer_1 = 10 s	-	-	-	-
-	EXCEPTION: Steps 7Ba1 to 7Bb1 describe a transaction that depends on the UE behaviour; the “lower case letter” identifies a test sequence that takes place if a specific behaviour happens (Note 1)	-	-	-	-
7B a1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB	-->	NAS: ESM DATA TRANSPORT	-	-
7B b1	The SS waits for Timer_1 expiry	-	-	-	-
7C	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
8	SS adjusts *MasterInformationBlock-NB/MasterInformationBlock-TDD-NB* of Ncell 12 with ab-Enabled-r13/ab-Enabled-r15 set to TRUE *and SystemInformationBlockType14-NB* of Ncell 12	-	-	-	-
9	The SS notifies the UE of change of System Information	<--	*Paging-NB*	-	-
10	Wait for 2.1* modification period (Note 4) to allow the new system information to take effect.	-	-	-	-
11	Trigger the UE to initiate MO Exception Data	-	-	-	-
12	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 12 with establishmentCause-r13 set to mo-ExceptionData?	-->	*RRCConnectionRequest-NB*	2	P
13-15	Steps 2 to 4 of the 'Generic Test Procedure NB-IoT Control Plan CIoT MO user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.3.3 are performed NOTE: The UE will transmit one ESM DATA TRANSPORT message containing user data generated in step 11.	-	-		-
16	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
17	SS adjusts *SystemInformationBlockType14-NB* of Ncell 12 with ab-Category set to ‘b’	-	-	-	-
18	Trigger the UE to initiate MO Exception Data	-	-	-	-
19	Check: Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 12 within 30s?	-->	*RRCConnectionRequest-NB*	3	F
20	SS adjusts cell levels according to row T2 of table 22.4.9.3.2-1	-	-	-	-

21	Step 1 to 5 of generic test procedure in TS 36.508 subclause 8.1.5A.5 to take place on Ncell 1. NOTE: The UE performs a TAU procedure.	-	-	-	-
21A	The SS starts timer Timer_1 = 10s	-	-	-	-
-	EXCEPTION: Steps 21Ba1 to 21Bb1 describe a transaction that depends on the UE behaviour; the “lower case letter” identifies a test sequence that takes place if a specific behaviour happens (Note 2)	-	-	-	-
21Ba1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB	-->	NAS: ESM DATA TRANSPORT	-	-
21Bb1	The SS waits for Timer_1 expiry	-	-	-	-
21C	The SS transmits an *RRCConnectionRelease-NB* message	<--	*RRCConnectionRelease-NB*	-	-
22	SS adjusts *MasterInformationBlock-NB/MasterInformationBlock-TDD-NB* of Ncell 1 with ab-Enabled-r13/ab-Enabled-r15 set to TRUE *and SystemInformationBlockType14-NB* of Ncell 1	-	-	-	-

22.4.10 Void

22.4.11 NB-IoT / RRC connection release / Redirection to another NB-IoT frequency

22.4.11.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an RRCConnectionRelease message including an IE redirectedCarrierInfo with
carrierFreq-r13 different from the frequency UE was on in RRC_CONNECTED state}
   then { UE enters RRC_IDLE state on new NB-IoT frequency included in IE redirectedCarrierInfo }
            }
```

22.4.11.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clauses 5.3.8.3, 5.3.12 and TS 36.304, clauses 5.2.4.1, 5.2.7a. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.8.3]

The UE shall:

1> delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

1> if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:

…

1> else:

2> apply the cell reselection priority information broadcast in the system information;

1> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *loadBalancingTAURequired*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';

…

1> else:

2> if the *extendedWaitTime* is present; and

2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:

3> forward the *extendedWaitTime* to upper layers;

2> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *rrc-Suspend*:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC suspension';

2> else:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

…

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

…

2> else:

3> release the *wlan-OffloadConfigDedicated*, if received;

3> if the *wlan-OffloadConfigCommon* corresponding to the RPLMN is broadcast by the cell:

4> apply the *wlan-OffloadConfigCommon* corresponding to the RPLMN included in *SystemInformationBlockType17*;

4> apply *steerToWLAN* if configured, otherwise apply the *wlan-Id-List* corresponding to the RPLMN included in *SystemInformationBlockType17*;

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

[TS 36.304, clause 5.2.4.1]

UE shall only perform cell reselection evaluation for E-UTRAN frequencies and inter-RAT frequencies that are given in system information and for which the UE has a priority provided.

[TS 36.304, clause 5.2.7a]

On transition from RRC_CONNECTED to RRC_IDLE, UE shall attempt to camp on a suitable cell according to *redirectedCarrierInfo*, if included in the *RRCConnectionRelease-NB* message. If the UE cannot find a suitable cell, the UE is allowed to camp on a suitable cell of any NB-IoT carrier. If the *RRCConnectionRelease-NB* message does not contain the *redirectedCarrierInfo* UE shall attempt to select a suitable cell on a NB-IoT carrier.

22.4.11.3 Test description

22.4.11.3.1 Pre-test conditions

System Simulator:

- 2 cells on different NB-IoT frequencies and different tracking areas:
  - Ncell 1 serving cell.
  - Ncell 23 suitable neighbour inter-frequency cell.
  - Cell power levels are selected according to [18] so that camping on Ncell 1 is guaranteed.
  - System information combination 3 as defined in TS 36.508 [18] is used.

UE:

None.

Preamble:

- The UE is in state 2-NB according to [18] on Ncell 1.

22.4.11.3.2 Test procedure sequence

Table 22.4.11.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 22.4.11.3.2-1.

Table 22.4.11.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 23	Remark
T0	Cell-specific NRS EPRE	dBm/15kHz	-85	"-97"	Ncell 23 is suitable neighbour cell
T1	Cell-specific NRS EPRE	dBm/15kHz	OFF	"-97"	NCell 1 shall be OFF to avoid Cell Selection to Ncell1 after Connection release

Table 22.4.11.3.2-1: Main behaviour

```

22.4.12.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clauses 5.3.8.3, 5.3.12 and TS 36.304, clauses 5.2.4.1, 5.2.7a. Unless otherwise stated these are Rel-13 requirements.

[TS 36.331, clause 5.3.8.3]

The UE shall:

1> delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

1> if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:

…

1> else:

2> apply the cell reselection priority information broadcast in the system information;

1> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *loadBalancingTAURequired*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';

…

1> else:

2> if the *extendedWaitTime* is present; and

2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:

3> forward the *extendedWaitTime* to upper layers;

2> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *rrc-Suspend*:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause ‘RRC suspension’;

2> else:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

…

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

…

2> else:

3> release the *wlan-OffloadConfigDedicated*, if received;

3> if the *wlan-OffloadConfigCommon* corresponding to the RPLMN is broadcast by the cell:

4> apply the *wlan-OffloadConfigCommon* corresponding to the RPLMN included in *SystemInformationBlockType17*;

4> apply *steerToWLAN* if configured, otherwise apply the *wlan-Id-List* corresponding to the RPLMN included in *SystemInformationBlockType17*;

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

…

[TS 36.304, clause 5.2.4.1]

UE shall only perform cell reselection evaluation for E-UTRAN frequencies and inter-RAT frequencies that are given in system information and for which the UE has a priority provided.

[TS 36.304, clause 5.2.7a]

On transition from RRC_CONNECTED to RRC_IDLE, UE shall attempt to camp on a suitable cell according to *redirectedCarrierInfo*, if included in the *RRCConnectionRelease-NB* message. If the UE cannot find a suitable cell, the UE is allowed to camp on a suitable cell of any NB-IoT carrier. If the *RRCConnectionRelease-NB* message does not contain the *redirectedCarrierInfo* UE shall attempt to select a suitable cell on a NB-IoT carrier.

22.4.12.3 Test description

22.4.12.3.1 Pre-test conditions

System Simulator:

- 2 cells on different NB-IoT frequencies and different tracking areas:
  - Ncell 1 serving cell.
  - Ncell 10 suitable neighbour inter-band cell.
  - Cell power levels are selected according to [18] so that camping on Ncell 1 is guaranteed.
  - System information combination 3 as defined in TS 36.508 [18] is used.

UE:

None.

Preamble:

- The UE is in state 2-NB according to [18] on Ncell 1.

22.4.12.3.2 Test procedure sequence

Table 22.4.12.3.2-0 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 22.4.12.3.2-1.

Table 22.4.12.3.2-0: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 10	Remark
T0	Cell-specific NRS EPRE	dBm/15kHz	-85	"-97"	Ncell 10 is suitable neighbour cell
T1	Cell-specific NRS EPRE	dBm/15kHz	OFF	"-97"	Ncell 1 shall be switched off to avoid selection of Ncell 1 after Connection release

Table 22.4.12.3.2-1: Main behaviour

22.4.13a NB-IoT / NTN / UE capability transfer / Success

22.4.13a.1 Test Purpose (TP)

(1)

```
with { UE in RRC_CONNECTED state }
ensure that {
  when { UE receives an UECapabilityEnquiry-NB message }
    then { UE transmits an UECapabilityInformation-NB message including UE radio access capability
parameters }
```

```
        }
```

22.4.13a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.6.3.1 and 5.6.3.3. Unless and otherwise stated these are Rel-17 requirements.

[TS 36.331, clause 5.6.3.1]

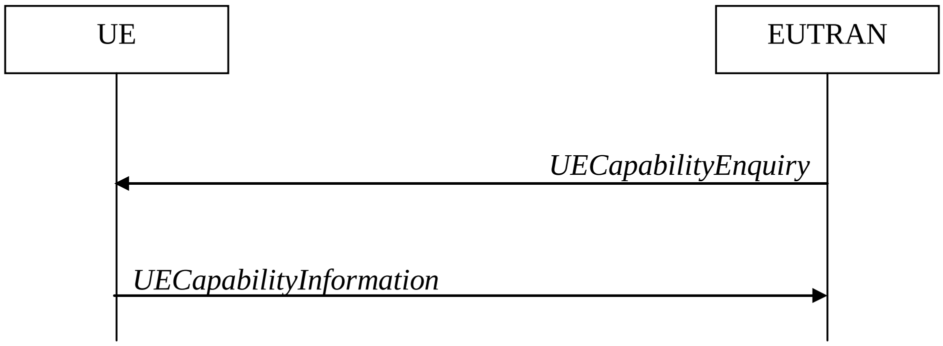

Figure 5.6.3.1-1: UE capability transfer

The purpose of this procedure is to transfer UE radio access capability information from the UE to E-UTRAN.

If the UE is NTN capable, the UE reports its E-UTRAN radio access capabilities for the network type (TN or NTN) to which it is connected.

[TS 36.331, clause 5.6.3.3]

The UE shall:

1> for NB-IoT, set the contents of *UECapabilityInformation* message as follows:

2> include the UE Radio Access Capability Parameters within the *ue-Capability*;

2> include *ue-RadioPagingInfo*;

2> submit the *UECapabilityInformation* message to lower layers for transmission, upon which the procedure ends;

22.4.13a.3 Test description

22.4.13a.3.1 Pre-test conditions

System Simulator:

- Ncell 1 is configured according to Table 8.1.4.2-1 and Table 8.1.4.2-2 in TS 36.508 [18].
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The preconfigured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble:

- The UE is in State Connected Mode (State 2-NB) according to [18].

22.4.14 NB-IoT / RRC Connection Establishment / Multi-Carrier

22.4.14.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_IDLE state }
ensure that {
  when { UE receives an RRCConnectionSetup-NB message including IE CarrierConfigDedicated }
    then { UE transmits an RRCConnectionSetupComplete-NB message }
            }
```

(2)

```
with { UE has received an RRCConnectionSetup-NB message including IE CarrierConfigDedicated }
ensure that {
  when { UE continues with initial registration }
    then { RRC signalling happens on non-anchor carrier }
            }
```

22.4.14.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.10.6.

[TS 36.331, clause 5.3.10.6]

...

For NB-IoT, the UE shall:

1> if the *carrierConfigDedicated* is not included in the received *physicalConfigDedicated*:

2> if the UE is configured with a carrier configuration previously received in *carrierConfigDedicated*:

3> use the carrier configuration received in *carrierConfigDedicated*;

2> else:

3> use the carrier configuration received for the anchor carrier in the system information;

1> else:

2> use the carrier configuration received in *carrierConfigDedicated*;

2> start to use the new carrier immediately after the last transport block carrying the RRC message has been acknowledged by the MAC layer, and any subsequent RRC response message sent for the current RRC procedure is therefore sent on the new carrier;

1> reconfigure the physical channel configuration in accordance with the received *physicalConfigDedicated*.

22.4.14.3 Test description

22.4.14.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

  NB-IoT Operation Mode set to standalone

UE:

None.

Preamble:

- UE is in State 1-NB switched off.

22.4.14.3.2 Test procedure sequence

```
with { UE has received an RRCConnectionSetup-NB message including IE CarrierConfigDedicated }
ensure that {
  when { UE continues with initial registration }
    then { RRC signalling happens on non-anchor carrier }
            }
```

22.4.14a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.10.6.

[TS 36.331, clause 5.3.10.6]

...

For NB-IoT, the UE shall:

1> if the *carrierConfigDedicated* is not included in the received *physicalConfigDedicated*:

2> if the UE is configured with a carrier configuration previously received in *carrierConfigDedicated*:

3> use the carrier configuration received in *carrierConfigDedicated*;

2> else:

3> use the carrier configuration received for the anchor carrier in the system information;

1> else:

2> use the carrier configuration received in *carrierConfigDedicated*;

2> start to use the new carrier immediately after the last transport block carrying the RRC message has been acknowledged by the MAC layer, and any subsequent RRC response message sent for the current RRC procedure is therefore sent on the new carrier;

1> reconfigure the physical channel configuration in accordance with the received *physicalConfigDedicated*.

22.4.14a.3 Test description

22.4.14a.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- NB-IoT Operation Mode set to standalone.
- System information combination 1 as defined in TS 36.508[18] clause 8.1.4.3.1.1.

UE:

None.

Preamble:

- UE is in State 1-NB switched off.

22.4.15 NB-IoT / RRC connection suspend-resume / Success / different cell

22.4.15.1 Test Purpose (TP)

(1)

```
with { NB-IoT UE in switched off state }
ensure that {
  when { NB-IoT UE has established User Plane (UP) bearer and a RRCConnectionRelease-NB message is
received with resumeIdentity and rrc-Suspend }
    then { NB-IoT UE suspends RRC Connection and stores the resumeIdentity and AS security context }
            }
```

(2)

```
with { NB-IoT UE in RRC_IDLE state }
ensure that {
  when { NB-IoT UE receives a Paging-NB message }
    then { NBIOT UE transmits RRCConnectionResumeRequest-NB message including the stored
resumeIdentity and AS security context to resume RRC Connection }
            }
```

(3)

```
with { NB-IoT UE in RRC_CONNECTED state }
ensure that {
  when { NB-IoT UE has established User Plane (UP) bearer and a RRCConnectionRelease-NB message is
received with a new resumeIdentity and rrc-Suspend }
    then { NB-IoT UE suspends RRC Connection and stores the new resumeIdentity and AS security
context }
            }
```

(4)

```
with { NB-IoT UE in RRC_IDLE state }
ensure that {
  when { NB-IoT UE detects the cell re-selection criteria are met for the new Ncell and reselects to
the new Ncell }
    then { NB-IoT UE transmits RRCConnectionResumeRequest-NB message including the stored new
resumeIdentity and AS security context to resume RRC Connection on the new Ncell }
            }
```

22.4.15.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.3.3a, 5.3.8.3, and 5.3.12.

[TS 36.331, clause 5.3.3.3a]

The UE shall set the contents of *RRCConnectionResumeRequest* message as follows:

1> if the UE is a NB-IoT UE; or

1> if field *useFullResumeID* is signalled in *SystemInformationBlockType2*:

2> set the *resumeID* to the stored *resumeIdentity*;

1> else

2> set the *truncatedResumeID* to include bits in bit position 9 to 20 and 29 to 40 from the left in the stored *resumeIdentity*.

1> if the UE supports *mo-VoiceCall* establishment cause and UE is resuming the RRC connection for mobile originating MMTEL voice and *SystemInformationBlockType2* includes *voiceServiceCauseIndication*:

2> set the *resumeCause* to *mo-VoiceCall*;

1> else

2> set the *resumeCause* in accordance with the information received from upper layers;

1> set the *shortResumeMAC-I* to the 16 least significant bits of the MAC-I calculated:

2> over the ASN.1 encoded as per section 8 (i.e., a multiple of 8 bits) *VarShortResumeMAC-Input* (or *VarShortResumeMAC-Input-NB* in NB-IoT);

2> with the K_{RRCint} key and the previously configured integrity protection algorithm; and

2> with all input bits for COUNT, BEARER and DIRECTION set to binary ones;

The UE shall submit the *RRCConnectionResumeRequest* message to lower layers for transmission.

The UE shall continue cell re-selection related measurements as well as cell re-selection evaluation. If the conditions for cell re-selection are fulfilled, the UE shall perform cell re-selection as specified in 5.3.3.5.

[TS 36.331, clause 5.3.8.3]

The UE shall:

1> delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

1> if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:

2> store the cell reselection priority information provided by the *idleModeMobilityControlInfo*;

2> if the *t320* is included:

3> start timer T320, with the timer value set according to the value of *t320*;

1> else:

2> apply the cell reselection priority information broadcast in the system information;

1> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *loadBalancingTAURequired*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';

1> else if the *releaseCause* received in the *RRCConnectionRelease* message indicates *cs-FallbackHighPriority*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'CS Fallback High Priority';

1> else:

2> if the *extendedWaitTime* is present; and

2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:

3> forward the *extendedWaitTime* to upper layers;

2> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *rrc-Suspend*:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC suspension';

2> else:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T325 and T330;

1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:

2> re-establish RLC entities for all SRBs and DRBs;

2> store the UE AS Context including the current RRC configuration, the current security context, the PDCP state including ROHC state, C-RNTI used in the source PCell, the *cellIdentity* and the physical cell identity of the source PCell;

2> store the following information provided by E-UTRAN:

3> the *resumeIdentity*;

2> suspend all SRB(s) and DRB(s);

2> indicate the suspension of the RRC connection to upper layers;

22.4.15.3 Test description

22.4.15.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 11.
- The Network and test case requires Attach with User Plane CIoT EPS optimisation.
- System information combination 3 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;

UE:

User Plane CIoT Optimisation is supported by UE (UE capability), pc_User_Plane_CIoT_Optimisation.

Preamble:

- The UE is in state Switched OFF (State 1-NB) according to TS 36.508 Table 8.1.5.1-1.

22.4.15.3.2 Test procedure sequence

Table 22.4.15.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 22.4.15.3.2-2.

Table 22.4.15.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 11	Remark
T0	Cell-specific NRS EPRE	dBm/15kHz	-85	"Off"	
T1	Cell-specific NRS EPRE	dBm/15kHz	-85	-73	Ncell 11 becomes stronger than $Thresh_{x, high}$.

Table 22.4.15.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Steps 1-14b1 of the generic procedure for UE registration specified in TS 36.508 subclause 8.1.5.2.3 are performed on Ncell1.	-	-	-	-

22.4.16 NB-IoT / RRC connection suspend-resume / Failure / Network reject

22.4.16.1 Test Purpose (TP)

(1)

with { NB-IoT UE transmitting *RRCConnectionResumeRequest-NB* message including the stored resumeIdentity and AS security context }
ensure that {
  when { NB-IoT UE receives a *RRCConnectionReject-NB* message without including rrc-SuspendIndication IE }
    then { NB-IoT UE discards the stored resumeIdentity along with AS security context and transmits *RRCConnectionRequest-NB* message to establish a new RRC Connection }
            }

(2)

with { NB-IoT UE transmitting *RRCConnectionResumeRequest-NB* message including the stored new resumeIdentity and AS security context to initiate Tracking Area Update procedure on a new Ncell }
ensure that {
  when { NB-IoT UE receives a *RRCConnectionReject-NB* message including rrc-SuspendIndication IE }
    then { NB-IoT UE stores the resumeIdentity along with AS security context and resumes RRC Connection by sending *RRCConnectionResumeRequest-NB* message including the stored resumeIdentity and AS security context to restart the ongoing Tracking Area Update procedure }
            }

22.4.16.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.3.3a, 5.3.3.8, 5.3.8.3, and 5.3.12 and TS 24.301, clause 5.3.1.3.

[TS 36.331, clause 5.3.3.3a]

The UE shall set the contents of *RRCConnectionResumeRequest* message as follows:

1> if the UE is a NB-IoT UE; or

1> if field *useFullResumeID* is signalled in *SystemInformationBlockType2*:

2> set the *resumeID* to the stored *resumeIdentity*;

1> else

2> set the *truncatedResumeID* to include bits in bit position 9 to 20 and 29 to 40 from the left in the stored *resumeIdentity*.

[TS 36.331, clause 5.3.3.8]

The UE shall:

1> stop timer T300;

1> reset MAC and release the MAC configuration;

1> except for NB-IoT, start timer T302, with the timer value set to the *waitTime*;

1> if the UE is a NB-IoT UE; or

1> *if* the *extendedWaitTime* is present *and the UE supports delay tolerant access:*

2> forward the *extendedWaitTime* to upper layers;

1> if *deprioritisationReq* is included and the UE supports RRC Connection Reject with deprioritisation:

2> start or restart timer T325 with the timer value set to the *deprioritisationTimer* signalled;

2> store the *deprioritisationReq* until T325 expiry;

NOTE: The UE stores the deprioritisation request irrespective of any cell reselection absolute priority assignments (by dedicated or common signalling) and regardless of RRC connections in E-UTRAN or other RATs unless specified otherwise.

1> if the *RRCConnectionReject* is received in response to an *RRCConnectionResumeRequest*:

2> *if* the *rrc-SuspendIndication* is not present:

3> discard the stored UE AS context and *resumeIdentity*;

3> inform upper layers about the failure to resume the RRC connection without suspend indication and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT for mobile originating CS fallback is applicable, upon which the procedure ends;

2> else:

3> inform upper layers about the failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT for mobile originating CS fallback is applicable, upon which the procedure ends;

1> else

2> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT, for mobile originating CS fallback is applicable, upon which the procedure ends;

[TS 36.331, clause 5.3.8.3]

The UE shall:

1> delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

1> if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:

2> store the cell reselection priority information provided by the *idleModeMobilityControlInfo*;

2> if the *t320* is included:

3> start timer T320, with the timer value set according to the value of *t320*;

1> else:

2> apply the cell reselection priority information broadcast in the system information;

1> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *loadBalancingTAURequired*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';

1> else if the *releaseCause* received in the *RRCConnectionRelease* message indicates *cs-FallbackHighPriority*:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'CS Fallback High Priority';

1> else:

2> if the *extendedWaitTime* is present; and

2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:

3> forward the *extendedWaitTime* to upper layers;

2> if the *releaseCause* received in the *RRCConnectionRelease* message indicates *rrc-Suspend*:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause ‘RRC suspension’;

2> else:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T325 and T330;

1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:

2> re-establish RLC entities for all SRBs and DRBs;

2> store the UE AS Context including the current RRC configuration, the current security context, the PDCP state including ROHC state, C-RNTI used in the source PCell, the *cellIdentity* and the physical cell identity of the source PCell;

2> store the following information provided by E-UTRAN:

3> the *resumeIdentity*;

2> suspend all SRB(s) and DRB(s);

2> indicate the suspension of the RRC connection to upper layers;

[TS 24.301, clause 5.3.1.3]

Suspend of the NAS signalling connection can be initiated by the network in EMM-CONNECTED mode when user plane CIoT EPS optimization is used. Resume of the suspended NAS signalling connection is initiated by the UE.

In the UE, when user plane CIoT EPS optimization is used:

- Upon indication from the lower layers that the RRC connection has been suspended, the UE shall enter EMM-IDLE mode with suspend indication, but shall not consider the NAS signalling connection released. Based on further indications provided by the lower layers, the UE shall update the status of the suspend indication for the EMM-IDLE mode;

- Upon trigger of a procedure using an initial NAS message when in EMM-IDLE mode with suspend indication, the UE shall request the lower layer to resume the RRC connection. In this request to the lower layer the NAS shall provide to the lower layer the RRC establishment cause and the call type according to annex D of this document;

- Upon trigger of a tracking area update procedure initiated due to mobility into a tracking area that is not in the current TAI list, when in EMM-IDLE mode with suspend indication and camped on an E-UTRAN cell not supporting user plane CIoT EPS optimization, the UE should enter EMM-IDLE mode without suspend indication and start the procedure;

- Upon indication from the lower layers that the RRC connection has been resumed when in EMM-IDLE mode with suspend indication, the UE shall enter EMM-CONNECTED mode. If the pending NAS message is:

  i) a SERVICE REQUEST message;

  ii) a CONTROL PLANE SERVICE REQUEST message, and the UE did not include any ESM message container, NAS message container or EPS bearer context status information elements; or

  iii) an EXTENDED SERVICE REQUEST message, and the Service type information element indicates "packet services via S1" and the UE did not include any EPS bearer context status information element,

  the message shall not be sent. Otherwise the UE shall send the pending initial NAS message upon entering EMM-CONNECTED mode;

NOTE: If a NAS message is discarded and not sent to the network, the uplink NAS COUNT value corresponding to that message is reused for the next uplink NAS message to be sent.

- Upon indication from the lower layers that the RRC connection resume has been fallbacked when in EMM-IDLE mode with suspend indication, the UE shall enter EMM-IDLE mode without suspend indication, send any pending initial NAS message and proceed as if RRC connection establishment had been requested;

- Upon indication from the lower layers that the RRC connection resume has failed and indication from the lower layers that the RRC connection is suspended, the UE shall enter EMM-IDLE mode with suspend indication and restart the ongoing NAS procedure if required; and

- Upon indication from the lower layers that the RRC connection resume has failed and indication from the lower layers that the RRC connection is not suspended, the UE shall enter EMM-IDLE mode without suspend indication and restart the ongoing NAS procedure if required.

In the network, when user plane CIoT EPS optimization is used:

- Upon indication from the lower layers that the RRC connection has been suspended, the network shall enter EMM-IDLE mode with suspend indication, but shall not consider the NAS signalling connection released; and

- Upon indication from the lower layers that the RRC connection has been resumed when in EMM-IDLE mode with suspend indication, the network shall enter EMM-CONNECTED mode.

22.4.16.3 Test description

22.4.16.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 11.

- The Network and test case requires Attach with User Plane CIoT EPS optimisation.

- System information combination 3 as defined in TS 36.508[18] clause 8.1.4.3.1.1 is used in NB-IoT cells;

UE:

User Plane CIoT Optimisation is supported by UE (UE capability), pc_User_Plane_CIoT_Optimisation.

Preamble:

- The UE is in state Switched OFF (State 1-NB) according to TS 36.508 Table 8.1.5.1-1.

22.4.16.3.2 Test procedure sequence

Table 22.4.16.3.2-1 illustrates the downlink power levels and other changing parameters to be applied for the cells at various time instants of the test execution. The configuration marked "T1" is applied at the point indicated in the Main behaviour description in Table 22.4.16.3.2-2.

Table 22.4.16.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 11	Remark
T0	Cell-specific NRS EPRE	dBm/15kHz	-85	"Off"	
T1	Cell-specific NRS EPRE	dBm/15kHz	-85	-73	Ncell 11 become stronger than $Thresh_{x, high.}$

Table 22.4.16.3.2-2: Main behaviour

22.4.18 NB-IoT / RRC connection reconfiguration / SRB reconfiguration / Success

22.4.18.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state}
ensure that {
  when { UE receives an RRCConnectionReconfiguration-NB message containing SRB reconfiguration }
    then { UE reconfigures affected SRBs and sends an RRCConnectionReconfigurationComplete-NB
message }
```

}

22.4.18.2 Conformance requirements

References: The conformance requirements covered in the current TC is specified in: TS 36.331, clauses 5.3.5.3 and 5.3.10.1.

[TS 36.331, clause 5.3.5.3]

If the RRCConnectionReconfiguration message does not include the mobilityControlInfo and the UE is able to comply with the configuration included in this message, the UE shall:

…

1> else:

2> if the *RRCConnectionReconfiguration* message includes the *radioResourceConfigDedicated*:

3> perform the radio resource configuration procedure as specified in 5.3.10;

[TS 36.331, clause 5.3.10.1]

The UE shall:

…

1> if the UE is a NB-IoT UE and SRB1 is established; or

1> for each *srb-Identity* value included in the *srb-ToAddModList* that is part of the current UE configuration (SRB reconfiguration):

2> reconfigure the RLC entity in accordance with the received *rlc-Config*;

2> reconfigure the DCCH logical channel in accordance with the received *logicalChannelConfig*;

22.4.19 Void

22.4.19a NB-IoT / Radio link failure / T301 expiry / T311 expiry / RRC connection re-establishment

22.4.19a.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE having sent an RRCConnectionReestablishmentRequest message on starting of timer T301 }
   then { UE goes to RRC_IDLE state after timer T301 is expired }
}
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE detects radio link failure }
    then { UE goes to RRC_IDLE state after timer T311 is expired }
            }
```

22.4.19a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.7.2, 5.3.7.3, 5.3.7.6, 5.3.7.7 and 5.3.7.12.

[TS 36.331, clause 5.3.7.2]

The UE shall only initiate the procedure either when AS security has been activated or for a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS optimisation. The UE initiates the procedure when one of the following conditions is met:

1> upon detecting radio link failure, in accordance with 5.3.11; or

...

Upon initiation of the procedure, the UE shall:

...

1> start timer T311;

...

1> perform cell selection in accordance with the cell selection process as specified in TS 36.304 [4];

[TS 36.331, clause 5.3.7.3]

Upon selecting a suitable E-UTRA cell, the UE shall:

1> stop timer T311;

1> start timer T301;

1> apply the *timeAlignmentTimerCommon* included in *SystemInformationBlockType2*;

1> initiate transmission of the *RRCConnectionReestablishmentRequest* message in accordance with 5.3.7.4;

[TS 36.331, clause 5.3.7.6]

Upon T311 expiry, the UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331, clause 5.3.7.7]

The UE shall:

1> if timer T301 expires; or

1> if the selected cell becomes no longer suitable according to the cell selection criteria as specified in TS 36.304 [4]:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331, clause 5.3.7.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T325 and T330;

...

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

...

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

22.4.20a NB-IoT / Radio link failure / RRC connection re-establishment reject / RRC connection re-establishment

22.4.20a.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE detecting radio link failure on expiring of timer T310 }
    then { UE starts timer T311 and UE sends RRCConnectionReestablishmentRequestt with ul-NAS-MAC-r14 }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE receives an RRCConnectionReestablishmentReject message }
    then { UE goes to RRC_IDLE state }
            }
```

22.4.20a.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clause 5.3.7.8 and 5.3.7.12.

[TS 36.331, clause 5.3.7.8]

Upon receiving the *RRCConnectionReestablishmentReject* message, the UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331, clause 5.3.7.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T325 and T330;

...

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

...

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

[TS 36.331, clause 5.3.7.2]

The UE shall only initiate the procedure either when AS security has been activated or for a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS optimisation. The UE initiates the procedure when one of the following conditions is met:

1> upon detecting radio link failure, in accordance with 5.3.11; or

...

Upon initiation of the procedure, the UE shall:

...

1> start timer T311;

...

1> perform cell selection in accordance with the cell selection process as specified in TS 36.304 [4];

22.4.20a.3 Test description

22.4.20a.3.1 Pre-test conditions

System Simulator:

- Ncell 1
- Ncell 2
- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1.
- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 10 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

None.

Preamble:

- The UE is in state State 2-NB.in Ncell 1,

22.4.21 NB-IoT / Radio link failure / Radio link recovery while T310 is running

22.4.21.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state}
ensure that {
  when { UE detecting physical layer recovery while T310 was running }
    then {the UE resumes the RRC connection without explicit signalling }
            }
```

22.4.21.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clause 5.3.11.1 and 5.3.11.2.

[TS 36.331, clause 5.3.11.1]

The UE shall:

1> upon receiving N310 consecutive "out-of-sync" indications for the PCell from lower layers while neither T300, T301, T304 nor T311 is running:

2> start timer T310;

[TS 36.331, clause 5.3.11.2]

Upon receiving N311 consecutive "in-sync" indications for the PCell from lower layers while T310 is running, the UE shall:

1> stop timer T310;

1> stop timer T312, if running;

NOTE 1: In this case, the UE maintains the RRC connection without explicit signalling, i.e. the UE maintains the entire radio resource configuration.

NOTE 2: Periods in time where neither "in-sync" nor "out-of-sync" is reported by layer 1 do not affect the evaluation of the number of consecutive "in-sync" or "out-of-sync" indications.

22.4.21.3 Test description

22.4.21.3.1 Pre-test conditions

System Simulator:

- Ncell 1

UE:

None.

Preamble:

- The UE is in Connected Mode (State 2-NB) according to 36.508 clause 8.1.5.2.3.

22.4.21.3.2 Test procedure sequence

Table 22.4.21.3.2-1 illustrates the downlink power level to be applied for the cell at various time instants of the test execution. Row marked "T0" denotes the initial condition, while column marked "T1"is applied according the procedure.

Table 22.4.21.3.2-1: Time instances of cell power level

	Parameter	Unit	Ncell 1	Remark
T0	NRS EPRE	dBm/15kHz	-85	Serving cell
T1	NRS EPRE	dBm/15kHz	Off	Non-suitable "Off" cell (NOTE 1)
NOTE 1: Power level “Off” is ≤ -150.

22.4.22 NB-IoT / Radio link failure / T301 expiry / T311 expiry / Dedicated RLF timer (UP/S1-U)

22.4.22.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE receives an RRCConnectionReconfiguration-NB message containing an rlf-
TimersAndConstants-r13 set to setup }
    then { UE uses timer value received in the RRCConnectionReconfiguration-NB message }
            }
```

(2)

```
with { UE in E-UTRA RRC_CONNECTED state and having received an RRCConnectionReconfiguration-NB
message containing an rlf-TimersAndConstants-r13 set to setup }
ensure that {
  when { UE receives an RRCConnectionReconfiguration-NB message containing an rlf-
TimersAndConstants-r13 set to release }
    then { UE does not use timer value received in the RRCConnectionReconfiguration-NB message }
            }
```

(3)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE having sent an RRCConnectionReestablishmentRequest message on starting of timer T301 }
   then { UE goes to RRC_IDLE state after timer T301 is expired and trigger TAU procedure in order
to recover RRC connection}
}
```

(4)

```
with { UE in E-UTRA RRC_CONNECTED state }
ensure that {
  when { UE detects radio link failure }
    then { UE goes to RRC_IDLE state after timer T311 expires}
            }
```

22.4.22.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clause 5.2.2.9, 5.3.7.2, 5.3.7.3, 5.3.7.6, 5.3.7.7, 5.3.10.0, 5.3.10.7 and 5.3.12.

[TS 36.331 clause 5.2.2.9]

Upon receiving *SystemInformationBlockType2-NB*, the UE shall:

1> apply the configuration included in the *radioResourceConfigCommon*;

1> apply the *defaultPagingCycle* included in the *radioResourceConfigCommon*;

1> apply the specified PCCH configuration defined in 9.1.1.3.

[TS 36.331 clause 5.3.7.2]

The UE shall only initiate the procedure when AS security has been activated. The UE initiates the procedure when one of the following conditions is met:

1> upon detecting radio link failure, in accordance with 5.3.11; or

…

Upon initiation of the procedure, the UE shall:

1> stop timer T310, if running;

1> stop timer T312, if running;

1> stop timer T313, if running;

1> stop timer T307, if running;

1> start timer T311;

[TS 36.331, clause 5.3.7.3]

Upon selecting a suitable E-UTRA cell, the UE shall:

1> stop timer T311;

1> start timer T301;

1> apply the *timeAlignmentTimerCommon* included in *SystemInformationBlockType2*;

1> initiate transmission of the *RRCConnectionReestablishmentRequest* message in accordance with 5.3.7.4;

[TS 36.331 clause 5.3.7.6]

Upon T311 expiry, the UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331 clause 5.3.7.7]

The UE shall:

1> if timer T301 expires; or

1> if the selected cell becomes no longer suitable according to the cell selection criteria as specified in TS 36.304 [4]:

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331 clause 5.3.10.0]

The UE shall:

…

1> if the received *radioResourceConfigDedicated* includes the *rlf-TimersAndConstants*:

2> reconfigure the values of timers and constants as specified in 5.3.10.7;

[TS 36.331 clause 5.3.10.7]

1> if the received *rlf-TimersAndConstants* is set to release:

2> use values for timers T301, T310, T311 and constants N310, N311, as included in *ue-TimersAndConstants* received in *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT);

1> else:

2> reconfigure the value of timers and constants in accordance with received *rlf-TimersAndConstants*;

[TS 36.331 clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T325 and T330;

1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:

2> re-establish RLC entities for all SRBs and DRBs;

2> store the UE AS Context including the current RRC configuration, the current security context, the PDCP state including ROHC state, C-RNTI used in the source PCell, the *cellIdentity* and the physical cell identity of the source PCell;

2> store the following information provided by E-UTRAN:

3> the *resumeIdentity*;

2> suspend all SRB(s) and DRB(s);

2> indicate the suspension of the RRC connection to upper layers;

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

...

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

22.4.22.3 Test description

22.4.22.3.1 Pre-test conditions

System Simulator:

- Ncell 1 and Ncell 5.
- System information combination 2 as defined in TS 36.508 [18] clause 8.1.4.3.1.

UE:

None.

Preamble:

- The UE is in Connected Mode (State 2-NB) on Ncell 1 according to [18].

22.4.22.3.2 Test procedure sequence

Table 22.4.22.3.2-1 illustrates the downlink power levels to be applied for the cells at various time instants of the test execution. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 22.4.22.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Ncell 5	Remark
T1	Cell-specific NRS EPRE	dBm/15 kHz	"Off"	"Off"	No Ncells are available. (NOTE 1).
T2	Cell-specific NRS EPRE	dBm/15 kHz	"Off"	-85	Only Ncell 5 is available. (NOTE 1).
T3	Cell-specific NRS EPRE	dBm/15 kHz	-85	"Off"	Only Ncell 1 is available. (NOTE 1).
NOTE 1: Power level "Off" is ≤ -150.					

Table 22.4.22.3.2-2: Main behaviour

```

22.4.23.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clause 5.2.2.9, 5.3.10.0, 5.3.10.7 and 5.3.11.3.

[TS 36.331 clause 5.2.2.9]

Upon receiving *SystemInformationBlockType2-NB*, the UE shall:

1> apply the configuration included in the *radioResourceConfigCommon*;

1> apply the *defaultPagingCycle* included in the *radioResourceConfigCommon*;

1> apply the specified PCCH configuration defined in 9.1.1.3.

[TS 36.331 clause 5.3.10.0]

The UE shall:

…

1> if the received *radioResourceConfigDedicated* includes the *rlf-TimersAndConstants*:

2> reconfigure the values of timers and constants as specified in 5.3.10.7;

[TS 36.331 clause 5.3.10.7]

The UE shall:

1> if the received *rlf-TimersAndConstants* is set to release:

2> use values for timers T301, T310, T311 and constants N310, N311, as included in *ue-TimersAndConstants* received in *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT);

1> else:

2> reconfigure the value of timers and constants in accordance with received *rlf-TimersAndConstants*;

[TS 36.331 clause 5.3.11.3]

The UE shall:

1> upon T310 expiry; or

…

2> consider radio link failure to be detected for the MCG i.e. RLF;

…

2> if AS security has not been activated:

3> if the UE is a NB-IoT UE:

4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

[TS 36.331, clause 5.3.12]

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;

1> stop all timers that are running except T320, T322, T325, T330;

1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:

…

1> else:

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running:

…

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4, 5.2.7];

22.4.23.3 Test description

22.4.23.3.1 Pre-test conditions

System Simulator:

- Ncell 1.

UE:

None.

Preamble:

- The UE is in registered Idle Mode (State 3-NB) on Ncell 1 according to Table 8.1.5.3.3 [18]

22.4.23.3.2 Test procedure sequence

Table 22.4.23.3.2-1 illustrates the downlink power levels to be applied for the cells at various time instants of the test execution. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 22.4.23.3.2-1: Time instances of cell power level and parameter changes

	Parameter	Unit	Ncell 1	Remark
T1	Cell-specific NRS EPRE	dBm/15kHz	”Off”	No Ncells are available. (NOTE 1).
T2	Cell-specific NRS EPRE	dBm/15kHz	-85	Only Ncell 1 is available. (NOTE 1).
NOTE 1: Power level “Off” is ≤ -150 dBm

22.4.24 NB-IoT / RRC / Paging for connection in idle mode / Non-anchor carrier

22.4.24.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state in a cell which has broadcasted SystemInformationBlockType22-NB message
including radio resource configuration for paging on non-anchor carrier and pagingWeightAnchor-r14
is not present}
ensure that {
  when { SS sends a Paging-NB message on UE's paging non-anchor carrier}
    then { UE successfully establishes the RRC connection }
            }
```

(2)

```
with { UE in RRC_IDLE state in a cell which has broadcasted SystemInformationBlockType22-NB message
including radio resource configuration for paging on non-anchor carrier and pagingWeightAnchor-r14
is not present }
ensure that {
  when { SS sends a Paging-NB message on anchor carrier }
    then { UE does not establish any RRC connection }
            }
```

22.4.24.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.2.2.3, TS 36.304, clauses 7.1

[TS 36.331, clause 5.2.2.3]

The UE shall:

1> ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:

2> if in RRC_IDLE:

3> if the UE is a NB-IoT UE:

4> the *MasterInformationBlock-NB* and *SystemInformationBlockType1-NB* as well as *SystemInformationBlockType2-NB* through *SystemInformationBlockType5-NB*, *SystemInformationBlockType22-NB*;

3> else:

4> the *MasterInformationBlock* and *SystemInformationBlockType1* (or *SystemInformationBlockType1-BR* depending on whether the UE is a BL UE or the UE in CE) as well as *SystemInformationBlockType2* through *SystemInformationBlockType8* (depending on support of the concerned RATs), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking);

2> if in RRC_CONNECTED; and

2> the UE is not a BL UE; and

2> the UE is not in CE; and

2> the UE is not a NB-IoT UE:

3> the *MasterInformationBlock*, *SystemInformationBlockType1* and *SystemInformationBlockType2* as well as *SystemInformationBlockType8* (depending on support of CDMA2000), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking);

2> if in RRC_CONNECTED and T311 is running; and

2> the UE is a BL UE or the UE is in CE or the UE is a NB-IoT UE;

3> the *MasterInformationBlock* (or *MasterInformationBlock-NB* in NB-IoT), *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) and *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT), and for NB-IoT *SystemInformationBlockType22-NB*;

1> delete any stored system information after 3 hours or 24 hours from the moment it was confirmed to be valid as defined in 5.2.1.3, unless specified otherwise;

1> consider any stored system information except *SystemInformationBlockType10, SystemInformationBlockType11, systemInformationBlockType12* and *systemInformationBlockType14* (*systemInformationBlockType14-NB* in NB-IoT) to be invalid if *systemInfoValueTag* included in the *SystemInformationBlockType1* (*MasterInformationBlock-NB* in NB-IoT) is different from the one of the stored system information and in case of NB-IoT UEs, BL UEs and UEs in CE, *systemInfoValueTagSI* is not broadcasted. Otherwise consider system information validity as defined in 5.2.1.3;

[TS 36.304, clause 7.1]

…

One Paging Narrowband (PNB) is one narrowband, on which the UE performs the paging message reception.

PF, PO, and PNB are determined by following formulae using the DRX parameters provided in System Information:

PF is given by following equation:

SFN mod T= (T div N)*(UE_ID mod N)

Index i_s pointing to PO from subframe pattern defined in 7.2 will be derived from following calculation:

i_s = floor(UE_ID/N) mod Ns

If P-RNTI is monitored on MPDCCH, the PNB is determined by the following equation:

PNB = floor(UE_ID/(N*Ns)) mod Nn

If P-RNTI is monitored on NPDCCH and the UE supports paging on a non-anchor carrier, and if paging configuration for non-anchor carrier is provided in system information, then the paging carrier is determined by the paging carrier with smallest index n ($0 \le n \le Nn-1$) fulfilling the following equation:

floor(UE_ID/(N*Ns)) mod W < W(0) + W(1) + … + W(n)

System Information DRX parameters stored in the UE shall be updated locally in the UE whenever the DRX parameter values are changed in SI. If the UE has no IMSI, for instance when making an emergency call without USIM, the UE shall use as default identity UE_ID = 0 in the PF, i_s, and PNB formulas above.

The following Parameters are used for the calculation of the PF, i_s, PNB, and the NB-IoT paging carrier:

- T: DRX cycle of the UE. Except for NB-IoT, if a UE specific extended DRX value of 512 radio frames is configured by upper layers according to 7.3, T =512. Otherwise, T is determined by the shortest of the UE specific DRX value, if allocated by upper layers, and a default DRX value broadcast in system information. If UE specific DRX is not configured by upper layers, the default value is applied. UE specific DRX is not applicable for NB-IoT.

- nB: 4T, 2T, T, T/2, T/4, T/8, T/16, T/32, T/64, T/128, and T/256, and for NB-IoT also T/512, and T/1024.

- N: min(T,nB)

- Ns: max(1,nB/T)

- Nn : number of paging narrowbands (for P-RNTI monitored on MPDCCH) or paging carriers (for P-RNTI monitored on NPDCCH) provided in system information

- UE_ID:

  IMSI mod 1024, if P-RNTI is monitored on PDCCH.

  IMSI mod 4096, if P-RNTI is monitored on NPDCCH.

  IMSI mod 16384, if P-RNTI is monitored on MPDCCH or if P-RNTI is monitored on NPDCCH and the UE supports paging on a non-anchor carrier, and if paging configuration for non-anchor carrier is provided in system information.

- W(i): Weight for NB-IoT paging carrier i.

- W: Total weight of all NB-IoT paging carriers, i.e. W = W(0) + W(1) + … + W(Nn-1).

22.4.24.3 Test description

22.4.24.3.1 Pre-test conditions

System Simulator:

- Ncell 1

- System information combination 6 as defined in TS 36.508[18] clause 8.1.4.3.1.1.

- *SystemInformationBlockType22-NB* as specified in Table 22.4.24.3.3-1.

- If UE supports NTN only access in NB-IoT (pc_NB_ntn_only_Connectivity_EPC), System information combination 12 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

None.

Preamble:

- The UE is in state Registered, Idle mode (State 3-NB) according to [18].

22.4.25 NB-IoT / SC-MCCH information acquisition

22.4.25.1 Test Purpose (TP)

(1)

```
with { UE in E-UTRAN RRC IDLE state and interested to receive SC-PTM services }
ensure that {
  when { The SystemInformationBlockType20-NB is broadcast }
    then { UE shall acquire the SCPTMConfiguration-NB message at the next repetition period }
            }
```

(2)

```
with { UE in E-UTRAN RRC IDLE state and interested to receive SC-PTM services and received
SCPTMConfiguration-NB message }
ensure that {
  when { SS transmits MBMS Packets on the SC-MTCH }
    then { UE receives the MBMS Packets }
            }
```

22.4.25.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.306, clause 6.16.1; TS 36.331, clause 5.8a.2.1, 5.8a.2.2, 5.8a.2.3 and 5.8a.3.1.

[TS 36.306, clause 6.16.1]

It is optional for UE to support the SC-PTM reception in RRC_IDLE as specified in TS 36.331 [5]. This feature is only applicable if the UE supports UE category M1 or UE category M2 or if the UE supports coverage enhancements (*ce-ModeB-r13* and/or *ce-ModeA-r13*) or if the UE supports any *ue-Category-NB*.

[TS 36.331, clause 5.8a.2.1]

The UE applies the SC-MCCH information acquisition procedure to acquire the SC-PTM control information that is broadcast by the E-UTRAN. The procedure applies to SC-PTM capable UEs that are in RRC_IDLE. This procedure also applies to SC-PTM capable UEs that are in RRC_CONNECTED except for BL UEs, UEs in CE or NB-IoT UEs.

[TS 36.331, clause 5.8a.2.2]

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT) (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE, except for BL UE, UE in CE or NB-IoT UE, that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB may apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service.

Unless explicitly stated otherwise in the procedural specification, the SC-MCCH information acquisition procedure overwrites any stored SC-MCCH information, i.e. delta configuration is not applicable for SC-MCCH information and the UE discontinues using a field if it is absent in SC-MCCH information unless explicitly specified otherwise.

[TS 36.331, clause 5.8a.2.3]

A SC-PTM capable UE shall:

1> if the procedure is triggered by an SC-MCCH information change notification and the UE has no ongoing MBMS service:

…

2> for a BL UE, UE in CE or NB-IoT UE, acquire the *SCPTMConfiguration* message scheduled by the PDCCH in which the change notification was received;

NOTE 1: The UE continues using the previously received SC-MCCH information until the new SC-MCCH information has been acquired.

1> if the UE enters a cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT):

2> acquire the *SCPTMConfiguration* message at the next repetition period;

1> if the UE is receiving an MBMS service via an SC-MRB:

…

2> a BL UE, UE in CE or NB-IoT UE shall start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed;

2> a BL UE, UE in CE or NB-IoT UE may start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service;

[TS 36.331, clause 5.8a.3.1]

The SC-PTM radio bearer configuration procedure is used by the UE to configure RLC, MAC and the physical layer upon starting and/or stopping to receive an SC-MRB transmitted on SC-MTCH. The procedure applies to SC-PTM capable UEs that are in RRC_IDLE and to SC-PTM capable UEs that are not BL UEs, UEs in CE or NB-IoT UEs in RRC_CONNECTED, and are interested to receive one or more MBMS services via SC-MRB.

22.4.25.3 Test description

22.4.25.3.1 Pre-test conditions

System Simulator:

- Ncell 1.
- System information combination 5 as defined in TS 36.508[18] clause 8.1.4.3.1.1.
- SCPTMConfiguration-NB as defined in TS 36.508[18] Table 8.1.6.1-15a is transmitted on SC-MCCH.

UE:

- NB-IOT UE supporting SC-PTM services

Preamble:

- UE is in state NB-IoT UE Attach, Connected Mode, UE Test Mode Activated (State 2A-NB) according to [18] with the UE TEST LOOP MODE F.

22.4.25.3.2 Test procedure sequence

Table 22.4.25.3.2-1: Main behaviour

22.4.25.3.3 Specific message contents

None.

22.4.26 NB-IoT / RRC connection establishment / Extended value, spare fields and non critical extensions in SI

22.4.26.1 Test Purpose (TP)

(1)

```
with { UE is powered on and receives system information }
ensure that {
  when { UE receives extended value that is not defined in the version of the transfer syntax
supported by the UE and non critical extensions }
   then { UE treats consider the value as not comprehended and treat the message as if the field
were absent and UE establishes an RRC connection }
}
```

22.4.26.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 36.331, clauses 5.2.2.3, 5.7.1, 5.7.3 and A3.3.

[TS 36.331 clause 5.2.2.3]

The UE shall:

1> ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:

2> if in RRC_IDLE:

3> if the UE is a NB-IoT UE:

4> the *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* and *SystemInformationBlockType1-NB* as well as *SystemInformationBlockType2-NB* through *SystemInformationBlockType5-NB*, *SystemInformationBlockType22-NB*;

3> else:

4> the *MasterInformationBlock* and *SystemInformationBlockType1* (or *SystemInformationBlockType1-BR* depending on whether the UE is a BL UE or the UE in CE) as well as *SystemInformationBlockType2* through *SystemInformationBlockType8* and *SystemInformationBlockType24* (depending on support of the concerned RATs), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking when the UE is connected to EPC), *SystemInformationBlockType25* (depending on support of E-UTRA/5GC);

2> if in RRC_INACTIVE:

3> the *MasterInformationBlock* and *SystemInformationBlockType1* as well as *SystemInformationBlockType2* through *SystemInformationBlockType8* (depending on support of the concerned RATs), *SystemInformationBlockType25*;

2> if in RRC_CONNECTED; and

2> the UE is not a BL UE; and

2> the UE is not in CE; and

2> the UE is not a NB-IoT UE:

3> the *MasterInformationBlock*, *SystemInformationBlockType1* and *SystemInformationBlockType2* as well as *SystemInformationBlockType8* (depending on support of CDMA2000), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking when the UE is connected to EPC), *SystemInformationBlockType25* (depending on support of E-UTRA/5GC);

2> if in RRC_CONNECTED and T311 is running; and

2> the UE is a BL UE or the UE is in CE or the UE is a NB-IoT UE;

3> the *MasterInformationBlock* (or *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* in NB-IoT), *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) and *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT), and for NB-IoT *SystemInformationBlockType22-NB*;

1> delete any stored system information after 3 hours or 24 hours from the moment it was confirmed to be valid as defined in 5.2.1.3, unless specified otherwise;

1> consider any stored system information except *SystemInformationBlockType10, SystemInformationBlockType11*, *systemInformationBlockType12* and *systemInformationBlockType14* (*systemInformationBlockType14-NB* in NB-IoT) to be invalid if *systemInfoValueTag* included in the *SystemInformationBlockType1* (*MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* in NB-IoT) is different from the one of the stored system information and in case of NB-IoT UEs, BL UEs and UEs in CE, *systemInfoValueTagSI* is not broadcasted. Otherwise consider system information validity as defined in 5.2.1.3;

[TS 36.331 clause 5.7.1]

The generic error handling defined in the subsequent sub-clauses applies unless explicitly specified otherwise e.g. within the procedure specific error handling.

The UE shall consider a value as not comprehended when it is set:

- to an extended value that is not defined in the version of the transfer syntax supported by the UE.
- to a spare or reserved value unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved value.

The UE shall consider a field as not comprehended when it is defined:

- as spare or reserved unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved field.

[TS 36.331 clause 5.7.3]

The UE shall, when receiving an RRC message on any logical channel:

1> if the message includes a field that has a value that the UE does not comprehend:

2> if a default value is defined for this field:

3> treat the message while using the default value defined for this field;

2> else if the concerned field is optional:

3> treat the message as if the field were absent and in accordance with the need code for absence of the concerned field;

2> else:

3> treat the message as if the field were absent and in accordance with sub-clause 5.7.4;

[TS 36.331 clause A3.3]

Each PDU (message) type is specified in an ASN.1 section similar to the one shown in the example below.

```
-- /example/ ASN1START
```

```
RRCConnectionReconfiguration ::=    SEQUENCE {
    rrc-TransactionIdentifier           RRC-TransactionIdentifier,
    criticalExtensions                  CHOICE {
        c1                                  CHOICE{
            rrcConnectionReconfiguration-r8     RRCConnectionReconfiguration-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture            SEQUENCE {}
    }
}

RRCConnectionReconfiguration-r8-IEs ::= SEQUENCE {
    -- Enter the IEs here.
    ...
}

-- ASN1STOP
```

Hooks for *critical* and *non-critical* extension should normally be included in the PDU type specification. How these hooks are used is further described in clause A.4.

Critical extensions are characterised by a redefinition of the PDU contents and need to be governed by a mechanism for protocol version agreement between the encoder and the decoder of the PDU, such that the encoder is prevented from sending a critically extended version of the PDU type, which is not comprehended by the decoder.

Critical extension of a PDU type is facilitated by a two-level CHOICE structure, where the alternative PDU contents are alternatives within the inner level *c1* CHOICE. Spare alternatives (i.e., *spare3* down to *spare1* in this case) may be included within the *c1* CHOICE. The number of spare alternatives to be included in the original PDU specification should be decided case by case, based on the expected rate of critical extension in the future releases of the protocol.

Further critical extension, when the spare alternatives from the original specifications are used up, is facilitated using the *criticalExtensionsFuture* in the outer level CHOICE.

In PDU types where critical extension is not expected in the future releases of the protocol, the inner level *c1* CHOICE and the spare alternatives may be excluded, as shown in the example below.

```
-- /example/ ASN1START

RRCConnectionReconfigurationComplete ::= SEQUENCE {
    rrc-TransactionIdentifier           RRC-TransactionIdentifier,
    criticalExtensions                  CHOICE {
        rrcConnectionReconfigurationComplete-r8
                                            RRCConnectionReconfigurationComplete-r8-IEs,
        criticalExtensionsFuture            SEQUENCE {}
    }
}

RRCConnectionReconfigurationComplete-r8-IEs ::= SEQUENCE {
    -- Enter the IEs here. --                                                  -- Cond condTag
    ...
}

-- ASN1STOP
```

Non-critical extensions are characterised by the addition of new information to the original specification of the PDU type. If not comprehended, a non-critical extension may be skipped by the decoder, whilst the decoder is still able to complete the decoding of the comprehended parts of the PDU contents.

Non-critical extensions at locations other than the end of the message or other than at the end of a field contained in a BIT or OCTET STRING are facilitated by use of the ASN.1 extension marker "...". The original specification of a PDU type should normally include the extension marker at the end of the sequence of information elements contained.

Non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING are facilitated by use of an empty sequence that is marked OPTIONAL e.g. as shown in the following example:

```
-- /example/ ASN1START

RRCMessage-r8-IEs ::=                   SEQUENCE {
    field1                                  InformationElement1,
    field2                                  InformationElement2,
    nonCriticalExtension                    SEQUENCE {}                 OPTIONAL
```

```
}
-- ASN1STOP
```

The ASN.1 section specifying the contents of a PDU type may be followed by a *field description* table where a further description of, e.g., the semantic properties of the fields may be included. The general format of this table is shown in the example below. The field description table is absent in case there are no fields for which further description needs to be provided e.g. because the PDU does not include any fields, or because an IE is defined for each field while there is nothing specific regarding the use of this IE that needs to be specified.

***%PDU-TypeIdentifier%* field descriptions**
%field identifier% Field description.
%field identifier% Field description.

The field description table has one column. The header row shall contain the ASN.1 type identifier of the PDU type.

The following rows are used to provide field descriptions. Each row shall include a first paragraph with a *field identifier* (in ***bold and italic*** font style) referring to the part of the PDU to which it applies. The following paragraphs at the same row may include (in regular font style), e.g., semantic description, references to other specifications and/ or specification of value units, which are relevant for the particular part of the PDU.

The parts of the PDU contents that do not require a field description shall be omitted from the field description table.

22.4.26.3 Test description

22.4.26.3.1 Pre-test conditions

System Simulator:

- Ncell 1

UE:

None.

Preamble:

- The UE is in state Switched OFF (state 1) according to TS 36.508 [18].

22.4.26.3.2 Test procedure sequence

Table 22.4.26.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	System information that includes extended and spare fields that the UE does not comprehend is broadcasted on BCCH. See NOTE	<--	RRC: SYSTEM INFORMATION (BCCH)	-	-
2	The UE is switched on.	-	-	-	-
3	Does the UE transmit an *RRCConnectionRequest-NB* message on Ncell 1?	-->	*RRCConnectionRequest-NB*	1	P
4	The SS transmits an *RRCConnectionSetup-NB* message on Ncell 1.	<--	*RRCConnectionSetup-NB*	-	-
5	Check: Does the UE transmit an *RRCConnectionSetupComplete-NB* message to confirm the successful completion of the connection establishment and to initiate the Attach procedure by including the ATTACH REQUEST message? The PDN CONNECTIVITY REQUEST message is piggybacked in ATTACH REQUEST.	-->	*RRCConnectionSetupComplete-NB* NAS: ATTACH REQUEST NAS: PDN CONNECTIVITY REQUEST	1	P

6-15	Steps 5 to 14b1 of the registration procedure described in TS 36.508 subclause 8.1.5.2 are performed on Ncell 1	-	-	-	-
NOTE: sib-TypeAndInfo-r13 in *SystemInformation-NB* is set to values in Rel-17 to check spare and extended fields in UE up to Rel-16.

22.4.27 NB-IoT / RRC connection establishment / Access barring enhancement

22.4.27.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state having an Access Class with a value in the range 0..9 and with Access
barring enabled in MasterInformationBlock-NB / MasterInformationBlock-TDD-NB and
SystemInformationBlockType14-NB with ab-PerNRSRP-r15 set to thresh1 is broadcast }
ensure that {
  when { UE has user data pending and measured RSRP is greater than the first entry in rsrp-
ThresholdsPrachInfoList }
    then { UE transmits RRC Connection Request-NB message }
            }
```

(2)

```
with { UE in RRC_IDLE state having an Access Class with a value in the range 0..9 and with Access
barring enabled in MasterInformationBlock-NB / MasterInformationBlock-TDD-NB and
SystemInformationBlockType14-NB with ab-PerNRSRP-r15 set to thresh1 is broadcast }
ensure that {
  when { UE has user data pending and measured RSRP is less than the first entry in rsrp-
ThresholdsPrachInfoList }
    then { UE does not transmit RRC Connection Request-NB message }
            }
```

(3)

```
with { UE in RRC_IDLE state having an Access Class with a value in the range 0..9 and with Access
barring enabled in MasterInformationBlock-NB / MasterInformationBlock-TDD-NB and
SystemInformationBlockType14-NB with ab-PerNRSRP-r15 set to thresh2 is broadcast }
ensure that {
  when { UE has user data pending and measured RSRP is greater than the second entry in rsrp-
ThresholdsPrachInfoList }
    then { UE transmits RRC Connection Request-NB message }
            }
```

(4)

```
with { UE in RRC_IDLE state having an Access Class with a value in the range 0..9 and with Access
barring enabled in MasterInformationBlock-NB / MasterInformationBlock-TDD-NB and
SystemInformationBlockType14-NB with ab-PerNRSRP-r15 set to thresh2 is broadcast }
ensure that {
  when { UE has user data pending and measured RSRP is less than the second entry in rsrp-
ThresholdsPrachInfoList }
    then { UE does not transmit RRC Connection Request-NB message }
            }
```

(5)

```
with { UE in RRC_IDLE state having an Access Class with a value in the range 0..9 and with Access
barring enabled in MasterInformationBlock-NB / MasterInformationBlock-TDD-NB and
SystemInformationBlockType14-NB with present ab-PerNRSRP-r15 and absent ab-Param is broadcast }
ensure that {
  when { UE has user data pending related to an exceptional event }
    then { UE transmits RRC Connection Request-NB message }
            }
```

22.4.27.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331, clauses 5.3.3.14.

[TS 36.331, clause 5.3.3.14]

The UE shall:

1> if *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:

2> if *ab-PerNRSRP* is included:

3> if the *establishmentCause* received from higher layers is set to a value other than *mo-ExceptionData*; and

3> if the UE has no Access Class, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11]:

4> if *ab-PerNRSRP* is set to *thresh1*:

5> if the measured RSRP is less than the first entry in *rsrp-ThresholdsPrachInfoList*;

6> consider access to the cell as barred;

5> else:

6> consider that only the resources indicated for the first NPRACH repetition level are configured;

4> if *ab-PerNRSRP* is set to *thresh2*:

5> if the measured RSRP is less than the second entry in *rsrp-ThresholdsPrachInfoList*;

6> consider access to the cell as barred;

5> else:

6> consider that only the resources indicated for the first and second NPRACH repetition levels are configured;

2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:

…

1> else:

2> consider access to the cell as not barred;

22.4.27.3 Test description

22.4.27.3.1 Pre-test conditions

System Simulator:

- Ncell 1
- System information combination 4 as defined in TS 36.508[18] clause 8.1.4.3.1.1.

UE:

- The UE belongs to access class 0 and does not belong to special access class 11..15.
- The UE is equipped with a USIM containing default values (as per TS 36.508) except for those shown in Table 22.4.27.3.1-1.

Table 22.4.27.3.1–1: USIM Configuration

USIM field	Value
EF_{UST}	Service 96 is supported
EF_{ACC}	Type “A” as defined in TS 34.108 clause 8.3.2.15
EFNASCONFIG	“Exception Data Reporting Allowed is set to 01”

Preamble:

- The UE is in state NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB) with test loop mode G on Ncell 1 according to [18].

22.4.27.3.2 Test procedure sequence

Table 22.4.27.3.2-1 shows the cell configurations used during the test. The configuration T0 indicates the initial conditions. Subsequent configurations marked “T1”, “T2” etc are applied at the points indicated in the Main behaviour description in Table 22.4.27.3.2-2.

Table 22.4.27.3.2-1: Cell configuration changes over time

	Parameter	Unit	Ncell 1	Remark
T0	NRS EPRE	dBm/15kHz	-85	
T1	NRS EPRE	dBm/15kHz	-70	
T2	NRS EPRE	dBm/15kHz	-90	
T3	NRS EPRE	dBm/15kHz	-110	

Table 22.4.27.3.2-2: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message

28	The SS transmits one IP packet to the UE embedded in an ESM DATA TRANSPORT and DLInformationTransfer-NB.	<--	*NAS: ESM DATA TRANSPORT*	-	-

29	Wait for 1 s after the IP packet has been transmitted. (Note 2)	-	-	-	-
30	The SS transmits an *RRCConnectionRelease-NB* message.	<--	*RRCConnectionRelease-NB*	-	-
31	Check: Does the UE transmit an *RRCConnectionRequest-NB* message with establishmentCause-r13 set to *mo-Data*?	-->	*RRCConnectionRequest-NB*	3	P
32-34	Steps 2 to 4 of the 'Generic Test Procedure NB-IoT Control Plan CIoT MO user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.3.3 are performed. NOTE: The UE will transmit one ESM DATA TRANSPORT message containing loopback data received in step 28.	-	-		-
35	The SS transmits a CLOSE UE TEST LOOP message to close the UE test loop mode for user data transfer (15 sec delay).	<--	*RRC: DLInformationTransfer-NB* *TC: CLOSE UE TEST LOOP*	-	-
36	The UE transmits a CLOSE UE TEST LOOP COMPLETE message to confirm that loopback is activated.	-->	*RRC: ULInformationTransfer-NB* *TC: CLOSE UE TEST LOOP COMPLETE*	-	-
37	The SS transmits one IP packet to the UE embedded in an ESM DATA TRANSPORT and DLInformationTransfer-NB.	<--	*NAS: ESM DATA TRANSPORT*	-	-
38	Wait for 1 s after the IP packet has been transmitted. (Note 2)	-	-	-	-
39	The SS transmits an *RRCConnectionRelease-NB* message.	<--	*RRCConnectionRelease-NB*	-	-
40	SS adjusts cell levels according to row T3 of table 22.4.27.3.2-1.	-	-	-	-
41	Check: Does the UE transmit an *RRCConnectionRequest-NB* message within 30s?	-->	*RRCConnectionRequest-NB*	4	F
42	'Generic Test Procedure NB-IoT Control Plane CIoT MT user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.2.3 are performed (Note 5)	-	-	-	-
43	The SS starts timer Timer_1 = 8 s.	-	-	-	-
-	EXCEPTION: Steps 44a1 to 44b1 describe a transaction that depends on the UE behaviour; the “lower case letter” identifies a test sequence that takes place if a specific behaviour happens (Note 5)	-	-	-	-
44a1	The UE transmits one IP packet embedded in a ESM DATA TRANSPORT and ULInformationTransfer-NB.	-->	*NAS: ESM DATA TRANSPORT*	-	-
44b1	The SS waits for Timer_1 expiry.	-	-	-	-
45	The SS transmits an OPEN UE TEST LOOP message to exit the UE test loop mode.	<--	*RRC: DLInformationTransfer-NB* *TC: OPEN UE TEST LOOP*	-	-
46	The UE transmits an OPEN UE TEST LOOP COMPLETE message.	-->	*RRC: ULInformationTransfer-NB* *TC: OPEN UE TEST LOOP COMPLETE*	-	-
47	The SS transmits an *RRCConnectionRelease-NB* message.	<--	*RRCConnectionRelease-NB*	-	-
48	Trigger the UE to initiate MO Exception Data.	-	-	-	-
49	Check: Does the UE transmit an *RRCConnectionRequest-NB* message with *establishmentCause-r13* set to *mo-ExceptionData*?	-->	*RRCConnectionRequest-NB*	5	P
50-52	Steps 2 to 4 of the 'Generic Test Procedure NB-IoT Control Plan CIoT MO user data transfer non-SMS transport' as described in TS 36.508 [18], clause 8.1.5A.3.3 are performed. NOTE: The UE will transmit one ESM DATA TRANSPORT message containing user data generated in step 48.	-	-	-	-

Note 1:	The wait time of 2.1* modification period is to allow for the network to paging the system information change during the next modification period, and update the system information at the subsequent modification period.
Note 2:	The 1 second delay is used to secure that the UE have received and forwarded the IP Packet transmitted by the SS to the UE test loop function before the RRCConnectionRelease-NB message is sent by the SS.
Note 3	The 1.28 second (twice SIB14-NB periodicity) delay is used to ensure that updated SIBs are transmitted.
Note 4:	A UE may send the pending data sent at step 16.
Note 5:	A UE may send the pending data sent at step 37.

22.4.28 NB-IoT / Wake-up Signal / DRX

22.4.28.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state and configured for DRX and WUS }
ensure that {
  when { network sends WUS followed by Paging message with a matched identity }
    then { UE establishes RRC connection }
            }
```

22.4.28.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304 clause 7.4

[TS 36.304, clause 7.4]

Paging with Wake Up Signal is only used in the cell in which the UE most recently entered RRC_IDLE triggered by:

- reception of *RRCEarlyDataComplete*; or
- reception of *RRCConnectionRelease* not including *noLastCellUpdate*; or
- reception of *RRCConnectionRelease* including *noLastCellUpdate* and the UE was using WUS in this cell prior to this RRC connection attempt.

If the UE is in RRC_IDLE, the UE is not using GWUS according to clause 7.5 and the UE supports WUS and WUS configuration is provided in system information, the UE shall monitor WUS using the WUS parameters provided in System Information. When DRX is used and the UE detects WUS the UE shall monitor the following PO. When extended DRX is used and the UE detects WUS the UE shall monitor the following *numPOs* POs or until a paging message including the UE's NAS identity is received, whichever is earlier. If the UE does not detect WUS the UE is not required to monitor the following PO(s). If the UE missed a WUS occasion (e.g. due to cell reselection), it monitors every PO until the start of next WUS or until the PTW ends, whichever is earlier.

- *numPOs* = Number of consecutive Paging Occasions (PO) mapped to one WUS provided in system information where (*numPOs*≥1).

The WUS configuration, provided in system information, includes time-offset between end of WUS and start of the first PO of the *numPOs* POs UE is required to monitor. The timeoffset in subframes, used to calculate the start of a subframe *g*0 (see TS 36.213 [6]), is defined as follows:

- for UE using DRX, it is the signalled *timeoffsetDRX*;
- for UE using eDRX, it is the signalled *timeoffset-eDRX-Short* if *timeoffset-eDRX-Long* is not broadcasted;
- for UE using eDRX, it is the value determined according to Table 7.4-1 if *timeoffset-eDRX-Long* is broadcasted

Table 7.4-1: Determination of GAP between end of WUS and associated PO

		timeoffset-eDRX-Long	
		1000ms	***2000ms***
UE Reported wakeUpSignalMinGap-eDRX	***40ms or not reported***	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Short*
	240ms	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Short*
	1000ms	*timeoffset-eDRX-Long*	*timeoffset-eDRX-Long*
	2000ms	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Long*

The timeoffset is used to determine the actual subframe *g*0 as follows (taking into consideration resultant SFN and/or H-SFN wrap-around of this computation):

*g*0 = PO – timeoffset, where PO is the Paging Occasion subframe as defined in clause 7.1

For UE using eDRX, the same timeoffset applies between the end of WUS and associated first PO of the *numPOs* POs for all the WUS occurrences for a PTW.

The timeoffset, *g*0, is used to calculate the start of the WUS as defined in TS 36.213 [6].

22.4.28.3 Test description

22.4.28.3.1 Pre-test conditions

System Simulator:

- NCell 1 supports WUS.

UE:

- The UE supports WUS.

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 1 according to [18].

22.4.28.3.2 Test procedure sequence

Table 22.4.28.3.2-1: Main behaviour

22.4.29 NB-IoT / Wake-up Signal / eDRX

22.4.29.1 Test Purpose (TP)

(1)

```
with { UE in RRC_IDLE state and configured for eDRX and WUS }
ensure that {
  when { network sends WUS followed by Paging message with a matched identity }
    then { UE establishes RRC connection }
            }
```

22.4.29.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.304 clause 7.4

[TS 36.304, clause 7.4]

Paging with Wake Up Signal is only used in the cell in which the UE most recently entered RRC_IDLE triggered by:

- reception of *RRCEarlyDataComplete*; or

- reception of *RRCConnectionRelease* not including *noLastCellUpdate*; or
- reception of *RRCConnectionRelease* including *noLastCellUpdate* and the UE was using WUS in this cell prior to this RRC connection attempt.

If the UE is in RRC_IDLE, the UE is not using GWUS according to clause 7.5 and the UE supports WUS and WUS configuration is provided in system information, the UE shall monitor WUS using the WUS parameters provided in System Information. When DRX is used and the UE detects WUS the UE shall monitor the following PO. When extended DRX is used and the UE detects WUS the UE shall monitor the following *numPOs* POs or until a paging message including the UE's NAS identity is received, whichever is earlier. If the UE does not detect WUS the UE is not required to monitor the following PO(s). If the UE missed a WUS occasion (e.g. due to cell reselection), it monitors every PO until the start of next WUS or until the PTW ends, whichever is earlier.

- *numPOs* = Number of consecutive Paging Occasions (PO) mapped to one WUS provided in system information where (*numPOs*≥1).

The WUS configuration, provided in system information, includes time-offset between end of WUS and start of the first PO of the *numPOs* POs UE is required to monitor. The timeoffset in subframes, used to calculate the start of a subframe *g*0 (see TS 36.213 [6]), is defined as follows:

- for UE using DRX, it is the signalled *timeoffsetDRX*;
- for UE using eDRX, it is the signalled *timeoffset-eDRX-Short* if *timeoffset-eDRX-Long* is not broadcasted;
- for UE using eDRX, it is the value determined according to Table 7.4-1 if *timeoffset-eDRX-Long* is broadcasted

Table 7.4-1: Determination of GAP between end of WUS and associated PO

		timeoffset-eDRX-Long	
		1000ms	***2000ms***
UE Reported wakeUpSignalMinGap-eDRX	***40ms or not reported***	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Short*
	240ms	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Short*
	1000ms	*timeoffset-eDRX-Long*	*timeoffset-eDRX-Long*
	2000ms	*timeoffset-eDRX-Short*	*timeoffset-eDRX-Long*

The timeoffset is used to determine the actual subframe *g*0 as follows (taking into consideration resultant SFN and/or H-SFN wrap-around of this computation):

*g*0 = PO – timeoffset, where PO is the Paging Occasion subframe as defined in clause 7.1

For UE using eDRX, the same timeoffset applies between the end of WUS and associated first PO of the *numPOs* POs for all the WUS occurrences for a PTW.

The timeoffset, *g*0, is used to calculate the start of the WUS as defined in TS 36.213 [6].

22.4.29.3 Test description

22.4.29.3.1 Pre-test conditions

System Simulator:

- NCell 1 supports WUS.

UE:

- The UE is configured to request the use of eDRX (in ATTACH REQUEST message) and supports WUS.

Preamble:

- The UE is in state Registered, Idle Mode (State 3-NB) on Ncell 1 according to [18]. UE sent "extended DRX parameters IE" in ATTACH REQUEST message and received "extended DRX parameters IE" in ATTACH ACCEPT message.

22.4.29.3.2 Test procedure sequence

22.4.30.1 Test Purpose (TP)

(1)

```
with { UE has acquired SystemInformationBlockType31-NB and starts timer T317 with the duration ul-SyncValidityDuration }
ensure that {
  when { T317 expires in RRC_CONNECTED state }
    then { UE informs lower layers that the UL synchronization is lost and start T318 }
            }
```

(2)

```
with { UE has started T318 in RRC_CONNECTED state }
ensure that {
  when { SystemInformationBlockType31-NB is acquired successfully }
    then { UE stops T318 and informs lower layers that the UL synchronization is restored }
            }
```

(3)

```
with { UE has started T318 in RRC_CONNECTED state }
ensure that {
  when { T318 expires }
    then { UE considers radio link failure and initiates the connection re-establishment procedure }
            }
```

22.4.30.2 Conformance requirements

References: The conformance requirements covered in the present TC are specified in: TS 36.331 clauses 5.2.1.3, 5.2.2.4, 5.2.2.39, 5.3.18, 5.3.11.33 and 5.3.7.2; TS 36.321 clause 5.2a. Unless otherwise stated these are Rel-17 requirements.

[TS 36.331, clause 5.2.1.3]

In RRC_CONNECTED, BL UEs or UEs in CE or NB-IoT UEs are not required to acquire system information except when T311 is running, or upon handover where the UE is only required to acquire the *MasterInformationBlock* in the target PCell, or for UEs in CE to receive ETWS/CMAS information, or upon expiry of T317 where the UE is only required to acquire the *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT). In RRC_IDLE, E-UTRAN may notify BL UEs or UEs in CE or NB-IoT UEs about SI update, and except for NB-IoT, ETWS and CMAS notification, EAB modification and UAC modification, using Direct Indication information, as specified in 6.6 (or 6.7.5 in NB-IoT) and TS 36.212 [22].

NOTE 2: Upon system information change essential for BL UEs, UEs in CE, or NB-IoT UEs in RRC_CONNECTED, E-UTRAN may initiate connection release.

NOTE 3: When acquiring SIB31(-NB) in RRC_CONNECTED, UE may assume that the scheduling is unchanged.

[TS 36.331, clause 5.2.2.4]

The UE shall:

…

1> if the UE is NTN capable:

2> if *schedulingInfoList* indicates that *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) is present:

3> immediately before establishing, resuming or re-establishing an RRC connection; or

3> if in RRC_CONNECTED and T317 is not running:

4> acquire *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT);

[TS 36.331, clause 5.2.2.39]

Upon receiving *SystemInformationBlockType31* (*SystemInformationBlockType31-NB*), the UE shall:

1> start or restart timer T317 with the duration *ul-SyncValidityDuration* from the subframe indicated by *epochTime*.

[TS 36.331, clause 5.3.18]

The UE shall:

1> if in RRC_CONNECTED:

2> inform lower layers that the UL synchronisation is lost;

2> start timer T318;

2> acquire *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) as specified in 5.2.2;

2> upon successful acquisition of *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT):

3> stop timer T318;

3> inform lower layers that the UL synchronisation is restored;

NOTE: *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) may be broadcast on a different narrowband or different NB-IoT carrier than the one configured to the UE.

[TS 36.331, clause 5.3.11.3]

The UE shall:

…

1> upon T318 expiry; or

…

2> consider radio link failure to be detected for the MCG i.e. RLF;

…

3> else:

4> initiate the connection re-establishment procedure as specified in 5.3.7;

[TS 36.331, clause 5.3.7.2]

The UE shall only initiate the procedure either when AS security has been activated or for a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS/5GS optimisation. The UE initiates the procedure when one of the following conditions is met:

[TS 36.321, clause 5.2a]

If upper layer informs that the UL synchronization is lost according to the clause 5.3.18 of TS 36.331 [8], the MAC entity shall:

- flush all HARQ buffers;
- not perform any uplink transmission.

If upper layer informs that the UL synchronization is restored for the SpCell according to the clause 5.3.18 of TS36.331 [8], uplink transmissions can be performed.

22.4.30.3 Test description

22.4.30.3.1 Pre-test conditions

System Simulator:

- Ncell 1 is configured according to Table 8.1.4.2-1 and Table 8.1.4.2-2 in TS 36.508 [18].
- System information combination 8 as defined in TS 36.508 [18] clause 8.1.4.3.1.1 is used.

UE:

- The UE is in Automatic PLMN selection mode.

- The preconfigured UE location is defined in TS 36.508 [18] Clause 4.13.

Preamble:

- The UE is in State 1-NB switched off according to TS 36.508 [18].

22.4.30.3.2 Test procedure sequence

Table 22.4.30.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	Power on UE.	-	-	-	-
2	UE acquires *SystemInformationBlockType31-NB* and start T317 = 60 seconds.	-	-	-	-

    then { the UE sends a correct AUTHENTICATION RESPONSE message }
            }
```

(6)

```
with { UE in EMM-REGISTERED state / EMM-CONNECTED mode}
ensure that {
  when { UE receives an AUTHENTICATION REQUEST message but UE deems that the network failed the
authentication check (it has been deemed by the UE that the source of the authentication challenge
is not genuine) }
    then { UE locally releases the RRC connection and treats the active cell as barred }
            }
```

22.5.1.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 24.301, clauses 5.4.2.5, 5.4.2.6, 5.4.2.7, 4.7, TS 36.304, clause 5.3.1. Unless otherwise stated these are Rel-13 requirements.

[TS 24.301, clause 5.4.2.5]

Upon receipt of an AUTHENTICATION REJECT message,

a) if the message has been successfully integrity checked by the NAS, the UE shall set the update status to EU3 ROAMING NOT ALLOWED, delete the stored GUTI, TAI list, last visited registered TAI and KSI_{ASME}. The USIM shall be considered invalid until switching off the UE or the UICC containing the USIM is removed. If the UE maintains a counter for "SIM/USIM considered invalid for GPRS services", then the UE shall set this counter to UE implementation-specific maximum value.

[TS 24.301, clause 5.4.2.6]

In an EPS authentication challenge, the UE shall check the authenticity of the core network by means of the AUTN parameter received in the AUTHENTICATION REQUEST message. This enables the UE to detect a false network.

During an EPS authentication procedure, the UE may reject the core network due to an incorrect AUTN parameter (see 3GPP TS 33.401 [19]). This parameter contains three possible causes for authentication failure:

a) MAC code failure:

   If the UE finds the MAC code (supplied by the core network in the AUTN parameter) to be invalid, the UE shall send an AUTHENTICATION FAILURE message to the network, with the EMM cause #20 "MAC failure". The UE shall then follow the procedure described in subclause 5.4.2.7, item c.

b) Non-EPS authentication unacceptable:

   If the UE finds that the "separation bit" in the AMF field of AUTN supplied by the core network is 0, the UE shall send an AUTHENTICATION FAILURE message to the network, with the EMM cause #26 "non-EPS authentication unacceptable" (see subclause 6.1.1 in 3GPP TS 33.401 [19]). The UE shall then follow the procedure described in subclause 5.4.2.7, item d.

c) SQN failure:

   If the UE finds the SQN (supplied by the core network in the AUTN parameter) to be out of range, the UE shall send an AUTHENTICATION FAILURE message to the network, with the EMM cause #21 "synch failure" and a re-synchronization token AUTS provided by the USIM (see 3GPP TS 33.102 [18]). The UE shall then follow the procedure described in subclause 5.4.2.7, item e.

If the UE returns an AUTHENTICATION FAILURE message to the network, the UE shall delete any previously stored RAND and RES and shall stop timer T3416, if running.

[TS 24.301, clause 5.4.2.7]

c) Authentication failure (EMM cause #20 "MAC failure"):

   The UE shall send an AUTHENTICATION FAILURE message, with EMM cause #20 "MAC failure" according to subclause 5.4.2.6, to the network and start timer T3418 (see example in figure 5.4.2.7.1). Furthermore, the UE shall stop any of the retransmission timers that are running (e.g. T3410, T3417, T3421 or T3430). Upon the first receipt of an AUTHENTICATION FAILURE message from the UE with EMM cause #20 "MAC failure", the network may initiate the identification procedure described in subclause 5.4.4. This is to allow the network to obtain the IMSI from the UE. The network may then check that the GUTI originally used in the authentication challenge corresponded to the correct IMSI. Upon receipt of the IDENTITY REQUEST message from the network, the UE shall send the IDENTITY RESPONSE message.

...

It can be assumed that the source of the authentication challenge is not genuine (authentication not accepted by the UE) if any of the following occur:

- the timer T3418 expires;

...

When it has been deemed by the UE that the source of the authentication challenge is not genuine (i.e. authentication not accepted by the UE), the UE shall proceed as described in item f.

...

d) Authentication failure (EMM cause #26 "non-EPS authentication unacceptable"):

The UE shall send an AUTHENTICATION FAILURE message, with EMM cause #26 "non-EPS authentication unacceptable", to the network and start the timer T3418 (see example in figure 5.4.2.7.1). Furthermore, the UE shall stop any of the retransmission timers that are running (e.g. T3410, T3417, T3421 or T3430). Upon the first receipt of an AUTHENTICATION FAILURE message from the UE with EMM cause #26 "non-EPS authentication unacceptable", the network may initiate the identification procedure described in subclause 5.4.4. This is to allow the network to obtain the IMSI from the UE. The network may then check that the GUTI originally used in the authentication challenge corresponded to the correct IMSI. Upon receipt of the IDENTITY REQUEST message from the network, the UE shall send the IDENTITY RESPONSE message.

...

If the GUTI/IMSI mapping in the network was incorrect, the network should respond by sending a new AUTHENTICATION REQUEST message to the UE. Upon receiving the new AUTHENTICATION REQUEST message from the network, the UE shall stop the timer T3418, if running, and then process the challenge information as normal. If the GUTI/IMSI mapping in the network was correct, the network should terminate the authentication procedure by sending an AUTHENTICATION REJECT message (see subclause 5.4.2.5).

...

e) Authentication failure (EMM cause #21 "synch failure"):

The UE shall send an AUTHENTICATION FAILURE message, with EMM cause #21 "synch failure", to the network and start the timer T3420 (see example in figure 5.4.2.7.2). Furthermore, the UE shall stop any of the retransmission timers that are running (e.g. T3410, T3417, T3421 or T3430). Upon the first receipt of an AUTHENTICATION FAILURE message from the UE with the EMM cause #21 "synch failure", the network shall use the returned AUTS parameter from the authentication failure parameter IE in the AUTHENTICATION FAILURE message, to re-synchronise. The re-synchronisation procedure requires the MME to delete all unused authentication vectors for that IMSI and obtain new vectors from the HSS. When re-synchronisation is complete, the network shall initiate the authentication procedure. Upon receipt of the AUTHENTICATION REQUEST message, the UE shall stop the timer T3420, if running.

...

If the network is validated successfully (a new AUTHENTICATION REQUEST message is received which contains a valid SQN and MAC) while T3420 is running, the UE shall send the AUTHENTICATION RESPONSE message to the network and shall start any retransmission timers (e.g. T3410, T3417, T3421 or T3430), if they were running and stopped when the UE received the first failed AUTHENTICATION REQUEST message.

...

f) Network failing the authentication check:

If the UE deems that the network has failed the authentication check, then it shall request RRC to locally release the RRC connection and treat the active cell as barred (see 3GPP TS 36.304 [21]). The UE shall start any retransmission timers (e.g. T3410, T3417, T3421 or T3430), if they were running and stopped when the UE received the first AUTHENTICATION REQUEST message containing an invalid MAC or SQN.

[TS 36.304, clause 5.3.1]

When cell status "barred" is indicated or to be treated as if the cell status is "barred",

- The UE is not permitted to select/reselect this cell, not even for emergency calls.
- The UE shall select another cell according to the following rule:

...

- else

  ...

  - else
    - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1 (*or *SystemInformationBlockType1-NB)* message is set to "allowed", the UE may select another cell on the same frequency if re-selection criteria are fulfilled.
      - The UE shall exclude the barred cell as a candidate for cell selection/reselection for 300 seconds.
    - If the field *intraFreqReselection* in field *cellAccessRelatedInfo* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB*) message is set to "not allowed" the UE shall not re-select a cell on the same frequency as the barred cell;
      - The UE shall exclude the barred cell and the cells on the same frequency as a candidate for cell selection/reselection for 300 seconds.

[TS 24.301, clause 4.7]

A UE in NB-S1 mode (see 3GPP TS 36.331 [22]) shall calculate the value of the applicable NAS timers:

- indicated in table 10.2.1 plus 240s; and
- indicated in table 10.3.1 plus 180s.

The timer value obtained is used as described in the appropriate procedure subclause of this specification. The NAS timer value shall be calculated at start of a NAS procedure and shall not re-calculate the use of the multiplier until the NAS procedure is completed, restarted or aborted.

22.5.1.3 Test description

22.5.1.3.1 Pre-test conditions

System Simulator:

- 2 NB-IoT cells, Ncell 1 and Ncell 11, default system information
  - Ncell 1, set to "Serving cell"
  - Ncell 2, set to "Non-Suitable cell"

UE:

None.

Preamble:

- The UE is in NB-IoT UE Attach, Connected mode (State 11-NB) on Ncell 1 according to TS 36.508 [18].

22.5.1.3.2 Test procedure sequence

Table 22.5.1.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1	The SS transmits an AUTHENTICATION REQUEST message intended to establish a new EPS security context. NOTE: The message is integrity protected and ciphered with the EPS security context established during the preamble.	<--	RRC: *DLInformationTransfer-NB* NAS: AUTHENTICATION REQUEST	-	-
2	The UE transmits an AUTHENTICATION RESPONSE message. NOTE: Because step 3 sends reject regardless of whether the AUTHENTICATION RESPONSE message is correct or not, the correctness of the AUTHENTICATION RESPONSE message e.g. integrity protection, ciphering, content, etc. needs not to be checked.	-->	RRC: *ULInformationTransfer-NB* NAS: AUTHENTICATION RESPONSE	-	-
3	The SS transmits an AUTHENTICATION REJECT message. NOTE: The message is integrity protected and ciphered with the EPS security context established during the preamble.	<--	RRC: *DLInformationTransfer-NB* NAS: AUTHENTICATION REJECT	-	-

```

(7)

```
with { UE in EMM-REGISTERED state / EMM-CONNECTED mode}
ensure that {
  when { UE receives an IDENTITY REQUEST message with IMEI in the IE Identity type }
    then { UE sends an IDENTITY RESPONSE message providing its IMEI }
            }
```

22.5.2.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 24.301 clause 4.4.2.4, 4.4.3.1, 4.4.3.4, 4.4.4.1, 4.4.4.2, 4.4.5, 5.4.3.1, 5.4.3.3, 5.4.3.5, 5.4.4.3. Unless otherwise stated these are Rel-13 requirements.

[TS 24.301, clause 4.4.2.4]

When the MME initiates a re-authentication to create a new EPS security context, the messages exchanged during the authentication procedure are integrity protected and ciphered using the current EPS security context, if any.

Both UE and MME shall continue to use the current EPS security context, until the MME initiates a security mode control procedure. The SECURITY MODE COMMAND message sent by the MME includes the eKSI of the new EPS security context to be used. The MME shall send the SECURITY MODE COMMAND message integrity protected with the new EPS security context, but unciphered. When the UE responds with a SECURITY MODE COMPLETE, it shall send the message integrity protected and ciphered with the new EPS security context.

The MME can also modify the current EPS security context or take the non-current native EPS security context, if any, into use, by sending a SECURITY MODE COMMAND message including the eKSI of the EPS security context to be modified and including a new set of selected NAS security algorithms. In this case the MME shall send the SECURITY MODE COMMAND message integrity protected with the modified EPS security context, but unciphered. When the UE replies with a SECURITY MODE COMPLETE message, it shall send the message integrity protected and ciphered with the modified EPS security context.

[TS 24.301, clause 4.4.3.1]

Each EPS security context shall be associated with two separate counters NAS COUNT: one related to uplink NAS messages and one related to downlink NAS messages. The NAS COUNT counters use 24 bit internal representation and are independently maintained by UE and MME. The NAS COUNT shall be constructed as a NAS sequence number (8 least significant bits) concatenated with a NAS overflow counter (16 most significant bits).

When NAS COUNT is input to NAS ciphering or NAS integrity algorithms it shall be considered to be a 32-bit entity which shall be constructed by padding the 24-bit internal representation with 8 zeros in the most significant bits.

The value of the uplink NAS COUNT that is stored or read out of the USIM or non-volatile memory as described in annex C, is the value that shall be used in the next NAS message.

The value of the downlink NAS COUNT that is stored or read out of the USIM or non-volatile memory as described in annex C, is the largest downlink NAS COUNT used in a successfully integrity checked NAS message.

The NAS sequence number part of the NAS COUNT shall be exchanged between the UE and the MME as part of the NAS signalling. After each new or retransmitted outbound security protected NAS message, the sender shall increase the NAS COUNT number by one, except for the initial NAS messages if the lower layers indicated the failure to establish the RRC connection (see 3GPP TS 36.331 [22]). Specifically, on the sender side, the NAS sequence number shall be increased by one, and if the result is zero (due to wrap around), the NAS overflow counter shall also be incremented by one (see subclause 4.4.3.5). The receiving side shall estimate the NAS COUNT used by the sending side. Specifically, if the estimated NAS sequence number wraps around, the NAS overflow counter shall be incremented by one.

[TS 24.301, clause 4.4.3.4]

The sender shall use its locally stored NAS COUNT as input to the ciphering algorithm.

The receiver shall use the NAS sequence number included in the received message (or estimated from the 5 bits of the NAS sequence number received in the message) and an estimate for the NAS overflow counter as defined in subclause 4.4.3.1 to form the NAS COUNT input to the deciphering algorithm.

The input parameters to the NAS ciphering algorithm are the constant BEARER ID, DIRECTION bit, NAS COUNT, NAS encryption key and the length of the key stream to be generated by the encryption algorithm. When an initial plain NAS message for transport of user data via control plane (i.e. CONTROL PLANE SERVICE REQUEST message) is to be partially ciphered, the length of the key stream is set to the length of the part of the initial plain NAS message (i.e. the value part of the ESM message container IE or the value part of the NAS message container) that is to be ciphered.

[TS 24.301, clause 4.4.4.1]

For the UE, integrity protected signalling is mandatory for the NAS messages once a valid EPS security context exists and has been taken into use. For the network, integrity protected signalling is mandatory for the NAS messages once a secure exchange of NAS messages has been established for the NAS signalling connection. Integrity protection of all NAS signalling messages is the responsibility of the NAS. It is the network which activates integrity protection.

The use of "null integrity protection algorithm" EIA0 (see subclause 9.9.3.23) in the current security context is only allowed for an unauthenticated UE for which establishment of emergency bearer services is allowed. For setting the security header type in outbound NAS messages, the UE and the MME shall apply the same rules irrespective of whether the "null integrity protection algorithm" or any other integrity protection algorithm is indicated in the security context.

...

When a NAS message needs to be sent both ciphered and integrity protected, the NAS message is first ciphered and then the ciphered NAS message and the NAS sequence number are integrity protected by calculating the MAC. The same applies when an initial NAS message needs to be sent partially ciphered and integrity protected.

NOTE: NAS messages that are ciphered or partially ciphered with the "null ciphering algorithm" EEA0 are regarded as ciphered or partially ciphered, respectively (see subclause 4.4.5).

[TS 24.301, clause 4.4.4.2]

Except the messages listed below, no NAS signalling messages shall be processed by the receiving EMM entity in the UE or forwarded to the ESM entity, unless the network has established secure exchange of NAS messages for the NAS signalling connection:

- EMM messages:
  - IDENTITY REQUEST (if requested identification parameter is IMSI);
  - AUTHENTICATION REQUEST;
  - AUTHENTICATION REJECT;
  - ATTACH REJECT (if the EMM cause is not #25);
  - DETACH ACCEPT (for non switch off);
  - TRACKING AREA UPDATE REJECT (if the EMM cause is not #25);
  - SERVICE REJECT (if the EMM cause is not #25).

NOTE: These messages are accepted by the UE without integrity protection, as in certain situations they are sent by the network before security can be activated.

All ESM messages are integrity protected.

Once the secure exchange of NAS messages has been established, the receiving EMM or ESM entity in the UE shall not process any NAS signalling messages unless they have been successfully integrity checked by the NAS. If NAS signalling messages, having not successfully passed the integrity check, are received, then the NAS in the UE shall discard that message. The processing of the SECURITY MODE COMMAND message that has not successfully passed the integrity check is specified in subclause 5.4.3.5. If any NAS signalling message is received as not integrity protected even though the secure exchange of NAS messages has been established by the network, then the NAS shall discard this message.

[TS 24.301, clause 4.4.5]

The use of ciphering in a network is an operator option subject to MME configuration. When operation of the network without ciphering is configured, the MME shall indicate the use of "null ciphering algorithm" EEA0 (see subclause 9.9.3.23) in the current security context for all UEs. For setting the security header type in outbound NAS messages, the UE and the MME shall apply the same rules irrespective of whether the "null ciphering algorithm" or any other ciphering algorithm is indicated in the security context.

...

If the "null ciphering algorithm" EEA0 has been selected as a ciphering algorithm, the NAS messages with the security header indicating ciphering are regarded as ciphered.

[TS 24.301, clause 5.4.3.1]

The purpose of the NAS security mode control procedure is to take an EPS security context into use, and initialise and start NAS signalling security between the UE and the MME with the corresponding EPS NAS keys and EPS security algorithms.

Furthermore, the network may also initiate the security mode control procedure in the following cases:

- in order to change the NAS security algorithms for a current EPS security context already in use; and
- in order to change the value of uplink NAS COUNT used in the latest SECURITY MODE COMPLETE message as described in 3GPP TS 33.401 [19], subclause 7.2.9.2.

[TS 24.301, clause 5.4.3.3]

Upon receipt of the SECURITY MODE COMMAND message, the UE shall check whether the security mode command can be accepted or not. This is done by performing the integrity check of the message and by checking that the received replayed UE security capabilities and the received $nonce_{UE}$ have not been altered compared to the latest values that the UE sent to the network. However, the UE is not required to perform the checking of the received $nonce_{UE}$ if the UE does not want to re-generate the K'_{ASME} (i.e. the SECURITY MODE COMMAND message is to derive and take into use a mapped EPS security context and the eKSI matches the current EPS security context, if it is a mapped EPS security context). When the UE has a PDN connection for emergency bearer services established or the UE is establishing a PDN connection for emergency bearer services, the UE is not required to locally re-generate the K_{ASME} (i.e. the SECURITY MODE COMMAND message is used to derive and take into use a native EPS security context where the KSI value "000" is included in the NAS key set identifier IE and the EIA0 and EEA0 are included as the selected NAS security algorithms).

The UE shall accept a SECURITY MODE COMMAND message indicating the "null integrity protection algorithm" EIA0 as the selected NAS integrity algorithm only if the message is received for a UE that has a PDN connection for emergency bearer services established or a UE that is establishing a PDN connection for emergency bearer services.

...

If the SECURITY MODE COMMAND message can be accepted, the UE shall take the EPS security context indicated in the message into use. The UE shall in addition reset the uplink NAS COUNT counter if:

- the SECURITY MODE COMMAND message is received in order to take an EPS security context into use created after a successful execution of the EPS authentication procedure;

...

If the SECURITY MODE COMMAND message can be accepted and a new EPS security context is taken into use and SECURITY MODE COMMAND message does not indicate the "null integrity protection algorithm" EIA0 as the selected NAS integrity algorithm, the UE shall:

- if the SECURITY MODE COMMAND message has been successfully integrity checked using an estimated downlink NAS COUNT equal 0, then the UE shall set the downlink NAS COUNT of this new EPS security context to 0;

...

If the SECURITY MODE COMMAND message can be accepted, the UE shall send a SECURITY MODE COMPLETE message integrity protected with the selected NAS integrity algorithm and the EPS NAS integrity key based on the K_{ASME} or mapped K'_{ASME} if the type of security context flag is set to "mapped security context" indicated by the eKSI. When the SECURITY MODE COMMAND message includes the type of security context flag set to "mapped security context" in the NAS key set identifier IE, the $nonce_{MME}$ and the $nonce_{UE}$, then the UE shall either:

- generate K'_{ASME} from both the $nonce_{MME}$ and the $nonce_{UE}$ as indicated in 3GPP TS 33.401 [19];or
- ...

Furthermore, if the SECURITY MODE COMMAND message can be accepted, the UE shall cipher the SECURITY MODE COMPLETE message with the selected NAS ciphering algorithm and the EPS NAS ciphering key based on the K_{ASME} or mapped K'_{ASME} indicated by the eKSI. The UE shall set the security header type of the message to "integrity protected and ciphered with new EPS security context".

From this time onward the UE shall cipher and integrity protect all NAS signalling messages with the selected NAS ciphering and NAS integrity algorithms.

If the MME indicated in the SECURITY MODE COMMAND message that the IMEISV is requested, the UE shall include its IMEISV in the SECURITY MODE COMPLETE message.

[TS 24.301, clause 5.4.3.5]

If the security mode command cannot be accepted, the UE shall send a SECURITY MODE REJECT message. The SECURITY MODE REJECT message contains an EMM cause that typically indicates one of the following cause values:

#23: UE security capabilities mismatch;

#24: security mode rejected, unspecified.

...

Both the UE and the MME shall apply the EPS security context in use before the initiation of the security mode control procedure, if any, to protect the SECURITY MODE REJECT message and any other subsequent messages according to the rules in subclauses 4.4.4 and 4.4.5.

[TS 24.301, clause 5.4.4.3]

A UE shall be ready to respond to an IDENTITY REQUEST message at any time whilst in EMM-CONNECTED mode.

Upon receipt of the IDENTITY REQUEST message the UE shall send an IDENTITY RESPONSE message to the network. The IDENTITY RESPONSE message shall contain the identification parameters as requested by the network.

22.5.2.3 Test description

22.5.2.3.1 Pre-test conditions

System Simulator:

- NB-IoT Ncell 1, default system information.

UE:

None.

Preamble:

- The UE is in State 1-NB "Switched OFF" according to TS 36.508 [18].

22.5.2.3.2 Test procedure sequence

Table 22.5.2.3.2-1: Main behaviour

St	Procedure	Message Sequence		TP	Verdict
		U - S	Message		
1-6	Steps 1-6 from the Generic procedure 'NB-IoT UE Attach, Connected mode (State 2-NB)' as	-	-	-	-

	described in TS 36.508 [18], clause 8.1.5.2 take place. NOTE 1: The SS shall send the AUTHENTICATION REQUEST message not secured (i.e. not integrity protected and not ciphered) regardless from whether EPS security context exists (e.g. may have been established during the preamble). The SS shall use an eKSI different from the eKSI received in ATTACH REQUEST (if any was received). NOTE 2: The AUTHENTICATION RESPONSE message may be integrity protected (if the UE has a security context) - the SS needs not to prove if this is valid or not.				
7	The SS transmits a NAS SECURITY MODE COMMAND message to activate NAS security requesting "null integrity protection algorithm" EIA0. NOTE: The message is integrity protected with the EPS security context created by the authentication procedure having taken place in steps 5-6 and the security header type is set to 'Integrity protected with new EPS security context' even though the message indicates "null integrity protection algorithm".	<--	RRC: *DLInformationTransfer-NB* NAS: SECURITY MODE COMMAND	-	-
8	Check: Does the UE transmit a NAS SECURITY MODE REJECT message? NOTE: The message may be integrity protected (if the UE has a security context) - the SS needs not to prove if this is valid or not.	-->	RRC: *ULInformationTransfer-NB* NAS: SECURITY MODE REJECT	1	P
9	The SS Transmits an IDENTITY REQUEST message for IMEI. NOTE: The message is not integrity protected nor ciphered.	<-	RRC: *DLInformationTransfer-NB* IDENTITY REQUEST	-	-
10	Check: Does the UE transmit IDENTITY RESPONSE message in the next 30 sec?	->	RRC: *ULInformationTransfer-NB* IDENTITY RESPONSE	1	F
11	The SS transmits a NAS SECURITY MODE COMMAND message to activate NAS security requesting "null ciphering algorithm" EEA0 and a not "null integrity protection algorithm" (i.e. different to EIA0). NOTE: The message is integrity protected with the EPS security context created by the authentication procedure having taken place in steps 5-6 and the integrity protection algorithm included in the message itself, but not ciphered.	<--	RRC: *DLInformationTransfer-NB* NAS: SECURITY MODE COMMAND	-	-
12	Check: Does the UE transmit a NAS SECURITY MODE COMPLETE message and establishes the initial security configuration? NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	-->	RRC: *ULInformationTransfer-NB* NAS: SECURITY MODE COMPLETE	2	P
13a1-18b1	Steps 9a1-14b1 from the Generic procedure 'NB-IoT UE Attach, Connected mode (State 2-NB)' as described in TS 36.508 [18], clause 8.1.5.2 take place.	-	-	-	-
19	The SS transmits a NAS SECURITY MODE COMMAND message to change the Type of ciphering algorithm for the current EPS security context already in use. The included replayed security capabilities of the UE does not match those provided by the UE. NOTE: The message is integrity protected with the EPS security context created by the	<--	RRC: *DLInformationTransfer-NB* NAS: SECURITY MODE COMMAND	-	-

	authentication procedure having taken place in steps 5-6 and the integrity protection algorithm included in the message itself, but not ciphered.				
20	Check: Does the UE transmit a NAS SECURITY MODE REJECT message? NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	-->	RRC: *ULInformationTransfer-NB* NAS: SECURITY MODE REJECT	3	P
21	The SS Transmits an IDENTITY REQUEST message for IMEI. NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	<-	RRC: *DLInformationTransfer-NB* IDENTITY REQUEST	-	-
22	Check: Does the UE transmit IDENTITY RESPONSE message providing its IMEI? NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	->	RRC: *ULInformationTransfer-NB* NAS: IDENTITY RESPONSE	3,7	P
23	The SS transmits an AUTHENTICATION REQUEST message to initiate the EPS authentication and AKA procedure for new key set generation. NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	<--	RRC: *DLInformationTransfer-NB* NAS: AUTHENTICATION REQUEST	-	-
24	The UE transmits an AUTHENTICATION RESPONSE message and establishes mutual authentication. NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 5-6 and using the algorithms provided in step 11.	-->	RRC: *ULInformationTransfer-NB* NAS: AUTHENTICATION RESPONSE	-	-
25	SS resets UL and DL NAS Count to zero.	-	-	-	-
26	The SS transmits a SECURITY MODE COMMAND message to activate NAS security. It is integrity protected and includes request to include IMEISV. NOTE: The message is integrity protected with the EPS security context created by the authentication procedure having taken place in steps 23-24 and the integrity protection algorithm included in the message itself, but not ciphered.	<--	RRC: *DLInformationTransfer-NB* NAS: SECURITY MODE COMMAND	-	-
27	Check: Does the UE transmit a NAS SECURITY MODE COMPLETE message providing IMEISV? NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 23-24 and using the algorithms provided in step 26, and, respecting the count set in step 25.	-->	RRC: *ULInformationTransfer-NB* NAS: SECURITY MODE COMPLETE	4,5	P
-	Exception: Steps 26 and 27 are executed 10 times to check UE is applying security correctly taking into account the NAS count.	-	-	-	-
28	The SS transmits an IDENTITY REQUEST message requesting IMEISV.	<-	RRC: *DLInformationTransfer-NB* NAS: IDENTITY REQUEST	-	-

	NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 23-24 and using the algorithms provided in step 26. The NAS COUNT number is increased by one after each new message being sent.				
29	Check: Does the UE transmit an IDENTITY RESPONSE message providing its IMEISV and increasing the NAS COUNT number by one after each new message being sent? NOTE: The message is integrity protected and ciphered with the EPS security context created by the authentication procedure having taken place in steps 23-24 and using the algorithms provided in step 26.	->	RRC: *ULInformationTransfer-NB* NAS: IDENTITY RESPONSE	4,6	P
30	SS releases the RRC connection	<--	RRC: *RRCConnectionRequest-NB*	-	-

22.5.3 NB-IoT / NW initiated detach Re-attach required / UE initiated detach Abnormal case EMM common procedure collision / UE initiated detach Abnormal case Local detach after 5 attempts due to no network response

22.5.3.1 Test Purpose (TP)

(1)

```
with { UE in EMM-REGISTERED state }
ensure that {
  when { SS sends DETACH REQUEST message with the Detach type IE "re-attach required" }
   then { UE detaches and re-attaches using the EPS security context established before the detach }
              }
```

(2)

```
with { UE in EMM-DEREGISTERED-INITIATED state due to normal detach }
ensure that {
  when { the UE receives AUTHENTICATION REQUEST, SECURITY MODE COMMAND or IDENTITY REQUEST message
from the network }
   then { the UE responds to the message }
            }
```

(3)

```
with { UE in EMM-DEREGISTERED-INITIATED state due to normal detach }
ensure that {
  when { the UE receives GUTI REALLOCATION COMMAND from the network }
   then { the UE ignores the message and continues the detach procedure }
            }
```

(4)

```
with { UE in EMM-DEREGISTERED-INITIATED state due to normal detach }
ensure that {
  when { the UE receives no response to the UE initiated DETACH REQUEST }
   then { the UE re-transmits the DETACH REQUEST up to 4 times on the expiry of timer T3421 }
            }
```

(5)

```
with { UE in EMM-DEREGISTERED-INITIATED state due to normal detach }
ensure that {
  when { the UE receives no response to the UE initiated DETACH REQUEST }
   then { the UE aborts the detach procedure and perform local detach on the 5th expiry of timer
T3421 }
            }
```

22.5.3.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 24.301 clauses 4.7, 5.5.2.2.4, 5.5.2.3.2. Unless otherwise stated these are Rel-13 requirements.

[TS 24.301, clause 4.7]

A UE in NB-S1 mode (see 3GPP TS 36.331 [22]) shall calculate the value of the applicable NAS timers:

- indicated in table 10.2.1 plus 240s; and
- indicated in table 10.3.1 plus 180s.

The timer value obtained is used as described in the appropriate procedure subclause of this specification. The NAS timer value shall be calculated at start of a NAS procedure and shall not re-calculate the use of the multiplier until the NAS procedure is completed, restarted or aborted.

[TS 24.301, clause 5.5.2.2.4]

The following abnormal cases can be identified:

...

c) T3421 timeout

On the first four expiries of the timer, the UE shall retransmit the DETACH REQUEST message and shall reset and restart timer T3421. On the fifth expiry of timer T3421, the detach procedure shall be aborted and the UE proceeds as follows:

...

- if "EPS detach" was requested for reasons other than disabling of EPS services, the UE shall enter the EMM-DEREGISTERED state;

...

...

e) Detach and EMM common procedure collision

Detach containing cause "switch off":

- If the UE receives a message used in an EMM common procedure before the detach procedure has been completed, this message shall be ignored and the detach procedure shall continue.

Detach containing other causes than "switch off" and containing detach type "IMSI detach":

- If the UE receives a message used in an EMM common procedure before the detach procedure has been completed, both the EMM common procedure and the detach procedure shall continue.

Detach containing other causes than "switch off" and containing other detach types than "IMSI detach":

- If the UE receives a GUTI REALLOCATION COMMAND, an EMM STATUS or an EMM INFORMATION message before the detach procedure is completed, this message shall be ignored and the detach procedure shall continue.
- If the UE receives an AUTHENTICATION REQUEST, SECURITY MODE COMMAND or IDENTITY REQUEST message before the detach procedure has been completed, the UE shall respond to it as described in subclause 5.4.2, 5.4.3 and 5.4.4 respectively and the detach procedure shall continue.

[TS 24.301, clause 5.5.2.3.2]

When receiving the DETACH REQUEST message and the detach type indicates "re-attach required", the UE shall deactivate the EPS bearer context(s), if any, including the default EPS bearer context locally without peer-to-peer signalling between the UE and the MME. The UE shall stop the timer T3346, if it is running. The UE shall also stop timer(s) T3396, if it is running. The UE shall send a DETACH ACCEPT message to the network and enter the state EMM-DEREGISTERED. Furthermore, the UE shall, after the completion of the detach procedure, and the release of the existing NAS signalling connection, initiate an attach or combined attach procedure. The UE should also re-establish any previously established PDN connection(s).

NOTE 1: When the detach type indicates "re-attach required", user interaction is necessary in some cases when the UE cannot re-activate the EPS bearer(s), if any, automatically.

A UE which receives a DETACH REQUEST message with detach type indicating "re-attach required" or "re-attach not required" and no EMM cause IE, is detached only for EPS services.

...

If the detach type indicates "IMSI detach" or "re-attach required", then the UE shall ignore the EMM cause IE if received.

22.5.3.3 Test description

22.5.3.3.1 Pre-test conditions

System Simulator:

- Ncell 1, default system information.

UE:

None.

Preamble:

- The UE is in NB-IoT UE Attach, Connected mode (State 2-NB) on Ncell 1 according to TS 36.508 [18].

22.5.3.3.2 Test procedure sequence

22.5.4 NB-IoT / Attach to new PLMN IMSI / Network reject with Extended Wait Timer / Paging with IMSI / Attach Rejected Illegal ME/UE / Detach upon switch-off

22.5.4.1 Test Purpose (TP)

(1)

```
with { the UE switched-off after registering to a PLMN }
ensure that {
  when { UE is powered on in a cell not belonging to the last visited registered PLMN which is not
in the UE's list of equivalent PLMNs nor in the UE's list with TAIs }
    then { the UE successfully attaches to the new PLMN (IMSI) }
           }
```

(2)

```
with { UE in RRC-IDLE/EMM-REGISTERED }
ensure that {
  when { the UE receives a Paging message with IMSI }
   then { the UE detaches locally and performs re-attach }
            }
```

(3)

```
with { UE has sent an ATTACH REQUEST message including a PDN CONNECTIVITY REQUEST message }
ensure that {
  when { UE receives an ATTACH REJECT message with the reject cause set to "Illegal UE" or "Illegal
ME" }
    then { UE considers the USIM as invalid for EPS services until switching off or the UICC
containing the USIM is removed }
            }
```

(4)

```
with { UE operating in NB-S1 mode, having sent an ATTACH REQUEST message }
ensure that {
  when { UE receives "Extended wait time" from the lower layers (due to reception of
RRCConnectionRelease message indicating “Extended Wait Time” }
    then { UE aborts the attach procedure, starts timer T3346, and, restarts attach procedure after
timer T3346 expires }
            }
```

(5)

```
with { the UE in RRC-IDLE/EMM-REGISTERED }
ensure that {
  when { UE is switched off }
    then { the UE performs a detach procedure }
            }
```

22.5.4.2 Conformance requirements

References: The conformance requirements covered in the current TC are specified in: TS 24.301 clauses 5.5.1.2.2, 5.5.1.2.4, 5.5.1.2.5, 5.5.1.2.6, 5.5.2.2.1, 5.6.2.2.2 and TS 36.331 clause 5.3.8.3. Unless otherwise stated these are Rel-13 requirements.

[TS 24.301, clause 5.5.1.2.2]

In state EMM-DEREGISTERED, the UE initiates the attach procedure by sending an ATTACH REQUEST message to the MME, starting timer T3410 and entering state EMM-REGISTERED-INITIATED (see example in figure 5.5.1.2.2.1). If timer T3402 is currently running, the UE shall stop timer T3402. If timer T3411 is currently running, the UE shall stop timer T3411.

The UE shall include the IMSI in the EPS mobile identity IE in the ATTACH REQUEST message if the selected PLMN is neither the registered PLMN nor in the list of equivalent PLMNs and:

- the UE is configured for "AttachWithIMSI" as specified in 3GPP TS 24.368 [15A] or 3GPP TS 31.102 [17]; or
- the UE is in NB-S1 mode.

For all other cases, the UE shall handle the EPS mobile identity IE in the ATTACH REQUEST message as follows:

If the UE supports neither A/Gb mode nor Iu mode:

- the UE shall include in the ATTACH REQUEST message a valid GUTI together with the last visited registered TAI, if available. In addition, the UE shall include Old GUTI type IE with GUTI type set to "native GUTI". If there is no valid GUTI available, the UE shall include the IMSI in the ATTACH REQUEST message.

[TS 24.301, clause 5.5.1.2.4]

During an attach for emergency bearer services, if not restricted by local regulations, the MME shall not check for mobility and access restrictions, regional restrictions, subscription restrictions, or perform CSG access control when processing the ATTACH REQUEST message. The network shall not apply subscribed APN based congestion control during an attach procedure for emergency bearer services.

If the attach request is accepted by the network, the MME shall send an ATTACH ACCEPT message to the UE and start timer T3450.

...

Upon receiving the ATTACH ACCEPT message, the UE shall stop timer T3410.

The GUTI reallocation may be part of the attach procedure. When the ATTACH REQUEST message includes the IMSI or IMEI, or the MME considers the GUTI provided by the UE is invalid, or the GUTI provided by the UE was assigned by another MME, the MME shall allocate a new GUTI to the UE. The MME shall include in the ATTACH ACCEPT message the new assigned GUTI together with the assigned TAI list. In this case the MME shall enter state EMM-COMMON-PROCEDURE-INITIATED as described in subclause 5.4.1.

...

If the ATTACH ACCEPT message contains a GUTI, the UE shall use this GUTI as the new temporary identity. The UE shall delete its old GUTI and store the new assigned GUTI. If no GUTI has been included by the MME in the ATTACH ACCEPT message, the old GUTI, if any available, shall be kept.

[TS 24.301, clause 5.5.1.2.5]

If the attach request cannot be accepted by the network, the MME shall send an ATTACH REJECT message to the UE including an appropriate EMM cause value.

...

The UE shall take the following actions depending on the EMM cause value received in the ATTACH REJECT message.

#3 (Illegal UE);

#6 (Illegal ME); or

...

The UE shall set the EPS update status to EU3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.3) and shall delete any GUTI, last visited registered TAI, TAI list and eKSI. The UE shall consider the USIM as invalid for EPS services and non-EPS services until switching off or the UICC containing the USIM is removed or the timer T3245 expires as described in subclause 5.3.7a. Additionally, the UE shall delete the list of equivalent PLMNs and enter state EMM-DEREGISTERED.

[TS 24.301, clause 5.5.1.2.6]

The following abnormal cases can be identified:

…

l) "Extended wait time" from the lower layers

If the ATTACH REQUEST message contained the low priority indicator set to "MS is configured for NAS signalling low priority", the UE shall start timer T3346 with the "Extended wait time" value and reset the attach attempt counter.

If the ATTACH REQUEST message did not contain the low priority indicator set to "MS is configured for NAS signalling low priority" and the UE is operating in NB-S1 mode, then the UE shall start timer T3346 with the "Extended wait time" value and reset the attach attempt counter.

...

The UE shall abort the attach procedure, stay in the current serving cell, change the state to EMM-DEREGISTERED.ATTEMPTING-TO-ATTACH and apply the normal cell reselection process.

The UE shall proceed as described below.

m) Timer T3346 is running

The UE shall not start the attach procedure unless:

- the UE is a UE configured to use AC11 – 15 in selected PLMN;
- the UE needs to attach for emergency bearer services; or
- the UE needs to attach without the NAS signalling low priority indication and if the timer T3346 was started due to rejection of a NAS request message (e.g. ATTACH REQUEST, TRACKING AREA UPDATE REQUEST or EXTENDED SERVICE REQUEST) which contained the low priority indicator set to "MS is configured for NAS signalling low priority".

The UE stays in the current serving cell and applies the normal cell reselection process.

NOTE 4: It is considered an abnormal case if the UE needs to initiate an attach procedure while timer T3346 is running independent on whether timer T3346 was started due to an abnormal case or a non successful case.

The UE shall proceed as described below.

...

For the cases b, c, d, l and m:

- Timer T3410 shall be stopped if still running.
- ...
- If the attach attempt counter is less than 5:
    - for the cases l and m, the attach procedure is started, if still necessary, when timer T3346 expires or is stopped;

[TS 36.331, clause 5.3.8.3]

The UE shall:

...
