Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Contents

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x the first digit:

1 presented to TSG for information;

2 presented to TSG for approval;

3 or greater indicates TSG approved document under change control.

y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document specifies and establishes the characteristics of the physical layer procedures for shared spectrum channel.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.

- For a specific reference, subsequent revisions do not apply.

- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

3.2 Symbols

For the purposes of the present document, the following symbols apply:

CW_p	Contention window for a given priority class
$CW_{max,p}$	Maximum contention window for a given priority class
$CW_{min,p}$	Minimum contention window for a given priority class
$T_{mcot,p}$	Maximum channel occupancy time for a given priority class

$T_{ulm\text{cot},p}$ Maximum Uplink channel occupancy time for a given priority class

X_{Thresh} Energy detection threshold

$X_{\text{Thresh\_max}}$ Maximum energy detection threshold

3.3   Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1].

AUL-DFI   Autonomous UL Downlink feedback indication
CAPC   Channel access priority class
COT   Channel Occupancy Time
LAA   Licensed Assisted Access
MCOT   Maximum Channel Occupancy Time

4   Channel access procedure

4.0   General

Unless otherwise noted, the definitions below are applicable for the following terminologies used in this specification:

- A channel refers to a carrier or a part of a carrier consisting of a contiguous set of resource blocks (RBs) on which a channel access procedure is performed in shared spectrum.

- A channel access procedure is a procedure based on sensing that evaluates the availability of a channel for performing transmissions. The basic unit for sensing is a sensing slot with a duration $T_{sl} = 9us$. The sensing slot duration T_{sl} is considered to be idle if an eNB/gNB or a UE senses the channel during the sensing slot duration, and determines that the detected power for at least $4us$ within the sensing slot duration is less than energy detection threshold X_{Thresh}. Otherwise, the sensing slot duration T_{sl} is considered to be busy.

- A *channel occupancy* refers to transmission(s) on channel(s) by eNB/gNB/UE(s) after performing the corresponding channel access procedures in this clause.

- A *Channel Occupancy Time* refers to the total time for which eNB/gNB/UE and any eNB/gNB/UE(s) sharing the channel occupancy perform transmission(s) on a channel after an eNB/gNB/UE performs the corresponding channel access procedures described in this clause. For determining a *Channel Occupancy Time*, if a transmission gap is less than or equal to $25us$, the gap duration is counted in the channel occupancy time. A channel occupancy time can be shared for transmission between an eNB/gNB and the corresponding UE(s).

- A *DL transmission burst* is defined as a set of transmissions from an eNB/gNB without any gaps greater than $16us$. Transmissions from an eNB/gNB separated by a gap of more than $16us$ are considered as separate DL transmission bursts. An eNB/gNB can transmit transmission(s) after a gap within a *DL transmission burst* without sensing the corresponding channel(s) for availability.

- A *UL transmission burst* is defined as a set of transmissions from a UE without any gaps greater than $16us$. Transmissions from a UE separated by a gap of more than 16 us are considered as separate UL transmission bursts. A UE can transmit transmission(s) after a gap within a *UL transmission burst* without sensing the corresponding channel(s) for availability.

- A *discovery burst* refers to a DL transmission burst including a set of signal(s) and/or channel(s) confined within a window and associated with a duty cycle. The *discovery burst* can be any of the following:

  - Transmission(s) initiated by an eNB that includes a primary synchronization signal (PSS), secondary synchronization signal (SSS) and cell-specific reference signal(s)(CRS) and may include non-zero power CSI reference signals (CSI-RS).

- Transmission(s) initiated by a gNB that includes at least an SS/PBCH block consisting of a primary synchronization signal (PSS), secondary synchronization signal (SSS), physical broadcast channel (PBCH) with associated demodulation reference signal (DM-RS) and may also include CORESET for PDCCH scheduling PDSCH with SIB1, and PDSCH carrying SIB1 and/or non-zero power CSI reference signals (CSI-RS).

4.1 Downlink channel access procedures

An eNB operating LAA Scell(s) on channel(s) and a gNB performing transmission(s) on channel(s) shall perform the channel access procedures described in this clause for accessing the channel(s) on which the transmission(s) are performed.

In this clause, X_{Thresh} for sensing is adjusted as described in clause 4.1.5 when applicable.

A gNB performs channel access procedures in this clause unless the higher layer parameter *ChannelAccessMode-r16* is provided and *ChannelAccessMode-r16 =' semistatic'*.

4.1.1 Type 1 DL channel access procedures

This clause describes channel access procedures to be performed by an eNB/gNB where the time duration spanned by the sensing slots that are sensed to be idle before a downlink transmission(s) is random. The clause is applicable to the following transmissions:

- Transmission(s) initiated by an eNB including PDSCH/PDCCH/EPDCCH, or

- Transmission(s) initiated by a gNB including unicast PDSCH with user plane data, or unicast PDSCH with user plane data and unicast PDCCH scheduling user plane data, or

- Transmission(s) initiated by a gNB with only discovery burst or with discovery burst multiplexed with non-unicast information, where the transmission(s) duration is larger than $1ms$ or the transmission causes the discovery burst duty cycle to exceed $1/20$.

The eNB/gNB may transmit a transmission after first sensing the channel to be idle during the sensing slot durations of a defer duration T_d and after the counter N is zero in step 4. The counter N is adjusted by sensing the channel for additional sensing slot duration(s) according to the steps below:

1) set $N = N_{init}$, where N_{init} is a random number uniformly distributed between 0 and CW_p, and go to step 4;

2) if $N > 0$ and the eNB/gNB chooses to decrement the counter, set $N = N - 1$;

3) sense the channel for an additional sensing slot duration, and if the additional sensing slot duration is idle, go to step 4; else, go to step 5;

4) if $N = 0$, stop; else, go to step 2.

5) sense the channel until either a busy sensing slot is detected within an additional defer duration T_d or all the sensing slots of the additional defer duration T_d are detected to be idle;

6) if the channel is sensed to be idle during all the sensing slot durations of the additional defer duration T_d, go to step 4; else, go to step 5;

If an eNB/gNB has not transmitted a transmission after step 4 in the procedure above, the eNB/gNB may transmit a transmission on the channel, if the channel is sensed to be idle at least in a sensing slot duration T_{sl} when the eNB/gNB is ready to transmit and if the channel has been sensed to be idle during all the sensing slot durations of a defer duration T_d immediately before this transmission. If the channel has not been sensed to be idle in a sensing slot duration T_{sl} when the eNB/gNB first senses the channel after it is ready to transmit or if the channel has been sensed to be not idle during any of the sensing slot durations of a defer duration T_d immediately before this intended transmission, the eNB/gNB proceeds to step 1 after sensing the channel to be idle during the sensing slot durations of a defer duration T_d.

The defer duration T_d consists of duration $T_f = 16us$ immediately followed by m_p consecutive sensing slot durations T_{sl}, and T_f includes an idle sensing slot duration T_{sl} at start of T_f.

$CW_{min,p} \le CW_p \le CW_{max,p}$ is the contention window. CW_p adjustment is described in clause 4.1.4.

$CW_{min,p}$ and $CW_{max,p}$ are chosen before step 1 of the procedure above.

m_p, $CW_{min,p}$, and $CW_{max,p}$ are based on a channel access priority class p associated with the eNB/gNB transmission, as shown in Table 4.1.1-1.

An eNB/gNB shall not transmit on a channel for a *Channel Occupancy Time* that exceeds $T_{m\ cot,p}$ where the channel access procedures are performed based on a channel access priority class p associated with the eNB/gNB transmissions, as given in Table 4.1.1-1.

If an eNB/gNB transmits discovery burst(s) as described in clause 4.1.2 when $N > 0$ in the procedure above, the eNB/gNB shall not decrement N during the sensing slot duration(s) overlapping with discovery burst(s).

A gNB may use any channel access priority class for performing the procedures above to transmit transmission(s) including discovery burst(s) satisfying the conditions described in this clause.

A gNB shall use a channel access priority class applicable to the unicast user plane data multiplexed in PDSCH for performing the procedures above to transmit transmission(s) including unicast PDSCH with user plane data.

For $p = 3$ and $p = 4$, if the absence of any other technology sharing the channel can be guaranteed on a long term basis (e.g. by level of regulation), $T_{m\ cot,p} = 10ms$, otherwise, $T_{m\ cot,p} = 8ms$.

Table 4.1.1-1: Channel Access Priority Class (CAPC)

Channel Access Priority Class (p)	m_p	$CW_{min,p}$	$CW_{max,p}$	$T_{m\ cot,p}$	allowed CW_p sizes
1	1	3	7	2 ms	{3,7}
2	1	7	15	3 ms	{7,15}
3	3	15	63	8 or 10 ms	{15,31,63}
4	7	15	1023	8 or 10 ms	{15,31,63,127,255,511,1023}

4.1.1.1　　　Regional limitations on channel occupancy time

In Japan, if an eNB/gNB has transmitted a transmission after $N = 0$ in step 4 of the procedure above, the eNB/gNB may transmit the next continuous transmission, for duration of maximum $T_j = 4ms$, immediately after sensing the channel to be idle for at least a sensing interval of $T_{js} = 34us$ and if the total sensing and transmission time is not more than $1000 \cdot T_{mcot} + \left\lceil \frac{T_{mcot}}{T_j} - 1 \right\rceil \cdot T_{js}$ us. The sensing interval T_{js} consists of duration $T_f = 16us$ immediately followed by two sensing slots and T_f includes an idle sensing slot at start of T_f. The channel is considered to be idle for T_{js} if it is sensed to be idle during the sensing slot durations of T_{js}.

4.1.2　　　Type 2 DL channel access procedures

This clause describes channel access procedures to be performed by an eNB/gNB where the time duration spanned by sensing slots that are sensed to be idle before a downlink transmission(s) is deterministic.

If an eNB performs Type 2 DL channel access procedures, it follows the procedures described in clause 4.1.2.1.

Type 2A channel access procedures as described in clause 4.1.2.1 are applicable to the following transmission(s) performed by an eNB/gNB:

- Transmission(s) initiated by an eNB including discovery burst and not including PDSCH where the transmission(s) duration is at most $1ms$, or

- Transmission(s) initiated by a gNB with only discovery burst or with discovery burst multiplexed with non-unicast information, where the transmission(s) duration is at most $1ms$, and the discovery burst duty cycle is at most $1/20$, or

- Transmission(s) by an eNB/ gNB following transmission(s) by a UE after a gap of $25us$ in a shared channel occupancy as described in clause 4.1.3.

Type 2B or Type 2C DL channel access procedures as described in clause 4.1.2.2 and 4.1.2.3, respectively, are applicable to the transmission(s) performed by a gNB following transmission(s) by a UE after a gap of $16us$ or up to $16us$, respectively, in a shared channel occupancy as described in clause 4.1.3.

4.1.2.1 Type 2A DL channel access procedures

An eNB/gNB may transmit a DL transmission immediately after sensing the channel to be idle for at least a sensing interval $T_{short\_dl} = 25us$. T_{short_dl} consists of a duration $T_f = 16us$ immediately followed by one sensing slot and T_f includes a sensing slot at start of T_f. The channel is considered to be idle for T_{short_dl} if both sensing slots of T_{short_dl} are sensed to be idle.

4.1.2.2 Type 2B DL channel access procedures

A gNB may transmit a DL transmission immediately after sensing the channel to be idle within a duration of $T_f = 16us$. T_f includes a sensing slot that occurs within the last $9us$ of T_f. The channel is considered to be idle within the duration T_f if the channel is sensed to be idle for a total of at least $5us$ with at least $4us$ of sensing occurring in the sensing slot.

4.1.2.3 Type 2C DL channel access procedures

When a gNB follows the procedures in this clause for transmission of a DL transmission, the gNB does not sense the channel before transmission of the DL transmission. The duration of the corresponding DL transmission is at most $584us$.

4.1.3 DL channel access procedures in a shared channel occupancy

For the case where an eNB shares a channel occupancy initiated by a UE, the eNB may transmit a transmission that follows an autonomous PUSCH transmission by the UE as follows:

- If 'COT sharing indication' in AUL-UCI in subframe n indicates '1', an eNB may transmit a transmission in subframe $n + X$, where X is subframeOffsetCOT-Sharing, including PDCCH but not including PDSCH on the same channel immediately after performing Type 2A DL channel access procedures in clause 4.1.2.1, if the duration of the PDCCH is less than or equal to duration of two OFDM symbols and it shall contain at least AUL-DFI or UL grant to the UE from which the PUSCH transmission indicating COT sharing was received.

If a gNB shares a channel occupancy initiated by a UE using the channel access procedures described in clause 4.2.1.1 on a channel, the gNB may transmit a transmission that follows a UL transmission on scheduled resources or a PUSCH transmission on configured resources by the UE after a gap as follows:

- The transmission shall contain transmission to the UE that initiated the channel occupancy and can include non-unicast and/or unicast transmissions where any unicast transmission that includes user plane data is only transmitted to the UE that initiated the channel occupancy.

  - If the higher layer parameters *ul-toDL-COT-SharingED-Threshold-r16* is not provided, the transmission shall not include any unicast transmissions with user plane data and the transmission duration is not more than the duration of 2, 4 and 8 symbols for subcarrier spacing of 15, 30 and 60 kHz of the corresponding channel, respectively.

- If the gap is up to $16us$, the gNB can transmit the transmission on the channel after performing Type 2C DL channel access as described in clause 4.1.2.3.

- If the gap is $25us$ or $16us$, the gNB can transmit the transmission on the channel after performing Type 2A or Type 2B DL channel access procedures as described in clause 4.1.2.1 and 4.1.2.2, respectively.

For the case where a gNB shares a channel occupancy initiated by a UE with configured grant PUSCH transmission, the gNB may transmit a transmission that follows the configured grant PUSCH transmission by the UE as follows:

- If the higher layer parameter *ul-toDL-COT-SharingED-Threshold-r16* is provided, the UE is configured by *cg-COT-SharingList-r16* where *cg-COT-SharingList-r16* provides a table configured by higher layer. Each row of the table provides a channel occupancy sharing information given by higher layer parameter *CG-COT-Sharing-r16*. One row of the table is configured for indicating that the channel occupancy sharing is not available.

    - If the 'COT sharing information' in CG-UCI detected in slot *n* indicates a row index that corresponds to a *CG-COT-Sharing-r16* that provides channel occupancy sharing information, the gNB can share the UE channel occupancy assuming a channel access priority class *p= channelAccessPriority-r16*, starting from slot *n+O*, where *O=offset-r16* slots, for a duration of *D=duration-r16* slots where *duration-r16*, *offset-r16*, and *channelAccessPriority-r16* are higher layer parameters provided by *CG-COT-Sharing-r16*.

- If the higher layer parameter *ul-toDL-COT-SharingED-Threshold-r16* is not provided, and if 'COT sharing information' in CG-UCI indicates '1', the gNB can share the UE channel occupancy and start the DL transmission X= *cg-COT-SharingOffset-r16* symbols from the end of the slot where CG-UCI is detected, where *cg-COT-SharingOffset-r16* is provided by higher layer. The transmission shall not include any unicast transmissions with user plane data and the transmission duration is not more than the duration of 2, 4 and 8 symbols for subcarrier spacing of 15, 30 and 60 kHz of the corresponding channel, respectively.

For the case where a gNB uses channel access procedures as described in clause 4.1.1 to initiate a transmission and shares the corresponding channel occupancy with a UE that transmits a transmission as described in clause 4.2.1.2, the gNB may transmit a transmission within its channel occupancy that follows the UE's transmission if any gap between any two transmissions in the gNB channel occupancy is at most $25us$. In this case the following applies:

- If the gap is $25us$ or $16us$, the gNB can transmit the transmission on the channel after performing Type 2A or 2B DL channel access procedures as described in clause 4.1.2.1 and 4.1.2.2, respectively.

- If the gap is up to $16us$, the gNB can transmit the transmission on the channel after performing Type 2C DL channel access as described in clause 4.1.2.3.

4.1.4   Contention window adjustment procedures

If an eNB/gNB transmits transmissions including PDSCH that are associated with channel access priority class p on a channel, the eNB/gNB maintains the contention window value CW_p and adjusts CW_p before step 1 of the procedure described in clause 4.1.1 for those transmissions as described in this clause.

4.1.4.1   Contention window adjustment procedures for transmissions by eNB

If an eNB transmits transmissions including PDSCH that are associated with channel access priority class p on a channel, the eNB maintains the contention window value CW_p and adjusts CW_p before step 1 of the procedure described in clause 4.1.1 for those transmissions using the following steps:

1) for every priority class $p \in \{1,2,3,4\}$ set $CW_p = CW_{min,p}$

2) if at least $Z = 80\%$ of HARQ-ACK values corresponding to PDSCH transmission(s) in reference subframe k are determined as NACK, increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value and remain in step 2; otherwise, go to step 1.

Reference subframe k is the starting subframe of the most recent transmission on the channel made by the eNB, for which at least some HARQ-ACK feedback is expected to be available.

The eNB shall adjust the value of CW_p for every priority class $p \in \{1,2,3,4\}$ based on a given reference subframe k only once.

For determining Z,

- if the eNB transmission(s) for which HARQ-ACK feedback is available start in the second slot of subframe k, HARQ-ACK values corresponding to PDSCH transmission(s) in subframe $k + 1$ are also used in addition to the HARQ-ACK values corresponding to PDSCH transmission(s) in subframe k.

- if the HARQ-ACK values correspond to PDSCH transmission(s) on an LAA SCell that are assigned by (E)PDCCH transmitted on the same LAA SCell,

  - if no HARQ-ACK feedback is detected for a PDSCH transmission by the eNB, or if the eNB detects 'DTX', 'NACK/DTX' or 'any' state, it is counted as NACK.

- if the HARQ-ACK values correspond to PDSCH transmission(s) on an LAA SCell that are assigned by (E)PDCCH transmitted on another serving cell,

  - if the HARQ-ACK feedback for a PDSCH transmission is detected by the eNB, 'NACK/DTX' or 'any' state is counted as NACK, and 'DTX' state is ignored.

  - if no HARQ-ACK feedback is detected for a PDSCH transmission by the eNB

    - if PUCCH format 1b with channel selection is expected to be used by the UE, 'NACK/DTX' state corresponding to 'no transmission' as described in Clauses 10.1.2.2.1, 10.1.3.1 and 10.1.3.2.1 is counted as NACK, and 'DTX' state corresponding to 'no transmission' is ignored in [4].

    - Otherwise, the HARQ-ACK for the PDSCH transmission is ignored.

- if a PDSCH transmission has two codewords, the HARQ-ACK value of each codeword is considered separately

- bundled HARQ-ACK across M subframes is considered as M HARQ-ACK responses.

If the eNB transmits transmissions including PDCCH/EPDCCH with DCI format 0A/0B/4A/4B and not including PDSCH that are associated with channel access priority class p on a channel starting from time t_0, the eNB maintains the contention window value CW_p and adjusts CW_p before step 1 of the procedure described in clause 4.1.1 for those transmissions using the following steps:

1) for every priority class $p \in \{1,2,3,4\}$ set $CW_p = CW_{min,p}$

2) if less than 10% of the UL transport blocks scheduled by the eNB using Type 2 channel access procedure (described in clause 4.2.1.2) in the time interval between t_0 and $t_0 + T_{CO}$ have been received successfully, increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value and remain in step 2; otherwise, go to step 1.

T_{CO} is computed as described in clause 4.2.1.0.3.

4.1.4.2   Contention window adjustment procedures for DL transmissions by gNB

If a gNB transmits transmissions including PDSCH that are associated with channel access priority class p on a channel, the gNB maintains the contention window value CW_p and adjusts CW_p before step 1 of the procedure described in clause 4.1.1 for those transmissions using the following steps:

1) For every priority class $p \in \{1,2,3,4\}$, set $CW_p = CW_{min,p}$.

2) If HARQ-ACK feedback is available after the last update of CW_p, go to step 3. Otherwise, if the gNB transmission after procedure described in clause 4.1.1 does not include a retransmission or is transmitted within a duration T_w from the end of the *reference duration* corresponding to the earliest DL transmission burst after the last update of CW_p transmitted after the procedures described in clause 4.1.1, go to step 5; otherwise go to step 4.

3) The HARQ-ACK feedback(s) corresponding to PDSCH(s) in the reference duration for the latest DL transmission burst for which HARQ-ACK feedback is available is used as follows:

   a. If at least one HARQ-ACK feedback is 'ACK' for PDSCH(s) with transport block based transmissions or at least 10% of HARQ-ACK feedbacks is 'ACK' for PDSCH(s) with code block group based transmissions go to step 1; otherwise go to step 4.

4) Increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value.

5) For every priority class p $\in \{1,2,3,4\}$, maintain CW_p as it is; go to step 2.

The *reference duration* and duration T_w in the procedure above are defined as follows:

- The *reference duration* corresponding to a channel occupancy initiated by the gNB including transmission of PDSCH(s) is defined in this clause as a duration starting from the beginning of the channel occupancy until the end of the first slot where at least one unicast PDSCH is transmitted over all the resources allocated for the PDSCH, or until the end of the first transmission burst by the gNB that contains unicast PDSCH(s) transmitted over all the resources allocated for the PDSCH, whichever occurs earlier. If the channel occupancy includes a unicast PDSCH, but it does not include any unicast PDSCH transmitted over all the resources allocated for that PDSCH, then, the duration of the first transmission burst by the gNB within the channel occupancy that contains unicast PDSCH(s) is the *reference duration* for CWS adjustment.

- $T_w = \max(T_A, T_B + 1ms)$ where T_B is the duration of the transmission burst from start of the *reference duration* in ms and $T_A = 5ms$ if the absence of any other technology sharing the channel can not be guaranteed on a long-term basis (e.g. by level of regulation), and $T_A = 10ms$ otherwise.

If a gNB transmits transmissions using Type 1 channel access procedures associated with the channel access priority class p on a channel and the transmissions are not associated with explicit HARQ-ACK feedbacks by the corresponding UE(s), the gNB adjusts CW_p before step 1 in the procedures described in subclase 4.1.1, using the latest CW_p used for any DL transmissions on the channel using Type 1 channel access procedures associated with the channel access priority class p. If the corresponding channel access priority class p has not been used for any DL transmissions on the channel, $CW_p = CW_{min,p}$ is used.

4.1.4.3 Common procedures for CWS adjustments for DL transmissions

The following applies to the procedures described in clauses 4.1.4.1 and 4.1.4.2:

- If $CW_p = CW_{max,p}$, the next higher allowed value for adjusting CW_p is $CW_{max,p}$.

- If the $CW_p = CW_{max,p}$ is consecutively used K times for generation of N_{init}, CW_p is reset to $CW_{min,p}$ only for that priority class p p for which $CW_p = CW_{max,p}$ is consecutively used K times for generation of N_{init}. K is selected by eNB/gNB from the set of values $\{1, 2, …,8\}$ for each priority class $p \in \{1,2,3,4\}$.

4.1.5 Energy detection threshold adaptation procedures

An eNB/gNB accessing a channel on which transmission(s) are performed, shall set the energy detection threshold (X_{Thresh}) to be less than or equal to the maximum energy detection threshold X_{Thresh_max}.

X_{Thresh_max} is determined as follows:

- If the absence of any other technology sharing the channel can be guaranteed on a long-term basis (e.g. by level of regulation) then:

  - $$X_{Thresh\_max} = min \begin{cases} T_{max} + 10\text{dB}, \\ X_r \end{cases}$$

    - X_r is maximum energy detection threshold defined by regulatory requirements in dBm when such requirements are defined, otherwise $X_r = T_{max} + 10dB$;

- otherwise,

  - $$X_{Thresh\_max} = max \begin{cases} -72 + 10 \cdot log\,1\,0(BW\,MHz\,/20MHz)\,dBm, \\ min \begin{cases} T_{\max}, \\ T_{\max} - T_A + (P_H + 10 \cdot log\,1\,0(BW\,MHz\,/20MHz) - P_{TX}) \end{cases} \end{cases}$$

  where:

  - T_A=5dB for transmissions including discovery burst(s) as described in clause 4.1.2, and $T_A = 10dB$ otherwise;

  - $P_H = 23dBm$;

  - P_{TX} is the set maximum eNB/gNB output power in dBm for the channel;

    - eNB/gNB uses the set maximum transmission power over a single channel irrespective of whether single channel or multi-channel transmission is employed

-    $T_{\max}(dBm) = 10 \cdot log\,10\,(3.16228 \cdot 10^{-8}(mW/MHz) \cdot BW\,MHz\,(MHz))$;

-    $BW\,MHz$ is the single channel bandwidth in MHz.

4.1.6   Channel access procedures for transmission(s) on multiple channels

An eNB/gNB can access multiple channels on which transmission(s) are performed, according to one of the Type A or Type B procedures described in this Clause.

4.1.6.1   Type A multi-channel access procedures

An eNB/gNB shall perform channel access on each channel $c_i \in C$, according to the procedures described in clause 4.1.1, where C is a set of channels on which the eNB/gNB intends to transmit, and $i = 0,1, \ldots q - 1$, and q is the number of channels on which the eNB/gNB intends to transmit.

The counter N described in clause 4.1.1 is determined for each channel c_i and is denoted as N_{c_i}. N_{c_i} is maintained according to clause 4.1.6.1.1 or 4.1.6.1.2.

4.1.6.1.1   Type A1 multi-channel access procedures

Counter N as described in clause 4.1.1 is independently determined for each channel c_i and is denoted as N_{c_i}.

If the absence of any other technology sharing the channel cannot be guaranteed on a long term basis (e.g. by level of regulation), when the eNB/gNB ceases transmission on any one channel $c_j \in C$, for each channel $c_i \neq c_j$, the eNB/gNB can resume decrementing N_{c_i} when idle sensing slots are detected either after waiting for a duration of $4 \cdot T_{sl}$, or after reinitialising N_{c_i}.

4.1.6.1.2   Type A2 multi-channel access procedures

Counter N is determined as described in clause 4.1.1 for channel $c_j \in C$, and is denoted as N_{c_j}, where c_j is the channel that has the largest CW_p value. For each channel c_i, $N_{c_i} = N_{c_j}$.

When the eNB/gNB ceases transmission on any one channel for which N_{c_i} is determined, the eNB/gNB shall reinitialise N_{c_i} for all channels.

4.1.6.2   Type B multi-channel access procedure

A channel $c_j \in C$ is selected by the eNB/gNB as follows:

-    the eNB/gNB selects c_j by uniformly randomly choosing c_j from C before each transmission on multiple channels $c_i \in C$, or

-    the eNB/gNB selects c_j no more frequently than once every 1 second,

where C is a set of channels on which the eNB/gNB intends to transmit, $i = 0,1, \ldots q - 1$, and q is the number of channels on which the eNB intends to transmit.

To transmit on channel c_j

-    the eNB/gNB shall perform channel access on channel c_j according to the procedures described in clause 4.1.1 with the modifications described in clause 4.1.6.2.1 or 4.1.6.2.2.

To transmit on channel $c_i \neq c_j$, $c_i \in C$

-    for each channel c_i, the eNB/gNB shall sense the channel c_i for at least a sensing interval $T_{mc} = 25us$ immediately before the transmitting on channel c_j, and the eNB/gNB may transmit on carrier c_i immediately after sensing the channel c_i to be idle for at least the sensing interval T_{mc}. The channel c_i is considered to be idle for T_{mc} if the channel is sensed to be idle during all the time durations in which such idle sensing is performed on the channel c_j in given interval T_{mc}.

The eNB/gNB shall not transmit a transmission on a channel $c_i \neq c_j$, $c_i \in C$, for a period exceeding $T_{m\,cot,p}$ as given in Table 4.1.1-1, where the value of $T_{m\,cot,p}$ is determined using the channel access parameters used for channel c_j.

For the procedures in this clause, the channel frequencies of the set of channels C selected by gNB, is a subset of one of the sets of channel frequencies defined in [6].

4.1.6.2.1   Type B1 multi-channel access procedure

A single CW_p value is maintained for the set of channels C.

For determining CW_p for channel access on channel c_j, step 2 of the procedure described in clause 4.1.4.1 is modified as follows

-   if at least $Z = 80\%$ of HARQ-ACK values corresponding to PDSCH transmission(s) in reference subframe k of all channels $c_i \in C$ are determined as NACK, increase CW_p for each priority class $p \in \{1,2,3,4\}$ to the next higher allowed value; otherwise, go to step 1.

For determining CW_p for a set of channels C, any PDSCH that fully or partially overlaps with any channel $c_i \in C$, is used in the procedure described in clause 4.1.4.2.

4.1.6.2.2   Type B2 multi-channel access procedure

A CW_p value is maintained independently for each channel $c_i \in C$ using the procedure described in clause 4.1.4.

For determining CW_p for channel c_i, any PDSCH that fully or partially overlaps with channel c_i, is used in the procedure described in clause 4.1.4.2.

For determining N_{init} for channel c_j, CW_p value of channel $c_{j1} \in C$ is used, where c_{j1} is the channel with largest CW_p among all channels in set C.

4.2   Uplink channel access procedures

A UE performing transmission(s) on LAA Scell(s), an eNB scheduling or configuring UL transmission(s) for a UE performing transmission(s) on LAA Scell(s), and a UE performing transmission(s) on channel(s) and a gNB scheduling or configuring UL transmission(s) for a UE performing transmissions on channel(s) shall perform the procedures described in this clause for the UE to access the channel(s) on which the transmission(s) are performed.

In this clause, transmissions from a UE are considered as separate UL transmissions, irrespective of having a gap between transmissions or not, and X_{Thresh} for sensing is adjusted as described in clause 4.2.3 when applicable.

A UE performs channel access procedures in this clause unless the higher layer parameter *ChannelAccessMode-r16* is provided and *ChannelAccessMode-r16 =' semistatic'*.

If a UE fails to access the channel(s) prior to an intended UL transmission to a gNB, Layer 1 notifies higher layers about the channel access failure.

4.2.1   Channel access procedures for uplink transmission(s)

A UE can access a channel on which UL transmission(s) are performed according to one of Type 1 or Type 2 UL channel access procedures. Type 1 channel access procedure is described in clause 4.2.1.1. Type 2 channel access procedure is described in clause 4.2.1.2.

If a UL grant scheduling a PUSCH transmission indicates Type 1 channel access procedures, the UE shall use Type 1 channel access procedures for transmitting transmissions including the PUSCH transmission unless stated otherwise in this clause.

A UE shall use Type 1 channel access procedures for transmitting transmissions including the autonomous or configured grant PUSCH transmission on configured UL resources unless stated otherwise in this clause.

If a UL grant scheduling a PUSCH transmission indicates Type 2 channel access procedures, the UE shall use Type 2 channel access procedures for transmitting transmissions including the PUSCH transmission unless stated otherwise in this clause.

A UE shall use Type 1 channel access procedures for transmitting SRS transmissions not including a PUSCH transmission. UL channel access priority class $p = 1$ in Table 4.2.1-1 is used for SRS transmissions not including a PUSCH.

If a UE is scheduled by an eNB/gNB to transmit PUSCH and SRS in contiguous transmissions without any gaps in between, and if the UE cannot access the channel for PUSCH transmission, the UE shall attempt to make SRS transmission according to uplink channel access procedures specified for SRS transmission.

A UE shall use Type 1 channel access procedures for PUCCH transmissions unless stated otherwise in this clause. If a DL grant determined according to Clause 9.2.3 in [7, TS38.213] or a random access response (RAR) message for successRAR scheduling a PUCCH transmission indicates Type 2 channel access procedures, the UE shall use Type 2 channel access procedures.

When a UE uses Type 1 channel access procedures for PUCCH transmissions or PUSCH only transmissions without UL-SCH, the UE shall use UL channel access priority class $p = 1$ in Table 4.2.1-1.

A UE shall use Type 1 channel access procedure for PRACH transmissions and PUSCH transmissions without user plane data related to random access procedure that initiate a channel occupancy with UL channel access priority class $p = 1$ in Table 4.2.1-1.

When a UE uses Type 1 channel access procedures for PUSCH transmissions on configured resource, the UE determines the corresponding UL channel access priority p in Table 4.2.1-1 following the procedures described in Clause 5.6.2 in [9].

When a UE uses Type 1 channel access procedures for PUSCH transmissions with user plane data indicated by a UL grant or related to random access procedure where the corresponding UL channel access priority p is not indicated, the UE determines p in Table 4.2.1-1 following the same procedures as for PUSCH transmission on configured resources using Type 1 channel access procedures.

A UE shall not transmit on a channel for a *Channel Occupancy Time* that exceeds $T_{ulm\,cot,p}$ where the channel access procedure is performed based on the channel access priority class p associated with the UE transmissions, as given in Table 4.2.1-1.

The total *Channel Occupancy Time* of autonomous uplink transmission(s) obtained by the channel access procedure in this clause, including the following DL transmission if the UE sets 'COT sharing indication' in AUL-UCI to '1' in a subframe within the autonomous uplink transmission(s) as described in Clause 4.1.3, shall not exceed $T_{ulm\,cot,p}$, where $T_{ulm\,cot,p}$ is given in Table 4.2.1-1.

Table 4.2.1-1: Channel Access Priority Class (CAPC) for UL

Channel Access Priority Class (p)	m_p	$CW_{min,p}$	$CW_{max,p}$	$T_{ulm\,cot,p}$	allowed CW_p sizes
1	2	3	7	2 ms	{3,7}
2	2	7	15	4 ms	{7,15}
3	3	15	1023	6ms or 10 ms	{15,31,63,127,255,511,1023}
4	7	15	1023	6ms or 10 ms	{15,31,63,127,255,511,1023}

NOTE1: For $p = 3,4$, $T_{ulm\,cot,p} = 10ms$ if the higher layer parameter *absenceOfAnyOtherTechnology-r14* or *absenceOfAnyOtherTechnology*-r16 is provided , otherwise, $T_{ulm\,cot,p} = 6ms$.

NOTE 2: When $T_{ulm\,cot,p} = 6ms$ it may be increased to $8ms$ by inserting one or more gaps. The minimum duration of a gap shall be $100us$. The maximum duration before including any such gap shall be $6ms$.

4.2.1.0 Channel access procedures and UL related signaling

4.2.1.0.0 Channel access procedures upon detection of a common DCI

If a UE detects 'UL duration and offset' field in DCI Format 1C as described in clause 5.3.3.1.4 of [5], the following are applicable:

- If the 'UL duration and offset' field indicates an 'UL offset' l and an 'UL duration' d for subframe n, then the scheduled UE may use channel access procedures Type 2 for transmissions in subframes $n + l + i$ where $i = 0,1, ... d - 1$, irrespective of the channel access Type signalled in the UL grant for those subframes, if the end of UE transmission occurs in or before subframe $n + l + d - 1$.

- If the 'UL duration and offset' field indicates an 'UL offset' l and an 'UL duration' d for subframe n and the 'COT sharing indication for AUL' field is set to '1', then a UE configured with autonomous UL may use channel access procedures Type 2 for autonomous UL transmissions assuming any priority class in subframes $n + l + i$ where $i = 0,1, ... d - 1$, if the end of UE autonomous UL transmission occurs in or before subframe $n + l + d - 1$ and the autonomous UL transmission between $n + l$ and $n + l + d - 1$ shall be contiguous.

- If the 'UL duration and offset' field indicates an 'UL offset' l and an 'UL duration' d for subframe n and the 'COT sharing indication for AUL' field is set to '0', then a UE configured with autonomous UL shall not transmit autonomous UL in subframes $n + l + i$ where $i = 0,1, ... d - 1$.

If a UE determines the duration in time domain and the location in frequency domain of a remaining channel occupancy initiated by the gNB from a DCI format 2_0 as described in clause 11.1.1 of [7], the following is applicable:

- The UE may switch from Type 1 channel access procedures as described in clause 4.2.1.1 to Type 2A channel access procedures as described in clause 4.2.1.2.1 for its corresponding UL transmissions within the determined duration in time and location in frequency domain of the remaining channel occupancy. In this case, if the UL transmissions are PUSCH transmissions on configured resources, the UE may assume any priority class for the channel occupancy shared with the gNB.

4.2.1.0.1 Channel access procedures for consecutive UL transmission(s)

For contiguous UL transmission(s), the following are applicable:

- If a UE is scheduled to transmit a set of UL transmissions including PUSCH using a UL grant , and if the UE cannot access the channel for a transmission in the set prior to the last transmission according to one of Type 1, Type 2, or Type 2A UL channel access procedures, the UE shall attempt to transmit the next transmission according to the channel access type indicated in the UL grant. Otherwise, if the UE cannot access the channel for a transmission in the set prior to the last transmission according to Type 2B UL channel access procedure, the UE shall attempt to transmit the next transmission according to Type 2A UL channel access procedure.

- If a UE is scheduled by a gNB to transmit a set of UL transmissions including PUSCH using a UL grant, the UE shall not apply a CP extension for the remaining UL transmissions in the set after the first UL transmission after accessing the channel.

- If a UE is scheduled to transmit a set of consecutive UL transmissions without gaps including PUSCH using one or more UL grant(s), PUCCH using one or more DL grant(s), or SRS with one or more DL grant(s) or UL grant(s) and the UE transmits one of the scheduled UL transmissions in the set after accessing the channel according to one of Type 1, Type 2, Type 2A, Type 2B or Type 2C UL channel access procedures, the UE may continue transmission of the remaining UL transmissions in the set, if any.

- If a UE is configured to transmit a set of consecutive PUSCH transmissions on resources configured by the gNB, the time domain resource configuration defines multiple transmission occasions, and if the UE cannot access the channel according to Type 1 UL channel access procedure for transmitting in a transmission occasion prior to the last transmission occasion, the UE shall attempt to transmit in the next transmission occasion according to Type 1 UL channel access procedure. If the UE transmits in one of the multiple transmission occasions after accessing the channel according to Type 1 UL channel access procedure, the UE may continue transmission in the remaining transmission occasions in the set, wherein each transmission occasion starts at the starting symbol of a configured grant PUSCH within the duration of the COT.

- If a UE is configured by the gNB to transmit a set of consecutive UL transmissions without gaps including PUSCH, periodic PUCCH, or periodic SRS and the UE transmits one of the configured UL transmissions in the

set after accessing the channel according to Type 1 UL channel access procedures, the UE may continue transmission of the remaining UL transmissions in the set, if any.

- A UE is not expected to be indicated with different channel access types for any consecutive UL transmissions without gaps in between the transmissions, except if Type 2B or Type 2C UL channel access procedures are identified for the first of the consecutive UL transmissions.

For UL transmission(s) with multiple starting positions scheduled by eNB, the following are applicable:

- If a UE is scheduled by an eNB to transmit transmissions including PUSCH Mode 1 using the Type 1 channel access procedure indicated in DCI, and if the UE cannot access the channel for a transmission according to the PUSCH starting position indicated in the DCI, the UE shall attempt to make a transmission at symbol 7 in the same subframe according to Type 1 channel access procedure. There is no limit on the number of attempts the UE can make using Type 1 channel access procedure.

- If a UE is scheduled by an eNB to transmit transmissions including PUSCH Mode 1 using the Type 2 channel access procedure indicated in DCI, and if the UE cannot access the channel for a transmission according to the PUSCH starting position indicated in the DCI, the UE may attempt to make a transmission at symbol 7 in the same subframe and according to Type 2 channel access procedure. The number of attempts the UE should make within the consecutively scheduled subframes including the transmission is limited to $w + 1$, where w is the number of consecutively scheduled subframes using Type 2 channel access procedure.

For contiguous UL transmissions(s) including a transmission pause, the following are applicable:

- If a UE is scheduled to transmit a set of consecutive UL transmissions without gaps using one or more UL grant(s), and if the UE has stopped transmitting during or before one of these UL transmissions in the set and prior to the last UL transmission in the set, and if the channel is sensed by the UE to be continuously idle after the UE has stopped transmitting, the UE may transmit a later UL transmission in the set using Type 2 channel access procedures or Type 2A UL channel access procedures without applying a CP extension.

- If a channel sensed by a UE is not continuously idle after the UE has stopped transmitting, the UE may transmit a later UL transmission in the set using Type 1 channel access procedure with the UL channel access priority class indicated in the DCI corresponding to the UL transmission.

For UL transmission(s) following autonomous UL transmission(s), the following are applicable:

- If a UE is scheduled by an eNB to transmit on channel c_i by a UL grant received on channel c_j, $i \neq j$, and if the UE is transmitting using autonomous UL on channel c_i, the UE shall terminate the ongoing PUSCH transmissions using the autonomous UL at least one subframe before the UL transmission according to the received UL grant.

- If a UE is scheduled by a UL grant received from an eNB on a channel to transmit a PUSCH transmission(s) starting from subframe n on the same channel using Type 1 channel access procedure and if at least for the first scheduled subframe occupies N_{RB}^{UL} resource blocks and the indicated PUSCH starting position is OFDM symbol zero, and if the UE starts autonomous UL transmissions before subframe n using Type 1 channel access procedure on the same channel, the UE may transmit UL transmission(s) according to the received UL grant from subframe n without a gap, if the priority class value of the performed channel access procedure is larger than or equal to priority class value indicated in the UL grant, and the autonomous UL transmission in the subframe preceding subframe n shall end at the last OFDM symbol of the subframe regardless of the higher layer parameter *endingSymbolAUL*. The sum of the lengths of the autonomous UL transmission(s) and the scheduled UL transmission(s) shall not exceed the maximum channel occupancy time corresponding to the priority class value used to perform the autonomous uplink channel access procedure. Otherwise, the UE shall terminate the ongoing autonomous UL transmission at least one subframe before the start of the UL transmission according to the received UL grant on the same channel.

For UL transmission(s) following configured grant UL transmission(s), the following are applicable:

- If a UE is scheduled to transmit UL transmission(s) starting from symbol i in slot n using Type 1 channel access procedures without CP extension with a corresponding CAPC, and if the UE starts configured grant UL transmissions before symbol i in slot n using Type 1 channel access procedures with a corresponding CAPC, and the scheduled UL transmission(s) occupies all the RBs of the same channels occupied by the configured grant UL transmission(s) or all the RBs of a subset thereof, the UE may directly continue to transmit the scheduled UL transmission(s) to the corresponding CAPC from symbol i in slot n without a gap, if the CAPC value of the performed channel access procedure is larger than or equal to the CAPC value corresponding to the scheduled

UL transmission(s). The sum of the transmission durations of the configured grant UL transmission(s) and the scheduled UL transmission(s) shall not exceed the MCOT duration corresponding to the CAPC value used to transmit the configured grant UL transmission(s). Otherwise, the UE shall terminate the configured grant UL transmission(s) by dropping the transmission on the symbols of at least the last configured grant UL transmission before symbol i in slot n and attempt to transmit the scheduled UL transmission(s) according to the corresponding CAPC. The symbols of the PUSCH transmission with a configured grant in a slot is dropped according to the mechanism in Clause 11.1 of [7, TS 38.213] relative to a last symbol of a CORESET where the UE detected the scheduling DCI. In this case, if the UE cannot terminate the configured grant UL transmission(s), the UE ignores the scheduling DCI.

4.2.1.0.2 Conditions for maintaining Type 1 UL channel access procedures

If a UE receives a DCI indicating a UL grant scheduling a PUSCH transmission using Type 1 channel access procedures or indicating a DL assignment scheduling a PUCCH transmission using Type 1 channel access procedures, and if the UE has an ongoing Type 1 channel access procedures before the PUSCH or PUCCH transmission starting time:

- If the UL channel access priority class value p_1 used for the ongoing Type 1 channel access procedures is same or larger than the UL channel access priority class value p_2 indicated in the DCI, the UE may transmit the PUSCH transmission in response to the UL grant by accessing the channel by using the ongoing Type 1 channel access procedure.

- If the UL channel access priority class value p_1 used for the ongoing Type 1 channel access procedure is smaller than the UL channel access priority class value p_2 indicated in the DCI, the UE shall terminate the ongoing channel access procedure.

- The UE may transmit the PUCCH transmission in response to the DL grant by accessing the channel by using the ongoing Type 1 channel access procedures.

4.2.1.0.3 Conditions for indicating Type 2 channel access procedures

An eNB/gNB may indicate Type 2 channel access procedures in the DCI of a UL grant or DL assignment scheduling transmission(s) including PUSCH or PUCCH on a channel, respectively, as follows:

If the UL transmissions occur within the time interval starting at t_0 and ending at $t_0 + T_{CO}$, where

- $T_{CO} = T_{m\,cot,p} + T_g$,

- t_0 is the time instant when the eNB/gNB has started transmission on the carrier according to the channel access procedure described in clause 4.1.1,

- $T_{m\,cot,p}$ value is determined by the eNB/gNB as described in clause 4.1.1,

- T_g is the total duration of all gaps of duration greater than $25us$ that occur between the DL transmission of the eNB/gNB and UL transmissions scheduled by the eNB/gNB, and between any two UL transmissions scheduled by the eNB/gNB starting from t_0,

then,

- the eNB/gNB may indicate Type 2 channel access procedures in the DCI if the eNB/gNB has transmitted on the channel according to the channel access procedures described in clause 4.1.1, or

- the eNB may indicate using the 'UL duration and offset' field that the UE may perform a Type 2 channel access procedure for transmissions(s) including PUSCH on a channel in a subframe n when the eNB has transmitted on the channel according to the channel access procedure described in clause 4.1.1, or

- the eNB may indicate using the 'UL duration and offset' field and 'COT sharing indication for AUL' field that a UE configured with autonomous UL may perform a Type 2 channel access procedure for autonomous UL transmissions(s) including PUSCH on a channel in subframe n when the eNB has transmitted on the channel according to the channel access procedure described in clause 4.1.1 and acquired the channel using the largest priority class value and the eNB transmission includes PDSCH, or

- the eNB/gNB may schedule UL transmissions on a channel, that follow a transmission by the eNB/gNB on that channel with Type 2A channel access procedures for the UL transmissions as described in clause 4.2.1.2.1 after a duration of $25us$.

The eNB/gNB shall schedule UL transmissions between t_0 and $t_0 + T_{CO}$ without gaps between consecutive UL transmissions if they can be scheduled contiguously. For a UL transmission on a channel that follows a transmission by the eNB/gNB on that channel using Type 2A channel access procedures as described in clause 4.2.1.2.1, the UE may use Type 2A channel access procedure for the UL transmission.

If the eNB/gNB indicates Type 2 channel access procedure for the UE in the DCI, the eNB/gNB indicates the channel access priority class used to obtain access to the channel in the DCI.

For indicating a Type 2 channel access procedure, if the gap is at least $25us$, or equal to $16us$, or up to $16us$, the gNB may indicate Type 2A, or Type 2B, or Type 2C UL channel procedures, respectively, as described in clauses 4.2.1.2.

4.2.1.0.4   Channel access procedures for UL multi-channel transmission(s)

If a UE

- is scheduled to transmit on a set of channels C, and if Type 1 channel access procedure is indicated by the UL scheduling grants for the UL transmissions on the set of channels C, and if the UL transmissions are scheduled to start transmissions at the same time on all channels in the set of channels C , or

- intends to perform an uplink transmission on configured resources on the set of channels C with Type 1 channel access procedure, and if UL transmissions are configured to start transmissions on the same time all channels in the set of channels C, and

if the channel frequencies of set of channels C is a subset of one of the sets of channel frequencies defined in clause 5.7.4 in [2]

- the UE may transmit on channel $c_i \in C$ using Type 2 channel access procedure as described in clause 4.2.1.2,

  - if Type 2 channel access procedure is performed on channel c_i immediately before the UE transmission on channel $c_j \in C$, $i \neq j$, and

  - if the UE has accessed channel c_j using Type 1 channel access procedure as described in clause 4.2.1.1,

    - where channel c_j is selected by the UE uniformly randomly from the set of channels C before performing Type 1 channel access procedure on any channel in the set of channels C.

- the UE may not transmit on channel $c_i \in C$ within the bandwidth of a carrier, if the UE fails to access any of the channels, of the carrier bandwidth, on which the UE is scheduled or configured by UL resources.

4.2.1.1   Type 1 UL channel access procedure

This clause describes channel access procedures by a UE where the time duration spanned by the sensing slots that are sensed to be idle before a UL transmission(s) is random. The clause is applicable to the following transmissions:

- PUSCH/SRS transmission(s) scheduled or configured by eNB/gNB, or

- PUCCH transmission(s) scheduled or configured by gNB, or

- Transmission(s) related to random access procedure.

A UE may transmit the transmission using Type 1 channel access procedure after first sensing the channel to be idle during the slot durations of a defer duration T_d, and after the counter N is zero in step 4. The counter N is adjusted by sensing the channel for additional slot duration(s) according to the steps described below.

1) set $N = N_{init}$, where N_{init} is a random number uniformly distributed between 0 and CW_p, and go to step 4;

2) if $N > 0$ and the UE chooses to decrement the counter, set $N = N - 1$;

3) sense the channel for an additional slot duration, and if the additional slot duration is idle, go to step 4; else, go to step 5;

4) if $N = 0$, stop; else, go to step 2.

5) sense the channel until either a busy slot is detected within an additional defer duration T_d or all the slots of the additional defer duration T_d are detected to be idle;

6) if the channel is sensed to be idle during all the slot durations of the additional defer duration T_d, go to step 4; else, go to step 5;

If a UE has not transmitted a UL transmission on a channel on which UL transmission(s) are performed after step 4 in the procedure above, the UE may transmit a transmission on the channel, if the channel is sensed to be idle at least in a sensing slot duration T_{sl} when the UE is ready to transmit the transmission and if the channel has been sensed to be idle during all the slot durations of a defer duration T_d immediately before the transmission. If the channel has not been sensed to be idle in a sensing slot duration T_{sl} when the UE first senses the channel after it is ready to transmit, or if the channel has not been sensed to be idle during any of the sensing slot durations of a defer duration T_d immediately before the intended transmission, the UE proceeds to step 1 after sensing the channel to be idle during the slot durations of a defer duration T_d.

The defer duration T_d consists of duration $T_f = 16us$ immediately followed by m_p consecutive slot durations where each slot duration is $T_{sl} = 9us$, and T_f includes an idle slot duration T_{sl} at start of T_f.

$CW_{min,p} \leq CW_p \leq CW_{max,p}$ is the contention window. CW_p adjustment is described in clause 4.2.2.

$CW_{min,p}$ and $CW_{max,p}$ are chosen before step 1 of the procedure above.

m_p, $CW_{min,p}$, and $CW_{max,p}$ are based on a channel access priority class p as shown in Table 4.2.1-1, that is signalled to the UE.

4.2.1.2 Type 2 UL channel access procedure

This clause describes channel access procedures by UE where the time duration spanned by the sensing slots that are sensed to be idle before a UL transmission(s) is deterministic.

If a UE is indicated by an eNB to perform Type 2 UL channel access procedures, the UE follows the procedures described in clause 4.2.1.2.1.

4.2.1.2.1 Type 2A UL channel access procedure

If a UE is indicated to perform Type 2A UL channel access procedures, the UE uses Type 2A UL channel access procedures for a UL transmission. The UE may transmit the transmission immediately after sensing the channel to be idle for at least a sensing interval $T_{short\_ul} = 25us$. T_{short_ul} consists of a duration $T_f = 16us$ immediately followed by one slot sensing slot and T_f includes a sensing slot at start of T_f. The channel is considered to be idle for T_{short_ul} if both sensing slots of T_{short_ul} are sensed to be idle.

4.2.1.2.2 Type 2B UL channel access procedure

If a UE is indicated to perform Type 2B UL channel access procedures, the UE uses Type 2B UL channel access procedure for a UL transmission. The UE may transmit the transmission immediately after sensing the channel to be idle within a duration of $T_f = 16us$. T_f includes a sensing slot that occurs within the last $9us$ of T_f. The channel is considered to be idle within the duration T_f if the channel is sensed to be idle for total of at least $5us$ with at least $4us$ of sensing occurring in the sensing slot.

4.2.1.2.3 Type 2C UL channel access procedure

If a UE is indicated to perform Type 2C UL channel access procedures for a UL transmission, the UE does not sense the channel before the transmission. The duration of the corresponding UL transmission is at most $584us$.

4.2.2   Contention window adjustment procedures

If a UE transmits transmissions using Type 1 channel access procedures that are associated with channel access priority class p on a channel, the UE maintains the contention window value CW_p and adjusts CW_p for those transmissions before step 1 of the procedure described in clause 4.2.1.1, as described in this clause.

4.2.2.1   Contention window adjustment procedures for UL transmissions scheduled/configured by eNB

If a UE transmits transmissions using Type 1 channel access procedures that are associated with channel access priority class p on a channel, the UE maintains the contention window value CW_p and adjusts CW_p for those transmissions before step 1 of the procedure described in clause 4.2.1.1, using the following procedure:

- If the UE receives an UL grant or an AUL-DFI, the contention window size for all the priority classes is adjusted as following:

    - If the NDI value for at least one HARQ process associated with HARQ_ID_ref is toggled, or if the HARQ-ACK value(s) for at least one of the HARQ processes associated with HARQ_ID_ref received in the earliest AUL-DFI after $n_{ref}+3$ indicates ACK,

        - for every priority class $p \in \{1,2,3,4\}$, set $CW_p = CW_{min,p}$;

    - Otherwise, increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value;

- If there exists one or more previous transmissions $\{T_0, \ldots, T_n\}$ using Type 1 channel access procedure, from the start subframe(s) of the previous transmission(s) of which, N or more subframes have elapsed and neither UL grant nor AUL-DFI was received, where N = max (*contentionWindowSizeTimer*, T_i burst length+1) if *contentionWindowSizeTimer* > 0 and N = 0 otherwise, for each transmission T_i, CW_p is adjusted as following:

    - increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value;

    - The CW_p is adjusted once

- Else if the UE transmits transmissions using Type 1 channel access procedure before N subframes have elapsed from the start of previous UL transmission burst using Type 1 channel access procedure and neither UL grant nor AUL-DFI is received,

    - the CW_p is unchanged.

- If the UE receives an UL grant or an AUL-DFI indicates feedback for one or more previous transmissions $\{T_0, \ldots, T_n\}$ using Type 1 channel access procedure, from the start subframe(s) of the previous transmission(s) of which, N or more subframes have elapsed and neither UL grant nor AUL-DFI was received, where N = max (*contentionWindowSizeTimer*, T_i burst length+1) if *contentionWindowSizeTimer* > 0 and N = 0 otherwise, the UE may recompute CW_p as follows:

    - The UE reverts CW_p to the value used to transmit at n_{T0} using Type 1 channel access procedure.

    - The UE updates CW_p sequentially in the order of the transmission $\{T_0, \ldots, T_n\}$

        - If the NDI value for at least one HARQ process associated with HARQ_ID_ref' is toggled, or if the HARQ-ACK value(s) for at least one of the HARQ processes associated with HARQ_ID_ref' received in the earliest AUL-DFI after $n_{Ti}+3$ indicates ACK,

            - for every priority class $p \in \{1,2,3,4\}$ set $CW_p = CW_{min,p}$.

        - Otherwise, increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value.

- If the UE transmits transmissions using Type 1 channel access procedure before N subframes have elapsed from the start of previous UL transmission burst using Type 1 channel access procedure and neither UL grant nor AUL-DFI is received,

    - CW_p is unchanged.

HARQ_ID_ref is the HARQ process ID of UL-SCH in reference subframe n_{ref}. The reference subframe n_{ref} is determined as follows

- If the UE receives an UL grant or an AUL-DFI in subframe n_g, subframe n_w is the most recent subframe before subframe $n_g - 3$ in which the UE has transmitted UL-SCH using Type 1 channel access procedure.

  - If the UE transmits transmissions including UL-SCH without gaps starting with subframe n_0 and in subframes $n_0, n_1, \cdots, n_w$ and the UL-SCH in subframe n_0 is not PUSCH Mode 1 that starts in the second slot of the subframe, reference subframe n_{ref} is subframe n_0.

  - If the UE transmits transmissions including PUSCH Mode 1 without gaps starting with second slot of subframe n_0 and in subframes $n_0, n_1, \cdots, n_w$ and the, reference subframe n_{ref} is subframe n_0 and n_1,

  - otherwise, reference subframe n_{ref} is subframe n_w.

HARQ_ID_ref' is the HARQ process ID of UL-SCH in reference subframe n_{Ti}. The reference subframe n_{Ti} is determined as the start subframe of a transmission T_i using Type 1 channel access procedure and of which, N subframes have elapsed and neither UL grant nor AUL-DFI was received.

If the AUL-DFI with DCI format 0A is indicated to a UE that is activated with AUL transmission and transmission mode 2 is configured for the UE for grant-based uplink transmissions, the spatial HARQ-ACK bundling shall be performed by logical OR operation across multiple codewords for the HARQ process not configured for autonomous UL transmission.

If CW_p changes during an ongoing channel access procedure, the UE shall draw a counter N_{init} and applies it to the ongoing channel access procedure.

The UE may keep the value of CW_p unchanged for every priority class $p \in \{1,2,3,4\}$, if the UE scheduled to transmit transmissions without gaps including PUSCH in a set subframes $n_0, n_1, \cdots, n_{w-1}$ using Type 1 channel access procedure, and if the UE is not able to transmit any transmission including PUSCH in the set of subframes.

The UE may keep the value of CW_p for every priority class $p \in \{1,2,3,4\}$ the same as that for the last scheduled transmission including PUSCH using Type 1 channel access procedure, if the reference subframe for the last scheduled transmission is also n_{ref}.

4.2.2.2 Contention window adjustment procedures for UL transmissions scheduled/configured by gNB

If a UE transmits transmissions using Type 1 channel access procedures that are associated with channel access priority class p on a channel, the UE maintains the contention window value CW_p and adjusts CW_p for those transmissions before step 1 of the procedure described in clause 4.2.1.1, using the following steps:

1) For every priority class $p \in \{1,2,3,4\}$, set $CW_p = CW_{min,p}$;

2) If HARQ-ACK feedback is available after the last update of CW_p, go to step 3. Otherwise, if the UE transmission after procedure described in clause 4.2.1.1 does not include a retransmission or is transmitted within a duration T_w from the end of the *reference duration* corresponding to the earliest UL transmission burst after the last update of CW_p transmitted after the procedures described in clause 4.1.1, go to step 5; otherwise go to step 4.

3) The HARQ-ACK feedback(s) corresponding to PUSCH(s) in the *reference duration* for the latest UL transmission burst for which HARQ-ACK feedback is available is used as follows:

   a. If at least one HARQ-ACK feedback is 'ACK' for PUSCH(s) with transport block (TB) based feedback or at least 10% of HARQ-ACK feedbacks is 'ACK' for PUSCH(s) with code block group (CBG) based feedback go to step 1; otherwise go to step 4.

4) Increase CW_p for every priority class $p \in \{1,2,3,4\}$ to the next higher allowed value;

5) For every priority class $p \in \{1,2,3,4\}$, maintain CW_p as it is; go to step 2.

The HARQ-ACK feedback, *reference duration* and duration T_w in the procedure above are defined as the following:

- HARQ-ACK feedback for PUSCH(s) transmissions are expected to be provided to UE(s) explicitly or implicitly where implicit HARQ-ACK feedback for the purpose of contention window adjustment in this clause is determined based on the indication for a new transmission or retransmission in the DCI scheduling PUSCH(s) as follows:

    - If a new transmission is indicated, 'ACK' is assumed for the transport blocks or code block groups in the corresponding PUSCH(s) for the TB-based and CBG-based transmission, respectively.

    - If a retransmission is indicated for TB-based transmissions, 'NACK' is assumed for the transport blocks in the corresponding PUSCH(s).

    - If a retransmission is indicated for CBG-based transmissions, if a bit value in the code block group transmission information (CBGTI) field is '0' or '1' as described in clause 5.1.7.2 in [8], 'ACK' or 'NACK' is assumed for the corresponding CBG in the corresponding PUSCH(s), respectively.

- The *reference duration* corresponding to a channel occupancy initiated by the UE including transmission of PUSCH(s) is defined in this clause as a duration starting from the beginning of the channel occupancy until the end of the first slot where at least one PUSCH is transmitted over all the resources allocated for the PUSCH, or until the end of the first transmission burst by the UE that contains PUSCH(s) transmitted over all the resources allocated for the PUSCH, whichever occurs earlier. If the channel occupancy includes a PUSCH, but it does not include any PUSCH transmitted over all the resources allocated for that PUSCH, then, the duration of the first transmission burst by the UE within the channel occupancy that contains PUSCH(s) is the *reference duration* for CWS adjustment.

- $T_w = \max(T_A, T_B + 1ms)$ where T_B is the duration of the transmission burst from start of the *reference duration* in ms and $T_A = 5ms$ if the absence of any other technology sharing the channel cannot be guaranteed on a long-term basis (e.g. by level of regulation), and $T_A = 10ms$ otherwise.

If a UE transmits transmissions using Type 1 channel access procedures associated with the channel access priority class p on a channel and the transmissions are not associated with explicit or implicit HARQ-ACK feedbacks as described above in this clause, the UE adjusts CW_p before step 1 in the procedures described in clause 4.2.1.1, using the latest CW_p used for any UL transmissions on the channel using Type 1 channel access procedures associated with the channel access priority class p. If the corresponding channel access priority class p has not been for any UL transmission on the channel, $CW_p = CW_{min,p}$ is used.

4.2.2.3   Common procedures for CWS adjustments for UL transmissions

The following applies to the procedures described in clauses 4.2.2.1 and 4.2.2.2:

- If $CW_p = CW_{max,p}$, the next higher allowed value for adjusting CW_p is $CW_{max,p}$.

- If the $CW_p = CW_{max,p}$ is consecutively used K times for generation of N_{init}, CW_p is reset to $CW_{min,p}$ only for that priority class p for which $CW_p = CW_{max,p}$ is consecutively used K times for generation of N_{init}. K is selected by UE from the set of values {1, 2, …,8} for each priority class $p \in \{1,2,3,4\}$.

4.2.3   Energy detection threshold adaptation procedure

A UE accessing a channel on which UL transmission(s) are performed, shall set the energy detection threshold (X_{Thresh}) to be less than or equal to the maximum energy detection threshold X_{Thresh_max}.

X_{Thresh_max} is determined as follows:

- If the UE is configured with higher layer parameter *maxEnergyDetectionThreshold-r14* or *maxEnergyDetectionThreshold-r16*,

    - X_{Thresh_max} is set equal to the value signalled by the higher layer parameter;

- otherwise

    - the UE shall determine X'_{Thresh_max} according to the procedure described in clause 4.2.3.1;

    - if the UE is configured with higher layer parameter *energyDetectionThresholdOffset-r14* or *energyDetectionThresholdOffset-r16*

- $X_{\text{Thresh\_max}}$ is set by adjusting $X'_{\text{Thresh\_max}}$ according to the offset value signalled by the higher layer parameter;

- otherwise

- the UE shall set $X_{\text{Thresh\_max}} = X'_{\text{Thresh\_max}}$.

If the higher layer parameter *absenceOfAnyOtherTechnology-r16* is not configured to a UE, and the higher layer parameter *ul-toDL-COT-SharingED-Threshold-r16* is configured to the UE, the gNB should use the gNB's transmit power in determining the resulting energy detection threshold *ul-toDL-COT-SharingED-Threshold-r16*.

For the case where a UE performs channel access procedures as described in clause 4.2.1.2.1 and shares its corresponding channel occupancy time with the gNB, $X_{\text{Thresh\_max}}$ is set equal to the value provided by the higher layer parameter *ul-toDL-COT-SharingED-Threshold-r16*, if provided.

4.2.3.1 Default maximum energy detection threshold computation procedure

If the higher layer parameter *absenceOfAnyOtherTechnology-r14* or *absenceOfAnyOtherTechnology-r16* is provided

- $X'_{\text{Thresh\_max}} = min \left\{ \begin{array}{l} T_{max} + 10\text{dB} \\ X_r \end{array} \right\}$ where

- X_r is Maximum energy detection threshold defined by regulatory requirements in dBm when such requirements are defined, otherwise $X_r = T_{max} + 10dB$

otherwise

- $X'_{\text{Thresh\_max}} = max \left\{ \begin{array}{l} -72 + 10 \cdot log\,1\,0(BW\,MHz\,/20MHz)\,dBm, \\ min \left\{ \begin{array}{l} T_{\max}, \\ T_{\max} - T_A + (P_H + 10 \cdot log\,1\,0(BW\,MHz\,/20MHz) - P_{TX}) \end{array} \right\} \end{array} \right\}$

where

- $T_A = 10dB$;

- $P_H = 23dBm$;

- P_{TX} is the set to the value of $P_{\text{CMAX\_H},c}$ as defined in [3];

- $T_{\max}(\text{dBm}) = 10 \cdot log\,10\,(3.16228 \cdot 10^{-8}(mW\,/MHz) \cdot BW\,MHz\,(MHz))$;

- $BW\,MHz$ is the single channel bandwidth in MHz.

4.3 Channel access procedures for semi-static channel occupancy

If the absence of any other technology sharing a channel can be guaranteed on a long-term basis (e.g. by level of regulation) and if a gNB provides UE(s) with higher layer parameters *ChannelAccessMode-r16* =*'semistatic'* by SIB1 or dedicated configuration, a periodic channel occupancy can be initiated every T_x within every two consecutive radio frames, starting from the even indexed radio frame at $x \cdot T_x$ with a maximum channel occupancy time $T_y = 0.95T_x$, where $T_x = Period$ in ms, is a higher layer parameter provided in *semiStaticChannelAccessConfig-r16* and $x \in \left\{ 0, 1, \dots, \frac{20}{T_x} - 1 \right\}$.

In the following procedures in this clause, when a gNB or UE performs sensing for evaluating a channel availability, the sensing is performed at least during a sensing slot duration $T_{sl} = 9us$. The corresponding X_{Thresh} adjustment for performing sensing by a gNB or a UE is described in clauses 4.1.5 and 4.2.3, respectively.

A channel occupancy initiated by a gNB and shared with UE(s) shall satisfy the following:

- The gNB shall transmit a DL transmission burst(s) starting at the beginning of the channel occupancy time immediately after sensing the channel to be idle for at least a sensing slot duration $T_{sl} = 9us$. If the channel is sensed to be busy, the gNB shall not perform any transmission during the current channel occupancy time.

- The gNB may transmit a DL transmission burst(s) within the channel occupancy time immediately after sensing the channel to be idle for at least a sensing slot duration $T_{sl} = 9us$ if the gap between the DL transmission burst(s) and any previous transmission burst is more than $16us$.

- The gNB may transmit DL transmission burst(s) after UL transmission burst(s) within the channel occupancy time without sensing the channel if the gap between the DL and UL transmission bursts is at most $16us$.

- A UE may transmit UL transmission burst(s) after detection of a DL transmission burst(s) within the channel occupancy time as follows:

  - If the gap between the UL and DL transmission bursts is at most $16us$, the UE may transmit UL transmission burst(s) after a DL transmission burst(s) within the channel occupancy time without sensing the channel.

  - If the gap between the UL and DL transmission bursts is more than $16us$, the UE may transmit UL transmission burst(s) after a DL transmission burst(s) within the channel occupancy time after sensing the channel to be idle for at least a sensing slot duration $T_{sl} = 9us$ within a $25us$ interval ending immediately before transmission.

- The gNB and UEs shall not transmit any transmissions in a set of consecutive symbols for a duration of at least $T_z = \max(0.05T_x, 100us)$ before the start of the next channel occupancy time.

If a UE fails to access the channel(s) prior to an intended UL transmission to a gNB, Layer 1 notifies higher layers about the channel access failure.
