BT_Threshold_DL indicates the RLA_EC (in dBm) or SLA (in dB) below which blind physical layer transmissions are used on EC-AGCH. CC2_Range_DL and CC3_Range_DL indicate the RLA_EC range (in dB) of downlink CC2 and CC3, respectively.

BT_Threshold_DL and EC_RXLEV_ACCESS_MIN are broadcast in EC SI 2 (see 3GPP TS 44.018 [17]).

CC2_Range_DL and CC3_Range_DL are optionally broadcast in EC SI 2. If either of CC2_Range_DL and CC3_Range_DL is not broadcast, its value shall be set to 0 and the corresponding downlink CC is not supported by the network.

If RLA_EC or SLA (whichever is applicable) is on the limit between two CC, the MS shall select the higher CC.

In case downlink CC1 is selected, the MS shall further indicate in the EC Packet Channel Request message (see 3GPP TS 44.018 [17]) the margin of the measured RLA_EC (or SLA) relative to BT_Threshold_DL. The parameter DL_Signal_Strength_Step_Size broadcast in EC SI 2 (see 3GPP TS 44.018 [17]) is used to quantize the margin to report in the EC Packet Channel Request message. The maximum margin that can be reported is dependent on the number of Coverage Classes supported in the cell, and whether or not the access is initiated on RACH or EC-RACH, see 3GPP TS 44.018 [17].

NOTE: When TX diversity (antenna hopping) is active a MS may underestimate RLA_EC. This can be compensated for by the NW in an adjustment of the BT_Threshold_DL.

3GPP TS 45.008 subclause 6.10.2

[…]

Table 3.5.2.1.2a.2: Values of parameters Scc and Tcc

	Scc	Tcc
CC1	Sm	Tm
CC2	Sm	Tm
CC3	2*Sm	2*Tm
CC4	4*Sm	2*(Tm+1)

The value for Sm is sent in the EC SYSTEM INFORMATION TYPE 2 message and is used for determining the Scc value applicable for monitoring the EC-AGCH according to the selected downlink coverage class of the mobile station

[…]

After sending the first EC PACKET CHANNEL REQUEST message or a subsequent retransmission, the mobile station shall start reading the EC-AGCH (according to the downlink coverage class indicated within the corresponding EC PACKET CHANNEL REQUEST message) in an attempt to find a response matching its last transmission.

- A MS that has selected downlink CC1 shall begin looking for a matching response starting within downlink 51-multiframe N (i.e. N = TDMA FN div 51) if it used uplink 51-multiframe N to send the last blind physical layer transmission of the EC PACKET CHANNEL REQUEST message and there is at least one remaining valid CC1 reception opportunity in downlink 51-multiframe N. If a matching response is not found or there are no remaining valid CC1 reception opportunities within downlink 51-multiframe N it shall start reading 51-multiframe N+1in an attempt to find a matching response. The total number of downlink 51-multiframes it reads (excluding downlink 51-multiframe N) in an attempt to find a matching response is determined by Scc (see Table 3.5.2.1.2a.2).

- A MS that has selected downlink CC2 shall begin looking for a matching response starting within downlink 51-multiframe N if it used uplink 51-multiframe N to send the last blind physical layer transmission of the EC PACKET CHANNEL REQUEST message, N mod 2 = 0 and there is at least one remaining valid CC2 reception opportunity that starts in downlink 51-multiframe N. If a matching response is not found using downlink 51-multiframes N and N+1 or there are no remaining valid CC2 reception opportunities that start within downlink 51-multiframe N it shall start reading downlink 51-multiframe N+1 (respectively N+2) if N mod 2 = 1 (respectively N mod 2 = 0). The total number of downlink 51-multiframes it reads (excluding downlink 51-multiframe N) in an attempt to find a matching response is determined by Scc (see Table 3.5.2.1.2a.2).

- A MS that has selected downlink CC3 shall begin looking for a matching response starting with downlink 51-multiframe N+1 (respectively N+2) when it used uplink 51-multiframe N to send the last blind physical layer transmission of the EC PACKET CHANNEL REQUEST message where N mod 2 = 1 (respectively N mod 2 =

0). The total number of downlink 51-multiframes it reads in an attempt to find a matching response is determined by Scc (see Table 3.5.2.1.2a.2).

- A MS that has selected downlink CC4 shall begin looking for a matching response starting with downlink 51-multiframe N+1 (respectively N+2, N+3, N+4) when it used uplink 51-multiframe N to send the last blind physical layer transmission of the EC PACKET CHANNEL REQUEST message where N mod 4 = 3 (respectively N mod 4 = 2, 1, 0). The total number of downlink 51-multiframes it reads in an attempt to find a matching response is determined by Scc (see Table 3.5.2.1.2a.2).

- 3GPP TS 44.018 subclause 3.5.2.1.2a

41.8.4.3.2 Test purpose

To verify that an MS make an EC operation access request shall select the downlink CC to use on EC-RACH, based on the downlink received signal strength and the associated parameters if the DL_CC_Selection indicates the RLA_EC based method.

41.8.4.3.3 Method of test

Initial conditions

System Simulator:

1 Serving cell, EC-GSM-IoT supported

DL_CC_Selection = 0 (RLA_EC based coverage class selection)

BT_Threshold_DL = 0 (-87 dBm)

BT_Threshold_UL = 20 (-110 dBm)

CC2_Range_DL = CC3_Range_DL = 3 (4 dB)

Access_Timeslots = 0 to use 1TS EC_RACH Mapping

EC_Max_Retrans = 0 (1 retransmission)

DL_Signal_Strength_Step_Size = 0 (2dB)

Mobile Station:

The MS is off.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is turned on with the cell at different power level. The EC-RACH access should indicate the proper DL coverage class or the proper margin if CC1 is indicated.

The Assignment message sent, once only, randomly on one of the EC-AGCH blocks according to the requested DL Coverage Class. The reception level being good enough for a one time only decoding, without blind physical layer transmissions, the MS shall then continue its GPRS attach procedure.

The procedure is repeated for all the DL coverage class. (k= 1 to 5).

Maximum duration of the test

-

Expected sequence

The test sequence is repeated for k = 1 … 5.

Step	Direction	Message	Comments
1	SS		The test is run with the following kx configurations: k=1: -70 dBm RxLev of the serving cell to ensure CC1 as DL coverage class k=2: -80 dBm RxLev of the serving cell to ensure CC1 as DL coverage class k=3: -89 dBm RxLev of the serving cell to ensure CC2 as DL coverage class k=4: -93 dBm RxLev of the serving cell to ensure CC3 as DL coverage class k=5: -100 dBm RxLev of the serving cell to ensure CC4 as DL coverage class (not lower than -105 dBm)
2	MS		The MS is powered on
3	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. UL coverage class (i.e. Training Sequence used) indicated by the MS shall be CC1 Selected DL coverage Class shall be set according to k configuration For k=1 and 2, two different margins, at least 2 steps apart shall be reported For k= 3 to 5, CC2, CC3 and CC4 shall be reported respectively
4	SS -> MS	EC IMMEDIATE ASSIGNMENT Type 2	Sent on EC-AGCH, once only, randomly on one of the blocks scheduled for the initial transmission or a potential blind repetition
5	MS -> SS	UPLINK RLC DATA BLOCKS	Transporting: **ATTACH REQUEST**

Specific message contents:

-

41.8.4.4 EC-GSM-IoT / Coverage Class / DL Coverage Class selection / SLA

41.8.4.4.1 Conformance requirement

The MS shall select the downlink CC based on either RLA_EC or SLA, as indicated by the DL_CC_Selection parameter sent in EC SI 2 (see 3GPP TS 44.018 [17]), according to table 6.10.2-1 and indicate it to the network in the EC Packet Channel Request message (see 3GPP TS 44.018 [17]). The network shall apply the indicated downlink CC on EC-AGCH.

Table 6.10.2-1: Downlink CC selection

Downlink CC	Upper limit of RLA_EC or SLA	Lower limit of RLA_EC or SLA
CC1	-	BT_Threshold_DL
CC2	BT_Threshold_DL	BT_Threshold_DL - CC2_Range_DL
CC3	BT_Threshold_DL - CC2_Range_DL	BT_Threshold_DL - CC2_Range_DL - CC3_Range_DL
CC4	BT_Threshold_DL - CC2_Range_DL - CC3_Range_DL	- (see note)
NOTE: There is no explicit lower limit for selection of downlink CC4 but the C1 criterion (see subclause 6.4.1) will trigger a cell re-selection if RLA_EC ≤ EC_RXLEV_ACCESS_MIN + Max(MS_TXPWR_MAX_CCH – MSPWR,0), which implicitly sets a lower limit if CC selection is based on RLA_EC.		

BT_Threshold_DL indicates the RLA_EC (in dBm) or SLA (in dB) below which blind physical layer transmissions are used on EC-AGCH. CC2_Range_DL and CC3_Range_DL indicate the RLA_EC range (in dB) of downlink CC2 and CC3, respectively.

BT_Threshold_DL and EC_RXLEV_ACCESS_MIN are broadcast in EC SI 2 (see 3GPP TS 44.018 [17]).

CC2_Range_DL and CC3_Range_DL are optionally broadcast in EC SI 2. If either of CC2_Range_DL and CC3_Range_DL is not broadcast, its value shall be set to 0 and the corresponding downlink CC is not supported by the network.

If RLA_EC or SLA (whichever is applicable) is on the limit between two CC, the MS shall select the higher CC.

In case downlink CC1 is selected, the MS shall further indicate in the EC Packet Channel Request message (see 3GPP TS 44.018 [17]) the margin of the measured RLA_EC (or SLA) relative to BT_Threshold_DL. The parameter DL_Signal_Strength_Step_Size broadcast in EC SI 2 (see 3GPP TS 44.018 [17]) is used to quantize the margin to report in the EC Packet Channel Request message. The maximum margin that can be reported is dependent on the number of Coverage Classes supported in the cell, and whether or not the access is initiated on RACH or EC-RACH, see 3GPP TS 44.018 [17].

NOTE: When TX diversity (antenna hopping) is active a MS may underestimate RLA_EC. This can be compensated for by the NW in an adjustment of the BT_Threshold_DL.

Reference

3GPP TS 45.008 subclause 6.10.2

41.8.4.4.2 Test purpose

To verify that an MS make an EC operation access request shall select the downlink CC to use on EC-RACH, based on the SINR and the associated parameters if the DL_CC_Selection indicates the SLA based method.

41.8.4.4.3 Method of test

Initial conditions

System Simulator:

1 Serving cell EC-GSM-IoT supported, RxLev -70dBm

2 non-serving cells (same ARFCN than the serving Cell), with RxLev set as per test configuration.

DL_CC_Selection = 1 (SLA based coverage class selection)

BT_Threshold_DL = 18 (8 dB)

BT_Threshold_UL = 20 (-110 dBm)

CC2_Range_DL = CC3_Range_DL = 5 (6 dB)

Access_Timeslots = 0 to use 1TS EC_RACH Mapping

EC_Max_Retrans = 0 (1 retransmission)

DL_Signal_Strength_Step_Size = 0 (2dB)

Mobile Station:

The MS is off.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is turned on with the non-serving cell at different power level to modify the SINR. The EC-RACH access should indicate the proper DL coverage class or the proper margin if CC1 is indicated.

The procedure is repeated for all the DL coverage class. (k= 1 to 5)

Maximum duration of the test

-

Expected sequence

The test sequence is repeated for k = 1 … 5.

Step	Direction	Message	Comments
1	SS		The test is run with the following kx configurations: k=1: -90 dBm RxLev of the non-serving cells to ensure CC1 as DL coverage class k=2: -84 dBm RxLev of the non-serving cells to ensure CC1 as DL coverage class k=3: -78 dBm RxLev of the non-serving cells to ensure CC2 as DL coverage class k=4: -72 dBm RxLev of the non-serving cells to ensure l ensure CC3 as DL coverage class k=5: -66 dBm RxLev of the non-serving cells to ensure CC4 as DL coverage class
2	MS		The MS is powered on
3	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. UL coverage class (i.e. Training Sequence used) indicated by the MS shall be CC1 Selected DL coverage Class shall be set according to k configuration For k=1 and 2, two different margins, at least 2 steps apart shall be reported For k= 3 to 5, CC2, CC3 and CC4 shall be reported respectively

Specific message contents:

-

41.8.4.5 EC-GSM-IoT / Coverage Class / UL Coverage Class Adaptation

41.8.4.5.1 Conformance requirement

If CC adaptation on EC-RACH and EC-AGCH is allowed (as indicated by the CC_Access_Adaptation parameter broadcast in EC-SI2), the MS shall gradually increase its CC as described in 3GPP TS 44.018 and use it as its selected uplink or downlink CC.

Reference

3GPP TS 45.008 subclause 6.10.4

A mobile station accessing the network for the purpose of *NAS signalling low priority* (see 3GPP TS 24.008) that has sent one or more EC PACKET CHANNEL REQUEST messages shall proceed as follows:

[…]

- When scheduling another EC PACKET CHANNEL REQUEST message the MS uses the "CC_Access_Adaptation" parameter (broadcast in EC SYSTEM INFORMATION TYPE 2 message) to determine if it is allowed to increment both its uplink CC and downlink CC to the next CC supported by the network (unless it is already using CC4).
- Upon incrementing its uplink/downlink CC the number of subsequent EC PACKET CHANNEL REQUEST message transmission attempts that may occur before it is allowed to increment its uplink/downlink CC once again is the same as when sending the first EC PACKET CHANNEL REQUEST message (i.e. determined by the "EC_Max_Retrans" parameter).
- When sending up to M + 1 EC PACKET CHANNEL REQUEST messages the MS may increment its uplink CC and downlink CC a maximum of 2 times if CC adaptations are allowed according to the "CC_Access_Adaptation" parameter.

Reference

- 3GPP TS 44.018 subclause 3.5.2.1.2a

41.8.4.5.2 Test purpose

To verify that an MS make an access for NAS low priority may gradually increment its coverage class if it is allowed by the network (based on CC_Access_Adaptation), it cannot be done more than 2 times

41.8.4.5.3 Method of test

Initial conditions

System Simulator:

1 cell EC-GSM-IoT supported

RLA_EC based coverage class selection.

BT_Threshold_UL = 0 (-90 dBm)

BT_Threshold_DL = 18 (-105 dBm)

CC2_Range_UL = CC3_Range_UL = 3 (4 dB)

Access_Timeslots = 0 to use 1TS EC_RACH Mapping

EC_Max_Retrans = 11 (7 retransmissions)

CC_Access_Adaptation = 1

Mobile Station:

The MS is off, configured for Low Priority.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is turned on and shall trigger an access for *NAS signalling low priority*.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS		The test is run with the following kx configurations: k=1: -80 dBm RxLev of the serving cell to ensure CC1 as UL coverage class
2	MS		The MS is powered on
3	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. UL coverage class (i.e. Training Sequence used) indicated by the MS shall match CC1 configuration. Selected DL coverage Class shall be CC1
4	SS		No response from the network
5	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH as retransmissions are allowed UL coverage class (i.e. Training Sequence used) indicated by the MS shall match the previous request or be one coverage class higher. DL coverage Class shall match the previous configuration or a be one coverage class higher. Both or none of the coverage classes shall be incremented.
6	SS		Step 5 is repeated 6 times (7 retransmissions). It is check that no more than 2 increases are requested. If CC2 or higher is requested, it is checked that the blind physical layers transmissions are properly sent according to TS 45.002.
6A			If the MS does not increase any Coverage Class request, the test case is considered as not applicable

Specific message contents:

-

41.8.4.6 EC-GSM-IoT / Coverage Class / DL Coverage Class Update

41.8.4.6.1 Conformance requirement

An EC capable MS whose last uplink transmission was in a cell that does not support EC-GSM-IoT may choose to enable EC operation upon reselection to a cell that supports EC-GSM-IoT. In this case it shall perform an uplink transmission (e.g. a cell update) to update the network (i.e. addition of Coverage Class information) and therefore be reachable for pages on the EC-PCH.

Reference

- 3GPP TS 44.018 subclause 3.5.1a.1

For the purpose of paging block monitoring on EC-PCH, the MS shall keep the network informed about the selected downlink CC (see subclause 6.10.2). The MS shall indicate the selected downlink CC using the DL Coverage Class field in the EC Packet Channel Request message. This shall be done in advance of the next occurrence of the paging group of the MS, and at least if any of the following conditions are fulfilled:

- the selected downlink CC is higher than the last downlink CC communicated to the network;
- the selected downlink CC is CC1 and the last downlink CC communicated to the network is CC4; or

- the MS has completed an uplink data transfer in a cell not supporting EC-GSM-IoT since the last time it communicated a downlink CC to the network.

The MS shall consider the network to be informed about the selected downlink CC at the completion of the uplink data transfer.

The network shall apply the indicated downlink CC on EC-PCH messages sent to that MS.

Reference

- 3GPP TS 45.005 subclause 6.10.5

41.8.4.6.2 Test purpose

To verify that an MS updates the network appropriately if the selected downlink coverage class is modified.

For EC Capable MS supporting GPRS, it is verified that the MS will inform the network, of its DL coverage class when the last uplink transmission was done in a cell not supporting EC-GSM-IoT.

41.8.4.6.3 Method of test

Initial conditions

System Simulator:

1 Serving cell EC-GSM-IoT supported, RxLev -70dBm

1 GPRS Cell, turned Off

2 non-serving cells (same ARFCN than the serving Cell), with RxLev set at -78dBm to ensure DL CC2 is used.

DL_CC_Selection = 1 (SLA based coverage class selection)

BT_Threshold_DL = 18 (8 dB)

BT_Threshold_UL = 20 (-110 dBm)

CC2_Range_DL = CC3_Range_DL = 7 (6 dB)

Access_Timeslots = 0 to use 1TS EC_RACH Mapping

EC_Max_Retrans = 0 (1 retransmission)

DL_Signal_Strength_Step_Size = 0 (2dB)

Mobile Station:

The MS is GPRS attached in packet idle mode. eDRX cycle negotiated to 0101 (~ 49 sec)

Specific PICS Statements

- GPRS Supported (TSPC_GPRS)

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is attached to the EC-GSM-IoT cell with DL coverage class CC2 conditions.

The SINR is decreased in order to trigger DL CC4 conditions. Before its next paging occasion, the MS should inform the network about the new DL CC.

The network conditions are then enhanced for CC1 to be selected as DL coverage Class. Before its next paging occasion, the MS should inform the network about the new DL CC.

If the MS support also GPRS, the MS is forced to move to a GPRS Cell and answer a paging. The MS is then moved again the EC-GSM-IoT cell and should inform the network of its coverage class.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1			The MS is GPRS and the DL coverage Class CC2 was used during the Attach procedure.
2	SS -> MS	EC PAGING REQUEST	Sent on the MS EC-PCH block, according to TS 45.002 (CC2)
3	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. DL Coverage class indicated by the MS shall be CC2
4	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 3 Sent on EC-AGCH according to TS 45.002
5			The RxLev of the non-serving cells is increased to -66 dBm to ensure CC4 as DL coverage class.
6	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. Payload: “Cell Update” UL coverage class (i.e. Training Sequence used) indicated by the MS shall be CC1 Selected DL coverage Class shall be CC4 This message should be sent within one eDRX cycle (49 sec) of step 1.
6a	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 6 Sent on EC-AGCH according to TS 45.002 (with blind repetitions as CC4 is used)
7	SS -> MS	EC PAGING REQUEST	Sent on the MS EC-PCH block, according to TS 45.002 (CC4)
8	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. DL Coverage class indicated by the MS shall be CC4
9	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 8 Sent on EC-AGCH according to TS 45.002 (with blind repetitions as CC4 is used)
10			The RxLev of the non-serving cells is decreased to -84 dBm to ensure CC1 as DL coverage class.
11	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. Payload: “Cell Update” UL coverage class (i.e. Training Sequence used) indicated by the MS shall be CC1 Selected DL coverage Class shall be CC1 This message should be sent within one eDRX cycle (49 sec) of step 7.
11a	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 11 Sent on EC-AGCH according to TS 45.002 (no Blind repetition as CC1 is used)
12	SS -> MS	EC PAGING REQUEST	Sent on the MS EC-PCH block, according to TS 45.002 (CC1)
13	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. DL Coverage class indicated by the MS shall be CC1
14	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 13 Sent on EC-AGCH according to TS 45.002 (no Blind repetition as CC1 is used)
			Next step are only applicable for EC Capable MS supporting GPRS (TSPC_GPRS)
15			The EC-GSM-IoT cell is turned Off and the GPRS cell is turned on (RxLev = -80dBm)
16			Wait for 30 sec.
17	SS -> MS	PAGING REQUEST Type 1	1st Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH.
18	MS -> SS	CHANNEL REQUEST	Establishment Cause = = "one phase packet access". Received on RACH.

19	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 18 Sent on AGCH
20			The EC-GSM-IoT cell is turned on (RxLev = -70dBm) and the GPRS cell is turned off
21	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. Payload: “Cell Update” UL coverage class (i.e. Training Sequence used) indicated by the MS shall be CC1 Selected DL coverage Class shall be CC1 This message should be sent within before next paging opportunity
21a	SS -> MS	EC IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 21 Sent on EC-AGCH according to TS 45.002 (no Blind repetition as CC1 is used)
22	SS -> MS	EC PAGING REQUEST	Sent on the MS EC-PCH block, according to TS 45.002 (CC1)
23	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH. DL Coverage class indicated by the MS shall be CC1

42 Test of Medium Access Control (MAC) protocol

42.1 Test of Medium Access Control (MAC) Procedures

Default conditions

The SS default conditions simulate one cell with default settings as defined in the GPRS general default section.

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

The default message contents and signalling macro not specified in the end of this subclause shall be set as in "GPRS default conditions" clause 40. Specific message contents for a test case is specified in each test case.

Conditions or message contents specified in a test case have the highest precedence. In addition, the default message contents described in the end of this subclause override those specified in "GPRS default conditions".

In case the test case not expected "short access" as access type for Packet Channel Request the amount of RLC data specified in the comments in expected sequence is not necessary to be exactly the specified amount of data. It only has to be more than the limit for short access. If the test case need a specific amount of data this is specified in the test case.

42.1.1 Void

42.1.2 Packet Uplink/Downlink Assignment

42.1.2.1 Packet uplink assignment procedure

42.1.2.1.1 Void

42.1.2.1.2 Void

42.1.2.1.3 Void

42.1.2.1.4 Void

42.1.2.1.5 Void

42.1.2.1.6 Void

42.1.2.1.7 Void

42.1.2.1.9.1 Void

42.1.2.1.9.2 Packet Uplink Assignment / Two phase access / Contention resolution

42.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168

42.1.2.1.9.2.1.1 Conformance requirements

The contention resolution has failed on the mobile station side when the mobile station does not receive a PACKET UPLINK ASSIGNMENT message with its TLLI before expiry of timer T3168. The mobile station shall then reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.3.3.

42.1.2.1.9.2.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure after a time equal to timer T3168 and the procedure shall be attempted a total of 4 or 5 times.

42.1.2.1.9.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH,SI13 GPRS Cell Options, T3168 = 7.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message including Single Block Allocation struct information to order the MS to send PACKET RESOURCE REQUEST message. The MS shall perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS wait for a time greater than timer T3168 so the MS shall reinitiate packet access procedure. This procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.
2	MS -> SS	CHANNEL REQUEST	
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single Block Allocation struct. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	ACCESS_TYPE = "Two Phase Access Request". Received on the single block assigned in step 3.
5	SS		The SS waits T3168 expiry.
6			The SS verifies that the MS attempts packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later.
NOTE: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

42.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

42.1.2.1.9.2.2.1 Conformance requirements

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reached its maximum value in the contention resolution procedure, and repetition as described in subclause 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued.

Reference

3GPP TS 04.60 subclauses 7.1.4 and 7.1.3.3.

42.1.2.1.9.2.2.2 Test purpose

To verify that the MS reinitiates packet access procedure with failure due to a TLLI mismatch in the contention resolution procedure, unless it has already been attempted 4 or 5 times. In that case, TBF failure has occurred.

42.1.2.1.9.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH, GPRS cell options ACCESS_BURST_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request two phase access. The MS shall then send PACKET RESOURCE REQUEST message. The SS responds with PACKET UPLINK ASSIGNMENT message with a TLLI different to that the MS has sent in PACKET RESOURCE REQUEST message. The MS shall reinitiate the packet access procedure.

This procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single Block Allocation struct. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on the single block assigned in step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Include incorrect TLLI according to step 4. Sent on the PACCH of the assigned PDCH.
6			The SS verifies that the MS attempts packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later.
Note: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

42.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment

42.1.2.1.9.3.1 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168. Further more, the mobile station shall not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running.

Reference

3GPP TS 04.60 subclause 7.1.3.1.

42.1.2.1.9.3.2 Test purpose

To verify that the mobile station does not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running after sending of the PACKET RESOURCE REQUEST message.

42.1.2.1.9.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH, T3168 indicates value 7 in GPRS Cell Options.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS shall send IMMEDIATE ASSIGNMENT message including Single Block Allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

While timer T3168 is running the SS send PACKET DOWNLINK ASSIGNMENT message and starts to send data on the allocated downlink before the timer expires. The MS shall not respond to the Downlink data transfer.

The SS should then send PACKET UPLINK ASSIGNMENT message before the timer T3168 expires and the MS should then begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU containing 400 octets of data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single block allocation struct. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 3.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH.
6	SS -> MS SS	DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH with poll bit set to 1. Verify no response from the MS.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	Dynamic allocation struct. Sent on the PACCH of the assigned PDCH 0,9* T3168.
8	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigning USF to the MS. Sent at least 3 block periods from the assignment in step 7.
9		{Uplink data transfer}	Macro. Completion of the TBF procedure.

Specific message contents

None.

42.1.2.1.10 Packet Uplink Assignment / Abnormal cases

42.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment

42.1.2.1.10.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.4.

42.1.2.1.10.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure when the mobile station has been assigned more PDCHs than it supports and after 4 or 5 attempts of the packet access procedure the mobile station shall initiate TBF failure.

42.1.2.1.10.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)
- GPRS Multislotclass (TSPC_Type_GPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test procedure

Convert the MS GPRS Multislot Class to number of uplink timeslot supported.

The MS is powered up or switched on and triggered to perform a GPRS attach. An uplink TBF is established and after PACKET RESOURCE REQUEST the SS sends PACKET UPLINK ASSIGNMENT message containing more assigned PDCHs than the MS supports according to its GPRS multislot class. The MS shall reinitiate packet access procedure; this procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and triggered to perform a GPRS attach.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single block allocation struct. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign one more Tx than the MS supported. Sent on PACCH.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the third block from the message sent in step 35 Assigning USF to the MS
7			The SS verifies that the MS does not send UPLINK RLC DATA BLOCKS and instead attempts packet access procedure (steps 2-6 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later
NOTE: After step 7 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

42.1.2.1.10.2 Packet Uplink Assignment / Abnormal cases / Expiry of timer T3164

42.1.2.1.10.2.1 Conformance requirements

On expiry of timer T3164, the mobile station shall reinitiate the packet access procedure unless it has already been reinitiated 3 times, in which case the mobile station shall return to packet idle mode and notify higher layers.

Reference

3GPP TS 04.60 subclause 7.1.4.

42.1.2.1.10.2.2 Test purpose

To verify that the mobile station reinitiate the packet access procedure when the network have sent a PACKET UPLINK ASSIGNMENT message but the MS has not sent the first block within the time equal to the timer T3164. This packet access procedure shall be reinitiated 3 times.

42.1.2.1.10.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message with a USF assigned to the MS. The SS shall send PACKET DOWNLINK DUMMY CONTROL BLOCK messages with USF not assigned to the MS. T3164 expires. The SS send a PACKET DOWNLINK DUMMY CONTROL BLOCK containing the assigned USF. The SS verifies that the MS does not send a RLC data block. The SS verifies that the MS reinitiate the packet access procedure within 5 seconds of T3164 expiry; this shall be repeated 3 times.

Maximum duration of the test

1 minute.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets of data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH
4	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Allocate a USF for the MS. Sent on PACCH.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKs	Don't contain the assigned USF in step 5. Repeat step 6 for a maximum of 5.5 seconds (1.1*T3164). The MS may send a CHANNEL REQUEST at any time after 0.9*T3164, in this case go to step 9.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKs	Containing the assigned USF in step 5.
8	SS		Verify the MS does not transmit an RLC data block
9	SS		The SS verifies that the packet access procedure (steps 2-6) is reinitiated three times. The CHANNEL REQUEST for reinitiation (in step 2) shall be sent within 5 sec of T3164 expiry (to cater for T3168 - the maximum duration of a packet access procedure).
NOTE: After step 9 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

42.1.2.2 Packet Downlink Assignment

42.1.2.2.1 Packet Downlink Assignment / Response to poll bit

42.1.2.2.1.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.

- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

The mobile station shall always transmit the uplink radio block on the same timeslot as the block where the RRBP was received. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit.

Reference

3GPP TS 04.60 subclause 7.2.1.1 and 10.4.5.

42.1.2.2.1.2 Test purpose

To verify that the mobile station sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts if the network sets the poll bit in the PACKET DOWNLINK ASSIGNMENT message when CONTROL_ACK_TYPE is set to four access bursts.

42.1.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to indicate PACKET CONTROL ACKNOWLEGEMENT format as four access bursts and the ACCESS_BURST_TYPE indicates 11 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message. The poll bit in the MAC header of the PACKET DOWNLINK ASSIGNMENT message will be set to indicate RRBP field is valid. The MS may delay the establishment of the downlink channels in order to answer the poll request on the common control channel. The SS verifies that the MS sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts on the timeslot on which it received the polling command.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The SS initiate a downlink transfer of 200 octets data.
2a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
2b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Poll bit in the MAC header is set to indicate a valid RRBP = 1. Sent on PACCH.
3	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	As four access bursts. Received on PACCH.
4	SS		The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT as four access bursts, one per TDMA frame of the uplink radio block.

Specific message contents

None.

42.1.2.2.2 Void

42.1.2.2.3 Void

42.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling

42.1.2.2.4.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.

- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING REQUEST message shall be sent on PAGCH.

Reference

3GPP TS 04.60 subclauses 7.2.1.3 and 7.2.1.1.

42.1.2.2.4.2 Test purpose

To verify that on receipt of a PACKET POLLING REQUEST message, the mobile station responds with PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

42.1.2.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to not indicate acknowledgement as four access bursts and ACCESS_BURST_TYPE indicate 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. The SS sends PACKET PDCH RELEASE message to the MS. The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS without TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The SS initiate a downlink transfer of 200 octets data.
2a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
2b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	See specific message contents. Sent on PACCH.
3	SS -> MS	PACKET POLLING REQUEST	Sent on PACCH after TBF starting time in step 2 has elapsed. See specific message contents.
4	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH.
5	SS -> MS	PACKET PDCH RELEASE	Sent on PACCH.
6	SS		Wait 20 s.
7	SS		The SS initiate a downlink transfer of 200 octets data.
8a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
8b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	See specific message contents. Sent on PACCH.
9	SS -> MS	PACKET POLLING REQUEST	Sent on PACCH. See specific message contents.
10	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH.

42.3 Dynamic Allocation in Packet Transfer Mode

42.3.1 Dynamic Allocation / Uplink Transfer

42.3.1.1 Dynamic Allocation / Uplink Transfer / Normal

42.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful

42.3.1.1.1.1 Conformance requirements

1. The mobile station shall set the TFI field of each uplink RLC data block to the TFI value assigned to the mobile station in the PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.

2. Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH in the next block period(s). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 05.02. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.

3. At two-phase access the mobile station does not include its TLLI in any RLC data block.

References

3GPP TS 04.60, subclauses 8.1.1, 8.1.1.1 and 7.1.3.3.

3GPP TS 05.02, subclause 6.3.2.2.1.

42.3.1.1.1.2 Test purposes

To verify that the MS:

1. depending on the parameter USF_GRANULARITY, transmits one or a sequence of four RLC/MAC data block(s) in the next block period(s) on the PDCH on which it has detected its corresponding assigned USF.

2. includes the assigned TFI in each uplink RLC data blocks.

3. does not include its TLLI in any RLC data block at two phase access.

42.3.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, .

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC unacknowledged mode. The SS orders the MS to have two-phase access, in PACKET UPLINK ASSIGNMENT message the USF_GRANURALITY is set to 4 blocks. The SS sends the assigned USF assigned to the MS and checks that a sequence of four RLC/MAC data blocks in the next radio block period is received, and that each data block contains the correct TFI, but without TLLI. The SS assigns the USF assigned to the MS again. The check is repeated. The procedure is going on until the MS completes the packet data transfer.

The above test procedure is repeated once for USF_GRANURALITY set to one block.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n =600 octets, without starting time, USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
4	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 3. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 4. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 5. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
7	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH, the USF not addressing the MS.
8	SS		Check that no RLC data blocks are transmitted from the MS in the next radio block to step 7.
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS.
10	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 10. Check that the TFI is correct.
12	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 11. Check that the TFI is correct.
13	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 12. Check that the TFI is correct.
14		{Completion of uplink RLC data block transfer}	USF_GRANULARITY = 4 blocks
15		{Uplink dynamic allocation two phase access}	Similar parameter values to step 1 Except USF_GRANULARITY = 1 blocks
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, the USF assigned to the MS on 3 blocks from the last radio block containing the uplink assignment.
17	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
18	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, the USF not addressing the MS.
19	SS		Check that no RLC data blocks are transmitted from the MS in the next radio block to step 18.
20	SS -> MS	PACKET UPLINK ACK/NACK	Sent on a PDCH with any different time slot as the assigned PDCH, the USF assigned to the MS.
21	SS		Check that no RLC data block is transmitted from the MS on the next radio block to step 20.
22	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, the USF assigned to the MS.
23	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
24		{Completion of uplink RLC data block transfer}	USF_GRANULARITY = 1 block

42.3.1.1.2 Void

42.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding

42.3.1.1.3.1 Conformance requirements

1. In case of dynamic allocation, if no uplink TBF is in progress, the MS needs not monitor the USF field until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.

2. If an uplink TBF is already in progress, the MS shall continue to use the parameters of the existing TBF until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.

3. In case of single block allocation, the mobile station shall use the assigned timeslot during the RLC/MAC block whose first TDMA burst occurs in the indicated TDMA frame number.

4. If the mobile station is in packet transfer mode during the block immediately before the starting time and the lowest numbered PDCH assigned to the MS is different immediately before and after the starting time then the mobile station shall be ready to receive or transmit no later than one radio block from the starting time

5 If the Starting FN (in absolute frame number encoding) is not aligned to the start of a block period and the mobile station is in packet transfer mode during the TDMA immediately before the Starting FN, then the mobile station shall align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

References

3GPP TS 04.60, subclauses 11.2.29, 12.21 and 12.21.1.

42.3.1.1.3.2 Test purposes

To verify that the MS, in transfer mode:

1. correctly uses the starting frame number description in PACKET UPLINK ASSIGNMENT, and in all subsequent RLC/MAC control messages which are sent on the uplink TBF;

2. is ready to receive or transmit no later than one radio block from the starting time;

3. is able to align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

42.3.1.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

Test Procedure

The MS is triggered to initiate packet uplink transfer 440 octets in the RLC unacknowledged mode. The IMMEDIATE ASSIGNMENT message contains a starting time for the single block allocation. It is checked that the MS uses the time slot at the assigned frame number. In the two-phase access a starting time is included in PACKET UPLINK ASSIGNMENT. The assigned USF is on a radio block before the starting time. The MS does not react upon that. The assigned USF is on one block after the starting time. The MS sends a RLC data block.

The test procedure is repeated once. The starting time is encoded in relative frame number format.

Maximum Duration of Test

5 minutes.

Expected Sequence

The expected sequence is repeated once. In the 2nd execution the starting frame numbers in the specific message contents are encoded in the relative format.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-3 The IMMEDIATE ASSIGNMENT contains starting time current frame + 1001. It is checked that PACKET RESOURCE REQUEST in the macro is sent at the starting time. The PACKET UPLINK ASSIGNMENT contains starting time specified in absolute frame number encoding, current frame + 91, The timeslot TN_7 assigned.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS, Sent on one radio block before the starting time.
3	SS		Check that there is no RLC data block sent by the MS on the assigned PDTCH.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on one block after the starting time.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND in step 1, and TFI is correct.
6		{Completion of uplink RLC data block transfer}	

42.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time

42.3.1.1.4.1 Conformance requirements

1 If a TBF starting time information element is present and no uplink TBF is in progress, but a downlink TBF is in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs.

2 If an uplink TBF is already in progress, the mobile station shall continue to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. At that time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters.

3 While waiting for the frame number indicated by the TBF starting time if the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

4 An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block B((x+3) mod 12) where block B(x) is the last radio block containing the assignment message. This applies also for the reception of the first USF for dynamic uplink assignment.

References

3GPP TS 04.60, subclause 8.1.1.1, 3GPP TS 45.010 subclause 6.11.1.

42.3.1.1.4.2 Test purposes

To verify that after the MS receives an uplink assignment with starting time:

1. if a downlink TBF is in progress and no uplink TBF is in progress it monitors the assigned PDCHs while waiting for the starting time. If another uplink assignment received while waiting, the mobile station acts upon that and ignores the previous uplink assignment.

2. if an uplink TBF is already in progress, it continues to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. While waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station acts upon that and ignores the previous uplink assignment. As soon as the starting time occurs the MS immediately begins to use the newly assigned uplink TBF parameters.

42.3.1.1.4.3 Method of test

Test Procedure

A downlink TBF is established and in progress. An uplink TBF is established with a starting time which does not yet elapse. The SS sends two downlink data blocks before the starting time to the MS and signals the assigned TBF addressing the MS for uplink transfer. It is checked that no uplink RLC data blocks are sent by the MS. The SS sends PACKET TIMESLOT RECONFIGURE on three radio blocks before the starting time, assigning a new starting time. Two downlink data blocks are then sent to the MS before the new starting time occurs. Each data block contains one of the assigned USFs addressing the MS. It is checked that no uplink data blocks are sent from the MS. After the new starting time elapses the SS sends a downlink data block containing the USF assigned to the MS. The MS sends an uplink data block. The MS is brought to Idle mode.

Subsequently an uplink TBF is established. The SS sends PACKET UPLINK ASSIGNMENT assigning a reconfigured PDCH with a starting time and a new USF associated. Before the starting time the SS signals the USF of the ongoing TBF addressing the MS. The SS receives an uplink data block from the MS. The SS sends UPLINK ASSIGNMENT on three radio blocks before the starting time, assigning a new reconfigured PDCH with a starting time and a different USF associated. The later assignment overwrites the earlier one.. While waiting for the frame number of the newly assigned starting time the SS signals the USF of the previous assignment on both the ongoing PDCH and on the previous assigned PDCH. The MS ignores it. The SS signals the USF of the ongoing TBF addressing the MS. An uplink data block can be received. On one radio block before the starting time the SS signals the later assigned USF assigned to the MS on the later assigned PDCH. No uplink data block is received. On one radio block after the starting time the SS signals the just expired USF. No uplink data block is received. Then the SS signals the valid USF assigned to the MS. An uplink data block is received.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	RLC mode: acknowledged, without starting time
2	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP, sent on the third block after the last radio block containing the downlink assignment.
3	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
4	MS		The MS is triggered to send 440 octets of user data.
5	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH. Contains Channel Request Description IE. Note : If the triggering of the uplink access involves a manual operation taking more than 5s to complete, steps 5 and 6 are repeated (until the MS does include the Channel Request Description IE) at least once every 5s in order to keep the downlink transfer active.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. TBF Starting Time : starting time$_1$, the current frame + 104 frames, encoded in absolute frame number. The uplink TBF is assigned on the same timeslot as the downlink TBF.
8	SS -> MS	DOWNLINK RLC DATA BLOCK	FBI=0, the assigned USF$_1$ to the MS. Sent on downlink PDTCH, 12 data blocks (52 TDMA frames) before the starting time$_1$.
9	SS -> MS	DOWNLINK RLC DATA BLOCK	FBI=0, the assigned USF$_1$ to the MS. Sent on downlink PDTCH, 5 blocks before the starting time$_1$, a valid RRBP = N+13.
10	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP on downlink PACCH.
11	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assigned USF$_1$ addressing the MS, sent on three blocks before the starting time$_1$. Assigned a new USF$_2$ on the same timeslot, with starting time$_2$, current frame + 104 frames in relative frame number encoding.
12	SS -> MS	DOWNLINK RLC DATA BLOCK	On 4 blocks from the last radio block containing the uplink assignment in step 11, with FBI=0, the assigned previous USF$_1$ addressing the MS. Sent on downlink PDTCH.

Step	Direction	Message	Comments
13	SS -> MS	DOWNLINK RLC DATA BLOCK	One data block with FBI=0, the assigned USF_2 addressing the MS. Sent on downlink PDTCH, one radio block before the starting $time_2$.
14	SS		Check that from the step 4 onwards till the starting $time_2$, there is no RLC data block sent by the MS on the assigned uplink PDTCH.
15	SS -> MS	DOWNLINK RLC DATA BLOCK	One data block with FBI=0, a valid RRBP, the assigned USF_2 addressing the MS. Sent on downlink PDTCH, on the frame number specified in the starting $time_2$.
16	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned uplink PDTCH.
17	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
18	SS -> MS	DOWNLINK RLC DATA BLOCK	One data block with FBI=1 and a valid RRBP. Sent on downlink PDTCH.
19	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of the downlink PACCH.
20		{Completion of uplink RLC data block transfer}	
21		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen CHANNEL_CODING_COMMAND: cs-1 The timeslot TN_3 assigned
22	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 addressing the MS, sent on 3 blocks from the last radio block containing the uplink assignment in step 21.
23	MS -> SS	UPLINK RLC DATA BLOCK	Check that the coding is cs1, the TFI is correct.
24	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 addressing the MS.
25	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
26		PACKET UPLINK ASSIGNMENT	Assign an uplink TBF on the timeslot TN_2, containing new TFI_2, USF_2, starting $time_3$, current frame + 117 in relative encoding. Sent on PACCH assigned.
27		PACKET UPLINK ACK/NACK	USF_1 addressing the MS, sent on 5 radio blocks before the starting $time_3$, on PACCH assigned in step 21.
28		UPLINK RLC DATA BLOCK	Check that the coding is cs1, the TFI is correct.
29	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign a TBF on the timeslot TN_1, containing new TFI_3, USF_3, cs-3 coding, starting $time_4$, current frame + 325 in relative encoding. Sent on three radio blocks before the starting $time_3$, on PACCH assigned in step 21.
30	SS -> MS	PACKET UPLINK ACK/NACK	USF_2 addressing the MS, sent on 4 blocks from the last radio block containing the uplink assignment in step 29 on the PACCH assigned in step 26.
31	SS		Check that no data block is sent from the MS on the assigned radio block on the PDTCH assigned in step 26.
32	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF_1 addressing the MS, sent on 5 radio blocks before the starting $time_4$, on PACCH assigned in step 21.
33	MS -> SS	UPLINK RLC DATA BLOCK	Check that the coding is cs1, the TFI is correct.
34	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF_3 addressing the MS, sent on one radio block before the starting $time_4$, on PACCH assigned in step 26.
35	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF_1 addressing the MS, sent on one radio block after the starting $time_4$, on PACCH assigned in step 21.
36	SS		Check that no data blocks are sent from the MS on the radio blocks assigned in steps 34 and 35, or any intermediate radio blocks, on any of the three PDTCHs assigned
37	SS -> MS	PACKET UPLINK ACK/NACK	Containing USF_3. Sent on PACCH of PDCH assigned in step 29.
38 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 29. Use coding cs-1. If step 38 is performed, then step 39 must be performed.
39(optional step)	SS -> MS	PACKET UPLINK ACK/NACK	Only performed if step 38 is performed Containing USF_3. Sent on PACCH of PDCH assigned in step 29.
40	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 29. Check that the coding cs-3 and TFI_3 are correct.
41		{Completion of uplink RLC data block transfer}	

42.3.1.1.5 Void

42.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry

42.3.1.1.6.1 Conformance requirements

When the mobile station transmits an RLC/MAC block to the network, it shall start timer T3180. When the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall reset timer T3180. If timer T3180 expires, the mobile station shall perform the abnormal release with random access procedure.

References

3GPP TS 04.60, subclause 8.1.1.1.

42.3.1.1.6.2 Test purposes

To verify that

1. Timer T3180 will not expire as long as an USF for the MS under test is detected in the downlink blocks within the defined time period of the timer. (It is implicitly verified).

2. Timer T3180 expires if no USF for the MS under test is detected during a time period longer than T3180.

3. The MS performs an abnormal release with random access procedure after T3180 expires.

42.3.1.1.6.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS for 4.5s. Before T3180 times out the SS signals the USF assigned to the MS. The MS sends a data block. Then the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS until receiving CHANNEL REQUEST from the MS for establishment of a new TBF.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS sent on 3 blocks from the last radio block containing the uplink assignment.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the TFI is correct.
4	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned in step 2, the USF assigned to the MS.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the TFI is correct.
6	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, containing a different TFI and USF from the assigned ones to the MS.
7	SS		Repeat step 6 every 5 radio blocks for 4.5 s. (T3180 * 90%) the SS signals different USFs on the assigned PDCH, but none of them addressing the MS.
8	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned in step 2, the USF assigned to the MS.
9	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the TFI is correct.
10	SS		Repeat step 6 every 5 radio blocks until step 11 occurs. The maximum period for the repetition is of 8s. None of the signalled USFs addresses the MS on the assigned PDCH.
11	MS -> SS	CHANNEL REQUEST	Received on RACH within 7.5 seconds
12	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to order the MS making two-phase access procedure. Sent on AGCH.
13	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the single block assigned in step 12.
14	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block, Sent on PACCH of the same PDCH assigned in step 12.
15	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 14.
16	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding scheme is that specified in step 14 by CHANNEL_CODING_COMMAND and the TFI is correct.
17		{Completion of uplink RLC data block transfer}	

Specific Message Contents

PACKET UPLINK ASSIGNMENT message in step 14:

CHANNEL_CODING_COMMAND	Arbitrarily chosen
Dynamic allocation	01
- Extended Dynamic Allocation	0 (Dynamic allocation)
-	0
- USF granularity	0 (1 block)
- {0|1<UPLINK_TFI_ASSIGNMENT>}	1 (uplink TFI assignment)
- UPLINK_TFI	00000
- {0|1<RLC_DATA_BLOCKS_GRANTED>}	0 (no RLC_DATA_BLOCKS_GRANTED, open-ended TBF)
- {0|1<TBF_STARTING_TIME>}	0 (no starting time)
-	0 (Timeslot Allocation Parameters)
	one slot arbitrarily chosen but different from the value in step 2

42.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation

42.3.1.1.7.1 Conformance requirements

1. The mobile station shall attempt to decode every downlink RLC/MAC block on all assigned PDCHs. Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message. The mobile station shall not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.

2. PACKET POLLING REQUEST is sent on the PCCCH or PACCH by the network to the mobile station to solicit a PACKET CONTROL ACKNOWLEDGEMENT message from the mobile station.

3. In downlink RLC/MAC control blocks, the TFI identifies the Temporary Block Flow (TBF) to which the RLC/MAC control message contained in the downlink RLC/MAC control block relates. If present, this field indicates the mobile station to which the control message is addressed, and all other mobile stations shall ignore the control message. If this field is present and the contents of the control message also contain a TFI addressing the mobile station, the mobile station shall ignore the TFI in the control message contents.

References

3GPP TS 04.60, subclauses 8.1.1.1.1, 11.2.12 and 10.4.10.

42.3.1.1.7.2 Test purposes

To verify that:

1. The MS attempts to decode every downlink RLC/MAC block on all assigned PDCHs whenever the MS receives an RLC/MAC block containing an RLC/MAC control block, the MS attempts to interpret the message contained therein, such as Payload type and TFI in the optional fields. If the message addresses the MS, it acts upon the message.

2. When receiving PACKET POLLING REQUEST on PACCH the MS responds with four PACKET CONTROL ACKNOWLEDGEMENT messages of access burst format and does not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.

42.3.1.1.7.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Test Procedure

A TBF is established. It is polled with PACKET POLLING REQUEST containing a global TFI not addressing the MS. The assigned USF addresses the MS. The MS transmits a data block. The SS polls the MS with PACKET POLLING REQUEST containing any global TFI not addressing the MS. The message has optional octets where TFI does address the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats. The SS polls again the MS with PACKET POLLING REQUEST containing the global TFI addressing the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen.
2	SS -> MS	PACKET POLLING REQUEST	the USF assigned to the MS, the TFI in the message not addressing the MS, no optional octets in RLC/MAC header, a valid RRBP
3	MS -> SS	UPLINK RLC DATA BLOCK	Check the TFI is correct as assigned in step 1.
4	SS -> MS	PACKET POLLING REQUEST	NOT the USF assigned to the MS, the global TFI in the message contents NOT addressing the MS, Payload type indicates the RLC/MAC header containing optional octets where TFI DOES address the MS, RBSN='0'. TYPE_OF_ACK = '0', a valid RRBP=N+13
5	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	4 access bursts. Received on PACCH, CTRL_ACK = '10'.
6	SS -> MS	PACKET POLLING REQUEST	Not the USF assigned to the MS. The global TFI in the message contents addressing the MS. Payload type indicates the RLC/MAC header containing optional octets where TFI not addressing the MS. a valid RRBP
7	SS		Check the MS ignores the polling .
8	SS -> MS	PACKET POLLING REQUEST	Not the USF assigned to the MS. the Global TFI addresses the MS, RLC/MAC header containing no optional octets. TYPE_OF_ACK = '0', a valid RRBP
9	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	4 access bursts, received on PACCH.
10		{Completion of uplink RLC data block transfer}	

42.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots

42.3.1.1.8.1 Conformance requirements

Mobile station belonging to multislot class 3, 5, 6, 7 and 9 to 29 shall support at least two transmit timeslots per TDMA frame (refer to 3GPP TS 05.02, clause B.1).

References

3GPP TS 05.02, clause B.1.

42.3.1.1.8.2 Test purposes

To verify that an MS belonging to GPRS multislot class 5, 6, 7 and 9 to 29 supports an uplink TBF using two timeslots per TDMA frame.

42.3.1.1.8.3 Method of test

Initial Conditions

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure, in PACKET UPLINK ASSIGNMENT two timeslots are assigned. On the same TDMA frame the SS signals to the MS the assigned USFs addressing the MS on the two assigned PDTCHs. It is checked that the two RLC/MAC data blocks in the next radio block period are received on the respective PDTCH channels and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USFs addressing the MS. The check is repeated. The same procedure is going on until the MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily. Two timeslots, USF_0 on TN_0 and USF_1 on TN_1, are assigned.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_0 on $PDTCH_0$ addressing the MS on 3 blocks from the last radio block containing the uplink assignment.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PDTCH_1$ addressing the MS, sent on the same TDMA frame as step 2.
4	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_0$. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$ on the same TDMA frame as step 4. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
6	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_0 on $PDTCH_0$ addressing the MS.
7	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 on $PDTCH_1$ addressing the MS, sent on the same TDMA frame as step 6.
8	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_0$. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
9	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$, on the same TDMA frame as step 8. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
10		{Completion of uplink RLC data block transfer}	

Specific Message Contents

None

42.3.1.1.9 Void

42.3.1.1.10 Dynamic Allocation / Uplink Transfer / Normal / USF assigned with MCS-1 to MCS-4

42.3.1.1.10.1 Conformance requirements

In 44.060 it is stated: “If dynamic or extended dynamic allocation is used, a mobile station in GPRS TBF mode shall be able to detect the USF that assigns the uplink to that mobile station. The network shall use GMSK modulation, i.e. either CS-1 to CS-4 or MCS-1 to MCS-4, in those blocks.”

In 45.003 it is stated: “For the coding schemes CS-2 to CS-4 and MCS-1 to MCS-4, the first three bits (USF-bits) of the data block are encoded such that the first twelve coded bits are representing the same bit pattern, irrespective of the coding scheme, depending only on the USF-bits. For these coding schemes, the USF-bits can therefore always be decoded from these twelve bits in the same way.”

According to these two requirements, a MS in GPRS TBF mode shall detect an assigned USF value on an assigned PDCH when the network sends the USF in a EGPRS RLC/MAC block coded with MCS-1 to MCS-4.

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode on one PDCH. The SS orders the MS to have a two-phase access, in PACKET UPLINK ASSIGNMENT message with the USF_GRANURALITY set to 1 block.

The SS sends on the assigned PDCH an EGPRS data block coded with MCS-1 containing the USF value assigned to the MS on the corresponding PDCH. The SS checks that the MS sends in response on the assigned PDCH the expected data block.

The test is repeated by the SS using EGPRS data blocks coded successively with MCS-2, MCS-3 and MCS-4 to assign the USF to the MS.

Then the data transfer is completed.

Maximum Duration of Test

1 minute.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n =200 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, TLLI_BLOCK_CHANNEL_CODING: CS-1, CHANNEL_CODING_COMMAND: CS-1, No starting time.
2	SS -> MS	DOWNLINK EGPRS RLC DATA BLOCK	Sent on the PDTCH assigned to the MS. The data block is coded with MCS-1 and contains the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 2. Check that the TFI and the data are coded with CS-1.
4	SS -> MS	DOWNLINK EGPRS RLC DATA BLOCK	Sent on the PDTCH assigned to the MS. The data block is coded with MCS-2 and contains the USF assigned to the MS.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 4. Check that the TFI and the data are coded with CS-1..
6	SS -> MS	DOWNLINK EGPRS RLC DATA BLOCK	Sent on the PDTCH assigned to the MS. The data block is coded with MCS-3 and contains the USF assigned to the MS.
7	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 6. Check that the TFI and the data are coded with CS-1.
8	SS -> MS	DOWNLINK EGPRS RLC DATA BLOCK	Sent on the PDTCH assigned to the MS. The data block is coded with MCS-4 and contains the USF assigned to the MS.
9	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH in the next radio block to step 8. Check that the TFI and the data are coded with CS-1.
10	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH, the USF not addressing the MS.
11		{Completion of uplink RLC data block transfer}	USF_GRANULARITY = 1 block; 1 slot assigned in uplink.

42.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal

42.3.1.2.1 Void

42.3.1.2.2 Void

42.3.1.2.3 Void

42.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent)

42.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal

42.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful

42.3.2.1.1.1 Conformance requirements

During uplink transfer, the network may initiate a downlink TBF by sending a PACKET DOWNLINK ASSIGNMENT message, or a PACKET TIMESLOT RECONFIGURE, to the mobile station on the PACCH. If a PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the DOWNLINK_TFI_ASSIGNMENT field. On receipt of an assignment message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. The operation of the downlink TBF follows the procedures in 3GPP TS 04.60, subclause 8.1.2 with the following additions:

1. If a timer or counter expiry causes the uplink TBF to be aborted in the mobile station, the mobile station shall also abort the downlink TBF and perform an abnormal release with random access.

2. If uplink and downlink TBFs are already established, then the network may send a PACKET TIMESLOT RECONFIGURE message without DOWNLINK_TFI_ASSIGNMENT. The mobile station shall interpret this as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs and the downlink TFI is not changed.

References

3GPP TS 04.60, subclauses 8.1.1.1.3 and 8.1.2.

42.3.2.1.1.2 Test purposes

To verify that during uplink transfer:

1. The MS switches to the assigned PDCHs when the network initiates a downlink TBF by sending PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE to the MS on PACCH.

2. When the MS receives PACKET TIMESLOT RECONFIGURE without DOWNLINK_TFI_ASSIGNMENT in the case of uplink and downlink TBFs established already, the MS interprets this message as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs.

3. The MS also aborts the downlink TBF and performs an abnormal release with random access if a timer or a counter expiry causes the uplink TBF to be aborted in the MS.

42.3.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. The SS sends a downlink data block with polling for acknowledgement and the assigned USF assigned to the MS for the MS, and indicates FBI=1 for the final data block. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame. The SS waits 2s for the MS releasing the downlink PDCH. The SS sends PACKET TIMESLOT RECONFIGURE assigning a new downlink PDCH. A downlink data block is sent, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the last received downlink data block on the correct frame.

The SS sends PACKET TIMESLOT RECONFIGURE without DOWNLINK_TFI_ASSIGNMENT replacing the existing uplink and downlink PDCH with another pair of concurrent PDCH. A downlink data block is sent on the replaced PDCH and the MS is polled for acknowledgement. The MS shall not react upon it. Another downlink data block is sent on the assigned PDCH, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame.

The SS sends downlink data blocks with USF not addressing the MS until receives CHANNEL REQUEST.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The assigned USF assigned to the MS on 3 blocks from the last radio block containing the uplink assignment.
3	MS -> SS	UPLINK RLC DATA BLOCK	
4	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on the PACCH, assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged, single timeslot, TFI_2, no starting time.
5	SS -> MS	DOWNLINK RLC DATA BLOCK	Containing RRBP= N+13 and USF assigned to the MS. FBI ='1'. Sent on the downlink PDTCH on 3 blocks from the last radio block containing the downlink assignment.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH assigned in step 1.
7	MS -> SS	PACKET CONTROL ACK	Received on the frame number = N+13, N is the frame number of the first burst of the data block in step 5.
8	SS -> MS	PACKET UPLINK ACK/NACK	Containing USF assigned to the MS
9	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH assigned in step 1.
10	SS		Wait 2 s for T3192 timeout.
11	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on the PACCH of the PDCH assigned in step 1. Assign a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged, single slot, TFI_2, no starting time.
12	SS -> MS	DOWNLINK RLC DATA BLOCK	Containing RRBP= N+21 or +22 and USF assigned to the MS. FBI ='0'. Sent on the downlink PDTCH assigned on 3 blocks from the last radio block containing the downlink assignment in step 11.
13	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH assigned in step 1.
14	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the block of frame number = N+21 or +22, N is the frame number of the first burst of the data block in step 12.
15	SS -> MS	PACKET TIMESLOT RECONFIGURE	Without DOWNLINK_TFI_ASSIGNMENT, Assign new uplink and downlink time slots, no starting time, sent on the PACCH of the PDCH assigned in step 11.
16	SS -> MS	DOWNLINK RLC DATA BLOCK	Containing USF assigned to the MS. Sent on the downlink PDTCH assigned in step 11 on 3 blocks from the last radio block containing the assignment in step 15.
17	SS		Check that neither data blocks, nor control blocks are sent by the MS within the next seven radio blocks.
18	SS -> MS	DOWNLINK RLC DATA BLOCK	Containing a valid RRBP= N+26 and USF assigned to the MS. Sent on the downlink PDTCH assigned in step 15.
19	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH assigned in step 15.
20	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the block of frame number = N+26, N is the frame number of the first burst of the data block in step 18, on the PACCH of the downlink PDCH.
21	SS -> MS	DOWNLINK RLC DATA BLOCK	USF not addressing the MS.
22	SS -> MS		Repeat step 21 until receives CHANNEL REQUEST in step 23.
23	MS -> SS	CHANNEL REQUEST	Received on RACH within 7.5 seconds from step 20.
24	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment,
25	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the single block assigned in step 24.
26	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = 4 blocks, Sent on PACCH of the same PDCH assigned in step 24.
27	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned on 3 blocks from the last radio block containing the uplink assignment in step 26.
28	MS -> SS	UPLINK RLC DATA BLOCK	Received 4 consecutive data blocks
29		{Completion of uplink RLC data block transfer}

42.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities

42.3.2.1.2.1 Conformance requirements

1. Mobile station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24 shall support as many uplink and downlink timeslots as indicated in 3GPP TS 05.02 clause B.1.

2. If transmission of the PACKET CONTROL ACKNOWLEDGEMENT would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class, transmission of the highest numbered PDCH(s) shall be omitted.

References

3GPP TS 05.02, clause B.1.

3GPP TS 04.60, subclause 8.6.

42.3.2.1.2.2 Test purposes

To verify that the GPRS multislot MS supports as many uplink and downlink TBFs per TDMA frame as indicated. Especially, it is verified that the Type 1 MS in a GPRS multislot class declared has the capability of supporting:

1. T_{tb}, the minimum number of slots allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed for type 1 MS;

2. T_{ra}, the minimum number of slots allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed for type 1 MS;

3. the maximum number of Rx and Tx supported;

4. the sum of slots supported.

It is also verified that the MS of a GPRS multislot class transmits PACKET CONTROL ACKNOWLEDGEMENT when polled, and omits the transmission of the highest numbered PDCH(s) if the transmission would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class.

42.3.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

- TSPC_Type_GPRS_Multislot_ClassX (where X = 1..45)

PIXIT Statements

Test Procedure

The following GPRS multislot configurations are tested in the test case:

- Class 2 and 3 support two downlink timeslots and one uplink timeslot, T_{tb}=2, T_{ra}=3;
- Class 4 and 6 support three downlink timeslots and one uplink timeslot, T_{tb}=1, T_{ra}=3;
- Class 5 and 9 supports two downlink timeslots and two uplink timeslots, T_{tb}=1, T_{ra}=3;
- Class 8 and 10 support four downlink timeslots and one uplink timeslot, T_{tb}=1, T_{ra}=2;
- Class 19 and 24 support five downlink timeslots and one uplink timeslot, T_{tb}=1, T_{ra}=2.

In the multislot configurations all assigned channels are frequency hopped except for the class 19 and 24 test where non-hopping channels are assigned for PDCHs. The class 3, 6, 9 an d 10 are tested in a reduced uplink configuration.

According to the multislot configurations an uplink TBF with one or two timeslots assigned is established and in progress. The SS establishes a concurrent downlink TBF with multiple timeslots assigned.

On the 1st radio block the SS sends downlink data in the maximum capability allowed under the configuration, signals to the MS the assigned USFs addressing the MS and polls the MS. On the 2nd radio block the MS sends RLC data in response of the addressing the MS USFs. On the 6th radio block the SS sends downlink data in the maximum capability allowed under the configuration and signals to the MS the assigned USFs addressing the MS. On the 7th radio block the MS responses PACKET DOWNLINK ACK/NACK and sends RLC data in response of one of the USFs addressing the MS if the configuration is allowed.

The basic test procedure is repeated until CV=1. The SS sends the last RLC data block with FBI=1 and polls the MS for acknowledgement. The SS sends PACKET UPLINK ACK/NACK setting FINAL_ACK_INDICATION=1. The MS sends two separate PACKET CONTROL ACKNOWLEDGEMENT messages to release the uplink and downlink TBFs.

Maximum Duration of Test

5 minutes.

Expected Sequence for GPRS multislot class 2 and class 3 (2 downlink timeslots + 1 uplink timeslot)

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1 CHANNEL_CODING_COMMAND: cs1 An uplink timeslot is assigned (see specific message contents).
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 1.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH.
4	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the uplink PDCH. Assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged mode, TFI_d (different from the uplink one), no starting time, assigning TN_1 and TN_2.
5	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on TN_1 of the downlink PDTCH, RRBP invalid.
6	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on TN_2 of the downlink PDTCH, a valid RRBP = N + 26, the assigned USF assigned to the MS, on the same radio block as step 5.
7	MS -> SS	UPLINK RLC DATA BLOCK	Received on the uplink PDTCH, on the next radio block from step 6.
8	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on TN_1 of the downlink PDTCH, RRBP invalid, on five radio blocks after step 6.
9	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on TN_2 of the downlink PDTCH, the assigned USF assigned to the MS and RRBP invalid, on the same radio block as in step 8. Note: The next uplink radio will not be used for the uplink data. It is reserved for a control block answering the polling in step 6.
10	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the RRBP block on TN_2 specified in step 6.
11			Repeat step 5 to 10, until CV=0 in step 7.
12	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on TN_2 with FBI = 1 and a valid RRBP=N+26.
13	SS -> MS	PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = 1. Sent on TN_2 PACCH of the uplink PDCH. With a valid RRBP=N+13
14	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	CTRL_ACK = 11. The MS releases the uplink TBF.
15	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP in step 12. CTRL_ACK = 11. The MS releases the downlink TBF.

42.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal

42.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access

42.3.2.2.1.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.

2. If the information in the PACKET TIMESLOT RECONFIGURE does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with random access.

3. If uplink and downlink TBFs are not already established and the PACKET TIMESLOT RECONFIGURE message does not include a DOWNLINK_TFI_ASSIGNMENT field, then the mobile station shall perform an abnormal release with random access.

4. If a failure in the PACKET TIMESLOT RECONFIGURE is due to any other reason, the mobile station shall abort the procedure and perform an abnormal release with random access.

5. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.

6. To perform an abnormal release with random access, the mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF.

3GPP TS 04.60, subclauses 8.1.1.1.3.1, 8.1.1.1.2.1 and 8.7.2.

42.3.2.2.1.2 Test purposes

To verify that the MS, in downlink TBF establishment during uplink transfer, performs an abnormal release with random access, when the information in the PACKET TIMESLOT RECONFIGURE:

1. does not properly specify an uplink and downlink PDCH;
2. violates the mobile station's GPRS multislot capabilities;
3. does not include a DOWNLINK_TFI_ASSIGNMENT field;
4. has a failure due to any other reason other than the reasons listed above.

42.3.2.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

- TSPC_Type_GPRS_Multislot_ClassX (where X = 1..45)

PIXIT Statements

Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET TIMESLOT RECONFIGURE for establishment a downlink TBF. A failure occurs at the mobile station side before the new downlink TBF has been successfully established. The MS starts a random access for uplink establishment. The SS assigns a new uplink PDCH to the MS. The SS signals the USF of the preceding uplink TBF addressing the MS on the preceding PDCH which shall have been released by the MS. It is checked that no RLC data block is received on the next three radio blocks. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is repeated 4 times. The message contents of PACKET TIMESLOT RECONFIGURE are varied as defined below.

1st execution, improper PDCH: hopping frequencies not all in one band.

2nd execution, violating the GPRS multislot capabilities.

3rd execution, no DOWNLINK_TFI_ASSIGNMENT.

4th execution, CONTROL_ACK = '1' (shall be set to '0' as the SS has not yet sent the final downlink RLC data block).

Maximum Duration of Test

10 minutes.

Expected Sequence

The sequence is repeated 4 times. The 2nd execution is not applicable for the MS GPRS multislot class 18 and 29.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The assigned USF assigned to the MS
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding and the TFI are correct.
4	SS -> MS	PACKET TIMESLOT RECONFIGURE	See specific message contents.
5	MS -> SS	CHANNEL REQUEST	Received on RACH.
6	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to force the MS making the two-phase access procedure. Sent on AGCH.
7	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the single block assigned in step 6.
8	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block, the assigned slot and USF different from TN_2 (as in the default)
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS in step 1, sent on TN_2, on PACCH in step 1.
10	SS		Check that no RLC data block is received on the next three radio blocks from step 9.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS sent on the PACCH assigned in step 8.
12	MS -> SS	UPLINK RLC DATA BLOCK	Received on the correct radio block of the assigned PDTCH.
13		{Completion of uplink RLC data block transfer}

42.3.3 Dynamic Allocation / Resource reallocation

42.3.3.1 Dynamic Allocation / Resource reallocation / Successful

During an uplink packet transfer, upper layer may request to transfer another LLC PDU with a different Radio Priority, a different peak throughput class or a different RLC mode than the current one, the MS may require the allocation of new uplink resources.

42.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority

42.3.3.1.1.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the mobile station has not started the countdown procedure and the new LLC PDU has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class, the mobile station shall immediately request a resource reallocation for uplink according to the new Radio Priority and peak throughput class of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.

2. Then the mobile station shall complete the transmission of the current LLC PDU.

3. After the transmission of the PACKET RESOURCE REQUEST message with the reason for changing the priority or peak throughput class of an assigned uplink TBF the mobile station shall continue to use the currently assigned uplink TBF assuming that the requested priority or peak throughput class is already assigned to that TBF.

References

3GPP TS 04.60 subclause 8.1.1.1.2.

42.3.3.1.1.2 Test purposes

It is verified that:

1. Having an uplink TBF in progress without starting the countdown procedure, the MS will immediately send PACKET RESOURCE REQUEST if upper layer requests to transfer another LLC PDU which has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class.

2. After the request of the resource reallocation for uplink the MS completes the transmission of the current LLC PDU independent of whether or not a new resource is allocated.

3. After the transmission of the PACKET RESOURCE REQUEST the MS continues to use the currently assigned uplink TBF.

42.3.3.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, T3168 timeout value=7 (4s), BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

- Test PDP context3 and context6 activated;

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher throughput in the same RLC mode and the same radio priority.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput. A new PDCH is assigned to MS to complete the RLC data block transferring.

The test procedure is executed twice. In the 2nd execution, after the MS requests a resource reallocation for transferring the data block with a higher throughput a new PDCH is assigned. It is verified that the MS switches on the new PDCH, completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is executed twice for k = 1 and 2.

When k=1 testing that the MS continues to use the currently assigned uplink TBF, while k=2 testing that the MS to use newly assigned the resource to complete transmission of the current PDU before starting transmission the PDU with a higher radio priority or a higher throughput.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets in test PDP context3, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5 (16k octets/s), RADIO_PRIORITY = 4, RLC_MODE = unacknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 440 octets with the peak throughput class 6 (32k octets/s) in the same RLC mode and the same radio priority as the current uplink TBF (test PDP context6).
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
6	MS -> SS	PACKET RESOURCE REQUEST OR UPLINK RLC DATA BLOCK	PACKET RESOURCE REQUEST received on the PACCH of the assigned PDCH, radio priority level = 4, peak throughput class = 6, unacknowledged mode. OR UPLINK RLC DATA BLOCK received on the assigned PDTCH. Check that the coding and the TFI are correct.
6-1			Repeat Steps 5,6 until PACKET RESOURCE REQUEST is received at Step 6.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, the USF assigned to the MS.
8	MS -> SS	UPLINK RLC DATA BLOCK OR PACKET RESOURCE REQUEST	UPLINK RLC DATA BLOCK received on the assigned PDTCH. Check that the coding and the TFI are correct. OR Retransmitted PACKET RESOURCE REQUEST received on the PACCH.
9	SS		For k=1 Repeat step 7 and 8 until the 2nd LLC PDU in PDP context6 is started. Observe the Length indicator, M bit and E bit of the received data headers. For k=2 Continue to step 10. .
10	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned, acknowledge all received data, without setting FINAL_ACK_INDICATION.
11	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH of the PDCH assigned in step 1, assigning a new PDCH.
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned in step 11, the USF assigned to the MS.
13	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 11.
14		{Completion of uplink RLC data block transfer}	For k=1, as defined in the macro. For k=2, Observe the Length indicator, M bit and E bit of the received data headers. Check that the MS completes firstly the transmission of the 1st LLC PDU in PDP context3 and then transmits the 2nd LLC PDU in PDP context6.

42.3.3.1.2 Dynamic Allocation / Resource reallocation / Successful / Lower throughput class

42.3.3.1.2.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class, the mobile station shall first complete the sending of the LLC PDU in transfer.

2. When the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, without waiting for the acknowledgement from the network if in RLC acknowledged mode, the mobile station shall then perform the request of a resource reallocation for uplink for any remaining LLC PDU(s) by sending a PACKET RESOURCE REQUEST message on the PACCH and start timer T3168.

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.1.2.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class.

1. The MS first complete the sending of the LLC PDU in transfer, including acknowledgement from the network if in RLC acknowledged mode.

2. After the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, the MS performs the request of a resource reallocation for uplink for any remaining LLC PDU(s).

42.3.3.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, T3168 timeout value=7 (4s), BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

- Test PDP context2 and context4 activated;

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a lower throughput or a lower radio priority in the same RLC mode.

The current TBF is maintained and SS assigns the USFs allowing the MS to transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then sends PACKET RESOURCE REQUEST.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	In PDP context4, n = 880 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 6, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 220 octets with the test PDP context2 in the same RLC mode as the current uplink TBF.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, the USF assigned to the MS.
6-1	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding and the TFI are correct.
6-2	MS -> SS	PACKET RESOURCE REQUEST	Received on the PACCH of the assigned PDCH, acknowledged mode.
7	SS		Repeat step 5 and 6-1 until PACKET RESOURCE REQUEST in 6-2, instead of a RLC data block in 6-1, is received. Observe the Length indicator, M bit and E bit of the received data headers. Check that the transmission of the LLC PDU(s) with higher peak throughput class is completed.
8	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned, acknowledge all received data
9	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH of the PDCH assigned in step 1, assigning a new PDCH.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned in step 10, the USF assigned to the MS.
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 10.
12		{Completion of uplink RLC data block transfer}	
13	MS		Switch off

Specific Message Contents

PACKET RESOURCE REQUEST message in step 6-2:

Channel Request Description	
- PEAK_THROUGHPUT_CLASS	For branch A: 5 For branch B: any allowed value
- RADIO_PRIORITY	For branch A: 4 For branch B: 1
- RLC_MODE	acknowledged mode
- LLC_PDU_TYPE	1 (not SACK or ACK)
- RLC_OCTET_COUNT	Any allowed value

PACKET UPLINK ASSIGNMENT message in step 9:

Same as in subclause 42.3.3.1.1.3, step 11.

42.3.3.1.3 Dynamic Allocation / Resource reallocation / Successful / Different RLC mode and higher radio priority

42.3.3.1.3.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode. The mobile station shall then release the TBF and establish a new uplink TBF for transmission of the new LLC PDU. When the sending of LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station shall try to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.1.3.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has a different RLC mode from the current uplink TBF but has a higher radio priority.

1. The mobile station completes the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode.

2. Then the MS releases the TBF and establishes a new uplink TBF for transmission of the new LLC PDU.

3. When the sending of the new LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station tries to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

42.3.3.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer 220 octets user data with a higher throughput or a higher radio priority, but in a different RLC mode.

SS assigns the USFs allowing the MS transmit more data blocks until the MS complete the countdown procedure. It is verified that the MS has transmitted only one LLC PDU.

Random accesses are received from the MS for channel request. SS assigns a PDCH to it. SS assigns USFs addressing to the MS allowing more data blocks are transmitted by the MS until the countdown value CV=0.

The MS requests more resources through random accesses of channel requests for the remaining LLC PDU in the initial test PDP context. SS starts a two-phase dynamic allocation. It is checked that the values of

PEAK_THROUGHPUT_CLASS, RADIO_PRIORITY and RLC_MODE requested by the MS in the PACKET RESOURCE REQUEST are in consistence with the initial test PDP context2.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 880 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 220 octets in test PDP context1, unacknowledged RLC mode and a higher radio priority.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, the USF assigned to the MS.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding and the TFI are correct.
7	SS		Repeat step 5 and 6 until countdown value CV=0. Observe the Length indicator, M bit and E bit of the received data headers. Check that transmitted is only the 1st LLC PDU, Note: the 1st LLC PDU is in PDP context2, the 2nd LLC PDU is waiting for transferring.
8	SS -> MS	PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = '1'. Acknowledge all received data, containing valid RRBP, sent on PACCH.
9	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.
10	MS -> SS	CHANNEL REQUEST	Received on RACH for TBF establishment for transferring of the LLC PDU in PDP context1.
11	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to force the MS making two-phase access procedure. Sent on AGCH.
12	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 11. Check that radio priority level = 1, peak throughput class = 5, unacknowledged RLC mode.
13	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 11.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 13.
15	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned.
16			Repeat step 14 and 15 until countdown value CV=0. Check the amount of data is consistent with what was indicated by the MS in step 4.
17	SS -> MS	PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = '1', a valid RRBP, acknowledge all received data, sent on PACCH.
18	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.
19	MS -> SS	CHANNEL REQUEST	Received on RACH, TBF establishment for transmission of a remaining LLC PDU in PDP context2.
20	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to force the MS making two-phase access procedure. Sent on AGCH.
21	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 20. Check that PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
22	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 20.
23	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 20.
24	MS -> SS	UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 20.

Step	Direction	Message	Comments
25	SS		Repeat step 23 and 24 until countdown value CV=0. Observe the Length indicator, M bit and E bit of the received data headers. Check that only one LLC PDU is transmitted. Note: the 2nd[t] LLC PDU in PDP context2.
26	SS -> MS	PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = '1'. Acknowledge all received data, containing valid RRBP, sent on PACCH.
27	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

Specific Message Contents

PACKET UPLINK ASSIGNMENT message in step 13:

42.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal

42.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry

42.3.3.2.1.1 Conformance requirements

On expiry of timer T3168 the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times in which case the mobile station shall return to packet idle mode and indicate a packet access failure to upper layer.

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.2.1.2 Test purposes

To verify that during uplink resource reallocation on expiry of timer T3168:

1. The MS retransmits the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times;

2. The MS returns to idle mode after PACKET RESOURCE REQUEST has been transmitted four times.

42.3.3.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, CONTROL_ACK_TYPE = 0, T3168 timeout value=0 (0.5s), BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7, Max Retrans = 11 (Max 7 retransmissions).

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks, but does not answers to the requested resources. The MS repeatedly sends PACKET RESOURCE REQUEST three times after T3168 expires each time.

SS waits 0,55 s after receiving the 4th PACKET RESOURCE REQUEST and then sends PAGING REQUEST TYPE 1 in the next paging block for the. The MS answers with CHANNEL REQUEST.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 440 octets with the peak throughput class 5 (16k octets/s) and the radio priority 1 in acknowledge RLC mode of the PDP context5.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
6	MS -> SS	UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST	Received on the PDCH assigned
7			Repeat steps 5 and 6 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources)
8			Repeat steps 5 – 7 twice, Note: the 1st LLC PDU may be sent out and the sending 2nd PDU in the PDP context5 is started Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct for all received UPLINK RLC DATA BLOCK.
9	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned, acknowledge all received data. USF assigned to MS
10	MS -> SS	UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST	Received on the PDCH assigned, the 4th time to send PACKET RESOURCE REQUEST.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
12			Repeat steps 10 and 11 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources)
13	SS -> MS	PAGING REQUEST TYPE 1	Sent in the next paging block for the MS and at least 0,55s after receiving Packet Resource Request in step 10. Channel requests to initiate TBF to proceed the data transfer shall be ignored by the SS.
14	MS -> SS	CHANNEL REQUEST	Establishment cause = “Answer to paging”

Specific Message Contents

PACKET RESOURCE REQUEST message in step 6 and 10:

Channel Request Description	
- PEAK_THROUGHPUT_CLASS	5
- RADIO_PRIORITY	1
- RLC_MODE	acknowledged mode
- LLC_PDU_TYPE	1 (not SACK or ACK)
- RLC_OCTET_COUNT	Any allowed value

42.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment

42.3.3.2.2.1 Conformance requirements

1. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, the mobile station shall perform an abnormal release with system information (see sub-clause 8.7.3), performing a partial acquisition of system information messages containing frequency information.

2. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.

3. If the mobile station receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency that is in a frequency band not supported by the mobile station then the mobile station shall perform an abnormal release with random access.

References

3GPP TS 04.60, subclause 8.1.1.1.2.1.

42.3.3.2.2.2 Test purposes

To verify that during uplink resource reallocation:

1. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band.

2. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency in the frequency band not supported.

3. The MS performs an abnormal release with system information if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message containing an Invalid Frequency Parameters information element.

42.3.3.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,, BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode. The MS sends PACKET RESOURCE REQUEST. SS sends PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE containing an invalid assignment (k=1…5, see step 6 in expected sequences).

It is checked that the MS starts random accesses.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test sequence is executed in total five times, k = 1 … 5. The 5th execution is applicable to the single band MS, but not to the multi-band one.

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 440 octets with the peak throughput class 5 (16k octets/s) and the radio priority 1 in acknowledge RLC mode of the PDP context5.
5-1	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, the USF assigned to the MS.
5	MS -> SS	UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST	Received on the PACCH of the PDCH assigned.
6-1			Repeat steps 5-1 and 5 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources)
6 k=1	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign a frequency hopping PDCH, but not all frequencies are in one frequency band.
6 k=2	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assign a frequency hopping PDCH, but not all frequencies are in one frequency band.
6 k=3	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign a frequency hopping PDCH, the MA_NUMBER and MA_CHANGE_MARK_1 mismatch the values of MA_NUMBER and MA_CHANGE_MARK stored in the MS.
6 k=4	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assign a frequency hopping PDCH, the MA_NUMBER and MA_CHANGE_MARK_1 mismatch the values of MA_NUMBER and MA_CHANGE_MARK stored in the MS.
6 k=5	SS -> MS	PACKET UPLINK ASSIGNMENT	Assigned ARFCN on PDCH is not in the frequency band supported by the MS.
7	MS -> SS	CHANNEL REQUEST	Received on RACH.

Dynamic allocation	01 (Dynamic allocation)
	As default

42.3.3.3 Dynamic Allocation / Resource reallocation / Reject

42.3.3.3.1 Conformance requirements

1. On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layers. If no downlink TBF exists, the mobile station shall return to packet idle mode.

2. If the PACKET ACCESS REJECT message contains a WAIT_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall start timer T3172 and if the mobile station has additional RLC data blocks to transmit, it shall initiate a new TBF establishment procedure on the RACH or PRACH, but the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, it may, however, attempt packet access in an other cell after successful cell reselection. A mobile station in GPRS MS class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.3.2 Test purposes

To verify that during the uplink resource reallocation:

1. The MS returns to packet idle mode when it receives PACKET ACCESS REJECT without WAIT_INDICATION.

2. On receipt of a PACKET ACCESS REJECT with a WAIT_INDICATION the MS waits until T3172 expires. The MS, if having another RLC data blocks to transmit, initiates a new TBF establishment procedure on the RACH.

42.3.3.3.3 Method of test

Initial Conditions

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. SS sends PACKET ACCESS REJECT without containing WAIT_INDICATION. The MS may attempt a new random access because of the user data from the upper layer.

The test procedure is repeated once. The difference between the two executions is that in the 2nd execution, PACKET ACCESS REJECT contains WAIT_INDICATION. The MS may start the random access after T3172 expires.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is executed twice for k = 1 … 2.

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
4	MS		To trigger the MS to transfer 440 octets with the peak throughput class 5 (16k octets/s) and the radio priority 1 in acknowledge RLC mode of the PDP context5.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
5-1	MS -> SS	UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST	Received on the PACCH of the PDCH assigned
5-2			Repeat steps 5 and 5-1 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources)
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
7	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct.
8	SS -> MS	PACKET ACCESS REJECT	Sent on the PACCH of the PDCH, including the same address reference received from step 5-1 addressing the MS, For k = 1 without WAIT_INDICATION For k = 2 with WAIT_INDICATION.
9(optional step)	MS -> SS	CHANNEL REQUEST	Optionally received on RACH, depending on the MS implementation. For k=2, check that the random access is received not before 4,5s from step 8

Specific Message Contents

PACKET ACCESS REJECT message in step 8 for k=1:

MESSAGE_TYPE	1 00001
PAGE_MODE	Normal Paging
Reject	
-	0 (TLLI)
- TLLI	the same value as the TLLI received
-	0 (no WAIT_INDICATION)
-	0

PACKET ACCESS REJECT message in step 8 for k=2:

MESSAGE_TYPE	1 00001
PAGE_MODE	Normal Paging
Reject	
-	0 (TLLI)
- TLLI	The same value as the TLLI received
-	1 (WAIT_INDICATION present)
- WAIT_INDICATION	5 s
- WAIT_INDICATION_SIZE	0 (units of seconds)
-	0 (end of reject IE)

PACKET RESOURCE REQUEST message in step 5:

Information Element	value/ remark
Channel Request Description	
- PEAK_THROUGHPUT_CLASS	5
- RADIO_PRIORITY	1
- RLC_MODE	Acknowledged mode
- LLC_PDU_TYPE	1 (not SACK or ACK)
- RLC_OCTET_COUNT	Any allowed value

42.3.3.4 Dynamic Allocation / Resource reallocation / Successful / Lower Coding Scheme Command

42.3.3.4.1 Void

42.3.3.4.2 Conformance requirements

1. 1. On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs (3GPP TS 04.60 sub-clause 8.1.1.1).

2. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED. As each RLC data block is transmitted the corresponding element in V(B) is set to the value PENDING_ACK, (3GPP TS 04.60 sub-clause 9.1.3.2).

3. If all RLC data blocks whose corresponding element in V(B) has the value PENDING_ACK have been transmitted once, the process shall be repeated beginning with the oldest RLC data block (3GPP TS 04.60 subclause 9.1.3.2).

4. In GPRS TBF mode, once an RLC data block has been transmitted over the physical link, should it be necessary to re-transmit the RLC data block, it shall be re-transmitted using the same channel coding scheme, BSN, and CV as it had in the previous transmission (3GPP TS 04.60 sub-clause 9.1.11)

References

3GPP TS 04.60, sub-clauses 8.1.1.1, 9.1.3.2, 9.1.11.

42.3.3.4.3 Test purposes

Verify that an MS switches to the newly assigned PDCH, retransmits unacknowledged RLC data blocks with the previous CS, transmits no more than one RLC data block with the previous CS and then applies the new CS command only to the new RLC data blocks.

42.3.3.4.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, has a PDP context 2 activated. One LLC frame of 225 octets (which fits in 3 CS-4 blocks and 3 CS-1 blocks, or 2 CS-4 blocks and 6 CS-1 blocks) are to be sent by the MS.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1) The MS receives a IMMEDIATE ASSIGNMENT message on its assigned PCH, containing a CS command set to CS4.

2) The SS transmits a USF assigned to the MS.

3) The MS responds by sending an uplink RLC data block.

4) the TLLI is sent in a Packet Uplink Ack/Nack in order to solve the contention.

5) The MS detects that the contention is solved.

6) The SS transmits another PACKET UPLINK ASSIGNMENT message on PACCH, containing new resources and a CS command set to CS1.

7) The MS transmits uplink RLC data blocks on the newly assigned resources: unacknowledged RLC data blocks or pending RLC data blocks are retransmitted using the previous CS; no more than one new RLC data block shall then be sent with the previous CS, and subsequent new RLC data blocks are transmitted using the new CS.

8) All blocks are acknowledged by the SS and the TBF is released.

Maximum Duration of Test

3 minutes.

Expected Sequence

Step	Direction	Message	Comments
1			MS is in the state "idle, GMM-registered" with a P-TMSI allocated, has a PDP context activated
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Triggers the MS to switch to PDCH0. (no starting time); CS4 is commanded.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3.
5	MS -> SS	RLC DATA BLOCK	MS sends the 1st RLC data block including its TLLI, on PDCH0.
6	SS -> MS	Packet Uplink Ack/Nack	The SS transmits the MS TLLI in order to solve the contention and indicates that the 1st RLC data block has been received.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3.
8	MS -> SS	UPLINK RLC DATA BLOCK	MS sends the 2nd RLC data block sent on PDCH0 using CS4. If the data block contains the TLLI perform optional steps 7a and 8a, otherwise continue with step 9.
7a (optional)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3.
8a (optional)	MS -> SS	UPLINK RLC DATA BLOCK	MS sends the 3rd RLC data block sent on PDCH0 using CS4, without the TLLI.
9	SS -> MS	PACKET UPLINK ACK/NACK	The SS indicates that the 2nd RLC data block has not been received.
10	SS -> MS	PACKET UPLINK ASSIGNMENT	Triggers the MS to switch to PDCH1. (no starting time) CS1 is commanded.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	3 blocks after the previous message, a USF is addressed to MS according to allocation from step 9.
12	MS -> SS	RLC DATA BLOCK	MS sends a RLC data block on PDCH1.
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The SS continues transmitting USF according to allocation from step 9.
14	MS -> SS	RLC DATA BLOCK	Verify that no more than one new RLC data block shall then be sent with the previous CS: at the latest the 4th RLC data block of the TBF is sent with CS1. The SS verifies that CS4 is used for the 2nd RLC data block, and that CS1 is used at the latest for the 4th RLC data block and the subsequent blocks. The 3rd RLC data block may be sent using the previous CS or the new one.
15			Repeat steps 12 and 13 until all the RLC data blocks have been sent, i.e. 6 times
16	SS -> MS	Packet Uplink Ack/Nack	The SS indicates that every data blocks have been received.
17		{Completion of uplink data transfer}	Macro

Specific Message Contents

IMMEDIATE ASSIGNMENT message in step 3:

TIMESLOT_ALLOCATION	<one timeslot assigned – PDCH0>
CHANNEL_CODING_COMMAND	11 (CS-4)
TLLI_BLOCK_CHANNEL_CODING	1 (the mobile station shall use the value commanded in the CHANNEL_CODING_COMMAND or EGPRS_CHANNEL_CODING_COMMAND field)
TBF STARTING TIME	<IE not present>

PACKET UPLINK ASSIGNMENT message in step 9:

TIMESLOT_ALLOCATION	<one timeslot assigned – PDCH1>
CHANNEL_CODING_COMMAND	00 (CS-1)
TLLI_BLOCK_CHANNEL_CODING	1 (the mobile station shall use the value commanded in the CHANNEL_CODING_COMMAND or EGPRS_CHANNEL_CODING_COMMAND field)
TBF STARTING TIME	<IE not present>

42.3.4 Default message contents

Default message contents and macros as defined in the GPRS defaults section 40 are used for subclause 42.3.

42.4 Measurement reports and Cell change order procedures

This subclause presents tests for "Measurement Reports and Cell Change Order Procedures" which are specified in 3GPP TS 04.60/3GPP TS 44.060 subclauses 5.6 and 8.4.

In the testcases which have uplink data transfer while in NC2, the USF needs to be assigned very frequently so that the measurement reports will be received by the SS within the 10% tolerance.

Default conditions

Default message contents and signalling macros are defined in the GPRS general defaults section, except for those messages and macros specified at the end of this subclause.

42.4.1 Measurement reports

42.4.1.1 Network Control measurement reporting / Uplink / Normal case

42.4.1.1.1 Conformance requirement

The behaviour of the mobile station is controlled by the NETWORK_CONTROL_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC_REPORTING_PERIOD_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC_REPORTING_PERIOD_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A mobile station in mode NC1 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

42.4.1.1.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

Reference

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

42.4.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. MS sends continuously data blocks and PACKET MEASUREMENT REPORT messages according to the indicated reporting period. A PACKET MEASUREMENT ORDER message is sent again with new reporting period. MS sends data blocks and PACKET MEASUREMENT REPORT messages according to the new reporting period.

Maximum duration of the test

-

Expected sequence

42.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection

42.4.1.2.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the expired timer T3158, perform the measurements and initiate the packet access.

The procedure for measurement report sending is initiated by the mobile station either on PCCCH (sub-clause 7.3.1) or, if a packet control channel not exists, on CCCH (sub-clause 7.3.2).

If the mobile station initiates the establishment of an RR connection, the timer T3158 shall be stopped and no measurement reports shall be sent. When the RR connection is released and if the mobile station has not changed cell, the measurement reporting procedure shall be restarted.

If a cell change has occurred during the RR connection, the measurements shall be cancelled until new NC orders have been received (see sub-clause 5.6).

42.4.1.2.2 Test Purpose

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the MS shall immediately restart timer T3158 with the indicated reporting period for the new cell.

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is shorter than the indicated reporting period for the new cell, the timer T3158 shall continue to run.

Reference

42.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case

42.4.1.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

The mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled.

42.4.1.3.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

To verify that the MS sends at least two PACKET DOWNLINK ACK/NACK messages before transmitting a PACKET MEASUREMENT REPORT message upon entering transfer state.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T	 01 (NC1) 000 (0,48 s)

PACKET MEASUREMENT ORDER in step 17:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T	 01 (NC1) 001 (0,96 s)

42.4.1.4 Network Control measurement reporting / Uplink transfer / Continuation in Idle mode.

42.4.1.4.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

3GPP TS 05.08, subclause 10.1.4

42.4.1.4.2 Test Purpose

To verify that if the NC parameters are changed while in packet transfer mode, the MS continues to use the changed parameters after returning to packet idle mode.

42.4.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is GPRS attached with a P-TMSI allocated.

PDP context 2 established.

Specific PICS Statements

- MS GPRS Release (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

MS is brought into uplink packet transfer mode. SS commands MS to NC2 with PACKET MEASUREMENT ORDER. SS checks that the MS is sending the PACKET MEASUREMENT REPORT at the expiry of the reporting period. SS allows the MS to complete the data transfer. SS checks that after entering packet idle mode MS continues being in NC2 mode by receiving the PACKET MEASUREMENT REPORT.

The test is repeated twice for k=1, and k=2.

K=1:

READY TIMER is set to 2 min, NC_REPORTING_PERIOD_I set to 61.44 sec and NC_REPORTING_PERIOD_T set to 1.92 sec.

K=2:

READY TIMER is set to 30 sec, NC_REPORTING_PERIOD_I set to 7.68 sec and NC_REPORTING_PERIOD_T set to 1.92 sec.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS->MS	{ Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access}	Macro parameters: **500**: the number of RLC data block to be transferred, **USF_GRANULARITY**: 1 **RLC_DATA_BLOCKS_GRANTED**: absent (open-end) **CHANNEL_CODING_COMMAND**: CS-1 TLLI_BLOCK_CHANNEL_CODING: CS-1
2	SS->MS	PACKET MEASUREMENT ORDER	-Sent on PACCH. - For K = 1 and K =2 NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are Specified. See specific message Contents
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS in step 1.
4a	MS -> SS	RLC data block	Received on PDTCH assigned in step 1.
4b	MS -> SS	PACKET MEASUREMENT REPORT	
5	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH. Acknowledging the received block.
6			Repeat steps 3-5 until the MS completes the data transfer of all the octets triggered in step 1. The last PACKET UPLINK ACK/NACK is sent with valid RRBP and FAI = 1. SS verifies that the time interval between two consecutive PACKET MEASUREMENT REPORTS is as per REPORTING_PERIOD_T of PMO sent in Step 2.
7	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on PACCH.
8	MS ->SS	CHANNEL REQUEST	'Single block packet access' For Rel4 and earlier MS: SS verifies that either Rel5 requirements are fulfilled OR: CHANNEL REQUEST arrives : - After NC_REPORTING_PERIOD_T from last execution of step 4b for first CHANNEL REQUEST. Note: When the MS enters Idle mode, the Channel Request may be delayed by one Paging block of the MS. - After NC_REPORTING_PERIOD_I from last CHANNEL REQUESTs (step 8) for following CHANNEL REQUEST(s). For Rel5 and later MS: SS verifies that CHANNEL REQUEST arrives : - After NC_REPORTING_PERIOD_I from step 7 After NC_REPORTING_PERIOD_I from last CHANNEL REQUEST (step 8) for following CHANNEL REQUEST(s).
9	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH.
10	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH. Steps 8-10 will be repeated till the READY TIMER expires.
11	SS		Check for NC_REPORTING_PERIOD_I that the MS stops sending Packet Measurement Reports
Note: in step 4x, the MS shall perform **either** the 'a' branch **or** the 'b' branch.			

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

For K = 1:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T	 10 (NC2) 111 (61.44 s) 010 (1.92 s)

For K = 2:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T	 10 (NC2) 100 (7.68 s) 010 (1.92 s)

42.4.1.5 Network Control measurement reporting / Idle mode / DSC failure/ reselection.

42.4.1.5.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD(s) and optionally REPORT_TYPE, MULTIBAND_REPORTING, SERVING_BAND_REPORTING, XXX_MULTIRAT_REPORTING, XXX_REPORTING_OFFSET, XXX_REPORTING_THRESHOLD (XXX indicates frequency band or radio access technologies), FDD_REPORTING_THRESHOLD_2, REP_PRIORITY, REPORTING_RATE, INVALID_BSIC_REPORTING, SCALE_ORD, FDD_REP_QUANT, Qsearch_P, 3G_SEARCH_PRIO), E-UTRAN_REP_QUANT, E-UTRAN_FDD_REPORTING_THRESHOLD, E-UTRAN_FDD_REPORTING_THRESHOLD_2, E-UTRAN_TDD_REPORTING_THRESHOLD, E-UTRAN_TDD_REPORTING_THRESHOLD_2, E-UTRAN_FDD_MEASUREMENT_REPORT_OFFSET and E-UTRAN_TDD_MEASUREMENT_REPORT_OFFSET, Qsearch_P_E-UTRAN) is broadcast on BCCH and, excepting E-UTRAN parameters, on PBCCH if it exists.

The MS shall send measurement reports to the network as defined in subclause 10.1.4.1.
The MS shall only perform autonomous cell re-selection when the reselection is triggered by a downlink signalling failure as defined in subclause 6.5 or a random access failure as defined in 3GPP TS 44.018 and 3GPP TS 44.060 or if the cell is barred or the C1 criterion falls below zero. The MS shall only determine whether the cell is barred once camped on the cell.

3GPP TS 045.008, subclause 10.1.4

42.4.1.5.2 Test Purpose

To verify that while in NC2, MS performs autonomous cell reselection when the reselection is triggered by the downlink signalling failure.

42.4.1.5.3 Method of test

Initial conditions

System Simulator:

2 cell, GPRS supported.

Parameter	Carrier1	Carrier2
RF Signal Level (dBm)	-60	-70
NETWORK_CONTROL_ORDER	NC2	NC2
NC_REPORTING_PERIOD_I	110 (30.72 sec)	110 (30.72 sec)

Mobile Station:

MS is GPRS attached on cell A (Carrier 1) with a P-TMSI allocated. Ready timer is set to 2 min.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

MS is in packet idle mode in cell A (Carrier 1). MS sends a CHANNEL REQUEST for the measurement report. SS assigns resources for it. MS sends a PACKET MEASUREMENT REPORT. SS receives one more PACKET MEASUREMENT REPORT by repeating the above steps. SS starts sending the corrupted blocks on the MS PCH channel in such a way that DSC < 0. SS checks that the MS does reselection to cell B.

Maximum duration of the test

5 min.

Expected sequence

Step	Direction	Message	Comments
1	MS->SS	CHANNEL REQUEST	ACCESS TYPE ='Single block packet access'. Received on RACH. Received on cell A
2	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH, assigning a single block.
3	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH.
4			Steps 1-3 are repeated once.
5	SS		SS Verifies that the measurement results for cells A, B are included in the PACKET MEASUREMENT REPORT.
6	SS		SS starts sending the corrupted data on successive paging blocks of the MS until DSC < 0. Then it reverts to sending of the normal data.
7	MS -> SS	CHANNEL REQUEST	Received on cell B. ’One phase packet access’

Specific message contents

None.

42.4.2 Cell change order procedures

42.4.2.1 Cell change order procedure / Uplink transfer

42.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case

42.4.2.1.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

42.4.2.1.1.2 Test Purpose

To verify the when NC2 is commanded, the MS sends PACKET MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

42.4.2.1.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A and cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS commands MS to NC2 with PACKET MEASUREMENT ORDER. SS waits for a PACKET MEASUREMENT REPORT to contain measurement results for both cell A and cell B. SS sends a PACKET CELL CHANGE ORDER message. SS checks that there is no traffic on the old cell. MS switches to the new cell and re-establishes the uplink TBF.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments

42.4.2.1.2 Void

42.4.2.1.3 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell

42.4.2.1.3.1 Conformance requirement

42.4.2.1.3.1.1 Conformance requirement for Rel-5 and earlier

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

Reference

3GPP TS 04.60/44.060, subclause 8.4.1.

42.4.2.1.3.1.2 Conformance requirement for Rel-6 and later

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause:* “Immediate Assign Reject or Packet Access Reject on target cell”.

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type “single block without TBF establishment” (PCCCH) / “single block packet access” (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

Reference

3GPP TS 44.060, subclause 8.4.2.

42.4.2.1.3.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network from the old cell, if a PACKET ACCESS REJECT message is received from the new cell.

42.4.2.1.3.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

CAUSE	0010

42.4.2.1.4 Cell change order procedure / Uplink transfer / Failure cases / Contention resolution failure

42.4.2.1.4.1 Conformance requirement

42.4.2.1.4.1.1 Conformance requirement for Rel-5 and earlier

If the contention resolution procedure fails on the new cell, then the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

References

3GPP TS 04.60/44.060, subclause 8.4.1

42.4.2.1.4.1.2 Conformance requirement for Rel-6 and later

The mobile station shall regard the network controlled cell reselection procedure as successfully completed when it has performed access and successfully completed contention resolution in the new cell.

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause:* 'No response on target cell'.

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type 'single block without TBF establishment' (PCCCH) / 'single block packet access' (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

References

3GPP TS 44.060, subclauses 8.4.1 and 8.4.2

42.4.2.1.4.2 Test Purpose

To verify that the mobile station initiates a random access to the old cell, if the contention resolution procedure fails on the new cell.

42.4.2.1.4.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on , GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached. Ready timer is set to 44 seconds

PDP context established.

Specific PICS Statements

-

PIXIT Statements

1		{Uplink dynamic allocation two phase access}	MS is brought into uplink packet transfer mode. Macro parameters: **USF_GRANULARITY**: 1 **RLC_DATA_BLOCKS_GRANTED**: absent (open-end) **CHANNEL_CODING_COMMAND**: CS-1 TLLI_BLOCK_CHANNEL_CODING: CS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	RLC data blocks	MS sends data
4	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH.
5	SS -> MS	PACKET CELL CHANGE ORDER	Contains -BSIC + BCCH frequency -The network control order MS is not capable of using the ordered frequency.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	PACKET CELL CHANGE FAILURE	Sent on the PACCH. Error cause "frequency not implemented". See specific message content.
8	MS		MS shall remain on the current PDCH(s).
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
10	MS -> SS	RLC data blocks	MS sends data
11	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH.

Specific message contents

PACKET CELL CHANGE FAILURE in step 7:

Packet Cell Change Failure message content: CAUSE	 0000

42.4.2.2 Cell change order procedure / Downlink transfer

42.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case

42.4.2.2.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

42.4.2.2.1.2 Test Purpose

To verify that when NC2 is commanded, the MS sends PACKET MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell.

To verify that the MS correctly performs a cell update.

To verify that the MS uses the established downlink TBF on the new cell.

Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

42.4.2.2.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message. MS switches to the new cell and SS establishes a new downlink TBF.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS->MS	IMMEDIATE ASSIGNMENT	SS establish a Downlink TBF.
2	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH, 3 block periods from the IMMEDIATE ASSIGNMENT in step 1. - Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD. See specific message contents
3	SS->MS	10 RLC data blocks	SS sends data, last block is polling.
4a	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
4b	MS->SS	PACKET MEASUREMENT REPORT	Sent on PACCH.
5	SS		Repeat steps 3-4 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message. The SS verifies that for the first 2 polls, PACKET DOWNLINK ACK/NACK messages are sent by the MS.
6	SS->MS	PACKET CELL CHANGE ORDER	Sent on the PACCH. IMMEDIATE_REL bit is set to "1" Contains -BSIC + BCCH frequency of cell B -The network control order, NC2 See specific message contents
7	MS->SS	CHANNEL REQUEST	To the new cell. Received on RACH
8	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH.
9	MS->SS	RLC data block	Sent on the PDCH. The RLC data also serves as cell update.
10	SS->MS	PACKET UPLINK ACK/NACK	Sent on the PACCH with valid RRBP.
11	MS->SS	PACKET CONTROL ACK	
12	SS		The SS waits 2 sec for expiring timer T3158 which was set in PACKET MEASUREMENT ORDER message in step 2; If the MS does not send a CHANNEL REQUEST for sending a PACKET MEASUREMENT REPORT continue with step 14
13a	MS->SS	CHANNEL REQUEST	Single Block without TBF establishment
13b	SS->MS	IMMEDIATE ASSIGNMENT	
13c	MS->SS	PACKET MEASUREMENT REPORT	
14	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCCH. On the new cell. Addressing the MS with TLLI.
15	SS->MS	10 RLC data blocks	SS sends data, last block is polling.
16	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.

Note 1: in step 4x, the MS shall perform **either** the ‘a’ branch **or** the ‘b’ branch.

Note 2: steps 13a-c are performed only when MS tries to send a PACKET MEASUREMENT REPORT after expiring of T3158 in step 12

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

Global TFI	TFI of the downlink TBF
NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	111 (61.44 sec)
NC_REPORTING_PERIOD_T	010 (1.92 sec)
NC_FREQUENCY_LIST	0 (not present)

PACKET CELL CHANGE ORDER in step 6:

Global TFI	TFI of the downlink TBF
IMMEDIATE_REL	1
ARFCN, BSIC	specified for cell B
NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	111 (61.44 sec)
NC_REPORTING_PERIOD_T	100 (7.68 sec)
NC_FREQUENCY_LIST	0 (not present)

42.4.2.2.2 Cell change order procedure / Downlink transfer / Failure cases / REJECT from the new cell

42.4.2.2.2.1 Conformance requirement

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in downlink packet transfer mode before the cell change, the mobile station shall initiate a random access to the old cell, with access type "single block without TBF establishment", and then transmit the PACKET CELL CHANGE FAILURE message on the single block.

42.4.2.2.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network in the old cell, if a IMMEDIATE ASSIGNMENT REJECT message is received from the new cell.

Reference

3GPP TS 04.60, subclause 8.4.1.

42.4.2.2.2.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached. Ready Timer is deactivated.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in idle mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends the CHANNEL REQUEST. SS sends IMMEDIATE ASSIGNMENT REJECT message. MS returns to the old cell and sends PACKET CELL CHANGE FAILURE message to the network.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on the PCH.
2	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH, 3 block periods from the IMMEDIATE ASSIGNMENT in step 1. - Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD. See specific message contents
3	SS -> MS	10 RLC data blocks	SS sends data, last block is polling.
4a	MS -> SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
4b	MS->SS	PACKET MEASUREMENT REPORT	Sent on PACCH.
5	SS		Repeat steps 3-4 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message. The SS verifies that for the first 2 polls, PACKET DOWNLINK ACK/NACK messages are sent by the MS.
6	SS -> MS	PACKET CELL CHANGE ORDER	Sent on the PACCH. IMMEDIATE_REL bit is set to "1" Contains -BSIC + BCCH frequency of cell B. -The network control order, NC2 See specific message contents

A9	MS->SS	RLC data block	LLC PDU implicitly indicating Cell Update
A10	SS->MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block, Final Ack Indicator = '1 ', a valid RRBP. Send on PACCH.
B6	MS->SS	PACKET CELL CHANGE FAILURE	Sent on PACCH. Error cause: "Frequency not implemented". See specific message content.

Note: Branch A is performed only in case MS wants to do a Cell Update. Branch B is performed if MS does not do a Cell Update.

Specific message contents

PACKET CELL CHANGE FAILURE in step A8 and B6:

Packet Cell Change Failure message content: CAUSE	0000 (Frequency not implemented)

42.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer

42.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case

42.4.2.3.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

When cell reselection is controlled by the network, the mobile station in packet transfer mode shall act upon the IMMEDIATE_REL value: it may continue its operation in the old serving cell, as in mobile steered cell reselection, or it shall immediately abort its TBF if it is indicated by the IMMEDIATE_REL value.

Under no circumstances, operations in the old cell shall be continued more than 5 s after a cell reselection has been determined.

42.4.2.3.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

To verify that the MS shall act upon the IMMEDIATE_REL value.

Reference

3GPP TS 04.60, subclauses 5.5.1.1, 8.4 and 8.4.1.

42.4.2.3.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in simultaneous uplink and downlink packet transfer mode.

Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE_REL value set to 1 to force the mobile to release all ongoing TBFs. MS switches to the new cell and simultaneous uplink and downlink TBF is re-established.

SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE_REL value set to 0. The MS continues its operation in the old serving cell.

Maximum duration of the test

-

Expected sequence

42.4.2.3.2 Void

42.4.2.3.3 Void

42.4.2.3.4 Packet Measurement order procedure / Downlink transfer / Normal case/ Routing Area Update/ NMO II

42.4.2.3.4.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate the normal routing area updating procedure, the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-AREA-UPDATING-INITIATED. The message ROUTING AREA UPDATE REQUEST shall contain the P-TMSI signature when received within a previous ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message.

If the routing area updating request has been accepted by the network, a ROUTING AREA UPDATE ACCEPT message shall be sent to the MS. The network may assign a new P-TMSI and/or a new P-TMSI signature for the MS. If a new P-TMSI and/or P-TMSI signature have been assigned to the MS, it/they shall be included in the ROUTING AREA UPDATE ACCEPT message together with the routing area identification.

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

42.4.2.3.4.2 Test Purpose

To test the behaviour of the MS when the network triggers a Packet Cell Change Order to a cell belonging to another routing area, whereas the network mode of operation II is active, i.e.:

- To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.
- To verify that the MS switches to the new cell.
- To verify that the MS uses the established downlink TBF on the new cell.
- To verify that the MS performs the Normal Routing Area Update procedure.

42.4.2.3.4.3 Method of test

Initial conditions

System simulator:

2 cells, GPRS supported, Carrier 1 is active, at –60dBm. Carrier 2 is on, at low level –70dBm (in order to prevent sync reading suspension due to unsuccessful synchronization attempts). PBCCH is not present on Cell A (Carrier 1), and not present on Cell B (Carrier 2). NETWORK_CONTROL_ORDER is set to NC0, and Network Mode of Operation is set to NMO 2, on both Carrier 1 and Carrier 2. Cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode on carrier 2.

Test procedure

The MS is brought into downlink packet transfer mode on carrier 1 in Cell A. The SS sends a PACKET MEASUREMENT ORDER message, setting NETWORK_CONTROL_ORDER to NC2. The SS raises carrier 2 (Cell B) with higher RF signal strength than carrier 1. The MS shall stay camping in the cell A.

During the transfer, the SS sends a PACKET CELL CHANGE ORDER message. The MS shall reselect carrier 2, MS will send a ROUTING AREA UPDATE REQUEST message and SS establishes a new downlink TBF

The SS accepts the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the P-TMSI.

NOTE: After ROUTING AREA UPDATE COMPLTE on carrier 2 and during the UL TBF, T3158 may expire and thus PACKET MEASUREMENT REPORT is sent there. The SS shall be prepared for this.

Maximum duration of the test

4 minutes

Expected Sequence

Step	Direction	Message	Comments
1	MS		The MS is GPRS attached and has activated a PDP context (see PICS) on carrier 1.
2	SS -> MS	IMMEDIATE ASSIGNMENT	sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment Triggers the MS to monitor the assigned PDCH.
3	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 0.48s.
			The SS shall accept PACKET MEASUREMENT REPORT messages during the TBF, while the MS is in NC2 mode.
4	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
5	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
6	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
7	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
8	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
9a	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
9b	MS->SS	PACKET MEASUREMENT REPORT	At NC_REPORTING_PERIOD_T expiry instead of PACKET DOWNLINK ACK/NACK, the MS sends the PACKET MEASUREMENT REPORT, which contains the "NC measurement report struct", on the PACCH.
10			Repetition of steps 8 and 9 until Measurement for Cell B are included in PACKET MEASUREMENT REPORT message.
11	SS		Raise the carrier 2 level to -50dBm
12			The MS still camps on carrier 1 and remains in Packet Transfer Check that no CHANNEL REQUEST is received on cell B.
13	SS->MS	PACKET CELL CHANGE ORDER	Sent on the PACCH. Contains –BSIC + BCCH frequency Network control order = NC2
14	MS->SS	CHANNEL REQUEST	To the new cell.
15	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Assigning a uplink TBF.
16	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' Routing area identity = RAI-1
17	SS->MS	IMMEDIATE ASSIGNMENT	Sent on CCCH. On the new cell. Assigns a Downlink TBF. Addressing the MS with TLLI.
18	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'RA updated' Routing area identity = RAI-2
19a	MS->SS	CHANNEL REQUEST	Received on RACH.
19b	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Assigning a uplink TBF.
20	MS -> SS	ROUTING AREA UPDATE COMPLETE	
21	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on PCH. Addressing the MS with TLLI.
22	SS->MS	10 RLC data blocks	SS sends data, last block is polling.
23	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.

NOTE: 9b is chosen depending at NC_REPORTING_PERIOD_T expiry, otherwise 9a is chosen.

Specific message contents

PACKET MEASUREMENT ORDER in step 3:

PACKET MEASUREMENT ORDER message content: NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T	 0010 (NC2) 000 (0.48s)

42.4.2.3.5 Packet Measurement order procedure / Downlink transfer / Normal case/ Routing Area Update/ NMO I

42.4.2.3.5.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate a combined routing area updating procedure the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-UPDATING-INITIATED and MM LOCATION UPDATING PENDING. The value of the update type IE in the message shall indicate "combined RA/LA updating". If for the last attempt to update the registration of the location area a MM specific procedure was performed, the value of the update type IE in the ROUTING AREA UPDATE REQUEST message shall indicate "combined RA/LA updating with IMSI attach". Furthermore the MS shall include the TMSI status IE if no valid TMSI is available.

References

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

42.4.2.3.5.2 Test Purpose

To test the behaviour of the MS when the network triggers a Packet Cell Change Order to a cell belonging to another routing area, whereas the network mode of operation 1 is active, i.e.:

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell.

To verify that the MS uses the established downlink TBF on the new cell.

To verify that the MS performs the Combined Routing Area Update procedure.

42.4.2.3.5.3 Method of test

Initial conditions

System simulator:

2 cells, GPRS supported, Carrier 1 is active, at –60dBm. Carrier 2 is on, at low level –70dBm (in order to prevent sync reading suspension due to unsuccessful synchronization attempts). NETWORK_CONTROL_ORDER is set to NC0, and Network Mode of Operation is set to NMO I, on both Carrier 1 and Carrier 2. Cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached (P-TMSI 1, P-TMSI signature 1). Ready timer deactivated.

PDP context established.

Specific PICS Statements

- MS operation mode A (TSPC_operation_mode_A)
- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode on carrier 2.

Test procedure

The MS is brought into downlink packet transfer mode on carrier 1 in Cell A. The SS sends a PACKET MEASUREMENT ORDER message, setting NETWORK_CONTROL_ORDER to NC2. The SS raises carrier 2 (Cell B) with higher RF signal strength than carrier 1. The MS shall stay camping in the cell A.

During the transfer, the SS sends a PACKET CELL CHANGE ORDER message. The MS shall reselect carrier 2.

In Cell B, the MS sends a ROUTING AREA UPDATE REQUEST message. The SS accepts the P-TMSI signature and returns ROUTING AREA UPDATE ACCEPT message without any P-TMSI nor any new TMSI but Force to Standby set. Further communication MS-SS is performed by the old P-TMSI.

NOTE: during the UL TBF, T3158 may expire and thus PACKET MEASUREMENT REPORT is sent there. The SS shall be prepared for this.

Maximum duration of the test

4 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Triggers the MS to monitor the assigned PDCH, establish a downlink TBF.
2	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 0.96s. The SS shall accept PACKET MEASUREMENT REPORT messages during the TBF, while the MS is in NC2 mode.
3	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
4	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
5	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
6	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
7	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
8a	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
8b	MS->SS	PACKET MEASUREMENT REPORT	At NC_REPORTING_PERIOD_T expiry instead of PACKET DOWNLINK ACK/NACK, the MS sends the PACKET MEASUREMENT REPORT, which contains the "NC measurement report struct", on the PACCH.
9			Repeat steps 7 and 8 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message.
10	SS		Raise the carrier 2 level to -50dBm
11			The MS still camps on carrier 1 and remains in Packet Transfer Check that no CHANNEL REQUEST is received on cell B.
12	SS->MS	PACKET CELL CHANGE ORDER	Sent on the PACCH. Contains -BSIC + BCCH frequency Network control order = NC2 The following messages are to be sent and received in Cell B.
13	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA/LA updating' (for operation mode A or operation mode B) Update type = 'RA updating' (for operation mode C) P-TMSI-1 signature Routing area identity = RAI1
14	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'Combined RA/LA updated' (for operation mode A or operation mode B) Update result = 'RA updated' (for operation mode C) No P-TMSI No TMSI Routing area identity = RAI-2 Negotiated Ready Timer not included Force to standby IE set
15	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on PCH establish downlink TBF. On the new cell. Addressing the MS with TLLI derived from P-TMSI-1. Triggers the MS to monitor the assigned PDCH.
16	SS->MS	10 RLC data blocks	SS sends data, last block is polling.
17	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.

Note: 8b is chosen depending on NC_REPORTING_PERIOD_T expiry, otherwise 8a is chosen.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

PACKET MEASUREMENT ORDER message content: NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T	 0010 (NC2) 001 (0.96s)

42.4.2.3.6 MT CS establishment whilst in NC2 with a downlink TBF established

42.4.2.3.6.1 Conformance requirements

The behaviour of the mobile station is controlled by the NETWORK_CONTROL_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC_REPORTING_PERIOD_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC_REPORTING_PERIOD_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Paging initiation using PACCH applies when sending a paging request message to a mobile station that is GPRS attached, when the mobile station is in packet transfer mode and the network is able to co-ordinate the paging request with the radio resources allocated for the mobile station on a PDCH. This kind of paging co-ordination shall be provided in network mode of operation I (see 3G TS 23.060). This kind of paging co-ordination may be provided also in network mode of operation II or III. This kind of paging co-ordination shall be provided if the network supports DTM.

When the mobile station responds to a paging request for RR connection establishment, it shall follow the paging response procedures as specified in 3GPP TS 04.18. For that purpose, a mobile station in packet transfer mode or a mobile station that has initiated a packet access procedure may abort any ongoing TBF or the packet access procedure in the following two cases:

- The mobile station requires that the BSS co-ordinates the allocation of radio resources for an RR connection and a simultaneous TBF (GPRS class A mode of operation by means of DTM).

References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4.

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

42.4.2.3.6.2 Test purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires. To verify that the MS reacts to CS paging on the PACCH, whilst the MS was in packet transfer mode and NC2, by releasing the downlink TBF and then establishing an RR connection.

42.4.2.3.6.3 Method of test

Initial Conditions

System Simulator:

2 cells, GPRS supported, NMO I activated, CTRL_ACK_TYPE=0 in SI13.

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

- GPRS Release Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Test Procedure

The MS is brought into packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. SS sends continuously data blocks and regularly polls so that PACKET MEASUREMENT REPORT messages are sent by the MS according to the indicated reporting period, before being paged on the PACCH. Upon receipt of the PACKET PAGING REQUEST message, the MS returns to packet idle mode and initiate the establishment of CS connection.

NOTE: carrier 2 is activated in order to prevent synchronisation reading suspension due to unsuccessful synchronization attempts.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	MS		The MS is GPRS attached and has activated a PDP context (see PICS) on carrier 1.
2	SS -> MS	IMMEDIATE ASSIGNMENT	Triggers the MS to monitor the assigned PDCH with a valid RRBP.
3	MS -> SS	PACKET CONTROL ACK	Sent in the block specified by RRBP field in step 2 as four access bursts
4	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 0.48s.
5	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
6	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
7	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
8	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
9	SS->MS	12 RLC data blocks	SS sends data, the last block contains a valid RRBP.
10a	MS->SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH.
10b	MS->SS	PACKET MEASUREMENT REPORT	At NC_REPORTING_PERIOD_T expiry instead of PACKET DOWNLINK ACK/NACK, the MS sends the PACKET MEASUREMENT REPORT, which contains the "NC measurement report struct", on the PACCH.
11			Repetition of steps 9 and 10 during 5s
12			Raise carrier 2 changing the carrier level to –70dBm
13	SS->MS	PACKET PAGING REQUEST	1st Repeated Page info contains IMSI of the MS, PAGE_MODE = " same as before ", sent on downlink PACCH.

42.4.4 Cell Change Order Procedures without PBCCH

42.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure

42.4.4.1.1 Conformance requirement

A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command.

Reference:

3GPP TS 04.60 subclause 8.4.0.

3GPP TS 05.08 subclause 10.1.4.2.

42.4.4.1.2 Test purpose

To verify that when the Network initiates the Packet Measurement Order Procedure, the MS correctly interprets the Packet Measurement Order Message, changes the network control mode and acts accordingly.

42.4.4.1.3 Method of test

Initial conditions

Parameter	Carrier1	Carrier2	Carrier3
RF Signal Level (dBm)	-70	-80	-50
GPRS_RXLEV_ACCESS_MIN	-100	-100	-100
NETWORK_CONTROL_ORDER	NC2	NC2	NC2
C1	30	20	50
C2	30	20	50

System simulator:

3 cells, GPRS supported, PBCCH not present (Carrier 1 & 2 is active. Carrier 3 is off).

Mobile Station:

MS is GPRS attached on carrier 1 (with Ready timer value unit set to '111' in the ATTACH ACCEPT message, thus the MS is always in Ready state).

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC2 to NC0. The MS shall reselect to carrier 3 and initiate channel request procedure.

The SS shall accept PACKET MEASUREMENT REPORT from the MS anytime during GPRS attach procedure

Expected Sequence

Step	Direction	Message	Comments
1	SS		Activate carrier 3
2 (optional step)	MS->SS	CHANNEL REQUEST	ACCESS TYPE ='Single block without TBF establishment.' Received on RACH carrier 1.
3(optional step)	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH, assigning a single block carrier 1.
4(optional step)	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH.
5	SS->MS	IMMEDIATE ASSIGNMENT	SS establishes a single block down link TBF on carrier 1.
6	SS->MS	PACKET MEASUREMENT ORDER	Sent on PACCH of carrier 1. PMO message contains Network Control Order 0
7	MS->SS	CHANNEL REQUEST	Verify MS sends channel request on carrier 3 within 30 s of step 6.
8	SS->MS	IMMEDIATE ASSIGNMENT REJECT.	Network sends immediate assignment reject on carrier 3.

42.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state

42.4.4.2.1 Conformance requirement

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to MS., there is a downlink signalling failure or the MS enters Standby State.

Reference:

3GPP TS 05.08 subclause 10.1.4.

42.4.4.2.2 Test purpose

To verify that the measurement reporting parameters are valid till the MS enters the standby state.

42.4.4.2.3 Method of test

Initial conditions

Parameter	Carrier1	Carrier2
RF Signal Level (dBm)	-80	-70
GPRS_RXLEV_ACCESS_MIN	-100	-100
NETWORK_CONTROL_ORDER	NC0	NC2
C1	20	30
C32	20	30

System simulator:

2 cells (cell A, cell B), GPRS supported, PBCCH not present (Carrier 1 is active. Carrier 2 is off)

Mobile Station:

MS is off.

42.4.4.3 Network Control measurement reporting / Idle mode / Returning to Broadcast parameters

42.4.4.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

3GPP TS 05.08, subclause 10.1.4

42.4.4.3.2 Test Purpose

To verify that individual parameters are valid only until the MS goes to Stand-by State. MS returns to broadcast parameters once it enters the Stand-by State and uses the broadcast parameters if it again goes to ready state.

42.4.4.3.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS assigns a single block downlink TBF to MS and sends PACKET MEASUREMENT ORDER changing the NC mode from NC0 to NC2. SS then receives PACKET MEASUREMENT REPORTS until the READY TIMER expires. SS then waits for 30 sec and checks that the MS is not sending any more PACKET MEASUREMENT REPORTs. SS pages the MS to bring the MS into ready state and receives the page response by giving the uplink TBF. SS then assigns a downlink TBF and checks that the MS is not sending any PACKET MEASUREMENT REPORTs.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	SS establishes a single block downlink TBF.
2	SS -> MS	PACKET MEASUREMENT ORDER	Sent on the blocks assigned in step 1. PMO message contains Network Control Order 2 (See the specific message content)
3	MS -> SS	CHANNEL REQUEST	With establishment cause 'single block access'. After the second execution of the step: SS verifies that CHANNEL REQUEST arrives after NC_REPORTING_PERIOD_I from last measurement report.
4	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 1seconds.
5	MS -> SS	PACKET MEASUREMENT REPORT	Received on the assigned block.
6	SS		Steps 3-5 are repeated until the expiry of READY TIMER.
7	SS		SS waits for 30 sec, checks that the MS is not sending any more measurement reports.
8	SS -> MS	PAGING REQUEST TYPE 1	Page info contains P-TMSI of the MS. Sent on PCH.
9	MS->SS	CHANNEL REQUEST	Establishment cause = "One phase access". Received on RACH.
10	SS -> MS	IMMEDIATE ASSIGNMENT	Random Reference = pertaining to the message received in step 9. Dynamic allocation for RLC data blocks, Sent on AGCH.
11	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
12	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 10.
13	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block, with FAI=1, Containing contention resolution TLLI. Sent on uplink PACCH. Valid RRBP.
14	MS ->SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on uplink PACCH.
15	SS -> MS	IMMEDIATE ASSIGNMENT	SS initiates a data transfer of 1000 octets. Sent on PCH. Downlink Assignment, TLLI value as received. Sent on PCH.
16	MS ->SS	Completion of macro {Downlink data transfer}	SS completes downlink transfer of 1000 octets of data. SS checks that the MS has not sent any PACKET MEASUREMENT REPORT during the TBF.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T	 10 (NC2) 100 (7.68 s) 000 (0.48 s)

42.4.4.4 Void

42.4.4.5 Network Control measurement reporting / Idle mode / Reselection due to RA failure

42.4.4.5.1 Conformance Requirement

Having made M + 1 attempts to send a PACKET CHANNEL REQUEST (respectively EGPRS PACKET CHANNEL REQUEST) message, the mobile station shall stop timer T3186 and start timer T3170. At expiry of timer T3170, the packet access procedure shall be aborted, a random access failure shall be indicated to upper layer and the mobile station shall perform autonomous cell re-selection according to 3GPP TS 43.022.

The MS shall only perform autonomous cell re-selection when the reselection is triggered by a downlink signalling failure as defined in subclause 6.5 or a random access failure as defined in 3GPP TS 44.018 and 3GPP TS 44.060.

Reference

3GPP TS 44.060, subclause 3.5.2.1.2.

3GPP TS 45.008, subclause 10.1.4

42.4.4.5.2 Test Purpose

To verify that while in NC2, MS performs autonomous cell reselection when the reselection is triggered by the random access failure.

42.4.4.5.3 Method of test

Initial conditions

System Simulator:

2 cell, GPRS supported.

Parameter	Carrier1	Carrier2
RF Signal Level (dBm)	-60	-70
NETWORK_CONTROL_ORDER	NC2	NC2
NC_REPORTING_PERIOD_I	Default	Default

Mobile Station:

MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated. Ready timer is set to 5 min.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

MS is in packet idle mode on carrier 1. MS sends a CHANNEL REQUEST for sending the measurement report. SS assigns resources for it. MS sends a PACKET MEASUREMENT REPORT. MS is triggered to send uplink data. MS sends (MAX_RETRANS+ 1) CHANNEL REQUESTs. SS does not respond to it. SS checks that after sending M + 1 channel requests MS does reselection and reselects to carrier 2.

Maximum duration of the test

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	SS establishes a single block downlink TBF.
2	SS -> MS	PACKET MEASUREMENT ORDER	Sent on the blocks assigned in step 1. PMO message contains Network Control Order 2 (See the specific message content)
3	MS->SS	CHANNEL REQUEST	With establishment cause 'single block access'.
4	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH, assigning a single block.
5	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH. The SS verifies that the measurement results for cells A, B are included in it.
6			Steps 3-5 repeated once again.
7	SS		SS Checks that the measurements of cell A and B are included in the PACKET MEASUREMENT REPORT.
8	MS		MS is triggered to send 1000 octets of uplink data.
9	MS -> SS	CHANNEL REQUEST	With establishment cause ‘one phase access' or 'two phase access'
10	MS ->SS	CHANNEL REQUEST	With establishment cause 'one phase access' or 'two phase access'
11	SS		MS sends M+1 CHANNEL REQUESTS but SS does not respond to it.
12	MS -> SS	CHANNEL REQUEST	Received on cell B.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	110 (30.72 s)
NC_REPORTING_PERIOD_T	000 (0.48 s)

42.4.5 Network Assisted Cell Change

42.4.5.1 Network Assisted Cell Change / Expiry of T3206

42.4.5.1.1 Conformance requirements

[3GPP TS 44.060, 8.1.3]

If CCN is enabled (see subclause 5.5.1.1a, 3GPP TS 44.160 subclause 5.4.1.3), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or PACKET CELL CHANGE ORDER messages.

If it is available and if it indicates that CCN mode shall not be entered towards that cell, then the mobile station shall perform the cell change and not enter CCN mode.

If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210.

The mobile station shall retransmit the PACKET CELL CHANGE NOTIFICATION message once at the first possible opportunity when the timer T3210 expires.

The mobile station shall leave CCN mode when either CCN is no longer enabled (towards all neighbour cells with the CCN_ACTIVE bit or towards the cell that had been re-selected) or when the network has responded with a PACKET CELL CHANGE CONTINUE or PACKET CELL CHANGE ORDER message or when either of the timers T3206 or T3208 have expired.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.1.2 Test purpose

To verify that the MS leaves the CCN mode and continues cell reselection in NC0 mode when T3206 expires.

42.4.5.1.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink data transfer. SS then waits 4 seconds and lower the signal strength of Cell A to – 80 dBm. The MS will enter CCN mode, and when T3206 expires it will leave CCN mode and continue cell reselection in NC0 mode. The MS change cell and perform a Cell update in the new cell.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	RLC mode: acknowledged, without starting time.
2	SS -> MS	DOWNLINK RLC DATA BLOCK	No valid RRBP
3	SS		SS waits 4 seconds.
4	SS -> MS	DOWNLINK RLC DATA BLOCK	No valid RRBP
5			Lower signal strength of Cell A to – 80 dBm.
6	SS		SS waits 4 seconds.
7	SS -> MS	DOWNLINK RLC DATA BLOCK	No valid RRBP Step 6 and 7 are repeated until the MS access Cell B, but no longer than for 15 seconds. The test has failed if the MS has not accessed Cell B within 15 sec from Step 5.
			The following messages are to be sent and received in Cell B.
8		{Uplink dynamic allocation one phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
9		{Completion of uplink RLC data block transfer}	MS performs a Cell Update.

Specific message contents

None.

42.4.5.2 Network Assisted Cell Change / No Packet Neighbouring Cell Data and Packet Cell Change Continue

42.4.5.2.1 Conformance requirements

[3GPP TS 44.060, 8.1.1]

The mobile station shall transmit RLC/MAC blocks with the following priority:

- RLC/MAC control blocks containing a Packet Cell Change Notification message;
- Other RLC/MAC control blocks, except Packet Uplink Dummy Control Blocks;
- RLC data blocks;
- RLC/MAC control blocks containing Packet Uplink Dummy Control Blocks.

[3GPP TS 44.060, 8.1.2.2]

Whenever the mobile station receives an RLC data block addressed to itself and with a valid RRBP field in the RLC data block header (i.e., is polled), the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the uplink radio block specified by the RRBP field whatever the BSN value of the received RLC data block, unless another RLC/MAC control message is waiting to be transmitted, in which case the other RLC/MAC control message shall be sent. Among the other RLC/MAC control blocks the PACKET CELL CHANGE NOTIFICATION message shall be sent with highest priority. However, the mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled. Furthermore the mobile station shall not transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message if the PACKET DOWNLINK ACK/NACK message would contain a Final Ack Indicator or Channel Request Description IE. The mobile station shall not send a PACKET CONTROL ACKNOWLEDGEMENT message unless otherwise specified.

[44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

1) The network responds with a PACKET CELL CHANGE CONTINUE message.
If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode.

References

3GPP TS 44.060, subclause 8.1.1, 8.1.2.2 and 8.8.3

42.4.5.2.2 Test purpose

1) To verify that MS sends a PACKET CELL CHANGE NOTIFICATION when it enters CCN mode.

2) To verify that MS leaves CCN mode and continues cell reselection in NC0 mode when a PACKET CELL CHANGE CONTINUE is received when no PACKET NEIGHBOUR CELL DATA has been received.

42.4.5.2.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

42.4.5.3 Void

42.4.5.4 Network Assisted Cell Change / Packet Neighbour Cell Data and Packet Cell Change Order

42.4.5.4.1 Conformance requirements

[3GPP TS 44.060, 5.5.1.4.3]

A mobile station supporting the Network Assisted Cell Change procedures shall implement the request for acquisition of system information (see clause 5.5.1.1a).

The PACKET PSI STATUS (respectively PACKET SI STATUS) message shall indicate the present status of PSI (respectively SI) messages stored in or requested but not received by the mobile station. The mobile station shall include as many PSI (respectively SI) message types that fit into the *Received PSI Message List* (respectively *Received SI Message List*) construction in the PACKET PSI STATUS (respectively PACKET SI STATUS) message and that meet the following criteria: The PACKET PSI STATUS (respectively PACKET SI STATUS) message is sent on PACCH when the mobile station is in packet transfer mode. The first sending of this message during the acquisition of PBCCH (respectively BCCH) information shall take place at the first suitable opportunity after the acquisition is initiated:

- The PSI (respectively SI) message type is relevant for the mobile station, based on the features the mobile station supports (e.g. non-GSM and multi-RAT capabilities); and

- In case of optional PSI (respectively SI) messages types, the PSI (respectively SI) message type shall be indicated by the network as present on PBCCH (respectively BCCH).

If the presence of an optional PSI (respectively SI) message type cannot be determined, based on the information received, the mobile station shall assume that the optional PSI (respectively SI) message type is present.

NOTE 1: On PBCCH, the presence of optional PSI messages is indicated in PSI1 and PSI2.

NOTE 2: On BCCH, SI2, SI3, SI4 and, if present, SI9 indicate the presence of optional SI messages, except SI1. The presence of SI1 can be determined by reading the BCCH Norm block at TC = 0.

The message type value for these PSI (respectively SI) messages shall be included in the *Received PSI Message List* (respectively *Received SI Message List*) in the PACKET PSI STATUS (respectively PACKET SI STATUS) message. The network may use this information to determine which PSI (respectively SI) message types the mobile station is able to receive and the present status of the PSI (respectively SI) messages stored in the mobile station.

[3GPP TS 44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

3) The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (clause 8.4) and in clause 8.8.1.

References

3GPP TS 44.060, subclause 5.5.1.4.3 and 8.8.3

42.4.5.4.2 Test purpose

1. To verify that the MS applies CCN when CCN is indicated in SI13 of the serving cell by sending a PACKET CELL CHANGE NOFITICATION when deciding to make a cell reselection.

2. To verify that MS leaves CCN mode when it receives a PACKET CELL CHANGE ORDER and follows the procedures as specified in the PACKET CELL CHANGE ORDER.

3. To verify that MS uses the System Information received in PACKET NEIGHBOUR CELL DATA when accessing the new cell.

4. To verify that MS requests remaining System Information messages when having accessed the new cell by sending PACKET SI STATUS.

42.4.5.4.3 Method of test

Initial conditions

System Simulator:

3 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: The indication of Cell C is removed in SI2. RLA_C = -50 dBm

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm

Cell C: The cell is not active at the start of the test.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledges. During the uplink the signal strength of cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send uplink data. SS sends a complete set of PACKET NEIGHBOUR CELL DATA with SI1, SI3 and SI13 of Cell B to the MS. The SS then sends a PACKET CELL CHANGE ORDER that orders the MS to change to Cell B.

The MS requests resources for an uplink in the Cell B and continues the uplink. The MS then requests the remaining SI messages by sending PACKET SI STATUS(Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages). SS verifies that the MS indicates that it has received the SI sent in PACKET NEIGHBOUR CELL DATA. SS sends the missing SI to the MS in PACKET SERVING CELL DATA messages during the uplink.

To ensure that the MS has received the requested SI, Cell A is deactivated and Cell C is activated with signal strength set to – 50 dBm. The signal strength of cell B is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The SS then sends PACKET CELL CHANGE ORDER and the MS changes to Cell C. The MS requests resources for an uplink in the new cell and re-establishes and completes the uplink transfer in the new cell.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access or two phase access }	n = 10000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	RLC DATA BLOCK	
4	SS -> MS	PACKET UPLINK ACK/NACK	
5	SS		Lower signal strength of Cell A to –80 dBm.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION	
8	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
9			Steps 7 and 8 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 7, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 5.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
11	MS -> SS	RLC DATA BLOCK	
12	SS -> MS	PACKET NEIGHBOUR CELL DATA	See specific message contents
13			Step 10 to 12 are repeated until all instances of PACKET NEIGHBOUR CELL DATA are sent.
14	SS -> MS	PACKET CELL CHANGE ORDER	See specific message contents
			The following messages are to be sent and received in Cell B.
15		{Uplink dynamic allocation one phase access or two phase access }	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS

17	MS -> SS	RLC DATA BLOCK Or PACKET SI STATUS Or PACKET RESOURCE REQUEST	
			Step 18 is performed only if a PACKET RESOURCE REQUEST is received in Step 17.
18	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 15. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 17
19	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
20			Steps 17 to 19 are repeated until both a PACKET SI STATUS and an RLC Data Block are received in step 17. The Packet SI Status shall be sent within 10 sec of accessing the cell. Verify that the MS not requests SI that was sent in step 12. Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages If the RLC DATA BLOCK with BSN = 0 received in Step 17 contains an empty LLC PDU as the first LLC PDU, Steps 17 to 19 are further repeated until a PACKET RESOURCE REQUEST is received in Step 17. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
21	SS -> MS	PACKET SERVING CELL DATA	See specific message contents
22			Step 21 is repeated until all instances of PACKET SERVING CELL DATA are sent.
23	SS		Cell A is deactivated and Cell C is activated and set to – 50 dBm.
24	SS		Lower signal strength of Cell B to –80 dBm.
25	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS

26	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION Or PACKET SI STATUS	
27	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
28			Steps 26 and 27 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 26, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell B within 15 sec from Step 24.
29	SS -> MS	PACKET CELL CHANGE ORDER	See specific message contents
			The following messages are to be sent and received in Cell C.
30		{Uplink dynamic allocation one phase access or two phase access }	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
31	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
32	MS -> SS	RLC DATA BLOCK Or PACKET RESOURCE REQUEST	
			Step 33 is performed only if a PACKET RESOURCE REQUEST is received in Step 32.
33	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 30. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 32.
34	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
35			If the RLC DATA BLOCK with BSN = 0 received in Step 32 contains an empty LLC PDU as the first LLC PDU, Steps 32 to 34 are repeated until a PACKET RESOURCE REQUEST is received in Step 32. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
36		Completion of {Uplink dynamic allocation}

42.4.5.5 Network Assisted Cell Change / Expiry of T3208 and T3210

42.4.5.5.2 Conformance requirements

[3GPP TS 44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

5) No network response
When timer T3210 expires, the mobile station shall retransmit once the PACKET CELL CHANGE NOTIFICATION message at the first possible opportunity.
When timer T3208 expires, the mobile station shall leave CCN mode and continue cell reselection in NC0/NC1 mode as described in clause 5.5.1.1 and in [15].

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.5.2 Test purpose

1. To verify that the MS retransmits the PACKET CELL CHANGE NOTIFICATION when T3210 expires 300 ms after no reception of any PACKET NEIGHBOUR CELL DATA, PACKET CELL CHANGE CONTINUE, PACKET MEASURMENT ORDER or PACKET CELL CHANGE ORDER.

2. To verify that MS leaves CCN mode when T3208 expires and continues cell reselection in NC0 mode.

42.4.5.5.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION and starts timer T3208 and T3210. The MS then continues to send uplink data. When timer T3210 expires, the MS retransmits PACKET CELL CHANGE NOTIFICATION once. When timer T3208 expires, the MS leaves CCN mode and performs cell reselection in NC0 mode. The MS change to Cell B and complete the upload.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access or two-phase access}	n = 5000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	RLC DATA BLOCK	
4	SS -> MS	PACKET UPLINK ACK/NACK	USF NOT assigned to the MS
5	SS		Lower signal strength of Cell A to –80 dBm.
6	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION	PCCN Sending = 0 (First sending)
8	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
9			Step 7 and 8 are repeated until the first PACKET CELL CHANGE NOTIFICATION is received in step 7, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 5.
10	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
11	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION	Sent at expiry of T3210. PCCN Sending = 1 (Second sending) SS shall schedule USF often enough so T3210 timer requirement can be met.
12	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
13			Step 11 and 12 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 11. It is verify that the PACKET CELL CHANGE NOTIFICATION was sent after expiry of T3210 - 10% from the previous PCCN received in Step 7.
14	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
15	MS -> SS	RLC DATA BLOCK	
16	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
17			Steps 15 and 16 are repeated for at least T3208 (0.96 sec) from the first PCCN sending (in step 7) but no more than 5 sec.
18	SS		SS verifies that no more RLC DATA BLOCKS are received from the MS.
			The following messages are to be sent and received in Cell B.
19		{Uplink dynamic allocation one phase or two-phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
21	MS -> SS	RLC DATA BLOCK Or PACKET RESOURCE REQUEST	
			Step 22 is performed only if a PACKET RESOURCE REQUEST is received in Step

			21.
22	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 19. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 21.
23	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
24			If the RLC DATA BLOCK with BSN = 0 received in Step 21 contains an empty LLC PDU as the first LLC PDU, Steps 21 to 23 are repeated until a PACKET RESOURCE REQUEST is received in Step 21. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
25		{Completion of uplink RLC data block transfer}	

Specific message contents

None.

42.4.5.6 Network Assisted Cell Change / Entering packet idle mode

42.4.5.6.1 Conformance requirements

[3GPP TS 44.060, 8.8.3]

The CCN mode is only valid in Packet Transfer Mode. If the mobile station is in CCN mode when entering packet idle mode, the mobile station shall stop the timers T3206 and T3208, stop timer T3210 if still running, leave CCN mode and continue the cell reselection procedure according to the NC0/NC1 procedures. If PACKET NEIGHBOUR CELL DATA messages are received on the PACCH before entering packet idle mode and the cell identity parameters are included, this information may then be used at the next cell change.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.6.2 Test purpose

To verify that the MS continues according to the normal packet idle mode cell reselection procedures when leaving CCN mode and entering packet idle mode.

42.4.5.6.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

T3192 = 0 ms

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink TBF and sends 4 RLC data blocks, the last one containing FBI = 0 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK. The signal strength of Cell A is lowered to –80 dBm. The downlink continues until MS sends PACKET CELL CHANGE NOTIFICATION. SS sends a RLC block that contains FBI = 1 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK containing FINAL_ACK_INDICATION = 1. The MS leaves CCN mode and enters packet idle mode and performs cell reselection in NC0 mode. The MS performs a Cell update in the new cell.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	RLC mode: acknowledged, without starting time.
2	SS -> MS	DOWNLINK RLC DATA BLOCK	
3	SS -> MS	DOWNLINK RLC DATA BLOCK	
4	SS -> MS	DOWNLINK RLC DATA BLOCK	
5	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
7			Lower signal strength of Cell A to –80 dBm.
8	SS -> MS	DOWNLINK RLC DATA BLOCK	
9	SS -> MS	DOWNLINK RLC DATA BLOCK	
10	SS -> MS	DOWNLINK RLC DATA BLOCK	
11	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
12	MS -> SS	PACKET DOWNLINK ACK/NACK Or PACKET CELL CHANGE NOTIFICATION	
13			Steps 8 to 12 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 12, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 7.
14	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=1 and a valid RRBP.
15	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH and contains FINAL_ACK_INDICATION = 1.
			The following messages are to be sent and received in Cell B.
16		{Uplink dynamic allocation one phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
17		{Completion of uplink RLC data block transfer}	MS performs a Cell Update.

Specific message contents

None.

42.4.5.7 Network Assisted Cell Change / CCN not supported towards target cell

42.4.5.7.1 Conformance requirements

The SI2quater message may also contain information, the CCN Support description, to be used when CCN is enabled in the serving cell, see 3GPP TS 44.060. This CCN Support description is associated with the Neighbour Cell list (see 3.4.1.2.1.3) having the same BA_IND value and 3G_BA_IND value. Each CCN_SUPPORTED bit of this field relates to indices of the Neighbour Cell list, starting with index 0. The CCN Support description may be received before the corresponding Neighbour Cell list.

Indices exceeding the value 95 or the number of cells in the Neighbour Cell List shall be ignored. If there are fewer indices than the number of cells in the Neighbour Cell List, the value 0 shall be assumed for the missing bits.

When this information is not present but CCN is enabled in the serving cell, the mobile station shall assume that CCN is enabled towards all neighbour cells.

References

3GPP TS 44.018, subclause 3.4.1.2.1.8

42.4.5.7.2 Test purpose

To verify that the MS does not apply CCN on a target cell when the CCN support description not is set for that cell.

42.4.5.7.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Cell A: CCN Active. SI3 indicates SI2quater broad cast on BCCH norm. SI2quater contains a CCN Support Description indicating that CCN not is supported towards Cell B. RLA_C = -50 dBm

Cell B: CCN Active. RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is given time to read all SI including SI2quater in idle mode.

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode but does not send any PACKET CELL CHANGE NOTIFICATION. The MS continues to send uplink data. After w while, the MS selects cell B. The MS requests resources for an uplink in cell B and completes the uplink transfer.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access or two phase access}	n = 5000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
2	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
3	MS -> SS	RLC DATA BLOCK	
4	SS -> MS	PACKET UPLINK ACK/NACK	
5	SS		Lower signal strength of Cell A to –80 dBm.
6	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
7	MS -> SS	RLC DATA BLOCK	
8	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS .
9			Step 7 and 8 are repeated until the MS access Cell B, but no longer than 18 sec. The test has failed if the MS sends data after 18 sec from Step 5. The test has failed if a PACKET CELL CHANGE NOTIFICATION is received in Cell A or if the MS has not accessed Cell B within 20 sec from Step 5.
			The following messages are to be sent and received in Cell B.
10		{Uplink dynamic allocation one phase access or two phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
12	MS -> SS	RLC DATA BLOCK Or PACKET RESOURCE REQUEST	
			Step 13 is performed only if a PACKET RESOURCE REQUEST is received in Step 12.
13	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 10. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 12.
14	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
15			If the RLC DATA BLOCK with BSN = 0 received in Step 12 contains an empty LLC PDU as the first LLC PDU, Steps 12 to 14 are repeated until a PACKET RESOURCE REQUEST is received in Step 12. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
16		Completion of {Uplink dynamic allocation}

42.4.5.8 Network Assisted Cell Change / NC mode change

42.4.5.8.1 Conformance requirements

[3GPP TS 44.060, 8.8.3 & 4)]

The network orders the mobile station into NC2 mode.
A mobile station may in response to a PACKET CELL CHANGE NOTIFICATION message sent to the network receive a PACKET MEASUREMENT ORDER message indicating NC2 mode. When the mobile station receives the NC2 order it shall leave CCN mode, stop timer T3208, stop timer T3210 if still running, and go into NC2 mode.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.8.2 Test purpose

To verify that the MS leaves the CCN mode and enters NC2 mode on receipt of Packet Measurement Order and the NC2 parameters.

42.4.5.8.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink TBF and sends 4 RLC data blocks, the last one containing FBI = 0 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK. The signal strength of Cell A is lowered to – 80 dBm. The downlink continues until MS sends PACKET CELL CHANGE NOTIFICATION. SS sends PACKET MEASUREMENT ORDER setting NC2 and then sends RLC data blocks, regularly polling the MS with a valid RRBP, and verifies that the MS has entered NC2 mode: the MS leaves CCN mode, starts reporting measurements and does not perform any cell reselection on its own as required in NC2.

Expected sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	RLC mode: acknowledged, without starting time.
2	SS -> MS	DOWNLINK RLC DATA BLOCK	
3	SS -> MS	DOWNLINK RLC DATA BLOCK	
4	SS -> MS	DOWNLINK RLC DATA BLOCK	
5	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
7			Lower signal strength of Cell A to –80 dBm.
8	SS -> MS	DOWNLINK RLC DATA BLOCK	
9	SS -> MS	DOWNLINK RLC DATA BLOCK	
10	SS -> MS	DOWNLINK RLC DATA BLOCK	
11	SS -> MS	DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
12	MS -> SS	PACKET DOWNLINK ACK/NACK Or PACKET CELL CHANGE NOTIFICATION	Sent on PACCH.
13			Step 8 to 12 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 12, but no longer than 10 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 10 sec from Step 7.
14	SS->MS	PACKET MEASUREMENT ORDER	-Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_T See specific message contents
15	SS -> MS	10 RLC data blocks	SS sends data, last block is polling.
16	MS -> SS	PACKET DOWNLINK ACK/NACK Or PACKET MEASUREMENT REPORT	Sent on PACCH. PACKET MEASUREMENT REPORT Contains the "NC measurement report struct" on PACCH
17			Repeat steps 15 to 16 until two PMRs are received.
18	SS -> MS	10 RLC data blocks	SS sends data, last block is polling.
19	MS -> SS	PACKET DOWNLINK ACK/NACK Or PACKET MEASUREMENT REPORT	Sent on PACCH. PACKET MEASUREMENT REPORT Contains the "NC measurement report struct" on PACCH
20			Repeat steps 18 to 19 during 10s.
21	SS -> MS	DOWNLINK RLC DATA BLOCK	FBI bit set to '1' and valid RRBP field
22	MS -> SS	PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBP field. Final Ack Indicator bit set to '1'

Specific message contents

42.4.5.9 Network Assisted Cell Change / NC mode change / Packet Neighbour Cell Data

42.4.5.9.1 Conformance requirements

[3GPP TS 44.060, 8.8.3 & 4)]

The network orders the mobile station into NC2 mode.
A mobile station may in response to a PACKET CELL CHANGE NOTIFICATION message sent to the network receive a PACKET MEASUREMENT ORDER message indicating NC2 mode. When the mobile station receives the NC2 order it shall leave CCN mode, stop timer T3208, stop timer T3210 if still running, and go into NC2 mode.
When the NC2 mode has been ordered, the network may send PACKET NEIGHBOUR CELL DATA messages on the PACCH before sending the PACKET CELL CHANGE ORDER to the mobile station.

42.4.5.9.2 References

3GPP TS 44.060, subclause 5.5.1.4.3 and 8.8.3

42.4.5.9.3 Test purpose

1. To verify that MS leaves CCN mode when it receives a PACKET MEASUREMENT ORDER activating NC2 and follows the NC2 procedures.

2. To verify that MS uses the System Information received in PACKET NEIGHBOUR CELL DATA when accessing the new cell.

3. To verify that MS requests remaining System Information messages when having accessed the new cell by sending PACKET SI STATUS.

42.4.5.9.4 Method of test

42.4.5.9.4.1 Initial conditions

System Simulator:

3 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: The indication of Cell C is removed in SI2. RLA_C = -50 dBm

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm. PSI13 shall be transmitted during transfer mode on cell B to prevent any TBF suspension.

Cell C: The cell is not active at the start of the test.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

42.4.5.9.4.2 Void

42.4.5.9.4.3 Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and the MS starts to send uplink data that the SS acknowledges. During the uplink transfer, the signal strength of cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send uplink data.

SS sends a Packet Measurement Order providing the MS with NC2 parameters. MS starts sending Packet Measurement Reports. SS then sends a complete set of PACKET NEIGHBOUR CELL DATA with SI1, SI3 and SI13 of Cell B to the MS. SS then sends a PACKET CELL CHANGE ORDER that orders the MS to change to Cell B.

The MS requests resources for an uplink transfer in Cell B and continues the uplink transfer. The MS then requests the remaining SI messages by sending PACKET SI STATUS(Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages). SS verifies that the MS indicates that it has received the SI sent in PACKET NEIGHBOUR CELL DATA. SS sends the missing SI to the MS in PACKET SERVING CELL DATA messages during the uplink transfer.

To ensure that the MS has received the requested SI, Cell A is deactivated and Cell C is activated with signal strength set to – 60 dBm. The signal strength of cell B is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The SS then sends PACKET CELL CHANGE ORDER and the MS changes to Cell C. The MS requests resources for an uplink transfer in the new cell and re-establishes and completes the uplink transfer in the new cell.

Expected sequence

Step	Direction	**Message**	**Comments**
1		{uplink dynamic allocation one phase access} or {uplink dynamic allocation two phase access}	n = 10000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
3	MS -> SS	RLC DATA BLOCK	
4	SS -> MS	PACKET UPLINK ACK/NACK	
5	SS		Lower signal strength of Cell A to –80 dBm.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
7	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION	
8	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS.
9			Steps 7 and 8 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 7, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 5.
10	SS->MS	PACKET MEASUREMENT ORDER	-Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_T See specific message contents
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
12	MS -> SS	RLC data block OR PACKET MEASUREMENT REPORT	MS sends data Or PACKET MEASUREMENT REPORT - Sent on PACCH. - Contains the "NC measurement report struct" on PACCH
13			Repeat steps 11 to 12 during T3158+2s
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
15	MS -> SS	RLC data block or PACKET MEASUREMENT REPORT	MS sends data or a PACKET MEASUREMENT REPORT
16	SS -> MS	PACKET NEIGHBOUR CELL DATA	See specific message contents
17			Step 14 to 16 are repeated until all instances of PACKET NEIGHBOUR CELL DATA are sent.
18	SS -> MS	PACKET CELL CHANGE ORDER	See specific message contents
			The following messages are to be sent and received in Cell B.
19		{uplink dynamic allocation one phase access} or {uplink dynamic allocation two phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.

21	MS -> SS	RLC DATA BLOCK Or PACKET SI STATUS Or PACKET RESOURCE REQUEST	
			Step 22 is performed only if a PACKET RESOURCE REQUEST is received in Step 21.
22	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 19. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 21.
23	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
24			Steps 21 to 23 are repeated until both a PACKET SI STATUS and an RLC Data Block are received in step 21. The Packet SI Status shall be sent within 10 sec of accessing the cell. Verify that the MS not requests SI that was sent in step 16. Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages. If the RLC DATA BLOCK with BSN = 0 received in Step 21 contains an empty LLC PDU as the first LLC PDU, Steps 21 to 23 are further repeated until a PACKET RESOURCE REQUEST is received in Step 21. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
25	SS -> MS	PACKET SERVING CELL DATA	See specific message contents
26			Step 25 is repeated until all instances of PACKET SERVING CELL DATA are sent.
27	SS		Cell A is deactivated and Cell C is activated and set to –60 dBm.
28	SS		Lower signal strength of Cell B to –80 dBm.
29	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
30	MS -> SS	RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION Or PACKET SI STATUS	
31	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS.
32			Steps 30 and 31 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 30, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell B within 15 sec from Step 28.
33	SS -> MS	PACKET CELL CHANGE ORDER	See specific message contents
			The following messages are to be sent and received in Cell C.

34		{uplink dynamic allocation one phase access} or {uplink dynamic allocation two phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present.
35	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
36	MS -> SS	RLC DATA BLOCK Or PACKET RESOURCE REQUEST	
			Step 37 is performed only if a PACKET RESOURCE REQUEST is received in Step 36.
37	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in Step 34. Send PACKET DOWNLINK DUMMY CONTROL BLOCK with USF assigned to the MS and continue with step 36..
38	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
39			If the RLC DATA BLOCK with BSN = 0 received in Step 36 contains an empty LLC PDU as the first LLC PDU, Steps 36 to 38 are repeated until a PACKET RESOURCE REQUEST is received in Step 36. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
40		Completion of {Uplink dynamic allocation}

42.4.6 Packet Enhanced Measurement Report (PEMR)

42.4.6.1 Network Control PEMR – Activation with SI Messages

42.4.6.1.1 Conformance requirement

1 The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network. The condition for sending the PACKET ENHANCED MEASUREMENT REPORT message instead of the PACKET MEASUREMENT REPORT message is based on the REPORT_TYPE parameter and if the MS has received BSIC information for all cells.

2 In packet idle mode, the reporting period is NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING PERIOD_I is greater than DRX period, else, the reporting period is DRX period

Reference:

3GPP TS 04.60 / 3GPP TS 44.060 subclause 5.6.1

3GPP TS 05.08 / 3GPP TS 45.008 subclause 10.1.4.1

42.4.6.1.2 Test purpose

To verify that the MS sends PEMR following the report type and according to the indicated reporting periods covering GSM neighbour list specified in SI2quater.

42.4.6.1.3 Method of test

Initial conditions

Transmitter	RF Signal Level (dBm)	NCC	BCC	Cell Identity
Serving, S1	-60	1	3	0001H
Neighbour, N1	-70	1	5	0002H

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 GPRS cells configured as GPRS cells with SI2 quater giving all adjacent cell configuration and GPRS PEMR parameters. SI13 and SI2quater indicate that Network Control Order is NC2. BCCH allocation sequence number(BA_IND) = 1

Mobile Station:

MS is Idle Updated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is powered on and Attach procedure is completed. The negotiated Ready Timer value in ATTACH ACCEPT indicates the ready timer function is active for 60 seconds. When the measurement reporting time becomes valid, the MS sends a CHANNEL REQUEST message indicating 'Single block packet access' on RACH. The network shall then respond with an IMMEDIATE ASSIGNMENT message granting a 'single block access' on a PDCH. The mobile station shall then send the PACKET ENHANCED MEASUREMENT REPORT message in the allocated radio block on the assigned PDCH as indicated in the Measurement Parameters struct.

Maximum duration of the test

3 minutes

Expected Sequence

Step	Direction	Message	Comments
1		{Attach procedure}	-MS is GPRS attached with PTMSI allocated -Ready timer is set to 60 seconds
2	MS->SS	CHANNEL REQUEST	-Sent on RACH. -Cause 'Single block packet access'
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4A (optional)	MS -> SS	PACKET MEASUREMENT REPORT	Optionally sent once after Attach procedure
4B	MS -> SS	PACKET ENHANCED MEASUREMENT REPORT	Sent on the allocated PDCH
5			Repeat steps 2, 3 and 4B until expiry of the Ready timer. The SS verifies that the interval between two subsequent PEMR messages corresponds to the reporting period +/- 10%. The reporting period is calculated from NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period.
6	SS		Verify that the mobile stops sending PEMR after Ready timer expiry.

Mobile Station:

MS is Idle Updated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is powered on and Attach procedure is completed. The negotiated Ready Timer value in ATTACH ACCEPT indicates the ready timer function is active for 32 seconds. A Packet Measurement Order is sent to the MS changing the scale order parameter as well as measurement reporting period. When the measurement reporting time becomes valid, the MS sends a CHANNEL REQUEST message indicating 'Single block without TBF establishment' on RACH. The network shall then respond with either a IMMEDIATE ASSIGNMENT message granting a ' Single block without TBF establishment' on a PDCH. The mobile station shall then send the PACKET ENHANCED MEASUREMENT REPORT message in the allocated radio block on the assigned PDCH as indicated in the Measurement Information struct.

Maximum duration of the test

3 minutes

Expected Sequence

Step	Direction	Message	Comments
1		{Attach procedure}	-MS is GPRS attached with PTMSI allocated -Ready timer is set to 32 seconds
2	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on PCH
3	SS->MS	PACKET MEASUREMENT ORDER	-Scale Order changed to 1 -Measurement Reporting time changed to 7.68 secs Sent on PACCH
4	MS->SS	CHANNEL REQUEST	-Cause 'Single block without TBF establishment'
5	SS -> MS	IMMEDIATE ASSIGNMENT	
6	MS -> SS	PACKET ENHANCED MEASUREMENT REPORT	Sent on the allocated PDCH Scale = 1
7			Repeat steps 4, 5 and 6 until expiry of the Ready timer. The SS verifies that the interval between two subsequent PEMR messages corresponds to the reporting period +/- 10%. The reporting period is calculated from NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period.
8	SS		Verify that the mobile stops sending PEMR after Ready timer expiry.

42.4.6.4 Network Control PEMR – Uplink Data Transfer

42.4.6.4.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station .

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

The procedure for NC measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send either the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' or the PACKET ENHANCED MEASUREMENT REPORT on PACCH.

42.4.6.4.2 Test Purpose

To verify that the MS sends PEMR during uplink packet transfer according to the indicated reporting type and reporting periods specified in SI2quater.

To verify that the MS sends PEMR during uplink packet transfer according to the indicated reporting type and reporting period specified in Packet Measurement Order.

Reference

3GPP TS 04.60, subclauses 5.6.1, 8.3 and 8.5.

42.4.6.4.3 Method of test

Initial conditions

Transmitter	RF Signal Level (dBm)	NCC	BCC	Cell Identity
Serving, S1	-60	1	3	0001H
Neighbour, N1	-70	1	5	0002H

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 cells configured as GPRS cells with SI2 quater giving adjacent cell configuration and GPRS PEMR parameters. Network Control Order is NC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. MS sends data blocks until T3158 is expired and then sends PACKET ENHANCED MEASUREMENT REPORT. SS sends a PACKET MEASUREMENT ORDER message with new reporting parameters. MS sends continuously data blocks and PACKET ENHANCED MEASUREMENT REPORT messages according to the indicated reporting period in PACKET MEASUREMENT ORDER

The SS shall accept PACKET ENHANCED MEASUREMENT REPORT from the MS anytime during GPRS attach and PDP Context activation procedures.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access}	MS is brought into uplink packet transfer mode. Macro parameters: **USF_GRANULARITY**: 1 **RLC_DATA_BLOCKS_GRANTED**: absent (open-end) **CHANNEL_CODING_COMMAND**: CS-1 TLLI_BLOCK_CHANNEL_CODING: CS-1
2	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	RLC data block	MS sends data
4	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH, USF assigned to MS
5			Repeat steps 3 and 4 until PACKET ENHANCED MEASUREMENT REPORT is received.
6	MS->SS	PACKET ENHANCED MEASUREMENT REPORT	Sent on PACCH.
7	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
8	MS -> SS	RLC data block	MS sends data
9	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH, USF assigned to MS
10			Repeat steps 8 and 9 until PACKET ENHANCED MEASUREMENT REPORT is received.
11	MS->SS	PACKET ENHANCED MEASUREMENT REPORT	- Sent on PACCH. SS verifies that the time interval between steps 6 and 11 corresponds to the reporting period T3158 (indicated in SI2quater) +/- 10%.
12	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
13	MS -> SS	RLC data block	MS sends data.
14	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH, USF not assigned to MS
15	SS ->MS	PACKET MEASUREMENT ORDER	- Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_T with new reporting period. See specific message contents

42.4.6.5 Network Control PEMR – Downlink Data Transfer

42.4.6.5.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

The procedure for NC measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send either the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' or the PACKET ENHANCED MEASUREMENT REPORT on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT or PACKET ENHANCED MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

Reference

3GPP TS 44.060, subclauses 5.6.1, 8.3 and 8.5.

42.4.6.5.2 Test Purpose

To verify that the MS sends PEMR during downlink packet transfer according to the indicated reporting type and reporting periods specified in SI2 quater.

To verify that the MS sends PEMR during downlink packet transfer according to the indicated reporting type and reporting period specified in Packet Measurement Order.

42.4.6.5.3 Method of test

Initial conditions

Transmitter	RF Signal Level (dBm)	NCC	BCC	Cell Identity
Serving, S1	-60	1	3	0001H
Neighbour, N1	-70	1	5	0002H

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 cells configured as GPRS cells with SI2 quater giving adjacent cell configuration and GPRS PEMR parameters. Network Control Order is NC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached, Ready timer deactivated.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK. When reporting period has expired and at least two PACKET DOWNLINK ACK/NACK messages have been sent, MS sends a PACKET ENHANCED MEASUREMENT REPORT message. SS sends data blocks continuously and MS sends PACKET ENHANCED MEASUREMENT REPORT messages when reporting period has expired and at least one PACKET DOWNLINK ACK/NACK message has been sent after the last PACKET ENHANCED MEASUREMENT REPORT message.

The SS shall accept PACKET ENHANCED MEASUREMENT REPORT from the MS anytime during GPRS attach and PDP Context activation procedures.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS->MS	IMMEDIATE ASSIGNMENT	Downlink assignment. Sent on the PCH.

42.4.6.6 Network Control PEMR / Packet Cell Change Order

42.4.6.6.1 Conformance requirement

For (NC) measurement reporting, the Mobile Station shall use PACKET ENHANCED MEASUREMENT REPORT messages instead of PACKET MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each frequency in the BA(GPRS) list.

Reference:

3GPP TS 04.60 / 3GPP TS 44.060 5.6.1

42.4.6.6.2 Test purpose

To verify that the MS sends PEMR following the report type specified in Packet Cell Change Order.

42.4.6.6.3 Method of test

Initial conditions

Transmitter	RF Signal Level (dBm)	NCC	BCC	Cell Identity
Serving, S1	-60	1	3	0001H
Neighbour, N1	-70	1	5	0002H

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 GPRS cells A and B SI2quater includes GPRS MEASUREMENT PARAMETERS description. In both cells Network Control Order is NC2 and PMR shall be used.

Mobile Station:

MS is Idle Updated and GPRS attached. Ready timer set to 1min.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is brought into downlink transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK until at least one PACKET MEASUREMENT REPORT has been received.

SS sends then a PACKET CELL CHANGE ORDER message to MS ordering the MS to select Cell-B and to use NC2 and PEMR.

The MS performs a cell update.

MS is brought into downlink transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK until at least one PACKET ENHANCED MEASUREMENT REPORT has been received.

Maximum duration of the test

3 minutes

Expected Sequence

42.4.6.7 Void

42.4.7 Inter-RAT (GPRS to UTRAN) Cell Change Order

42.4.7.1 Inter-RAT Cell Change Order (Known Cell) – Uplink Data Transfer

42.4.7.1.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBP field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is know or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.1.2 Test Purpose

To verify the when NC2 is commanded, the MS sends PACKET ENHANCED MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS switches to the commanded UTRAN cell.

Reference

3GPP TS 04.60, subclause 8.4.

3GPP TS 25.331 subclause 8.3.10

42.4.7.1.3 Method of test

Initial conditions

System simulator:

2 cells - Cell A is GPRS, Cell B is UTRAN (activated at power ON)

3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

3GPP TS 34.123-3, subclause 8.3.2 shall be referenced for configuring channels on Cell 2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

42.4.7.2 Inter-RAT Cell Change Order (Unknown Cell) – Uplink Data Transfer

42.4.7.2.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBP field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is know or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.2.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS switches to the commanded UTRAN cell.

42.4.7.3 Inter-RAT Cell Change Order (Known Cell) – Downlink Data Transfer

42.4.7.3.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBP field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is know or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.3.2 Test Purpose

To verify that when the cell change order procedure is started when the MS receives PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1.

To verify that the MS switches to the commanded UTRAN cell.

42.4.7.4 Inter-RAT Cell Change Order (Known Cell) – Simultaneous uplink and downlink transfer

42.4.7.4.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBP field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is know or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.4.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS switches to the commanded UTRAN cell.

42.4.7.5 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure

42.4.7.5.1 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure / Uplink transfer / T3174 expiry

42.4.7.5.1.1 Conformance requirement

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The PACKET CELL CHANGE ORDER message commands the mobile station to a frequency in a frequency band not supported by the mobile station. *Cause:* "frequency not implemented".

- The PACKET CELL CHANGE ORDER message is received while a circuit switched connection is on going. *Cause:* "on-going CS connection".

- In *A/Gb mode*, the PACKET CELL CHANGE ORDER message is received and the GMM READY timer (see 3GPP TS 24.008) is not running (i.e., mobile station in GMM STAND-BY state). *Cause*, if the GMM READY timer has a negotiated value equal to zero: "Forced to the Standby State". *Cause*, if the GMM READY timer has a negotiated value greater than zero: "MS in GMM Standby state".

- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause:* "Immediate Assign Reject or Packet Access Reject on target cell".

- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause:* "No response on target cell".

- Due to any other reason (e.g. unknown or unsupported target cell information). In this case the MS shall set the ARFCN and BSIC fields to the value zero and set the cause to value "frequency not implemented".

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode, dual transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type "single block without TBF establishment" (PCCCH) / "single block packet access" (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

Reference

3GPP TS 044.060, subclause 8.4.2

42.4.7.5.1.2 Test Purpose

To verify that an MS in uplink packet transfer mode when commanded by a PACKET CELL CHANGE ORDER, reports a PACKET CELL CHANGE FAILURE on the old GPRS cell due to the expiry of T3174 before receiving response to RRC CONNECTION REQUEST on target UTRAN cell.

42.4.7.5.1.3 Method of test

Initial conditions

System Simulator:

- 2 cells, Cell A, GPRS Supported without PBCCH, NC2.

- Cell B is a UTRAN cell. UTRAN cell is the better cell of the two cells. It is activated after MS is GPRS attached to Cell A. 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell B except that T300 and N300 are to be set to the maximum values (8000 milliseconds for T300 and 7 for N300).3GPP TS 34.123-3, subclause 8.3.2 shall be referenced for configuring channels on Cell B.

- 3G Neighbour Cell Description of Cell A refers to the UTRAN Cell B. XXX_MUTIRAT_REPORTING is set to 1. REPORT_TYPE is set to indicate the usage of Packet Enhanced Measurement Report.

Mobile Station:

- MS is in Packet Idle mode and GPRS attached on Cell A.

- PDP context 2 established

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Packet transfer mode in the GPRS cell.

Test procedure

MS is brought into uplink packet transfer mode. MS sends PEMR with UTRAN cell information. SS sends the PACKET CELL CHANGE ORDER message giving a UTRAN cell description to the MS. MS sends RRC Connection Request on the UTRAN cell. The SS does not respond to the request and timer T3174 expires. MS returns to the old cell, sends a PACKET CELL CHANGE FAILURE message to the SS and continues data transfer on the old cell.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS	{Uplink dynamic allocation one phase access}	Initiate uplink transfer of 1500 octets. The TBF is active at steps 2-3 and 7-9.
2a	MS -> SS	Uplink data	MS sends uplink data.
2b	MS -> SS	PACKET ENHANCED MEASUREMENT REPORT	Sent on PACCH. Contains NC Measurement Report struct.
3			Repeat steps 2a and 2b until UTRAN cell information is sent in PEMR.
4	SS -> MS	PACKET CELL CHANGE ORDER	Sent on the PACCH. Contains Description of the UTRAN cell. See specific message contents.
5	MS -> SS	RRC CONNECTION REQUEST	To the UTRAN cell.
6	SS		SS does not respond to the request until timer T3174 has expired. During this period MS will retransmit RRC CONNECTION REQUEST after the expiry of T300.
7	MS -> SS	CHANNEL REQUEST	After the expiry of T3174, to the old cell within 15 sec.
8	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH, Dynamic allocation
9	MS -> SS	PACKET CELL CHANGE FAILURE	Sent when USF is allocated to the MS. Error cause:" No response on target cell " See specific message contents
11			(MS may perform ROUTING AREA UPDATE procedure)

Note: MS will send Packet Enhanced Measurement Report at the expiry of T3158 during the entire test case.

Specific message contents

Packet Cell Change Failure message content: CAUSE	0001(No response on target cell)

42.4.7.5.2 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure / Downlink transfer / REJECT from target UTRAN cell with Inter-RAT info set to GSM.

42.4.7.5.2.1 Conformance requirement

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The PACKET CELL CHANGE ORDER message commands the mobile station to a frequency in a frequency band not supported by the mobile station. *Cause:* “frequency not implemented”.

- The PACKET CELL CHANGE ORDER message is received while a circuit switched connection is on going. *Cause:* “on-going CS connection”.

- In *A/Gb mode*, the PACKET CELL CHANGE ORDER message is received and the GMM READY timer (see 3GPP TS 24.008) is not running (i.e., mobile station in GMM STAND-BY state). *Cause*, if the GMM READY timer has a negotiated value equal to zero: “Forced to the Standby State”. *Cause*, if the GMM READY timer has a negotiated value greater than zero: “MS in GMM Standby state”.

- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause:* “Immediate Assign Reject or Packet Access Reject on target cell”.

- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause:* “No response on target cell”.

- Due to any other reason (e.g. unknown or unsupported target cell information). In this case the MS shall set the ARFCN and BSIC fields to the value zero and set the cause to value “frequency not implemented”.

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode, dual transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type “single block without TBF establishment” (PCCCH) / “single block packet access” (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

Reference

3GPP TS 04.60, Chapter 8.4.2

42.4.7.5.2.2 Test Purpose

To verify that an MS in downlink packet transfer mode when commanded by a PACKET CELL CHANGE ORDER, reports PACKET CELL CHANGE FAILURE on the old GPRS cell if an RRC CONNECTION REJECT with Inter-RAT info set to GSM is received on the target UTRAN cell.

42.4.7.5.2.3 Method of test

Initial conditions

System Simulator:

- 2 cells, Cell A, GPRS Supported without PBCCH, NC2. Cell B is a UTRAN cell. Cell Selection conditions favour Cell A. 3G Neighbour Cell Description of Cell A refers to UTRAN Cell B. XXX_MUTIRAT_REPORTING is set to 1. REPORT_TYPE is set to indicate the usage of Packet Enhanced Measurement Report.

- 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell B.

- 3GPP TS 34.123-3, subclause 8.3.2 shall be referenced for configuring channels on Cell B.

Mobile Station:

- MS is in Packet Idle mode and GPRS attached on cell A.

- PDP context 2 established

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS idle in GPRS cell

Test procedure

MS is brought into downlink packet transfer mode. MS sends PEMR with UTRAN cell information. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS tries to establish RRC connection with UTRAN cell. SS sends the RRC Connection Reject including Inter-RAT info set to “GSM”. MS returns to the old cell and sends PACKET CELL CHANGE FAILURE message to the network. It is verified that the MS can continue downlink transfer on the old cell once a downlink TBF is established.

Maximum duration of the test

-

Expected sequence

PACKET CELL CHANGE FAILURE in step 8:

Packet Cell Change Failure message content: CAUSE	0010 (Packet Access Reject on target cell)

42.4.8 NC2 Procedures

42.4.8.1 NC2 and DRX

42.4.8.1.1 NC2 and DRX / NC_NON_DRX_PERIOD / Respect of NC2 non-DRX mode period

42.4.8.1.1.1 Conformance requirement

There are four cases when the mobile station shall enter a non-DRX mode period.

1) At the transition from the packet transfer mode to the packet idle mode, the mobile station shall enter the Transfer non-DRX mode period.

2) At the transition from the dual transfer mode to the dedicated mode or packet idle mode, the mobile station shall enter the Transfer non-DRX mode period.

In both cases, the duration of the Transfer non-DRX mode period is determined by value of the NON_DRX_TIMER parameter, requested in the *GPRS attach procedure*, and the value of the DRX_TIMER_MAX parameter broadcast in the cell. The mobile station may use the minimum value of these two parameters.

If the mobile station receives a new value of the DRX_TIMER_MAX parameter during the Transfer non-DRX mode period, the mobile station may wait to apply the new value until the next time the Transfer non-DRX mode period is entered.

3) A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

4) When initiating the MM procedures for *GPRS attach* and *routeing area update* defined in 3GPP TS 04.08, the mobile station shall enter the MM non-DRX mode period. This period ends when either of the messages GPRS ATTACH ACCEPT, GPRS ATTACH REJECT, ROUTING AREA UPDATE ACCEPT or ROUTING AREA UPDATE REJECT is received by the mobile station. This period also ends after timeout when waiting for any of these messages.

The non-DRX mode periods defined above run independent of each other and may overlap. The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

42.4.8.1.1.2 Test Purpose

To verify that an MS in Idle mode enters and remains in the non-drx mode only for the duration of NC2 non-DRX mode period which is equal to NC_NON_DRX_PERIOD parameter, when it sends a NC measurement report

Reference

42.4.8.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

Test PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message to MS. NETWORK_CONTROL_ORDER is commanded to be NC2. NC_NON_DRX_PERIOD is commanded to be 1.92 Sec.

At the end of reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS. After receiving the PACKET MEASUREMENT REPORT message, SS waits for 0.8*NC_NON_DRX_PERIOD and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS responds to the Paging.

SS waits for 1.1*NC_NON_DRX_PERIOD and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS does not respond to the Paging.

Maximum duration of the test

5 min

Expected sequence

Step	Direction	Message	Comments
1a	SS->MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment. Triggers the MS to monitor the assigned PDCH.

11	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH.
12	SS		Wait until 1.1*NC_NON_DRX_PERIOD after Step 11.
13	SS->MS	PAGING REQUEST	Sent on a PCH not belonging to the MS paging subgroup.
14	SS		SS verifies that MS does not respond to the paging in Step 13

Specific message contents

PACKET MEASUREMENT ORDER in step 1b:

NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	100 (7.68 sec)
NC_ NON_DRX_PERIOD	111 (1.92 sec)
NC_FREQUENCY_LIST	0 (not present)

42.4.8.1.2 NC2 and DRX / NC_NON_DRX_PERIOD / NC2 non-DRX mode period ordered in Packet Cell Change Order

42.4.8.1.2.1 Conformance requirement

A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

A mobile station in packet idle mode shall take into account the page mode information in any message received in a radio block on PCCCH corresponding to its paging group. The mobile station shall not take into account the page mode information in a message received in any other radio block than those corresponding to its paging group. The requirements yielded by the page mode information are as follows:

- *normal paging:* no additional requirements;

[…]

- *paging reorganization:* The mobile station shall receive all messages on the PCCCH regardless of the BS_PAG_BLKS_RES setting. It is required to receive all PBCCH messages. When the mobile station receives the next message to its (possibly new) paging group, subsequent action is defined by the page mode information in that message;

Reference

Test procedure

SS sends a PACKET MEASUREMENT ORDER message to MS ordering the MS to send measurement, the MS starts sending measurements. SS continues receiving measurements until measurement results of cell B are included. SS sends then a PACKET CELL CHANGE ORDER message to MS ordering the MS to select Cell-B. NETWORK_CONTROL_ORDER is commanded to be NC2. NC_NON_DRX_PERIOD for Cell-B is commanded to be 1.2 Sec.

MS selects Cell-B.

At the end of reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B, this is done twice. After receiving the second PACKET MEASUREMENT REPORT message, the SS waits for 0.8*NC_NON_DRX_PERIOD and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS responds to the Paging.

At the end of next reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B. After receiving the PACKET MEASUREMENT REPORT message, the SS waits for 1.1*NC_NON_DRX_PERIOD and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS does not respond to the Paging.

Maximum duration of the test

5 min

Expected sequence

Step	Direction	Message	Comments
1a	SS->MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment. Triggers the MS to monitor the assigned PDCH.

NC_FREQUENCY_LIST	0 (not present)

42.4.8.1.3 Void

42.4.8.1.4 NC2 and DRX / NC_NON_DRX_PERIOD / NC2 non-DRX mode period broadcast in SI2Quater

42.4.8.1.4.1 Conformance requirement

A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

If no parameters have been brought from the old cell, and until individual measurement parameters are received in the new cell, the mobile station shall use the broadcast measurement parameters from PSI5 if a PBCCH is allocated in the cell or SI2quater if a PBCCH is not allocated in the cell or use the default parameter values.

The mobile station in idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging subchannel corresponding to its paging subgroup, as specified in 3GPP TS 05.02.

[…]

This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

- normal paging: no additional requirements;

[…]

- paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

42.4.8.2.1 Void

42.4.8.2.2 User Data vs Measurement Report Sending / Conflict situation / Expiry of T3192 and T3158

42.4.8.2.2.1 Conformance requirement

The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

A mobile station in mode NC1 or NC2 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

42.4.8.2.2.2 Test Purpose

To verify that if T3158 expires before the MS leaves Downlink Packet Transfer mode, the MS waits till T3192 expires before it initiate a Packet Access procedure to send PACKET MEASUREMENT REPORT message.

42.4.8.2.3 User Data vs Measurement Report Sending / Conflict situation / Expiry of T3182 and T3158

42.4.8.2.3.1 Conformance requirement

The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

A mobile station in mode NC1 or NC2 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

The mobile station shall transmit RLC/MAC blocks with the following priority:

- RLC/MAC control blocks, except Packet Uplink Dummy Control Blocks
- RLC data blocks
    - RLC/MAC control blocks containing Packet Uplink Dummy Control Blocks

42.4.8.2.3.2 Test Purpose

To verify that if T3158 expires before the MS leaves Uplink Packet Transfer mode and after MS has started T3182

1 the MS will send a PACKET MEASUREMENT REPORT to the SS if uplink resource is allocated before the expiry of T3182.

2 the MS will initiate a Access procedure after T3182 is stopped, if no uplink resource is allocated to the MS while T3182 is running.

Reference

3GPP TS 04.60, sub-clauses 5.6.1, 8.1.1, 9.3.2.6

42.4.8.2.3.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is GPRS attached and is in Packet Idle mode. Ready Timer set to 5 min.

Test PDP context2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

An uplink TBF is established.

While the TBF is active SS sends a PACKET MEASUREMENT ORDER message to MS. NETWORK_CONTROL_ORDER is commanded to be NC2. NC_REPORTING_PERIOD_T is chosen to be less than T3182.

The USF allocation is controlled by the SS so that T3158 is running when MS sends RLC Data block with CV=0

At the end of reporting period MS sends a PACKET MEASUREMENT REPORT.

SS sends a PACKET DOWNLINK DUMMY CONTROL BLOCK after the expiry of T3158 and while T3182 is running. SS verifies that MS sends a PACKET MEASUREMENT REPORT in the allocated radio block.

SS waits till T3158 expires while T3182 is still running. SS sends a PACKET UPLINK ACK/NACK with FAI set to ‘1’.

SS verifies that MS sends a PACKET CONTROL ACK and releases the TBF.

SS verifies that MS initiates an Access procedure to send PACKET MEASUREMENT REPORT after releasing the TBF.

Maximum duration of the test

5 min

Expected sequence

42.4.8.2.4 User Data vs Measurement Report Sending / Conflict situation / Random Access procedure for PMR sending and User Data transmission

42.4.8.2.4.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station . The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

The sending of an RLC/MAC control message other than the PACKET RESOURCE REQUEST message from a mobile station in packet idle mode to the network may be initiated by the RR entity on the mobile station side using the packet access procedure. If access to the network is allowed, the packet access is done using the single block packet access option.

Further action depends on the RLC/MAC control message sent by the mobile station. Unless otherwise indicated by the RLC/MAC control message, the mobile station remains in packet idle mode.

42.4.8.2.4.2 Test Purpose

To verify that if the MS is triggered to send user data while random access procedure is ongoing to send a PACKET MEASUREMENT REPORT message, the MS will continue the random access procedure, send the PACKET MEASUREMENT REPORT message, will return to Idle mode and then will initiate a random access procedure to send user data.

42.4.8.3 Network Control measurement reporting and Dedicated connection

42.4.8.3.1 Network Control measurement reporting / Dedicated connection / Timer Ready expiry

42.4.8.3.1.1 Conformance requirement

42.4.8.3.1.1.1 Conformance requirement for R97 and R98 MS

When the mobile station leaves the MM Ready state, the timer T3158 shall be stopped and no more measurement reports shall be sent to the network.

Reference

3GPP TS 04.60, subclauses 5.6.1

42.4.8.3.1.1.2 Conformance requirement for R99 and later MS

The parameter values NC1 and NC2 only apply in Ready state. In Standby state, the MS shall always use normal MS control independent of the ordered NC mode.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.1.2 Test Purpose

To verify that some R97 or R98 MS involved in NC measurement reporting, stops its reporting if the Ready Timer expires within a dedicated connection.

For some R97 or R98 MS and for R99 or later MS, the NC measurement reporting is stopped when entering a dedicated connection.

42.4.8.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported. PBCCH not supported. Default Ready Timer (44s)

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in standby state

Test procedure

MS is in packet idle mode, SS sends a PACKET MEASUREMENT ORDER message to change NC reporting parameters. The MS sends measurement reports according to the new NC parameters. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST TYPE 1 message, the MS initiate the establishment of CS connection. The call lasts for 1 minute, thus the Ready Timer expires during the dedicated connection. At the end of the call, no more measurement should be sent by the MS.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	SS establishes a single block downlink TBF.
2	SS -> MS	PACKET MEASUREMENT ORDER	Sent on the blocks assigned in step 1. PMO message contains Network Control Order 2 (See the specific message content)
3	MS -> SS	CHANNEL REQUEST	With establishment cause 'single block access'.
4	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 1seconds.
5	MS -> SS	PACKET MEASUREMENT REPORT	Received on the assigned block.
6		{MT Call while GPRS Attach}	Macro parameters: **T** : 60 seconds **R** : 1, Resumption GPRS done Ready Timer expires before the end of the CS call
7	MS		Stand-by state
8	SS		Verify that no more PMR are sent by the MS.

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I	 10 (NC2) 110 (30,72 s)

42.4.8.3.2 Network Control measurement reporting / Dedicated connection / Different NC parameters / No T3158 expiry

42.4.8.3.2.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

42.4.8.3.2.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.2.2 Test Purpose

To verify that a MS involved in NC measurement reporting on a NC2 cell, continue its measurement reporting after a dedicated call, with the same NC parameters for some R97 or R98 MS, and with the broadcasted parameters for other R97 or R98 MS and for R99 and later MS.

42.4.8.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported, NC2, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 Cell, and receive a PACKET MEASUREMENT ORDER to override the NC parameters broadcasted in SI2 quater. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PACKET PAGING REQUEST message, the MS initiate the establishment of CS connection. SS stops the call after 5 seconds in order to avoid T3158 expiry during the dedicated connection (for R97 MS).

R97 MS should either continue to send PACKET MEASUREMENT REPORT every T3158, calculated with the NC parameters sent in the PACKET MEASUREMENT ORDER, or , like R99 and later release MS, restart the NC measurement reporting but with T3158 based on the broadcasted parameters sent in the PACKET SYSTEM INFORMATION 5.

Maximum duration of the test

-

Specific message contents

PACKET MEASUREMENT ORDER in step 1:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I	 10 (NC2) 110(30.72secs)

SI2quater Rest Octets:

NC Measurement parameter struct Network Control Order NC_NON_DRX_PERIOD NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T	 10 (NC2) 111 101 (15,36 s) 100 (7,68 s)

42.4.8.3.3 Network Control measurement reporting / Dedicated connection / Handover / No T3158 expiry

42.4.8.3.3.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 message on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET, see 3GPP TS 05.08.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T field of the PSI5, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If no PBCCH is allocated in the cell or if no individual order has been received by the mobile station, the default values of the parameters NC_NON_DRX_PERIOD, NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PARAMETER_I when in packet idle mode or the NC_REPORTING_PARAMETER_T when in packet transfer mode. The measurement results shall be sent to the network using the procedures specified in subclause 7.3 for packet idle mode, and in subclause 8.3 for packet transfer mode.

A mobile station may reselect a new cell or may be ordered to reselect a new cell with mode NC1 or NC2 while timer T3158 is active. If time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the mobile station shall immediately restart timer T3158 with the indicated reporting period for the new cell. Otherwise, the timer T3158 shall continue to run.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.3.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.3.2 Test Purpose

To verify that a MS involved in NC measurement reporting and making a handover to a new NC2 cell, uses the broadcasted NC reporting parameters of its new serving cell for its NC measurement reporting.

42.4.8.3.3.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A and cell B), GPRS supported, NC2, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 cell A, and sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the broadcasted parameters. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS initiate the establishment of CS connection. During the call, SS triggers the MS to do a handover to cell B. SS stops the call after 15 second in order to avoid T3158 expiry during the dedicated connection (for R97 MS).

As cell B has a NETWORK CONTROL ORDER set to NC2, all MS shall then restart measurement reporting by sending PACKET MEASUREMENT REPORT every T3158. The reporting timer is calculated with the NC parameters broadcasted in the second cell on SI2 quater.

42.4.8.3.4.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

After each reporting period, the MS shall send a measurement report to BSS (see 3GPP TS 04.60). The MS shall then discard any previous measurement report, which it has not been able to send.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 05.08, subclause 10.1.4.1

42.4.8.3.4.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.4.2 Test Purpose

To verify that some R97 or R98 MS involved in NC measurement reporting, sends only its latest PACKET MEASUREMENT REPORT when many reporting periods had expired during a CS call on the same cell.

To verify that some other R97or R98 MS andR99 and later releases MS stop their measurement reporting with the dedicated call and do not restart it if the broadcasted parameters give a NETWORK CONTROL ORDER set to NC0.

42.4.8.3.4.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC0 Cell, and receive a PACKET MEASUREMENT ORDER changing the Network Control Order to NC2. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER, including measurement done on its neighbour, cell B. 15 seconds after the second PACKET MEASUREMENT ORDER the MS is paged on its paging channel. Upon receipt of the PAGING REQUEST TYPE 1 message, the MS initiate the establishment of CS connection. After 30 seconds the cell B transmission is cut and the call lasts for 55 seconds more.

Some R97 or R98 MS and the R99 and later release MS should then be back on CCCH parameters and not trigger any PACKET MEASUREMENT REPORT anymore.

Other R97 or R98 MS should continue to send PACKET MEASUREMENT REPORT every T3158, calculated with the NC parameters sent in the PACKET MEASUREMENT ORDER. As the T3158 timer has expired 3 times during the dedicated connection (once before Cell B has been cut, twice after), and that the MS shall send only its latest PACKET MEASUREMENT REPORT, the first one sent after the dedicated call should not contain any Cell B measurement.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
2	SS -> MS	PACKET MEASUREMENT ORDER	Sent on the block assigned in step 1 Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_I See specific message contents
3	MS -> SS	CHANNEL REQUEST	with establishment cause 'single block access'.
4	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.

17B	MS -> SS	CHANNEL REQUEST	with establishment cause 'single block access'.
18B	SS		RACH in step 17B should be sent 4*T3158 +/-10% after step 6 T3158 calculated using NC parameters sent in step 2
19B	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.
20B	MS -> SS	PACKET MEASUREMENT REPORT	Shall be sent in the assigned block.
Note: In step 13x, the test procedure follows **either** the 'a' branch **or** the 'b' branch.			

PACKET MEASUREMENT ORDER in step 1:

NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I	 10 (NC2) 110(30.72secs)

42.4.8.3.5 Network Control measurement reporting / Dedicated connection / Handover / T3158 expiry

42.4.8.3.5.1 Conformance requirement

42.4.8.3.5.1.1 Conformance requirement for R97 and R98 MS

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 message on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET, see 3GPP TS 05.08.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T field of the PSI5, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If no PBCCH is allocated in the cell or if no individual order has been received by the mobile station, the default values of the parameters NC_NON_DRX_PERIOD, NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PARAMETER_I when in packet idle mode or the NC_REPORTING_PARAMETER_T when in packet transfer mode. The measurement results shall be sent to the network using the procedures specified in subclause 7.3 for packet idle mode, and in subclause 8.3 for packet transfer mode.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

After each reporting period, the MS shall send a measurement report to BSS (see 3GPP TS 04.60). The MS shall then discard any previous measurement report, which it has not been able to send.

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 05.08, subclauses 10.1.4 and 10.1.4.1

42.4.8.3.5.1.2 Conformance requirement for R99 and later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclauses 10.1.4

42.4.8.3.5.2 Test Purpose

To verify that some R97 MS involved in NC measurement reporting, and making a handover during a dedicated connection do not send any buffered PACKET MEASUREMENT REPORT when many reporting periods had expired during a CS call on the first cell. They shall restart their measurement reporting on the new serving cell only if the broadcasted parameters allow it.

For other R97 MS and for R99 or later MS, the NC measurement reporting is stopped when entering a dedicated connection. At the end of the CS call, after a handover, it shall restart its measurement reporting on the new serving cell only if the broadcasted parameters allow it.

42.4.8.3.5.3 Method of test

Initial conditions

System Simulator:

1 cell (Cell A), GPRS supported, NC2, Ready Timer set to 5 minutes

1 cell (Cell B), GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 Cell, and receive a PACKET MEASUREMENT ORDER. The MS then sends PACKET MEASUREMENT REPORT based on T3158 calculation done with the NC parameters in the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS initiate the establishment of CS connection. During the call, after 30 seconds in order to have T3158 expiry during the dedicated connection (for some R97 MS), SS triggers the MS to do a handover to the second cell. SS stops the call after 30 seconds on the new serving cell, cell B.

As cell B has a NETWORK CONTROL ORDER set to NC0, no MS should send any measurement reporting, even if some PACKET MEASUREMENT REPORT were not sent when the MS was camped on cell A (before the handover during the dedicated connection)

After 1 minute, a PACKET MEASUREMENT ORDER is then sent to the MS camped on cell B. The SS verifies that the PACKET MEASUREMENT REPORT sent by the MS is including cell A measurements and is not a previous PACKET MEASUREMENT REPORT not sent in cell A.

Maximum duration of the test

NC_REPORTING_PERIOD_T	100 (7,68 s)

42.4.8.3.6 Network Control measurement reporting / Dedicated connection / Assignment Reject/

42.4.8.3.6.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station, stops sending CHANNEL REQUEST messages, starts timer T3122 with the indicated value, ("wait indication" information element), starts T3126 if it has not already been started, and listens to the downlink CCCH until T3126 expires.

The Wait Indication IE (i.e. T3122) relates to the cell from which it was received.

The mobile station in packet idle mode (only applicable to mobile station supporting GPRS) may initiate packet access in the same cell before T3122 has expired, see 3GPP TS 04.60 and sub-clause 3.5.2.1.3.4.

After T3122 expiry, no CHANNEL REQUEST message shall be sent as a response to a page until a PAGING REQUEST message for the mobile station is received.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 04.08/44.018, subclause 3.3.1.1.3.2

42.4.8.3.6.2 Test Purpose

To verify that if a MS involved in NC measurement reporting is paged for CS connection but receives an IMMEDIATE ASSIGNMENT REJECT to its CHANNEL REQUEST sent in response to the paging, the MS continues its NC measurement reporting.

42.4.8.3.6.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC0 Cell, and receive a PACKET MEASUREMENT ORDER to override the NC parameters broadcasted. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS sends a CHANNEL REQUEST but the SS denies the dedicated connection by sending an IMMEDIATE ASSIGNMENT REJECT with a wait indication (T3122) of 20 seconds.

The MS does not enter any dedicated connection and should so continue its NC reporting measurement, even if T3122 is not expired at T3158 expiry.

Maximum duration of the test

-

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	101 (15.36secs)

42.4.8.4 Network Control measurement reporting / NC_FREQUENCY_LIST

42.4.8.4.1 Network Control measurement reporting / NC_FREQUENCY_LIST / NC_FREQUENCY_LIST in Packet measurement order.

42.4.8.4.1.1 Conformance requirement

The GSM Neighbour Cell list may be modified by "NC Frequency List" in a PACKET CELL CHANGE ORDER message (in which case the reference list is given on the new cell) or one or more instances of the PACKET MEASUREMENT ORDER message with the same BA_IND value or PSI3_CHANGE_MARK value.

The "NC Frequency List" may add cells to the GSM Neighbour Cell list (see sub-clause 11.2.4 and 11.2.9b, "PACKET CELL CHANGE ORDER" and "PACKET MEASUREMENT ORDER"). These cells shall be added at the end of the

GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

The "NC Frequency List" may delete frequencies from the BA(GPRS) list (see 11.2.9b). The frequencies to be removed are identified by their indices in the BA(GPRS). In this case all cells associated with the removed frequencies shall be removed from the GSM Neighbour Cell list. Removed cells/frequencies shall keep their indices but no measurements or reporting shall be performed. If the index points to a cell that does not exist, this shall not be considered as an error.

When ordered to send measurement reports, the MS shall continuously monitor all carriers in BA(GPRS) or as indicated by the parameter NC_FREQUENCY_LIST and the BCCH carrier of the serving cell. The measurement requirements are defined in subclause 10.1.1 for the actual packet mode.

Reference

3GPP TS 04.60, subclause 5.6.1.

3GPP TS 05.08, subclause 10.1.4

42.4.8.4.1.2 Test Purpose

To verify that if the NC_FREQUENCY_LIST is included in the PACKET MEASUREMENT ORDER, MS updates the neighbour cell list and uses the updated list for the measurement reporting and reselection.

42.4.8.4.1.3 Method of test

Initial conditions

System Simulator:

3 cells, GPRS supported.

Cell A (in case of GSM900 only): BS_PA_MFRMS = 2 (4 multi frames)

Initial conditions

Parameter	Cell A	Cell B	Cell C
	Carrier 1	**Carrier 2**	**Carrier 3**
Channel Type Carried	BCCH	BCCH	BCCH
RF Signal Level (dBm)	-60	-75	-75
Serving Cell Parameters			
NETWORK_CONTROL_ORDER	NC0	NC0	NC0

NOTE 1: All cells support GPRS. None of the cells support PBCCH.

NOTE 2: Cell C is not a part of BA(GPRS) on cell A. Cell B is part of BA(GPRS) on cell A.

Mobile Station:

MS is in Packet Idle mode and GPRS attached, Ready Timer Deactivated.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER to MS, changing the NC mode to NC2. SS receives few measurement reports. SS checks that the measurements of cell B are included in the measurement report while that of the Cell C are not included in it. SS transmits a PACKET MEASUREMENT ORDER including

NC_FREQUENCY_LIST, adding Cell C while removing cell B. SS receives few measurement reports and checks that MS now includes cell C in the PACKET MEASUREMENT REPORT, while the measurements of the cell B are not included in it. SS reduces the signal strength of cell A to –85dBm. The signal strengths of cells B and C are increased to –50dBm and –60dBm respectively, making cell B better than cell C for cell reselection. SS changes the NC mode to NC0 by sending a PACKET MEASUREMENT ORDER. SS checks that the MS has done the reselection to cell C even though the cell B was better as the cell B is not a part of the measurement list.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1	SS->MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
2	SS->MS	PACKET MEASUREMENT ORDER	-Sent on blocks assigned in step 1 NETWORK_CONTROL_ORDER is set to NC2. NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are specified. See specific message contents
3	MS ->SS	CHANNEL REQUEST	with establishment cause 'single block access'. Received on RACH.
4	SS->MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.
5	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH.
6			Steps 3-5 are repeated twice. SS Verifies that the measurement results for cells A, B are included in the PACKET MEASUREMENT REPORT, while the measurements of cell C is not included in it as the cell C is not a part of BA(GPRS) on cell A.
7	SS->MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
8	SS->MS	PACKET MEASUREMENT ORDER	Sent on block assigned in step 7. NETWORK_CONTROL_ORDER is set to NC2. NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are specified. NC_FREQUENCY_LIST is included. This list adds cell C while deletes cell B from the measurement list. See specific message contents
9	MS ->SS	CHANNEL REQUEST	with establishment cause 'single block access'. Received on RACH.
10	SS->MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.
11	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH.
12			Steps 9-11 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization.
13	SS		Reduce the signal strength of cell A to –85dBm and increase the signal strength of cell B to –50dBm and cell C to –60 dBm.
14	SS->MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
15	SS->MS	PACKET MEASUREMENT ORDER	Sent on block assigned in step 14. NETWORK_CONTROL_ORDER is set to NC0. See specific message contents
16	MS->SS	CHANNEL REQUEST	Establishment Cause is 'one phase packet access'. Received on cell C.

42.4.8.4.2 Void

42.4.8.4.3 Network Control measurement reporting / NC_FREQUENCY_LIST / PMO with empty NC_FREQUENCY_LIST/ Return to BA(GPRS).

42.4.8.4.3.1 Conformance requirement

The "NC Frequency List" may add cells to the GSM Neighbour Cell list (see sub-clause 11.2.4 and 11.2.9b, "PACKET CELL CHANGE ORDER" and "PACKET MEASUREMENT ORDER"). These cells shall be added at the end of the GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

In case the same cell (ARFCN+BSIC) or the same ARFCN without BSIC occur more than once in the resulting GSM Neighbour Cell list, each occurrence shall be assigned an index but only the cell with the highest index shall be used for cell re-selection and referred to in measurement reports.

The "NC Frequency List" may delete frequencies from the BA(GPRS) list (see 11.2.9b). The frequencies to be removed are identified by their indices in the BA(GPRS). In this case all cells associated with the removed frequencies shall be removed from the GSM Neighbour Cell list. Removed cells/frequencies shall keep their indices but no measurements or reporting shall be performed. If the index points to a cell that does not exist, this shall not be considered as an error.

A parameter NC_FREQUENCY_LIST may also be sent individually to an MS on PCCCH or PACCH. This list adds/deletes frequencies to the BA(GPRS) both for cell re-selection and for measurement reports. For added frequencies, the corresponding cell re-selection parameters may be included. If no cell re-selection parameters are given for a particular cell, that cell shall only be used in mode NC2. The list is valid until an empty list is sent to the MS.

Reference

3GGP 04.60, subclause 5.6.3.2

3GPP 05.08, subclause 10.1.4

42.4.8.4.3.2 Test Purpose

To verify that MS involved in measurement reporting reverts to BA(GPRS) on reception of PMO with empty NC_FREQUENCY_LIST list.

42.4.8.4.3.3 Method of test

Initial Conditions

System Simulator:

- 3 cells. Cell B is part of BA(GPRS) of Cell A. Cell C is not a part of the BA(GPRS) of Cell A. None of the cells support PBCCH.
Cell A (in case of GSM900 only): BS_PA_MFRMS = 2 (4 multi frames)

Mobile Station:

- The MS is in GPRS attached with a P-TMSI allocated on Cell A, Ready Timer deactivated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, deleting the cell B, while adding the cell C in the measurement list. SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included. The SS sends a PACKET MEASUREMENT ORDER message with an empty NC_FREQUENCE_LIST. SS checks that the MS starts sending the measurements of cell B while stops sending the measurements of the cell C.

Maximum Duration of Test

-

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
2	SS -> MS	PACKET MEASUREMENT ORDER	Sent on block assigned in step 1. See specific message content
3	MS -> SS	CHANNEL REQUEST	with establishment cause 'single block access'. Received on RACH.
4	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.
5	MS -> SS	PACKET MEASUREMENT REPORT	-Sent on allocated PDCH -Contains "NC measurement report Struct"
6			Steps 3-5 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization.
7	SS->MS	IMMEDIATE ASSIGNMENT	for single block downlink assignment on PCH corresponding to MS.
8	SS -> MS	PACKET MEASUREMENT ORDER	-Sent on block assigned in step 1 See specific message content Empty NC_FREQUENCY_LIST list
9	MS -> SS	CHANNEL REQUEST	with establishment cause 'single block access'. Received on RACH.
10	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds.
11	MS -> SS	PACKET MEASUREMENT REPORT	-Sent on allocated PDCH -Contains "NC measurement report Struct"
12			Steps 9-11 are repeated twice. SS Verifies that the measurement results for cells A, B are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell C is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell B (but should not include cell C), due to the new BSIC synchronization.

Specific message contents:

SYSTEM INFORMATION TYPE 2 of Cell A:

Neighbour Cells Description	For SI 2
- Format identifier	For GSM 900: Bit map 0. For DCS 1 800 and PCS 1 900: Range 512. For GSM 700, T-GSM 810 and GSM 850: Range 128.
- BCCH Allocation Sequence	0
- BCCH Allocation ARFCN	For GSM 900: Channel numbers 5, 20, 90, 100, 110, 120, 122 and 124. For DCS 1 800: Channel numbers 515, 590, 700, 780, 810, 870, 875 and 885. For PCS 1 900 Channel numbers 515, 590, 655, 700, 710, 740, 780 and 810. For GSM 700, T-GSM 810: Channel numbers 437, 447, 467, 477, 487, 497, 502 and 507. For GSM 850: Channel numbers 137,147, 157, 177, 197, 217, 227 and

- EXT-IND	237. For GSM 900, this IE carries only part of the BA. For DCS 1 800, PCS 1 900, GSM 700, T-GSM 810 and GSM 850, this IE carries complete BA.

PACKET MEASUREMENT ORDER in step 2:

NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	‘100’ (7,68 s)
NC_FREQUENCY_LIST	1
REMOVED FREQ LIST	1
NR_OF_REMOVED_FREQ	00000
REMOVED_FREQ_INDEX	000000 – Remove Cell B
Add Frequency list struct	1
START_FREQUENCY	GSM 900 GPRS: Containing ARFCN 80 of Cell C 00010100 ARFCN 80 (MSB) 00 ARFCN 80 (LS 2bits) DCS 1 800 and PCS 1 900 GPRS: Containing ARFCN 600 for Cell C 10010110 ARFCN 600 (MSB) 00 (LS 2 bits) GSM 700, T-GSM 810 GPRS: Containing ARFCN 447 01101111 ARFCN 447(MSB) 11 ARFCN 447(LS 2 bits) GSM 850 GPRS: Containing ARFCN 207 00110011 ARFCN 207 (MSB) 11 ARFCN 207 (LS 2 bits)

PACKET MEASUREMENT ORDER in step 8:

NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	‘100’ (7,68s)
NC_FREQ_LIST	0 (NC Frequency list not present)

42.4.8.4.4 Network Control measurement reporting / NC_FREQUENCY_LIST / Changes in BA(GPRS)/ Return to BA(GPRS).

42.4.8.4.4.1 Conformance requirement

A parameter NC_FREQUENCY_LIST may also be sent individually to an MS on PCCCH or PACCH. This list adds/deletes frequencies to the BA(GPRS) both for cell re-selection and for measurement reports. For added frequencies, the corresponding cell re-selection parameters may be included. The list is valid until an empty list is sent to the MS, there is a downlink signalling failure or the MS selects a new cell or the BA(GPRS) that is modified by the NC_FREQUENCY_LIST changes or the MS enters dedicated mode. A list given by Packet Cell Change Order applies in the new cell. The lists may also include cells with other radio access technologies.

Reference

3GPP 05.08, subclause 10.1.4

42.4.8.4.4.2 Test Purpose

To verify that MS returns to BA(GPRS) if BA(GPRS) on which the NC_FREQ_LIST is built, is changed.

42.4.8.4.4.3 Method of test

Initial Conditions

System Simulator:

3 cells, default settings. Cell C is removed from the BA(GPRS) on cell A.

Mobile Station:

The MS is in GPRS attached with a P-TMSI allocated on Cell A. READY TIMER is set to 5 min.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, deleting the cell B, while adding the cell C in the measurement list. SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included. The SS changes the BA(GPRS) given on the broadcast channels. SS waits for 35 seconds. SS checks that the MS reverts back to sending of the measurements of cell B while stops sending the measurements of the cell C.

Maximum Duration of Test

-

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	SS establishes a single block downlink
1b	SS -> MS	PACKET MEASUREMENT ORDER	See specific message content
2	MS -> SS	CHANNEL REQUEST	'Single block packet access'
3	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Single block assignment
4	MS -> SS	PACKET MEASUREMENT REPORT	-Sent on allocated PDCH -Contains “NC measurement report Struct”
5	SS		Steps 2-4 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization.
6	SS		SS Changes BA(GPRS) list broadcast in SI2 (SI2bis) on BCCH. SI2 change is indicated in SI13 rest octets. See Specific message content SS waits for 35 seconds While waiting, MS may send measurement reports, in that case repeat steps 2-4.
7	MS -> SS	CHANNEL REQUEST	'Single block packet access'
8	SS -> MS	IMMEDIATE ASSIGNMENT	-Sent on AGCH Single block assignment
9	MS -> SS	PACKET MEASUREMENT REPORT	-Sent on allocated PDCH -Contains “NC measurement report Struct” SS verifies that measurement reports for Cell B are included and not of Cell C.

42.4.8.4.5 Network Control measurement reporting / NC_FREQUENCY_LIST / Dedicated connection/ Return to BA(GPRS)

42.4.8.4.5.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of either the NC measurement report interval timer T3158 or the EM measurement report interval timer T3178. At expiry of the timer T3158 or T3178 the mobile station shall restart the expired timer T3158 or T3178, perform the measurements and initiate the packet access.

The procedure for measurement report sending is initiated by the mobile station either on PCCCH (subclause 7.3.1) or, if a packet control channel not exists, on CCCH (subclause 7.3.2).

If the mobile station initiates an RR connection establishment, the timers T3158 and T3178 shall be stopped and no measurement reports shall be sent. When the RR connection is released and if the mobile station has not changed cell, the measurement reporting procedure shall be restarted.

In a cell with a PBCCH allocated, if PSI3_CHANGE_MARK is changed, the mobile station shall re-read and rebuild the GSM Neighbour Cell list.

Reference

3GPP 04.60, subclause 7.3
3GPP 04.60, subclause 5.6.3.2

42.4.8.4.5.2 Test Purpose

To verify that MS involved in measurement reporting successfully returns to BA(GPRS) broadcast on BCCH after a dedicated connection.

42.4.8.4.5.3 Method of test

Initial Conditions

System Simulator:

- 3 cells, default settings. Cell C is removed from the BA(GPRS) on both cell A and cell B.
- Ready Timer Deactivated on all cells.

Mobile Station:

The MS is in GPRS attached with a TMSI and a P-TMSI allocated.

Specific PICS Statements

- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) changing the NC mode to NC2, deleting the cell B, while adding the cell C to the measurement list. SS checks that the measurements of the cell C are included in the third Packet measurement report while that of Cell B are not included. The SS pages MS for a CS call. SS establishes a call with MS. After 5 seconds releases the call. SS reduces the signal strength of the cell A, in such a way that the cell B and C are better than cell A. Cell C is better than cell B. SS checks that the MS does the reselection to cell B, even though cell C is better. This way we will check that the MS returns to broadcast parameters after a dedicated connection.

Maximum Duration of Test

-

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	SS establishes a single block down link
1b	SS -> MS	PACKET MEASUREMENT ORDER	See specific message content

42.4.8.4.6 Network Control measurement reporting / NC_FREQUENCY_LIST / PMO sent in multiple instances.

42.4.8.4.6.1 Conformance requirement

If the mobile station receives a PACKET MEASUREMENT ORDER message (full set of instances) with changed PMO_IND parameter value, any old "NC frequency list" shall be deleted. If the last PACKET MEASUREMENT ORDER message (full set of instances) does not contain a "NC frequency list" (no added or deleted frequencies) the mobile station shall return to BA(GPRS).

MS receives NC_FREQUENCY_LIST in multiple instances by adding and deleting a cell in each of these instances. SS verifies that MS constructs Frequency list and checks PACKET MEASUREMENT REPORTS of these cells are included

Reference

3GPP TS 05.08 Sec 10.1.4

3GPP TS 04.60 Sec 5.6.1

42.4.8.4.6.2 Test Purpose

To verify that when instances of PACKET MEASUREMENT ORDER is sent including NC_FREQUENCY_LIST MS has to construct this frequency list and include the cells in the PACKET MEASUREMENT REPORTS.

42.4.8.4.6.3 Method of test

Initial conditions

System Simulator:

3 cells default settings.,

Cell A in NC2. Cell C is removed from the BA(GPRS) of cell A.

Mobile Station:

MS is in Packet Idle mode and GPRS attached on Cell A.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

SS receives few PACKET MEASUREMENT REPORTS. SS checks that the measurements of the cell B are included in the Packet measurement report while that of Cell C is not included.

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) in 2 instances. It deletes the cell B in instance 1, while adds the cell C in instance 2.

SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution} Or {Uplink dynamic allocation two phase access}	Macro parameters: **4000**: the number of RLC data block to be transferred, **USF_GRANULARITY**: 1 **RLC_DATA_BLOCKS_GRANTED**: absent (open-end) **CHANNEL_CODING_COMMAND**: CS-1 TLLI_BLOCK_CHANNEL_CODING: CS-1
2a	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS in step 1.
2b	SS -> MS	PACKET UPLINK ACK/NACK	Sent on PACCH. USF assigned to the MS in step 1. The SS acks all the received RLC data blocks.

42.4.8.4.7 Network Control measurement reporting / NC_FREQUENCY_LIST / same cell present twice in the list.

42.4.8.4.7.1 Conformance requirement

The "NC Frequency List" may add cells to the GSM Neighbour Cell list . These cells shall be added at the end of the GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

In case the same cell (ARFCN+BSIC) or the same ARFCN without BSIC occur more than once in the resulting GSM Neighbour Cell list, each occurrence shall be assigned an index but only the cell with the highest index shall be used for cell re-selection and referred to in measurement reports.

Reference

3GPP TS 04.60, subclause 5.6.1.

42.4.8.4.7.2 Test Purpose

To verify that if a same cell (ARFCN+BSIC) occurs more than once in the Neighbour cell list; MS reports the cell with the highest index.

42.4.8.4.7.3 Method of test

Initial conditions:

System Simulator:

2 cells, GPRS supported.

Mobile Station:

The MS is GPRS attached, in Packet Idle Mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, adding the cell B to the Neighbour cell list.

SS checks that the MS is reporting the cell B, with the highest index number for the cell given by the NC_FREQUENCY_LIST.

Maximum duration of the test

5 min.

Expected sequence

Step	Direction	Message	Comments
1A	SS->MS	IMMEDIATE ASSIGNMENT	SS establishes a single block down link
1B	SS->MS	PACKET MEASUREMENT ORDER	Sent in the allocated block. See specific message contents.
2	MS->SS	CHANNEL REQUEST	ACCESS TYPE ='Single block packet access' Received on RACH.
3	SS->MS	IMMEDIATE ASSIGNMENT	Sent on AGCH, assigning a single block.
4	MS ->SS	PACKET MEASUREMENT REPORT	Received on the allocated PDCH. Check that the MS reports the measurements for cell B with the highest Index . See specific message contents.

Specific message contents

Step 1B: Packet Measurement Order

MESSAGE_TYPE	0000 11

42.4.8.5 NC2 and DTM

42.4.8.5.1 Ignoring Packet Measurement Order and Packet Cell Change Order whilst in DTM

42.4.8.5.1.1 Conformance requirements

An MS in network control mode NC1 or NC2 may enter an exceptional case if a circuit switched connection is established, which takes precedence over GPRS cell re-selection. This includes an MS operating in DTM.

References

3GPP TS 45.008, sub-clause 10.1.4.3

42.4.8.5.1.2 Test purpose

To verify that the MS operating in DTM ignores Packet Measurement Order and Packet Cell Change Order.

42.4.8.5.1.3 Method of test

Initial Conditions

System Simulator:

2 cells with default parameter: A, B with same LAI, both supporting GPRS DTM

Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. Right after the beginning a PACKET UPLINK ACK/NACK is send from the SS to reset T3182 on MS side. Then the SS sends a PACKET CELL CHANGE ORDER to the MS containing BSIC and the BCCH frequency of cell B. The SS maintains the CS call and checks that no CHANNEL REQUESTS on cell B received. Then the transmission is completed.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.
2	MS		Trigger the MS to initiate an uplink packet transfer containing 2000 octets.
3	MS -> SS	DTM REQUEST	
4	SS -> MS	PACKET ASSIGNMENT	See specific message contents
5	SS<->MS	{Uplink Data}	Macro
6	SS -> MS	PACKET CELL CHANGE ORDER	Sent on PACCH: Contains -BSIC + BCCH frequency of cell B. -The network control order, NC2 See specific message contents SS maintaining the CS call and check for 3 seconds that MS is not sending any Channel Requests on cell B
7	SS<->MS	{ Uplink data transfer }	Macro - Completion of the 2.000 octets of Data

Specific Message Contents

PACKET ASSIGNMENT (Step 4):

k=1:

Information Element	Value/remark
As default message contents except: RR Packet Uplink Assignment IE RR Packet Downlink Assignment IE - TIMESLOT_ALLOCATION	 Not included (N ± 1) MOD 8

k=2:

Information Element	Value/remark
As default message contents except: RR Packet Uplink Assignment IE RR Packet Downlink Assignment IE - TIMESLOT_ALLOCATION	 Not included N

PACKET CELL CHANGE ORDER (Step 7):

Global TFI	TFI of the uplinkTBF
IMMEDIATE_REL	1
ARFCN, BSIC	specified for cell B
NC Measurement parameters	
NETWORK_CONTROL_ORDER	10 (NC2)
NC_REPORTING_PERIOD_I	111 (61.44 sec)
NC_REPORTING_PERIOD_T	100 (7.68 sec)
NC_FREQUENCY_LIST	0 (not present)

42.5 Downlink Transfer

42.5.1 Downlink Transfer / Normal Operation

42.5.1.1 Void

42.5.1.2 Downlink Transfer/ Normal Operation / Without TBF starting time

42.5.1.2.1 Void

42.5.1.2.2 Conformance Requirement

1. On receipt of a PACKET DOWNLINK ASSIGNMENT message, the mobile station shall switch to the assigned PDCHs.

2. The Packet downlink assignment procedure is completed when the mobile station receives a valid RLC/MAC block. The mobile station has entered the packet transfer mode.

3. If the MS is required to transmit a PACKET CONTROL ACKNOWLEDGEMENT subsequent to a PACKET DOWNLINK ASSIGNMENT, the MS shall be ready to receive on the new assignment no later than the next occurrence of block B((x+2) mod 12) where block B(x) is radio block containing the PACKET CONTROL ACKNOWLEDGEMENT.

References

3GPP TS 04.60, subclauses 7.2.1.1, 7.2.1.2 and 10.4.5.

3GPP TS 05.10, subclause 6.11.1.

42.5.1.2.3 Test purpose

Verify that an MS switches to the assigned PDCH when assigned to it without a starting time, within 3 blocks.

42.5.1.2.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, CTRL_ACK_TYPE=0 in GPRS cell options.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF, Sent on PCH.
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to the assigned PDCH. (no starting time) With valid RRBP field
2	MS->SS	PACKET CONTROL ACK	4 access bursts. Sent in the block specified by RRBP field in step 1.
3	SS -> MS	RLC DATA BLOCK	2 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS.
4	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges on PACCH the RLC data block sent in step 3.
5		{Competition of downlink data transfer}	Macro

Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1b:

TIMESLOT_ALLOCATION	<one timeslot assigned>
PACKET TIMING ADVANCE	Timing Advance Value as default
TBF STARTING TIME	<IE not present>

DOWNLINK RLC DATA BLOCKS (various steps):

RRBP	00 – Response shall be sent by MS in N+13 frames.
S/P	1 – RRBP field is valid

42.5.2 Downlink Transfer / Polling

42.5.2.1 Downlink Transfer/ Polling/ Normal operation/RLC data block

42.5.2.1.1 Void

42.5.2.1.2 Conformance Requirement

Whenever the mobile station receives an RLC data block addressed to itself and with a valid RRBP field in the RLC data block header (i.e., is polled), the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the uplink radio block specified by the RRBP field whatever the BSN value of the received RLC data block, unless another RLC/MAC control message is waiting to be transmitted, in which case the other RLC/MAC control message shall be sent.

The RRBP value specifies a single uplink block in which the mobile station shall transmit either a PACKET CONTROL ACKNOWLEDGEMENT message or a PACCH block to the network. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing any message except Packet Paging Request, Packet Access Reject, and Packet Queuing Notification, the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message in the uplink radio block specified. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing a Packet Paging Request, Packet Access Reject, or Packet Queuing Notification message, the mobile station shall ignore this RRBP field. The mobile station shall only react on RLC/MAC control blocks containing a valid RRBP field if the mobile station is unambiguously addressed either in the downlink RLC/MAC control block header or in the control message itself.

References

3GPP TS 04.60, subclauses 8.1.2.2 and 10.4.5.

42.5.2.1.3 Test purpose

Verify that an MS responds to a poll with a PACKET DOWNLINK ACK/NACK message in the block specified by the RRBP field.

42.5.2.1.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a IMMEDIATE ASSIGNMENT message to establish a downlink TBF , containing no starting time.

2. SS transmits a downlink RLC data block.

3. MS responds by sending a PACKET DOWNLINK ACK/NACK in the block specified by the RRBP field of the RLC data block.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Triggers the MS to switch to assigned PDCH.
2	SS -> MS	RLC DATA BLOCK	3 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS.
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the RLC DATA BLOCK 26 frames after step 2.
4		{Competition of downlink data transfer}	Macro

Specific Message Contents

IMMEDIATE ASSIGNMENT message in step 1:

Packet Channel Description	
- TN	<One timeslot assigned>
TIMING ADVANCE	Timing Advance Value = as default
TBF STARTING TIME	<IE not present>

DOWNLINK RLC DATA BLOCK in step 2:

RRBP	11 – Response shall be sent by MS in N+26 frames.
S/P	1 – RRBP field is valid

42.5.2.2 Downlink Transfer/ Polling/ Packet Polling Request/ Access Burst format

42.5.2.2.1 Void

42.5.2.2.2 Conformance Requirement

The network may send to the mobile station a PACKET POLLING REQUEST message. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING message shall be sent on PAGCH. The mobile station shall be addressed by its TLLI or TFI.

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRBP field. The reserved block is considered as a one block PACCH allocation.

References

3GPP TS 04.60, subclause 7.2.1.3.

42.5.2.2.3 Test purpose

Verify that an MS responds to a PACKET POLLING REQUEST message (requesting access burst format) with a PACKET CONTROL ACKNOWLEDGEMENT message in access burst format.

42.5.2.2.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

TLLI (32) CTRL_ACK	<of this MS> 11

42.5.3 Downlink Transfer / T3190 Expiry / Initial allocation

42.5.3.1 Downlink Transfer/ T3190 Expiry / Initial allocation / Restart with valid RLC data block

42.5.3.1.1 Void

42.5.3.1.2 Conformance Requirement

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

On expiry of timer T3190, the mobile station shall abort the procedure and return to packet idle mode.

If the mobile station receives a valid RLC data block addressed to itself, the mobile station shall reset and restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

References

3GPP TS 04.60, subclauses 7.2.1.1, 8.1.2.1 and 10.4.5.

42.5.3.1.3 Test purpose

Verify that an MS starts T3190 when receiving the PACKET DOWNLINK ASSIGNMENT, resets and restarts the timer when a valid RLC/MAC block is received, and returns to packet idle mode when T3190 expires.

42.5.3.1.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT, containing relative-encoded starting time.

2. (0.8*T3190) seconds after the starting time occurs, the SS transmits a downlink RLC data block with polling indicated.

3. MS sends PACKET DOWNLINK ACK/NACK on PACCH in response to the RLC data block.

4. (1.2*T3190) seconds after the previous downlink RLC data block, the SS transmits another downlink RLC data block with polling indicated.

5. The MS ignores the downlink block (because it has already returned to packet idle mode upon expiry of T3190).

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF, Sent on PCH.
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to the assigned PDCH and start T3190 at the starting time indicated.
2	SS -> MS	RLC DATA BLOCK	Sent on assigned PDCH, (T3190*0.8) seconds after expiry of the TBF Starting Time indicated in Step 1, with valid RRBP field, addressed to MS. T3190 is then restarted.
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previous RLC data block.
4	SS -> MS	RLC DATA BLOCK	Sent on assigned PDCH, (T3190*1.2) seconds after step 2, with valid RRBP field, addressed to MS.
5	SS		Verify the MS does not respond to the previous RLC block, and that the MS does not transmit on the PACCH of the assigned PDCH.
6	SS->MS	IMMEDIATE ASSIGNMENT	Sent on assigned paging channel. This is to verify the MS is in packet idle mode with no starting time.
7	SS->MS	RLC DATA BLOCK	Sent on assigned PDCH, (T3190*0.8) seconds after step 6, with valid RRBP field, addressed to MS.
8	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previous RLC data block.
9		{Competition of downlink data transfer}	Macro

Specific Message Contents

42.5.4.1 Downlink Transfer/ T3190 Expiry / Resource reallocation / Without TBF starting time

42.5.4.1.1 Void

42.5.4.1.2 Conformance Requirement

On receipt of a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. Upon switching to the new PDCHs the mobile station shall restart timer T3190.

When the mobile station receives an RLC/MAC block addressed to itself on any of the new assigned resources it shall restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

References

3GPP TS 04.60, subclause 8.1.2.4.

42.5.4.1.3 Test purpose

Verify that an MS switches to the newly assigned PDCH when no starting time is present, and release the PDCH when T3190 expires.

42.5.4.1.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a IMMEDIATE ASSIGNMENT message establish downlink TBF, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.
4. SS transmits another PACKET DOWNLINK ASSIGNMENT message on PACCH, containing no starting time.
5. (T3190 * 1.2) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
6. MS ignores the downlink block (because it has already returned to packet idle mode because T3190 expired).
7. SS transmits another IMMEDIATE ASSIGNMENT message on PCH, containing no starting time.
8. (T3190 * 0.8) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
9. MS responds by sending a PACKET DOWNLINK ACK/NACK.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Triggers the MS to switch to PDCH0. (no starting time)
2	SS -> MS	RLC DATA BLOCK	3 blocks after the previous message, with valid RRBP field, on assigned PDCH0, addressed to MS.
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges on PACCH the RLC data block sent on PDCH0.
4	SS -> MS	RLC DATA BLOCKS	SS continues to transmit RLC data blocks according to allocation from step 1.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to PDCH1. (no starting time)
6	SS -> MS	RLC DATA BLOCK	(T3190 * 1.2) seconds after the previous message, with valid RRBP field, on PDCH1, addressed to MS.
7	SS		Verify the MS does not transmit on the PACCH of PDCH1.
8	SS->MS	IMMEDIATE ASSIGNMENT	Sent on assigned paging channel (no starting time). This is to verify the MS is in idle mode.
9	SS->MS	RLC DATA BLOCK	Sent on assigned PDCH, (T3190*0.8) seconds after step 8, with valid RRBP field, addressed to MS.
10	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previous RLC data block.
11		{Competition of downlink data transfer}	Macro

Specific Message Contents

IMMEDIATE ASSIGNMENT message in step 1:

Packet Channel Description - TN	 <One timeslot assigned – PDCH0>
TIMING ADVANCE	Timing Advance Value as default
TBF STARTING TIME	<IE not present>

PACKET DOWNLINK ASSIGNMENT message in step 5:

TIMESLOT_ALLOCATION	<one timeslot assigned – PDCH1>
TBF STARTING TIME	<IE not present>

IMMEDIATE ASSIGNMENT message in step 8:

Packet Channel Description - TN	 <One timeslot assigned – PDCH1>
TBF STARTING TIME	<IE not present>

DOWNLINK RLC DATA BLOCKS (various steps):

RRBP	00 – Response shall be sent by MS in N+13 frames.
S/P	1 – RRBP field is valid

42.5.4.2 Downlink Transfer/ T3190 Expiry / Resource reallocation / With TBF starting time

42.5.4.2.1 Void

42.5.4.2.2 Conformance Requirement

On receipt of a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. Upon switching to the new PDCHs the mobile station shall restart timer T3190.

When the mobile station receives an RLC/MAC block addressed to itself on any of the new assigned resources it shall restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

42.5.5 Downlink Transfer / Reestablishment

42.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry

42.5.5.1.1 Void

42.5.5.1.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall release the downlink TBF. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the uplink assignment. If there is no ongoing uplink TBF, the mobile station in packet transfer mode shall return to packet idle mode; the mobile station in dual transfer mode shall return to dedicated mode. The DRX mode procedures shall be applied, as specified in subclause 5.5.1.5.

42.5.5.3 Void

42.6 MAC Modes whilst in DTM

42.6.1 Exclusive allocation in single-slot configuration

42.6.1.1 Conformance requirements

The exclusive allocation shall be used in dual transfer mode during single slot operation with a half-rate PDCH.

When mobile station has received the uplink assignment and granted the right to transmit using exclusive allocation, the mobile station shall start timer T3184 and transmit an RLC/MAC block in every uplink radio block on the PDCHs assigned for the TBF. The timer T3184 shall be restarted every time the mobile station receives a PACKET UPLINK ACK/NACK message.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign a downlink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02). In this case, the downlink assignment message shall be encoded with a timeslot allocation including the timeslot number for the half-rate TCH and the half-rate PDCH and only that timeslot number. The mobile station shall interpret this allocation as an allocation of a half-rate PDCH.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign an uplink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02

42.6.1.2 Test purpose

To guarantee that the MS transmits an RLC/MAC block in every uplink radio block on the PDCH assigned for the single-slot TBF, ignoring the USF indicator in the downlink radio block corresponding to the uplink PDCH/H channel.

42.6.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, DTM supported, PCCCH present.

Mobile Station:

The MS is in the active state (U10) of a call.
The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

The MS is in a active CS call with an assigned TCH/H. The MS is triggered to initiate an uplink TBF and the MS is allocated the same timeslot for use in a uplink TBF. The MS interprets this as a command to use a combined TCH/H and exclusive mode PDCH/H in a single Timeslot. The SS verifies that the MS sends uplink RLC blocks in each block in the PDCH/H

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS		MS in the active state (U10) of a call on Timeslot N, with Channel Type=TCH/H
2	MS		Trigger the MS to initiate an uplink packet transfer containing 1000 octets of data.
3	MS->SS	DTM REQUEST	
4	SS->MS	PACKET ASSIGNMENT	SS sends this message such that it is received before Timer T3148 expiry.
5	MS<->SS	{ Uplink data transfer }	Macro – Test completes when 1000 octets of data is received.

Specific Message Contents

PACKET ASSIGNMENT (Step 4):

As default message contents except: RR Packet Uplink Assignment IE - TIMESLOT_ALLOCATION RR Packet Downlink Assignment IE	 N Not included

42.6.2 Void

42.6.3 Void

42.7 Packet assignment/ TA Value

42.7.1 Void

42.7.2 Packet Assignment / TA Value/TA not present in Packet uplink assignment sent On the PACCH

42.7.2.1 Conformance requirements

If TIMING_ADVANCE_VALUE field is not provided in the assignment message, the mobile station shall use its previous timing advance (either assigned in the previous IMMEDIATE ASSIGNMENT message received on AGCH or in the previous PACKET UPLINK ASSIGNMENT message received on PAGCH, or got through the continuous timing advance procedure).

Reference

3GPP TS 04.60 subclause 7.1.3.5.

42.7.2.2 Test purpose

To verify that the mobile station considers the previous timing advance contained in the PACKET UPLINK ASSIGNMENT allocating the single block allocation for sending the PACKET RESOURCE REQUEST message. When receiving the PACKET UPLINK ASSIGNMENT for the uplink TBF allocation without Timing advance, MS shall use the timing advance value given in the initial PACKET UPLINK ASSIGNMENT message.

42.7.2.3 Method of test

Initial conditions

System Simulator:

1cell, supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS initiates an uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT with timing advance included with a single block allocation forcing two-phase access procedure. As response to the PACKET RESOURCE REQUEST message, the SS sends PACKET UPLINK ASSIGNMENT message on PACCH (not containing TA value). The MS shall complete the transfer of the uplink data.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 500 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH. Including timing advance value.
4	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the single block assigned in step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	uplink dynamic allocation, no starting time, no timing advance value. Sent on PACCH of the same PDCH assigned in step 3.
6	SS	{Uplink data transfer}	Macro. Completion of the data transfer procedure.

Specific message contents

None

42.7.3 Packet Assignment / TA Value/ PACKET POWER CONTROL/TIMING ADVANCE during contention resolution

42.7.3.1 Conformance requirements

For a R97 and R98 MS only:

During the contention resolution, the mobile station may receive a non-distribution RLC/MAC control message addressing the mobile station by TLLI or the TFI value associated with the uplink TBF, other than the PACKET UPLINK ACK/NACK message. The mobile station may act on the other non-distribution messages, using the procedure defined for that message when it is received in packet transfer mode during operation on an uplink TBF (see clause 8).

For a R99 or later MS only:

During the contention resolution, the mobile station shall not accept a PACKET MEASUREMENT ORDER message, a PACKET CELL CHANGE ORDER message and a PACKET POWER CONTROL/TIMING ADVANCE message addressing the mobile station with the TFI value associated with the uplink TBF.

Reference:

For a R97 and R98 MS only:

3GPP TS 04.60 subclause 7.1.2.3.

For a R99 or later MS only:

3GPP TS 04.60/44.060 subclause 7.1.2.3a.

42.7.3.2 Test purpose

For a R97 and R98 MS only:

To verify that during contention resolution the mobile station may accept the PACKET POWER CONTROL/TIMING ADVANCE addressed with TFI.

For a R99 or later MS only:

To verify that during contention resolution the mobile station does not accept PACKET POWER CONTROL/TIMING ADVANCE addressed with TFI.

42.7.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

For a R97 and R98 MS only:

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access and includes a Timing Advance Value field. The SS shall wait 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS may accept this message even though the contention resolution was not solved. It is verified that the uplink transfer is successfully completed.

For a R99 or later MS only:

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access and includes a Timing Advance Value field. The SS shall wait 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS shall not consider this message since the contention resolution was not solved. It is verified that the uplink transfer is successfully completed.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 440 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Including Timing Advance Value. Indicating Packet UL Assignment struct. Sent on AGCH.
4	SS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigning USF to the MS. Sent at least 3 block periods from the assignment in step 3.
5	MS->SS	RLC DATA BLOCK	with TLLI included
6	SS -> MS	PACKET POWER CONTROL/TIMING ADVANCE	Include a valid Timing Advance Index. Sent on PACCH. Addressing MS with TFI assigned in step 3.
7A	SS		For R97/R98 terminals: SS waits 3 s. The MS may send access bursts on the PTCCH/U.
7B	SS		For R99 and later terminals: SS waits 3 s and verifies that the MS does not send access burst on the PTCCH/U.
8	SS->MS	PACKET UPLINK ACK/NACK	Including the TFI and TLLI of the MS, finishing the contention resolution. Assigning USF to the MS.
9	SS	{Uplink data transfer }	Macro. Completion of the macro procedure.

Note: Step 7A is performed for R97/R98 terminals. Step 7B is performed for R99 and later terminals.

Specific message contents

None.

42.7.4 Packet Assignment / TA Value/TAI present/ multislot capabilities

42.7.4.1 Conformance requirements

If the PDCH containing the mobile station's only assigned TAI value is removed, the mobile station shall, if it is performing an uplink TBF, perform an abnormal release with access retry.

Reference

3GPP TS 04.60 subclause 8.7.

42.7.4.2 Test purpose

To verify that If the PDCH containing the mobile station's only assigned TAI value is removed, the mobile station shall, if it is performing an uplink TBF, perform an abnormal release with access retry.

42.7.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. SI13, ACCESS_BURST_TYPE indicates 8 bits access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with IMMEDIATE ASSIGNMENT message for two phase access. The PACKET UPLINK ASSIGNMENT message contains a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the uplink data transfer, the SS shall verify that the access bursts are sent correctly (by the MS) in the PTCCH. Then PDCH containing the mobile station's only assigned TAI value is removed. Verify that MS perform an abnormal release with access retry.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of 2000 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3a	SS -> MS	IMMEDIATE ASSIGNMENT	Single block allocation.
3b	MS->SS	PACKET RESOURCE REQUEST	
3c	SS -> MS	PACKET UPLINK ASSIGNMENT	Including Timing Advance Index = 0 (on TN0), Dynamic allocation struct. Sent on PDCH. Assigning TN0 and TN1
4	MS->SS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS, sent on TN0
5	MS->SS	UPLINK RLC DATA BLOCK	Received on PDCH0
6	SS->MS	PACKET UPLINK ACK/NACK	With correct TLLI (to complete the contention resolution).
7	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	USFs assigned to MS on TN0 and TN1
8	MS->SS	UPLINK RLC DATA BLOCKS	Received on both PDCH0 and PDCH1
9	SS		Repeat steps 7 and 8 20 times.
10	SS->MS	PACKET PDCH RELEASE	Sent on PACCH of PDCH0 with TIMESLOTS_AVAILABLE indicating that only timeslot 1 is available
11	SS		Verify that MS did not continue on both PDCH0 and PDCH1 (max 6 blocks should be received)
12	MS->SS	CHANNEL REQUEST	MS re-initiates the packet access procedure

Verification

During the uplink data transfer (steps 3b to 9) the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that (FN mod (8*52)) = 12 for Timing Advance Index = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

Specific message contents

None.

42.7.5 Packet Assignment / TA Value/ Update of TA using PACKET POWER CONTROL/TIMING ADVANCE

42.7.5.1 Conformance requirements

The timing advance could be updated using a PACKET POWER CONTROL /TIMING ADVANCE message.

Reference

3GPP TS 04.60 subclause 7.2.2.1.

42.7.5.2 Test purpose

To verify that the mobile station is able to use the updated value received in a PACKET POWER CONTROL/TIMING ADVANCE message.

42.7.5.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access with Timing Advance Value field (=30bits). After contention resolution SS sends a PACKET POWER CONTROL/TIMING ADVANCE message with TA different from the assigned one. The SS verifies that MS is able to use the value received in PACKET POWER CONTROL/TIMING ADVANCE.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 440 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Timing Advance Value=30. Indicating Packet UL Assignment struct. Sent on AGCH.
4	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH with USF assigned to MS
5	MS->SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
6	SS->MS	PACKET UPLINK ACK/NACK	Sent on the PACCH with correct TLLI.
7	SS -> MS	PACKET POWER CONTROL/TIMING ADVANCE	Include a valid Timing Advance information. Sent on PACCH. Addressing MS with TFI assigned in step 3. With TA different from the previous value. (Change SS TA parameters)
8	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH with USF assigned to MS.
9	MS -> SS	UPLINK RLC DATA BLOCK	Sent on the PACCH with correct TLLI. Verify that MS uses the updated value sent in message of step 7.
10	SS<-> MS	Completion of macro {Uplink data transfer}	

Specific message contents

None.

42.7.6 Packet Uplink Assignment / Timing Advance / TA Index change

42.7.6.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10). If MS receives an other value of TAI in a PACKET POWER CONTROL /TIMING ADVANCE message, it shall use it.

Reference

3GPP TS 04.60 subclause 7.1.2.5.

3GPP TS 03.64 subclause 6.5.7.2.

42.7.6.2 Test purpose

To verify that the mobile station is able to update Timing Advance Index when received as part of PACKET POWER CONTROL /TIMING ADVANCE

42.7.6.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. SI13, ACCESS_BURST_TYPE indicates 8 bits access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with IMMEDIATE ASSIGNMENT message for two phase access. The PACKET UPLINK ASSIGNMENT message contains a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the Uplink data transfer, the SS shall verify that MS sends access bursts correctly in the PTCCH frames. The SS completes the contention resolution by including the TLLI of the MS in the PACKET UPLINK ACK/NACK message. Then SS sends PACKET POWER CONTROL /TIMING ADVANCE with new Timing advance index. Then SS verifies that MS uses correctly these values.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of 2000 octets data.
2	MS -> SS	CHANNEL REQUEST	Received on RACH.
3a	SS -> MS	IMMEDIATE ASSIGNMENT	Single block allocation.
3b	MS->SS	PACKET RESOURCE REQUEST	
3c	SS -> MS	PACKET UPLINK ASSIGNMENT	Including Timing Advance Index = 0, Dynamic allocation struct.
4	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS.
5	MS->SS	UPLINK RLC DATA BLOCK	Received on the PDTCH
6	SS->MS	PACKET UPLINK ACK/NACK	USF assigned to MS. Including the TLLI of MS in the CONTENTION_RESOLUTION_TLLI field
7	MS->SS	UPLINK RLC DATA BLOCK	Received on the PDTCH
8			Repeat steps 6 and 7 20 times; excluding the TLLI for the contention resolution in step 6.
9	SS -> MS	PACKET POWER CONTROL/TIMING ADVANCE	Include a different Timing Advance Index (=2). Sent on PACCH 6 blocks before the MS PTCCH channel. Addressing MS with TFI assigned in step 3.
10	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS. Sent after the 4 multiframes and 3 blocks of sending the message in step 9.
11		{Uplink data transfer}	Macro. Completion of data transfer. Verification, see below.

Verification

During the uplink data transfer in steps 3 to 8 the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that (FN mod (8*52)) = 12 for Timing Advance Index = 0 (3GPP TS 03.64/6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

During the uplink transfer in steps 9 to 11 the SS continues monitoring the access burst on PTCCH such that (FN mod (8*52)) = 64 (TAI =2).

Specific message contents

None.

42.7.7 Void

42.8 Dynamic allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168

42.8.1 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Expiry

42.8.1.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;

- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

- If timer T3168 expires, the mobile station shall retransmit the Channel Request Description information element in the next PACKET DOWNLINK ACK/NACK message unless it has been transmitted four times in which case the mobile station shall perform an abnormal release with random access. If the downlink TBF is released, including expiry of timer T3192, before expiry of timer T3168 the mobile station shall stop timer T3168 and perform an abnormal release with random access.

- Abnormal Release with Random Access: The mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF as defined in subclause 7.1.

References

3GPP TS 04.60, subclauses 8.1.2.5 and 8.7.2.

42.8.1.2 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS makes the request 4 times. Verify that if uplink resources are not assigned within T3168, the MS performs abnormal release with random access.

42.8.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.

2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).

3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.

4. MS is triggered to begin an uplink transfer.

5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.

6. When T3168 expires, MS repeats the Channel Request Description request. (This step is done 3 times, for a total of 4 Channel Request Descriptions.)

7. MS sends CHANNEL REQUEST again after returning to packet idle mode.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to assigned PDCH. (no starting time)
2	SS -> MS	RLC DATA BLOCKS	Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling).
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data blocks.
4			Steps 2 and 3 are repeated throughout
5	MS		MS is triggered to begin an uplink data transfer.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Message contains Channel Request Description IE. - MS starts timer T3168
7			Steps 2 and 3 are repeated until the next Channel Request Description is sent in step 8.
8	MS -> SS	PACKET DOWNLINK ACK/NACK	MS requests additional resources (message contains Channel Request Description IE) - Sent more than T3168 seconds after previous request for additional resources - MS re-starts timer T3168
9			Steps 7 and 8 are repeated 2 more times such that a total of 4 Channel Request Descriptions are sent.
10	MS -> SS	CHANNEL REQUEST	Sent after T3168 seconds after step 8 is executed the last time.

SYSTEM INFORMATION TYPE 13 (throughout):

T3168	1 (1 second)

42.8.2 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Stop with Packet Uplink Assignment

42.8.2.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure.

- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

References

3GPP TS 04.60, subclause 8.1.2.5.

42.8.2.2 Test purpose

Verify that during a downlink TBF, when the MS requests additional resources, that the MS stops timer T3168 when a PACKET UPLINK ASSIGNMENT is received.

42.8.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.

2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).

3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.

4. MS is triggered to begin an uplink transfer.

5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.

6. When T3168 expires, MS repeats the Channel Request Description request.

7. MS receives a PACKET UPLINK ASSIGNMENT message with a starting time such that more Channel Requests could be sent before the starting time.

8. MS does not repeat the Channel Request Description request.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to assigned PDCH. (no starting time)
2	SS -> MS	RLC DATA BLOCKS	Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling).
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data blocks.
4			Steps 2 and 3 are repeated throughout
5	MS		MS is triggered to begin an uplink data transfer.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Message contains Channel Request Description IE. - MS starts timer T3168
7			Steps 2 and 3 are repeated until the next Channel Request Description is sent in step 8.
8	MS -> SS	PACKET DOWNLINK ACK/NACK	MS requests additional resources (message contains Channel Request Description IE) - Sent after T3168seconds after previous request for additional resources - MS re-starts timer T3168
9	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent (.5*T3168) seconds after step 8. Allocates one uplink timeslot (same timeslot as the downlink assignment) With valid RRBP field (polling). With starting time T3168*2 seconds from now.
10	MS -> SS	PACKET CONTROL ACK	Received according to RRBP in step 9
11			Steps 2 and 3 are repeated until (1.5*T3168) seconds after step 9. Verify MS does not send additional Channel Request Description IE.

SYSTEM INFORMATION TYPE 13 (throughout):

T3168	1 (1 second)

42.8.3 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/Packet Access Reject/ With WAIT_INDICATION

42.8.3.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;

- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message containing a WAIT_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and start timer T3172 with the indicated value (Wait Indication). The mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection.

References

3GPP TS 04.60, subclause 8.1.2.5.

42.8.3.2 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS obeys a PACKET ACCESS REJECT message with WAIT_INDICATION by waiting the specified time before any possible subsequent attempt to request uplink resources.

42.8.3.3 Method of test

Initial Conditions

System Simulator:

1 cells, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to each poll.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET ACCESS REJECT message with WAIT_INDICATION.
7. MS acts on the PACKET ACCESS REJECT by waiting the indicated time.
8. MS shall not include the channel request description IE before T3172 expiry

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to assigned PDCH. (no starting time)
2	SS -> MS	RLC DATA BLOCKS	Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling).
3	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data blocks.
4			Steps 2 and 3 are repeated throughout until step 7.
5	MS		MS is triggered to begin an uplink data transfer.
6	MS -> SS	PACKET DOWNLINK ACK/NACK	Message contains Channel Request Description IE. - MS starts timer T3168
7	SS -> MS	PACKET ACCESS REJECT	Sent (0.5 * T3168) seconds after step 6. - MS starts T3172
8	SS->MS	RLC DATA BLOCK	With RRBP field valid
9	MS->SS	PACKET DOWNLINK ACK/NACK	Verify that Channel Request Description IE is not present
10			Repeat steps 8 and 9 until T3172 expiry.

PACKET ACCESS REJECT message in step 8:

TLLI	Addressing this MS
WAIT_INDICATION	2
WAIT_INDICATION_SIZE	0 – WAIT_INDICATION in units of seconds

42.8.4 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/Packet Access Reject/No WAIT_INDICATION

42.8.4.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;

- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message that contains a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and indicate a packet access failure to upper layer.

PACKET ACCESS REJECT message in step 8:

RRBP	00 – Response shall be sent by MS in N+13 frames.
S/P (MAC Header)	1 – RRBP field is valid
WAIT_INDICATION	<not present>

42.9 Extended Dynamic Allocation in Packet Transfer Mode

42.9.1 Default message contents

All default conditions, message contents and macros are defined in section 40, except for the messages as described in this subclause. These messages are applicable to the whole section 42.9, they shall be transmitted by the system simulator and are required to be received by the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

PACKET DOWNLINK ASSIGNMENT message:

MESSAGE_TYPE	000010
PAGE_MODE	Normal Paging
{0|1<PERSISTENCE_LEVEL>}	0
-	10 (address is TLLI)
- TLLI	same value as received from MS since GPRS attached
	0, message escape
MAC_MODE	Extended Dynamic Allocation
RLC_MODE	acknowledged mode
CONTROL_ACK	0
TIMESLOT_ALLOCATION	single slot arbitrarily chosen from valid values, default slot 2
Packet Timing Advance	
- {0|1<TIMING_ADVANCE_VALUE>}	1 (presence of the timing advance value)

1. For re-assignment of an uplink TBF, the address information should be changed to UPLINK_TFI of Global_TFI. UPLINK_TFI_ASSIGNMENT is absent.

2. For assignment of an uplink TBF while a downlink TBF has been established, the address information should be changed to DOWNLINK_TFI of Global_TFI. UPLINK_TFI_ASSIGNMENT is present.

42.9.2 Extended Dynamic Allocation / Uplink Transfer

42.9.2.1 Extended Dynamic Allocation / Uplink Transfer / Normal

42.9.2.1.1 Extended Dynamic Allocation / Uplink Transfer / Normal / Successful

42.9.2.1.1.1 Conformance requirements

The mobile station shall monitor the downlink PDCHs corresponding to (i.e. with the same timeslot number as) its assigned uplink PDCHs starting with the lowest numbered PDCH, then the next lowest numbered PDCH, etc., up to the one corresponding to the highest numbered assigned uplink PDCH.

Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH and all higher numbered assigned PDCHs. The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 45.002. The number of RLC/MAC blocks to transmit on each PDCH is controlled by the USF_GRANULARITY parameter characterising the uplink TBF. The mobile station shall ignore the USF on those higher numbered PDCHs during the block period where the assigned USF value is detected.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. Up to 4 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

1) The SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDTCH. It is checked that the MS sends RLC/MAC data blocks in the next radio block period on all assigned PDTCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USF addressing the MS. The check is repeated.

The same procedure is going on until the MS completes the packet data transfer.

2) The SS signals to the MS the assigned USF addressing the MS on the highest assigned PDTCH. It is checked that the MS sends RLC/MAC data blocks in the next radio block period only on the highest assigned PDTCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USF addressing the MS. The check is repeated.

The same procedure is going on until the MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

42.9.2.1.2 Extended Dynamic Allocation / Uplink Transfer / Normal / USF_GRANULARITY = 4 blocks

42.9.2.1.2.1 Conformance requirements

The number of RLC/MAC blocks to transmit on each PDCH is controlled by the USF_GRANULARITY parameter characterising the uplink TBF. The mobile station shall ignore the USF on those higher numbered PDCHs during the block period where the assigned USF value is detected. In addition, if USF_GRANULARITY is set to four blocks allocation, it may ignore the USF on all other PDCHs during the first three block periods in which the mobile station has been granted permission to transmit. As specified in 3GPP TS 45.002, the USF corresponding to the last three blocks of a four blocks allocation shall be set to an unused value for each PDCH on which the mobile station has been granted permission to transmit.

42.9.2.1.3 Extended Dynamic Allocation / Uplink Transfer / Normal / Allocation via polling mechanism

42.9.2.1.3.1 Conformance requirements

During the block period where an uplink radio block is allocated on a PDCH via the polling mechanism (see sub-clause 10.4.4), the mobile station shall monitor for the assigned USF on the downlink PDCHs corresponding to its assigned uplink PDCHs starting with the lowest numbered assigned PDCH up to the highest numbered PDCH which is feasible when taking into account the PDCH's allocated for transmission in the block period and the switching requirements of the mobile station multislot class (see 3GPP TS 45.002)

The mobile station shall either transmit the uplink radio block on the same timeslot as the block where the RRBP was received or, if an UPLINK_CONTROL_TIMESLOT is assigned to the mobile station, the mobile station shall transmit the uplink radio block on this UPLINK_CONTROL_TIMESLOT. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit. However, when Extended Dynamic Allocation or Shifted USF operation is used, corresponding USF monitoring procedure shall apply as described in sub-clause 8.1.1.2.1 and sub-clause 8.1.1.2.4 respectively.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. Up to 3 timeslots are assigned, according to the mobile multi-slot class (3GPP TS 45.002 Annex B.1).

1) The SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH. It is checked that the MS sends the RLC/MAC data blocks in the next radio block period on all assigned PDCHs and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

2) On the block before the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH.

On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH.

It is checked that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and RLC/MAC data blocks on all other assigned PDCH and that each data block contains the correct TFI without TLLI.

It is checked that the MS sends RLC/MAC data blocks on the next radio block period on all assigned PDCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

3) On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the second assigned PDCH. It is checked that the MS sends PACKET

CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and in the next block period the MS sends RLC/MAC data blocks on all assigned PDCHs except the first assigned PDCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

4) This sequence is applicable only for MS multislot classes class 7, 11, 12, 20 to 23, 25 to 29, 33, 34, 38, 39.

On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the third assigned PDCH. It is checked that the MS sends PACKET CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and no RLC/MAC data blocks are sent.

5) Successfully complete the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1500 octets, without starting time, Up to 3 timeslots are assigned according to MS multi-slot class (TS 5.02 Annex B.1) : - USF_1 on $PDCH_1$, - USF_2 on $PDCH_2$, - USF_3 on $PDCH_3$,
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF_1 on block N_1 of $PACCH_1$ is addressing the MS (must be at least 3 blocks after the block containing the uplink assignment.)

Specific Message Contents

None

42.9.2.1.4 Extended Dynamic Allocation / Uplink Transfer / Normal / PACCH operation in downlink

42.9.2.1.4.1 Conformance requirements

The mobile station shall attempt to decode every downlink RLC/MAC block on the lowest numbered timeslot in the PDCH allocation. Whenever the mobile station receives a RLC/MAC block containing a RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message.

The network shall transmit all PACCH messages on the PDCH carried on the lowest numbered timeslot in the allocation. Additionally for the concurrent TBF case, the network may transmit PACCH messages on any of the common timeslots assigned to the downlink and uplink PDCH allocation.

Whenever the mobile station detects an assigned USF value on any assigned PDCH, the mobile station may transmit a PACCH block on the same PDCH in the next block period. The mobile station shall not transmit a RLC data block in any uplink radio block allocated via the polling mechanism.

References

3GPP TS 44.060, subclause 8.1.1.2.2.

42.9.2.1.4.2 Test purposes

To verify that a MS having an uplink GPRS TBF with Extended Dynamic Allocation MAC mode:

1. Decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation when there is no concurrent downlink TBF.

2. Decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation when there is a concurrent downlink TBF.

3. Does not transmit a RLC data block in any uplink radio block allocated via the polling mechanism.

42.9.2.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure.

1) At this point in time the MS has an uplink GPRS TBF established with Extended Dynamic Allocation MAC mode. It may receive RLC/MAC blocks containing RLC/MAC control blocks for the uplink TBF on the PDCH carried on the lowest numbered timeslot in the allocation.

To test that the MS decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation when there is no concurrent downlink TBF the SS process as follow:

- The SS sends on the lowest numbered timeslot in the PDCH allocation a PACKET DOWNLINK ASSIGNMENT message to establish a concurrent downlink GPRS TBF with the Extended Dynamic Allocation MAC mode. The SS checks that the MS sends in response a PACKET CONTROL ACKNOWLEDGEMENT message on the lowest numbered timeslot in the PDCH allocation.

2) At this point in time the MS has an uplink TBF and a downlink GPRS TBF established with Extended Dynamic Allocation MAC mode. It may receive RLC/MAC blocks containing RLC/MAC control blocks for the uplink GPRS TBF on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation.

To test, in case there is a concurrent downlink GPRS TBF, that the MS decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation, the SS process as follow:

- The MS is triggered to transfer 64+1 (window size +1) GPRS RLC data blocks without acknowledgement from SS in such a way that the window is stalled.

- The SS sends on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation a PACKET UPLINK ACK/NACK message acknowledging only the oldest GPRS RLC data block. Then the MS is triggered to transfer one GPRS RLC data block. If the MS has correctly decoded the PACKET UPLINK ACK/NACK message, the BSN of the GPRS RLC data block shall be the next in sequence expected BSN.

- The SS sends on one of the common timeslots assigned to the downlink and uplink PDCH allocation a PACKET UPLINK ACK/NACK message acknowledging only the oldest GPRS RLC data block. Then the MS is triggered to transfer one GPRS RLC data block. If the MS has correctly decoded the PACKET UPLINK ACK/NACK message, the BSN of the GPRS RLC data block shall be the next in sequence expected BSN. The test is repeated with all PDCHs common for both reception and transmission.

3) To test that the MS does not transmit a GPRS RLC data block in any uplink radio block allocated via the polling mechanism the SS process as follow:

- The SS sends on one of the common timeslots assigned to the downlink and uplink PDCH allocation a PACKET UPLINK ACK/NACK message containing the TFI value assigned to the uplink TBF and a valid RRBP. On the block period preceding the block period where the polling response to the PACKET UPLINK ACK/NACK message should be received, the SS assigns an USF to the MS on the lowest numbered timeslot of the uplink PDCH allocation. The SS checks that during the block period where the polling response should be received, the MS responds to the polling with a PACKET CONTROL ACKNOWLEDGEMENT message sent on the PDCH where the polling request was sent and sends RLC data blocks on the other PDCHs of the uplink PDCH allocation. The test is repeated with all PDCHs common for both reception and transmission.

Then the data transfer is completed.

The following table gives the number of timeslots allocated for the uplink and downlink TBFs during the test according to the multislot class (see 45.002 annex B.1):

Multislot class	Number of PDCHs for the downlink TBF	Number of PDCHs for the uplink TBF
3	1	2
5	2	2
6	2	2
7	2	2
9	3	2
10	3	2
11	3	2
12	3	2
13	3	3
14	4	4
15	5	5
16	6	6
17	7	7
18	8	8
19	6	2
20	6	3
21	6	4
22	6	4
23	6	6
24	8	2
25	8	3
26	8	4
27	8	4
28	8	6
29	8	8
31	4	2
32	3	3
33	3	3
34	3	3
36	4	2
37	3	3
38	3	3
39	3	3
41	5	2
42	4	3
43	4	3
44	4	3
45	4	3

NOTE: The multislot class of the MS under test may impose that the highest PDCH of the uplink allocation is not a member of the downlink allocation. In this case the SS shall transmit a downlink RLC data block on a PDCH common to the downlink and uplink PDCH allocation at least every 5 seconds to avoid expiry of timer T3190.

Maximum Duration of Test

1 minute.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	Default PACKET UPLINK ASSIGNMENT message content for EDA defined in sub-clause 42.9.1shall be used. n = 1500 octets, without starting time,
2	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Default PACKET DOWNLINK ASSIGNMENT message content for EDA defined in sub-clause 42.9.1shall be used. Sent on the PACCH of the lowest PDCH of the uplink PDCH allocation. Including the Polling bit set and a valid RRBP field. Including the TFI assigned to the uplink TBF.
3	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the PACCH of the lowest PDCH of the uplink PDCH allocation.
4	SS		The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT message, on the uplink radio block specified by the RRBP of the lowest PDCH of the uplink PDCH allocation.
5	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP.
6	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation. SI=0
7			Repeat steps 5 and 6 for BSN=1 to 63. SS doesn't acknowledge any of the GPRS RLC data blocks with BSN from 0 to 63 (see note below).
8	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP.
9	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation. SI=1
10	SS->MS	PACKET UPLINK ACK/NACK	SS acknowledges the oldest GPRS RLC data block. Sent on the PACCH of the lowest PDCH of the uplink PDCH allocation. Including the TFI assigned to the uplink TBF. Including an USF not assigned to the MS on this PDCH. Wait for 6 blocks with no assigned USF
11	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP.
12	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation.
13	SS		The steps 11 and 12 are repeated k times <=8 until V(R) has been incremented by one (i.e. the MS has correctly understood the PACKET UPLINK ACK/NACK).
14	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP.
15	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation.
16			The steps 14 and 15 are repeated until a RLC DATA BLOCK with SI=1 is received (see note below).

17	SS->MS	PACKET UPLINK ACK/NACK	SS acknowledges the oldest GPRS RLC data block. Sent on a PDCH common to the downlink and uplink PDCH allocation. Including the TFI of the uplink TBF. Including an USF not assigned to the MS on this PDCH. Wait for 6 blocks with no assigned USF
18	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on this PDCH. Including an invalid RRBP.
19	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation.
20	SS		The steps 18 and 19 are repeated k times <=8 until V(R) has been incremented by one (i.e. the MS has correctly understood the PACKET UPLINK ACK/NACK).
21	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP.
22	MS -> SS	UPLINK GPRS RLC DATA BLOCK	Received on the highest PDCH of the uplink PDCH allocation.
23			The steps 21 and 22 are repeated until a RLC DATA BLOCK with SI=1 is received (see note below).
24			The steps 17, 18, 19, 20, 21, 22 and 23 are repeated for each PDCH common to the downlink and uplink PDCH allocation.
25	SS->MS	PACKET UPLINK ACK/NACK	SS acknowledges all RLC data block. Sent on a PDCH common to the downlink and uplink PDCH allocation. Including the Polling bit set and a valid RRBP field Including the TFI assigned to the uplink TBF.
26	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on the lowest PDCH of the uplink PDCH allocation on the block period preceding the response to the polling requested in step 25. Including the USF assigned to the MS on this PDCH.
27	MS -> SS	UPLINK GPRS RLC/MAC BLOCK	Received during the block period where the polling response should be sent. An UPLINK RLC CONTROL BLOCK should be received on the PDCH where the MS is polled or an UPLINK RLC DATA BLOCK should be received on the other PDCHs.
28			The step 27 is repeated a number of times equal to the number of PDCHs of the uplink PDCH allocation to get all RLC/MAC BLOCK sent by the MS.
29	SS		Verify that the MS did not transmit a RLC data block on the reserved uplink radio block specified by the RRBP on the PDCH where it has been polled. A PACKET CONTROL ACKNOWLEDGEMENT shall be transmitted instead. Verify that the MS has transmitted RLC data blocks on the other PDCHs.
30			The steps 25, 26, 27, 28 and 29 are repeated for each PDCH common to the downlink and uplink PDCH allocation.
31	SS -> MS	DOWNLINK GPRS RLC DATA BLOCK	Sent on a PDCH common to the downlink and uplink PDCH allocation. Including a valid RRBP and FBI = 1. Including an USF not assigned to the MS on this PDCH.
32	MS -> SS	PACKET DOWNLINK ACK/NACK	
33		{Completion of uplink RLC data block transfer in extended dynamic mode}	

NOTE: If the multislot class of the MS under test imposes that the highest PDCH of the uplink allocation is not a member of the downlink allocation, the SS shall transmit a downlink RLC data block on a PDCH common to the downlink and uplink PDCH allocation at least every 5 seconds to avoid expiry of timer T3190. The RLC data block shall be transmitted including an invalid RRBP and an USF not assigned to the MS on this PDCH.

42.9.2.1.5 Extended Dynamic Allocation / Uplink Transfer / Normal / Polling for PDAN

42.9.2.1.5.1 Conformance requirements

In case of simultaneous uplink and downlink TBFs and extended dynamic allocation, the network may apply polling in downlink RLC data blocks only when sent on a PDCH common for both reception and transmission. A mobile station operating with extended dynamic allocation need to respond to polling in downlink RLC data blocks only when received on a PDCH common for both reception and transmission.

References

3GPP TS 44.060, subclause 8.1.2.2.

42.9.2.1.5.2 Test purposes

To verify, in case the MS has a simultaneous uplink and downlink GPRS TBF with Extended Dynamic Allocation MAC mode, that the MS responds to polling when it is polled on blocks belonging to PDCHs common for both reception and transmission.

42.9.2.1.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure. Then a concurrent downlink GPRS TBF is established. The PDCH allocation for the downlink and uplink TBFs is chosen to maximise the number of PDCHs common for both reception and transmission.

The SS sends on a PDCH common for both reception and transmission a GPRS RLC data block with polling and checks that the MS responds with a PACKET DOWNLINK ACK/NACK acknowledging the GPRS RLC data block in the uplink radio block specified by RRBP. The test is repeated on all PDCHs common for both reception and transmission.

The following table gives the number of timeslots allocated for the uplink and downlink TBFs during the test according to the multislot class (see 45.002 annex B.1):

Multislot class	Number of PDCHs for the downlink TBF	Number of PDCHs for the uplink TBF

42.9.2.2 Extended Dynamic Allocation / Uplink Transfer / Configuration Change

42.9.2.2.1 Extended Dynamic Allocation / Uplink Transfer / configuration change / Changes in the Allocation from Dynamic to Extended Dynamic.

42.9.2.2.1.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. In PACKET UPLINK ASSIGNMENT SS assigns a dynamic allocation TBF. Up to 2 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

After receiving some data SS reconfigures the TBF to an Extended Dynamic allocation TBF giving up to 4 timeslots according to the mobile multislot class (TS 5.02 Annex B.1), giving PACKET UPLINK ASSIGNMENT. SS checks that MS has started using the TBF in Extended Dynamic allocation mode by giving the USFs only on the lower numbered PDCH and receiving the data on all the higher numbered PDCH.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1500 octets, without starting time, Assigning the TBF in dynamic mode. Up to 2 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1): - USF_1 on TN_1, - USF_2 on TN_2,
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PACCH_1$ addressing the MS sent on 3 blocks from the last radio block containing the uplink assignment.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 1. Assigned USF_2 on $PACCH_2$ addressing the MS sent on the same TDMA frame as step 2.
4	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
5	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 1. Received on the assigned $PDTCH_2$ on the same TDMA frame as in step 4.
6	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 on $PACCH_1$ addressing the MS.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 1. USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 6
8	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
9			This step is optional; it is performed only if 2 timeslots have been assigned in step 1. Check that the MS does not send the data on the $PDTCH_2$ as the USF sent on the $PACCH_{2\ in}$ step 7 is not addressing to the MS.
10	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on $PACCH_1$ addressing the MS, without starting time, assigning extended dynamic allocation. Up to 4 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1): - USF_1 on TN_1, - USF_2 on TN_2, - USF_3 on TN_3, - USF_4 on TN_4,
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PACCH_1$ addressing the MS on 3 blocks from the last radio block containing the uplink assignment in step 10.
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 11.
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 10. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 11.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 10. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 11.
15	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
16	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$ on the same TDMA frame as step 15.
17	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 10. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 15.
18	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 10. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 15.

19	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 on $PACCH_1$ addressing the MS.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 19
21	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 10. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 19
22	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 10. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 19
23	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.

42.9.2.2.2 Extended Dynamic Allocation / Uplink Transfer / configuration change / Changes in the Allocation from Extended Dynamic to Dynamic.

42.9.2.2.2.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

42.9.2.2.2.2 Test purposes

To verify that the MS while on Uplink TBF in Extended Dynamic Allocation mode receives a PACKET UPLINK ASSIGNMENT giving a Dynamic Allocation mode continues the TBF in Dynamic Allocation.

42.9.2.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default settings.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. In PACKET UPLINK ASSIGNMENT SS assigns an extended dynamic allocation TBF. Up to 4 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

After receiving some data SS reconfigures the TBF to a Dynamic Allocation giving up to 2 timeslots according to the mobile multislot class (TS 5.02 Annex B.1), by giving a PACKET UPLINK ASSIGNMENT. SS checks that MS has started using the TBF now in dynamic allocation mode by checking that the MS is sending data only on the timeslot where the USF is assigned.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1500 octets, without starting time, Assigning the TBF in extended dynamic mode. Up to 4 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1) : - USF_1 on TN_1, - USF_2 on TN_2, - USF_3 on TN_3, - USF_4 on TN_4,
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PACCH_1$ addressing the MS. Sent on third block from the last radio block containing the uplink assignment in step 1.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 2.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 2.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 1. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 2.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
7	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$ on the same TDMA frame as step 6.
8	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 6.
9	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 1. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 6.
10	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 on $PACCH_1$ addressing the MS.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 10
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 10
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 1. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 10
14	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
15	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$ on the same TDMA frame as step 14
16	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 14.
17	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 1. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 14.
18		PACKET UPLINK ASSIGNMENT	Reconfigures the TBF. Up to 2 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1) : - USF_1 on TN_1, - USF_2 on TN_2,

19	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PACCH_1$ addressing the MS. Sent on third block from the last radio block containing the uplink assignment.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 18. Assigned USF_2 on $PACCH_2$ addressing the MS sent on the same TDMA frame as step 19.
21	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
22	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 18. Received on the assigned $PDTCH_2$ on the same TDMA frame as step 21.
23	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_1 on $PACCH_1$ addressing the MS.
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots have been assigned in step 18. USF on $PACCH_2$ is not addressing the MS, sent on the same TDMA frame as step 23
25	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
26			This step is optional; it is performed only if 2 timeslots have been assigned in step 18. Check that the MS does not send the data on the $PDTCH_2$ as the USF sent on the $PACCH_{2,}$ step 24 is not addressing to the MS.

42.9.2.2.5 Extended Dynamic Allocation / Uplink Transfer / configuration change / Increase in number of uplink slots.

42.9.2.2.5.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

42.9.2.2.5.2 Test purposes

To verify that the MS:

While in extended Dynamic mode TBF, if the number of slots is increased then MS adheres to the new allocation properly.

42.9.2.2.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. In PACKET UPLINK ASSIGNMENT SS assigns a extended dynamic allocation TBF. Up to 3 timeslots are assigned, One slot less than the allowed by MS multislot class (TS 5.02 Annex B.1).

After receiving some data SS reconfigures the TBF to a have one slot more then given earlier, by giving PACKET UPLINK ASSIGNMENT. The new slot assigned is assigned towards the lower end. SS checks that MS using the MS is using the new timeslot configuration properly.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1500 octets, without starting time, Assigning the TBF in extended dynamic mode. One slot less (Up to 3 timeslots are assigned) than the allowed limit according to MS multislot class (TS 05.02 Annex B.1): - USF_2 on TN_2, - USF_3 on TN_3, - USF_4 on TN_4,
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_2 on $PACCH_2$ addressing the MS on 3 blocks from the last radio block containing the uplink assignment.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 2.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 2.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$.
6	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 5.
7	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 5.
8	SS -> MS	PACKET UPLINK ACK/NACK	Assigned USF_2 on $PACCH_2$ addressing the MS.
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 8.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 8.
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$.
12	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 11
13	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 11.
14	SS -> MS	PACKET UPLINK ASSIGNMENT	SS reconfigures the TBF. Assignment assigns a starting time of 104 frames. Number of slots is increased by one from the earlier allocation given in step 1. The slot is assigned at the lower end, i.e. TN_1 is assigned with USF_1 associated with it.
15	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PACCH_1$ addressing the MS. Send on three blocks before the starting time given in step 14.
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_2 on $PACCH_2$ addressing the MS. Send on three blocks before the starting time given in step 14.
17	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1. USF on $PACCH_3$ is not addressing the MS, sent on the same TDMA frame as step 15.

18	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. USF on $PACCH_4$ is not addressing the MS, sent on the same TDMA frame as step 15.
19			SS checks that the MS does not send any data block on $PDTCH_1$.
20	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$.
21	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 2 timeslots at least have been assigned in step 1 Received on the assigned $PDTCH_3$ on the same TDMA frame as step 20.
22	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 1. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 20.
23	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF addressing the MS. Sent on the lowest numbered PDCH assigned in step 14. Send on the next block of the block given by starting time in step 14. USF on the other PDCHs are not addressing the MS.
24	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_1$.
25	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_2$ on the same TDMA frame as step 24.
26	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 3 timeslots at least have been assigned in step 14. Received on the assigned $PDTCH_3$ on the same TDMA frame as step 24.
27	MS -> SS	UPLINK RLC DATA BLOCK	This step is optional; it is performed only if 4 timeslots have been assigned in step 14. Received on the assigned $PDTCH_4$ on the same TDMA frame as step 24.
28		{Completion of uplink RLC data block transfer in extended dynamic mode}

42.9.3 Extended Dynamic Allocation / Shifted USF

42.9.3.1 Extended Dynamic Allocation / Shifted USF / Normal

42.9.3.1.1 Extended Dynamic Allocation / Shifted USF / Normal / PACCH management

42.9.3.1.1.1 Conformance requirements

When Shifted USF operation is used, PACCH operation shall be as described in sub-clause 8.1.1.2.2 except that the network shall transmit all PACCH messages on the PDCH carried on the second lowest numbered timeslot in the allocation, and the mobile station shall attempt to decode every downlink RLC/MAC block on the second lowest numbered timeslot in the PDCH allocation.

References

3GPP TS 44.060, sub-clause 8.1.1.2.4.

42.9.3.1.1.2 Test purposes

To verify that when the MS is configured for a multi-slot uplink data transfer with shifted USF operation in use, it will decode a PACCH message sent to the MS on the second lowest numbered timeslot in the PDCH assignment.

42.9.3.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer in RLC acknowledged mode, with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure. The maximum number of UL timeslots is assigned, according to the mobile multislot class (TS 45.002 Annex B.1).

The SS sends to the MS a PACKET DOWNLINK ASSIGNMENT message on the second lowest numbered timeslot in the PDCH assignment, together with a valid RRBP and the TFI assigned to the uplink TBF. It is checked that the MS responds with a PACKET CONTROL ACKNOWLEDGEMENT on the same timeslot.

The SS completes the data transfer.

Maximum Duration of Test

1 minute.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 40 octets, without starting time, Up to 6 consecutive timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1): - USF_1 on TN_1, - USF_2 on TN_2, ($USF_2 \neq USF_1$) - up to … - USF_N on TN_N, where N = 5 or 6.
2	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on the PACCH of $PDCH_2$, 3 blocks on from the last radio block containing the uplink assignment. Includes the Polling bit set, and a valid RRBP field. Includes the TFI assigned to the uplink TBF. The timeslot assigned is TN_2. The USF is not addressing the MS.
3	MS-SS	PACKET CONTROL ACKNOWLEDGEMENT	Sent on the PACCH of $PDCH_2$, and on the radio block specified by the RRBP.
4		{ Completion of uplink RLC data block transfer in extended dynamic mode }	Using all assigned PDTCHs.

42.9.3.1.2 Extended Dynamic Allocation / Shifted USF / Normal / USF assignment on 2nd PDCH

42.9.3.1.2.1 Conformance requirements

When Shifted USF operation is used, the USF for the first assigned PDCH shall be sent on the second assigned PDCH. The MS shall monitor the second assigned PDCH for the USF corresponding to both the first assigned PDCH and the second assigned PDCH. If the USF corresponding to the first assigned PDCH is detected then the mobile station shall transmit on the first assigned PDCH and all higher numbered assigned PDCHs. Otherwise, operation shall be as described in sub-clause 8.1.1.2.1.

The USF value corresponding to the first assigned PDCH shall be different from the USF value corresponding to the second assigned PDCH.

References

3GPP TS 44.060, subclauses 8.1.1.2.4

42.9.3.1.2.2 Test purposes

To verify that the MS:

In a multi-slot uplink data transfer with shifted USF operation in use, the USF for the 1st and 2nd assigned PDCH's are monitored and detected by the MS on the 2nd assigned PDCH, and otherwise operation is as for normal Extended Dynamic Allocation.

42.9.3.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer in RLC acknowledged mode, and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure. The maximum number of UL timeslots is assigned, according to the mobile multislot class (TS 45.002 Annex B.1).

For one block period, the SS allocates blocks on all but the two lowest-numbered assigned PDCHs, by signalling to the MS the USF assigned to the third PDTCH using the third PDCH. It is checked that the MS sends RLC data blocks on all but the two lowest-numbered assigned PDTCHs.

For the next block period, the SS increases the number of PDCHs allocated to the MS, and allocates blocks on all but the lowest PDCH, by signalling to the MS the USF assigned to the second PDTCH using the second PDCH. It is checked that the MS sends RLC data blocks on all but the lowest-numbered assigned PDTCH.

For the next block period, the SS increases the number of PDCHs again, and allocates blocks on all assigned PDCHs, by signalling to the MS the USF assigned to the first PDTCH, but using the second PDCH. It is checked that the MS sends RLC data blocks on all PDTCHs.

The MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1500 octets, without starting time, Up to 6 consecutive timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1): - USF_1 on TN_1, - USF_2 on TN_2, ($USF_2 \neq USF_1$) - up to … - USF_N on TN_N, where N = 5 or 6.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of $PDCH_3$, 3 blocks on from the last radio block containing the uplink assignment; the assigned USF_3 is addressing the MS.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	Sent on the PACCH of $PDCH_1$, $PDCH_2$ and $PDCH_4$ to $PDCH_N$ on the same block period as step 2; the USF is not addressing the MS.
4	MS -> SS	UPLINK RLC DATA BLOCKS	Received on the assigned $PDTCH_3$ to $PDTCH_N$

42.9.3.1.3 Extended Dynamic Allocation / Shifted USF / Normal / Release of 2nd PDCH

42.9.3.1.3.1 Conformance requirements

1. If a PACKET PDCH RELEASE message releases the second PDCH in the current timeslot configuration of a mobile station using Shifted USF operation then the first timeslot shall be considered released. If any PDCHs remain in the new timeslot configuration then normal USF operation shall continue starting on the lowest available timeslot.

2. If the current timeslot configuration requires Shifted USF operation (see sub-clause 8.1.1.2.4) and the PACKET PDCH RELEASE message modifies the configuration in such a way that Shifted USF operation is no longer required then normal USF operation shall apply after a suitable reaction time as defined in 3GPP TS 45.010.

3. Upon a receipt of a commanding message or indication from the network requiring an action by the mobile station, if the reaction time for such action is not specified elsewhere, the mobile station shall begin to perform the required action no later than the next occurrence of block B((x+6) mod 12), where block B(x) is the radio block containing the commanding message or indication form the network.

Test Procedure

The MS is triggered to initiate packet uplink transfer in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. The maximum number of UL timeslots is assigned, according to the mobile multislot class (TS 45.002 Annex B.1).

The SS signals to the MS the USF assigned to the lowest PDTCH on the second PDCH, and, in the next block period, it is checked that the MS sends RLC/MAC data blocks on all assigned PDTCH.

The SS sends a PACKET PDCH RELEASE message with TIMESLOTS_AVAILABLE indicating that the second lowest assigned PDCH timeslots is not available for packet data. For that block period, and the next five block periods, the SS continues signals to the MS the USF assigned to the lowest PDTCH on the second PDCH, and also the USF assigned to the third PDTCH on the corresponding PACCH.

On the sixth block period following the PACKET PDCH RELEASE message, it is checked that the MS has stopped transmitting on the two lowest timeslots, but continues to transmit on the remaining timeslots.

The SS completes the data transfer using the remaining timeslots.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 2000 octets, without starting time, Up to 6 consecutive timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1): - USF_1 on TN_1, - USF_2 on TN_2, ($USF_2 \neq USF_1$) - up to … - USF_N on TN_N, where N = 5 or 6.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	Sent on the PACCH of $PDCH_1$ to $PDCH_N$, 3 blocks on from the last radio block containing the uplink assignment; the USF values are: $PACCH_1$ - USF is not addressing the MS. $PACCH_2$ - assigned USF_1 is addressing the MS. $PACCH_3$ - USF is not addressing the MS. up to … $PACCH_N$ - USF is not addressing the MS.
3	MS -> SS	UPLINK RLC DATA BLOCKS	Received on all assigned $PDTCH_1$ to $PDTCH_N$
4	SS -> MS	PACKET PDCH RELEASE	Sent on the PACCH of $PDCH_2$ on the same block period as step 3; the assigned USF_1 is addressing the MS.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	Sent on the PACCH of $PDCH_1$ and $PDCH_3$ to $PDCH_N$, on the same block period as step 3; the USF values are: $PACCH_1$ - USF is not addressing the MS. $PACCH_3$ - assigned USF_3 is addressing the MS. $PACCH_4$ - USF is not addressing the MS. up to … $PACCH_N$ - USF is not addressing the MS.
6	MS -> SS	UPLINK RLC DATA BLOCKS	RLC data blocks may optionally be received on $PDTCH_1$ and $PDTCH_2$. RLC data blocks are mandatorily received on assigned $PDTCH_3$ to $PDTCH_N$
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of $PDCH_1$ to $PDCH_N$, on the same block period as step 6; the USF values are: $PACCH_1$ - USF is not addressing the MS. $PACCH_2$ - assigned USF_1 is addressing the MS. $PACCH_3$ - assigned USF_3 is addressing the MS. $PACCH_4$ - USF is not addressing the MS. up to $PACCH_N$ - USF is not addressing the MS.
8	SS,MS		Steps 6 and 7 are repeated four times more.
9	MS -> SS	UPLINK RLC DATA BLOCKS	RLC data blocks are received on assigned $PDTCH_3$ to $PDTCH_N$ only. No RLC data blocks are received on $PDTCH_1$ and $PDTCH_2$.
10		{ Completion of uplink RLC data block transfer in extended dynamic mode }	Using $PDTCH_3$ to $PDTCH_N$

- TIMESLOTS_AVAILABLE	Indicating that TN_1 and TN_3 to TN_N are available for GPRS. TN_2 is not available.

42.10 EC-GSM-IoT

42.10.1 EC-GSM-IoT / Packet Uplink Assignment

42.10.1.1 EC-GSM-IoT / Packet Uplink Assignment /Successful / CCCH

42.10.1.1.1 Conformance requirements

The establishment of an EC Temporary Block Flow (EC TBF), for a mobile station that has enabled EC operation, is performed on the EC-CCCH. It can be initiated by either the mobile station or the network. The establishment of an EC TBF can also be performed on the CCCH if the mobile station has selected Coverage Class 1 in both the uplink and downlink directions, see 3GPP TS 45.008 and 3GPP TS 44.018.

...

When the mobile station receives a Fixed Uplink Allocation, FUA, in e.g. the EC PACKET UPLINK ASSIGNMENT or EC PACKET UPLINK ACK/NACK message it shall perform uplink transmissions according to that allocation.

...

This message may be sent by an EC capable mobile station attempting system access using the EC-RACH (see sub-clause 3.5.2.1.2a) in which the message format is as shown in Tables 9.1.65.1 and 9.1.65.2. This message can also be sent using the RACH (see sub-clause 3.5.2.1.2) in which the message format is as shown in Tables 9.1.65.3 and 9.1.65.4.

...

In case overlaid CDMA is used, see 3GPP TS 43.064 [6], up to four MS can be multiplexed on the same physical resource, simultaneously transmitting, using different orthogonal codes assigned by the network, see 3GPP TS 44.060 [11]. The codes are applied per burst over the assigned PDCHs for EC-PDTCH and EC-PACCH in each TDMA frame from the lowest to the highest numbered assigned TN, according to Table 6.3-2, and are only applied in case blind physical layer transmissions are used (i.e. for CC2, CC3 and CC4).

...

When EC operation is enabled the packet uplink resource is assigned to the mobile station in an EC IMMEDIATE ASSIGNMENT TYPE 1 message sent in unacknowledged mode on the same CCCH timeslot on which the network received the EC PACKET CHANNEL REQUEST message (see Table 3.5.2.1.2.3). Timer T3141 is started on the network side.

...

Specific Message Contents

Step 2: EC IMMEDIATE ASSIGNMENT TYPE 1

TBD

42.10.1.2 EC-GSM-IoT / Packet Uplink Assignment /Successful / During Downlink ongoing

42.10.1.2.1 Conformance requirements

When the mobile station receives a Fixed Uplink Allocation, FUA, in e.g. the EC PACKET UPLINK ASSIGNMENT or EC PACKET UPLINK ACK/NACK message it shall perform uplink transmissions according to that allocation. The uplink resources are allocated with respect to a BTTI configuration, the mobile station uplink coverage class, the assigned MCS, the number of RLC data blocks required for the EC TBF as indicated by the mobile station and with respect to the latest ack/nack status as perceived by the network, if such exists, and transmitted to the mobile station in the message containing the FUA. The uplink resources will be allocated according to the coverage class dependent resource mapping (see 3GPP TS 45.002) and the mobile station shall transmit accordingly.

...

When the mobile station has an ongoing downlink EC TBF, it may initiate an uplink EC TBF by including the EC Channel Request Description information element in the EC PACKET DOWNLINK ACK/NACK message on the EC-PACCH and start timer T3168. The network may then establish an uplink EC TBF by sending an EC PACKET UPLINK ASSIGNMENT message to the mobile station, in which case the downlink EC TBF is released.

...

In EC operation, the downlink EC TBF is released at establishment of the uplink EC TBF.

...

In case overlaid CDMA is used, see 3GPP TS 43.064 [6], up to four MS can be multiplexed on the same physical resource, simultaneously transmitting, using different orthogonal codes assigned by the network, see 3GPP TS 44.060 [11]. The codes are applied per burst over the assigned PDCHs for EC-PDTCH and EC-PACCH in each TDMA frame from the lowest to the highest numbered assigned TN, according to Table 6.3-2, and are only applied in case blind physical layer transmissions are used (i.e. for CC2, CC3 and CC4).

Step 9: EC PACKET UPLINK ASSIGNMENT

TBD

42.10.1.3 EC-GSM-IoT / Packet Uplink Assignment /Resource Assignment

42.10.1.3.1 Conformance requirements

STARTING_DL_TIMESLOT_OFFSET (2 bit field)

This field defines the timeslot number of the lowest timeslot included in the assignment that is used for transfer of downlink RLC/MAC control messages on the EC-PACCH during the UL EC TBF. The number of additional timeslots that are included in the downlink assignment depends on the assigned DL Coverage Class. The assigned timeslots are contiguous, starting with the timeslot number indicated in the STARTING_DL_TIMESLOT_OFFSET field. The STARTING_DL_TIMESLOT_OFFSET field is encoded as an offset to the timeslot assigned with the STARTING_UL_TIMESLOT field. The encoding of the field is dependent of the value of the UL_COVERAGE_CLASS and DL_COVERAGE_CLASS fields in the same message.

…

References

3GPP TS 44.018, table 9.1.60.2

42.10.1.3.2 Test purpose

To verify that the parameter STARTING_DL_TIMESLOT_OFFSET is properly used when uplink and downlink coverage classes are different and at least one of them is CC1.

42.10.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT

Mobile Station:

The MS is GPRS attached. In EC Operation mode in CC1 (UL and DL)

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS triggers and uplink data transfer. A downlink data transfer is requested by the network and different type of coverage class combination and values of STARTING_DL_TIMESLOT_OFFSET are tested.

The EC PACKET UPLINK ACK/NACK requested a Packet control acknowledgement is sent according to the STARTING_DL_TIMESLOT_OFFSET. For DL CC2 where 4 slots are used for the transmission of this message, the last 3 blocks are corrupted.

The procedure is repeated different combination of coverage classes (k= 1 to 2).

Maximum duration of the test

5 min

Expected sequence

The test sequence is repeated for k = 1 … 2.

Step	Direction	Message	Comments
1			The NW is configured as follow: k=1, Uplink CC1, DL CC2 k=2, Uplink CC2, DL CC1
2			TMS is triggered to send 50 Octets of data.
3	MS -> SS	EC PACKET CHANNEL REQUEST	Verify received on EC-RACH X blocks requested
			UL and DL CC1
4	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 2	Fixed uplink assignment, sent on EC-AGCH See specific message content
5	MS -> SS	UPLINK RLC DATA BLOCKS	
6	MS		Step 4 is repeated X-1 times.
			Branch A is done for k=1 (DL CC2) Branch B is done for k=2 (DL CC1)
7- A	SS -> MS	EC PACKET UPLINK ACK/NACK	k=1 Acknowledge all the UL RLC data. Received on EC-PACCH on DL timeslot defined in step 4. Corrupted data sent of the next 3 DL TS allocated EC Packet Control Ack requested with a valid RRBP.
7-B	SS -> MS	EC PACKET UPLINK ACK/NACK	k=2 Sent on EC-PACCH on TimeSlot = STARTING_UL_TIMESLOT. No UL RLC Data block acknowledged The MS shall not see this message.
7bis-B	SS -> MS	EC PACKET UPLINK ACK/NACK	Acknowledge all the UL RLC data. Received on EC-PACCH on DL timeslot defined in step 4. EC Packet Control Ack requested with a valid RRBP.
8	MS -> SS	EC PACKET CONTROL ACKNOWLEDGEMENT	Sent according to UL CC1

Specific Message Contents

EC IMMEDIATE ASSIGNMENT TYPE 2 message in step 4:

UL_COVERAGE_CLASS	00 UL CC1 for k=1 01 UL CC2 for k=2

EC Fixed Uplink Allocation	
STARTING_UL_TIMESLOT	011 Timeslot 3
Uplink_TFI_Assignment	00001
STARTING_DL_TIMESLOT_OFFSET	01 STARTING_UL_TIMESLOT - 1 for k=1 01 STARTING_UL_TIMESLOT + 1 for k=2

42.10.1.4 EC-GSM-IoT / Packet Uplink Assignment /Resource Assignment / Gap

42.10.1.4.1 Conformance requirements

The mobile station in EC TBF mode may include an EC Channel Request Description in the EC PACKET DOWNLINK ACK/NACK message in order to request an uplink TBF. The network may then establish an uplink EC TBF for the mobile station by sending an EC PACKET UPLINK ASSIGNMENT message, in which case the downlink EC TBF is released.

…

TIMESLOT_MULTIPLICATOR (3 bit field) This field defines how many UL timeslots that the assignment contains when the assigned UL Coverage Class, according to the UL_COVERAGE_CLASS field, is CC1. … Values other than '000' can only be used if supported by the mobile station, as indicated by its multislot capability, see 3GPP TS 45.002. If the assigned uplink Coverage Class > CC1 (according to the UL_COVERAGE_CLASS field), the mobile station shall consider the TIMESLOT_MULTIPLICATOR field as not valid
START_FIRST_UL_RLC_DATA_BLOCK (4 bit field) This field indicates the starting position of the resources for the first allocated RLC Data block in the fixed uplink allocation. The starting position is relative to the first TDMA frame (N) of the downlink block containing the last blind physical layer transmission of this EC PACKET UPLINK ASSIGNMENT message, according to the USED_DL_COVERAGE_CLASS field. The encoding of the field is dependent of the value of the UL_COVERAGE_CLASS and the TIMESLOT_MULTIPLICATOR fields in the same message. …
DELAY_NEXT_UL_RLC_DATA_BLOCK (3 bit field) This field indicates the position of the next allocated RLC Data block in the fixed uplink allocation. The position is calculated as the number of transmission opportunities from the previous uplink allocation, according to the UL_COVERAGE_CLASS and TIMESLOT_MULTIPLICATOR fields in the same assignment message, where the next uplink allocation for the mobile station is placed and where the mobile station thus shall transmit the next RLC data block. In the transmission opportunity/ies between the previous uplink allocation and this allocation the mobile station is not allocated any resource, and shall thus not transmit.

42.10.1.5 EC-GSM-IoT / Packet Uplink Assignment /Downlink Coverage Class Adaptation/ T3248

42.10.1.5.1 Conformance requirements

When timer T3226 expires, the mobile station shall monitor the EC-PACCH according to its assigned downlink coverage class and, as long as T3228 is running, attempt to decode every downlink RLC/MAC block on the PDCHs corresponding to the downlink assigned EC-PACCH resources.

Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message.

If timer T3228 expires, the mobile station shall release the ongoing uplink TBF and may perform an abnormal release with access retry, unless timer T3248 (sent in EC-SI) is used. If T3248 is used, i.e. it has a value > 0, the mobile station shall instead start timer T3248 and continue to monitor the DL EC-PACCH using the next higher DL Coverage Class, if such exists. If no higher DL CC than the assigned DL CC exists, the mobile station shall continue to monitor the DL EC-PACCH for reception of an EC PACKET UPLINK ACK/NACK message or an EC PACKET UPLINK ACK/NACK AND CONTENTION RESOLUTION message according to the last assigned DL CC until T3248 expires.

The assigned resources (timeslots) to be used for the downlink EC-PACCH according to the next higher DL Coverage Class are either the same as the assigned timeslots for the uplink EC-PDTCH or given in the assignment message. If no valid resources for the next higher Coverage Class are assigned, the mobile station shall continue to monitor the downlink EC-PACCH using the assigned DL Coverage Class while timer T3248 is running.

When the mobile station receives an EC PACKET UPLINK ACK/NACK message or an EC PACKET UPLINK ACK/NACK AND CONTENTION RESOLUTION message addressing the mobile station with the TFI value associated with its uplink TBF it shall stop T3228, if running. If timer T3248 was running at reception of the EC PACKET UPLINK ACK/NACK message or the EC PACKET UPLINK ACK/NACK AND CONTENTION RESOLUTION message (and thus not T3228), the timer T3248 shall be stopped.

References

42.10.1.5.2 Test purpose

To verify that in EC operation, if T3248 is used and running, the MS will monitor the DL EC_PACCH using the next higher DL coverage Class (if any).

42.10.1.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT. T3248 set to 3 secs

Mobile Station:

The MS is GPRS attached. In EC Operation mode in CC1 (UL and DL)

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is set to trigger an UL data transfer.

Following the last radio block transmitted according to the fixed uplink allocation, the MS should then T3226 then T3228 and start to monitor the EC-PACCH according to its DL CC.

The SS does not send the corresponding EC PACKET UPLINK ACK/NACK.

At the expiry of T3228, the MS should start T3248 and monitor the EC-PACCH with DL CC2 configuration.

The SS then sends the expected EC PACKET UPLINK ACK/NACK.

The UL transfer is then complete and no retransmission is expected.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1			The MS is triggered to send 50 Octets of data
2	MS -> SS	EC PACKET CHANNEL REQUEST	Verify received on EC-RACH UL and DL CC1 should be requested. X blocks requested
3	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 2	Fixed uplink assignment, sent on EC-AGCH according to DL CC1 MCS1 STARTING_DL_TIMESLOT_OFFSET same as STARTING_UL_TIMESLOT
4	MS -> SS	UPLINK RLC DATA BLOCKS	
5	MS		Step 4 is repeated X-1 times.
6			Wait for T3226 + T3228 + 1 sec
7	SS -> MS	EC PACKET UPLINK ACK/NACK	Acknowledge all the UL RLC data. Received on EC-PACCH during T3248. Mapped according to DL CC2 (see TS 45.002) on 4 slots. EC Packet Control Ack requested with a valid RRBP.
8	MS -> SS	EC PACKET CONTROL ACKNOWLEDGEMENT	Sent according to UL CC1

42.10.2 EC-GSM-IoT / Packet Downlink Assignment

42.10.2.1 EC-GSM-IoT / Packet Downlink Assignment / Successful / T3238

42.10.2.1.1 Conformance requirements

The purpose of network initiated TBF establishment is to establish a TBF to support the transfer of upper layer PDUs in the direction from the network to the mobile station. The procedure is triggered by a request from upper layers on the network side to transfer an upper layer PDU to a mobile station in packet idle mode that has enabled EC operation. Upon such a request, the network shall initiate a packet downlink assignment procedure on the EC-CCCH as described in 3GPP TS 44.018.

...

For a TBF in BTTI configuration, prior to the initiation of RLC data block transfer on the downlink, the network assigns the following parameters in a downlink assignment.

in case of a downlink EC TBF, the network also assigns the following parameters:

- uplink and downlink coverage classes;
- a set of PDCHs to be used for transmission of uplink RLC/MAC control messages.

...

If the mobile station, in the EC PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1', has been indicated to continue monitoring the EC-PACCH, it shall start timer T3238. The mobile station shall then monitor the EC-PACCH, according to its assigned downlink Coverage Class of the TBF, after an initial waiting time as indicated in the EC PACKET UPLINK ACK/NACK message. The mobile station shall then monitor the EC-PACCH, using a monitoring pattern as indicated in the EC PACKET UPLINK ACK/NACK message, until timer T3238 expires or until a downlink RLC/MAC control message triggering the release of the TBF is received. When timer T3238 expires, the mobile station shall leave the TBF and return to packet idle mode.

...

If the mobile station receives an EC PACKET DOWNLINK ASSIGNMENT message addressing the mobile station while listening to the EC-PACCH, it shall stop timer T3238, release the uplink TBF and act on the assigned resources.

...

An uplink EC TBF is released when the network has received all RLC data blocks for a TBF, as indicated by the mobile station, and sent the EC PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1'. An exception is when the mobile station, in the EC PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1', is ordered to continue monitoring the EC-PACCH, see sub-clause 9.3.2.4.3

...

42.10.2.1.2 Test purpose

To verify that the MS:

1. Start a Uplink TBF

2. Send FAI for the Uplink with a value of the T3238

3. Establish a downlink TBF before expire of T3238

42.10.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT.

Mobile Station:

The MS is GPRS attached.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS triggers an UL data transfer in EC Operation mode. The SS acknowledges all the UL data blocks and activate T3238.

The MS shall monitor the DL EC-PACCH for a Downlink transfer when T3228 is used.

The SS then sends an EC DOWNLINK ASSIGNMENT before T3238 expiry.

The MS shall proceed with the DL transfer

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS -> SS	EC PACKET CHANNEL REQUEST	Verify received on RACH
2	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 1	Fixed uplink assignment, sent on EC-AGCH. 5 RLC Blocks to be sent
3	MS -> SS	UPLINK RLC DATA BLOCKS	Received on the assigned PDTCH
4	MS -> SS	UPLINK RLC DATA BLOCKS	Received on the assigned PDTCH
5	MS -> SS	UPLINK RLC DATA BLOCKS	Received on the assigned PDTCH
6	SS -> MS	EC PACKET UPLINK ACK/NACK	acknowledge the received RLC data block, Final Ack Indicator = ‘1’ , a valid RRBP. Sent on EC-PACCH. T3238 set to 96s
7	SS		Wait 20s
12	SS -> MS	EC PACKET DOWNLINK ASSIGNMENT	Triggers the MS to switch to the assigned PDCH. (no starting time) With valid RRBP field Started before T3238 expired Meaning verify EC-PACCH channel still monitored by MS as T3238 not expired
13	MS->SS	EC PACKET CONTROL ACK	4 access bursts. Sent in the block specified by RRBP field in step 1.
14	SS -> MS	RLC DATA BLOCK	2 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS.
15	MS -> SS	EC PACKET DOWNLINK ACK/NACK	MS acknowledges on PACCH the RLC data block sent in step 3.
	MS<->SS	Completion of macro {Downlink data transfer}	SS completes downlink transfer of 200 octets of data.

Specific Message Contents

Step 12: EC PACKET DOWNLINK ASSIGNMENT

TBD

42.10.3.1 EC-GSM-IoT / Contention resolution / Enhanced Access Burst procedure

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

42.10.3.1.1 Conformance requirements

The TLLI is used to uniquely identify the mobile station when sending on the uplink. A mobile station, that has enabled EC operation, includes its TLLI in one or several of the uplink blocks that are transmitted during the establishment of an EC TBF, depending on what packet access procedure is used.

The contention resolution is described for the different packet access procedures in the following sub-clauses:

- using Access Burst procedure, with inclusion of the full TLLI in each RLC data block that is sent on the TBF until contention resolution is completed, described in 7a.2.1.1;

- using Enhanced Access Burst procedure, with inclusion of the full TLLI in only the first RLC data block that is sent on the TBF and then inclusion of a limited part of the TLLI in the subsequent RLC data blocks that are sent until contention resolution is completed, described in 7a.2.1.2.

The network indicates in the EC Immediate Assignment message which of the procedures that shall be used for the contention resolution, see 3GPP TS 44.018.

…

When the Enhanced Access Burst procedure is used, only the first RLC data block that is sent on the TBF shall include the TLLI of the mobile station. If MCS-7, MCS-8 or MCS-9 is used for the transmission of the TLLI (i.e. the RLC/MAC block is carrying two RLC data blocks), the TLLI shall be inserted in both RLC data blocks that are included in the first RLC/MAC block. Every RLC data block that is sent on the TBF, except the first one, shall include the reduced TLLI (rTLLI) of the mobile station until the mobile station receives an EC PACKET UPLINK ACK/NACK AND CONTENTION RESOLUTION message or an EC PACKET UPLINK ACK/NACK message addressing the mobile station with the TFI value associated with the uplink TBF and containing either the TLLI or the rTLLI of the mobile station. The reduced TLLI (rTLLI) consists of the 4 least significant bits of the TLLI of the mobile station. The rTLLI shall not be included in the RLC/MAC header if the TLLI is included in the RLC Data block. The rTLLI value shall thus not be included in the RLC/MAC header of the first RLC Data block of a TBF, with BSN=0 and, if MCS-7, MCS-8 or MCS-9 is used for the transmission, with BSN=1, since the TLLI of the mobile station is included in the RLC data block(s).

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reached its maximum value in the contention resolution procedure, and repetition as described in subclause 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued.

Reference

3GPP TS 44.060 subclauses 7a.2.1, 7a.2.1.2.

42.10.3.1.2 Test purpose

To verify that the MS uses the Enhanced Access Burst procedure when indicated by the network.

42.10.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, EC-GSM-IoT supported

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with EC IMMEDIATE ASSIGNMENT TYPE 2 message that request fixed link assignment, sent on EC-AGCH, with Enhanced Access Burst value set to 1..

The MS shall then send the first RLC data block including the TLLI. The SS responds with EC PACKET UPLINK ACK/NACK with the same TLLI.

The MS then sends two additional RLC data blocks with a reduced TLLI. The SS then acknowledge the received data blocks with the EC PACKET UPLINK ACK/NACK message. The MS acknowledge with the EC PACKET CONTROL ACKNOWLEDGEMENT message.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of three RLC data blocks.
2	MS -> SS	EC PACKET CHANNEL REQUEST	Received on EC-RACH.
3	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 2	Request Reference = pertaining to the message received in step 2. Fixed link assignment, sent on EC-AGCH **Enhanced Access Burst value:** 1 (The Enhanced Access Burst procedure shall be used)
4	MS -> SS	UPLINK RLC DATA BLOCK	MS sends the 1st RLC data block including its TLLI
5	SS -> MS	EC PACKET UPLINK ACK/NACK	The SS transmits the MS TLLI in order to solve the contention and indicates that the 1st RLC data block has been received.
6	MS -> SS	UPLINK RLC DATA BLOCK	MS sends the 2nd RLC data block including its reduced TLLI (rTLLI) that is set to the 4 least significant bits of the TLLI of the mobile station
7	MS -> SS	UPLINK RLC DATA BLOCK	MS sends the 3rd RLC data block including its reduced TLLI (rTLLI) that is set to the 4 least significant bits of the TLLI of the mobile station
8	SS -> MS	EC PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block, Final Ack Indicator = '1' , a valid RRBP. Sent on EC-PACCH
9	MS -> SS	EC PACKET CONTROL ACKNOWLEDGEMENT	MS acknowledge the RLC data. Received on EC-PACCH

Specific message contents

The default conditions, message contents and macros not specified in this subclause must be set as in clause 40.

Initial conditions

Unless otherwise indicated, the initial conditions for all acknowledged mode tests, as a minimum, are as follows. Other initial conditions may apply. In the event of conflict between initial conditions stated here and those stated in a test case, the test case shall take precedence.

- The MS is GPRS attached.
- A PDP context has been established with RLC acknowledged mode operation.

43.1 Acknowledged Mode

43.1.1 Acknowledged mode / Uplink TBF

43.1.1.1 Acknowledged mode / Uplink TBF / Send state variable V(S)

43.1.1.1.1 Conformance requirements

1. The send state variable, V(S), can take on the values 0 through 127. Each RLC data block contains a block sequence number (BSN) field that is 7 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable.
2. V(S) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(S) shall be incremented by 1 after transmission of the RLC data block with BSN = V(S).

References

3GPP TS 04.60, subclause 9.1.1.

43.1.1.1.2 Test purpose

1. To verify that the mobile station sets the V(S) to 0 at the beginning of each TBF.
2. To verify that the mobile station increases the V(S) by 1 after transmission of the RLC data block with BSN set to V(S).
3. To verify that the mobile station wraps the V(S) to 0 after 127.

43.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. SS checks that the BSN in the RLC data block:

1. is set to the value 0 at the beginning of each TBF in which the mobile station is the transmitter;
2. is incremented by 1 in each subsequent RLC data block in the TBF; and
3. takes on all values in the range 0 to 127 and then back to 0.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 3500 octets, USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges each RLC data block, RBB set to 1, containing USF assigned to the MS
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN is updated according to BSN(n) = (BSN(n-1) + 1) mod 128
6	-	Steps 4 & 5 are repeated at least 128 times	The PACCH of the PDCH assigned in step 2, containing USF assigned to the MS.
7		{ Completion of uplink RLC data block transfer}	

43.1.1.2 Acknowledged mode / Uplink TBF / Transmit window size

43.1.1.2.1 Conformance requirements

1. V(S) shall not exceed V(A) modulo 128 by more than the maximum allowed number of outstanding RLC data blocks k (window size k is defined in 3GPP TS 04.60 subclause 9.1.9).
2. If V(S) = V(A) + k modulo 128 (i.e., the transmit window is stalled), the mobile station shall set the stall indicator to 1 in each RLC data block transmitted and transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING_ACK, then the next oldest RLC data block whose corresponding element in V(B) has the value PENDING_ACK, etc.

References

3GPP TS 04.60, subclauses 9.1.1, 9.1.3 and 9.1.9.

43.1.1.2.2 Test purpose

1. To verify that the mobile station sets the stall indicator to 1 in each RLC data block transmitted once the transmit window is stalled.
2. To verify that the mobile station retransmits data blocks that are pending acknowledgment.
3. To verify that the mobile station retransmits unacknowledged RLC data blocks in correct order while the transmit window is stalled.

43.1.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS transmits k (window size) blocks without acknowledgement from SS. Confirm that the MS:

a) sets the stall indicator bit once the window is stalled; and

b) retransmits blocks that are pending acknowledgement, oldest first.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 1500 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SI=0
4			Repeat steps 2 and 3 for BSN=1 to 63. SS doesn't acknowledge any of the data blocks with BSN from 0 to 63
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SI=1
7			Repeat steps 5 & 6 for BSN = 1 to 63 until all unacknowledged blocks are retransmitted. SS verifies that the unacknowledged data blocks are retransmitted with SI field set to 1. SS verifies that in the retransmitted blocks the BSN is from 0 to 63
8	SS->MS	Packet Uplink Ack/Nack	SS acknowledges all the data blocks USF not assigned to the MS
9			Wait for 6 blocks with no assigned USF
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A11 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH, BSN = 0 Repeat step 10
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
12	SS		Verify that MS is not retransmitting any acknowledged blocks Verify transmitted data blocks are BSNs 64 and higher
13		{ Completion of uplink RLC data block transfer}	

43.1.1.3 Acknowledged mode / Uplink TBF / Acknowledge state variable V(A)

43.1.1.3.1 Conformance requirements

1. The Acknowledge state variable V(A) contains the BSN value of the oldest RLC data block that has not been positively acknowledged by its peer. V(A) can take on the values 0 through 127.
2. V(A) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(A) shall be updated from the values received from its peer in the received block bitmap (RBB) of the Packet Ack/Nack message (see subclause 9.1.8).

References

3GPP TS 04.60, subclauses 9.1.2 and 9.1.8.

43.1.1.3.2 Test purpose

1. To verify that the mobile station correctly decodes the RBB and updates the values of V(A).

43.1.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The mobile station transmits k (window size) blocks without acknowledgement from SS. SS then acknowledges the first N blocks. The MS retransmits the negatively acknowledged data blocks with BSN from N to 63 and then it transmits N more new data blocks (from 64 to N+63).

2. The test is performed for the values of N = 10,15 and 20.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 3000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SI=0
4			Repeat steps 2 and 3 for BSN=1 to 63. SS doesn't acknowledge any of the data blocks with BSN from 0 to 63
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SI=1
7			Repeat steps 5 and 6 until unacknowledged data blocks (BSN = 0 to 30) are retransmitted with SI field set to 1
8			Wait BS_CV_MAX periods without granting USF.
9	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges first N (=10) RLC data blocks, RBB set to 1 and negatively acknowledges all the other data blocks from BSN=N to BSN=63 with RBB set to 0 USF not assigned to the MS
10			Wait for 6 blocks with no USF
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A12 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may retransmit block BSN = 31 if it has already been scheduled while Packet Uplink Ack/Nack is being processed.
A13 (optional step)	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
12	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN = N & SI = 0
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
14	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
15	SS		Repeat steps 13 and 14 until all negatively acknowledged data blocks are retransmitted followed by new data blocks SS verifies that the negatively acknowledged data blocks are retransmitted before new data blocks are sent, by verifying that RLC data blocks with BSN from N to 63 are received subsequently first, then RLC data blocks with BSN from 64 to 63+N are received.
16		{ Completion of uplink RLC data block transfer}	
17	-	-	The procedure is repeated for different values of N

43.1.1.4 Acknowledged mode / Uplink TBF / Negatively acknowledged RLC data blocks

43.1.1.4.1 Conformance requirements

1. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED.

2. If [V(S) < V(A) + k] modulo 128 and no RLC data blocks have a corresponding element in V(B) with the value NACKED, the RLC data block with BSN = V(S) shall be transmitted.

3. As each RLC data block is transmitted the corresponding element in V(B) shall be set to the value PENDING_ACK.

References

3GPP TS 04.60, subclause 9.1.3.

43.1.1.4.2 Test purpose

1. To verify that the mobile station retransmits Nacked data blocks before transmission of new information.

2. To verify that the mobile station retransmits Nacked blocks in order of age, older first.

3. To verify that the mobile station only retransmit Nacked blocks once per negative acknowledgment.

43.1.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS_CV_MAX = 0.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to transmit RLC data blocks. The SS randomly negatively acknowledges RLC data blocks. The MS retransmits the negatively acknowledged RLC data blocks, oldest first before transmitting new RLC data blocks.

The SS does not send further acknowledgements. The MS does not retransmit the previously negatively acknowledged RLC data blocks.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 3000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
4			Repeat steps 2 and 3 until received data block BSN = 30
5	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data blocks with BSN 10 to 30, RBB set to 1 and negatively acknowledges the rest with RBB set to 0 USF not assigned to the MS
6			Wait for 6 blocks with no USF
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A8 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may retransmit block BSN = 31 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 7
8	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN = 0..9
9	SS		Repeat steps 7 & 8 ten (11 in case mobile sends BSN = 31 in step A8) times SS verifies that the Nacked data blocks are received before new data block once per negative acknowledgment. After these data blocks new data block BSN=31 (32 if MS sends BSN = 31 earlier in step A8) should be received
10	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges retransmitted (BSN 0..9) RLC data blocks, RBB set to 1
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
12	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
13	SS		Repeat steps 11 and 12 until the stall indication bit is set in the data block received in step 12. SS verifies that acknowledged blocks are not retransmitted
14	SS -> MS	PACKET UPLINK ACK/NACK	SS negatively acknowledges RLC data blocks with BSN 55 to 60, RBB set to 0 and acknowledges the rest with RBB set to 1 USF not assigned to the MS
15			Wait for 6 blocks with no USF.
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A17	MS -> SS	UPLINK RLC DATA BLOCK	MS may retransmit block BSN = 32 (or 33) if it has already been scheduled while Packet Uplink Ack/Nack is being processed.
A18	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
17	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN = 55..60
18	SS		Repeat steps 16 & 17 until all Nacked blocks are received SS verifies that the Nacked data blocks are received before new data blocks once per negative acknowledgment.
19		{Completion of uplink RLC data block transfer}	

43.1.1.5 Acknowledged mode / Uplink TBF / Invalid Negative Acknowledgment

43.1.1.5.1 Conformance requirements

For a R97 and R98 MS only:

1. If the mobile station is the transmitter, it shall set an instance of timer T3198 for each RLC data block sent (subclause 9.1.3 3GPP TS 04.60).
2. The timer T3198 shall have the expiry value set to BS_CV_MAX block periods (subclause 9.1.3 3GPP TS 04.60).
3. The mobile station shall not modify the element in the acknowledge state array, V(B), corresponding to an RLC data block that cannot be validly negatively acknowledged (subclause 9.1.8 3GPP TS 04.60).

For a R99 or later MS only:

If the RLC transmitter is on the mobile station side, the bit contains the value '0' and the number of block periods between the end of the block period used for the last transmission of the corresponding RLC data block and the beginning of the block period containing the Packet Uplink Ack/Nack message is less than (max(BS_CV_MAX,1) – 1) (i.e., the RLC data block was recently (re)transmitted and thus can not be validly negatively acknowledged in this particular Packet Uplink Ack/Nack message), the element in V(B) shall not be modified.

References

3GPP TS 04.60, subclauses 9.1.3 and 9.1.8.

43.1.1.5.2 Test purpose

To verify the correct response of the mobile station to an invalid negative acknowledgement.

43.1.1.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

- GPRS Release (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges some RLC data blocks within BS_CV_MAX block periods. The MS shall not retransmit the RLC data blocks that were negatively acknowledged.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 440 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN = 0
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
5	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN = 1

10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH BSN =4
			Wait for BS_CV_MAX block period of Block BSN = 0 to expire
12	SS -> MS	PACKET UPLINK ACK/NACK	SS negatively acknowledges blocks BSN = 0 and BSN =3, RBB = 0 and acknowledges blocks BSN = 1, BSN = 2 and BSN = 4, RBB = 1, SSN = 5. USF not assigned to the MS
13			Wait for 6 blocks with no USF.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A15 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may transmit block BSN = 5 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 14
15	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that data block BSN = 0 is retransmitted
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
17	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that data block BSN = 3 is not retransmitted New data block received with BSN = 5 (6 if mobile sends BSN=5 earlier in step A15)
18		{ Completion of uplink RLC data block transfer}	

43.1.1.6 Acknowledged mode / Uplink TBF / Decoding of Received Block Bitmap

43.1.1.6.1 Conformance requirements

For each bit in the RBB whose corresponding BSN value is within the transmit window, if the bit contains the value '1', the corresponding element in V(B) indexed relative to SSN shall be set to the value ACKED. If the bit contains the value '0', the element in V(B) shall be set to the value NACKED. A bit within the RBB whose corresponding BSN is not within the transmit window, shall be ignored.

References

3GPP TS 04.60, subclause 9.1.8.

43.1.1.6.2 Test purpose

1. To verify the decoding of the received block bitmap of the Packet Uplink Ack/Nack message.

43.1.1.6.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges one or more RLC data blocks after BS_CV_MAX block periods. The MS retransmits these blocks.

The SS negatively acknowledges data blocks outside the transmit window. The MS ignores these negative acknowledgments.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{ Uplink dynamic allocation two phase access}	n = 4000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
3	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
4			Repeat steps 2 and 3 until received data block BSN = 19 SS doesn't acknowledge any of the data blocks with BSN from 0 to 19
5			Wait BS_CV_MAX periods without granting USF.
6	SS -> MS	PACKET UPLINK ACK/NACK	SS negatively acknowledges RLC data block with BSN 0, RBB set to 0 and acknowledges data blocks with BSN from 1 to 19, RBB set to 1 USF not assigned to the MS
7			Wait for 6 blocks with no USF.
8	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A9 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may transmit block BSN = 20 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 8
9	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the Nacked data block (BSN = 0) is received before new data blocks
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
11	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH

Step	Direction	Message	Comments
12			Repeat steps 10 and 11 until BSN=63 SS doesn't acknowledge any of the data blocks until BSN = 63
13	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges all RLC data blocks with RBB set to 1
14			Wait for 6 blocks with no USF.
15	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
A16 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may transmit block BSN = 0 (or BSN = 20 if step A09 was performed) if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 15
16	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS receives new data block with BSN = 64
17	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
18	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
19			Repeat steps 17 and 18 until BSN=80 SS doesn't acknowledge any of the data blocks
20			Wait BS_CV_MAX periods without granting USF.
21	SS -> MS	PACKET UPLINK ACK/NACK	SS negatively acknowledges RLC data block with bit corresponding to BSN 50 in RBB set to 0 and all other bits set to 1 USF not assigned to the MS
22			Wait for 6 blocks with no USF.
23	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, containing USF assigned to the MS.
24	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned PDTCH
25	SS		Repeat steps 23 and 24 until BSN=127 SS verifies that the MS ignored negative acknowledgment outside the window and sends new data blocks BSN=81 to 127
26		{ Completion of uplink RLC data block transfer}	

43.1.2 Acknowledged mode / Downlink TBF

43.1.2.1 Acknowledged mode / Downlink TBF / Receive state variable V(R)

43.1.2.1.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive state variable V(R). The receive state variable denotes the BSN of the next in-sequence RLC data block expected to be received.

2. The mobile station shall set V(R) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

References

3GPP TS 04.60, subclause 9.1.5.

43.1.2.1.2 Test purpose

1. To verify correct initialisation of the receive state variable, V(R).

2. To verify the receive state variable, V(R) is set to the next in sequence RLC data block expected to be received.

43.1.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

Test Procedure

SS establishes a downlink TBF and sends RLC data blocks with BSN values between 0 to N in sequence. The MS is polled in each RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack messages sent by the MS are set to [BSN+1] modulo 128. SS then sends RLC data block with random BSN N1 that holds a value between [N+1] modulo 128 and [N+64] modulo 128. The MS is polled in the last RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack message sent by the MS is set to [N1+1] modulo 128.

The test is performed for the values of N = 1, 10, 63, 64, 126, 127.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Macro parameters: **Acknowledged mode**
2	SS -> MS	DOWNLINK RLC DATA BLOCK	MS is polled S/P bit '1' RRBP 00
3	MS -> SS	Packet Downlink Ack/ Nack	SS verifies that SSN = [BSN + 1] modulo 128
4			Repeat steps 2 and 3 until BSN = N
5	SS -> MS	DOWNLINK RLC DATA BLOCK	BSN = N1 a random number between [N+1] mod 128 and [N+64] modulo 128 MS is polled S/P bit '1' RRBP 00
6	MS -> SS	Packet Downlink Ack/ Nack	SS verifies that SSN = [N1+1] modulo 128.

43.1.2.2 Acknowledged mode / Downlink TBF / Receive window state variable V(Q)

43.1.2.2.1 Conformance requirements

In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive window state variable, V(Q). The mobile station shall set V(Q) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

The value of V(Q) shall be updated when the RLC receiver receives the RLC data block whose BSN is equal to V(Q).

References

3GPP TS 04.60, subclause 9.1.6.

43.1.2.2.2 Test purpose

1. To verify that V(Q) is not updated when data blocks with BSN not equal to V(Q) are received.

43.1.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Test Procedure

SS establishes a downlink TBF and sends an RLC data block with BSN value N (N in the range 1..63) and polls the MS. The MS shall accept the block and sends a Packet Downlink Ack/Nack message. SS verifies that SSN is set to [N+1] and RBB bit corresponding to N is set to 1. SS sends another RLC data block to the MS with BSN value 64 and polls the MS. SS verifies that the SSN and RBB fields in the Packet Downlink Ack/Nack message sent by the MS are not updated.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Macro parameters: **Acknowledged mode**
2	SS -> MS	DOWNLINK RLC DATA BLOCK	BSN = N (N is in the range of [1..63]) polls the MS
3	MS -> SS	Packet Downlink Ack/ Nack	SSN value should be [N+1] RBB set for block N
4	SS -> MS	DOWNLINK RLC DATA BLOCK	BSN = 64, polls the MS
5	MS -> SS	Packet Downlink Ack/ Nack	SSN value should be [N+1]. No change in RBB
6	SS -> MS	DOWNLINK RLC DATA BLOCK	BSN = 0, polls the MS
7	MS -> SS	Packet Downlink Ack/ Nack	SSN value should be [N+1]. RBB updated
8	SS -> MS	DOWNLINK RLC DATA BLOCK	BSN = 64, polls the MS
9	MS -> SS	Packet Downlink Ack/ Nack	SSN value should be 65.

43.1.2.3 Acknowledged mode / Downlink TBF / Re-assembly of RLC data blocks

43.1.2.3.1 Conformance requirements

RLC data blocks shall be collected at the receiver until all RLC data blocks comprising an LLC PDU have been received. The RLC headers shall be removed from each RLC data block at this time and the RLC data units re-assembled into an LLC PDU and passed to the next higher layer.

References

3GPP TS 04.60, subclause 9.1.11.

43.1.2.3.2 Test purpose

To verify the correct re-assembly of the RLC data blocks.

43.1.2.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 is activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends several data blocks in random sequence , but within the range of transmit and receive window.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	**Macro parameters:** **Acknowledged mode**
2	SS -> MS	DOWNLINK RLC DATA BLOCK	A bit set (A=1) in LLC frame SS sends data blocks in random sequence
3			Repeat step 2 until all the data blocks in one LLC frame is transmitted
4	MS -> SS	Packet Downlink Ack/ Nack	
5		{Uplink dynamic allocation two phase access}	USF_GRANULARITY = 1 block
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
7	MS -> SS	UPLINK RLC DATA BLOCK	LLC Supervisory frame (RR) acknowledging a valid LLC frame
8		{ Completion of uplink RLC data block transfer}	

43.1.2.4 Acknowledged mode / Downlink TBF / Re-assembly / Length Indicator

43.1.2.4.1 Conformance requirements

1. The Extension (E) bit is used to indicate the presence of an optional extension octet in the RLC data block header. The More (M) bit is used to indicate the presence of an LLC frame following the current LLC frame. The M bit, the E bit, and the Length Indicator, are used to delimit LLC frames within a TBF.

2. The Length Indicator (LI) field is six bits in length and shall be encoded as a binary number. The value 0 shall indicate that no LLC frame boundary does exist, that the M bit shall be ignored and that the E bit shall be interpreted as having the value 1.

3 A singular case occurs when the end of the LLC PDU would fit within the RLC data block but the addition of the Length Indicator octet (to indicate the LLC PDU boundary) causes the LLC PDU to extend into the next RLC data block. In this case, this additional LI field shall take the value 0 whatever is the length of the last but one LLC PDU segment.

References

3GPP TS 04.60, subclause 9.1.11 and clause B.2.

43.1.2.4.2 Test purpose

To verify the correct decoding of RLC data block length indication, more(M) and extension(E) bit fields during reassembly of LLC frames into RLC data blocks.

43.1.2.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends data blocks containing two LLC frames (A bit set) with length indicator encoded. The MS is expected to decode these fields and re-assemble LLC frames correctly.

The size of the first LLC frame is 15 octets and second is 24 octets.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Macro parameters: **Acknowledged mode**
2	SS -> MS	DOWNLINK RLC DATA BLOCK	15 octets of first LLC frame and 4 octets of second LLC frame Length Indicator = 15,M =1, E = 1 A bit set (A = 1) in both LLC frames
3	SS -> MS	DOWNLINK RLC DATA BLOCK	19 octets from second LLC frame Length indicator = 0, M = 0, E = 1
4	SS -> MS	DOWNLINK RLC DATA BLOCK	1 octet from second LLC frame Length indicator = 1, M = 0, E = 1, FBI = 1
5	MS -> SS	PACKET DOWNLINK ACK/NACK	Optionally Including channel request description
6		{Uplink dynamic allocation two phase access}	USF_GRANULARITY = 1 block
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
8	MS -> SS	UPLINK RLC DATA BLOCK	LLC Supervisory frame (RR) acknowledging first LLC frame. If this UPLINK RLC DATA BLOCK contains a second RR frame acknowledging the second LLC frame steps A9 and B9 should be skipped.
A9 (Optional)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, USF assigned to the MS.
B9 (Optional)	MS -> SS	UPLINK RLC DATA BLOCK	LLC Supervisory frame (RR) acknowledging second LLC frame
9		{Completion of uplink RLC data block transfer}	

Note: If the negotiated window size is less than 2, the testcase ends at the PDP context activation and link establishment.

43.2 Control Blocks

43.2.1 Control Blocks Re-assembly

43.2.1.1 Conformance requirements

The network may segment RLC/MAC control messages into one or two RLC/MAC control blocks depending on the length of the RLC/MAC control message.

RLC/MAC control blocks shall be collected at the receiver until all RLC/MAC control blocks comprising a RLC/MAC control message have been received. The receiving side shall determine the length of the RLC/MAC control message contents by interpreting the RLC/MAC control block contents.

References

3GPP TS 04.60, subclauses 9.1.11a, 9.1.11b and 9.1.2.

43.2.1.2 Test purpose

To verify that the MS re-assembles a RLC control message If it spans across more than one RLC control block.

43.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends a PACKET UPLINK ASSIGNMENT message that spans more than one RLC control block. The PACKET UPLINK ASSIGNMENT message contains Dynamic Allocation struct (Timeslot allocation with power control parameters included) and frequency parameters with direct encoding 2 struct information fields. The SS verifies that RLC data blocks containing Attach Request message are received from the MS.. Switch off the MS.

Maximum Duration of Test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is switched on and triggered to perform a GPRS attach.
2	MS -> SS	CHANNEL REQUEST	
3	SS -> MS	IMMEDIATE ASSIGNMENT	Indicating two phase access
4	MS -> SS	PACKET RESOURCE REQUEST	
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Frequency Parameter direct encoding 2 information element. Dynamic Allocation struct information element (Timeslot allocation and Power Control parameters included) Payload type = 10, Sent on PACCH.(See section below)
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	UPLINK RLC DATA BLOCKS	Attach Request received on PDTCH assigned in step 5

43.3.1 Message Contents

none

43.3.2 Macros

43.3.2.1 Macro for uplink dynamic allocation two phase access (PBCCH not present)

Step	Direction	Message	Comments
		{Uplink dynamic allocation two phase access}	Macro parameters: n: the number of data octets to be transferred, USF_GRANULARITY: 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED: 9-261 (close-end), or absent (open-end) CHANNEL_CODING_COMMAND: CS-1, -2, -3, -4 TBF_STARTING_TIME
0	MS		Trigger the MS initiating uplink transfer **n** octets data according to the test PDP context activated
1	MS -> SS	CHANNEL REQUEST	Received on RACH.
2	SS -> MS	IMMEDIATE ASSIGNMENT	Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH.
3	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the single block assigned in step 2. Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used.
4	SS -> MS	PACKET UPLINK ASSIGNMENT	uplink dynamic allocation, no starting time (as default, otherwise use TBF_STARTING_TIME), Sent on PACCH of the same PDCH assigned in step 2.

43.3.2.2 Macro for downlink TBF establishment (PBCCH not present)

Step	Direction	Message	Comments
		{Downlink TBF establishment}	Macro parameters: TBF_STARTING_TIME
1	SS -> MS	PAGING REQUEST	Page info contains P-TMSI of the MS. Sent on PCH.
2	MS -> SS	CHANNEL REQUEST	Establishment cause = "One phase access". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Random Reference = pertaining to the message received in step 2. Dynamic allocation for RLC data blocks, Sent on AGCH.
4	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3.
5	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block. Sent on uplink PACCH.
6	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Acknowledge the RLC control message. Received on uplink PACCH.
7	SS -> MS	IMMEDIATE ASSIGNMENT	Downlink Assignment, TLLI value as received. Sent on PCH. Macro parameter as assigned in the test case.

43.4

43.4.1

43.4.1.1 EC-GSM-IoT / Acknowledged mode / EC Uplink TBF / Transmit window size

43.4.1.1.1 Conformance requirements

For EC-GSM-IoT, i.e. for an EC TBF, the window size (WS) shall be 16.

…

Each RLC endpoint transmitter shall have an associated acknowledge state array (V(B)). V(B) is an array of SNS elements indicating the acknowledgement status of WS previous RLC data blocks. The array is indexed relative to the acknowledge state variable V(A) modulo SNS. The values of V(B) shall be updated from the values received from its peer in the received block bitmap (RBB) of the Packet Ack/Nack message (see sub-clause 9.1.8.3).

The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED. As each RLC data block is transmitted the corresponding element in V(B) is set to the value PENDING_ACK. If the RLC data block to be transmitted is split over two radio blocks, both radio blocks shall be transmitted.

If [V(S) < V(A) + WS] modulo SNS and no RLC data blocks have a corresponding element in V(B) with the value NACKED, the RLC data block with BSN = V(S) shall be transmitted and the corresponding element in V(B) shall be set to the value PENDING_ACK. If the transmitter is the mobile station that, for a fixed uplink allocation it has received, has no further RLC data blocks available for transmission (i.e. the RLC data block with BSN= V(S) does not exist), the mobile station shall retransmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING_ACK, then the next oldest block whose corresponding element in V(B) has the value PENDING_ACK, etc.

If [V(S) = V(A) + WS] modulo SNS (i.e. the transmit window is stalled), the sending side shall transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING_ACK, then the next oldest RLC data block whose corresponding element in V(B) has the value PENDING_ACK, etc.

If the transmitter is on the network side the process of pre-emptive retransmission, i.e. retransmitting the oldest RLC data blocks whose value in V(B) has the value PENDING_ACK, is optional.

When an element in V(B) falls outside of the active transmit window, i.e. [V(A) ≤ BSN < V(S)] modulo SNS, the element shall be set to the value INVALID.

References

3GPP TS 44.060, subclauses 9.1.3 and 9.1.92a

43.4.1.1.2 Test purpose

1. To verify that the mobile station sets the stall indicator to 1 in each RLC data block transmitted once the transmit window is stalled.
2. To verify that the mobile station retransmits data blocks that are pending acknowledgment.
3. To verify that the mobile station retransmits unacknowledged RLC data blocks in correct order while the transmit window is stalled.

43.4.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS transmits 16 (EC TBF window size) blocks without acknowledgement from SS. Confirm that the MS:

a) sets the stall indicator bit once the window is stalled; and

b) retransmits blocks that are pending acknowledgement, oldest first.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1			The MS is triggered to send 1500 octets of data
2	MS -> SS	EC PACKET CHANNEL REQUEST	**DL Coverage Class:** CC1
3	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 2	Request Reference = pertaining to the message received in step 2. Fixed link assignment, sent on EC-AGCH
4	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned EC-PDTCH SI=0
5			Repeat steps 4 for BSN=1 to 15. SS doesn't acknowledge any of the data blocks with BSN from 0 to 15
6	MS -> SS	UPLINK RLC DATA BLOCK	Received on the assigned EC-PDTCH SI=1
7			Repeat steps 6 for BSN = 1 to 15 until all unacknowledged blocks are retransmitted. SS verifies that the unacknowledged data blocks are retransmitted with SI field set to 1. SS verifies that in the retransmitted blocks the BSN is from 0 to 15
8	SS->MS	EC PACKET UPLINK ACK/NACK	SS acknowledges all the data blocks
9	SS		Verify that MS is not retransmitting any acknowledged blocks Verify transmitted data blocks are BSNs 16 and higher

43.4.1.2 EC-GSM-IoT / Packet transfer/ EC Uplink TBF/ Verification of Coding Schemes

43.4.1.2.1 Conformance requirements

1. In EC TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the MCS commanded, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6.

2. A re-segment bit is included within each EC PACKET UPLINK ACK/NACK, EC PACKET UPLINK ASSIGNMENT and EC PACKET TIMESLOT RECONFIGURE messages.

3. For retransmissions, setting the resegment bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split.

References

3GPP TS 44.060, subclause 8.1.1.

43.4.1.2.2 Test purpose

1. To verify that the mobile station uses the correct channel coding commanded by the Network for initial transmission for specific EC channels MCS-1/M.

2. To verify that correct channel coding command is used for retransmission.

43.4.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT.

Mobile Station:

The MS is EC operation with a P-TMSI allocated, and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

- Support of PSK in uplink (TSPC_Type_EGPRS_8PSK_uplink)

Test Procedure

The EC capable MS is made to transmit uplink RLC data blocks in EC TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE is commanded in the EC Packet Uplink Assignment message. The resegment IE is set to 1.

The SS checks that the Uplink RLC Data Blocks are transmitted by the mobile using the channel coding scheme commanded by the SS.

The SS negatively acknowledges the received data blocks. The Coding scheme to be used by the mobile is commanded in the EGPRS Channel Coding Command IE.

The SS checks that the Uplink RLC data blocks are retransmitted using the channel coding scheme commanded by the SS.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1			The MS is triggered to send 200 Octets of data
2	MS -> SS	EC PACKET CHANNEL REQUEST	Verify received on EC-RACH UL and DL CC1 should be requested. X block requested, at least 2 blocks must be requested
3	SS -> MS	EC IMMEDIATE ASSIGNMENT TYPE 2	Fixed uplink assignment, sent on EC-AGCH according to DL CC1 MCS A STARTING_DL_TIMESLOT_OFFSET same as STARTING_UL_TIMESLOT
4	MS -> SS	UPLINK RLC DATA BLOCKS	**MSC A**
5	MS		Step 4 is repeated X-1 times
6	SS -> MS	EC PACKET UPLINK ACK/NACK	UnAcknowledge all the received UL RLC data. Received on EC-PACCH. Mapped according to DL CC1 EGPRS Channel Coding Command: MCS-B
7	MS -> SS	UPLINK RLC DATA BLOCKS	**MSC B**
8	MS		Step 7 is repeated until FBI is sent.
9	SS -> MS	EC PACKET UPLINK ACK/NACK	Acknowledge all the UL RLC data. Received on EC-PACCH. Mapped according to DL CC1 EC Packet Control Ack requested with a valid RRBP.
10	MS -> SS	EC PACKET CONTROL ACKNOWLEDGEMENT	Sent according to UL CC1

43.4.2.1 EC-GSM-IoT / Packet transfer / EC Downlink TBF / Decoding of Coding Schemes

43.4.2.1.1 Conformance requirements

1- In EC TBF mode, the transfer of RLC Data Blocks in the acknowledged RLC/MAC mode may be controlled by a selective type I ARQ mechanism, or by type II hybrid ARQ mechanism, coupled with the numbering of the RLC Data Blocks within one Temporary Block Flow.

2. According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block (see note). For the retransmissions, the same or another MCS from the same family of MCSs may be selected.

3. The selection of MCS is controlled by the network. Only MCS-1 shall be used when the assigned Coverage Class > CC1.

4. RLC data blocks which are retransmitted using a new MCS shall at the first transmission after the MCS switch be sent with the puncturing scheme indicated in table 9.3.2.1a.1.

Table 9.3.2.1a.1: RLC data blocks re-transmitted in new MCS

MCS switched from	MCS switched to	PS of last transmission before MCS switch	PS of first transmission after MCS switch
MCS-9	MCS-6	PS 1 or PS 3	PS 1
		PS 2	PS 2
MCS-6	MCS-9	PS 1	PS 3
		PS 2	PS 2
MCS-7	MCS-5	any	PS 1
MCS-5	MCS-7	any	PS 2
all other combinations		any	PS 1

References

3GPP TS 44.060, subclauses 9.3.2.1a.

43.4.2.1.2 Test purpose

To verify that the mobile station correctly decode RLC data blocks sent using different coding schemes (MCS-1 to MCS-9).

43.4.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EC-GSM-IoT.

Mobile Station:

The MS is EC operation with a P-TMSI allocated, and the test PDP context2 activated

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS establishes a Downlink EC TBF.

The SS sends a few RLC data blocks in different coding schemes and asks for an acknowledgement from the MS.

The MS shall correctly acknowledge all the received data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	EC-DOWNLINK ASSIGNMENT	**DL Coverage Class:** CC1 Sent on EC-AGCH
2	SS -> MS	DOWNLINK RLC DATA BLOCK	With MCS-1, BSN=0
3	SS -> MS	DOWNLINK RLC DATA BLOCK	With MCS-1, BSN=1
4			Repeat step 2 and 3 using MCS-2 till MCS-6 in each iteration. Repeat Step 2 using MCS-7, MCS-8 and MCS-9. The BSNs of the data blocks shall be sequential, with BSN=14 and BSN=15 for the last block transmitted. ECS/P = '01'B and RRBP='00'B is set in the header of last RLC Data Block sent with BSN=14 and 15.
5	MS -> SS	EC PACKET DOWNLINK ACK/NACK	Received on the corresponding EC-PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks. SSN shall be equal to 16

44 Test case requirements for GPRS mobility management

44.1 Default conditions and default messages

Note that only the layer 3 messages are described in the document. The mapping of the layer 3 messages to lower layers and the use of logical channels is not described in the present document.

The default conditions and default message contents not specified in this clause must be set as in "GPRS default conditions".

Below is a list of the RAI values and the corresponding RAC, LAC and MCC used in the test cases:

RAI-1: MCC1/MNC1/LAC1/RAC1 (Used if only one cell);

RAI-2: MCC2/MNC1/LAC1/RAC1;

RAI-3: MCC1/MNC1/LAC2/RAC1;

RAI-4: MCC1/MNC1/LAC1/RAC2;

RAI-5: MCC1/MNC1/LAC1/RAC3;

RAI-6: MCC2/MNC1/LAC2/RAC1;

RAI-7: MCC2/MNC1/LAC1/RAC2;

RAI-8: MCC1/MNC2/LAC1/RAC1;

RAI-9: MCC1/MNC2/LAC2/RAC1;

RAI10: MCC1/MNC2/LAC1/RAC2.

If the mobile station initial condition specifies that the mobile has a valid IMSI but the initial condition does not mention P-TMSI, than that shall be interpreted as that the mobile has no valid P-TMSI.

Test cases identified in TS 51.010-2 as “EC-GSM –IoT compatible” should consider the default cells in the “Initial Conditions” to be EC-GSM-IoT cells if the test has to be executed in “EC Mode”. Otherwise the cell should be considered as a basic GPRS cell. The test must then be run according to the “MS operation mode C” procedure.

44.2 Elementary procedures of GPRS mobility management

The tests are based on 3GPP TS 04.08 / 3GPP TS 24.008.

44.2.1 GPRS attach procedure

This procedure is used to indicate for the network that the IMSI is available for traffic by establishment of a GMM context.

44.2.1.1 Normal GPRS attach

The normal GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C to IMSI attach for GPRS services only.

44.2.1.1.1 GPRS attach / accepted

44.2.1.1.1.1 Conformance requirement

1) If the network accepts the GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.

2) If the network accepts the GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.

3) If the network accepts the GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

1) P-TMSI / P-TMSI signature is allocated;

2) P-TMSI / P-TMSI signature is reallocated;

3) Old P-TMSI / P-TMSI signature is not changed.

44.2.1.1.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

2) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS reallocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.

3) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the old P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 26.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
7	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
8	MS		The MS is switched off or power is removed (see PICS).
9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
10	MS		The MS is powered up or switched on and initiates an attach (see PICS).
11	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1
12	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
13	MS -> SS	ATTACH COMPLETE	
14	SS ->MS	GMM INFORMATION	Message sent with P-TMSI-1
14b	MS -> SS	GMM STATUS	Message sent in case the MS does not support reception of GMM information message Cause #97
15	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
16	MS		No response from the MS to the request. This is checked for 10 s.

Step	Direction	Message	Comments
17	MS		The MS is switched off or power is removed (see PICS).
18	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
19	MS		The MS is powered up or switched on and initiates an attach (see PICS).
20	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
21	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Routing area identity = RAI-1 Attach result = 'GPRS only attached' Negotiated Ready timer value IE should not be included. Force to standby indicator set
22	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
23	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
24	MS		The MS is switched off or power is removed (see PICS).
25	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
26	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 25.

Specific message contents

None.

44.2.1.1.1a GPRS attach / accepted / Attach with IMSI

44.2.1.1.1a.1 Conformance requirement

1) If the MS is configured for "AttachWithIMSI" and the selected PLMN is neither the registered PLMN nor in the list of equivalent PLMNs, the MS shall include the IMSI in the Mobile identity IE in the ATTACH REQUEST message

2) If the network accepts the GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the UE shall acknowledge the P-TMSI and continue communication with the P-TMSI.

Reference(s):

3GPP TS 24.008 clause 4.7.3.1 and 4.4.4.1

44.2.1.1.1a.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

1) To verify that the Attach with IMSI indicator can be set in the MS

2. To verify that the MS registers with IMSI (not Temporary ID) when registering with a new PLMN if the selected PLMN is neither the registered PLMN nor in the list of equivalent PLMNs.

44.2.1.1.1a.3 Method of test

Initial conditions

System Simulator:

Two cells; cell A with MCC1/MNC1/LAC1/RAC1 (RAI-1) and cell B in MCC2/MNC1/LAC2/RAC1 (RAI-6).

Both cells are operating in network operation mode II (in case of MS operation mode A).

The PLMN that contains Cell B is not equivalent to the PLMN that contains Cell A.

Mobile Station:

The MS has a valid IMSI.

The MS has been registered in the CS domain.

The MS is configured for "AttachWithIMSI"

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

2) The SS changes the serving cell to a cell that belongs to a new PLMN. When the MS selects the new cell it sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		Make cell A available and cell B not available
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 16.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	

Step	Direction	Message	Comments
6	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
7	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
			The following messages are sent and shall be received on cell B.
8	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
9	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
10	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-6
11	MS -> SS	ATTACH COMPLETE	
12	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
13	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
16	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 15.

Specific message contents

None.

44.2.1.1.1b GPRS attach / accepted / PSM

44.2.1.1.1b.1 Conformance requirement

An MS supporting PSM may request the network to assign a value for T3324 by including a requested timer value in:

- the ATTACH REQUEST or ROUTING AREA UPDATE REQUEST message (in A/Gb mode and Iu mode); or
- the ATTACH REQUEST or TRACKING AREA UPDATE REQUEST message (in S1 mode).

The value of timer T3324 can be sent by the network to the MS in:

- the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message (in A/Gb mode and Iu mode); and
- the ATTACH ACCEPT or TRACKING AREA UPDATE ACCEPT message (in S1 mode).

…

The network accepts the use of PSM by providing a specific value for timer T3324 when accepting the attach or routing area updating procedure. The MS may use PSM only if the network has provided the T3324 value IE during the last attach or routing area updating procedure with a value different from "deactivated".

…

If the MS supports PSM and requests the use of PSM, then the MS shall include the T3324 value IE with a requested timer value in the ATTACH REQUEST message. When the MS includes the T3324 value IE and the MS indicates support for extended periodic timer value in the MS network feature support IE, it may also include the T3312 extended value IE to request a particular T3312 value to be allocated.

Reference(s):

3GPP TS 24.008 clauses 4.7.2.8, 4.7.2.9 and 4.7.3.1

44.2.1.1.1b.2 Test purpose

1) To verify that the MS indicates PSM by providing a T3324 value IE during the attach procedure
2) To verify that an MS accepts the value for timer T3324 provided by the network

44.2.1.1.1b.3 Method of test

Initial conditions

System Simulator:

One cell, cell A with MCC1/MNC1/LAC1/RAC1 (RAI-1), operating in network operation mode II

Mobile Station:

The MS has a valid IMSI

The UE is configured to use Power Saving Mode

The UE is configured to use a specific value of T3324

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff)
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP)

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI and the T3324 value set to 2 minutes.
2) The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI and a value of T3324 set to 2 minutes. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.
3) The MS is PS paged before timer T3324 expires in order to verify that the new P-TMSI is used for PS services and that the MS has not entered PSM.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS MS		Make cell A available and cell B not available The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 11.

Step	Direction	Message	Comments
2	MS		The MS is powered up or switched on and initiates an attach (see PICS)
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' T3324 value = any value
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 T3324 value = 2 minutes
5	MS -> SS	ATTACH COMPLETE	
6	SS		The SS shall wait for 1 minute and then execute step 7 before timer T3324 expires
7	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
8	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
9	MS		The MS is switched off or power is removed (see PICS).
11	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 10.

Specific message contents

None.

44.2.1.1.2 GPRS attach / rejected / IMSI invalid / illegal MS

44.2.1.1.2.1 Conformance requirements

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the LAI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'illegal MS'.

44.2.1.1.2.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A with MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC2/RAC1, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

SpecificPICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal MS'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH REJECT	GMM cause = 'Illegal MS'.
			The following messages are sent and shall be received on cell B.
6	SS		The SS deactivates cell A and activates cell B.
7	MS		Cell B is preferred by the MS.
8	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
9	MS		The MS initiates an attach by MMI or by AT command.
10	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell C.
11	SS		The SS deactivates cell B and activates cell C.
12	MS		Cell C is preferred by the MS.
13	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
14	MS		The MS initiates an attach by MMI or by AT command.
15	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
16	MS		If possible (see PICS) switch off is performed. Otherwise the power is removed.
17	MS		The MS is powered up or switched on. Step 18 is only performed for MS Operation Mode B.
18		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
19	MS		The MS initiates an attach (see PICS).
20	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
21	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
22	MS -> SS	ATTACH COMPLETE	
23	MS		The MS is switched off or power is removed (see PICS).
24	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.3 GPRS attach / rejected / IMSI invalid / GPRS services not allowed

44.2.1.1.3.1 Conformance requirement

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

44.2.1.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 19.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH REJECT	GMM cause = 'GPRS services not allowed'
			The following messages are sent and shall be received on cell B.
6	SS		The SS deactivates cell A and activates cell B.
7	MS		Cell B is preferred by the MS. Step 8 is only performed for NW Mode II / MS Operation Mode B.
8		{Location Update Procedure}	Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS.
9			The MS initiates an attach automatically (see PICS), by MMI or AT commands.
10	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
11	MS		If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed.
12	MS		The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS).
13	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
14	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
15	MS -> SS	ATTACH COMPLETE	
16	MS		The MS is switched off or power is removed (see PICS).
17	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
18			The SS deactivates cell B and activates cell A.
19	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 17.

Specific message contents

None.

44.2.1.1.4 GPRS attach / rejected / PLMN not allowed

44.2.1.1.4.1 Conformance requirement

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:

    1.1 not perform GPRS attach when switched on in the same routing area or location area;

    1.2 not perform GPRS attach when in the same PLMN and when that PLMN is not selected manually;

    1.3 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;

    1.4 store the PLMN in the 'forbidden PLMN' list.

2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall perform GPRS attach when a new PLMN is entered.

3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' and if after that the PLMN from which this rejection was received, is manually selected, the Mobile Station shall perform a GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'PLMN not allowed'.

44.2.1.1.4.3 Method of test

44.2.1.1.4.3.1 Test procedure 1

Initial conditions

System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC1, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

- All four cells are operating in network operation mode II. The PLMN of the four cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-8. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same routing area or location area and performs GPRS attach only when a new PLMN is entered.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-8
5	SS -> MS	ATTACH REJECT	GMM cause = 'PLMN not allowed'
6	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell B.
7	SS		The SS deactivates cell A and activates cell B.
8	MS		Cell B is preferred by the MS.
9	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell C.
10	SS		The SS deactivates cell B and activates cell C.
11	MS		Cell C is preferred by the MS.
12	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell D.
13	SS		The SS deactivates cell C and activates cell D.
14	MS		Cell D is preferred by the MS. Step 15 is only performed for MS Operation Mode B.
15		**{Location Update Procedure}**	Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS.
16	MS		The MS initiates an attach automatically, by MMI or by AT command.
17	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
18	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
19	MS -> SS	ATTACH COMPLETE	
20	MS		The MS is switched off or power is removed (see PICS).
21	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.4.3.2 Test procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode II: MCC2/MNC1/LAC1/RAC1. The PLMN of the cell should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The subscribers access rights is changed to allow GPRS attach. Then the PLMN from which this rejection was received is manually selected and the SS check that a GPRS attach is performed.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2
4	SS -> MS	ATTACH REJECT	GMM cause = 'PLMN not allowed'
5	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds)
6	MS		The current PLMN is selected manually. Step 7 is only performed for MS Operation Mode B.
7		**{Location Update Procedure}**	Macro. MOBILE IDENTITY set to IMSI. Location Update Procedure initiated from the MS.
8	MS		The MS initiates an attach automatically, by MMI or by AT command.
9	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
10	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
11	MS -> SS	ATTACH COMPLETE	
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.5 GPRS attach / rejected / roaming not allowed in this location area

44.2.1.1.5.1 Conformance requirement

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station shall:

   1.1 not perform GPRS attach when in the same location area;

   1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;

   1.3 store the LA in the 'forbidden location areas for roaming' list;

   1.4 perform GPRS attach when a new location area is entered;

   1.5 Periodically search for its HPLMN.

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

3) The MS shall be capable of storing at least 6 entries in the list of 'Forbidden location areas for roaming'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.5.2 Test purpose

Test purpose 1

To test that on receipt of a rejection using the 'roaming not allowed in this location area' cause code, the MS ceases trying to attach on that location area. Successful GPRS attach procedure is possible in other location areas.

Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

Test purpose 3

To test that at least 6 entries can be held in the list of 'forbidden location areas for roaming' (the requirement in 3GPP TS 04.08 / 3GPP TS 24.008 is to store at least 10 entries. This is not fully tested by the third procedure).

Test purpose 4

To test that if a cell of the Home PLMN is available then the MS returns to it in preference to any other available cell.

44.2.1.1.5.3 Method of test

44.2.1.1.5.3.1 Test procedure 1

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN) and cell C in MCC2/MNC1/LAC1/RAC2 (Not HPLMN).

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. A new attempt for a GPRS attach is not possible. Successful GPRS attach / detach procedures are performed in another location area. A new attempt for a GPRS attach is performed in the 1st location area. This attempt shall not succeed, as the LA is on the forbidden list.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 21.
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2
5	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
6	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell B.
7	SS		The SS Deactivates cell A and activates cell B.
8	MS		Cell B is preferred by the MS. Step 9 is only performed for NW Mode II / MS Operation Mode B.
9		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
10	MS		The MS initiates an attach automatically, by MMI or by AT command.
11	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
12	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-6
13	MS -> SS	ATTACH COMPLETE	
14	MS		The MS initiates a GPRS detach (without power off) by MMI or by AT command .
15	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
16	SS -> MS	DETACH ACCEPT	
			The following messages are sent and shall be received on cell C.
17	SS		The SS deactivates cell B and activates cell C.
18	MS		Cell C is preferred by the MS.
19	MS		No LOCATION UPDATE REQUEST sent to SS (SS waits 30 seconds). Initiate GPRS Attach by MMI or AT command. Check that the No ATTACH REQUEST is sent to the SS (SS waits for 30 seconds). The MS is switched off or power is removed (see PICS).
20	SS		The SS deactivates cell C.
21	MS		The MS is set in MS operation mode B, if supported (see PICS) and the test is repeated from step 2 to step 20.

Specific message contents

None.

44.2.1.1.5.3.2 Test procedure 2

Initial conditions

System Simulator:

One cell in MCC2/MNC1/LAC1/RAC1 (Not HPLMN) operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).

Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS check that a GPRS attach is possible on the cell on which the GPRS attach had been rejected.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		If MS operation mode C is supported, the MS is set in MS operation mode C (see PICS). If MS operation mode C is not supported, the MS is set in MS operation mode B.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2
4	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
5	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
6	MS		If possible (see PICS) switch off is performed. Otherwise the power is removed.
7	MS		The MS is powered up or switched on and initiates an attach (see PICS). Step 8 is only performed for NW Mode II / MS Operation Mode B.
8		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
9	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
10	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
11	MS -> SS	ATTACH COMPLETE	
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.5.3.3 Test procedure 3

Initial conditions

System Simulator:

Six cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN), cell C in MCC2/MNC1/LAC3/RAC1 (Not HPLMN), cell D in MCC2/MNC1/LAC4/RAC1 (Not HPLMN), cell E in MCC2/MNC1/LAC5/RAC1 (Not HPLMN), cell F in MCC2/MNC1/LAC6/RAC1 (Not HPLMN).

All six cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).

- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. This is done for 6 different location areas. Then the SS checks that the MS does not attempt to perform an attach procedure on the non-allowed location areas.

Different types of MS may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12 am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

20 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C or B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2
5	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
6	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds)
			The following messages are sent and shall be received on cell B.
7	SS		The SS deactivates cell A and activates cell B.
8	MS		Cell B is preferred by the MS.
			Step 9 is only performed for MS Operation Mode B.
9		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
10	MS		The MS initiates an attach automatically, by MMI or by AT command.
11	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
12	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
13	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell C.
14	SS		The SS deactivates cell B and activates cell C.
15	MS		Cell C is preferred by the MS.
			Step 16 is only performed for NW Mode II / MS Operation Mode B.
16		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
17	MS		The MS initiates an attach automatically, by MMI or by AT command.
18	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
19	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'

Step	Direction	Message	Comments
20	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell D.
21	SS		The SS deactivates cell C and activates cell D.
22	MS		Cell D is preferred by the MS.
			Step 23 is only performed for MS Operation Mode B.
23		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
24	MS		The MS initiates an attach automatically, by MMI or by AT command.
25	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
26	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
27	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell E.
28	SS		The SS deactivates cell D and activates cell E.
29	MS		Cell E is preferred by the MS.
			Step 30 is only performed for MS Operation Mode B.
30		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
31	MS		The MS initiates an attach automatically, by MMI or by AT command.
32	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
33	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
34	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell F.
35	SS		The SS deactivates cell E and activates cell F.
36	MS		Cell F is preferred by the MS.
			Step 37 is only performed for MS Operation Mode B.
37		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
38	MS		The MS initiates an attach automatically, by MMI or by AT command.
39	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
40	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
41	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds)
			The following messages are sent and shall be received on cell E.
42	SS		The SS deactivates cell F and activates cell E.
43	SS		Cell E is preferred by the MS.
44	MS		The MS initiates an attach automatically, by MMI or by AT command.
45	MS		No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell C.
46	SS		The SS deactivates cell E and activates cell C.
47	SS		Cell C is preferred by the MS.
48	MS		The MS initiates an attach automatically, by MMI or by AT command.

Step	Direction	Message	Comments
49	MS		No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell A.
50	SS		The SS deactivates cell C and activates cell A.
51	SS		Cell A will be preferred by the MS.
52	MS		The MS initiates an attach automatically, by MMI or by AT command.
53	MS		No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds).

Specific message contents

None.

44.2.1.1.5.3.4 Test procedure 4

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1 (not HPLMN) and cell B in MCC1/MNC1/LAC1/RAC1 (HPLMN).

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. Two cells are then available. The cell with the weakest level belongs to the HPLMN. It is checked that the MS returns to its HPLMN.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2
5	SS -> MS	ATTACH REJECT	GMM cause = 'Roaming not allowed in this area'
6	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A.
8	MS		The RF level of cell A is lowered until cell B is preferred by the MS.
			Step 9 is only performed for MS Operation Mode B
9		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
10	MS		The MS initiates an attach automatically, by MMI or by AT command.
11	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
12	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
13	MS -> SS	ATTACH COMPLETE	
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.6 GPRS attach / abnormal cases / access barred due to access class control

44.2.1.1.6.1 Conformance requirement

1) The MS shall not perform GPRS attach procedure, but stays in the current serving cell and applies normal cell reselection process.

2) The Mobile Station shall perform the GPRS attach procedure when:

   2.1 Access is granted.

   2.2 Cell is changed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.6.2 Test purpose

Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

44.2.1.1.6.3 Method of test

44.2.1.1.6.3.1 Test procedure 1

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred.

System Simulator:

One cell operating in network operation mode II.

Access class x barred.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

The SS indicates that access class x is not barred. A GPRS attach procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The SIM is programmed with access class x.
2	MS		The MS is set in MS operation mode C or B (see PICS). If MS operation mode C not supported, goto step 12.
3	MS		The MS is powered up or switched on and attempts to initiate an attach (see PICS).
4	MS		No ATTACH REQUEST sent to SS, as access class x is barred (SS waits 30 seconds).
5	SS		The access class x is not barred anymore.
6	MS		The MS initiates a GPRS attach either automatically or manually (see PICS).
7	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
8	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
9	MS -> SS	ATTACH COMPLETE	
10	MS		The MS is switched off or power is removed (see PICS).
11	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
12	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 11.

Specific message contents

None.

44.2.1.1.6.3.2 Test procedure 2

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell A.

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 has access class x barred, cell B in MCC1/MNC1/LAC1/RAC1 has access class x not barred.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-2 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A GPRS attach procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The SIM is programmed with access class x.
	SS		The following messages are sent and shall be received on cell A.
2	SS		The SS activates cell A.
3	MS		The MS is set in MS operation mode C or B (see PICS).
4	MS		The MS is powered up or switched on and attempts to initiate an attach (see PICS).
5	MS		No ATTACH REQUEST sent to SS, as access class x is barred (SS waits 30 seconds).
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		The MS initiates an attach either automatically or manually (see PICS).
8	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1
9	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
10	MS -> SS	ATTACH COMPLETE	
11	MS		The MS is switched off or power is removed (see PICS).
12	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.7 GPRS attach / abnormal cases / change of cell into new routing area

44.2.1.1.7.1 Conformance requirement

When a change of cell into a new routing area is performed before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and re-initiate it immediately.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.7.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.7.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

If the MS automatically performs a GPRS Attach on power on, is the attach procedure performed and then is the MS triggered to perform a normal GPRS Detach.

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS attach procedure. The ATTACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area. The MS shall re-initiate a GPRS attach procedure in the new routing area.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A and B. The RF level of cell A is –50 dBm and cell B – 60 dBm.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4			Go to step 10 if the MS not automatically performs a GPRS attach when switched on.
5	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
6	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
7	MS		Trigger the MS to perform a GPRS detach
8	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
9	SS -> MS	DETACH ACCEPT	
10			Wait 20 sec.
11	MS		The MS is triggered to initiate a GPRS Attach.
12	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
13	SS		No response to the ATTACH REQUEST message is given by the SS.
			The following messages are sent and shall be received on cell B.
14	SS		The RF level of cell A is lowered to –100 dBm.
15	MS		The MS automatically re-initiates the attach in the new cell.
16	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
17	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-4 Negotiated Ready timer value IE should not be included Force to standby indicator set
18	MS		The MS is switched off or power is removed (see PICS).
19	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.8 GPRS attach / abnormal cases / power off

44.2.1.1.8.1 Conformance requirement

When power is switched off before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and perform a GPRS detach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.8.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).-
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS is switched off after initiating an attach procedure. A GPRS detach is automatically performed by the MS before power is switched off.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 7.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS		No response to the ATTACH REQUEST message is given by the SS.
5	MS		The MS is powered off and initiates a GPRS detach (with power off)
6	MS -> SS	DETACH REQUEST	Detach type = 'power switched off, GPRS detach'
7	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 6.

Specific message contents

None.

44.2.1.1.9 GPRS attach / abnormal cases / GPRS detach procedure collision

44.2.1.1.9.1 Conformance requirement

1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message, the MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.

2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message, the MS shall ignore the GPRS detach procedure and continue with the GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Re-attach automatically when the network commands a detach with no cause value (TSPC_AddInfo_GPRS_Attach_on_NW_Detach_NoCause).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the GPRS detach procedure and continue with the GPRS attach.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS		The SS ignores the ATTACH REQUEST message and initiates a detach procedure.
5	SS -> MS	DETACH REQUEST	Detach type = 're-attach not required'
6	MS -> SS	DETACH ACCEPT	
7	MS		The MS is attached by MMI or AT command if the MS does not re-attach automatically upon receiving a network initiated detach with no cause value, (See PICS).
8	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
9	SS		The SS ignores the ATTACH REQUEST message and initiates a detach procedure.
10	SS-> MS	DETACH REQUEST	Detach type = 're-attach required'
11	MS		The MS ignores the DETACH REQUEST message and continue with the attach procedure.
12	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
13	MS -> SS	ATTACH COMPLETE	
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.1.10 GPRS attach / rejected / GPRS services not allowed in this PLMN

44.2.1.1.10.1 Conformance requirement

If the network rejects a GPRS attach procedure from the Mobile Station with the cause ' GPRS services not allowed in this PLMN’:

1. The MS shall delete any RAI, P-TMSI, P-TMSI signature, and GPRS ciphering key sequence number stored, shall set the GPRS update status to GU3 ROAMING NOT ALLOWED (and shall store it according to section 4.1.3.2) and shall change to state GMM-DEREGISTERED.

2. The MS shall store the PLMN identity in the "forbidden PLMNs for GPRS service" list. A GPRS MS operating in MS operation mode C shall perform a PLMN selection instead of a cell selection.

3. A GPRS MS operating in MS operation mode A or B in network operation mode II, is still IMSI attached for CS services in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.10.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed in this PLMN'.

44.2.1.1.10.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC2/MNC1/LAC1/RAC1.

All two cells are operating in network operation mode II.. The PLMN of the two cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-8. MS is Idle Updated on Cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C). (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'GPRS services not allowed in this PLMN'. The SS checks that the MS does not perform GPRS attach if activated in the same PLMN and performs GPRS attach only when a new PLMN is entered.

Maximum duration of test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode B or C (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-8
5	SS -> MS	ATTACH REJECT	GMM cause = ' GPRS services not allowed in this PLMN '
6	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds)
			Steps 7, 8 and 9 are only performed for MS Operation Mode B.
7	MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
8			Verify that the MS initiates a RR connection and sends a PAGING RESPONSE
9	SS		SS releases the RR connection.
10	SS		SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		No response from the MS to the request. This is checked for 10 seconds.
			The following messages are sent and shall be received on cell B.
12	SS		The SS deactivates cell A and activates cell B.
13	MS		Cell B is preferred by the MS.
			Step 14 is only performed MS Operation Mode B.
14		**{Location Update Procedure}**	Location Update Procedure initiated from the MS.
15	MS		The MS initiates an attach automatically, by MMI or by AT command.
16	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
17	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2
18	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell A.
19	SS		The SS deactivates cell B and activates cell A again.
20	MS		Cell A is preferred by the MS.
			Step 21 is only performed for MS Operation Mode B.
21		**{Location Update Procedure}**	Location Update Procedure initiated from the MS.
22			Verify No ATTACH REQUEST sent to SS (SS waits 30 seconds) in case auto attach
23	MS		The MS initiates an attach by MMI or by AT command.
24			Verify No ATTACH REQUEST sent to SS (SS waits 30 seconds)
25	MS		The MS is switched off or power is removed (see PICS).

Specific message contents

None.

44.2.1.1.11 GPRS attach / access barred due to EAB

44.2.1.1.11.1 Conformance requirement

For a mobile originated access attempt, a mobile station configured for EAB shall perform a preliminary access barring check (see sub-clause 3.3.1.4). If the preliminary access barring check indicates network access is barred then access to the network is not allowed. Otherwise, the mobile station shall proceed according to the remainder of this sub-clause.

The preliminary access barring check shall indicate network access is barred if all of the following conditions are satisfied:

- the establishment cause for the request received from the MM sublayer is not "emergency call".
- the SYSTEM INFORMATION TYPE 21 message is broadcast in the cell and includes EAB information;
- the mobile station is a member of a subcategory of mobile stations targeted by the EAB information;
- the EAB Authorization Mask sent in the EAB information indicates the mobile station’s access class is not authorized;
- the mobile station is not a member of any of the authorized special access classes (i.e. an Access Class in the range 11-15) permitted by the network;

Otherwise, the preliminary access barring check shall indicate network access is not barred.

A network operator can also restrict some MSs to access the network for location registration, although via common access class control or domain specific access class control the MSs are permitted to access the network for other purposes. Therefore, for each access to the network the mobile station shall determine from the information received via the system information broadcast whether access is allowed or not:

- For paging response the mobile station shall evaluate the control information for common access control (as specified in 3GPP TS 44.018 [84], 3GPP TS 44.060 [76], and 3GPP TS 25.331 [23c]), domain specific access control (as specified in 3GPP TS 25.331 [23c]), and the specific control information for paging response (as specified in 3GPP TS 25.331 [23c]; see "Paging Permission with Access Control").
- For generic location updating, GPRS attach and routing area updating procedures the mobile station shall evaluate the control information for:
    - common access control (as specified in 3GPP TS 44.018 [84], 3GPP TS 44.060 [76], and 3GPP TS 25.331 [23c]);
    - domain specific access control (as specified in 3GPP TS 25.331 [23c]);
    - specific control information for location registration (as specified in 3GPP TS 25.331 [23c]; see "Paging Permission with Access Control"); and
    - EAB as specified in 3GPP TS 44.018 [84] and 3GPP TS 44.060 [76].

Reference

3GPP TS 44.018 subclauses 3.3.1.1.1, 3.3.1.4. 3GPP TS 24.008 subclause 4.1.1.5

44.2.1.1.11.2 Test purpose

To verify that Extended Access class Barring can be activated in the MS.

To verify that the MS does not perform location updating, GPRS attach or routing area updating if the network broadcast EAB and EAB is enabled in the MS.

44.2.1.1.11.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

The SYSTEM INFORMATION TYPE 3 message indicates that the SYSTEM INFORMATION TYPE 21 is sent on the BCCH by setting the SYSTEM INFORMATION 21 Indicator in the SI3 Rest Octet IE.

The SYSTEM INFORMATION TYPE 21 is sent on the BCCH. The SI 21 Rest Octets information element is configured with: EAB Authorization Mask set to"xxxxxxxxx1" and EAB Subcategory set to "00".

Mobile Station:

The MS is in "idle, updated" state on cell A, with a TMSI allocated.

The MS is configured for "Extended Access Barring"

The MS belong to access class 0

Specific PICS statements

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements

-

Test Procedure

The MS, configured for Extended Access Class barring reads the system information block 21. The MS initiates the location updating procedure and the SS verifies that no access attempt is made by the MS. The SS sends SYSTEM INFORMATION TYPE 21 is sent on the BCCH with the SI 21 Rest Octets information element in configured with EAB Authorization Mask set to"0000000000". The MS successfully performs the location updating procedure and is powered off.

The SS then reactivates EAB by configuring the SI 21 Rest Octets IE configured with EAB Authorization Mask set to"xxxxxxxxx1" in the SYSTEM INFORMATION TYPE 21 and the MS is powered on. The SS verifies that the MS does not make any access attempts. The SS deactivates EAB and the SS verifies that the MS performs a GPRS attach.

The SS then reactivates EAB again. The RF level of cell A is lowered until cell B is preferred by the MS but the SS verifies that the MS does not perform the routing area update procedure. The SS deactivates EAB and verifies that the MS successfully perform the routing are update procedure.

Maximum duration of test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The following messages are sent and shall be received on cell A Make the MS perform the location updating procedure
2	SS		Verify that the MS does not access the network within 1 minute
3	SS -> MS	SYSTEM INFORMATION TYPE 21	The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to"0000000000" and the SS waits for 30 seconds to allow the MS to read the modified system information.
4	MS	**{Location Update Procedure}**	Location Update Procedure initiated from the MS.
5	MS		The MS is switched off or power is removed (see PICS).
6	SS	SYSTEM INFORMATION TYPE 21	The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to"xxxxxxxxx1" and EAB Subcategory set to "00". The following messages are sent and shall be received on cell A.
7	SS		The SS activates cell A but not cell B.
8	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22.
9	MS		The MS is powered up or switched on and initiates an attach (see PICS).
10	SS		Verify that the MS does not access the network within 1 minute
11	SS -> MS	SYSTEM INFORMATION TYPE 21	The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to"0000000000" and the SS waits for 30 seconds to allow the MS to read the modified system information.
12	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
13	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
14	MS -> SS	ATTACH COMPLETE	
15	SS	SYSTEM INFORMATION TYPE 21	The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to"xxxxxxxxx1" and EAB Subcategory set to "00".
			The following messages are sent and shall be received on cell B.
16	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
17	SS		Verify that the MS does not access the network within 30 seconds
18	SS -> MS	SYSTEM INFORMATION TYPE 21	The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to"0000000000"
19	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
20	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
21	MS -> SS	ROUTING AREA UPDATING COMPLETE	
	MS		The MS is switched off or power is removed (see PICS).
22	MS		The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 6 to step 21.

Specific message contents

SYSTEM INFORMATION TYPE 3 broadcast by Cell A and B:

Same as default content except

Information Element	Value/remark
SI 3 Rest Octets	
SYSTEM INFORMATION 21 Indicator	H (SYSTEM INFORMATION TYPE 21 message is available)
SI21_POSITION	0 (SYSTEM INFORMATION TYPE 21 message is sent on BCCH Norm)

SYSTEM INFORMATION TYPE 21 broadcast by Cell A initially and in steps 6 and 15:

Same as default content except

Information Element	Value/remark
SI 21 Rest Octets	
EAB Authorization Mask	'xxxxxxxxx1' (MSs configured for EAB and a member of Access Class 0 are barred)
EAB Subcategory	'00' (applicable to all mobile stations configured for EAB)

SYSTEM INFORMATION TYPE 21 broadcast by Cell A in step 3 and 11 and by Cell B in step 18:

Same as default content except

Information Element	Value/remark
SI 21 Rest Octets	
EAB Authorization Mask	'0000000000 '(MSs configured for EAB are authorized)
EAB Subcategory	'00' (applicable to all mobile stations configured for EAB)

44.2.1.1.12 GPRS attach / eDRX

44.2.1.1.12.1 Conformance requirement

1) If the MS supports eDRX and requests the use of eDRX, the MS shall include the extended DRX parameters IE in the ATTACH REQUEST message.

2) The MS shall use extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last attach procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.1.

44.2.1.1.12.2 Test purpose

To verify that a MS that supports eDRX and requests the use of eDRX will include the extended DRX parameters IE in the ATTACH REQUEST message.

To verify that a MS that supports eDRX and requests the use of eDRX will use extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last attach procedure.

44.2.1.1.12.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.

- The cell supports eDRX.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated.
- The MS is configured to use eDRX.
- The MS is configured to use a specific value of extended DRX cycle.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends an ATTACH REQUEST message with extended DRX parameters IE. The SS accepts the request to use eDRX and returns ATTACH ACCEPT message with an extended DRX parameters IE. The MS shall use extended idle mode DRX cycle that the network has provided during the last attach procedure.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 13.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI Extended DRX parameters IE included.
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 Extended DRX value: 0111 (195.84 seconds)
5	MS -> SS	ATTACH COMPLETE	
6	SS		Wait for 1 minute for Ready Timer to expire.
7	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
8			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315.
9	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle.
10			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
11	MS		The MS is switched off or power is removed (see PICS).
12	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'.

Step	Direction	Message	Comments
13	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 12.

Specific message contents

None.

44.2.1.2 Combined GPRS attach

The combined GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode A or B to IMSI attach for GPRS or non-GPRS services. In order to use the combined GPRS attach procedure, the network must be in network operation mode I. All Combined GPRS test case are only applicable when the MS operates in Class- A or B mode.

44.2.1.2.1 Combined GPRS attach / GPRS and non-GPRS attach accepted

44.2.1.2.1.1 Conformance requirement

1) If the network accepts the combined GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.

2) If the network accepts the combined GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.

3) If the network accepts the combined GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the previously used P-TMSI, the MS shall continue communication with the previously used P-TMSI.

4) If the network accepts the combined GPRS attach procedure and determines that IMSI shall be used in CS operations, the MS shall continue communication with the IMSI for CS operations.

5) If the network accepts the combined GPRS attach procedure and determines that a TMSI shall be used in CS operations, the MS shall continue communication with the TMSI for CS operations.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

1) P-TMSI / P-TMSI signature is allocated;

2) P-TMSI / P-TMSI signature is reallocated;

3) Old P-TMSI / P-TMSI signature is not changed;

4) Mobile terminating CS call is allowed with IMSI;

5) Mobile terminating CS call is not allowed with TMSI.

44.2.1.2.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.
2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
3) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services.
4) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS allocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI and a new TMSI. The MS acknowledge the P-TMSI and the TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the new TMSI is used. The MS is CS paged in order to verify that the new TMSI is used for CS services.
5) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services. The MS will not answer signalling addressed to the old P-TMSI.
6) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the previously used P-TMSI.
7) The MS is GPRS paged in order to verify that the previously used P-TMSI is used for GPRS services.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity =IMSI Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS		SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell.

Step	Direction	Message	Comments
7	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with IMSI.
8	SS		SS releases the RR connection, indicating a successful resumption of GPRS services and pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Comment: A TBF will be established on lower layers.
9	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Comment: The TBF will be released on lower layers.
10	MS		The MS is switched off or power is removed (see PICS).
11	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'
12	MS		The MS is powered up or switched on and initiates an attach (see PICS).
13	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 TMSI status = no valid TMSI available Routing area identity = RAI-1
14	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-1 Routing area identity = RAI-1
15	MS -> SS	ATTACH COMPLETE	
16	SS ->MS	GMM INFORMATION	Message sent with P-TMSI-2
16b	MS -> SS	GMM STATUS	Message sent in case the MS does not support reception of GMM information message Cause #97
17	SS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
18	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1.
19	SS		SS releases the RR connection, indicating a successful resumption of GPRS services and pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
20	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
21	SS		SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
22	MS		No response from the MS to the request. This is checked for 10 s.
23	MS		The MS is switched off or power is removed (see PICS).
24	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'
25	MS		The MS is powered up or switched on and initiates an attach (see PICS).

Step	Direction	Message	Comments
26	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-2 Routing area identity = RAI-1
27	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. TMSI and P-TMSI not included. Attach result = 'Combined GPRS / IMSI attached' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
28	SS		SS pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
29	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
30	MS		The MS is switched off or power is removed (see PICS).
31	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.2 Combined GPRS attach / GPRS only attach accepted

44.2.1.2.2.1 Conformance requirement

1) If the network accepts the combined GPRS attach procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.

2) If the network accepts the combined GPRS attach procedure, but GMM cause code 'MSC temporarily not reachable', or 'Network failure' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.2.2 Test Purpose

Test purpose 1

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'IMSI unknown in HLR'.

Test purpose 2

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'MSC temporarily not reachable', or 'Network failure'.

44.2.1.2.2.3 Method of test

44.2.1.2.2.3.1 Test Procedure 1

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature GMM cause = 'IMSI unknown in HLR' Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS -> MS		SS pages MS with Mobile identity = IMSI according to the channel combination of the cell. Paging order is for RR-connection.
7	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
8	MS		The MS is switched off or power is removed (see PICS).
9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.1.2.2.3.2 Test Procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode I. T3212 is set to 6 minutes.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic MM IMSI attach procedure at switch-on/power-on (TSPC_AddInfo_auto_MM_IMSI_AP_on_off).
- Switch off on button Yes/No (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends an ATTACH REQUEST message. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS returns a ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. The ROUTING AREA UPDATE procedure is repeated four times. An MS operation mode B MS may then perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity.

Maximum duration of test

15 minutes.

Expected sequence

Dependent whether the option ' Automatic MM IMSI attach procedure at switch-on/power-on' is supported or not, the steps 1-19 or 20-39 apply depending on manufacturer (see PICS).

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B and no automatic MM IMSI attach procedure is indicated (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen)
5	MS -> SS	ATTACH COMPLETE	
7	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1

Step	Direction	Message	Comments
8	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
10	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-3 signature Routing area identity = RAI-1
11	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-4 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
12	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-4 signature Routing area identity = RAI-1
13	SS		The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%)
14	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-5 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
16	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-5 signature Routing area identity = RAI-1
17	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-6 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
18	MS		The MS is switched off or power is removed (see PICS).
19	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'. Stop the sequence.
20	MS		Automatic MM IMSI attach procedure is indicated (see PICS).
21	MS		The MS is powered up or switched on and initiates an attach (see PICS).
22	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted

Step	Direction	Message	Comments
23	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Negotiated Ready timer value IE should not be included. Force to standby indicator set.
24	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1
25	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
26	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-3 signature Routing area identity = RAI-1
27	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-4 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
28	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-4 signature Routing area identity = RAI-1
29	SS		The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%)
30	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-5 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
31	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-5 signature Routing area identity = RAI-1
32	SS		The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%)
33	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-6 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set.
34 (optional step)		**{Location Update Procedure}**	Macro. Location Update Procedure may be initiated from the MS. Parameter is TMSI-1.

Step	Direction	Message	Comments
			Steps 35, 36 and 37 are only performed if the MS has performed the Location Update Procedure in step 34.
35	SS -> MS		SS pages MS with Mobile identity = TMSI-1 and Paging order is for RR-connection.
36	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with Mobile identity = TMSI-1
37	SS		SS releases the RR connection and indicate the successfully resumption of GPRS services.
38	MS		The MS is switched off or power is removed (see PICS).
39	MS -> SS	DETACH REQUEST	Message not sent if power is removed.

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A) in Test Procedure 2:

Information element	Value/remark
As default message contents except:	
Control Channel Description T3212 timeout value	 6 min

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT in Test Procedure 2:

Information Element	Value/remark
As default message contents except: T3302 value	 6 min

Note: This IE is only read by MSs supporting R99 and onwards.

44.2.1.2.3 Combined GPRS attach / GPRS attach while IMSI attach

44.2.1.2.3.1 Void

44.2.1.2.3.2 Conformance requirement

If the GPRS MS is already attached for non-GPRS services by the MM specific attach procedure, but wants to perform an attach for GPRS services, the combined GPRS attach procedure is performed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.3.3 Test Purpose

To test the behaviour of the MS if GPRS attach performed while IMSI attached.

44.2.1.2.3.4 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I. ATT flag is set.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS attaches for non-GPRS services. The MS does not answer to paging orders for GPRS. The MS attaches for GPRS services. Paging orders for GPRS are answered.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS) and configured not to perform a GPRS attach.
2	MS		The MS is powered up or switched on. No GPRS attach is performed (see PICS).
3	MS	**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
4	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
5	MS		No response from the MS to the request. This is checked for 10 s.
6	MS		The MS is triggered to perform a GPRS attach (in combination with IMSI attach).
7	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach while IMSI attached' or 'Combined GPRS/IMSI attach' Mobile identity =P-TMSI-1 Routing area identity = RAI-1
8	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' No new mobile identity assigned. TMSI and P-TMSI not included P-TMSI-2 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included. Force to standby indicator set.
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
11	MS		The MS is switched off or power is removed (see PICS).
12	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.3a Combined GPRS attach / NMO-I enabled in MS

44.2.1.2.3a.1 Conformance requirement

1) The network operation mode (mode I, II, or III) shall be indicated as system information to MSs. Additional system information can indicate that MSs configured to use the extended NMO I system information (see TS 24.368 [111]) shall use NMO I, regardless of what NMO is indicated by system information for other MSs. If this additional system information is absent, MSs configured to use the extended NMO I system information shall use the system information that represents the network operation mode for other MSs. From these indications, the MS determines which mode applies to it. That mode shall be used when using the procedures described in other clauses of this specification.

2) If the parameter "NMO_I_Behaviour" in the NAS configuration Management Object or USIM is set to the value of "1", the bit 2 "NMO I" of system information is applied

3) If the network accepts the combined PS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the UE shall acknowledge the P-TMSI and continue communication with the P-TMSI.

Reference(s):

3GPP TS 24.008 clauses 4.7.3.2 and 4.1.1.4.2. 3GPP TS 23.060 clause 5.3.13.2

44.2.1.2.3a.2 Test Purpose

To verify that if “Network mode of operation I" is set in the MS, the MS performs a combined attach when the extended NMO-I system information is broadcast from the network

44.2.1.2.3a.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II. ATT flag is set to 0.

System Information Type 13: The GPRS Cell Info IE has the NMO_I_ALTERNATE bit set to “1”

Mobile Station:

The MS has a valid IMSI.

The MS has the parameter "NMO_I_Behaviour" set to “1”

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS reads the NMO_I_ALTERNATE bit in the GPRS Cell Info IE, received in the System Information Type 13 message.

2) The MS sends an ATTACH REQUEST message with identity IMSI and type 'Combined GPRS/IMSI attach'. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the

P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.

2) The MS is CS paged in order to verify that the IMSI is used for CS calls.

3) The MS is PS paged in order to verify that the new P-TMSI is used for PS services.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS)
2	MS		The MS is powered up or switched on and initiates attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS/IMSI attach' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS/IMSI attached' Allocated P-TMSI = P-TMSI-1 P-TMSI Signature = P-TMSI-1 signature MS identity =IMSI Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS		The SS releases the signalling connection and waits 5s to allow the MS to read system information.
7	SS		SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell.
8	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with IMSI.
9	SS		The SS releases the signalling connection and waits 5s to allow the MS to read system information.
10	SS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.3b Combined GPRS attach / PSM

44.2.1.2.3b.1 Conformance requirement

An MS supporting PSM may request the network to assign a value for T3324 by including a requested timer value in:

- the ATTACH REQUEST or ROUTING AREA UPDATE REQUEST message (in A/Gb mode and Iu mode); or
- the ATTACH REQUEST or TRACKING AREA UPDATE REQUEST message (in S1 mode).

The value of timer T3324 can be sent by the network to the MS in:

- the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message (in A/Gb mode and Iu mode); and
- the ATTACH ACCEPT or TRACKING AREA UPDATE ACCEPT message (in S1 mode).

…

The network accepts the use of PSM by providing a specific value for timer T3324 when accepting the attach or routing area updating procedure. The MS may use PSM only if the network has provided the T3324 value IE during the last attach or routing area updating procedure with a value different from "deactivated".

…

If the MS supports PSM and requests the use of PSM, then the MS shall include the T3324 value IE with a requested timer value in the ATTACH REQUEST message. When the MS includes the T3324 value IE and the MS indicates support for extended periodic timer value in the MS network feature support IE, it may also include the T3312 extended value IE to request a particular T3312 value to be allocated.

Reference(s):

3GPP TS 24.008 clauses 4.7.2.8, 4.7.2.9 and 4.7.3.1

44.2.1.2.3b.2 Test Purpose

1) To verify that the MS indicates PSM by providing a T3324 value IE during the combined attach procedure
2) To verify that an MS accepts the value for timer T3324 provided by the network

44.2.1.2.3b.3 Method of test

Initial conditions

System Simulator:

One cell, cell A with MCC1/MNC1/LAC1/RAC1 (RAI-1), operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI

The MS is Idle Updated

The UE is configured to use Power Saving Mode

The UE is configured to use a specific value of T3324

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI, type 'Combined GPRS/IMSI attach' and the T3324 value set to 2 minutes.

2) The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI and a value of T3324 set to 2 minutes. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

3) The MS is PS paged before timer T3324 expires in order to verify that the new P-TMSI is used for PS services and that the MS has not entered PSM.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS)
2	MS		The MS is powered up or switched on and initiates attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS/IMSI attach' Mobile identity =IMSI TMSI status = no valid TMSI available T3324 value = any value
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS/IMSI attached' Allocated P-TMSI = P-TMSI-1 P-TMSI Signature = P-TMSI-1 signature MS identity =IMSI Routing area identity = RAI-1 T3324 value = 2 minutes
5	MS -> SS	ATTACH COMPLETE	
6	SS		The SS releases the signalling connection and waits 1 minute and then execute the step 7 before timer T3324 expires
7	SS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
8	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
9	MS		The MS is switched off or power is removed (see PICS).

Specific message contents

None.

44.2.1.2.4 Combined GPRS attach / rejected / IMSI invalid / illegal ME

44.2.1.2.4.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'Illegal ME'.

44.2.1.2.4.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on Yes/No (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted
5	SS -> MS	ATTACH REJECT	GMM cause 'Illegal ME'.
6	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
7	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
8	SS -> MS		SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell.
9	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
10	SS -> MS		SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		No response from the MS to the request. This is checked for 10 s.
			The following messages are sent and shall be received on cell B.
12	SS		The SS deactivates cell A and activates cell B.
13	MS		Cell B is preferred by the MS.
14	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
15	SS -> MS		SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell.
16	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
			The following messages are sent and shall be received on cell C.
17	SS		The SS deactivates cell B and activates cell C.
18	MS		Cell C is preferred by the MS.
19	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
20	SS -> MS		SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell.
21	MS		No response from the MS to the request. This is checked for 10seconds.
22	MS		If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed.

Step	Direction	Message	Comments
23	MS		The MS gets the SIM replaced, is powered up or switched on. Step 22 is only performed for non-auto attach MS.
24		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter Mobile identity is IMSI.
25	MS		MS initiates an attach automatically (see PICS), via MMI or AT commands.
26	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available
27	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-2
28	MS -> SS	ATTACH COMPLETE	
29	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
30	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1.
31	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
32	MS		The MS is switched off or power is removed (see PICS).
33	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.5 Combined GPRS attach / rejected / GPRS services and non-GPRS services not allowed

44.2.1.2.5.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.5.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'GPRS services and non-GPRS services not allowed'.

44.2.1.2.5.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'GPRS services and non-GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted
5	SS -> MS	ATTACH REJECT	GMM cause 'GPRS services and non-GPRS services not allowed'
6	MS		No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds).
7	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
8	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		No response from the MS to the request. This is checked for 10 s
11	SS MS		The SS deactivates cell A and activates cell B. Cell B is preferred by the MS.
12	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
13	MS		No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds).
14	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
15	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
16	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
17	MS		No response from the MS to the request. This is checked for 10seconds.
18	MS		If possible (see PICS) switch off is performed. Otherwise the power is removed.

Step	Direction	Message	Comments
19	MS		The MS is powered up or switched on. Step 20 is only performed for non-auto attach MS.
20		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
21	MS		MS initiates an attach automatically (see PICS), via MMI or AT commands.
22	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available
23	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-2
24	MS -> SS	ATTACH COMPLETE	
25	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
26	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1.
27	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
28	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
29	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
30	MS		The MS is switched off or power is removed (see PICS).
31	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.6 Combined GPRS attach / rejected / GPRS services not allowed

44.2.1.2.6.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

3) A GPRS class B MS shall perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.6.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed'.

44.2.1.2.6.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

ATT flag set to 1.

Mobile Station:

The MS has a valid TMSI, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach. GPRS services are not possible. After receiving the ATTACH REJECT message from the SS the mobile can react in several ways, due to an ambiguity in the core specification. Part 3 of the conformance requirements can be interpreted in the following ways:

1. The MS shall in any case perform a Location Update with the update type set to IMSI attach.
2. The MS shall perform the IMSI attach by means of a explicit Location update procedure only if the conditions specified for the IMSI attach procedure in 3GPP TS 04.08 / 3GSPP TS 24.008, subclause 4.4.3 are fulfilled.
3. The MS shall perform a Location Update with the update type set either to IMSI attach or normal updating.

Because all three options are allowed a GPRS class B MS may perform an MM IMSI attach. Therefore step 8 in the expected sequence is an optional step.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on. Step 4 is only performed for non-auto attach MS.
4	MS	**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
5			MS initiates an attach automatically (see PICS), via MMI or AT commands.
6	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =P-TMSI-1 Routing area identity = RAI-1
7	SS -> MS	ATTACH REJECT	GMM cause 'GPRS services not allowed'
8 (optional step)	MS	**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-2.
9	SS -> MS		SS pages the MS with mobile identity of TMSI-2 or TMSI-1 for MS which did not perform step 8 and paging order for RR connection on CCCH.
10	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2 or TMSI-1 for MS which did not perform step 8.
11	SS		SS releases the RR connection.
			The following messages are sent and shall be received on cell B.
12	SS		The SS deactivates cell A and activates cell B.
13	MS		Cell B is preferred by the MS.
14		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
15	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
16	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
17			SS releases the RR connection.
18	SS -> MS		SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
19	MS		No response from the MS to the request. This is checked for 10seconds.
20	MS		If possible (see PICS) switch off is performed. Otherwise the power is removed.
21	MS	{IMSI Detach}	Macro. If switch off is performed then MS performs IMSI detach.

Step	Direction	Message	Comments
22	MS		The MS is powered up or switched on. Step 23 is only performed for non-auto attach MS.
23	MS	**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
24			MS initiates an attach automatically (see PICS), via MMI or AT commands.
25	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI
26	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-2 Routing area identity = RAI-2
27	MS -> SS	ATTACH COMPLETE	
28	SS -> MS		SS pages the MS with mobile identity of TMSI-2 and paging order for RR connection according to the channel combination of the cell.
29	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2
30	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
31	MS		The MS is switched off or power is removed (see PICS).
32	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.7 Combined GPRS attach / rejected / location area not allowed

44.2.1.2.7.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

   1.1 not perform combined GPRS attach when in the same location area;

   1.2 delete the stored LAI, CKSN, TMSI, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;

   1.3 store the LA in the 'forbidden location areas for regional provision of service'.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

   2.1 perform combined GPRS attach when a new location area is entered;

   2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.3.2.

44.2.1.2.7.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.1.2.7.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test procedure

The SS rejects a combined GPRS attach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform combined GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH REJECT	GMM cause 'Location Area not allowed'
6	MS		No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds).
7	SS -> MS		SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell.

Step	Direction	Message	Comments
8	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		No response from the MS to the request. This is checked for 10 s
			The following messages are sent and shall be received on cell B.
11	SS		The SS deactivates cell A and activates cell B.
12	MS		Cell B is preferred by the MS.
13	MS		No ATTACH REQUEST or LOCATION UPDATING REQ is sent to SS (SS waits 60 seconds)
14	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
15	MS		No response from the MS to the request. This is checked for 10seconds.
16	MS		The MS initiates an attach by MMI or AT command.
17			No attach is performed by the MS. This is checked for 10 s.
			The following messages are sent and shall be received on cell C.
18	SS		The SS deactivates cell B and activates cell C.
19	MS		Cell C is preferred by the MS.
			Steps 20 and 21 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS).
20 (conditional)		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter Mobile identity is IMSI.
21 (conditional)	MS		MS initiates an attach via MMI or AT commands.
22	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available
23	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-3
24	MS -> SS	ATTACH COMPLETE	
25	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
26	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
27	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
28	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
29	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
30	MS		The MS is switched off or power is removed (see PICS).

Step	Direction	Message	Comments
31	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'
			The following messages are sent and shall be received on cell B.
32	MS		The SS deactivates cell C and activates cell B. Cell B is preferred by the MS.
33	MS		The MS is powered up or switched on. Step 34 is only performed for non-auto attach MS.
34		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
35	MS		MS initiates an attach automatically (see PICS), via MMI or AT commands.
36	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-3
37	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-2 Routing area identity = RAI-4
38	MS -> SS	ATTACH COMPLETE	
39	SS -> MS		SS pages the MS with mobile identity TMSI-2 and paging order for RR connection according to the channel combination of the cell.
40	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2.
41	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
42	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
43	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
44	MS		The MS is switched off or power is removed (see PICS).
45	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.7a Combined GPRS attach / rejected / network reject with Extended Wait Timer

44.2.1.2.7a.1 Conformance requirement

If the attach request can neither be accepted by the network for GPRS nor for non-GPRS services, an ATTACH REJECT message is transferred to the MS. The MS receiving the ATTACH REJECT message stops timer T3310, and for all causes except #12, #14, #15, #22 and #25 deletes the list of "equivalent PLMNs".

If the attach request is rejected due to NAS level mobility management congestion control, the network shall set the MM cause value to #22 "congestion" and assign a back-off timer T3346.

22 (Congestion);

If the T3346 value IE is present in the ATTACH REJECT message and the value indicates that this timer is neither zero nor deactivated, the MS shall proceed as described below, otherwise it shall be considered as an abnormal case and the behaviour of the MS for this case is specified in subclause 4.7.3.1.5.

The MS shall abort the attach procedure, reset the attach attempt counter, set the GPRS update status to GU2 NOT UPDATED and enter state GMM-DEREGISTERED.ATTEMPTING-TO-ATTACH.

The MS shall stop timer T3346 if it is running.

If the ATTACH REJECT message is integrity protected, the MS shall start timer T3346 with the value provided in the T3346 value IE.

If the ATTACH REJECT message is not integrity protected, the MS shall start timer T3346 with a random value from the default range specified in table 11.3a.

The MS stays in the current serving cell and applies the normal cell reselection process. The attach procedure is started, if still necessary, when timer T3346 expires or is stopped.

A GPRS MS operating in MS operation mode A or B which is already IMSI attached for CS services in the network is still IMSI attached for CS services in the network.

If S1 mode is supported in the MS, the MS shall handle the EMM parameters EMM state, EPS update status, and attach attempt counter as specified in 3GPP TS 24.301 [120] for the case when the attach procedure is rejected with the EMM cause with the same value.

Reference(s):

3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.7a.2 Test purpose

To verify that the MS uses the extended back-off timer if the network reject a request with the Extended Wait Timer.

44.2.1.2.7a.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II MCC1/MNC1/LAC1/RAC1

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on Yes/No (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a combined GPRS attach with the cause value #22 'Congestion'. The SS includes the T3346 timer in the reject message. The SS checks that the MS does not perform GPRS attach before the timer T3346 has expired.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted Device properties = 'MS is configured for NAS signalling low priority'
4	SS -> MS	ATTACH REJECT	GMM cause #22 'Congestion' T3346 value = 2 min
5	SS		The SS verifies that the MS does not initiate the attach procedure before timer T3346 has expired
6	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available
7	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-1
8	MS -> SS	ATTACH COMPLETE	
9	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
10	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1.
11	SS		SS releases the RR connection indicating a successful resumption of GPRS services.

Specific message contents

None.

44.2.1.2.8 Combined GPRS attach / abnormal cases / attempt counter check / miscellaneous reject causes

44.2.1.2.8.1 Conformance requirement

1) When a combined GPRS attach procedure is rejected with the attach attempt counter less than five, the Mobile Station shall repeat the combined GPRS attach procedure after T3311 timeout.

2) When a combined GPRS attach procedure is rejected with the attach attempt counter five, the Mobile Station shall delete the stored TMSI, LAI, CKSN, P-TMSI, P-TMSI signature, GPRS CKSN and RAI and start T3302.

3) When the T3302 expire, a new combined GPRS attach procedure shall be initiated.

- GMM cause codes that can be selected are:

  - 'IMSI unknown in HLR';

  - 'MS identity cannot be derived by the network';

  - 'Network failure';

  - 'Congestion';

- 'retry upon entry into a new cell';
- 'Message type not compatible with the protocol state';
- 'Conditional IE error';
- 'Message not compatible with the protocol state';

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.8.2 Test purpose

To test the behaviour of the MS with respect to the attach attempt counter.

44.2.1.2.8.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I. T3302 is set to 12 minutes.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Switch off on button (TSPC_Feat_OnOff).

PIXIT statements:

-

Test procedure

The MS initiates a combined GPRS attach procedure (attach attempt counter zero). The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter one) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter two) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter three) after T3311 expires The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter four) after T3311 expires The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is not started, as the attach attempt counter is five. T3302 is started.

The MS initiates a combined GPRS attach procedure with attach attempt counter zero after T3302 expires without P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

20 minutes.

Expected sequence

24	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
25	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1.
26	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
27	SS -> MS		SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
28	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
29	MS		The MS is switched off or power is removed (see PICS).
30	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.9 Combined GPRS attach / abnormal cases / GPRS detach procedure collision

44.2.1.2.9.1 Conformance requirement

1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.

2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.2.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Re-attach automatically when the network commands a detach with no cause value (TSPC_AddInfo_GPRS_Attach_on_NW_Detach_NoCause).

PIXIT statements:

-

Test procedure

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach. CS services are also possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS		The SS ignores the ATTACH REQUEST message and initiates a detach procedure.
5	SS -> MS	DETACH REQUEST	Detach type = 're-attach not required'
6	MS -> SS	DETACH ACCEPT	
7	MS		The MS is attached by MMI or AT command if the MS does not re-attach automatically upon receiving a network initiated detach with no cause value, (see PIXIT).
8	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
9	SS		The SS ignores the ATTACH REQUEST message and initiates a detach procedure.
10	SS -> MS	DETACH REQUEST	Detach type = 're-attach required'
11	MS		The MS ignores the DETACH REQUEST message and continue with the attach procedure
12	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-2 Routing area identity = RAI-1
13	MS -> SS	ATTACH COMPLETE	
14	SS -> MS		SS pages the MS with mobile identity of TMSI-2 and paging order for RR connection according to the channel combination of the cell.
15	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-2.
16	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
17	SS -> MS		SS pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
18	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
19	MS		The MS is switched off or power is removed (see PICS).
20	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.1.2.10 Combined GPRS attach / eDRX

44.2.1.2.10.1 Conformance requirement

1) If the MS supports eDRX and requests the use of eDRX, the MS shall include the extended DRX parameters IE in the ATTACH REQUEST message.

2) The MS shall use extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last attach procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.1.

44.2.1.2.10.2 Test Purpose

To verify that a MS that supports eDRX and requests the use of eDRX will include the extended DRX parameters IE in the ATTACH REQUEST message.

To verify that a MS that supports eDRX and requests the use of eDRX will use extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last attach procedure.

44.2.1.2.10.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode I.
- The cell supports eDRX.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated.
- The MS is configured to use eDRX.
- The MS is configured to use a specific value of extended DRX cycle.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a combined ATTACH REQUEST message with extended DRX parameters IE. The SS accepts the request to use eDRX and returns ATTACH ACCEPT message with an extended DRX parameters IE. The MS shall use extended idle mode DRX cycle that the network has provided during the last attach procedure.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI Extended DRX parameters IE included.
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 extended DRX value: 0111(195.84 seconds)
5	MS -> SS	ATTACH COMPLETE	
6			Waits for 1 minute for Ready Timer to expire.
7	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
8			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315.
9	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle.
10			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
11	MS		The MS is switched off or power is removed (see PICS).
12	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.2 GPRS detach procedure

This procedure is used to indicate for the network that the IMSI is not available for traffic. The GMM context is removed.

44.2.2.1 MS initiated GPRS detach procedure

44.2.2.1.1 GPRS detach / power off / accepted

44.2.2.1.1.1 Conformance requirement

The MS detaches the IMSI for GPRS services if the MS is switched off.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 8.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS is switched off (see PICS).
7	MS -> SS	DETACH REQUEST	Detach type = 'power switched off, GPRS detach'
8	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 7.

Specific message contents

None.

44.2.2.1.2 GPRS detach / accepted

44.2.2.1.2.1 Conformance requirement

1) The MS detaches the IMSI for GPRS services if the MS is ordered to do so with MMI or AT commands.
2) (For R99 or after MS only) Upon completion of the subsequent attach, routing area update, service request or detach procedure the used P-TMSI signature shall be deleted.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

3GPP TS 24.008 subclause 4.7.1.3 (additional reference for R99 or after MS only)

44.2.2.1.2.2 Test purpose

To test the behaviour of the MS for the detach procedure, including treatment of P-TMSI signature by R99 and after MS.

44.2.2.1.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- MS Higher Layer release(TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 17.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
5	MS->SS	ATTACH COMPLETE	
6	MS		The MS initiates a GPRS detach (without power off) by MMI or AT command.
7	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
8	SS -> MS	DETACH ACCEPT	
9	SS -> MS		SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		No response from the MS to the request. This is checked for 10 s.
11	MS		The MS initiates an attach by MMI or AT commands
12	MS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 (If MS is to R99 or after then P-TMSI-1 signature shall not be present) Routing area identity = RAI-1
13	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
14	MS		The MS initiates a GPRS detach (without power off) by MMI or AT command.
15	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
16	SS -> MS	DETACH ACCEPT	
17	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 16.

Specific message contents

None.

44.2.2.1.3 GPRS detach / abnormal cases / attempt counter check / procedure timeout

44.2.2.1.3.1 Conformance requirement

1) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter less than five, the Mobile Station shall repeat the GPRS detach procedure.

2) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter five, the Mobile Station shall not repeat the procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.3.2 Test purpose

To test the behaviour of the MS with respect to the retransmission counter.

44.2.2.1.3.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Switch off on button (TSPC_Feat_OnOff).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS detach procedure. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is set to one.

The MS initiates a new GPRS detach procedure (retransmission counter one) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter two) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter three) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter four) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS then deletes the logical link since the retransmission has been repeated four times.

The MS performs a new GPRS attach procedure.

Maximum duration of test

8 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 25.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
5	MS		The MS initiates a GPRS detach (without power off) by MMI or AT command.
6	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
7	SS		No response is given from the SS.
8	SS		The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%)
9	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
10	SS		No response is given from the SS.
11	SS		The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%)
12	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
13	SS		No response is given from the SS.
14	SS		The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%)
15	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
16	SS		No response is given from the SS.
17	SS		The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%)
18	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
19	SS		No response is given from the SS within 40 seconds and SS verifies that the MS will not send a DETACH REQUEST again.
20	MS		Initiate a GPRS attach
21	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
22	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
23			MS is switched off or power is removed (see PICS)
24	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
25	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 24.

Specific message contents

None.

44.2.2.1.4 GPRS detach / abnormal cases / GMM common procedure collision

44.2.2.1.4.1 Conformance requirement

When any of the GMM common messages P-TMSI REALLOCATION COMMAND, GMM STATUS or GMM INFORMATION is received by the MS while waiting for a DETACH ACCEPT message with detach cause different from "power off", the MS shall ignore the GMM common message.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.4.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The following test procedure is repeated for sequence counter k = 1, 2, 3:

- The MS performs a GPRS attach.
- The MS initiates a GPRS detach. The SS initiates a P-TMSI REALLOCATION COMMAND message (k = 1), a GMM STATUS message (k = 2) and a GMM INFORMATION message (k = 3). The MS shall ignore the GMM common messages and continue with the GPRS detach procedure. The sending of the P-TMSI REALLOCATION COMMAND message (k = 1), the GMM STATUS message (k = 2), the GMM INFORMATION message (k = 3) and the DETACH ACCEPT message shall be completed within Timer T3321 -10%.
- The SS signal to the MS, but no response is received, as the signalling link is disconnected.

Maximum duration of test

5 minutes.

Expected sequence

The test sequence is repeated for k = 1 … 3

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS initiates a detach (without power off) by MMI or AT command.
7	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
8A (k=1)	SS		The SS sends a P-TMSI REALLOCATION COMMAND message
9A (k=1)	SS -> MS	P-TMSI REALLOCATION COMMAND	
10A (k=1)	MS		The MS ignores the message. This is verified for 10 seconds.
8B (k=2)	SS		The SS sends a GMM STATUS message
9B (k=2)	SS -> MS	GMM STATUS	
10B (k=2)	MS		The MS ignores the message. This is verified for 10 seconds.
8C (k=3)	SS		The SS sends a GMM INFORMATION message
9C (k=3)	SS -> MS	GMM INFORMATION	
10C (k=3)	MS		The MS ignores the message which is verified for 10 seconds or, if GMM INFORMATION message not implemented, sends a GMM STATUS with GMM Cause 'Message type non-existent or not implemented'.
11	SS -> MS	DETACH ACCEPT	The SS responds to the DETACH REQUEST
12	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
13	MS		No response from the MS to the request. This is checked for 10 s.
NOTE: Steps 8x, 9x, 10x and 11 shall be completed within Timer T3321 -10%.			

Specific message contents

None.

44.2.2.1.5 GPRS detach / power off / accepted

44.2.2.1.5.1 Conformance requirement

The MS detach the IMSI for GPRS and non-GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.5.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.5.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS initiates a detach (without power off) by MMI or AT command.
7	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, combined GPRS / IMSI detach'
8	SS -> MS	DETACH ACCEPT	
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		No response from the MS to the request. This is checked for 10 s.
11	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
12	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.

Specific message contents

None.

44.2.2.1.7 GPRS detach / accepted / IMSI detach

44.2.2.1.7.1 Conformance requirement

The MS shall detach for CS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.7.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.7.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS performs an GPRS detach (for non-GPRS services).

CS services are not possible.

The MS attach for non-GPRS services by a routing area update procedure and CS services are again possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS initiates a detach for non-GPRS services without power off.
7	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, IMSI detach'
8	SS -> MS	DETACH ACCEPT	
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
11	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
12	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
13	MS		The MS initiates an attach for non-GPRS services by a RA update procedure.
14	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = "combined RA/LA updating with IMSI attach" Routing area identity = RAI-1
15	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'Combined RA/LA updated'' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-1 Routing area identity = RAI-1
16	MS -> SS	ROUTING AREA UPDATE COMPLETE	
17	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
18	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
19	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
20	MS		The MS is switched off or power is removed (see PICS).
21	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.2.1.8 GPRS detach / abnormal cases / change of cell into new routing area

44.2.2.1.8.1 Conformance requirement

When a change of cell into a new routing area is performed before DETACH ACCEPT message is received by the MS, the MS shall abort the GPRS detach procedure and re-initiate it after the routing area update procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.8.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS detach procedure. The DETACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area and performs a routing area update procedure.

The Ms shall re-initiate a GPRS detach procedure when the routing area update procedure is finished.

The MS deletes the logical link.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A and B. The RF level of cell A is -50 dBm and cell B -60 dBm.
2	MS		The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
3A	MS	**{Location Update Procedure}**	Macro for Class B MS. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
7	SS		Wait 30 sec
8	MS		The MS initiates a GPRS detach (without power off) by MMI or AT command.
9	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
10	SS		No response to the DETACH REQUEST message is given by the SS
			The following messages are sent and shall be received on cell B.
11	SS		The RF level of cell A is lowered to -100 dBm.
12	MS		The MS performs a RA update in the new cell.
13	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = ''RA updating' P-TMSI-1 signature Routing area identity = RAI-1 TMSI status = valid TMSI available or IE omitted
14	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = ‘RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4
15	MS -> SS	ROUTING AREA UPDATE COMPLETE	
16	MS -> SS	DETACH REQUEST	The detach is automatically re-attempted. Detach type = 'normal detach, GPRS detach'
17	SS -> MS	DETACH ACCEPT	

Specific message contents

None.

44.2.2.1.9 GPRS detach / abnormal cases / GPRS detach procedure collision

44.2.2.1.9.1 Conformance requirement

When a DETACH REQUEST is received by the MS while waiting for a DETACH ACCEPT message, the MS shall answer the network initiated GPRS detach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure for Class B devices and a normal GPRS attach for Class C devices The MS initiates a GPRS detach. The SS does not answer the detach procedure, but initiates a detach procedure (cause re-attach not required). The MS shall continue with the network initiated detach procedure.

The MS deletes the logical link.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = For Class B: 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' For Class C: ‘ GPRS Attach’ Mobile identity = IMSI TMSI status(Class B) = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result for Class B = 'Combined GPRS / IMSI attached' Attach result for Class C: 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity (Class B)= TMSI-1 Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS initiates a GPRS detach (without power off) by MMI or AT command.
7	MS -> SS	DETACH REQUEST	Detach type for Class B = 'normal detach, combined GPRS / IMSI detach' Detach type for Class C = 'normal detach, GPRS detach'
8	SS -> MS	DETACH REQUEST	Detach type = 're-attach not required', GMM cause = ‘GPRS services and non-GPRS services not allowed’
9	MS -> SS	DETACH ACCEPT	The MS answers the network initiated detach.
10	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		No response from the MS to the request. This is checked for 10 s. For Class C MS, test is over.
12	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
13	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.

Specific message contents

None.

44.2.2.2 Network initiated GPRS detach procedure

44.2.2.2.1 GPRS detach / re-attach not required / accepted

44.2.2.2.1.1 Conformance requirement

The MS detach the IMSI for GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.2.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The SS sends a DETACH REQUEST message to the MS. The MS then deletes the logical link.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The SS is set in network operation mode II.
2	MS		The MS is set in MS operation mode B or C (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
7	SS -> MS	DETACH REQUEST	Detach type = 're-attach not required'
8	MS -> SS	DETACH ACCEPT	
9	SS -> MS		SS pages MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10 optional	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS Attach' Mobile identity = P–TMSI-1
11	MS		No response from the MS to the request of step 9. This is checked for 10 s.

Specific message contents

None.

44.2.2.2.2 GPRS detach / rejected / IMSI invalid / GPRS services not allowed

44.2.2.2.2.1 Conformance requirement

1) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.2.2 Test purpose

To test the behaviour of the MS if the network orders a GPRS detach procedure with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

44.2.2.2.2.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS performs a detach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
7	SS -> MS	DETACH REQUEST	Detach type = 're-attach not required' Cause = 'GPRS services not allowed'
8	MS -> SS	DETACH ACCEPT	
			The following messages are sent and shall be received on cell B.
9	SS		The SS deactivates cell A and activates cell B.
10	MS		Cell B is preferred by the MS.
			Step 11 is only performed for MS Operation Mode B.
11		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
12			The MS initiates an attach automatically (see PICS), by MMI or AT commands.
13	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
14	MS		If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed.
15	MS		The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS).
16	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
17	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
18	MS -> SS	ATTACH COMPLETE	
19	MS		The MS is switched off or power is removed (see PICS).
20	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
21			The SS deactivates cell B and activates cell A.
22	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 20.

Specific message contents

None.

44.2.2.2.3 GPRS detach / IMSI detach / accepted

44.2.2.2.3.1 Conformance requirement

The MS detach the IMSI for GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.3.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.2.3.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The SS sends a DETACH REQUEST message to the MS. The MS then performs an IMSI detach (detach for non-GPRS services).

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS attach for non-GPRS services by a routing area update procedure. Both GPRS and CS services are possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available

12	MS -> SS	ROUTING AREA UPDATE COMPLETE	
13	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
14	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
15	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
16	MS		The MS is switched off or power is removed (see PICS).
17	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.2.2.4 GPRS detach / re-attach requested / accepted

44.2.2.2.4.1 Conformance requirement

When receiving the DETACH REQUEST message and the detach type IE indicates "re-attach required", the MS shall deactivate the PDP contexts and deactivate the logical link(s), if any. The MS shall then send a DETACH ACCEPT message to the network and shall change state to GMM-DEREGISTERED. The MS shall, after the completion of the GPRS detach procedure, initiate a GPRS attach procedure. The MS should also activate PDP context(s) to replace any previously active PDP contexts.

NOTE: In some cases, user interaction may be required and then the MS cannot activate the PDP context(s) automatically.

A GPRS MS operating in MS operation mode A or B in network operation mode I, which receives an DETACH REQUEST message with detach type indicating "re-attach required" or "re-attach not required" and no cause code, is only detached for GPRS services in the network.

.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.2.

44.2.2.2.4.2 Test purpose

To test the behaviour of the MS for the detach procedure in case automatic re-attach.

44.2.2.2.4.3 Method of test

Initial conditions

System Simulator:

One cell in operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI(for Class B MS), P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure for Class B devices and a normal GPRS attach for Class C devices.

The SS sends a DETACH REQUEST message to the MS with cause re-attach. The MS then detaches for GPRS services. The MS automatically performs a new combined GPRS attach procedure with Attach Type “GPRS attach while IMSI attached” (for Class B) or normal GPRS Attach procedure for Class C devices. GPRS and CS (only for Class B) services are again possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = For Class B: 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' For Class C: ‘ GPRS Attach’ Mobile identity = P-TMSI-1 Routing area identity = RAI-1

44.2.2.2.5 GPRS detach / rejected / location area not allowed

44.2.2.2.5.1 Conformance requirement

44.2.2.2.5.1.1 Conformance requirement for a R97 and R98 MS

1) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

    1.1 not perform combined GPRS attach when in the same location area;

    1.2 delete any RAI or LAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number;

    1.3 store the LAI in the list of in the 'forbidden location areas for regional provision of service';

    1.4 delete any TMSI, LAI and ciphering key sequence number for GPRS MS operating in MS operation mode A or B.

2) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

    2.1 perform combined GPRS attach when a new location area is entered;

    2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 04.08 subclauses 4.7.4.2.

44.2.2.2.5.1.2 Conformance requirement for a R99 or later MS

1) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

    1.1 not perform combined GPRS attach when in the same location area;

    1.2 delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number;

    1.3 store the LAI in the list of 'forbidden location areas for regional provision of service';

    1.4 delete any TMSI, LAI and ciphering key sequence number if the MS is IMSI attached and if no RR connection exists or if the MS is operating in MS operation mode A and an RR connection exists when the RR connection is subsequently released.

2) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

    2.1 perform combined GPRS attach when a new location area is entered;

    2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 24.008 subclauses 4.7.4.2.

44.2.2.2.5.2 Test purpose

To test the behaviour of the MS if the network orders the GPRS detach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.2.2.5.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC1/RAC2 (Not HPLMN), cell C in MCC2/MNC1/LAC2/RAC1 (Not HPLMN).

All cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test procedure

The SS orders a GPRS detach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform (combined) GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. For Class B MS, CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B, or mode C if mode B is not supported (see PICS)
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = ‘GPRS attach’ Mobile identity = IMSI TMSI status = no valid TMSI available (Class B Only)
5	SS -> MS	ATTACH ACCEPT	Attach result for Class B = 'Combined GPRS / IMSI attached' Attach Result for Class C = ‘GPRS Only attached’ Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 (Class B Only) Routing area identity = RAI-2
6	MS -> SS	ATTACH COMPLETE	

Step	Direction	Message	Comments
7 8	SS -> MS MS -> SS	DETACH REQUEST DETACH ACCEPT	Detach type = 're-attach not required' Cause 'Location Area not allowed'
			For Class C MS, go to Step 12
9 10 11 12 13	MS SS -> MS MS SS -> MS MS -> SS		No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. The MS shall not initiate an RR connection. This is checked during 3 seconds. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. No response from the MS to the request. This is checked for 10 s
			The following messages are sent and shall be received on cell B.
14 15 16 17 18 19 20 21 22	SS MS MS MS MS SS -> MS MS SS -> MS		The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. The MS initiates an attach automatically, by MMI or by AT command. No ATTACH REQUEST sent to SS (SS waits 30 seconds) For Class C MS, go to Step 21 No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. The MS shall not initiate an RR connection. This is checked during 3 seconds. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. No response from the MS to the request. This is checked for 10 s
			The following messages are sent and shall be received on cell C.
23 24 25 (conditional) 26 (conditional) 27	SS MS MS MS -> SS	 **{Location Update Procedure}** ATTACH REQUEST	The SS deactivates cell B and activates cell C. Cell C is preferred by the MS. Steps 25 and 26 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS) For Class C MS, go to Step 26 Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. MS initiates an attach via MMI or AT command. Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' Mobile identity = IMSI TMSI status = no valid TMSI available (Class B Only)

Step	Direction	Message	Comments
28	SS -> MS	ATTACH ACCEPT	Attach result for Class B = 'Combined GPRS / IMSI attached' Attach Result for Class C = 'GPRS Only attached' Mobile identity = P-TMSI1 P-TMSI-1 signature Mobile identity (for Class B)= TMSI-1 Routing area identity = RAI-6
29	MS -> SS	ATTACH COMPLETE	
			For Class C MS, go to Step 33
30	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
31	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
32	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
33	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
34	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
35	MS		The MS is switched off or power is removed (see PICS).
36	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type for Class B = 'power switched off, combined GPRS / IMSI detach' Detach type for Class C = 'power switched off, GPRS detach'
			The following messages are sent and shall be received on cell B.
37	MS		The SS deactivates cell C and activates cell B. Cell B is preferred by the MS.
38	MS		The MS is powered up or switched on. Step 39 is only performed for non-auto attach Class B MS.
39		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1.
40	MS		MS initiates an attach automatically (see PICS), via MMI or AT commands.
41	MS -> SS	ATTACH REQUEST	Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-6
42	SS -> MS	ATTACH ACCEPT	Attach result for Class B = 'Combined GPRS / IMSI attached' Attach Result for Class C = 'GPRS only attached Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity (for Class B)= TMSI-2 Routing area identity = RAI-7
43	MS -> SS	ATTACH COMPLETE	
			For Class C MS, go to Step 47
44	SS -> MS		SS pages the MS with mobile identity TMSI-2 and paging order for RR connection according to the channel combination of the cell.
45	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2.

Step	Direction	Message	Comments
46	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
47	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
48	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
49	MS		The MS is switched off or power is removed (see PICS).
50	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type for Class B = 'power switched off, combined GPRS / IMSI detach' Detach type for Class C = 'power switched off, GPRS detach'

Specific message contents

44.2.2.2.6 GPRS detach / rejected / GPRS services not allowed in this PLMN

44.2.2.2.6.1 Conformance requirement

If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed in this PLMN' the Mobile Station shall:

1. The MS shall delete any RAI, P-TMSI, P-TMSI signature, and GPRS ciphering key sequence number stored, shall set the GPRS update status to GU3 ROAMING NOT ALLOWED (and shall store it according to section 4.1.3.2) and shall change to state GMM-DEREGISTERED.

2. The MS shall store the PLMN identity in the "forbidden PLMNs for GPRS service" list.

3. A GPRS MS operating in MS operation mode A or B in network operation mode I shall set the timer T3212 to its initial value and restart it, if it is not already running.

4. A GPRS MS operating in MS operation mode A or B, is still IMSI attached for CS services in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.2

44.2.2.2.6.2 Test purpose

To test the behaviour of the MS if the network orders the GPRS detach procedure with the cause ' GPRS services not allowed in this PLMN.

44.2.2.2.6.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC2/MNC1/LAC1/RAC1.

All two cells are operating in network operation mode II. The PLMN of the two cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-8. MS is Idle Updated on Cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS orders a GPRS detach with the cause value ' GPRS services not allowed in this PLMN‘. The SS checks that the MS responds to RR paging (in case of MS operation mode B) and does not respond to packet paging, does not perform periodic ROUTING AREA UPDATE procedure in this PLMN and performs periodic ROUTING AREA UPDATE procedure when new PLMN is entered.

T3312: set to 6 minutes.

Maximum duration of test

20 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode B or C (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-8
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-8 T3312 = 6 minutes
6	MS -> SS	ATTACH COMPLETE	
7	SS -> MS	DETACH REQUEST	Cause = 'GPRS services not allowed in this PLMN'
8	MS -> SS	DETACH ACCEPT	
			Steps 9, 10 and 11 are only performed for MS Operation Mode B.
9	SS -> MS		SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell.
10	MS -> SS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
11	SS		SS releases the RR connection.
12			SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
13			No response from the MS to the request. This is checked for 10 seconds.
14			No ROUTING AREA UPDATE REQUEST sent to the SS (SS waits Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+10%)).
			The following messages are sent and shall be received on cell B.
15	SS		The SS deactivates cell A and activates cell B.
16	MS		Cell B is preferred by the MS.
			Step 17 is only performed for MS Operation Mode B.
17		**{Location Update Procedure}**	Location Update Procedure initiated from the MS.
	MS		The MS initiates an attach automatically, by MMI or by AT command.
18	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
19	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 T3312 = 6 minutes
20	MS -> SS	ATTACH COMPLETE	
21	SS		The SS verifies that the time between the Attach and the periodic RA updating is Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+/- 10%)
22	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-2

23	SS -> MS	ROUTING AREA UPDATING ACCEPT	No new mobile identity assigned. P-TMSI and TMSI not included. Update result = 'RAupdated' Negotiated Ready timer value IE should not be included. Force to standby indicator set
24	MS		The MS is switched off or power is removed (see PICS).
25	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off,

Specific message contents

44.2.3 Routing area updating procedure

This procedure is used to update the actual routing area of an MS in the network.

44.2.3.1 Normal routing area updating

The routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C that are IMSI attached for GPRS services only.

44.2.3.1.1 Routing area updating / accepted

44.2.3.1.1.1 Conformance requirement

1) If the network accepts the routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.

2) If the network accepts the routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the routing area updating procedure.

The following cases are identified:

1) P-TMSI / P-TMSI signature is reallocated;

2) Old P-TMSI / P-TMSI signature is not changed.

44.2.3.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).

- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.

2) The MS sends a ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A but not cell B.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
9	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
10	MS -> SS	ROUTING AREA UPDATING COMPLETE	
11	SS->MS	GMM INFORMATION	
11b	MS->SS	GMM STATUS	Message sent in case the MS does not support reception of GMM information message. Cause #97
12	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
13	MS		No response from the MS to the request. This is checked for 10 s.
			The following messages are sent and shall be received on cell A.
14	SS		The RF level of cell B is lowered until cell A is preferred by the MS.
15	MS		Cell A is preferred by the MS.
16	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-4
17	SS -> MS	ROUTING AREA UPDATING ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-2 signature Routing area identity = RAI-1
18	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
19	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response.
20	MS		The MS is switched off or power is removed (see PICS).
21	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
22	MS		The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 3 to step 21.

Specific message contents

None.

44.2.3.1.1a Routing area updating / accepted / old P-TMSI

44.2.3.1.1a.1 Conformance requirement

Upon receipt of a GMM message containing a new P-TMSI the MS shall consider the new P-TMSI and new RAI and also the old P-TMSI and old RAI as valid in order to react to paging requests and downlink transmission of LLC frames.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.1.5.1.

44.2.3.1.1a.2 Test purpose

To test the validity of old and new P-TMSI the network accepts the routing area updating procedure.

44.2.3.1.1a.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. The MS will answer signalling addressed to the old P-TMSI and to the new P-TMSI. The SS sends a GMM INFORMATION MESSAGE. The MS will answer signalling addressed only to the new P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A but not cell B.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 23.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
9	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
10	MS -> SS	ROUTING AREA UPDATING COMPLETE	
11	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
12	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Message not ciphered
13	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
14	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Message not ciphered

16	MS->SS	GMM STATUS	Message sent in case the MS does not support reception of GMM information message. Cause #97
17	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
18	MS		No response from the MS to the request. This is checked for 10 s.
19	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
20	MS -> SS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Message not ciphered
21	MS		The MS is switched off or power is removed (see PICS).
22	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

23	MS		The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 3 to step 22.

Specific message contents

None.

44.2.3.1.1b Routing area updating / accepted / PSM

44.2.3.1.1b.1 Conformance requirement

An MS supporting PSM may request the network to assign a value for T3324 by including a requested timer value in:

- the ATTACH REQUEST or ROUTING AREA UPDATE REQUEST message (in A/Gb mode and Iu mode); or
- the ATTACH REQUEST or TRACKING AREA UPDATE REQUEST message (in S1 mode).

The value of timer T3324 can be sent by the network to the MS in:

- the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message (in A/Gb mode and Iu mode); and
- the ATTACH ACCEPT or TRACKING AREA UPDATE ACCEPT message (in S1 mode).

…

The network accepts the use of PSM by providing a specific value for timer T3324 when accepting the attach or routing area updating procedure. The MS may use PSM only if the network has provided the T3324 value IE during the last attach or routing area updating procedure with a value different from "deactivated".

…

Periodic routing area updating is used to periodically notify the availability of the MS to the network. The value of the update type IE in the ROUTING AREA UPDATE REQUEST message shall indicate "periodic updating". The procedure is controlled in the MS by timer T3312. When timer T3312 expires, the periodic routing area updating procedure is started. Start and reset of timer T3312 is described in subclause 4.7.2.2.

The normal routing area updating procedure is initiated:

- when the MS detects a change of the routing area in state GMM-REGISTERED;
- when the MS determines that GPRS resumption shall be performed;
- when the MS needs to update the network with the new MS Radio Access Capability IE;
- when the MS needs to update the network with the new DRX parameter IE;
- in Iu mode, to re-synchronize the PMM mode of MS and network after RRC connection release with cause "Directed signalling connection re-establishment", see subclause 4.7.2.5;
- in Iu mode, to re-synchronize the PMM mode of MS and network after inter-system change not due to PS handover from PMM-CONNECTED mode in Iu mode to A/Gb mode or S1 mode, if the MS performs an inter - system change back to Iu mode without sending a ROUTING AREA UPDATE REQUEST message while in A/Gb mode or a TRACKING AREA UPDATE REQUEST message while in S1 mode;
- in Iu mode and A/Gb mode, after intersystem change from S1 mode, and the GMM receives an indication of "RRC connection failure" from lower layers due to lower layer failure while in S1 mode. In this case, if the TIN indicates "RAT-related TMSI", the MS shall set the TIN to "GUTI" before initiating the routing area updating procedure;
- in A/Gb mode, after intersystem change from S1 mode if the TIN indicates "RAT-related TMSI", but the MS is required to perform routing area updating for IMS voice termination as specified in annex P.4;
- when the MS enters GMM-REGISTERED.NORMAL-SERVICE and the TIN indicates "GUTI";

- when the MS has selected a CSG cell whose CSG identity and associated PLMN identity are not included in the Allowed CSG list; or in the Operator CSG list;
- when the MS supports SRVCC and changes the mobile station classmark 2, mobile station classmark 3 or the supported codecs;
- when the MS changes the MS network capability information;
- when the UE's usage setting or the voice domain preference for E-UTRAN change in the MS;
- when the MS activates mobility management for IMS voice termination as specified in annex P.2 and the TIN indicates "RAT-related TMSI";
- upon reception of a paging indication, using P-TMSI, even if the timer T3346 is running and the MS is in state GMM-REGISTERED.ATTEMPTING-TO-UPDATE;
- in A/Gb mode, after intersystem change from S1 mode via cell change order procedure not due to CS fallback, if the TIN indicates "RAT-related TMSI"; in this case the MS shall set the TIN to "GUTI" before initiating the routing area updating procedure;
- in A/Gb mode, after Inter RAT handover from S1 mode or Iu mode;
- when the UE needs to request the use of PSM or needs to stop the use of PSM; or
- when a change in the PSM usage conditions at the MS requires a different timer T3312 value or different timer T3324 value.

NOTE: A change in the PSM usage conditions at the MS can include e.g. a change in the MS configuration, a change in requirements from upper layers or the battery running low at the MS.

…

If the MS supports PSM and requests the use of PSM, the MS shall include the T3324 value IE with a requested timer value in the ROUTING AREA UPDATE REQUEST message. When the MS includes the T3324 value IE and the MS indicates support for extended periodic timer value in the MS network feature support IE, it may also include the T3312 extended value IE to request a particular T3312 value to be allocated.

Reference(s):

3GPP TS 24.008 clause 4.7.2.8, 4.7.2.9, 4.7.5.1

44.2.3.1.1b.2 Test purpose

1) To verify that the MS indicates PSM by providing a T3324 value IE during the RAU procedure
2) To verify that the MS accepts the value for timer T3324 provided by the network
3) To verify that the MS, upon expiry of the timer T3324 deactivate the AS layer and activate PSM by entering the state GMM-REGISTERED.NO-CELL-AVAILABLE
4) To verify that the MS can deactivate PSM.

44.2.3.1.1b.3 Method of test

Initial conditions

System Simulator:

Two cell, cell A in MCC1/MNC1/LAC1/RAC1, operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).

- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends a ROUTING AREA UPDATE REQUEST message indicating activation of Power Save Mode by including the T3324 timer set to 2 minutes. The SS acknowledge the PSM request by including the T3324 timer set to 2 minutes in the ROUTING AREA UPDATE ACCEPT message.
2) When timer T3324 expires the MS enters state GMM-REGISTERED.NO-CELL-AVAILABLE. The SS sends a PAGING TYPE1 message that is not acknowledged by the MS.
3) The MS deactivates PSM by sending a ROUTING AREA UPDATE REQUEST message indicating a new value of the T3324 timer set to “deactivated”. The SS acknowledge the new timer value by including the T3324 timer set to “deactivated” in the ROUTING AREA UPDATE ACCEPT message.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 23
2	MS		The MS is powered up or switched on and initiates an attach (see PICS)
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		The MS requests PSM by MMI or by AT command.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' Old P-TMSI signature=P-TMSI-2 signature Old Routing area identity T3324 value = any value
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' No new mobile identity assigned. P-TMSI not included. Routing area identity = RAI-1 T3324 value = 1 minute
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10			When the T3324 timer expires the following message is sent.
11	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
12	MS		No response from the MS to the request. This is checked for 10 s.
13	MS		The MS requests to deactivate PSM by requesting to use a new value for timer T3324. This can be initiated by MMI or AT command.
14	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' Old P-TMSI signature=P-TMSI-2 signature Old Routing area identity = RAI-1 T3324 value = “deactivated”
15	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' Routing area identity = RAI-1 T3324 value = “deactivated”
16	MS -> SS	ROUTING AREA UPDATING COMPLETE	
17	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
18	MS -> SS SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response. Wait 2 minutes before executing step 19.
19	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment.
20	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response.
21	MS		The MS is switched off or power is removed (see PICS).
22	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
23	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 22.

Specific message contents

44.2.3.1.2 Routing area updating / rejected / IMSI invalid / illegal ME

44.2.3.1.2.1 Conformance requirement

1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Illegal ME'.

44.2.3.1.2.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a routing area updating with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		Cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' Routing area identity = RAI-1
9	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Illegal ME'
10	SS -> MS		SS page MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		No response from the MS to the request. This is checked for 10 s.
			The following messages are sent and shall be received on cell C.
12	SS		The SS deactivates both cell A and cell B. The SS activates cell C.
13	MS		Cell C is preferred by the MS.
14	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
15	MS		If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed.
16	MS		The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS). Step 17 is only performed by MS in operation mode B
17		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
18	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
19	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2
20	MS -> SS	ATTACH COMPLETE	
21	MS		The MS is switched off or power is removed (see PICS).
22	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.1.3 Routing area updating / rejected / MS identity cannot be derived by the network

44.2.3.1.3.1 Conformance requirement

If the network rejects a routing area updating procedure from the Mobile Station with the cause 'MS identity cannot be derived by the network', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Depending on the manufacturer the MS may or may not perform a GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'MS identity cannot be derived by the network'.

44.2.3.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Automatic attach procedure when MS identity cannot be derived by the network (TSPC_AddInfo_auto_AP_no_MS ID).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal routing area updating with the cause value 'MS identity cannot be derived by the network'. The MS detach locally. A new GPRS attach may be performed.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C or B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity =P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
8	MS		Cell B is preferred by the MS.
9	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
10	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'MS identity cannot be derived by the network'
11	MS		If an automatic attach procedure by the MS is not possible when the MS identity cannot be derived by the network (see PICS) goto step 19.
12	MS		An Automatic GPRS attach procedure is initiated (see PICS).
13	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
14	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
15	MS -> SS	ATTACH COMPLETE	
16	MS		The MS is switched off or power is removed (see PICS).
17	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
18			Stop the sequence
19	SS -> MS		SS page MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
20	MS		No response from the MS to the request, as the MS has detached locally. This is checked for 10 s.

Specific message contents

None.

44.2.3.1.4 Routing area updating / rejected / location area not allowed

44.2.3.1.4.1 Conformance requirement

1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

1.1 not perform GPRS attach when in the same location area;

1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;

1.3 store the LA in the 'forbidden location areas for regional provision of service'.

2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

2.1 perform GPRS attach when a new location area is entered;

2.2 delete the list of forbidden LAs after switch off (power off).

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.5.1.

44.2.3.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.3.1.4.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell C.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a routing area updating with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell C.
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 42.
2	SS		The SS activates cell C.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell C is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-3
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		The SS deactivates cell C and activates cell B.
8	SS		Cell B is preferred by the MS.
9			The following step is only performed for MS Operation Mode B.
10		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
11	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-3
12	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Location Area not allowed'
13	SS -> MS		SS pages MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
14	MS		No response from the MS to the request. This is checked for 10 s.
15			The following messages are sent and shall be received on cell A.
16	SS		The SS deactivates cell B and activates cell A.
17	MS		Cell A is preferred by the MS.
18	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds)
19			The following messages are sent and shall be received on cell C.
20	SS		The SS deactivates cell A and activates cell C.
21	MS		Cell C is preferred by the MS.
22			The following step is only performed for MS Operation Mode B.
23		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
	MS		The MS initiates a GPRS attach either automatically or manually (see PICS).
24	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
25	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-3
26	MS -> SS	ATTACH COMPLETE	
			If SIM removal is possible (see PICS), perform steps 27A, 28A-1, 28A-2. Otherwise if switch off is possible (see PICS) perform steps 27B, 28B. Otherwise perform step 27C.
27A	MS		SIM removal is performed.

Step	Direction	Message	Comments
28A-1	MS -> SS	DETACH REQUEST	Detach type = Normal Detach, 'GPRS detach' or 'power switched off, GPRS detach' If Detach Type is 'power switched off, GPRS detach' go to step 29
28A-2 (conditional)	SS -> MS	DETACH ACCEPT	
27B	MS		Switch off is performed.
28B	MS -> SS	DETACH REQUEST	Detach type = 'power switched off, GPRS detach'
27C	MS		Power is removed.
29	MS		The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS).
30	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-3
31	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-3
32	MS -> SS	ATTACH COMPLETE	
33	SS		The following messages are sent and shall be received on cell A.
34			The SS deactivates cell C and activates cell A.
35			Cell A is preferred by the MS.
36			The following step is only performed for MS Operation Mode B.
37		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
38	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-3
39	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Update result = 'RA updated' Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set
40	MS		The MS is switched off or power is removed (see PICS).
41	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
42	MS		The MS is set in MS operation mode B (see PICS), cell A is switched off and the test is repeated from step 2 to step 41.

Specific message contents

None.

44.2.3.1.5 Routing area updating / abnormal cases / attempt counter check / miscellaneous reject causes

44.2.3.1.5.1 Conformance requirement

1) When a routing area updating procedure is rejected with the routing area updating attempt counter less than five, the Mobile Station shall repeat the routing area updating procedure after T3311 timeout.

2) When a routing area updating procedure is rejected with the routing area updating attempt counter five, the Mobile Station shall start timer T3302.

3) When the T3302 expires, a new routing area updating procedure shall be initiated.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.5.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

44.2.3.1.5.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2. T3302 is set to 12 minutes. The ATT-flag shall indicate that the MS should use IMSI attach/detach procedures.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS has a valid IMSI and is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter two) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter three) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter four) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented but T3311 is not started, as the routing area updating attempt counter is five. T3302 is started.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4			The following step is only performed for MS Operation Mode B.
5		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Location updating type = "IMSI Attach". Parameter mobile identity is IMSI. T3212 is started at the end of the procedure.
6	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
7	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included. Force to standby indicator set
8			The following messages are sent and shall be received on cell B.
9	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
10	SS		Cell B is preferred by the MS.
11	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
12	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion'
13	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
14	SS		The SS verifies that the time between the routing area update reject and the routing area update request is T3311 (+/- 10%)
15	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion'
16	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
17	SS		The SS verifies that the time between the previous routing area update reject and the previous routing area update request is T3311 (+/- 10%)
18	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion'
19	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
20	SS		The SS verifies that the time between the previous routing area update reject and the previous routing area update request is T3311 (+/- 10%)
21	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion'

Step	Direction	Message	Comments
22	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
23	SS		The SS verifies that the time between the previous routing area update reject and the previous routing area update request is T3311 (+/- 10%)
24	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion'
25	SS		The SS verifies that the MS does not attempt to initiate a RAU procedure for T3302 (+/- 10%).
26			The following step is only performed for MS Operation Mode B.
27		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS when T3212 expires. Location updating type Periodic Updating". Parameter mobile identity is IMSI.
28	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
29	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-3 signature Routing area identity = RAI-4
30	MS -> SS	ROUTING AREA UPDATE COMPLETE	
31	MS		The MS is switched off or power is removed (see PICS).
32	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' An IMSI Detach must be performed for an MS in Operation Mode B either before or after the GPRS Detach. If an IMSI Detach is performed before the GPRS Detach then the following also applies: - The MS performs a GPRS Suspension Procedure in order to send the IMSI Detach while still attached for GPRS Services. - The SS must include the Resumption IE in the subsequent Channel Release to allow resumption of the GMM context so GPRS Detach can be performed

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A):

Information element	Value/remark
As default message contents except:	
Control Channel Description T3212 timeout value	12 min

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT and ROUTING AREA UPDATE REJECT:

Information Element	Value/remark
As default message contents except: T3302 value	12 min

Note: This IE is only read by MS's supporting R99 and onwards.

44.2.3.1.6 Routing area updating / abnormal cases / change of cell into new routing area

44.2.3.1.6.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.6.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.6.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2 and cell C In MCC1/MNC1/LAC1/RAC3.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The MS shall re-initiate a routing area updating procedure in the new routing area.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18.
2	SS		The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
7			Wait 30 sec to let the MS identify the neighbour cells B and C.
			The following messages are sent and shall be received on cell B.
8	SS		The RF level of cell A is lowered to –100 dBm.
9	SS		Cell B is preferred by the MS.
10	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
11	SS		No response to the ROUTING AREA UPDATING REQUEST message is given by the SS
			The following messages are sent and shall be received on cell C.
12	SS		The RF level of cell B is lowered to –100 dBm.
			The following message may be sent and shall be received on cell B.
13 Optional step	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
14	SS		Cell C is preferred by the MS.
15	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
16	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-3 signature Routing area identity = RAI-5
17	MS -> SS	ROUTING AREA UPDATE COMPLETE	
18	MS		The MS is switched off or power is removed (see PICS).
19	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
20	MS		The MS is set in MS operation mode B (see PICS), and the test is repeated from step 2 to step 19.

Specific message contents

None.

44.2.3.1.7 Routing area updating / abnormal cases / change of cell during routing area updating procedure

44.2.3.1.7.1 Conformance requirement

When a change of cell within a new routing area is performed before the routing area updating procedure is finished, the MS shall perform the cell update before the routing area updating procedure is finished.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.7.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.7.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2 and cell C in MCC1/MNC1/LAC1/RAC2.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update within the routing area. The MS then waits for the ROUTING AREA UPDATE ACCEPT message.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach result = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI-1 included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
7			Wait 30 sec to let the MS identify the neighbour cells B and C.
			The following messages are sent and shall be received on cell B.
8	SS		The RF level of cell A is lowered to –100 dBm.
9	SS		Cell B is preferred by the MS.
10	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
11	SS		No response to the ROUTING AREA UPDATE REQUEST message is given by the SS
			The following messages are sent and shall be received on cell C.
12	SS		The RF level of cell B is lowered to –100 dBm. The following message may be sent and shall be received on cell B.
13 Optional step	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
14	SS		Cell C is preferred by the MS.
15	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating cell update.
16 Optional step	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1
17	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-3 signature Routing area identity = RAI-4
18	MS -> SS	ROUTING AREA UPDATE COMPLETE	
19	MS		The MS is switched off or power is removed (see PICS).
20	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.1.8 Routing area updating / abnormal cases / P-TMSI reallocation procedure collision

44.2.3.1.8.1 Conformance requirement

When a P-TMSI REALLOCATION COMMAND message is received by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.8.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a P-TMSI reallocation procedure. The MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	MS		The MS is set in MS operation mode C or B (see PICS).
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
4	MS -> SS	ATTACH REQUEST	Attach result = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
8	SS		Cell B is preferred by the MS.
9	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-1
10	SS -> MS	P-TMSI REALLOCATION COMMAND	Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
11	MS		The MS ignores the P-TMSI reallocation command.
12	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4
13	MS -> SS	ROUTING AREA UPDATE COMPLETE	
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.1.9 Routing area updating / abnormal cases / Network reject with Extended Wait Timer

44.2.3.1.9.1 Conformance requirement

#22 (Congestion);

If the T3346 value IE is present in the ROUTING AREA UPDATE REJECT message and the value indicates that this timer is neither zero nor deactivated, the MS shall proceed as described below, otherwise it shall be considered as an abnormal case and the behaviour of the MS for this case is specified in subclause 4.7.5.1.5.

The MS shall abort the routing area updating procedure, reset the routing area updating attempt counter and set the GPRS update status to GU2 NOT UPDATED. If the rejected request was not for initiating a PDN connection for emergency bearer services, the MS shall change to state GMM-REGISTERED.ATTEMPTING-TO-UPDATE.

The MS shall stop timer T3346 if it is running.

If the ROUTING AREA UPDATE REJECT message is integrity protected, the MS shall start timer T3346 with the value provided in the T3346 value IE.

If the ROUTING AREA UPDATE REJECT message is not integrity protected, the MS shall start timer T3346 with a random value from the default range specified in table 11.3a.

The MS stays in the current serving cell and applies the normal cell reselection process. The routing area updating procedure is started, if still necessary, when timer T3346 expires or is stopped.

If the update type is "periodic updating", a GPRS MS operating in MS operation mode A or B in network operation mode I is still IMSI attached for CS services in the network.

If S1 mode is supported in the MS, the MS shall handle the EMM parameters EMM state, EPS update status, and tracking area updating attempt counter as specified in 3GPP TS 24.301 [120] for the case when the tracking area update procedure is rejected with the EMM cause with the same value.

An MS configured for NAS signalling low priority indicates this by including the Device properties IE in the appropriate NAS message and setting the low priority indicator to "MS is configured to NAS signalling low priority

"Extended wait time" for PS domain from the lower layers

If the ROUTING AREA UPDATE REQUEST message contained the low priority indicator set to "MS is configured for NAS signalling low priority", the MS shall start timer T3346 with the "Extended wait time" value.

Timer T3346 is running

The MS shall not start the routing area updating procedure unless:

- the READY timer is running (A/Gb mode);
- the MS is accessing the network with access class 11 – 15; or
- the MS is in PMM-CONNECTED mode (Iu mode);
- the MS receives a paging;
- the MS has a PDN connection for emergency bearer services established; or
- the MS is establishing a PDN connection for emergency bearer services; or
- the MS has a PDN connection established without the NAS signalling low priority indication or is establishing a PDN connection without the NAS signalling low priority indication and if the timer T3346 was started due to a NAS request message (ATTACH REQUEST, ROUTING AREA UPDATE REQUEST or SERVICE REQUEST) which contained the low priority indicator set to "MS is configured for NAS signalling low priority". The MS stays in the current serving cell and applies the normal cell reselection process.

The routing area updating procedure is started, if still necessary, when timer T3346 expires or is stopped.

NOTE 2: It is considered an abnormal case if the MS needs to initiate an routing area updating procedure while timer T3346 is running independent on whether timer T3346 was started due to an abnormal case or a non successful case.

Reference(s):

3GPP TS 24.008 clause 1.8, 3GPP TS 24.008 clauses 4.7.5.1.4, 4.7.5.1.5

44.2.3.1.9.2 Test purpose

1. To verify that the LAP indicator can be set in the UE
2. To verify that the Delay Tolerant indicator is sent by the UE
3. To verify that the UE uses the back-off timer if the network reject a request with the Extended Wait Timer

44.2.3.1.9.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

The MS is configured for “low access priority”

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal routing area updating with the cause value 'Congestion'. The SS includes the T3346 timer in the reject message. The SS checks that the MS does not perform new Routing Area Updating before the timer T3346 has expired.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 17.
2	SS		The SS activates cell A.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.
			Step 4 is only performed for MS Operation Mode B.
4		{Location Update Procedure}	Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS.
5	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity =P-TMSI-1 Routing area identity = RAI-1
6	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
7	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
8	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
9	MS		Cell B is preferred by the MS.
10	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Device properties = ‘MS is configured for NAS signalling low priority’
11	SS -> MS	ROUTING AREA UPDATE REJECT	GMM cause = 'Congestion' T3346 value = 2 minutes
12	SS		The SS verifies that the MS does not initiate the routing area update procedure before timer T3346 has expired
			Step 13 is only performed for MS Operation Mode B.
13		{Location Update Procedure}	Macro. MOBILE_IDENTITY set to TMSI. Location Update Procedure initiated from the MS.
14	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Device properties = ‘MS is configured for NAS signalling low priority’
15	SS -> MS	ROUTING AREA UPDATE ACCEPT	No new mobile identity assigned. P-TMSI-1 and P-TMSI-1 signature not included. Update result = 'RA updated' Routing area identity = RAI-2
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
17	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 16.

Specific message contents

None.

44.2.3.1.10 Routing area updating / eDRX

44.2.3.1.10.1 Conformance requirement

1) If the MS supports eDRX and requests the use of eDRX, the MS shall include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

2) The MS shall use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.1.

44.2.3.1.10.2 Test purpose

To verify that a MS that supports eDRX and requests the use of eDRX will include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

To verify that a MS that supports eDRX and requests the use of eDRX will use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

44.2.3.1.10.3 Method of test

Initial conditions

System Simulator:

- Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.
- Both cells are operating in network operation mode II.
- Both cells support eDRX.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated on cell A.
- The MS is configured to use eDRX.
- The MS is configured to use a specific value of extended DRX cycle.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a ROUTING AREA UPDATE REQUEST message including the extended DRX parameters IE. The SS accepts the request to use eDRX and returns ROUTING AREA UPDATE ACCEPT message with the extended DRX parameters IE. The MS shall use extended idle mode DRX cycle that the network has provided during the last routing area updating procedure.

Maximum duration of test

6 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A but not cell B.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 18.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
6	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
7	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-1 Extended DRX parameters IE included.
9	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 extended DRX value: 0111 (195.84 seconds)
10	MS -> SS	ROUTING AREA UPDATING COMPLETE	
11	SS		Waits for 1 minute for Ready Timer to expire.
12	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
13			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315.
14	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle.
15			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
16	MS		The MS is switched off or power is removed (see PICS).
17	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
18	MS		The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 3 to step 17.

Specific message contents

None.

44.2.3.1.11 Routing area updating / eDRX / Usage condition change

44.2.3.1.11.1 Conformance requirement

1) If a change in the eDRX usage conditions at the MS requires eDRX activation or deactivation, or a change of different extended DRX parameters, the MS shall initiate the routing area updating procedure and include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

2) The MS shall use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.

44.2.3.1.11.2 Test purpose

To verify that a MS shall initiate the routing area updating procedure and include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message if there is a change of eDRX usage conditions.

To verify that a MS that supports eDRX and requests the use of eDRX will use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

44.2.3.1.11.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.
- The cell supports eDRX.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated on cell A.
- The MS is configured to deactivate eDRX.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS is configured to activate eDRX, then a ROUTING AREA UPDATE REQUEST message including the extended DRX parameters IE is sent by the MS. The SS accepts the request of activate the eDRX and returns ROUTING AREA UPDATE ACCEPT message with an extended DRX value. The MS shall use the extended idle mode DRX cycle that the network has provided during the last routing area updating procedure.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 17.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Routing area identity = RAI-1 Mobile identity = P-TMSI-1 P-TMSI-1 signature Extended DRX parameters IE not included.
5	MS -> SS	ATTACH COMPLETE	
6	MS		MS is configured to activate the eDRX via AT command or MMI.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' Routing area identity = RAI-1 P-TMSI-1 signature Extended DRX parameters IE included.
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 extended DRX value: 0111 (195.84 seconds)
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10	SS		Wait for 1 minute for Ready Timer to expire.
11	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
12			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315.
13	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle (195.84 s).
14			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
17	MS		The MS is set in MS operation mode B (see PICS), the test is repeated from step 2 to step 16.

Specific message contents

None.

44.2.3.2 Combined routing area updating

The combined routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode A or B that are IMSI attached for GPRS and non-GPRS services. In order to use the combined routing area updating procedure, the network must operate in network operation mode I.

44.2.3.2.1 Combined routing area updating / combined RA/LA accepted

44.2.3.2.1.1 Conformance requirement

1) If the network accepts the combined routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.

2) If the network accepts the combined routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the combined routing area updating procedure.

The following cases are identified:

1) P-TMSI / P-TMSI signature is reallocated;

2) Old P-TMSI / P-TMSI signature is not changed;

3) Mobile terminating CS call is allowed with IMSI;

4) Mobile terminating CS call is allowed with TMSI.

44.2.3.2.1.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) A combined GPRS attach procedure is performed. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI, unassigns the TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI and IMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.

2) The MS is CS paged in order to verify that the IMSI is used for CS calls.

3) The MS sends an ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI signature and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI and with a new TMSI. The MS acknowledge the new TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS-SS is performed by the old P-TMSI. For CS calls, the new TMSI is used.

4) The MS is CS paged in order to verify that the TMSI is used for CS calls.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-4
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10	SS->MS	GMM INFORMATION	Message sent with P-TMSI-1
10b Optional	MS->SS	GMM STATUS	Message sent in case the MS does not support reception of GMM information message. Cause #97
11	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
12	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
13	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
14	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity IMSI.
15	SS		SS releases the RR connection indicating a successful resumption of GPRS services.

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
16	SS		The RF level of cell A is increased and the RF level of cell B is lowered until cell A is preferred by the MS.
17	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-1 signature Routing area identity = RAI-4 TMSI status = no valid TMSI available
18	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' No P-TMSI Mobile identity = TMSI-1 Routing area identity = RAI-1
19	MS -> SS	ROUTING AREA UPDATING COMPLETE	
20	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
21	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
22	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
23	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
24	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
25	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
26	MS		No response from the MS to the request. This is checked for 10 s.
27	MS		The MS is switched off or power is removed (see PICS).
28	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.3.2.2 Combined routing area updating / MS in CS operation at change of RA

44.2.3.2.2.1 Conformance requirement

GPRS MS that is in an ongoing CS transaction at change of routing area shall initiate the routing area updating procedure only after the CS transaction has been released.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.2.2 Test purpose

To test the behaviour of the MS when using the combined routing area updating procedure in cases where the MS is CS connected at change of RA.

44.2.3.2.2.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A combined GPRS attach procedure is performed. The MS initiates a CS call. The routing area change. MS will not send a ROUTING AREA UPDATE REQUEST message until the CS operation is terminated.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	MS		A CS call is initiated.
7	SS		Activate cell B with the same signal strength as cell A.
8	SS -> MS		Handover commanded by SS on to DCCH of cell B The following messages are sent and shall be received on cell B.
9	MS		No RA updating procedure is initiated. This is checked for 60 seconds.
10	MS		The CS call is terminated
11	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating ~~with IMSI attach'~~ P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
12	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-4
13	MS -> SS	ROUTING AREA UPDATING COMPLETE	
14	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
15	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
16	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
17	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity IMSI.
18	SS		SS releases the RR connection.
19	MS		The MS is switched off or power is removed (see PICS).
20	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.3.2.3 Combined routing area updating / RA only accepted

44.2.3.2.3.1 Conformance requirement

1) If the network accepts the combined routing area updating procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.

2) If the network accepts the combined routing area updating procedure, but GMM cause code 'MSC temporarily not reachable', or 'Network failure' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.3.2 Test Purpose

Test purpose 1

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'IMSI unknown in HLR'.

Test purpose 2

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'MSC temporarily not reachable', or 'Network failure'.

44.2.3.2.3.3 Method of test

44.2.3.2.3.3.1 Test Procedure 1

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message. The SS allocates a P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 GMM cause = 'IMSI unknown in HLR'
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
12	SS -> MS		SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell.
13	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.2.3.3.2 Test Procedure 2

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I. T3212 is set to 6 minutes.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic MM IMSI attach procedure at switch-on/power-on (TSPC_AddInfo_auto_MM_IMSI_AP_on_off).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message . The SS allocates a new P-TMSI signature and returns ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. This procedure is repeated until the routing area updating attempt counter is equal to five. An MS operation mode B MS may perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity. It is further verified that the MS after a successful IMSI attach procedure can perform CS services.

Maximum duration of test

10 minutes.

Expected sequence

Dependent whether the option Automatic MM IMSI attach procedure at switch-on/power-on ' is supported or not, the steps 1-28 or 29-62 apply depending on manufacturer (see PICS).

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A
1	MS		The MS is set in MS operation mode B and no automatic MM IMSI attach procedure is indicated (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen)
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10			The routing area updating attempt counter =1. The combined routing area updating procedure is reinitialized at the expiry of T3311

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A) in Test Procedure 2:

Information element	Value/remark
As default message contents except:	
Control Channel Description T3212 timeout value	 6 min

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT in Test Procedure 2:

Information Element	Value/remark
As default message contents except: T3302 value	 6 min

Note: This IE is only read by MS's supporting R99 and onwards.

44.2.3.2.3a Combined routing area updating / PSM

44.2.3.2.3a.1 Conformance requirement

MS supporting PSM may request the network to assign a value for timer T3324 by including a requested IE value in ROUTING AREA UPDATE REQUEST message.

The MS may use PSM only if the network has provided the T3324 value IE during the routing area updating procedure with a value different from "deactivated".

Upon expiry of the timer T3324 or if the T3324 value provided by the network is zero, the MS may deactivate the AS layer and activate PSM by entering the state GMM-REGISTERED.NO-CELL-AVAILABLE:

Reference(s):

3GPP TS 24.008 subclause 4.7.2.8, 4.7.2.9 and 4.7.5.2.

44.2.3.2.3a.2 Test Purpose

1. To test the behaviour of MS if the MS supports PSM by providing a T3324 value IE during the RAU procedure.

2. To test the behaviour of MS if the network provides a value of timer T3324.

3. To test the behaviour of MS upon the expiry of timer T3324.

44.2.3.2.3a.3 Method of test

Initial conditions

System Simulator:

- Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.
- Both cells operating in network operation mode I.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated on cell A.
- The MS is configured to use Power Saving Mode.
- The MS is configured to use a specific value of T3324.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

After attach the MS sends a ROUTING AREA UPDATE REQUEST message including the T3324 value IE. The SS allocates a P-TMSI and returns ROUTING AREA UPDATE ACCEPT message providing a value for timer T3324. Upon expiry of the timer T3324, the MS deactivate the AS layer and activate PSM by entering the state GMM-REGISTERED.NO-CELL-AVAILABLE.

Maximum duration of test

8 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B or A (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 T3324 value IE included
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 T3324 value is set to 6 minutes
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
11	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. This is checked during 3 seconds.
12	SS		SS waits for 6 minutes until the timer T3324 time out.
13	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 or IMSI and paging order for RR connection according to the channel combination of the cell.
14	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
15	MS		The MS is switched off or power is removed (see PICS).

Specific message contents

Contents of ROUTING AREA UPDATING ACCEPT message:

Protocol discriminator	1000 (MM message for GPRS service)
Skip indicator	0000
T3324 value	0010 0110 (6 minutes)

44.2.3.2.4 Combined routing area updating / rejected / PLMN not allowed

44.2.3.2.4.1 Conformance requirement

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:

1.1. not perform combined GPRA attach when switched on in the same location area or PLMN;

1.2. delete the stored RAI, GPRS-CKSN, P-TMSI, P-TMSI signature, TMSI CKSN and LAI;

1.3. store the PLMN in the 'forbidden PLMN list'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined routing area updating procedure of the MS with the cause 'PLMN not allowed'.

44.2.3.2.4.3 Method of test

Initial conditions

System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC2, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

All four cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test Procedure

The SS rejects a combined routing area updating with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same PLMN. The SS checks that the MS does not perform IMSI attach if activated in the same PLMN.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS.
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-8 Mobile identity = TMSI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		Cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-8
9	SS -> MS	ROUTING AREA UPDATING REJECT	GMM cause = 'PLMN not allowed'
10	MS		The MS initiates an attach by MMI or AT command.
11	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
12	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
13	MS		No response from the MS to the request. This is checked for 10 s.
			The following messages are sent and shall be received on cell C.
14	SS		The SS deactivates cell B and activates cell C.
15	MS		Cell C is preferred by the MS.
16	MS		The MS initiates an attach by MMI or by AT command.
17	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
18	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
19	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
			The following messages are sent and shall be received on cell A.
20	SS		The SS deactivates cell C and activates cell A.
21	MS		Cell A is preferred by the MS.
22	MS		The MS initiates an attach by MMI or by AT command.
23	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
24	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
25	MS		No response from the MS to the request. This is checked for 10 s.

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell D.
26	SS		The SS deactivates cell A and activates cell D.
27	MS		Cell D is preferred by the MS.
			Steps 28 and 29 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS)
28 (conditional)		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS.
29 (conditional)	MS		MS initiates an attach via MMI or AT commands.
30	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
31	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 Mobile identity = IMSI
32	MS -> SS	ATTACH COMPLETE	
33	MS		The MS is switched off or power is removed (see PICS).
34	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.3.2.5 Combined routing area updating / rejected / roaming not allowed in this location area

44.2.3.2.5.1 Conformance requirement

For a R97 and R98 MS only:

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station:

   1.1 shall not perform combined GPRS attach when in the same location area;

   1.2 shall delete the stored RAI, GPRS-CKSN, P-TMSI P-TMSI signature, TMSI, CKSN and LAI;

   1.3 shall store the LA in the 'forbidden location areas for roaming';

   1.4 may perform combined GPRS attach when a new location area is entered.

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

For a R99 or later MS only:

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station:

   1.1 shall not perform combined GPRS attach when in the same location area;

   1.2 shall store the LA in the 'forbidden location areas for roaming';

1.3 shall perform a routing area update when entering in a new location area if the LAI or the PLMN identity is not contained in any of the lists "forbidden LAs for roaming", "forbidden LAs for regional provision of service", "forbidden PLMNs for GPRS service" or "forbidden PLMNs" and the current update status is different from "IDLE NO IMSI".

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

Additional references for R99 or after MS only, TS 23.122 subclause 4.5.2.

44.2.3.2.5.2 Test purpose

Test purpose 1

To test that on receipt of a rejection using the 'Roaming not allowed in this area' cause code, the MS ceases trying a routing area updating procedure on that location area. Successful combined routing area updating procedure is possible in other location areas.

Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

44.2.3.2.5.3 Method of test

44.2.3.2.5.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1 (RAI-2), cell B in MCC2/MNC1/LAC2/RAC1 (RAI-6).

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).
- MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. A new attempt for a combined GPRS attach is not possible.

For a R97 and R98 MS only, successful combined GPRS attach procedure is performed in another location area.

For a R99 or after MS only, successful combined routing area updating procedure is performed in another location area.

The MS is moved back to the 1st location area. A combined routing area updating shall not be performed, as the LA is on the forbidden list.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS.
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 Mobile identity = TMSI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		Cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-2 The RF level of cell A is lowered until cell A is no more suitable.
9	SS -> MS	ROUTING AREA UPDATING REJECT	GMM cause = 'Roaming not allowed in this area'
10	MS		The MS initiates an attach by MMI or by AT command. This step is only performed for a R97 and R98 mobile.
11	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds). This step is only performed for a R97 and R98 mobile.
12	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
13	MS		No response from the MS to the request. This is checked for 10 s.
14	SS -> MS		SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell.
15	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
			The following messages are sent and shall be received on cell A.
16	SS		The RF level of cell A is increased and the RF level of cell B is lowered until cell A is preferred by the MS.
17	MS		Cell A is preferred by the MS.
18 (optional)		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS. Step 19 is performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS).
A19 (conditional)	MS		MS initiates an attach via MMI or AT commands. This step is only performed for a R97 and R98 mobile.

Step	Direction	Message	Comments
A20	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available (See note)
A21	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 Mobile identity = TMSI-1
A22	MS -> SS	ATTACH COMPLETE	
B20	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' or 'Combined RA/LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-2 (See note)
B21	SS -> MS	ROUTING AREA UPDATE ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 Mobile identity = TMSI-1
B22	MS -> SS	ROUTING AREA UPDATE COMPLETE	
23	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
24	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
25	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
26	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
27	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
			The following messages are sent and shall be received on cell B.
28	SS		The RF level of cell B is increased and the RF level of cell A is lowered until cell B is preferred by the MS.
29	MS		No ROUTING AREA UPDATING REQUEST sent to SS (SS waits 30 seconds).
30	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
31	MS		No response from the MS to the request. This is checked for 10 s.
NOTE: An R97 and R98 MS follows the steps in the order specified as A. An R99 or later MS follows the steps in the order specified as B.			

Specific message contents

None.

44.2.3.2.5.3.2 Test procedure 2

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1, cell B in MCC2/MNC1/LAC2/RAC1.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE).

PIXIT statements:

-

Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS checks that a combined GPRS attach is possible on the cell on which the previous combined routing area updating had been rejected.

For a R97 and R98 MS only, the Mobile identity is IMSI for the combined GPRS attach.

For a R99 or after MS only, the Mobile identity is either IMSI or P-TMSI for the combined GPRS attach.

If SIM removal is possible without switching off: The SS rejects a routing area updating with the cause value 'Roaming not allowed in this area'. The SIM is removed and inserted in the MS. The SS checks that a GPRS attach procedure and routing area updating procedure is possible on the cell on which the routing area updating had previously been rejected.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS.
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 Mobile identity = TMSI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		Cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-2 The RF level of cell A is lowered until cell A is no more suitable.
9	SS -> MS	ROUTING AREA UPDATING REJECT	GMM cause = 'Roaming not allowed in this area'
10	MS		The MS initiates an attach by MMI or by AT command.
11	MS		No ATTACH REQUEST sent to SS (SS waits 30 seconds).
12	SS -> MS		SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.
13	MS		No response from the MS to the request. This is checked for 10 s.
14	SS -> MS		SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell.
15	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
16	MS		If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed.
17	MS		The MS gets the SIM replaced, is powered up or switched on. Step 18 is only performed for non-auto attach MS.
18		**{Location Update Procedure}**	Macro. Location Update Procedure initiated from the MS.
19	MS		MS initiates an attach automatically (see PICS), via MMI or AT commands.
A20	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available (See note)
B20	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI or P-TMSI (See note)

Step	Direction	Message	Comments
21	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-6 Mobile identity = TMSI-1
22	MS -> SS	ATTACH COMPLETE	
23	SS -> MS		SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell.
24	MS		Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1.
25	SS		SS releases the RR connection indicating a successful resumption of GPRS services.
26	SS -> MS		SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
27	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request.
28	MS		The MS is switched off or power is removed (see PICS).
29	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'
NOTE: An R97 and R98 MS shall perform step A20. An R99 or later MS shall perform step B20.			

Specific message contents

None.

44.2.3.2.6 Combined routing area updating / abnormal cases / access barred due to access class control

44.2.3.2.6.1 Conformance requirement

1) The MS shall not perform combined routing area updating procedure, but stays in the current serving cell and applies normal cell reselection process.

2) The Mobile Station shall perform the combined routing area updating procedure when:

   2.1 Access is granted.

   2.2 Cell is changed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.6.2 Test purpose

Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

44.2.3.2.6.3 Method of test

44.2.3.2.6.3.1 Test procedure 1

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred on Cell B.

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has Access Class x not barred, cell B in MCC1/MNC/LAC1/RAC2 has Access Class x barred.

Both cells are operating in network operation mode I.

Access class x barred.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

The SS indicates that access class x is not barred. A routing area updating procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Mobile identity = IMSI
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		No ROUTING AREA UPDATE REQUEST sent to SS, as access class x is barred (SS waits 30 seconds).
8	SS		The access class x is not barred anymore. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the access class change.
9	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
10	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-4
11	MS -> SS	ROUTING AREA UPDATING COMPLETE	
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

None.

44.2.3.2.6.3.2 Test procedure 2

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell B.

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has access class x not barred, cell B in MCC1/MNC1/LAC1/RAC2 has access class x barred, cell C in MCC1/MNC1/LAC1/RAC2 has access class x not barred.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A routing area updating procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Mobile identity = IMSI
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		No ROUTING AREA UPDATING REQUEST sent to SS, as access class x is barred (SS waits 30 seconds).
			The following messages are sent and shall be received on cell C.
8	SS		Activate cell C with a lower signal strength than cell B. The RF level of cell B is lowered until cell C is preferred by the MS.
9	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
10	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-4
11	MS -> SS	ROUTING AREA UPDATING COMPLETE	
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

None.

44.2.3.2.7 Combined routing area updating / abnormal cases / attempt counter check / procedure timeout

44.2.3.2.7.1 Conformance requirement

1) When a T3330 timeout has occurred during a routing area updating procedure, the Mobile Station shall repeat the routing area updating procedure after T3330 timeout until the procedure is repeated five times.

2) When a routing area updating procedure is repeated five times, the routing area updating attempt counter is incremented and five more routing area updating procedures are performed. This procedure is repeated until the routing area updating attempt counter is five, the Mobile Station shall then start timer T3302.

3) When the T3302 expire, a new routing area updating procedure shall be initiated.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.7.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

44.2.3.2.7.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC/LAC1/RAC2. T3302 is set to 12 minutes.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter two) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter three) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter four) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and as the routing area updating attempt counter is five. T3302 is started.

The MS may perform a Location Update procedure.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

30 minutes.

28	MS -> SS	ROUTING AREA UPDATING COMPLETE	
29	MS		The MS is switched off or power is removed (see PICS).
30	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A):

Information element	Value/remark
As default message contents except:	
Control Channel Description T3212 timeout value	 12 min

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT:

Information Element	Value/remark
As default message contents except: T3302 value	 12 min

Note: This IE is only read by MS's supporting R99 and onwards.

44.2.3.2.8 Combined routing area updating / abnormal cases / change of cell into new routing area

44.2.3.2.8.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.8.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC3.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The Ms shall re-initiate a routing area updating procedure in the new routing area. The MS shall not increment the attempt counter.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS.
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Mobile identity = IMSI
5	MS -> SS	ATTACH COMPLETE	
6			Wait 30 sec to let the MS identify the neighbour cells B and C.
			The following messages are sent and shall be received on cell B.
7	SS		The RF level of cell A is lowered to –100 dBm.
8	MS		Cell B is preferred by the MS.
9	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
10	SS		No response id given from the SS.
			The following messages are sent and shall be received on cell C.
11	MS		The RF level of cell B is lowered to –100 dBm. The following message may be sent and shall be received on cell B.
12 Optional step	MS -> SS	ROUTING AREA UPDATE REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
13	MS		Cell C is preferred by the MS.
14	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
15	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-5
16	MS -> SS	ROUTING AREA UPDATING COMPLETE	
17	MS		The MS is switched off or power is removed (see PICS).
18	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

None.

44.2.3.2.9 Combined routing area updating / abnormal cases / change of cell during routing area updating procedure

44.2.3.2.9.1 Conformance requirement

When a change of cell within new routing area is performed before the routing area updating procedure is finished, the MS shall perform the cell update before the routing area updating procedure is finished.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.9.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC2.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update within the routing area. The MS then waits for the ROUTING AREA UPDATE ACCEPT message.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm.

17	MS -> SS	ROUTING AREA UPDATING COMPLETE	
18	MS		The MS is switched off or power is removed (see PICS).
19	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

None.

44.2.3.2.10 Combined routing area updating / abnormal cases / GPRS detach procedure collision

44.2.3.2.10.1 Conformance requirement

1) When a detach request is received with cause 'GPRS detach' or 'combined GPRS/IMSI detach' by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall terminate the routing area updating procedure and continue with the GPRS detach procedure.

2) When a detach request is received with cause 'IMSI detach' by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall ignore the detach request and continue with the routing area updating procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.10.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.10.3 Method of test

44.2.3.2.10.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a GPRS detach procedure with cause 'GPRS detach' or 'combined GPRS/IMSI detach'. The MS shall terminate the routing area updating procedure and continue with the GPRS detach procedure.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS.

5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS		Cell B is preferred by the MS.
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available
9	SS		The SS ignores the ROUTING AREA UPDATING REQUEST message and initiates a detach procedure.
10	SS -> MS	DETACH REQUEST	Detach type = 'IMSI detach'
11	MS		The MS ignores the DETACH REQUEST message and continue the routing area updating procedure.
12	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-4
13	MS -> SS	ROUTING AREA UPDATING COMPLETE	
14	MS		The MS is switched off or power is removed (see PICS).
15	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach'

Specific message contents

None.

44.2.3.2.11 Combined routing area updating / eDRX

44.2.3.2.11.1 Conformance requirement

1) If the MS supports eDRX and requests the use of eDRX, the MS shall include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

2) The MS shall use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.1.

44.2.3.2.11.2 Test Purpose

To verify that a MS that supports eDRX and requests the use of eDRX will include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

To verify that a MS that supports eDRX and requests the use of eDRX will use extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

44.2.3.2.11.3 Method of test

Initial conditions

System Simulator:

- Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

- Both cells operating in network operation mode I.

- Both cells support eDRX.

Mobile Station:

- The MS has a valid IMSI. MS is Idle Updated on cell A.

- The MS is configured to use eDRX.

- The MS is configured to use a specific value of extended DRX cycle.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).

- MS operation mode A (TSPC_operation_mode_A).

- Switch off on button (TSPC_Feat_OnOff).

- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a combined ROUTING AREA UPDATE REQUEST message including the extended DRX parameters IE. The SS accepts the request to use eDRX and returns ROUTING AREA UPDATE ACCEPT message with the extended DRX parameters IE. The MS shall use the extended idle mode DRX cycle that the network has provided during the last routing area updating procedure.

Maximum duration of test

6 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating' P-TMSI-1 signature Routing area identity = RAI-1 extended DRX parameters IE included
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 extended DRX value: 0111 (195.84 seconds)
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10			Waits for 1 minute for Ready Timer to expire.
11	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
12			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315.
13	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle.
14			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.3 Periodic routing area updating

44.2.3.3.1 Periodic routing area updating / accepted

44.2.3.3.1.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.1.

44.2.3.3.1.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. A routing area updating procedure is performed at T3312 timeout.

T3312; set to 6 minutes.

Maximum duration of test

20 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 11.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes
5	MS -> SS	ATTACH COMPLETE	
6	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1
7	SS		The SS verifies that the time between the attach and the periodic RA updating is Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+/- 10%)
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set
9	MS		The MS is switched off or power is removed (see PICS).
10	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
11	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 10.

Specific message contents

None.

44.2.3.3.2 Periodic routing area updating / accepted / T3312 default value

44.2.3.3.2.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.2.

44.2.3.3.2.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a (combined) GPRS attach procedure (see PICS). The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. After 54 minutes, a periodic routing area updating procedure is initiated by the MS.

T3312; default value 54 minutes.

Maximum duration of test

60 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and initiates an attach (see PICS).
2	MS -> SS	ATTACH REQUEST	Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1

9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type for Class B = 'power switched off, combined GPRS/IMSI detach' Detach type for Class C= 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.3.2a Periodic routing area updating / accepted / per-device value

44.2.3.3.2a.1 Conformance requirement

Periodic routing area updating is used to periodically notify the availability of the MS to the network. The procedure is controlled in the MS by timer T3312. The value of timer T3312 is sent by the network to the MS in the messages ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT. The value of timer T3312 shall be unique within a RA.

The network may include timer T3312 extended value IE in the ATTACH ACCEPT message or ROUTING AREA UPDATE ACCEPT message only if the MS indicates support of the timer T3312 extended value in the MS network feature support IE.

If the network includes the timer T3312 extended value IE in the ATTACH ACCEPT message or ROUTING AREA UPDATE ACCEPT message, the network shall use the timer T3312 extended value IE as the value of timer T3312.

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 24.008 clauses 4.7.2.2 and 4.7.5.1

44.2.3.3.2a.2 Test purpose

To verify that the MS uses the per-device timer value for Periodic Routing Area Update received in an Attach Accept or RAU Accept message

44.2.3.3.2a.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. In the GPRS attach procedure the MS indicates support of the extended timer value. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI, timer T3312 and the extended value of T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. A routing area updating procedure is performed when the extended value of timer T3312 times out.

Maximum duration of test

20 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 11.

44.2.3.3.2b Periodic routing area updating / accepted / PSM / T3312 Extended Value

44.2.3.3.2b.1 Conformance requirement

An MS supporting PSM may request the network to assign a value for timer T3324 by including the IE in ROUTING AREA UPDATE REQUEST message.

The MS may use PSM only if the network has provided the T3324 value IE during the last routing area updating procedure with a value different from "deactivated".

Upon expiry of the timer T3324 or if the T3324 value provided by the network is zero, the MS may deactivate the AS layer and activate PSM by entering the state GMM-REGISTERED.NO-CELL-AVAILABLE.

The network may include timer T3312 extended value IE in the ROUTING AREA UPDATE ACCEPT message if the MS indicates support of the timer T3312 extended value in the MS network feature support IE.

If the network includes the timer T3312 extended value IE in the ROUTING AREA UPDATE ACCEPT message, the network shall use the timer T3312 extended value IE as the value of timer T3312. The MS shall perform a periodic routing area update procedure after a T3312 extended value timeout.

Reference(s):

3GPP TS 24.008 clauses 4.7.2.8, 4.7.2.9 and 4.7.5.1.

44.2.3.3.2b.2 Test purpose

1. To test the behaviour of MS if the MS supports PSM by providing a T3324 value IE during the RAU procedure.

2. To test the behaviour of MS if the network provides a value of timer T3324.

3. To test the behaviour of MS if the MS supports the timer T3312 extended value during the attach procedure.

4. To test the behaviour of MS if the network provides an extended value of timer T3312.

5. To test the behaviour of MS if the extended timer 3312 expires at the MS side.

44.2.3.3.2b.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.

Mobile Station:

- The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.
- The MS is configured to use Power Saving Mode.
- The MS is configured to use a specific value of T3324.
- The MS is configured to use a specific extended value of T3312.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. In the GPRS attach procedure the MS indicates support of the extended timer value. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI, timer T3312 and the extended value of T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message.

When the extended value of timer T3312 times out, the MS sends a ROUTING AREA UPDATE REQUEST message including the T3324 value IE. The SS allocates a P-TMSI and returns a ROUTING AREA UPDATE ACCEPT message providing a value for timer T3324. Upon expiry of the timer T3324, the MS deactivate the AS layer and activate PSM by entering the state GMM-REGISTERED.NO-CELL-AVAILABLE.

Then after the expiry of extended timer T3312, the MS sends a ROUTING AREA UPDATE REQUEST message to the network for wakeup.

Maximum duration of test

24 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 19.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 MS network feature support = 1 (MS support of extended timer)
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 4 minutes T3312 extended value = 6 minutes
5	MS -> SS	ATTACH COMPLETE	
6	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 T3324 value IE included.
7	SS		The SS verifies that the time between the attach and the periodic RA updating is Ready Timer Period (T3314) + the extended value of the Periodic Routing Area Updating timer (T3312 extended value) (+/- 10%).
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-3 P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included. T3324 value is set to 8 minutes. Force to standby indicator set
9	SS -> MS		SS pages the MS with mobile identity P-TMSI-3 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. This is checked during 3 seconds.
11	SS		SS waits for 8 minutes until the timer T3324 time out.
12	SS -> MS		SS pages the MS with mobile identity P-TMSI-3 or IMSI and paging order for RR connection according to the channel combination of the cell.
13	MS		The MS shall not initiate an RR connection. This is checked during 3 seconds.
14	SS		SS waits for 6 minutes until the extended timer T3312 time out.
15	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-3 signature Routing area identity = RAI-1
16	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 Force to standby indicator set
17	MS		The MS is switched off or power is removed (see PICS).
18	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

19	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 18.

Specific message contents

Contents of ROUTING AREA UPDATING ACCEPT message on Step 8:

T3324 value	0010 1000 (8 minutes).

44.2.3.3.3 Periodic routing area updating / no cell available / network mode I

44.2.3.3.3.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode I, then the MS shall perform a combined routing area update procedure indicating 'combined RA/LA updating with IMSI attach'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.1.

44.2.3.3.3.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.3.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Cell A is operating in network operation mode II and cell B is in network operation mode I.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a routing area updating procedure is performed immediately.

T3312; set to 6 minutes.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
	SS		The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	SS		The MS is set in MS operation mode B (see PICS).
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
5	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes
6	MS -> SS	ATTACH COMPLETE	
7	SS		After 5 minutes, the signal strength is lowered until the MS has lost contact with the SS.
8	SS		Wait 2 minutes.
			The following messages are sent and shall be received on cell B.
9	SS		The SS activates cell B.
10	MS		Cell B is preferred by the MS.
11	MS		The MS immediately starts a combined RA updating procedure
12	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Combined RA/LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted
13	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-3 P-TMSI-3 signature Mobile identity = TMSI-2 Routing area identity = RAI-4
14	MS -> SS	ROUTING AREA UPDATE COMPLETE	
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'

Specific message contents

None.

44.2.3.3.4 Periodic routing area updating / no cell available

44.2.3.3.4.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode II, then the MS shall perform a periodic routing area update procedure and a periodic location update procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.2.

44.2.3.3.4.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a periodic routing area updating procedure is performed immediately (no periodic location update procedure is performed as T3212=0).

T3312; set to 6 minutes.

Maximum duration of test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and initiates an attach (see PICS).
2	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
3	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes
4	MS -> SS	ATTACH COMPLETE	
5	SS		After 5 minutes, the signal strength is lowered until the MS have lost contact with the SS.
6	SS		After 2 minutes, the signal strength is increased until the MS have got contact with the SS.
7	MS		The MS immediately start the periodic RA updating procedure
8	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1
9	SS -> MS	ROUTING AREA UPDATING ACCEPT	No new mobile identity assigned. P-TMSI not included. Update result = 'RAupdated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set
10	MS		The MS is switched off or power is removed (see PICS).
11	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.3.3.5 Periodic routing area updating / eDRX

44.2.3.3.5.1 Conformance requirement

1) If the MS supports eDRX and requests the use of eDRX, the MS shall include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

2) The MS shall use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

Reference(s):

3GPP TS 24.008 subclause 4.7.2.10, 4.7.3.1.1 and 4.7.5.1.1.

44.2.3.3.5.2 Test purpose

To verify that a MS that supports eDRX and requests the use of eDRX will include the extended DRX parameters IE in the ROUTING AREA UPDATE REQUEST message.

To verify that a MS that supports eDRX and requests the use of eDRX will use the extended idle mode DRX cycle only if the network has provided the extended DRX parameters IE during the last ROUTING AREA UPDATE procedure.

44.2.3.3.5.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.
- The cell supports eDRX.

Mobile Station:

- The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.
- The MS is configured to use eDRX.
- The MS is configured to use a specific value of extended DRX cycle.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a ROUTING AREA UPDATE REQUEST message including the extended DRX parameters IE. The SS accepts the request to use eDRX and returns ROUTING AREA UPDATE ACCEPT message with the extended DRX parameters IE. The MS shall use extended idle mode DRX cycle that the network has provided during the last routing area updating procedure.

Maximum duration of test

12 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 17.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes
5	MS -> SS	ATTACH COMPLETE	
6	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 Extended DRX parameters IE included
7	SS		The SS verifies that the time between the attach and the periodic RA updating is Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+/- 10%)
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-3 P-TMSI-3 signature Routing area identity = RAI-1 extended DRX value: 0111(195.84 seconds)
9	MS -> SS	ROUTING AREA UPDATING COMPLETE	
10	SS		Wait for 1 minute for Ready Timer to expire.
11	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the lowest eDRX cycle.
12			There should be no response from MS as the eDRX Cycle is now set to eDRX Value: 0111. This is verified for the duration of T3315
13	SS -> MS	PAGING REQUEST TYPE 1	Page indication indicates packet paging procedure. Sent on PCH according to the negotiated eDRX cycle.
14			Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response.
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
17	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 16.

Specific message contents

None.

44.2.4 P-TMSI reallocation

44.2.4.1 Conformance requirement

1) A Mobile Station shall acknowledge a new P-TMSI when explicitly allocated.

2) The P-TMSI shall be updated on the SIM when the Mobile Station is correctly deactivated in accordance with the manufacturer's instructions.

3) A Mobile Station shall use the given P-TMSI in further communication with the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.6.

44.2.4.2 Test Purpose

To verify that the MS is able to receive and acknowledge a new P-TMSI by means of an explicit P-TMSI reallocation procedure.

To verify that the MS has stored the P-TMSI in a non-volatile memory.

The implicit reallocation procedure is tested in the attach procedure.

44.2.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An explicit P-TMSI reallocation procedure is performed (P-TMSI reallocation command sent from the SS and acknowledged from the MS by P-TMSI reallocation complete). The MS is GPRS detached and switched off. Its power supply is interrupted for 10 s. The power supply is resumed and then the MS is switched on. A GPRS attach procedure is performed with the given P-TMSI as identity.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS -> MS	P-TMSI REALLOCATION COMMAND	Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
7	MS -> SS	P-TMSI REALLOCATION COMPLETE	
8	MS		The MS is switched off or power is removed (see PICS).
9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
10	MS		Ensure the power is removed from the MS for at least 10 s
11	MS		The MS is powered up or switched on and initiates an attach (see PICS).
12	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1
13	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set
14	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
15	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response.
16	MS		The MS is switched off or power is removed (see PICS).
17	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.5 GPRS authentication and ciphering

44.2.5.1 Test of authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

44.2.5.1.1 Authentication accepted

44.2.5.1.1.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure.

44.2.5.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure.

The SS checks the value SRES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message.

The MS initiates a routing area updating procedure and the SS checks the value of the GPRS Ciphering Key Sequence Number sent by the MS in the ROUTING AREA REQUEST message.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request authentication. Set GPRS-CKSN-1 RAND
6	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	SRES
7	SS		The SS checks the SRES value. "Auth. Response Parameter (extension)" IE might be included if the RES value is more than 4 octets long.
8	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
9	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
10	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
11	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1
12	SS		The value of GPRS-CKSN is checked
13	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
14	MS -> SS	ROUTING AREA UPDATING COMPLETE	
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
17	SS		Reset the RF level of cell A to default state. Deactivate cell B.
18	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 16.

Specific message contents

None.

44.2.5.1.2 Authentication rejected

44.2.5.1.2.1 Conformance requirement

1. Upon receipt of an AUTHENTICATION AND CIPHERING REJECT message, the MS shall set the GPRS update status to GU3 ROAMING NOT ALLOWED and shall delete the P-TMSI, P-TMSI signature, RAI and GPRS ciphering key sequence number stored.

2. The SIM shall be considered as invalid until switching off or the SIM is removed.

3. If the AUTHENTICATION AND CIPHERING REJECT message is received, the MS shall abort any GMM procedure, shall stop the timers T3310 and T3330 (if running) and shall enter state GMM-DEREGISTERED.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.5.

44.2.5.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the authentication and ciphering procedure.

44.2.5.1.2.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The test sequence is repeated for k = 1, 2.

A complete GPRS attach procedure is performed. The SS rejects the following authentication and ciphering procedure. The MS is paged with its former P-TMSI and shall not respond.

The Cell is changed into a new Routing Area.

The SS checks that the MS does not perform normal routing area updating.

The SS then checks that the MS does not perform a GPRS attach.

The SS checks that the MS does not perform a GPRS detach if switched off.

The MS is switched on or powered up. The SS checks that the MS performs a GPRS Attach procedure.

Maximum duration of test

10 minutes.

Expected sequence

The test sequence is repeated for k = 1, 2.

For k =1, the MS is set in MS operation mode C. If MS operation mode C not supported then k = 2.

For k = 2 the MS is set in MS operation mode B.

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request authentication. Set GPRS-CKSN-1 RAND
7	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	SRES
8	SS -> MS	AUTHENTICATION AND CIPHERING REJECT	
9	SS -> MS		The SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell.
10	MS		No response from the MS to the request. This is checked for 10 s.
			The following messages are sent and shall be received on cell B.
11	SS		The SS deactivates cell A and activates cell B.
12	MS		Cell B is preferred by the MS.
13	MS		No ROUTING AREA UPDATING REQUEST sent to the SS (SS waits 30 seconds).
14	MS		If possible (see PICS) the MS initiates an attach by MMI or by AT command.
15	MS		No ATTACH REQUEST sent to the SS (SS waits 30 seconds).
16	MS		The MS is switched off (see PICS).
17	SS		No DETACH REQUEST sent to the SS (SS waits 30 seconds).
18			The MS is powered up or switched on. Step 19 is only performed for k =2
19		{Location Update Procedure}	Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI.
19a			MS initiates an attach (see PICS).
20	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS only attached' Mobile identity = IMSI
21	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS attach' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
22	MS -> SS	ATTACH COMPLETE	
23	MS		The MS is switched off or power is removed. (see Pics)
24	MS -> SS	DETACH REQUEST	Message not sent if power is removed.
25	MS		If k=1 then the test is repeated for k=2.

Specific message contents

None.

44.2.5.1.3 Authentication accepted with USIM

44.2.5.1.1.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

In a UMTS authentication challenge, if the AUTHENTICATION_AND_CIPHERING REQUEST message includes the UMTS authentication parameters GPRS CKSN, RAND and AUTN, then upon receipt of the message, the MS verifies the AUTN parameter and if this is accepted, the MS processes the challenge information and sends an AUTHENTICATION_AND_CIPHERING RESPONSE message to the network.

Reference(s):

3GPP TS 24.008 subclause 4.7.7.2.

44.2.5.1.1.2 Test purpose

To verify that the MS is able to authenticate itself for GPRS transmission using the USIM application through an UMTS challenge.

44.2.5.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II, SGSN is R99

Mobile Station:

Test USIM is plugged into the MS.
The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure with an UMTS challenge request.

The SS checks the value RES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message (calculated with UMTS AKA algorithm).

The MS initiates a routing area updating procedure and the SS checks the value of the GPRS Ciphering Key Sequence Number sent by the MS in the ROUTING AREA REQUEST message.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content)
6	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	RES
7	SS		The SS checks the RES value.
8	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
9	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
10	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
11	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1
12	SS		The value of GPRS-CKSN is checked
13	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
14	MS -> SS	ROUTING AREA UPDATING COMPLETE	
15	MS		The MS is switched off or power is removed (see PICS).
16	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
17	SS		Reset the RF level of cell A to default state. Deactivate cell B.
18	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 16.

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 5:

Same as default content except :

Information element	Value/remark
IE AUTN	Calculated as defined for Test USIM

44.2.5.2 Test of ciphering mode setting

The purpose of this procedure is to let the network to trigger the start and stop of stream ciphering.

The SS shall start and synchronise ciphering and deciphering according to 3GPP TS 03.20 / 3GPP TS 33.102, 3GPP TS 33.220. The bitstream shall be generated according to the commanded algorithm GExA.

44.2.5.2.1 Ciphering mode / start ciphering

44.2.5.2.1.1 Conformance requirements

1. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode off', the Mobile Station shall:

   1.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;

   1.2. not start ciphering.

2. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode on', the Mobile Station shall:

   2.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;

   2.2. start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;

   2.3. the ciphering uses the cipher key determined during the authentication procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure with ciphering.

44.2.5.2.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

For execution counter K = 4 (GEA4) Test USIM has to be plugged into the MS
The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Supported encryption Algorithm : GEA1 (TSPC_Feat_GEA1)
- Supported encryption Algorithm : GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm : GEA3 (TSPC_Feat_GEA3)

- Supported encryption Algorithm : GEA4 (TSPC_Feat_GEA4)

PIXIT statements:

-

Test procedure

A GPRS attach is performed. Authentication procedure without ciphering is performed.

The MS initiates a routing area updating procedure, and the SS initiates an authentication and ciphering procedure to start ciphering. GEA1, GEA2, GEA3 or GEA4 encryption is used depending on the execution counter K.

The test is performed for all GEAx encryption algorithm supported by the MS.

Maximum duration of test

15 minutes.

Expected sequence

The sequence is performed for execution counter K=1 when the MS supports GEA1, for K=2 when the MS supports GEA2, for K=3 when the MS supports GEA3 and for K=4 when the MS supports GEA4.

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 28.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI Message not ciphered
5	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request authentication. Ciphering off Set GPRS-CKSN-1 RANDFor K=4 AUTN Message not ciphered
6	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	For K=1,2,3 SRES For K=4 RES "Auth. Response Parameter (extension)" IE might be included if the RES value is more than 4 octets long. Message not ciphered
7	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Message not ciphered
8	MS -> SS	ATTACH COMPLETE	Message not ciphered
9	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment. Message not ciphered
10	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response. Message not ciphered
			The following messages are sent and shall be received on cell B.
11	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
12	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Message not ciphered

Step	Direction	Message	Comments
13	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request authentication. Ciphering on with encryption: GEA1 for K=1, GEA2 for K=2, GEA3 for K=3. GEA4 for K=4. Set GPRS-CKSN-2 RAND For K=4 AUTN Message not ciphered
14	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	For K=1,2,3 SRES For K=4 RES "Auth. Response Parameter (extension)" IE might be included if the RES value is more than 4 octets long. Message not ciphered
15	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message ciphered
16	MS -> SS	ROUTING AREA UPDATING COMPLETE	Message ciphered
17	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-1 Paging order is for TBF establishment. Message not ciphered
18	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response. Message may be ciphered depending on the type of LLC PDU that are sent. The 'E' bit is therefore not checked.
19	SS -> MS	P-TMSI REALLOCATION COMMAND	Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4 Message ciphered
20	MS -> SS	P-TMSI REALLOCATION COMPLETE	Message ciphered
21	SS -> MS	IDENTITY REQUEST	Identity type = IMEI Message not ciphered
22	MS -> SS	IDENTITY RESPONSE	Mobile identity = IMEI Message not ciphered
23	SS -> MS	P-TMSI REALLOCATION COMMAND	Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message ciphered
24	MS -> SS	P-TMSI REALLOCATION COMPLETE	Message ciphered
25	MS		The MS is switched off or power is removed (see PICS).
26	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' Message ciphered
27	SS		Cell B is powered down and Cell A is restored to full power.
28	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 26.

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Specific message contents

None.

44.2.5.2.4 Ciphering mode/Cipher key Kc_{128} and algorithm changes

44.2.5.2.4.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

In a UMTS authentication challenge, if the AUTHENTICATION_AND_CIPHERING REQUEST message includes the UMTS authentication parameters GPRS CKSN, RAND and AUTN, then upon receipt of the message, the MS verifies the AUTN parameter and if this is accepted, the MS processes the challenge information and sends an AUTHENTICATION_AND_CIPHERING RESPONSE message to the network.

In a UMTS authentication challenge, the new UMTS ciphering key, the new GSM ciphering key and the new UMTS integrity key calculated from the challenge information shall overwrite the previous UMTS ciphering key, GSM ciphering key and UMTS integrity key. The new UMTS ciphering key, GSM ciphering key and UMTS integrity key are stored on the USIM together with the ciphering key sequence number. Furthermore, in A/Gb mode when after the authentication procedure an A5 ciphering algorithm that requires a 128-bit ciphering key is taken into use, then a new GSM Kc_{128} shall also be calculated as described in the subclause 4.3.2.3a

Reference(s):

3GPP TS 24.008 subclause 4.7.7.2.

3GPP TS 24.008 subclause 4.3.2.2.

44.2.5.2.4.2 Test purpose

To verify that the MS uses correctly Kc and Kc_{128} when the GPRS Encryption Algorithm is changed from GEA2/GEA3 to GEA4 and from GEA4 to GEA2/GEA3.

44.2.5.2.4.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II, SGSN is R99

Mobile Station:

Test USIM is plugged into the MS. The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Supported encryption Algorithm: GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm: GEA3 (TSPC_Feat_GEA3)

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure with an UMTS challenge request; type of algorithm is GEA2 or GEA3 dependent on supported algorithm.

The SS checks the value RES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message (calculated with UMTS AKA algorithm).

The cell A is deactivated and cell B activated .

The MS initiates a routing area updating procedure and the SS initiates an authentication and ciphering procedure with an UMTS challenge request. The SS sends ROUTING ARE UPDATING ACCEPT ciphered with GEA4 and the MS answer with ciphered ROUTING ARE UPDATING COMPLETE.

The cell B is deactivated and cell A activated

The MS initiates a routing area updating procedure and the SS initiates an authentication and ciphering procedure with an UMTS challenge request. The SS sends ROUTING ARE UPDATING ACCEPT ciphered with GEA2/GEA3 and the MS answer with ciphered ROUTING ARE UPDATING COMPLETE.

Expected sequence

The sequence is executed with GEAx = GEA3 when GEA2 is not supported or GEA2 when GEA2 is supported.

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 23.
3	MS		The MS is powered up or switched on and initiates an attach (see PICS).
4	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
5	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm : GEAx
6	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long.
7	SS -> MS	ATTACH ACCEPT	Message ciphered with GEAx Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
8	MS -> SS	ATTACH COMPLETE	Message ciphered
9	SS		The SS deactivates cell A and activates cell B.
			The following messages are sent and shall be received on cell B.
10	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1
11	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm: GEA4
12	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long.
13	SS -> MS	ROUTING AREA UPDATING ACCEPT	Message ciphered with GEA4 Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4
14	MS -> SS	ROUTING AREA UPDATING COMPLETE	Message ciphered
15	SS		The SS deactivates cell B and activates cell A.
			The following messages are sent and shall be received on cell A.
16	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-4 GPRS-CKSN-1
17	SS -> MS	AUTHENTICATION AND CIPHERING REQUEST	Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm: GEAx
18	MS -> SS	AUTHENTICATION AND CIPHERING RESPONSE	The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long.

19	SS -> MS	ROUTING AREA UPDATING ACCEPT	Message ciphered with GEAx Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
20	MS -> SS	ROUTING AREA UPDATING COMPLETE	Message ciphered
21	MS		The MS is switched off or power is removed (see PICS).
22	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
23	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 22.

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 5:

Same as default content except :

Information element	Value/remark
IE AUTN Ciphering Algorithm Type of Algorithm	Calculated as defined for Test USIM GPRS Encryption Algorithm - GEA2 when supported - GEA3 when GEA2 is not supported

AUTHENTICATION AND CIPHERING REQUEST in step 11:

Same as default content except :

Information element	Value/remark
IE AUTN Ciphering Algorithm Type of Algorithm	Calculated as defined for Test USIM GPRS Encryption Algorithm GEA4

AUTHENTICATION AND CIPHERING REQUEST in step 17:

Same as default content except :

Information element	Value/remark
IE AUTN Ciphering Algorithm Type of Algorithm	Calculated as defined for Test USIM GPRS Encryption Algorithm - GEA2 when supported - GEA3 when GEA2 is not supported

44.2.5.2.5 Ciphering mode / Non support of GEA1

44.2.5.2.5.1 Conformance requirement

It is mandatory for GEA2, GEA3 and non encrypted mode (i.e. GEA0) to be implemented in mobile stations. GEA1 and GEA4 may be implemented in the mobile stations.

NOTE: As mobile stations are not allowed to implement GEA1 from Release 12 onwards, it is strongly discouraged to support GEA1 in Release 11 MS.

Reference(s):

3GPP TS 43.020 Annex D.4.9

44.2.5.2.5.2 Test Purpose

To verify that MS does not apply GEA1 ciphering algorithm.

44.2.5.2.5.3 Method of Test

Initial Conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

MS sends ATTACH REQUEST. The SS checks that GPRS Encryption Algorithm GEA/1 bit is 0.

The SS sends GMM CIPHERING AND AUTHENTICATION REQUEST with Cipher algorithm GEA1. MS sends GMM STATUS message with Cause Value #95.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is set in MS operation mode B or C (see PICS).
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	GPRS Encryption Algorithm GEA/1= 0 Attach type = 'GPRS attach' Mobile identity = IMSI Message not ciphered
4	SS -> MS	GMM AUTHENTICATION AND CIPHERING REQUEST	Request authentication. Cipher algorithm = GEA1 Ciphering On Set GPRS-CKSN-1 RAND Message not ciphered
5	MS -> SS	GMM STATUS	Cause Value #95 Message not ciphered
6	SS -> MS	ATTACH REJECT	GMM cause = ''Network failure' Message not ciphered

Specific message contents

None.

44.2.6 Identification procedure

The purpose of this procedure is to check that the MS gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the MS.

44.2.6.1 General Identification

44.2.6.1.1 Conformance requirement

1) When requested by the network the Mobile Station shall send its IMSI.

2) When requested by the network the Mobile Station shall send its IMEI as stored in the Mobile Equipment.

3) When requested by the network the Mobile Station shall send its IMEISV as stored in the Mobile Equipment.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.8.

44.2.6.1.2 Test purpose

To verify that the MS sends identity information as requested by the system. The following identities can be requested: IMSI, IMEI and IMEISV.

44.2.6.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS requests identity information from the MS:

- IMSI;
- IMEI;
- IMEISV.

Maximum duration of test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 14.
2	MS		The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1
5	MS -> SS	ATTACH COMPLETE	
6	SS -> MS	IDENTITY REQUEST	Identity type = IMSI
7	MS -> SS	IDENTITY RESPONSE	Mobile identity = IMSI
8	SS -> MS	IDENTITY REQUEST	Identity type = IMEI
9	MS -> SS	IDENTITY RESPONSE	Mobile identity = IMEI
10	SS -> MS	IDENTITY REQUEST	Identity type = IMEISV
11	MS -> SS	IDENTITY RESPONSE	Mobile identity = IMEISV
12	MS		The MS is switched off or power is removed (see PICS).
13	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'
14	MS		The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 13.

Specific message contents

None.

44.2.7 GMM READY timer handling

The READY timer, T3314 is used in the MS and in the network per each assigned P-TMSI to control the cell updating and paging procedure.

When the READY timer is running the MS shall perform cell update each time a new cell is selected (see 3GPP TS 03.22 [3]). If a routing area border is crossed a routing area updating procedure shall be performed instead of a cell update.

44.2.7.1 Conformance requirement

1) When the READY timer is running the MS shall perform cell update each time a new cell is selected.

2) The READY timer shall be restarted in the MS when the GMM entity receives an indication from lower layers that user data or GMM or SM signalling messages have been transmitted.

3) The READY timer shall be stopped when force to standby is received in a signalling message from the network, after successful completion of the signalling procedure.

4) if the negotiated READY timer value indicates that the ready timer function is deactivated, then the MS shall behave as if READY timer never expires (i.e. the MS remains in READY state all the time).

5) If the READY timer length is set to zero, the MS shall immediately be forced into STANDBY state .MS shall not perform cell update.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.1.

44.2.7.2 Test Purpose

To verify the functionality of the READY timer.

44.2.7.3 Method of test

44.2.7.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS negotiates T3314. The MS selects a new cell within the old RA. A cell update is performed.

T3314; set to 60 s.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3314 = 60 seconds
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
7	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating cell update.
8	MS		The MS is switched off or power is removed (see PICS).
9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.7.3.2 Test procedure 2

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS negotiates T3314. A page is responded by the MS. The MS selects a new cell within the old RA. A cell update is performed, as T3314 is reset by the paging response.

T3314; set to 60 s.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported set the MS in operation mode B. The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3314 = 60 seconds
5	MS -> SS	ATTACH COMPLETE	
6	SS		No action for 90 seconds
7	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
8	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response. T3314 reset.
			The following messages are sent and shall be received on cell B.
9	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
10	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating cell update.
11	MS		The MS is switched off or power is removed (see PICS).
12	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

Specific message contents

None.

44.2.7.3.3 Test procedure 3

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS indicates 'force to standby'. The MS selects a new cell within the old RA. No cell update is performed as the MS is in STANDBY state.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on cell A.
1	SS		The SS activates cell A.
2	MS		The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Force to standby indicator set
5	MS -> SS	ATTACH COMPLETE	
			The following messages are sent and shall be received on cell B.
6	SS		Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS.
7	SS		The SS verifies for 45 seconds that no cell update is received, as the MS is in STANDBY state
8	MS		The MS is switched off or power is removed (see PICS).
9	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'

44.2.8 DTM mobility management

44.2.8.1 Change of cell between two LAs in idle mode

44.2.8.1.1 Change of cell between two LAs in idle mode / RAU completes first

44.2.8.1.1.1 Conformance requirements

RA update and LA update procedures shall be supported in parallel in the main DCCH with SAPI 0. This helps reduce the congestion caused by GPRS signalling on GPRS TCHs that naturally exists in cells on the border of a RA or RA/LA without noticeably affecting the QoS of the CS connection.

In network mode of operation II and III, whenever a Class-A MS determines that it shall perform both a LA update and an RA update it shall initiate the LA update and then initiate the RA update.

A MS supporting the «GPRS» option whose CHANNEL REQUEST message contained a packet access establishment cause shall obey an IMMEDIATE ASSIGNMENT message to a channel which is to be used in dedicated mode.

44.2.8.1.1.2 Test purpose

To verify that both Location Updating and Routeing Area Updating procedures are completed in parallel and also to guarantee that the GPRS mobile obeys a command to use the SDCCH for signalling.

44.2.8.1.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with different LAIs, both operating in network operation mode II and both support DTM.

Mobile Station:

The MS is in packet idle mode with a TMSI and P-TMSI allocated.

Specific PICS statements:

-

PIXIT statements:

-

Test Procedure

Once the MS is camped on cell A in the first LA, the SS commences the test by lowering the RF level of cell A below that of cell B prompting the MS to complete cell reselection. Once cell B has been selected by the MS, the MS initiates the Location Updating and Routing Area Updating procedures. The SS responds to the ROUTING AREA UPDATE REQUEST message with a ROUTING AREA UPDATE ACCEPT message and then completes the Location Updating procedure by replying with a LOCATION UPDATING ACCEPT message to the LOCATION UPDATING REQUEST sent by the MS. The SS then releases the RR connection.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS		The RF level of cell A is lowered until the MS selects cell B.
2	MS->SS	CHANNEL REQUEST	"Establishment cause": Location updating.
3	SS->MS	IMMEDIATE ASSIGNMENT	Allocates an SDCCH to the MS.
4	MS->SS	LOCATION UPDATING REQUEST	SS verifies that all signalling sent on the main DCCH is transmitted on the allocated SDCCH.
5	MS->SS	GPRS INFORMATION	Contains the ROUTING AREA UPDATE REQUEST message. SS verifies that all signalling sent on the main DCCH is transmitted on the allocated SDCCH
6	SS->MS	GPRS INFORMATION	Contains the ROUTING AREA UPDATE ACCEPT message
7	SS->MS	LOCATION UPDATING ACCEPT	
8	SS->MS	CHANNEL RELEASE	

44.2.8.1.2 Change of cell between two LAs in idle mode / LAU completes first / SS releases channel

44.2.8.1.2.1 Conformance requirements

RA update and LA update procedures shall be supported in parallel in the main DCCH with SAPI 0. This helps reduce the congestion caused by GPRS signalling on GPRS TCHs that naturally exists in cells on the border of a RA or RA/LA without noticeably affecting the QoS of the CS connection.

In network mode of operation II and III, whenever a Class-A MS determines that it shall perform both a LA update and an RA update it shall initiate the LA update and then initiate the RA update.

44.2.8.2 Void

44.2.9 Network Identity and Timezone (NITZ)

44.2.9.1 NITZ and GPRS procedures

44.2.9.1.1 NITZ / GPRS / Timezone, Time and DST Handling

44.2.9.1.1.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

The serving PLMN shall make Local Time Zone (LTZ) available to the MS as an offset from Universal Time in units of 15 minutes.

When the LTZ is compensated for DST (summertime), the serving PLMN shall provide a DST parameter to indicate this. The adjustment for DST can be +1h or +2h.

The Time Zone code enables the receiver to calculate the equivalent time in GMT from the other semi-octets in the Service-Centre-Time-Stamp, or indicate the time zone (GMT, GMT+1H etc.), or perform other similar calculations as required by the implementation. The value contained in the Time Zone field must take into account daylight saving time, such that when the sending entity changes from regular (winter) time to daylight saving (summer) time, there is a change to the value in the Time Zone field.

The mobile station should assume that this time zone applies to the routing area the MS is currently in. The mobile station shall not assume that the time information is accurate.

If the local time zone has been adjusted for Daylight Saving Time, the network shall indicate this by including the IE Network Daylight Saving Time.

44.2.9.1.1.2 Test purpose

To verify that a MS supporting any of the NITZ Time related feature (Local Time Zone, Universal Time and DST IE (and thus GMM Information) is able to handle them properly.

44.2.9.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells operating in network operation mode I, cell A in MCC1/MNC1/LAC1/RAC1 (RAI-1), cell B in MCC1/MNC1/LAC1/RAC2 (RAI-4).

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ DST (TSPC_NITZ_DST)
- Use of NITZ Universal Time for PLMN (TSPC_NITZ_Universal_Time)
- Use of NITZ Local Time Zone for PLMN (TSPC_NITZ_Time_Zone)

PIXIT statements:

-

Test procedure

Following the GPRS attachment on Cell A, SS sends its local time and date (on GMT+1, Winter Time) using the GMM INFORMATION Message to the MS. The operator verifies then the parameters and/or the time and date stored in the MS.

The MS is then moved to a second cell (Cell B), and after a ROUTING AREA UPDATE procedure, the time is changed to "Summer Time" with the DST IE using a GMM INFORMATION Message. The operator verifies then the parameters and/or the time and date stored in the MS and switches Off the MS

The MS is re-attached on Cell A, the Time Zone is then changed, no DST present (GMT+2, Winter Time), using GMM INFORMATION message. The operator verifies then the parameters and/or the time stored on the MS

Maximum duration of test

44.2.9.1.2 NITZ / GPRS / NITZ Parameters / Storage / Deletion

44.2.9.1.2.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

When using the default character set (see TS 23.038 [4]), the serving PLMN shall make both a "short" and a "long" name available to the MS. As an alternative or, in addition, to the default character set, the serving PLMN can make a name available in UCS2. The MS shall be free to choose one of these names depending upon its own characteristics and/or limitations, such as those of its display.

Switching off the MS should not cause the updated name of the network(s) to be deleted.

Reference(s):

3GPP TS 02.42 / 3GPP TS 22.042 subclause 4 and 6.2

44.2.9.1.2.2 Test purpose

To verify that a MS supporting any of the NITZ Name related feature (Short or Full PLMN name and thus GMM Information) is able to handle the names properly and does not erase the PLMN name sent using NITZ procedure at switch off.

44.2.9.1.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ Full name for PLMN (TSPC_NITZ_Full_Name)
- Use of NITZ Short name for PLMN (TSPC_NITZ_Short_Name)PIXIT statements:
-

Test procedure

Following the GPRS attachment, SS sends a Short and a Full Name for the PLMN using the GMM INFORMATION Message to the MS. The operator verifies then the parameters stored in the MS.

The MS is then switched Off. The MS is re-attached after switching on, and the operator verifies then that the names are still stored/used in the MS.

Maximum duration of test

5 minutes

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and initiates an attach (see PICS).
2	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached'
3	SS -> MS	ATTACH ACCEPT	Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature

Step	Direction	Message	Comments
4	MS -> SS	ATTACH COMPLETE	
5	SS ->MS	GMM INFORMATION	Full Name for Network and Short Name for Network IE are included : "NITZDeletionPLMN" for Full Name "NITZPLMN" for Short Name See specific message content
6	MS		**Operator Action :** Verify that the names are stored and handled correctly according to Specific PICS Statements: "NITZDeletionPLMN" for Full name, "NITZPLMN" for Short name
7	MS		The MS is switched off or power is removed (see PICS).
8	MS -> SS	DETACH REQUEST	Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach'
9	MS		The MS is powered up or switched on and initiates an attach (see PICS).
10	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached'
11	SS -> MS	ATTACH ACCEPT	No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'Combined GPRS / IMSI attached'
12	MS		**Operator Action :** Verify that the same names are still stored and handled correctly according to Specific PICS Statements: "NITZDeletionPLMN" for Full name, "NITZPLMN" for Short name

Specific message contents

44.2.9.1.3 NITZ / GPRS / MM and GMM Signalling

44.2.9.1.3.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

When using the default character set (see TS 23.038 [4]), the serving PLMN shall make both a "short" and a "long" name available to the MS. As an alternative or, in addition, to the default character set, the serving PLMN can make a name available in UCS2. The MS shall be free to choose one of these names depending upon its own characteristics and/or limitations, such as those of its display.

It is expected that the MS will display the most up to date information transferred to it.

Reference(s):

3GPP TS 02.42 / 3GPP TS 22.042 subclause 4 and 6.2

44.2.9.1.3.2 Test purpose

To verify that a MS supporting NITZ (any of the Fields) is able to handle both MM INFORMATION and GMM INFORMATION messages and that parameters set in the latest message override the previous ones.

44.2.9.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells operating in network operation mode I (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (RAI-1), cell B in MCC1/MNC1/LAC1/RAC2 (RAI-4).

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ DST (TSPC_NITZ_DST)
- Use of NITZ Full name for PLMN (TSPC_NITZ_Full_Name)
- Use of NITZ Short name for PLMN (TSPC_NITZ_Short_Name)
- Use of NITZ Universal Time for PLMN (TSPC_NITZ_Universal_Time)
- Use of NITZ Local Time Zone for PLMN (TSPC_NITZ_Time_Zone)

PIXIT statements:

-

Test procedure

Following its GPRS Attachment procedure, the MS receives from SS, through the GMM INFORMATION a complete set of NITZ parameters (PLMN long name, short name, and Universal time with local time adjustment). The operator verifies then the names used and the time and date stored in the MS (according to specific PICS Statements).

The MS is then paged on its paging group with its IMSI. SS verifies that the MS sends a PAGING RESPONSE. SS sends back a MM INFORMATION message changing the NITZ PLMN names (short and full names) and the local time information.

The operator verifies then that the new NITZ names are used and the time information changed (if supported).

The serving cell is then lowered and the MS triggers a ROUTING AREA UPDATE procedure on the second cell. Following this procedure, SS sends some new NITZ PLMN names (full and short) using the GMM INFORMATION message.

The operator verifies then that the new NITZ names are used, if supported, and, if possible, that the time information is not changed.

Maximum duration of test

5 minutes

Expected sequence:

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and initiates an attach (see PICS).
2	MS -> SS	ATTACH REQUEST	Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI

44.2.10 MS Radio Access Capability Interrogation

This procedure allows the network to request the MS to supply its radio access capability information to the network.

44.2.10.1 Conformance requirements

In state GMM-DEREGISTERED, the MS initiates the GPRS attach procedure by sending an ATTACH REQUEST message to the network, starts timer T3310 and enters state GMM-REGISTERED-INITIATED.

The ATTACH REQUEST message contains the MS Radio Access capability information element.

The purpose of the *MS RA capability* information element is to provide the radio part of the network with information concerning radio aspects of the mobile station. The contents might affect the manner in which the network handles the operation of the mobile station.

The *MS RA capability* is a type 4 information element, with a maximum length of 52 octets.

DARP is contained in the Release 6 specifications. In order to implement an MS conforming to Release 99 but supporting DARP, it is necessary for the MS to additionally conform to some parts of the Release 6 specifications, such as the radio frequency requirements for DARP and some signalling extensions relating to the MS Classmark and radio access capabilities.

3GPP TS 05.15 / 3GPP TS 45.015

44.2.10.2 Test purpose

To verify that the MS supplies all its radio access capabilities and Network MS Capabilities, when attaching to the network for GPRS services.

44.2.10.3 Method of test

44.2.10.3.1 Initial Conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

- Contents of MS Radio Access Capability.

Maximum duration of test

3 minutes.

44.2.10.3.2 Test procedure

The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is powered up or switched on and initiates an attach procedure (see PICS).
2	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = IMSI Contents as defined for default message.
3	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1
4	MS -> SS	ATTACH COMPLETE	

Specific message Contents

Contents of ATTACH REQUEST message:

Protocol discriminator Skip indicator Attach request message identity MS network capability	1000 (MM message for GPRS service) 0000 00000001 See PICS/PIXIT.
MS Radio Access capability	See PICS/PIXIT. Note for R99 and onwards a MS that supports “Downlink Advance Receiver Performance” shall include the Downlink Advanced Receiver Performance indication.

44.2.11 Cell Notification

44.2.11.1 Conformance Requirement

When the READY timer is running or has been deactivated the MS shall perform cell update each time a new cell is selected.

When the READY timer has expired the MS shall:

- perform the routing area updating procedure when a routing area border is crossed;
- not perform a cell update when a new cell is selected.

The READY timer is started:

- in the MS when the GMM entity receives an indication from lower layers that an LLC frame other than LLC NULL frame has been transmitted on the radio interface; and

- in the network when the GMM entity receives an indication from lower layers that an LLC frame other than LLC NULL frame has been successfully received by the network.

If a new READY timer value is negotiated, the MS shall upon the reception of the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message perform a initial cell update (either by transmitting a LLC frame or, if required, a ATTACH COMPLETE or ROUTING AREA UPDATE COMPLETE message), in order to apply the new READY timer value immediately. If both the network and the MS supports the Cell Notification, the initial cell update shall use any LLC frame except the LLC NULL frame.

In A/Gb mode, if the ATTACH ACCEPT message contains the Cell Notification information element, then the MS shall start to use the LLC NULL frame to perform cell updates.

In A/Gb mode, if the ROUTING AREA UPDATE ACCEPT message contains the Cell Notification information element, then the MS shall start to use the LLC NULL frame to perform cell updates.

44.2.11.2 Test Purpose

Test purpose 1

The MS shall start to use the LLC NULL frame to perform cell updates following receipt of an ATTACH ACCEPT message containing the Cell Notification information element.

Test purpose 2

The MS shall start to use the LLC NULL frame to perform cell updates following receipt of a ROUTING AREA UPDATE ACCEPT message containing the Cell Notification information element.

44.2.11.3 Method of Test

44.2.11.3.1 Test Procedure 1 – Ready Timer Behaviour

Initial Conditions

System Simulator:

Two cells (not simultaneously activated), Cell A in MCC1/MNC1/LAC1/RAC1, Cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is switched off.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test Procedure

The MS switches on and performs GPRS ATTACH on Cell A. Cell Notification is indicated in the ATTACH ACCEPT message. The MS is made to re-select to Cell B whilst the READY timer is still running. The MS performs Cell Update / Cell Notification on Cell B by sending an LLC NULL frame. The SS then waits for the READY TIMER to expire.

The MS is made to re-select to Cell A. It is checked that the MS does not perform Cell Update / Cell Notification. The MS is paged to confirm the cell-reselection to Cell A.

NOTE: the READY timer is not reset following the cell update from Cell A to Cell B but is runs uninterrupted since being started following transmission of the ATTACH COMPLETE message in the initial Cell Update - during the GPRS ATTACH Procedure on Cell A. The value of the ready timer is chosen such that if the MS were to have erroneously re-set the READY timer following the Cell Update from Cell A to Cell B it would perform a Cell Update when returning to Cell B from Cell A.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on Cell A.
1	SS		The SS activates Cell A.
2	MS		The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach'
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3314 = 3 mins Cell Notification IE = Present
5	MS -> SS	ATTACH COMPLETE	
6	SS		The SS waits for 1.5 mins.
			The following messages are sent and shall be received on Cell B.
7	SS		Activate Cell B with a lower signal strength than Cell A The RF level of Cell A is lowered until Cell B is preferred by the MS.
8	MS -> SS	UPLINK RLC DATA BLOCK	Contains the LLC NULL frame. Received within T3314 of Step 5.
9	SS		The SS waits for 1.5 minutes for the READY timer to expire.
			The following messages are sent and shall be received on Cell A.
10	SS		The RF level of cell A is increased until cell A is preferred by the MS.
11	SS		The SS checks that no LLC frame is received on Cell A for a period equivalent to T3314 following Step 8.
12	SS -> MS	PAGING REQUEST TYPE 1	Mobile identity = P-TMSI-2 Paging order is for TBF establishment.
13	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response.

Specific Message Contents

None.

44.2.11.3.2 Test Procedure 2 – Use of LLC NULL Frame

Initial Conditions

System Simulator:

Three cells (not simultaneously activated), Cell A in MCC1/MNC1/LAC1/RAC1, Cell B in MCC1/MNC1/LAC1/RAC2 and Cell C in MCC1/MNC1/LAC1/RAC2.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI and P-TMSI-1 stored. MS is switched off.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test Procedure

The MS switches on and performs GPRS ATTACH on Cell A. In the ATTACH ACCEPT message the SS assigns a new (non-default) value for the READY timer but does not assign a new P-TMSI. Cell Notification is indicated in the ATTACH ACCEPT message. The MS performs an initial Cell Update by sending an LLC frame. It is checked that the MS does not send the LLC NULL frame. The MS is made to re-select to Cell B. The MS sends a ROUTING AREA UPDATE REQUEST. The SS sends a ROUTING AREA UPDATE ACCEPT message assigning a new value for the Ready timer but does not assign a new P-TMSI. Cell Notification is indicated in the ROUTING AREA UPDATE ACCEPT message. The MS performs an initial Cell Update by sending an LLC frame. It is checked that the MS does not send the LLC NULL frame. Before the Ready timer expires, the MS is made to re-select to Cell C. The MS performs Cell Update / Cell Notification by sending an LLC NULL frame.

NOTE: The SS does not assign a new value of P-TMSI in either the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT messages to prevent the sending of ATTACH COMPLETE and ROUTING AREA UPDATE COMPLETE messages by the MS which would obscure possible erroneous use of the LLC NULL frame for the initial cell update by the MS.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
			The following messages are sent and shall be received on Cell A.
1	SS		The SS activates Cell A.
2	MS		The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported set the MS in operation mode B. The MS is powered up or switched on and initiates an attach (see PICS).
3	MS -> SS	ATTACH REQUEST	Attach type = 'GPRS attach' Mobile identity = P-TMSI-1
4	SS -> MS	ATTACH ACCEPT	Attach result = 'GPRS only attached' Routing area identity = RAI-1 T3314 = 3 mins Allocated P-TMSI = Not Included Cell Notification IE = Present
5	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU for initial cell update. Must not contain the LLC NULL frame.
			The following messages are sent and shall be received on Cell B.
6	SS		Activate Cell B with a lower signal strength than Cell A The RF level of Cell A is lowered until Cell B is preferred by the MS.
7	MS -> SS	ROUTING AREA UPDATING REQUEST	Update type = 'RA updating' Routing area identity = RAI-1
8	SS -> MS	ROUTING AREA UPDATING ACCEPT	Update result = 'RA updated' Routing area identity = RAI-4 T3314 = 4 mins Allocated P-TMSI = Not Included Cell Notification IE = Present
9	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU for initial cell update. Must not contain the LLC NULL frame.
			The following messages are sent and shall be received on Cell C.
10	SS		Activate Cell C with a lower signal strength than Cell B. The RF level of Cell B is lowered until Cell C is preferred by the MS.
11	MS -> SS	UPLINK RLC DATA BLOCK	Contains the LLC NULL frame. Received within T3314 of Step 9.

Specific Message Contents

None.

45 Session Management Procedures

45.1 Definition

Test cases identified in TS 51.010-2 as "EC-GSM –IoT compatible" should consider the default cells in the "Initial Conditions" to be EC-GSM-IoT cells if the test has to be executed in "EC Mode. Otherwise the cell should be considered as a basic GPRS cell.

45.2 PDP context activation

45.2.1 Initiated by the mobile station

45.2.1.1 Attach initiated by context activation/QoS Offered by Network is the QoS Requested

45.2.1.1.1 Conformance requirement

PDP context activation shall initiate GPRS Attach by the MS when the MS is GPRS Detached.

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is the same as the QoS requested by the mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall stop timer T3380 and shall initiate establishment of the logical link with the offered QoS.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.1 and 6.1.3.1.1.

45.2.1.1.2 Test purpose

To check the MS initiates a GPRS ATTACH if one is not already active. To test the behaviour of the MS when the network responds to a PDP context activation request with the requested QoS.

45.2.1.1.3 Method of test

Specific PICS statements:

- GPRS Auto Attach (TSPC_AddInfo_on_auto_GPRS_AP)

PIXIT statements:

-Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-DEREGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

If the MS is attached, it should be triggered to initiates a GPRS detach procedure. A context activation is then requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with the same requested QoS. The contents of the ACTIVATE PDP CONTEXT REQUEST message shall then be checked. The SS then waits for T3380 +10% seconds to ensure T3380 has been stopped and no more ACTIVATE PDP CONTEXT REQUEST messages are sent by the MS. The SS then sends a MODIFY PDP CONTEXT REQUEST message to which the MS shall reply with a MODIFY PDP CONTEXT ACCEPT message to ensure the context has been set up.

Expected sequence

Step	Direction	Message	Comments
1	MS		If MS is not configured for GPRS auto attachment (see PICS), go to step 5.
2	MS		The MS initiates a GPRS detach (without power off) by MMI or by AT command.
3	MS -> SS	DETACH REQUEST	Detach type = 'normal detach, GPRS detach'
4	SS -> MS	DETACH ACCEPT	
5	MS		Initiate a context activation
6	MS -> SS	ATTACH REQUEST	Request attach
7	SS -> MS	ATTACH ACCEPT	Accept attach Negotiated Ready timer value IE should not be included Force to standby indicator set
8	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
9	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation
10	SS		Wait for T3380 +10% seconds to ensure no further activate request messages come from the MS
11	SS -> MS	MODIFY PDP CONTEXT REQUEST	Send a modify request for the activated context
12	MS -> SS	MODIFY PDP CONTEXT ACCEPT	Accept the modification request to show context is activated

Specific message contents

As default except:

Activate PDP Context Request

45.2.1.2 QoS Offered by Network is a lower QoS

45.2.1.2.1 QoS Accepted by MS

45.2.1.2.1.1 Conformance requirement

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is acceptable to mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall initiate establishment of the logical link with the offered QoS.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.1.

45.2.1.2.1.2 Test purpose

To test the behaviour of the MS when the network responds to a PDP context activation request with a lower QoS than that requested.

45.2.1.2.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

The requested QoS and Minimum QoS are set. A context activation is requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with a QoS lower than the requested but higher than or equal to the minimum. The SS then sends a MODIFY PDP CONTEXT REQUEST message and the MS shall respond with a MODIFY PDP CONTEXT ACCEPT message to confirm the context is active.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept a PDP context activation
4	SS -> MS	MODIFY PDP CONTEXT REQUEST	Send a modify request for the activated context
5	MS -> SS	MODIFY PDP CONTEXT ACCEPT	Accept the modification request to show context is activated

45.2.1.2.2 QoS Rejected by MS

45.2.1.2.2.1 Conformance requirement

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network.

Upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT offering a QoS which is not acceptable to the mobile, the MS shall initiate the PDP context deactivation procedure.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.1.

45.2.1.2.2.2 Test purpose

To test the behaviour of the MS when the QoS offered by the network in response to a PDP context activation request is not acceptable to the MS.

45.2.1.2.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

The requested QoS and Minimum QoS are set. A context activation is requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message an ACTIVATE PDP CONTEXT ACCEPT message is returned by the SS with a QoS lower than the minimum. The MS shall then send a DEACTIVATE PDP CONTEXT REQUEST message. A DEACTIVATE PDP CONTEXT ACCEPT message will be sent in return by the SS.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation
4	MS -> SS	DEACTIVATE PDP CONTEXT REQUEST	Deactivate the PDP context
5	SS -> MS	DEACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context deactivation

45.2.2 PDP context activation requested by the network, successful and unsuccessful

Applicability

This test needs to take into account the number of contexts supported by the MS to be able to test the response when all contexts are activated and the network tries to initiate a new context.

45.2.2.1 Conformance requirement

1) Upon receipt of a REQUEST PDP CONTEXT ACTIVATION message:

    - If the MS accepts the request the MS shall then initiate the PDP context activation procedure.

    - If the MS rejects the request, the MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with one of the following causes:

        - #26: insufficient resources;

        - #31: activation rejected, unspecified;

        - #40: feature not supported; or

        - #95 – 111: protocol errors.

2) The MS shall not ignore the request.

3) If the MS accepts the request, the ACTIVATE PDP CONTEXT REQUEST message sent by the MS shall contain the parameters requested by the network in the REQUEST PDP CONTEXT ACTIVATION message, except for the offered QoS which may be changed by the MS.

4) Whenever a REQUEST PDP CONTEXT ACTIVATION message is received by the MS specifying a transaction identifier relating to a PDP context not in state PDP-INACTIVE, the MS shall locally deactivate the old PDP context relating to the received transaction identifier. Furthermore, the MS shall continue with the activation procedure of a new PDP context as indicated in the received message.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.1.2, 6.1.3.1.4 and 8.3.2 (f).

45.2.2.2 Test purpose

To test the behaviour of the MS upon receipt of a context activation request from the network.

45.2.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

- Number of network initiated PDP contexts supported

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Case 1

For an MS that supports PDP Context Activation requested by the network.

Test procedure

A REQUEST PDP CONTEXT ACTIVATION message is sent by the SS. On receipt of the ACTIVATE PDP CONTEXT REQUEST message an ACTIVATE PDP CONTEXT ACCEPT message is returned by the SS. This is repeated until the maximum number of contexts supported by the MS are activated. If the MS cannot support seven PDP contexts then one greater than the maximum supported by the MS should be requested. In response to this activation request the MS shall return a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-#111. A REQUEST PDP CONTEXT ACTIVATION message is then sent using a currently activated context transaction identifier. The MS shall activate this context in place of the previous context.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation
4	SS		Steps 1-3 are repeated for Min(number of Network Initiated contexts supported, 7) NOTE: If all 7 contexts are supported steps 5 and 6 should not be performed
5	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request
6	MS -> SS	REQUEST PDP CONTEXT ACTIVATION REJECT	The context activation request is rejected with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111.
7	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request for an existing context
8	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation to replace the existing context
9	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation

Case 2

For an MS that does not support PDP Context Activation requested by the network.

Test procedure

A REQUEST PDP CONTEXT ACTIVATION message is sent by the SS. The MS shall then send an REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors'.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request
2	MS -> SS	REQUEST PDP CONTEXT ACTIVATION REJECT	Reject the PDP context activation request with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111.

Specific message contents

As default except:

Request PDP Context Activation

45.2.3 Void

45.2.4 Abnormal cases

45.2.4.1 T3380 Expiry

45.2.4.1.1 Conformance requirement

1) On the first expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.

2) On the second expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.

3) On the third expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.

4) On the fourth expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.

5) On the fifth expiry of the timer T3380, the MS shall release all resources possibly allocated for this invocation and shall abort the procedure; no automatic PDP context activation re-attempt shall be performed.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.5.

45.2.4.1.2 Test purpose

To test the behaviour of the MS when the network does not reply to PDP CONTEXT ACTIVATION REQUEST

45.2.4.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A context activation is requested by the user. The MS shall send the ACTIVATE PDP CONTEXT REQUEST message five times with T3380 ±10 % seconds between each message. After this no further ACTIVATE PDP CONTEXT REQUEST messages shall be sent by the MS.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS		T3380 ±10% seconds
4	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
5	SS		T3380 ±10% seconds
6	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
7	SS		T3380 ±10% seconds
8	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
9	SS		T3380 ±10% seconds
10	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
11	SS		Wait for T3380 +10% seconds to ensure no further ACTIVATE PDP CONTEXT REQUEST messages are sent by the MS

Specific message contents

As default except:

Activate PDP Context Request

Requested QoS	Arbitrarily chosen
Requested PDP address	Arbitrarily chosen

45.2.4.2 Collision of MS initiated and network requested PDP context activation

45.2.4.2.1 Conformance requirement

In the event of collision between MS initiated and network initiated PDP context activation requests, the MS shall discard the REQUEST PDP CONTEXT ACTIVATION message and shall wait for an ACTIVATE PDP CONTEXT ACCEPT message.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.5.

45.2.4.2.2 Test purpose

To test the behaviour of the MS when there is a collision between an MS initiated and network requested PDP context activation.

45.2.4.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Case 1

For an MS that supports PDP Context Activation requested by the network.

Test procedure

A context activation is requested by the user. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message followed by an ACTIVATE PDP CONTEXT ACCEPT message in a time less than T3380 (Use T3380/2). The MS shall send no messages within this time.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request
4	SS		Wait for T3380/2 seconds to ensure MS does not resend ACTIVATE PDP CONTEXT REQUEST
5	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation

Case 2

For an MS that does not support PDP Context Activation requested by the network.

Test procedure

A context activation is requested by the user. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message. The MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors'. The SS then sends an ACTIVATE PDP CONTEXT ACCEPT.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP context activation
3	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request a PDP context activation request
4	MS -> SS	REQUEST PDP CONTEXT ACTIVATION REJECT	The context activation request is rejected with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111.
5	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation

45.2.4.3 Network initiated PDP context activation request for an already activated PDP context (on the MS side)

45.2.4.3.1 Definition

45.2.4.3.2 Conformance requirement

If the MS receives a REQUEST PDP CONTEXT ACTIVATION message with the same combination of APN, PDP type and PDP address as an already activated PDP context, the MS shall deactivate the existing PDP context and, if any, all the linked PDP contexts (matching the combination of APN, PDP type and PDP address) locally without notification to the network and proceed with the requested PDP context activation.

Reference

3GPP TS 24.008 clause 6.1.3.1.5 d).

45.2.4.3.3 Test purpose

To test the behaviour of the MS when it detects a network initiated PDP context activation for the PDP context already activated on the MS side.

45.2.4.3.4 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Specific PICS statements:

- Network requested PDP context activation supported(TSPC_AddInfo_N_req_PDP_CA)

PIXIT statements:

-

Test procedure

A PDP context activation is requested by the user. SS accepts PDP context activation. Secondary PDP context activation is requested by the user. SS accepts secondary PDP context activation. SS sends a REQUEST PDP CONTEXT ACTIVATION message with the same combination of APN, PDP type and PDP address as an already activated PDP context. 2 cases are expected:

Case A (MS supports “Network requested PDP context activation”):
The MS deactivates the existing PDP context and linked secondary PDP context (matching the combination of APN, PDP type and PDP address) locally without notification to the SS and proceeds with the requested PDP context activation.

Case B (MS does not support “Network requested PDP context activation”):
The MS sends REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors' and the existing PDP contexts stay still active.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	MS requests a PDP context activation
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	SS accepts the PDP context activation
4	MS -> SS	ACTIVATE SECONDARY PDP CONTEXT REQUEST	MS requests a secondary PDP context activation
5	SS -> MS	ACTIVATE SECONDARY PDP CONTEXT ACCEPT	SS accepts the secondary PDP context activation
6	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	SS requests a PDP context activation with the same combination of APN, PDP type and PDP address as the activated PDP context If the MS supports “Network requested PDP context activation” branch A is performed, otherwise branch B is performed.
7A	MS		MS locally deactivates the activated PDP context and the secondary PDP context
8A	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	MS replies with a Request PDP context activation
9A	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	SS accepts the PDP context activation
10A	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the secondary PDP context
11A	MS -> SS	SM STATUS	Cause set to #81. This verifies that the secondary PDP context was locally deactivated.
12A	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the first PDP context
13A	MS -> SS	SM STATUS	Cause set to #81. This verifies that the first PDP context was locally deactivated.
7B	MS -> SS	REQUEST PDP CONTEXT ACTIVATION REJECT	The context activation request is rejected with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111.
8B	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the secondary PDP context
9B	MS -> SS	MODIFY PDP CONTEXT ACCEPT	MS Accepts PDP context modification.

Specific message contents

None.

45.2.4.4 Network reject with Extended Wait Timer

45.2.4.4.1 Conformance requirement

An MS configured for NAS signalling low priority indicates this by including the Device properties IE in the appropriate NAS message and setting the low priority indicator to "MS is configured to NAS signalling low priority" except for the following cases in which the MS shall set the low priority indicator to "MS is not configured for NAS signalling low priority":

- the MS is performing an attach for emergency bearer services;
- the MS has a PDN connection for emergency bearer services established and is performing mobility management procedures, or is establishing a PDN connection for emergency bearer services;
- the MS is accessing the network with access class 11 – 15; or
- the MS is responding to paging.

The network may use the NAS signalling low priority indication for NAS level mobility management congestion control on a per core network node basis and APN based congestion control.

If the NAS signalling low priority indication is provided in an ACTIVATE PDP CONTEXT REQUEST message, the SGSN stores the NAS signalling low priority indication within the default PDP context activated due to this request

The network may detect and start performing the APN based congestion control when one or more APN congestion criteria as specified in 3GPP TS 23.060 [74] are met. The network may store an APN congestion back-off time on a per MS and congested APN basis and reject any subsequent PDP context activation request, secondary PDP context activation request or PDP context modification request from the MS targeted towards the congested APN before the APN congestion back-off time for the congested APN elapses.

Reference

3GPP TS 24.008 clauses 1.8 and 6.1.3.11

45.2.4.4.2 Test purpose

1) To verify that the LAP indicator can be set in the UE.

2) To verify that the Delay Tolerant indicator is sent by the UE.

3) To verify that the UE uses the back-off timer if the network reject a request with the T3396 timer.

45.2.4.4.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context activation is requested by the user. The UE shall send the ACTIVATE PDP CONTEXT REQUEST. The SS responds with the ACTIVATE PDP CONTEXT REJECT message with cause code #26, “insufficient resources”, and the T3396 timer with a value of 10 seconds. The UE starts the T3396 timer with the value of 10 seconds. When timer T3396 has expired the UE requests a PDP context activation.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP Context Activation The SS verifies that the IE "Device properties" is set to "MS is configured for NAS signalling low priority"
3	SS -> MS	ACTIVATE PDP CONTEXT REJECT	The SS includes the IEs SM Cause with value #26 "insufficient resources" and T3396 with value 10 seconds. MS starts timer T3396 with the value of 10 seconds.
4	SS		The SS verifies that the UE does not initiate any communication before the T3396 timer has expired
5	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Request a PDP Context Activation
6	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP Context Activation

Specific message contents

None.

45.2.5 Secondary PDP context activation procedures

45.2.5.1 Successful Secondary PDP Context Activation Procedure Initiated by the MS

45.2.5.1.1 QoS Offered by Network is the QoS Requested

45.2.5.1.1.1 Definition

45.2.5.1.1.2 Conformance requirement

In order to request a PDP context activation with the same PDP address and APN as an already active PDP context, the MS shall send an ACTIVATE SECONDARY PDP CONTEXT REQUEST message to the network, enter the state PDP-ACTIVE-PENDING and start timer T3380. The message shall contain the selected NSAPI. The MS shall ensure that the selected NSAPI is not currently being used by another Session Management entity in the MS. The message shall also include a QoS profile, a requested LLC SAPI and the Linked TI. The QoS profile is the requested QoS.

Reference

3GPP TS 24.008 clauses 6.1.3.2 and 6.1.3.2.1.

45.2.5.1.1.3 Test purpose

To test the behaviour of the MS when SS responds to a Secondary PDP context activation request with the requested QoS.

45.2.5.1.1.4 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

A PDP context activation is requested by the MS and accepted by the SS. Secondary PDP context activation is requested by the MS. On receipt of the ACTIVATE SECONDARY PDP CONTEXT REQUEST message an ACTIVATE SECONDARY PDP CONTEXT ACCEPT is returned by the SS with the same requested QoS. The SS then waits for T3380 seconds to ensure T3380 has been stopped and no more ACTIVATE SECONDARY PDP CONREXT REQUEST messages are sent by the MS. The SS then sends a MODIFY PDP CONTEXT REQUEST message to which the MS shall reply with a MODIFY PDP CONTEXT ACCEPT message to ensure the PDP context has been activated.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a PDP context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
4	MS		Initiate a secondary PDP context activation
5	MS -> SS	ACTIVATE SECONDARY PDP CONTEXT REQUEST	Request a Secondary PDP context activation. Check that TFT filed is present in message and *TFT operation* is "Create a new TFT".
6	SS -> MS	ACTIVATE SECONDARY PDP CONTEXT ACCEPT	Accept the Secondary PDP context activation, the QoS is set to the requested QoS.
7	SS		Wait for T3380 seconds to ensure no further activate request messages come from the MS
8	SS -> MS	MODIFY PDP CONTEXT REQUEST	SS sends a modify request to MS for the activated context
9	MS -> SS	MODIFY PDP CONTEXT ACCEPT	The MS accepts the modification request from the network to show context is activated

Specific message contents

45.2.5.1.2 QoS Offered by Network is a lower QoS

45.2.5.1.2.1 QoS accepted by MS

45.2.5.1.2.1.1 Definition

-

45.2.5.1.2.1.2 Conformance requirement

In order to request a PDP context activation with the same PDP address and APN as an already active PDP context, the MS shall send an ACTIVATE SECONDARY PDP CONTEXT REQUEST message to the network, enter the state PDP-ACTIVE-PENDING and start timer T3380. The message shall contain the selected NSAPI. The MS shall ensure that the selected NSAPI is not currently being used by another Session Management entity in the MS. The message shall also include a QoS profile, a requested LLC SAPI and the Linked TI. The QoS profile is the requested QoS.

Upon receipt of the message ACTIVATE SECONDARY PDP CONTEXT ACCEPT, the MS shall stop timer T3380 and enter the state PDP-ACTIVE. If the offered QoS parameters received from the network differ from the QoS requested by the MS, the MS shall either accept the negotiated QoS or initiate the PDP context deactivation procedure.

In GSM the MS shall initiate establishment of the logical link for the LLC SAPI indicated by the network with the offered QoS and selected radio priority level if no logical link has been already established for that SAPI. If the LLC

SAPI indicated by the network can not be supported by the MS, the MS shall initiate the PDP context deactivation procedure.

Reference

None.

45.3 PDP context modification procedure

45.3.1 Network initiated PDP context modification

45.3.1.1 Conformance requirement

1) Upon receipt of a MODIFY PDP CONTEXT REQUEST message.

   - If the MS can accept the modification requested, the MS shall reply with the MODIFY PDP CONTEXT ACCEPT message.

   - If the MS is unable to accept the modification requested, the MS shall initiate the PDP context deactivation procedure for the NSAPI that has been indicated in the message MODIFY PDP CONTEXT REQUEST - the reject cause IE value of the DEACTIVATE PDP CONTEXT REQUEST message shall indicate "QoS not accepted".

2) The MS shall either accept the modification request or deactivate the PDP context, it shall not ignore the modification request.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.2.

45.3.1.2 Test purpose

To test the behaviour of the MS upon receipt of a MODIFY PDP CONTEXT REQUEST message.

45.3.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context is activated by the user and accepted by the SS. A MODIFY PDP CONTEXT REQUEST message is then sent to the MS with a QoS that is acceptable to the MS (higher than or equal to the minimum QoS set in the MS). The MS shall send a MODIFY PDP CONTEXT ACCEPT message in return. A MODIFY PDP CONTEXT REQUEST message is then sent to the MS with a QoS that is not acceptable to the MS (lower than the minimum QoS set in the MS). The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message in return.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
4	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of a PDP context
5	MS -> SS	MODIFY PDP CONTEXT ACCEPT	Accept the PDP context modification
6	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of a PDP context
7	MS -> SS	DEACTIVATE PDP CONTEXT REQUEST	Reject the PDP context modification by deactivating the PDP context. Cause set to 'QoS not acceptable'
8	SS -> MS	DEACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context deactivation

45.3.2 MS initiated PDP context modification

45.3.2.1 MS initiated PDP Context Modification accepted by network

45.3.2.1.1 Definition

-

45.3.2.1.2 Conformance requirement

In order to initiate the procedure, the MS sends the MODIFY PDP CONTEXT REQUEST message to the network, enters the state PDP-MODIFY-PENDING and starts timer T3381. The message may contain the requested new QoS and/or the TFT and the requested LLC SAPI (used in GSM).

Upon receipt of the MODIFY PDP CONTEXT REQUEST message, the network may reply with the MODIFY PDP CONTEXT ACCEPT message in order to accept the context modification. The reply message may contain the negotiated QoS and the radio priority level based on the new QoS profile and the negotiated LLC SAPI that shall be used in GSM by the logical link.

Upon receipt of the MODIFY PDP CONTEXT ACCEPT message, the MS shall stop the timer T3381. If the offered QoS parameters received from the network differs from the QoS requested by the MS, the MS shall either accept the negotiated QoS or initiate the PDP context deactivation procedure.

Reference

3GPP TS 24.008 clauses 6.1.3.3 and 6.1.3.3.2.

45.3.2.1.3 Test purpose

To test the behaviour of the MS upon receipt of a MODIFY PDP CONTEXT ACCEPT message from the network with

- Requested QoS;

45.3.2.1.4 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Specific PICS statements:

MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

For a R97 to R7 MS, MS initiated PDP Context Modification for first PDP context is supported.

For a R8 MS, MS initiated PDP Context Modification for first PDP context is not supported. Hence this TC is not applicable.

The requested QoS and Minimum QoS are set. A PDP context is activated by the user and accepted by the SS. The MS initiates a PDP context modification by sending a MODIFY PDP CONTEXT REQUEST message with new QoS. The SS accepts the context modification and replies with the MODIFY PDP CONTEXT ACCEPT message with the QoS requested. The SS waits ‘T3390’ seconds to confirm that UE will not initiate a PDP context deactivation.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a PDP context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
4	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request the modification of a PDP context, with new QoS
5	SS -> MS	MODIFY PDP CONTEXT ACCEPT	Accept the PDP context modification with QoS requested
6			SS waits ‘T3390’ seconds to confirm UE does not initiate PDP context deactivation.

Specific message contents

None.

45.3.2.2 MS initiated PDP Context Modification not accepted by the network

45.3.2.2.1 Definition

45.3.2.2.2 Conformance requirement

In order to initiate the procedure, the MS sends the MODIFY PDP CONTEXT REQUEST message to the network, enters the state PDP-MODIFY-PENDING and starts timer T3381. The message may contain the requested new QoS and/or the TFT and the requested LLC SAPI (used in GSM).

Upon receipt of a MODIFY PDP CONTEXT REQUEST message, the network may reject the MS initiated PDP context modification request by sending a MODIFY PDP CONTEXT REJECT message to the MS. The message shall contain a cause code that typically indicates one of the following:

26: insufficient resources;

32: Service option not supported;

41: semantic error in the TFT operation;

42: syntactical error in the TFT operation;

44: semantic errors in packet filter(s);

45: syntactical errors in packet filter(s);

95 - 111: protocol errors.

Upon receipt of a MODIFY PDP CONTEXT REJECT message, the MS shall stop timer T3381 and enter the state PDP-ACTIVE.

Reference

3GPP TS 24.008 clauses 6.1.3.3, 6.1.3.3.2 and 6.1.3.3.3.

45.3.2.2.3 Test purpose

To test the behaviour of the MS upon receipt of a MODIFY PDP CONTEXT REJECT message from the network.

Step	Direction	Message	Comments
1	MS		Initiate a PDP context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation
4	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
5	SS		T3381 ±10% seconds
6	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
7	SS		T3381 ±10% seconds
8	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
9	SS		T3381 ±10% seconds
10	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
11	SS		T3381 ±10% seconds
12	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
13	SS		Wait for T3381 +10% seconds to ensure no further MODIFY PDP CONTEXT REQUEST messages are sent by the MS. The MS may initiate PDP context deactivation procedure.

Specific message contents

None.

45.3.3.2 Collision of MS and network initiated PDP context modification procedures

45.3.3.2.1 Definition

45.3.3.2.2 Conformance requirement

A collision of a MS and network initiated PDP context modification procedures is identified by the MS if a MODIFY PDP CONTEXT REQUEST message is received from the network after the MS has sent a MODIFY PDP CONTEXT REQUEST message itself, and both messages contain the same TI and the MS has not yet received a MODIFY PDP CONTEXT ACCEPT message from the network.

In the case of such a collision, the network initiated PDP context modification shall take precedence over the MS initiated PDP context modification. The MS shall terminate internally the MS initiated PDP context modification procedure, enter the state PDP-Active and proceed with the network initiated PDP context modification procedure by sending a MODIFY PDP CONTEXT ACCEPT message. The network shall ignore the MODIFY PDP CONTEXT REQUEST message received in the state PDP-MODIFY-PENDING. The network shall proceed with the network initiated PDP context modification procedure as if no MODIFY PDP CONTEXT REQUEST message was received from the MS.

Reference

3GPP TS 24.008 clause 6.1.3.3.4 b).

45.3.3.2.3 Test purpose

To test behaviour of the MS when it identifies collision of the MS and SS initiated PDP context modification with the same TI.

45.3.3.2.4 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Specific PICS statements:

MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

For a R97 to R7 MS, MS initiated PDP Context Modification for first PDP context is supported.

For a R8 MS, MS initiated PDP Context Modification for first PDP context is not supported. Hence this TC is not applicable.

A PDP context is activated by the user and accepted by the SS. The MS initiates a PDP context modification by sending a MODIFY PDP CONTEXT REQUEST message. Then the SS initiates the PDP context modification by sending MODIFY PDP CONTEXT REQUEST message with the same TI. The MS shall reply to the SS initiated PDP context modification procedure by sending MODIFY PDP CONTEXT ACCEPT message with the same TI.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a PDP context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context activation
4	MS -> SS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context, with new QoS
5	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request modification of the PDP context with the same TI
6	MS		MS identifies collision, terminates internally the MS initiated PDP context modification procedure
7	MS -> SS	MODIFY PDP CONTEXT ACCEPT	Accept SS initiated PDP context modification. The TI flag set to 0.
8	SS		Wait for T3381 +10% seconds from Step 4 to ensure no further MODIFY PDP CONTEXT REQUEST messages are sent by the MS

Specific message contents

Activate PDP Context Request (used in step 2)

45.4 PDP context deactivation procedure

45.4.1 PDP context deactivation initiated by the MS

45.4.1.1 Conformance requirement

The message contains the transaction identifier in use for the PDP context to be deactivated and a cause code that typically indicates one of the following causes:

- #26: insufficient resources;
- #36: regular PDP context deactivation; or
- #37: QoS not accepted.

Upon receipt of the DEACTIVATE PDP CONTEXT ACCEPT message, the MS shall stop timer T3390.

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.3.1 and 8.3.2 (b).

45.4.1.2 Test purpose

To test the behaviour of the MS upon receipt of a DEACTIVATE PDP CONTEXT ACCEPT message from the network.

45.4.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context is activated by the user and accepted by the SS. The context deactivation is then requested by the user. The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message to the SS. The SS shall then reply with a DEACTIVATE PDP CONTEXT ACCEPT message. The SS shall then wait for T3390 +10% seconds to ensure T3390 has been stopped and that no further messages are sent from the MS. If the MS did not initiate detach procedure, the SS shall then send a MODIFY PDP CONTEXT REQUEST for the deactivated context and the MS shall reply with an SM STATUS message with cause #81 'transaction identifier not known'.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
4	MS		Initiate a context deactivation
5	MS -> SS	DEACTIVATE PDP CONTEXT REQUEST	Request a deactivation of a PDP context
6	SS -> MS	DEACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context deactivation
7	SS		Wait for T3390 +10% seconds to ensure no further deactivate request messages are sent Note: The MS may initiate Detach procedure during this time.
8A	MS -> SS	DETACH REQUEST	
9A	SS -> MS	DETACH ACCEPT	
8B	SS -> MS	MODIFY PDP CONTEXT REQUEST	Send a modify request for the deactivated context.
9B	MS -> SS	SM STATUS	Cause set to #81

Note: Branch ‘A’ is applicable if the MS initiates Detach procedure after the PDP context is deactivated. Otherwise branch ‘B’ is applicable.

45.4.2 PDP context deactivation initiated by the network

45.4.2.1 Conformance requirement

The MS shall, upon receipt of the DEACTIVATE PDP CONTEXT REQUEST message, reply with a DEACTIVATE PDP CONTEXT ACCEPT message.

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation the MS shall send a SM-

STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.

45.4.3 Abnormal cases

45.4.3.1 T3390 Expiry

45.4.3.1.1 Conformance requirement

1) On the first expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.

2) On the second expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.

3) On the third expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.

4) On the fourth expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.

5) On the fifth expiry of timer T3390, the MS shall release all resources allocated and shall erase the PDP context related data.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.3.3.

45.4.3.1.2 Test purpose

To test the behaviour of the MS when the network does not reply to a DEACTIVATE PDP CONTEXT REQUEST message from the MS.

45.4.3.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context is activated by the user and accepted by the SS. A context deactivation is then requested by the user. The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message five times with T3390 ±10% seconds between each message. T3390 +10 % seconds after the fifth message the SS shall send a MODIFY PDP CONTEXT REQUEST message for the deactivated context and the MS shall reply with SM STATUS with cause set to #81 'Transaction identifier not known'.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation

45.4.4 PDP context deactivation initiated by the network / Tear down indicator

45.4.4.1 Conformance requirement

The PDP context deactivation may be initiated by the MS or by the network. The *tear down indicator* information element may be included in the DEACTIVATE PDP CONTEXT REQUEST message in order to indicate whether only the PDP context associated with this specific TI or all active PDP contexts sharing the same PDP address as the PDP context associated with this specific TI shall be deactivated. If the *tear down indicator* information element is not included in the DEACTIVATE PDP CONTEXT REQUEST message, only the PDP context associated with this specific TI shall be deactivated.

The Tear down indicator IE is included in the message in order to indicate whether only the PDP context associated with this specific TI or all active PDP contexts sharing the same PDP address as the PDP context associated with this specific TI shall be deactivated.

Reference

3GPP TS 24.008 subclauses 6.1.3.4, 8.3.2 (b) and 9.5.14.1.

45.4.4.2 Test purpose

To test the behaviour of the MS upon receipt of a DEACTIVATE PDP CONTEXT REQUEST message from the network including Tear down indicator IE.

45.4.4.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context is activated by the user and accepted by the SS. A Secondary PDP context is activated by the user and accepted by the SS. A DEACTIVATE PDP CONTEXT REQUEST message is then sent by the SS indicating the TI of second PDP context and including Tear down indicator IE. The MS shall reply with a DEACTIVATE PDP CONTEXT ACCEPT message. The SS shall then send a MODIFY PDP CONTEXT REQUEST including the TI of second PDP context and the MS shall reply with an SM STATUS message with cause #81 'transaction identifier not known'. The SS shall then send a MODIFY PDP CONTEXT REQUEST including the TI of the first PDP context and the MS shall reply with an SM STATUS message with cause #81 'transaction identifier not known'.

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		Initiate a context activation
2	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context
3	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
4	MS		Initiate a secondary PDP context activation
5	MS -> SS	ACTIVATE SECONDARY PDP CONTEXT REQUEST	Request a Secondary PDP context activation
6	SS -> MS	ACTIVATE SECONDARY PDP CONTEXT ACCEPT	Accept the Secondary PDP context activation
7	SS -> MS	DEACTIVATE PDP CONTEXT REQUEST	Request a deactivation of a PDP context. Include TI of second PDP context and Tear down indicator flag set to 1.
8	MS -> SS	DEACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context deactivation. TI is the same as step 7.
9	SS -> MS	MODIFY PDP CONTEXT REQUEST	Send a modify request including the TI of second PDP context.
10	MS -> SS	SM STATUS	Cause set to #81
11	SS -> MS	MODIFY PDP CONTEXT REQUEST	Send a modify request including the TI of first PDP context.
12	MS -> SS	SM STATUS	Cause set to #81

Specific message contents

45.5 Unknown or Unforeseen Transaction Identifier/Non-semantical Mandatory Information Element Errors

45.5.1 Error cases

45.5.1.1 Conformance requirement

45.5.1.1.1 Conformance requirement for release 98 and earlier MS

The mobile station shall reject a session management message other than SM-STATUS received with TI value "111" by immediately sending an SM-STATUS message with TI value "111". For a session management message received with TI different from "111", the following procedures shall apply:

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation or has been [recently] deactivated, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.

- When a REQUEST PDP CONTEXT ACTIVATION message is received with a transaction identifier flag set to "1", this message shall be ignored.

When on receipt of a message:

- an "imperative message part" error; or

- a "missing mandatory IE" error;

is diagnosed or when a message containing:

- a syntactically incorrect mandatory IE; or

- an IE unknown in the message, but encoded as "comprehension required"; or

- an out of sequence IE encoded as "comprehension required";

is received, the mobile station shall proceed as follows:

- If the message was an SM message the SM-STATUS message with cause # 96 "invalid mandatory information" shall be returned.
- If a mobile station receives a GMM message or SM message with message type not defined for the PD or not implemented by the receiver, it shall return a status message (GMM STATUS or SM STATUS depending on the protocol discriminator) with cause #97 'message type non-existent or not implemented'.
- If the mobile station receives a message not compatible with the protocol state, the mobile station shall ignore the message except for the fact that, if an RR connection exists, it returns a status message (STATUS, MM STATUS depending on the protocol discriminator) with cause #98 "Message type not compatible with protocol state". When the message was a GMM message the GMM-STATUS message with cause #98 "Message type not compatible with protocol state" shall be returned. When the message was a SM message the SM-STATUS message with cause #98 'Message type not compatible with protocol state' shall be returned.
- Other syntactic errors.

This subclause applies to the analysis of the value part of an information element. It defines the following terminology:

- An IE is defined to be syntactically incorrect in a message if it contains at least one value defined as 'reserved', or if its value part violates syntactic rules given in the specification of the value part. However it is not a syntactical error that a type 4 standard IE specifies in its length indicator a greater length than possible according to the value part specification: extra bits are ignored.

Reference

3GPP TS 04.08 subclauses 8.3.2 and 8.5.

3GPP TS 04.07 subclause 11.4.2.

45.5.1.1.2 Conformance requirement for release 99 and later MS

The mobile station and network shall ignore a session management message with TI EXT bit = 0. Otherwise, the following procedures shall apply:

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognized as relating to an active context or to a context that is in the process of activation or deactivation, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value including the extension octet and remain in the PDP-INACTIVE state.
- When REQUEST PDP CONTEXT ACTIVATION message is received with a transaction identifier flag set to "1", this message shall be ignored.

When on receipt of a message,

- an "imperative message part" error; or
- a "missing mandatory IE" error;

is diagnosed or when a message containing:

- a syntactically incorrect mandatory IE; or
- an IE unknown in the message, but encoded as "comprehension required" (see 3GPP TS 24.007); or
- an out of sequence IE encoded as "comprehension required" (see 3GPP TS 24.007) is received,

  the mobile station shall proceed as follows:

  If the message is not one of the messages listed in subclauses 8.5.1, 8.5.2, 8.5.3, 8.5.4 and 8.5.5 a) or b), the mobile station shall ignore the message except for the fact that, if an RR connection exists, it shall return a status message (STATUS, MM STATUS depending on the protocol discriminator) with cause # 96 "Invalid mandatory information". If the message was a GMM message the GMM-STATUS message with cause #96 " Invalid mandatory information" shall be returned. If the message was an SM message the SM-STATUS message with cause # 96 "invalid mandatory information" shall be returned.

- the network shall proceed as follows:

  When the message is not one of the messages listed in subclause 8.5.3 b), c), d) or e) and 8.5.5 a) or c), the network shall either:

  - try to treat the message (the exact further actions are implementation dependent), or

  - ignore the message except that it should return a status message (STATUS, or MM STATUS (depending on the protocol discriminator), GMM STATUS, or SM STATUS) with cause # 96 "Invalid mandatory information".

This subclause applies to the analysis of the value part of an information element. It defines the following terminology:

- An IE is defined to be syntactically incorrect in a message if it contains at least one value defined as 'reserved', or if its value part violates syntactic rules given in the specification of the value part. However it is not a syntactical error that a type 4 standard IE specifies in its length indicator a greater length than possible according to the value part specification: extra bits are ignored.

Reference

3GPP TS 24.008 subclauses 6.1, 8.3.2, 8.5 and 9.5.2.1.

3GPP TS 24.007 subclause 11.4.2.

45.5.1.2 Test Purpose

To test the behaviour of the MS when messages with unknown or unforeseen transaction identifiers or non-semantical mandatory information element errors occur.

45.5.1.3 Method of test

Specific PICS statements:

- MS Higher Layer Release (TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A PDP context activation is requested by the SS with the transaction identifier set to '1'. The MS shall not respond to this request.

A PDP context is then activated from the MS. An invalid accept message is then sent by the SS. The MS shall then send an SM STATUS message. After the MS has sent an ACTIVATE PDP CONTEXT REQUEST message the SS sends a MODIFY PDP CONTEXT REQUEST message with the same transaction identifier. The MS shall reply with an SM STATUS message with the cause set to #98 'Message type not compatible with protocol state'.

After T3380 has expired ±10% seconds the MS shall send another ACTIVATE PDP CONTEXT REQUEST message. The SS sends back a Session Management message with an unknown message type. The MS shall reply with an SM STATUS message with the cause set to #97 'Message type non-existent or not implemented'.

After a further T3380 has expired the MS shall send another ACTIVATE PDP CONTEXT REQUEST message ±10% seconds. Another invalid accept message is sent by the SS.

After a further T3380 has expired ±10% seconds a valid accept message with QoS length greater than 3 is sent by the SS. This shall be accepted by the MS.

A deactivate message is then sent from the SS coded with the extension mechanism for TI. Therefore the TIO value is set to 111 and the transaction identifier extension TIE is set to an unused value greater than 6(no reserved value) . A MS implemented release 98 or earlier should reply with an SM STATUS message with transaction identifier set to '111'. A Rel.99 MS shall reply with an SM STATUS message with cause #81 'invalid transaction identifier value'.

A deactivate message is then sent from the SS with a different transaction identifier to the one used in the activate request message sent by the MS. The MS shall reply with an SM STATUS message with cause #81 'invalid transaction identifier value'.

Two invalid modification messages are then sent to the MS in turn. The MS shall respond each time with an SM-STATUS message with cause # 96 "invalid mandatory information".

Maximum duration of test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	REQUEST PDP CONTEXT ACTIVATION	Request the activation of a PDP context with the transaction identifier flag set to "1"
2	SS		Wait 30 seconds to ensure MS does not request context activation
3	MS		Initiate a context request
4	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context from the MS
5	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Unknown IE encoded as 'comprehension required'
6	MS -> SS	SM STATUS	Cause set to #96
7	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context from the MS (auto-generated) This message shall be sent within T3380 seconds ±10% from the last ACTIVATE PDP CONTEXT REQUEST message
8	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the PDP context
9	MS -> SS	SM STATUS	Cause set to #98 'Message type not compatible with protocol state'.
10	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context from the MS (auto-generated) This message shall be sent within T3380 seconds ±10% from the last ACTIVATE PDP CONTEXT REQUEST message
11	SS -> MS	UNKNOWN MESSAGE	Message with unknown message type
12	MS -> SS	SM STATUS	Cause set to #97 'message type non-existent or not implemented'.
13	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context from the MS (auto-generated) This message shall be sent within T3380 seconds ±10% from the last ACTIVATE PDP CONTEXT REQUEST message
14	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Out of sequence IE encoded as 'comprehension required'
15	MS -> SS	SM STATUS	Cause set to #96
16	MS -> SS	ACTIVATE PDP CONTEXT REQUEST	Activate a PDP context from the MS (auto-generated) This message shall be sent within T3380 seconds ±10% from the last ACTIVATE PDP CONTEXT REQUEST message
17	SS -> MS	ACTIVATE PDP CONTEXT ACCEPT	Accept the PDP context
-			Step 18A, 19A is performed for release 98 and earlier MS and step 18B, 19B for release 99 and later MS implementation
18A	SS -> MS	DEACTIVATE PDP CONTEXT REQUEST	TI set to "111"
18B	SS -> MS	DEACTIVATE PDP CONTEXT REQUEST	TIO=111 and TIE=not used value greater than 6
19A	MS -> SS	SM STATUS	TI set to "111", cause value not checked
19B	MS->SS	SM STATUS	with cause #81 "invalid transaction identifier value
20	SS -> MS	DEACTIVATE PDP CONTEXT REQUEST	Try to deactivate the context with a different transaction identifier to that used to activate the context
21	MS -> SS	SM STATUS	Cause set to # 81
22	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the PDP context
23	MS -> SS	SM STATUS	Cause set to # 96
24	SS -> MS	MODIFY PDP CONTEXT REQUEST	Request the modification of the PDP context
25	MS -> SS	SM STATUS	Cause set to # 96

Specific message contents

As default except:

Request PDP Context Activation

Information Element	Value/remark
Transaction identifier	In the range 0-6
Transaction identifier flag	1
Offered PDP address	Arbitrarily chosen

Activate PDP Context Request

Information Element	Value/remark
Transaction identifier	In the range 0-6
Transaction identifier flag	0
NSAPI	In the range 5-15
Requested LLC SAPI	3, 5, 9 or 11
Requested QoS	Arbitrarily chosen
Requested PDP address	Arbitrarily chosen

Activate PDP Context Accept (used in step 5)

Information Element	Value/remark
Transaction identifier	As above
Transaction identifier flag	1
Negotiated LLC SAPI	As above
Negotiated QoS	As above
Radio priority level	Arbitrarily chosen
Spare half octet	0
PDP address	Arbitrarily chosen
'Comprehension required IE'	0Fh NOTE: first four bits encoded as 'comprehension required'

Activate PDP Context Accept (used in step 14)

Information Element	Value/remark
Transaction identifier	As above
Transaction identifier flag	1
Negotiated LLC SAPI	As above
Negotiated QoS	As above
Radio priority level	Arbitrarily chosen
Spare half octet	0
PDP address	omitted
'Comprehension required IE'	07h NOTE: first four bits encoded as 'comprehension required'
Protocol configuration options	Minimum length with Configuration protocol of 'PPP'

Activate PDP Context Accept (used in step 17)

Information Element	Value/remark
Transaction identifier	As above
Transaction identifier flag	1
Negotiated LLC SAPI	As above
Negotiated QoS	As above but For R97 and R98 : Length set to 5 and 2 extra octets set to 0 after the normal QoS octets For R99 and Rel-4 : Length set to 13 and 2 extra octets set to 0 after the normal QoS octets For Rel-5 and later: Length set to 16 and 2 extra octets set to 0 after the normal QoS octets For Rel-7 and later: Length set to 18 and 2 extra octets set to 0 after the normal QoS octets
Radio priority level	Arbitrarily chosen
Spare half octet	0
PDP address	Arbitrarily chosen

Deactivate PDP Context Request (used in step 18)

Information Element	Value/remark
Transaction identifier	111
Transaction identifier flag	1
SM cause	24h, regular deactivation

Deactivate PDP Context Request (used in step 20)

Information Element	Value/remark
Transaction identifier	In the range 0-6, but different from the TI in the Activate PDP Context Request message
Transaction identifier flag	1
SM cause	24h, regular deactivation

Modify PDP Context Request (used in step 22)

Information Element	Value/remark
Transaction identifier	As in step 17
Transaction identifier flag	1
Radio priority level	As above
Spare half octet	0
Requested LLC SAPI	As above
New QoS	This IE will NOT be present

Modify PDP Context Request (used in step 24)

Information Element	Value/remark
Transaction identifier	As in step 17
Transaction identifier flag	1
Radio priority level	As above
Spare half octet	0
Requested LLC SAPI	Fh, NOTE: this is a reserved value
New QoS	Arbitrary value

46 LLC and SNDCP Tests

46.1 LLC Tests

This subclause contains the test case requirements for Logical Link Control (LLC) procedures in the General Packet Radio Service (GPRS).

46.1.1 Default Conditions

The default values of LLC layer parameters are as per "Table 9: LLC layer parameter default values" in clause 8.9.8 of 3GPP TS 04.64. It is possible that the MS negotiates values different from what is given in the table. In the case where the negotiated value affects the test operation, this is noted in the test.

- The MS default initial condition is that it is GPRS attached and ciphering disabled.

Unless stated otherwise, the default conditions shall apply. $_{NMS}$ denotes the frames sent from the MS and N_{SS} denotes the frames sent from the SS.

Unless stated otherwise the timer T3192 should be set to 80ms.

For all timers, a measurement tolerance of ±10 % shall be applied.

The MS may send an XID command any time. The SS shall send an XID response accepting the values proposed by the MS, unless stated otherwise in the test case.

Test cases identified in TS 51.010-2 as “EC-GSM –IoT compatible” should consider the default cells in the “Initial Conditions” to be EC-GSM-IoT cells if the test has to be executed in “EC Mode”. Otherwise the cell should be considered as a basic GPRS cell.

46.1.2 Test cases

46.1.2.1 Unacknowledged data transfer

46.1.2.1.1 Data transmission in protected mode

46.1.2.1.1.1 Conformance requirement

LLC has two modes of operation - acknowledged and unacknowledged. In the unacknowledged mode of operation, layer3 information is transmitted in numbered Unconfirmed Information (UI) frames. The UI frames are not acknowledged at the LLC layer. Neither error recovery nor reordering mechanisms is defined, but transmission and format errors are detected. Duplicate UI frames are discarded.

In the protected mode of unacknowledged operation, the FCS field protects the frame header and the information field.

Unacknowledged mode of operation is defined for all SAPIs that are not reserved.

Reference

3GPP TS 04.64, subclause 4.3.

46.1.2.1.1.2 Test purpose

To verify that the MS performs unacknowledged data transfer for SAPIs 3, 5 and 11 in the protected mode to the network

46.1.2.1.1.3 Method of test

Initial conditions

For execution counter K = 4 (GEA4) Test USIM has to be plugged into the MS
The MS shall be GPRS attached with ciphering enabled. Encryption GEA1, GEA2, GEA3 or GEA4 is used depending on the execution counter K.

Specific PICS statements:

- Supported encryption Algorithm: GEA1 (TSPC_Feat_GEA1)
- Supported encryption Algorithm: GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm: GEA3 (TSPC_Feat_GEA3)
- Supported encryption Algorithm: GEA4 (TSPC_Feat_GEA4)

PIXIT statements:

-

Test procedure

During GPRS attach ciphering GEA1, GEA2, GEA3 or GEA4 is activated depending on the execution counter K.

During GPRS attach and PDP context activation, the GMM messages are sent and received by the LLC layer at the MS using UI frames in the unacknowledged mode, on SAPI 1. This implicitly verifies bi-directional unacknowledged data transmission on SAPI 1.

After the PDP context is activated, the MS is made to initiate unacknowledged data transfer on SAPI 3. MS shall transmit UI frames with the E and PM bits set to 1, indicating that encryption and protection are on. Transmit 5 000 octets from the MS.

Repeat the test case for SAPIs 5 and 11.

The test is performed for all GEAx encryption algorithm supported by the MS.

Maximum duration of the test

10 minutes.

Expected sequence

The sequence is performed for execution counter K=1 when the MS supports GEA1, for K=2 when the MS supports GEA2, for K=3 when the MS supports GEA3 and for K=4 when the MS supports GEA4.

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. PDP context activation from the MS. The PDP context used here is PDP context 5.
2			Initiate data transfer of 5000 octets from the MS.
3	MS -> SS	UI frame	Verify that the number of octets in the UI frame does not exceed N201-U. Verify that E=1 and PM=1, PD=0, C/R = 0 and the FCS is correct. Check whether the SAPI is 3, 5 or 11 when data is sent from the MS on these SAPIs. Verify that the sequence numbers are correct and that there are no duplicate or missing frames
4			Repeat step 3 until 5000 octets are sent.
5			Repeat the test case for SAPIs 5 and 11.The PDP context used for SAPI 5 is PDP Context 8 and the one for SAPI 11 is PDP Context 9.

46.1.2.1.2 Data transmission in unprotected mode

46.1.2.1.2.1 Conformance requirement

LLC has two modes of operation - acknowledged and unacknowledged. In the unacknowledged mode of operation, layer3 information is transmitted in numbered Unconfirmed Information (UI) frames. The UI frames are not acknowledged at the LLC layer. Neither error recovery nor reordering mechanisms is defined, but transmission and format errors are detected. Duplicate UI frames are discarded.

In the unprotected mode of unacknowledged operation, the FCS field protects the frame header and the first N202 octets of the information field

Unacknowledged mode of operation is defined for all SAPIs that are not reserved.

Reference

3GPP TS 04.64, subclause 4.3.

46.1.2.1.2.2 Test purpose

To verify that the MS performs unacknowledged data transfer without protection in the correct manner, on SAPIs 5 and 9.

46.1.2.1.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After the PDP context is activated, the MS initiates unacknowledged data transfer on SAPI 5. The MS shall transmit UI frames with the E and PM bits set to 0, indicating that encryption and protection are off.

Repeat the test case for SAPI 9.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 10.
2			Initiate unacknowledged data transfer for 5000 octets, from the MS.
3	MS -> SS	UI frame	Verify that the number of octets received at the MS in the UI frame does not exceed N201-U. Verify that E=0 and PM=0, PD=0, C/R = 0 and the FCS is correct. Verify that SAPI = 5 for the first run of the test case and SAPI=9 for the second run of the test case. Verify that the sequence numbers are correct and that there are no duplicate frames.
4	MS -> SS		Repeat step 3 until data transfer is complete.
5			Repeat the test case with PDP Context 6. This will use SAPI 9.

46.1.2.1.3 Reception of I frame in ADM

46.1.2.1.3.1 Conformance requirement

The DM unnumbered response shall be used by an LLE to report to its peer entity that the LLE is in a state such that ABM operation cannot be performed. An LLE shall transmit a DM response to any valid command received that it cannot action.

No information field is permitted within the DM response.

Reference

3GPP TS 04.64, clause 6.4.1.4.

46.1.2.1.3.2 Test purpose

To verify that the MS sends a DM response if an I frame is received while in unacknowledged mode.

46.1.2.1.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After sending data to the MS in unacknowledged mode, send an I frame from the SS. The MS shall send a DM response to indicate that it cannot perform an ABM operation.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 1.
2			Initiate unacknowledged data transfer for 2000 octets, from the SS.
3	SS -> MS	UI frame	
4			Repeat step 3 until 1500 octets are transmitted.
5	SS -> MS	I frame	Send an I Command frame (C/R bit set to 1) from the SS
6	MS -> SS	DM response	Verify that the MS sends a DM response with F = 0.
7			Repeat step 3 until all 2000 octets are transmitted. The MS must not send anymore DM frames.

46.1.2.2 Acknowledged data transfer

46.1.2.2.1 Link establishment

46.1.2.2.1.1 Link establishment from MS to SS

46.1.2.2.1.1.1 Conformance requirement

In the acknowledged operation, layer 3 information is transmitted in numbered Information (I) frames. The I frames are acknowledged at the LLC layer. Error recovery and reordering procedures based on retransmission of unacknowledged I frames are specified.

Acknowledged operation requires that ABM operation has been initiated by an establishment procedure using the Set Asynchronous Balanced Mode (SABM) command.

Acknowledged operation is allowed for all SAPIs that are not reserved except SAPIs 1 and 7 for Release 97-98 and 1, 2, 7 and 8 for Release 99.

Reference

3GPP TS 04.64, subclauses 4.4 and 8.5.2.

46.1.2.2.1.1.2 Test purpose

To test the establishment of acknowledged mode data transfer from the MS to the SS.

46.1.2.2.1.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate acknowledged data transfer from the MS on SAPI 3. Verify that the MS establishes a link before initiating data transfer.

Initiate data transfer from the MS and ensure that the data sent from the MS is received at the SS.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context11.
2	MS -> SS	SABM	Verify that P/F =1.
3	SS -> MS	UA	Send UA from the SS before T200 can expire at the MS. Verify that the MS does not resend SABM.
4			Initiate data transfer of 5000 octets from the MS.
5	MS -> SS	I + S	
6	SS -> MS	RR	Acknowledge whenever requested by the MS. Ensure that the MS does not retransmit the data.
7			Repeat steps 5 and 6 until data transfer is completed

46.1.2.2.1.2 Link establishment from SS to MS

46.1.2.2.1.2.1 Conformance requirement

In the acknowledged operation, layer 3 information is transmitted in numbered Information (I) frames. The I frames are acknowledged at the LLC layer. Error recovery and reordering procedures based on retransmission of unacknowledged I frames are specified.

Acknowledged operation requires that ABM operation has been initiated by an establishment procedure using the Set Asynchronous Balanced Mode (SABM) command.

Acknowledged operation is allowed for all SAPIs that are not reserved except SAPIs 1 and 7.

An LLE shall initiate a request for release of the ABM operation by transmitting a DISC command with the P bit set to 1.

An LLE receiving a DISC command while in ABM state shall transmit a UA response with the F bit set to the same binary value as the P bit in the received DISC command.

Reference

3GPP TS 04.64, subclauses 4.4 and 8.5.2.

46.1.2.2.1.2.2 Test purpose

To test the establishment and release of acknowledged mode data transfer from the SS to the MS.

46.1.2.2.1.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate PDP context activation from the MS . Do a PDP context modification from the SS, which will make the SS initiate a link establishment.

Initiate acknowledged data transfer from the SS on SAPI 9. Verify that the MS responds with a UA.

Initiate data transfer from the SS and ensure that the data sent from the SS is received at the MS.

Terminate data transfer from the SS.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 10.
2		{PDP Context Modification}	Macro. Initiate PDP context modification from the SS using PDP Context 12.
3	SS -> MS	SABM	Send SABM with P/F = 1.
4	MS -> SS	UA	Verify that UA is received before the T200 timer at the SS expires.
5			Initiate data transfer of 2000 octets from the SS.
6	SS -> MS	I + S	Set the A bit to 1 in each I+S frame.
A7(optional step)	MS -> SS	RNR	The MS can send an RNR. Stop data transmission until the MS sends an RR.
7	MS -> SS	RR	Verify that the MS sends an RR for each frame.
8			Repeat steps 6 and 7 until 2000 octets are sent.
9	SS -> MS	DISC	Send DISC from the SS.
10	MS -> SS	UA	

46.1.2.2.1.3 Loss of UA frame

46.1.2.2.1.3.1 Conformance requirement

If timer T200 expires before the UA or DM response with the F bit set to 1 is received, the LLE shall:

- retransmit the SABM command;
- set timer T200;
- increment the retransmission counter.

Reference

3GPP TS 04.64, subclause 8.5.1.3.

46.1.2.2.1.3.2 Test purpose

To test the MS response to the loss of a UA frame during link establishment.

46.1.2.2.1.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate link establishment for acknowledged data transfer from the MS, for SAPI 9. When the SS receives the SABM frame, do not send a response.

After the MS sends another SABM, respond with a UA from the SS and send some frames from the SS to ensure that the link is established.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP context 12.
2	MS -> SS	SABM	Verify that P/F = 1.
3	MS -> SS	SABM	Do not send UA from the SS. Verify that MS sends another SABM with P/F = 1 after T200 seconds, with the same SAPI that it sent in the first SABM.
4	SS -> MS	UA	Send UA from the SS before T200 for that SAPI expires at the MS.
5			Initiate sending 5 I+S frames from the SS.
6	SS -> MS	I+S	Set the A bit to 1 in all the I+S frames.
A7 (optional step)	MS -> SS	RNR	The MS may send an RNR. If it does, stop transmitting from the SS until the MS sends an RR.
7	MS -> SS	RR	Verify that the MS receives and acknowledges all the frames by sending an RR for each I+S frame received.
8			Repeat steps 6 and 7 until 5 I+S frames are sent from the SS.

46.1.2.2.1.4 Total loss of UA frame

46.1.2.2.1.4.1 Conformance requirement

If timer T200 expires before the UA or DM response with the F bit set to 1 is received, the LLE shall:

- retransmit the SABM command;
- set timer T200;
- increment the retransmission counter.

Reference

3GPP TS 04.64, subclause 8.5.1.3.

46.1.2.2.1.4.2 Test purpose

To verify that:

- the MS attempts to establish a link N200 times after sending the first SABM.

46.1.2.2.1.4.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate link establishment from the MS by sending a SABM frame, for SAPI 11. At the SS, ignore the SABM from the MS.

The MS shall wait for time-out of timer T200 and then send a new SABM frame.

At the SS, ignore the SABM frame sent by the MS. Wait until the MS sends N200 + 1 SABM frames in all.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS, using PDP Context 13.
2	MS -> SS	SABM	Verify that P/F = 1, SAPI = 11.
3	MS -> SS	SABM	Do not send UA from the SS. Verify that MS sends another SABM with P/F = 1 after T200 seconds, with the same SAPI that it sent in the first SABM .
4			Perform step 3 N200 times. Ensure that the MS sends N200 + 1 SABM frames in step 2 and steps 3 only.

46.1.2.2.1.5 DM response

46.1.2.2.1.5.1 Conformance requirement

The DM unnumbered response shall be used by an LLE to report to its peer that the LLE is in such a state that ABM operation cannot be performed.

Upon reception of the DM response with the F bit set to 1, the originator of the SABM command shall enter the ADM state.

If the originator of the establishment procedure receives an LL-RELEASE.indication with Cause "DM received", it shall inform the SM sub-layer using the SNSM-STATUS.request primitive with Cause "DM received". SM shall then deactivate all PDP contexts for that SAPI requiring acknowledged peer-to-peer LLC operation.

Reference

3GPP TS 04.64, subclauses 6.4.1.4 and 8.5.1.2.

3GPP TS 04.65, subclause 6.2.1.4.

46.1.2.2.1.5.2 Test purpose

To verify that a link is not established with the MS when a DM response is sent in response to a SABM command.

46.1.2.2.1.5.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate PDP context activation from the MS on SAPI 3. From the SS, send a DM with the F bit set to 1.

Verify that the MS deactivated the PDP Context.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation using PDP Context 11.
2	MS -> SS	SABM	Verify that P/F =1 in the SABM sent from the MS.
3	SS -> MS	DM	Send DM with F=1 from the SS before T200 can expire at the MS. Wait for 2 * T200 seconds after the transmission of DM and verify that the MS does not resend SABM in this period.
4		{PDP Context De-Activation}	Verify that the MS initiates PDP Context Deactivation. MS may initiate this deactivation during 2*T200 sec wait given in step 3.

46.1.2.2.2 MS sends I+S frames

46.1.2.2.2.1 Checking N(S)

46.1.2.2.2.1.1 Conformance requirement

Having either transmitted the UA response to a received SABM command or received the UA response to a transmitted SABM command, I frames and supervisory frames may be transmitted and received. I frames shall be transmitted in ascending N(S) order.

When there is an opportunity to transmit a frame, then the LLE shall do one of the following in the order of priority:

- If there are any I frames marked for retransmission and if the LLE is not in the peer receive busy condition, then the LLE shall increment by 1 the retransmission count variable for the I frame with lowest send sequence number N(S). If the retransmission count variable does not exceed the value of N200, then the LLE shall retransmit the frame.
- If the LLE has a new frame to retransmit, if V(S) < V(A) + k and if the LLE is not in the peer receiver busy condition, then the new I frame shall be transmitted.
- If the LLE has an acknowledgement to transmit, then the LLE shall transmit an S frame.

Reference

3GPP TS 04.64, subclauses 8.6 and 8.6.1.

46.1.2.2.2.1.2 Test purpose

To verify that the MS handles the send sequence number N(S) correctly.

46.1.2.2.2.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate data transfer from the MS on SAPI 3. Send 515 I+S frames continuously. The value of N(S) shall begin from 0 and increment by 1 mod (512) for each frame.

Acknowledge each I frame by sending an RR frame to the MS, in sequence.

Maximum duration of the test

30 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate a PDP context activation using PDP Context 11, from the MS.
2			Initiate data transfer, from the MS.
3	MS -> SS	I+S frame	N(S) = 0 for the first frame.
4	SS -> MS	S frame with RR	Respond whenever acknowledgement is requested.
5			Repeat steps 3 and 4 until all 515 I+S frames have been transmitted from the MS. Verify that : the MS does not retransmit any frame. N(S) begins with 0 and is incremented by 1 mod (512).

NOTE: The application will resend data until all data have been sent.

46.1.2.2.2.2 Busy condition at the peer, with RR sent for resumption of transmission

46.1.2.2.2.2.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1 . Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

If timer T201 expires, the LLE shall:

- if the value of the retransmission count variable is less than N200:
    - transmit an appropriate supervisory frame with an A bit set to 1;
    - set timer T201; and
    - add one to its retransmission count variable.

The LLE receiving the supervisory frame with the A bit set to 1 shall respond, at the earliest opportunity, with an appropriate supervisory frame (see subclause 8.6.4.1) to indicate whether or not its own receiver busy condition still exists.

Upon receipt of the supervisory frame, the LLE shall reset timer T201, and:

- if the frame is an RR, ACK or SACK frame:
    - the peer receiver busy condition shall be cleared;
    - if timer T201 was active before the peer receiver busy condition was set, and if the associated I frame is still not acknowledged, then timer T201 shall be set and associated with the same I frame; and
    - the LLE may transmit new I frames or retransmit I frames as defined in subclauses 8.6.1 or 8.6.3, respectively.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered I frame was received with N(S)=V(R), the appropriate supervisory frame is the RR frame.

Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

46.1.2.2.2.2.2 Test purpose

To verify that the MS:

- Handles busy condition when an RNR is sent from the SS;
- Resumes transmission upon reception of an RR.

46.1.2.2.2.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

The MS is made to send 1 I+S frame on SAPI 9.

The SS does not acknowledge the received I+S frame, when sending as response a supervisory RNR frame.

Immediately after the first RNR frame, the MS shall stop sending I+S frames and start the retransmission timer T201.

After T201 seconds, the MS shall send an RR frame with the A bit set to 1.

The SS responds with a RNR frame.

Within T201 after the second RNR frame, the SS transmit an RR frame to resume transmission.

Immediately after the RR frame, the MS shall start the retransmission of the I+S frame from the point at which it ceased to receive acknowledgement.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 12. Negotiate a value of at least 1 minute for T201.
2			Initiate data transfer of 1 LLC frame (<= N201-I octets) in acknowledged mode from the MS.
3	MS -> SS	I+S frame	Send 1 LLC frame (<=N201-I octets). N(S) = 0 for the first frame
4	SS -> MS	RNR frame	After sending an RNR frame with N(R) = 0 verify that the MS does not send any I + S frames during the next T201 seconds .
5	MS -> SS	RR frame	MS sends an RR frame at T201 after step 4. Verify that the A bit is set to 1.
6	SS -> MS	RNR frame	
7	SS -> MS	RR	Send within T201 after step 6 an RR from the SS with N(R) = 0
8	MS -> SS	I + S	Verify that the MS starts retransmission of the I+S frame from the point at which it had stopped sending, that is, from N(S) = 0
9	SS -> MS	RR	Acknowledge the I + S frame transmitted by the MS.

46.1.2.2.2.3 Busy condition at the peer, with ACK sent for resumption of transmission

46.1.2.2.2.3.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1 . Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

If timer T201 expires, the LLE shall:

- if the value of the retransmission count variable is less than N200:
  - transmit an appropriate supervisory frame with an A bit set to 1;
  - set timer T201; and
  - add one to its retransmission count variable.

The LLE receiving the supervisory frame with the A bit set to 1 shall respond, at the earliest opportunity, with an appropriate supervisory frame (see subclause 8.6.4.1) to indicate whether or not its own receiver busy condition still exists.

Upon receipt of the supervisory frame, the LLE shall reset timer T201, and:

- if the frame is an RR, ACK or SACK frame:
  - the peer receiver busy condition shall be cleared;
  - if timer T201 was active before the peer receiver busy condition was set, and if the associated I frame is still not acknowledged, then timer T201 shall be set and associated with the same I frame; and
  - the LLE may transmit new I frames or retransmit I frames as defined in subclauses 8.6.1 or 8.6.3, respectively.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered frame was received with N(S) = V(R) +1, the appropriate frame is the ACK frame.

Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

46.1.2.2.2.3.2 Test purpose

To verify that the MS:

- Handles busy condition when an RNR is sent from the SS;
- Resumes transmission upon reception of an ACK.

46.1.2.2.2.3.3 Method of test

Initial conditions

\-

Specific PICS statements:

- \-

PIXIT statements:

- \-

Test procedure

The MS is made to send I+S frames continuously on SAPI 9. The SS acknowledges the received I+S frames with supervisory RR frames.

After receiving the last transmitted frame, the SS responds with a supervisory RNR frame. The RNR frame will indicate that all frames except the one before and the last one have been received.

Immediately after the first RNR frame, the MS shall stop sending I+S frames and start the retransmission timer T201.

After T201 seconds, send an ACK frame from the SS, which acknowledges the last received I+S frame.

Immediately after the ACK frame, the MS shall retransmit the unacknowledged frame $N(S)=N_{MS}-2$.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. PDP context activation from the MS with PDP Context 12. If the mobile negotiates a window size kU less than 3, this test shall end at this step.
2			Initiate acknowledged mode data transmission from the MS.
3	MS -> SS	I+S frame	N(S)=0 for the first frame
4	SS -> MS	RR frame	Acknowledge when requested.
5			Repeat steps 3 and 4. The N(S) of the frames shall range from N(S) = 0 until N(S) = N_{MS} -3 mod 512.
6	MS -> SS	I+S frames	The MS sends the I+S frames with N(S) = N_{MS} -2 and N(S) = N_{MS} - 1
7	SS -> MS	RNR frame	After sending RNR frame with N(R) = N_{MS} - 2 mod 512, wait for T201 seconds at the SS.
7a (Optional)	MS -> SS	I+S frames	MS may send few I+S frames before the RNR frame is received completely at the mobile. SS does not acknowledge them.
8	MS -> SS	RR frame	MS sends an RR frame after T201 times out.
9	SS -> MS	RNR frame	
10	SS -> MS	ACK	Send an ACK from the SS with N(R) = N_{MS} - 2 mod 512 within T201 after step 9.
11	MS -> SS	I + S frame	Verify that the MS sends an I+S frame with N(S) = N_{MS} - 2 mod 512.
12	SS -> MS	RR	Acknowledge all the frames transmitted by the MS so far with N(R) = N_{MS}.

46.1.2.2.2.4 SACK frame

46.1.2.2.2.4.1 Conformance requirement

On receipt of a valid SACK frame, the LLE shall consider all I frames with the corresponding bit set to 1 in the SACK bitmap as acknowledged.

Reference

3GPP TS 04.64, subclause 8.6.3.2.

46.1.2.2.2.4.2 Test purpose

To verify that the MS considers only the frames as indicated by the SACK bitmap have been received correctly and that it retransmits the frames that have not been acknowledged.

46.1.2.2.2.4.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

N_{MS} >= 1.

Initiate data transfer from the MS and send frames from N(S) = 0 to N(S) = N_{MS}, where N_{MS}= kU - 1.

If N_{MS} is even, do not acknowledge an arbitrarily chosen sequence of N_{MS}/2 frames and acknowledge the other frames by using SACK.

If N_{MS} is odd, do not acknowledge an arbitrarily chosen sequence of (N_{MS} -1)/2 frames and acknowledge the other frames by using SACK.

Verify that the MS retransmits the not-acknowledged frames.
Acknowledge the retransmitted frames.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. PDP context activation from the MS with PDP Context 11. If the mobile negotiates a window size kU less than 2, this test shall end at this step.
2			Initiate acknowledged mode data transfer from the MS.
3	MS -> SS	I+S frames	N(S) = 0 for the first frame
4			Repeat step 3, with N(S) incremented by 1 for each step. These must be repeated until an I+S frame with the A bit set to 1 is received at the SS and at least N_{MS} +1 I+S frames were transmitted.
5	SS -> MS	SACK	If N_{MS} is even, do not acknowledge an arbitrarily chosen sequence of N_{MS} /2 frames and acknowledge the other frames by using SACK. If N_{MS} is odd, do not acknowledge an arbitrarily chosen sequence of (N_{MS} -1)/2 frames and acknowledge the other frames by using SACK.
6	MS -> SS	I+S frames	Verify that the MS retransmits the not acknowledged frames.
7	SS -> MS	RR	Acknowledge all the frames. N(R) = N_{MS} + 1

46.1.2.2.3 Reception of I + S frames at the MS

46.1.2.2.3.1 Checking N(R)

46.1.2.2.3.1.1 Conformance requirement

Whenever an LLE receives a frame with the A bit set to 1, it shall transmit an I+S or S frame.

In ABM mode, all I frames and Supervisory frames contain N(R), the expected send sequence number of the next in-sequence received I frame. At the time that a frame of the above type is designated for transmission, the value of N(R) is equal to the value of the receive state variable V(R). N(R) indicates that the LLE transmitting the N(R) has correctly received all I frames numbered up to and including N(R) - 1.

Reference

3GPP TS 04.64, subclauses 6.3.5.4.5 and 8.6.3.1.

46.1.2.2.3.1.2 Test purpose

To verify that the MS transmits acknowledgements with the correct N(R).

Test procedure

Send I+S frames continuously from the SS. Send more than 512 frames. The delay between two I+S frames should be less than T201.

Do not send any data from the MS.

When the MS sends RR frames, check the value of N(R) to verify that it indicates that all frames sent from the SS has been acknowledged.

Maximum duration of the test

30 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 11.
2			Initiate acknowledged mode data transfer from the SS.
3	SS -> MS	I+S frame	
4	SS -> MS	I+S frame	The last I+S frame shall have its N(S) = N_{SS} + i mod 512. Set the A bit to 1 in the last frame of each window and the last frame sent from the SS.
A5 (optional step)	MS -> SS	RR	Verify whether the RR frames received from the MS have the correct N(R) values. Verify whether all the I+S frames sent from the SS have been acknowledged.
B5 (optional step)	MS -> SS	RNR	The SS shall wait for an RR frame before it sends the next I+S frame.
			The MS may not send an RR if the A bit is not set in step 4.
6			Repeat from step 4 515 times.
7			At the end of the test, all the frames sent shall have been acknowledged.

46.1.2.2.3.2 MS handling busy condition during bi-directional data transfer

46.1.2.2.3.2.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1. Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered frame was received with N(S) = V(R) +1, the appropriate frame is the ACK frame.

Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

46.1.2.2.3.2.2 Test purpose

To verify that the MS handles peer receiver busy condition when it is transmitting to the SS and receiving data from the SS.

46.1.2.2.3.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Send 1 I+S frame (<=N201-I octets) from the MS.

Send 1 I+S frame from the SS, containing 1 octet of data.

Send an RNR from the SS to indicate receiver busy condition, after 1 frame (N(S) = 0) has been received at the SS. The N(R) value that is sent in the RNR frame is 0.

Verify that the MS stops transmission of I+S frames.

T201 seconds after sending the RNR frame, send an RR frame from the SS with N(R) = 0 to request the MS to resume transmission.

Verify that the MS resumes transmission. The frame sent from the MS should have its N(S) = 0.

Verify that the MS sends acknowledgements for all the I+S frames transmitted from the SS.

Maximum duration of the test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 12.
2			Initiate acknowledged mode data transfer of 1 LLC frame (<= N201-I octets)from the MS and the SS.
3	MS -> SS	I+S frame	N(S) =0 for the first frame
4	SS -> MS	I+S frame	A bit set to 1.
5	SS -> MS	RNR frame	Do not acknowledge the first I+S frame received at the SS. N(R) = 0.
A6 (optional step)	MS -> SS	RNR frame	The MS may repeat this step In this case, the MS shall send an RR frame for resumption of transmission.
6	MS -> SS	RR	Acknowledgement to the I+S frame sent in step 4. This could have been sent by the MS already directly after step 4.
7	MS -> SS	RR	Verify that the MS sends this after T201 seconds after step 5. The MS shall not resend the I+S frame sent in step 3.
8	SS -> MS	RR	N(R) = 0. Send this to resume transmission from the MS.
9	MS -> SS	I+S	Verify that the MS - resends the I+S frame sent in step 3.
10	SS -> MS	RR	Acknowledge the frame transmitted by the MS.

46.1.2.2.3.3 SACK frame

46.1.2.2.3.3.1 Conformance requirement

The SACK supervisory frame shall be used by an LLE to acknowledge single or multiple frames. Frames up to and including N(R) – 1, and frames indicated by the SACK bitmap, have been received correctly.

If the LLE is in the own receiver busy condition, the appropriate supervisory frame is the RNR frame. Otherwise, if the highest numbered frame was received with N(S) = V(R), the appropriate supervisory frame is the RR frame. Otherwise, if the highest numbered I frame was received with N(S) = V(R) + 1, the appropriate supervisory frame is the ACK frame. Otherwise, the appropriate supervisory frame is the SACK frame.

Reference

3GPP TS 04.64, subclauses 6.4.3.3 and 8.6.4.1.

46.1.2.2.3.3.2 Test purpose

To verify whether the MS sends a SACK frame when it is required and that the SACK frame has the correct bits set.

2			Initiate acknowledged mode data transmission from the SS.
3	SS -> MS	I+S frame	A = 1
A4 (Optional step)	MS -> SS	RNR	If the MS sends an RNR, do not transmit data until it has sent an RR.
4	MS -> SS	RR	
5			Repeat steps 3 to 5 until frames 0 to N_{SS} –2 have been sent. Verify that RR frames are sent to acknowledge frames from N(S) = 0 until N(S) = N_{SS} – 2.
6	SS -> MS	I+S frame	Send the frame N_{SS} with A=1. Do not send the frame with N(S) = N_{SS} – 1.
A7 (Optional step)	MS -> SS	RNR	N(R) = NSS – 2. If the MS sends an RNR, do not transmit data until it sends an ACK.
7	MS -> SS	ACK	Verify that an ACK frame is sent to acknowledge the frames N_{SS} –2 and N_{SS} , with N(R) = N_{SS} –1
8	SS -> MS	I+S frame	N(S) = N_{SS} – 1, with A=1.
A9 (Optional step)	MS -> SS	RNR	Verify that N(R) = N_{SS} + 1
9	MS -> SS	RR	Verify that an RR frame is received to acknowledge frame N_{SS} – 1 with N(R) = N_{SS} + 1

46.1.2.2.4 Link Reestablishment

46.1.2.2.4.1 Reestablishment due to reception of SABM

46.1.2.2.4.1.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In Asynchronous Balanced Mode, only I frames contain N(S), the send sequence number of transmitted I frames. At the time that an in-sequence I frame is designated for transmission, the value of N(S) is set equal to the value of the send state variable V(S).

An LLE receiving a SABM command, if it is able to enter the ABM state, shall:

- inform layer 3 using the LL-ESTABLISH-IND primitive;
- if the received SABM command contains a Layer-3 Parameters XID parameter, wait for the receipt of an LL-ESTABLISH-RES primitive from layer 3;

- respond with a UA response with the F bit set to the same binary value as the P bit in the received SABM command (i.e., F=1);
- reset timer T200 if active;
- set V(S), V(R), V(A), and B to 0;
- enter the ABM state;
- clear all existing exception conditions; and
- clear any existing peer receiver busy condition.

Reference

3GPP TS 04.64, subclauses 8.7.1, 6.3.5.4.3 and 8.5.1.2.

46.1.2.2.4.1.2 Test purpose

To verify whether the MS initiates reestablishment of the link if it receives a SABM while in ABM state.

46.1.2.2.4.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the MS . After receiving 1frame from the MS, send a SABM from the SS and verify whether the MS responds with a UA. After the link is re-established, verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context establishment from the MS, using PDP Context 12. Negotiate kU = 1.
2			Initiate acknowledged mode data transfer of 2000 octets from the MS.
3	MS -> SS	I + S	
4	SS -> MS	RR	Acknowledge one frame.
5	MS -> SS	I + S	N(S) = 1.
6	SS -> MS	SABM	After receiving 2 frame from the MS, send a SABM from the SS to re-establish the link.
7	MS -> SS	UA	Verify that the MS responds with a UA.
8	MS -> SS	I+S	Verify that that N(S) begins from 0.
9	SS -> MS	RR	Acknowledge the frame sent from the MS.
10			Repeat steps 8 and 9 until all the frames from the MS are transmitted.

46.1.2.2.4.2 Reestablishment due to N200 failures

46.1.2.2.4.2.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In case of a re-establishment, all NSAPIs mapped to the affected SAPI shall enter the recovery state and all buffered N-PDUs (i.e. the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting with the oldest N-PDU when the link is re-established

Reference

46.1.2.2.4.2.2 Test purpose

To verify whether the MS initiates reestablishment of the link when there is an N200 retransmission failure.

46.1.2.2.4.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the MS, to send 1 LLC frame (<=N201-I octets). Do not acknowledge the data frame sent from the SS. The MS shall retransmit the frame N200 times. Wait for (N200 * T201) seconds and see if the MS initiates link reestablishment by sending a SABM. After the link is re-established verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP context 11.
2			Initiate acknowledged mode data transfer from the MS.
3	MS -> SS	I + S	Send 1 LLC frame (<= N201-I octets). Do not acknowledge this frame from the SS
4	MS -> SS	I + S	Verify that the MS retransmits the I+S frame N200 times and that it does not send any SABM frames during retransmission. SS does not acknowledge any of these frames.
5	MS -> SS	SABM	Verify that the MS sends a SABM and that it stops sending anymore data to the SS. Verify that this occurs after T201 seconds after the last I+S frame in step 4.
6	SS -> MS	UA	
7	MS -> SS	I+S	Verify that the MS resumes transmission of data from step 2.
8	SS -> MS	RR	Acknowledge the frame transmitted from the MS.

46.1.2.2.4.3 Reestablishment due to reception of DM

46.1.2.2.4.3.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In case of a re-establishment, all NSAPIs mapped to the affected SAPI shall enter the recovery state and all buffered N-PDUs (i.e. the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting with the oldest N-PDU when the link is re-established.

Reference

3GPP TS 04.64, subclause 8.7.1.

3GPP TS 04.65, subclauses 5.1.2.3, 5.1.2.5 and 6.2.1.2.

46.1.2.2.4.3.2 Test purpose

To verify whether the MS initiates reestablishment of the link if it receives a DM while in ABM state.

46.1.2.2.4.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the MS . After receiving 3 frames from the MS, send a DM with F=0 from the SS and verify whether the MS responds with a SABM. After the link is re-established, verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS, using PDP context 12.
2			Initiate acknowledged mode data transfer of 8000 octets from the MS.
3	MS -> SS	I + S	
4	SS -> MS	RR	Send RR frames as acknowledgements from the SS.
5			Repeat steps 3 and 4 once.
6	MS -> SS	I+S	
7	SS -> MS	DM	Send a DM with the F bit set to 0 from the SS.
			Discard all the I+S frames received at the SS.
8	MS -> SS	SABM	Verify that the MS re-establishes the link with a SABM
9	SS -> MS	UA	Respond with a UA
10	MS -> SS	I+S	Verify that the MS resumes data transmission , with N(S) set to 0, only for the first frame sent after resumption of transmission.
11	SS -> MS	RR	Acknowledge all frames sent from the MS.
12			Repeat steps 10 and 11 until all the frames from the MS are transmitted.

46.1.2.3 Collision of commands and responses

46.1.2.3.1 Collision of SABM

46.1.2.3.1.1 Conformance requirement

If the transmitted and received unnumbered commands are SABM commands and a Layer-3 Parameters XID parameter is present in both or in neither, then the SABM command transmitted by the SGSN shall be ignored and treated as not transmitted. The LLE in the SGSN shall send the UA response at the earliest possible opportunity if it is able to enter ABM.

Reference

3GPP TS 04.64 subclause 8.5.5.1

46.1.2.3.1.2 Test purpose

To verify that the MS ignores a SABM command received from the SS when it (the MS) is waiting for a UA response, when a Layer-3 Parameters XID parameter is present in both.

46.1.2.3.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate link establishment from the MS by sending a SABM with Layer-3 Parameters XID parameter present. Upon reception of the SABM at the SS, send a SABM with Layer-3 Parameters XID parameter present. Verify that the MS ignores the SABM sent by the SS. Wait for T200 seconds at the SS after receiving the SABM from the MS see if the

MS resends the SABM. After reception of the SABM, respond with a UA. Initiate data transmission from the MS. Acknowledge all the frames sent from the MS.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS with PDP Context 11.
2	MS -> SS	SABM	Verify that P/F = 1. A layer-3 XID parameter shall be present in the SABM received from the MS.
3	SS -> MS	SABM	Send a SABM with P/F =1 to simulate collision. Send the SABM from the SS with a layer 3 XID parameter.
4	MS -> SS	SABM	Ensure that the MS resends the SABM.
5	SS -> MS	UA	Send UA from the SS before T200 can expire at the MS.
6	MS -> SS	I + S	Initiate data transfer from the MS.
7	SS -> MS	RR	Send a supervisory frame as acknowledgement. Wait for T201 seconds to ensure that the MS does not retransmit the data.

46.1.2.3.2 Collision of SABM and DISC

46.1.2.3.2.1 Conformance requirement

If the transmitted and received unnumbered commands are a SABM and DISC command, the LLEs shall issue a DM response at the earliest possible opportunity. Upon receipt of a DM response with the F bit set to 1, the LLE shall enter the ADM state and notify layer3 by means of the appropriate primitive.

Reference

3GPP TS 04.64, subclauses 8.5.5.2 and 8.5.4.

46.1.2.3.2.2 Test purpose

To verify that when the MS receives a DISC after sending a SABM, it shall send a DM response to the SS. Upon reception of a DM response, it shall enter the ADM state.

46.1.2.3.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate link establishment from the MS by sending a SABM command. Send a DISC command in response to this from the SS. Verify that the MS sends a DM and upon reception of a DM from the SS, it enters the ADM state. The MS might try to re-establish ABM directly, or after sending numbered frames from the SS verify that the MS does not acknowledge them and answers with a DM.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 12.
2	MS -> SS	SABM	Verify that P/F = 1
3	SS -> MS	DISC	Send DISC from the SS before T200 can expire at the MS.
4	MS -> SS	DM	
5	SS -> MS	DM	Send DM with F=1
			Branch A, B or C is executed
A6 (Optional)	MS -> SS	DEACTIVATE PDP CONTEXT REQUEST	MS may deactivate the PDP context
A7 (Conditional)	SS -> MS	DEACTIVATE PDP CONTEXT ACCEPT	
B6 (Optional)	MS -> SS	SABM	The MS may try to re-establish ABM.
C6 (Optional)	SS -> MS	I+S	Send an I+S Command (C/R bit set to 1)frame from the SS.
C7 (Conditional)	MS -> SS	DM	The MS shall send a DM as response to the I+S frame with the F bit set to 0.

46.1.2.3.3 Collision of SABM and XID commands

46.1.2.3.3.1 Conformance requirement

If the transmitted unnumbered command is a SABM command and the received unnumbered command is an XID command, then the LLE shall ignore the received XID command.

Reference

3GPP TS 04.64 subclause 8.5.5.2.

46.1.2.3.3.2 Test purpose

To verify that the MS ignores the XID command if it collides with a SABM command.

46.1.2.3.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

When the MS initiates link establishment using a SABM, send an XID command. Verify that the XID command is ignored.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 12.
2	MS -> SS	SABM	Verify that P/F = 1.
3	SS -> MS	XID	Send an XID command without layer3 parameters.
4	MS -> SS	SABM	Ensure that the MS does not send an XID response and resends the SABM.
5	SS -> MS	UA	Send UA from the SS before T200 can expire at the MS. Wait for T200 seconds after the transmission of UA to ensure that the MS does not send an XID response.

46.1.2.4 Unsolicited response frames

46.1.2.4.1 Unsolicited DM

46.1.2.4.1.1 Conformance requirement

When a DM response with the F bit set to 0 is received by an LLE, a collision between a transmitted SABM or DISC command and the unsolicited DM response may have occurred.

A DM response with the F bit set to 0 colliding with a SABM or DISC shall be ignored.

An LLE shall ignore a DM response received with F=0 when it is in the Local Establishment state.

Reference

3GPP TS 04.64 subclauses 8.5.6 and 8.8.4.

46.1.2.4.1.2 Test purpose

To verify that the MS ignores a DM response sent with F=0 when LLC is in the Local Establishment state.

46.1.2.4.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Send SABM with P/F =1 from the MS to establish a link. Send a DM response with F=0 from the SS, in response to this. Verify that the MS ignores this DM response and sends SABM after expiry of T200. Respond with UA from the SS after receiving SABM. Send 1 I+S frame from the SS and verify that the MS acknowledges it.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS with PDP Context 11.
2	MS -> SS	SABM	Initiate data transfer from the MS. Verify that P/F = 1.
3	SS -> MS	DM	Send a DM response with F=0
4	MS -> SS	SABM	Ensure that the second SABM is sent.
5	SS -> MS	UA	Send UA from the SS before T200 expires at the MS.
6	SS -> MS	I+S frame	Send one I+S frame from the SS.
A7 (Optional step)	MS -> SS	RNR	Verify that the RNR acknowledges the frame transmitted in step 6.
7	MS -> SS	RR frame	Verify that the MS acknowledges the I+S frame transmitted from the SS.

46.1.2.5 FRMR frames

46.1.2.5.1 Sending FRMR due to undefined command control field

46.1.2.5.1.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall:

- discard the frame causing the frame rejection condition;
- transmit a FRMR response frame; and
- if the LLE is in ABM operation, initiate re-establishment.

Reference

3GPP TS 04.64, subclauses 6.4.1.5 and 8.8.2.

46.1.2.5.1.2 Test purpose

To verify that if the MS receives a frame with a command control field that is not implemented, it sends an FRMR frame and re-establishes the link.

46.1.2.5.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the MS. After receiving the first frame, send a supervisory frame from the SS to acknowledge the last I+S frame received. In this set the first byte of the S frame control field to 1110 0000. Verify whether the MS sends an FRMR. After the link is re-established, verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS with PDP context 11.
2			Initiate acknowledged mode data transfer of 1 LLC frame (<= N201-I octets) from the MS.
3	MS -> SS	I + S	
4	SS -> MS		After receiving the first I + S frame, send a frame, with the contents of the control field as 1110 0000.
5	MS -> SS	FRMR	Verify that the control field of the frame sent in step 4 is sent back in the FRMR response. Verify that the value of V(S) received is 1. W3 shall be set to 1. W1 and W2 shall be set to 0. W4 shall be set to 1.
6	MS -> SS	SABM	Verify that the MS re-establishes the link with a SABM and that it stops sending anymore data to the SS.
7	SS -> MS	UA	Respond with a UA
8	MS -> SS	I+S	Verify that the MS resumes data transmission, with N(S)=0, for the first frame transmitted
9	SS -> MS	RR	Acknowledge all frames sent from the MS.

46.1.2.5.2 Sending FRMR due to reception of an S frame with incorrect length

46.1.2.5.2.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

Reference

3GPP TS 04.64, subclauses 6.4.1.5 and 8.8.2.

46.1.2.5.2.2 Test purpose

To verify that if the MS receives an S frame with incorrect length, it sends an FRMR frame and re-establishes the link.

46.1.2.5.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the MS. Send an RR with incorrect length, from the SS, when an I+S frame from the MS with the A bit set is received. Verify whether the MS sends an FRMR. After the link is re-established, verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS with PDP context 12.
2			Initiate acknowledged mode data transfer from the MS with a sufficient amount of data so that an I+S frame with the A bit set to 1 is sent by the MS.
3	MS -> SS	I + S	
4			Repeat step 3 until a frame with the A bit set to 1 is received.
5	SS -> MS	RR	There shall be an extra octet in this RR frame, before the FCS. The RR frame shall appear as follows: Address field (1 octet) Control field (2 octets) Extra field (1 octet) FCS (3 octets)
			SS shall discard I+S frames received from the MS.
6	MS -> SS	FRMR	Verify that the control field of the RR message is sent back in the FRMR response. W1, W3 and W4 shall be set to 1. The content of W2 shall not be checked.
7	MS -> SS	SABM	Verify that the MS re-establishes the link with a SABM and that it stops sending anymore data to the SS.
8	SS -> MS	UA	Respond with a UA
9	MS -> SS	I+S	Verify that the MS resumes transmission of data.
10	SS -> MS	RR	Acknowledge all frames sent from the MS.
11			Repeat 9 and 10 until all the frames from the MS are transmitted and acknowledged.

46.1.2.5.3 Sending FRMR due to reception of an I frame information field exceeding the maximum length

46.1.2.5.3.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

Reference

3GPP TS 04.64, subclauses 6.4.15 and 8.8.2.

46.1.2.5.3.2 Test purpose

To verify that if the MS receives an I frame with an information field that exceeds the maximum established length, it sends an FRMR frame and re-establishes the link.

46.1.2.5.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

After establishing a link, initiate data transfer from the SS. After sending 5 frames from the SS, send an I+S frame with length greater than N201-I, from the SS. Verify whether the MS sends an FRMR. After the link is re-established, send frames from the SS with N(S) = 0 until N(S) = 5. Verify that the MS acknowledges all the data sent.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP context 11,
2			Initiate acknowledged mode data transfer from the SS.
3	SS -> MS	I + S	A = 1
A4 (Optional step)	MS -> SS	RNR	If the MS sends an RNR, do not transmit data until it sends an RR.
4	MS -> SS	RR	Send RR frames as acknowledgements from the MS.
5			Repeat steps 3 and 4 until 5 frames are sent from the SS.
6	SS -> MS	I + S	Send an I+S frame with the information field length greater than N201-I, from the SS .
7	MS -> SS	FRMR	Verify that the control field of the I+S message is sent back in the FRMR response. Also verify that the value of V(R) indicates all the frames sent so far except the erroneous I+S frame have been received. W2 and W4 shall be set to 1. W1, W3 shall be set to 0.
8	MS -> SS	SABM	Verify that the MS re-establishes the link with a SABM .
9	SS -> MS	UA	Respond with a UA
10	SS -> MS	I+S	Send data from the SS.
A11 (Optional step)	MS -> SS	RNR	If the MS sends an RNR , do not transmit data until it has sent an RR.
B11 (Optional step)	MS -> SS	RR	Verify that all the frames sent from the SS are acknowledged.
12			Repeat 10 and 11 until all the frames from the SS are transmitted and acknowledged.

46.1.2.5.4 Frame reject condition during establishment of ABM

46.1.2.5.4.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

Upon occurrence of a frame rejection condition during establishment of or release from ABM operation, or whilst in ADM state, the LLE shall discard the frame.

Reference

3GPP TS 04.64, subclauses 6.4.15 and 8.8.2.

46.1.2.5.4.2 Test purpose

To verify that if the MS receives a U frame with its frame type not implemented during ABM establishment, it shall ignore the message.

46.1.2.5.4.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate link establishment from the MS by sending a SABM. Send an invalid U frame as response. Check if the MS resends the SABM. Respond with a UA. Initiate data transfer from the MS and acknowledge all the frames sent from the MS.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 13.
2	MS -> SS	SABM	Verify that P/F = 1.
3	SS -> MS	Invalid U frame	Send a U frame with its control field M4 M3 M2 M1 = 0010
4	MS -> SS	FRMR	
5	MS -> SS	SABM	Ensure that the MS resends SABM
6	SS -> MS	UA	
7	MS -> SS	I + S	Initiate data transfer from the MS.
8	SS -> MS	RR	Acknowledge all frames sent from the MS.

46.1.2.6 Multiple Connections

46.1.2.6.1 Simultaneous acknowledged and unacknowledged data transfer on the same SAPI

46.1.2.6.1.1 Conformance requirement

The purpose of LLC is to convey information between layer-3 entities in the MS and SGSN. Specifically, LLC shall support:

- multiple MSs, at the Um interface;
- multiple layer-3 entities within the MS.

Reference

3GPP TS 04.64, subclause 4.2.

46.1.2.6.1.2 Test purpose

To verify that LLC supports simultaneous acknowledged and unacknowledged data transfer in the same direction on the same SAPI.

46.1.2.6.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate acknowledged data transfer from the MS on SAPI 3. Send 300 frames continuously. The value of N(S) shall begin from 0 and increment by 1 mod (512) for each frame. Initiate unacknowledged data transfer from the MS on the same SAPI within 1 minute from initiation of the acknowledged data transfer.

Acknowledge all the I frames sent from the SS by sending RR frames to the MS.

Maximum duration of the test

30 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation on PDP context 11 and 5 from the MS. - For PDP context 11, SS negotiates a value of 140 for N201-I. - For PDP context 5, SS triggers an XID negotiation to set N201-U to 140.
2			Initiate acknowledged mode data transfer from the MS.
3	MS -> SS	I+S frame	N(S) = 0 for the first frame
4	SS -> MS	S frame with RR	Send RR only when A bit = 1.
5			Initiate unacknowledged mode data transfer of 200 UI frames (using PDP context 5) from the MS within 1 minute from step2.
6	MS -> SS	I+S frame	
7	SS -> MS	RR	Send RR only when A bit = 1.
8	MS -> SS	UI	
9			Repeat from step 6 until 300 I+S frames of acknowledged data and 200 UI frames of unacknowledged data are transmitted. I Verify that : The MS does not retransmit any frame. N(S) begins with 0 and is incremented by 1 mod (512) for each transmission N(U) begins with 0 and is incremented by 1 mod (512) for each transmission

46.1.2.6.2 Simultaneous acknowledged and unacknowledged data transfer on different SAPIs

46.1.2.6.2.1 Conformance requirement

The purpose of LLC is to convey information between layer-3 entities in the MS and SGSN. Specifically, LLC shall support:

- multiple MSs, at the Um interface;
- multiple layer-3 entities within the MS.

Reference

3GPP TS 04.64, subclause 4.2.

46.1.2.6.2.2 Test purpose

To verify that LLC supports simultaneous acknowledged and unacknowledged data transfer on different SAPIs in different directions.

46.1.2.6.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate unacknowledged data transfer from the MS on SAPI 5. Initiate acknowledged data transfer from the SS on SAPI 3 after the first i frames have been received from the MS. Send 300 I+S frames continuously from the SS. The value of N(S) shall begin from 0 and increment by 1 mod (512) for each frame.

Verify that the MS acknowledges all the I frames sent from the SS. Verify that the UI frames are received at the SS in sequence.

Maximum duration of the test

15 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation on PDP Contexts 8 and 11 from the MS. For PDP context 8, SS triggers an XID negotiation to set N201-U to 140.
2			Initiate unacknowledged mode data transfer of 200 UI frames octets from the MS.
3	MS -> SS	UI frame	
4			Initiate acknowledged mode data transfer of 300 I+S frames octets from the SS.
5	SS -> MS	I+S frame	Start sending I+S frames after i UI frames have been received. Set the A bit to 1 when the window is full and for the last I+S frame.
A6	MS -> SS	UI frame	
B6	MS -> SS	RNR	If the MS sends an RNR, the SS shall resume transmission only after it transmits a SACK, RR or an ACK.
C6	MS -> SS	SACK	The SS shall retransmit the unacknowledged frames.
D6	MS -> SS	ACK	The SS shall retransmit the unacknowledged frames.
E6	MS -> SS	S frame with RR	Verify that the MS acknowledges all the frames sent from the SS.
			The MS may not send any frame if the A bit was not set in step 5.
7			Repeat steps 5 and 6 until all 300 I+S frames have been transmitted for the acknowledged mode from the SS and 200 UI frames for the unacknowledged mode to the SS. Verify that : The MS acknowledges all I+S frames sent. -The MS sends all UI frames in the correct sequence.

46.1.2.7 XID Negotiation

46.1.2.7.1 Negotiation initiated by the SS during ABM, for T200 and N200

46.1.2.7.1.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

T200, N200 and N201-U can be negotiated in ADM and ABM.

Reference

3GPP TS 04.64, subclause 6.4.1.6.

46.1.2.7.1.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of T200 and N200, the MS complies with the final negotiated values

46.1.2.7.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate XID negotiation from the SS, with N200 = 4 and T200 = 10 s. The MS will send an XID response. Initiate data transfer from the MS. Verify that the MS complies with the values of T200 and N200 that were agreed upon.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS for PDP Context 11
2	SS -> MS	XID	XID command with N200 = 4, T200 = 10 s. Check if the P/F bit is set to 1.
3	MS -> SS	XID	XID response. Check if the P/F bit is set to 1. The values, if received in this message shall be the negotiated values, else the values are deemed to be confirmed.
4			Initiate acknowledged mode data transfer of 1 LLC frame (<= N201-I octets)from the MS.
5	MS -> SS	I + S	
6			Do not respond with an RR.
7	MS -> SS	I+S	Verify that the MS resends the I+S frame every T200 seconds N200 times.
8	MS -> SS	SABM	Verify that the MS sends a SABM to re-establish the link
9	SS -> MS	UA	Respond with a UA within T200 seconds.

46.1.2.7.2 Negotiation initiated by the SS during ADM, for N201-I

46.1.2.7.2.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

N201-I, mD, mU, kD and kU can be negotiated to any value in Range in ADM. In ABM, N201-I, mD, mU, kD and kU can only be negotiated to the same or higher value as previously used.

Reference

3GPP TS 04.64, subclause 6.4.1.6.

46.1.2.7.2.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of N201-I during ADM, the MS complies with the final negotiated values.

46.1.2.7.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate PDP context activation from the MS and in the UA response from the SS send a value of 140 for N201-I. If the MS responds with an XID command, in the XID response, give N201-I = 140.

Initiate data transfer from the SS. Send an I+S frame of length N201-I with the A bit set to 1. Verify that the MS acknowledges this I+S frame.

The next I+S frame sent from the SS shall be of length N201-I +1. Verify that the MS sends FRMR and re-establishes the link.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 11.
2	MS -> SS	SABM	
3	SS -> MS	UA	Set N201-I = 140 in the UA sent. If the MS sends an XID command with a different value of N201-I, send back a response with N201-I = 140.
4	SS -> MS	I+S	Send an I+S frame from the SS with length N201-I with the A bit set to 1.
A5 (optional step)	MS -> SS	RNR	If the MS sends an RNR, verify that the RNR acknowledges the frame sent in step 4. Do not transmit the next I+S frame to the SS until the MS sends an RR.
5	MS -> SS	RR	Verify that the MS responds with an RR.
6	SS -> MS	I+S	The length of this I+S frame shall be N201-I + 1. Set the A bit to 1.
7	MS -> SS	FRMR	Verify that the control field of the I+S message is sent back in the FRMR response. Also verify that the value of V(R) indicates all the frames sent so far except the erroneous I+S frame have been received. W2 and W4 shall be set to 1. W1 and W3 shall be set to 0.
8	MS -> SS	SABM	Verify that the MS re-establishes the link with a SABM.
9	SS -> MS	UA	Respond with a UA within T200 seconds.

46.1.2.7.3 Negotiation initiated by the SS (using XID, for IOV-UI)

46.1.2.7.3.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

LLC layer and layer-3 parameters may be negotiated with the exchange of XID frames or with the exchange of SABM and UA frames. After successful negotiations of SABM and UA frames, the LLE shall be in ABM mode of operation.

IOV-UI shall only be negotiated in ADM. IOV-UI and IOV-I shall only be transmitted in the downlink direction.

Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.5.3.

46.1.2.7.3.2 Test purpose

To verify that when the SS sends IOV-UI to the MS in a XID, the MS shall cipher its output using this value of IOV-UI.

46.1.2.7.3.3 Method of test

Initial conditions

For execution counter K = 4 (GEA4) Test USIM has to be plugged into the MS. The MS shall be GPRS attached with ciphering enabled. Encryption GEA1, GEA2, GEA3 or GEA4 is used depending on the execution counter K.

Specific PICS statements:

- Supported encryption Algorithm: GEA1 (TSPC_Feat_GEA1)
- Supported encryption Algorithm: GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm: GEA3 (TSPC_Feat_GEA3)
- Supported encryption Algorithm: GEA4 (TSPC_Feat_GEA4)

PIXIT statements:

-

Test procedure

During GPRS attach ciphering GEA1, GEA2, GEA3 or GEA4 is activated depending on the execution counter K.

Initiate link establishment from the SS. In the XID command, send a new value of IOV-UI, different from the default used. Send 1000 octets from the MS and verify that the frames have been ciphered as per the new value of IOV-UI.

The test is performed for all GEAx encryption algorithm supported by the MS.

Maximum duration of the test

5 minutes.

Expected sequence

The sequence is performed for execution counter K=1 when the MS supports GEA1, for K=2 when the MS supports GEA2, for K=3 when the MS supports GEA3 and for K=4 when the MS supports GEA4.

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 5.
2		{PDP Context Modification}	Macro. Initiate PDP context modification to PDP Context 3 from the SS.
3	SS -> MS	XID	With IOV-UI = $2^{27} * 10$.
4	MS -> SS	XID	
5			Initiate data transfer from the MS. Send 1000 octets.
6	MS -> SS	UI	Verify that ciphering is as per the new value of IOV-UI. The SS shall check this by analyzing the FCS.
7			Repeat the steps 6 till the data transfer is complete.

46.1.2.7.4 Negotiation initiated by the SS (during ADM, for N201-U)

46.1.2.7.4.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

T200, N200 and N201-U can be negotiated in ADM and ABM.

N201-U is used for U and UI frames.

Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.9.5.

46.1.2.7.4.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of N201-U during ADM, the MS complies with the final negotiated values.

46.1.2.7.4.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Initiate XID negotiation from the SS, with N201-U = 140. The MS shall send an XID response. The value of N201-U shall either be not present in the XID response or set to 140.

Initiate data transfer from the MS. Verify that the length of the UI frames sent from the MS never exceeds the negotiated value of N201-U.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 9.
2	SS -> MS	XID	XID command with N201-U = 140
3	MS -> SS	XID	XID response. Check if the P/F bit is set to 1. The N201-U value, if received in this message shall beset to 140, else the value is deemed to be confirmed.
4			Initiate unacknowledged data transfer of 1000 octets from the MS.
5	MS -> SS	UI	Verify that the frame length does not exceed the negotiated value of N201-U.
6			Repeat step 5 until 1000 octets have been sent from the MS.

46.1.2.7.5 Negotiation initiated by the SS (during ADM, for IOV-UI)

46.1.2.7.5.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

IOV-UI shall only be negotiated in ADM. IOV-UI and IOV-I shall only be transmitted in the downlink direction.

IOV-UI is associated with a TLLI.

Reference

3GPP TS 04.64, subclauses 6.4.1.6, 8.5.3 and 8.9.

3GPP TS 04.08 subclause 4.7.12.

46.1.2.7.5.2 Test purpose

To verify that when the SS sends IOV-UI to the MS in an XID command:

- The MS shall cipher its output using this value of IOV-UI.
- This value of IOV-UI shall be applicable for all SAPIs using this TLLI.
- Identity Response sent from the MS shall not be ciphered.

46.1.2.7.5.3 Method of test

Initial conditions

- For execution counter K = 4 (GEA4) Test USIM has to be plugged into the MS.

Specific PICS statements:

- Supported encryption Algorithm : GEA1 (TSPC_Feat_GEA1)
- Supported encryption Algorithm : GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm : GEA3 (TSPC_Feat_GEA3)
- Supported encryption Algorithm : GEA4 (TSPC_Feat_GEA4)

PIXIT statements:

-

Test procedure

Send a value of IOV-UI from the SS, different from the default used. Send 1 000 octets from the MS and verify that the frames have been ciphered as per the new value of IOV-UI.

Send 1 000 octets from the MS on SAPI 11. Verify that the frames have been ciphered as per the new value of IOV-UI.

The test is performed for all GEAx encryption algorithm supported by the MS.

Maximum duration of the test

3 minutes.

Expected sequence

The sequence is performed for execution counter K=1 when the MS supports GEA1, for K=2 when the MS supports GEA2, for K=3 when the MS supports GEA3 and for K=4 when the MS supports GEA4.

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate a PDP context activation from the MS using PDP Context 10.
2	SS -> MS	UI [Authentication and Ciphering Request]	Send the Authentication and Ciphering Request from the SS to start ciphering using the following encryption algorithm: GEA1 for K=1, GEA2 for K=2, GEA3 for K=3, GEA4 for K=4.
3	MS -> SS	UI [Authentication and Ciphering Response]	For K=1,2,3 the SS checks the SRES For K=4, the SS check the RES and "Auth. Response Parameter (extension)" IE might be included if the RES value is more than 4 octets long.
4	SS -> MS	XID	XID command with IOV-UI = 5000.
5	MS -> SS	XID	Verify that the MS accepts this value of IOV-UI by sending an XID response. Verify the XID response received. If the MS has requested for a new set of XID parameters, verify that the values requested are within range.
6			Initiate unacknowledged data transfer of 1000 octets from the MS.
7	MS -> SS	UI	Verify that these frames have been ciphered as per the new value of IOV-UI.
8	SS -> MS	UI [Identity Request]	This UI frame must not be sent ciphered.
9	MS -> SS	UI [Identity Response]	This UI frame shall not be ciphered. The E bit shall not be set to 1.
10		{PDP Context Deactivation}	Macro. Deactivate PDP Context 10.
A11 (Optional step)			If the MS performs a GMM detach the SS completes the Detach procedure.
11		{PDP Context Activation}	Macro. Activate PDP Context 9. If the MS is detached in step A11, GPRS-re-attachment shall be performed.
A12 (Conditional step)			If the MS is re-attached in step 11, then step 2, 3, 4 and 5 shall be repeated to set IOV-UI parameter and restart ciphering.
12			Initiate a data transfer of 1000 octets from the MS on SAPI 11 for the same value of TLLI as before.
13	MS -> SS	UI	Verify that ciphering is as per the new value of IOV-UI.

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 2:

Same as default content except :

Information element	Value/remark
IE AUTN	Not present for K = 1 Not present for K = 2 Not present for K = 3 Present for K = 4
Ciphering Algorithm Type of Algorithm	 GEA/1 for K = 1 GEA/2 for K = 2 GEA/3 for K = 3 GEA/4 for K = 4

46.1.2.7.6 Negotiation initiated by the SS (during ABM, for Reset)

Send Reset during unacknowledged mode data transfer and check if N(S) begins from 0.

46.1.2.7.6.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

Reset shall only be negotiated with an XID frame, and only transmitted in the downlink direction. If Reset is present in an XID frame, it shall be the first parameter in the XID information field.

The Reset parameter shall be used, in the SGSN originating Reset and the MS receiving Reset, to:

- set all LLC layer parameters to the default values given in table 9;
- change any LLEs in ABM state to ADM state;
- set the unconfirmed state variable V(U) to value 0;
- set the unconfirmed receive state variable V(UR) to 0;
- set the OCs for unacknowledged information transfer to 0.

The Reset parameter shall be treated before any additional XID parameters present in the same XID frame.

Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.5.3.1.

46.1.2.7.6.2 Test purpose

To verify that when the SS sends the Reset parameter to the MS in an XID:

- it sets all LLC layer parameters to the default values;
- change any LLEs in ABM state to ADM state;
- set the unconfirmed state variable V(U) to value 0;
- set the unconfirmed receive state variable V(UR) to 0;
- set the OCs for unacknowledged information transfer to 0.

46.1.2.7.6.3 Method of test

Initial conditions

System simulator

The System Simulator shall support two cells, each in a different SGSN Routing Area.

Mobile station:

The MS shall be GPRS attached with ciphering enabled.

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

For this test case, $N_{MS} = N_{SS} = 10$.

Initiate unacknowledged data transfer from the MS. Send N_{MS} UI frames.

Initiate unacknowledged data transfer from the SS. Send N_{SS} UI frames.

During PDP context activation for Context 11, initiate XID negotiation from the SS, with N200 = 4 and T200 = 10, if it is not done by the MS or if the MS tries to negotiate with N200 < 4 and T200 < 10, otherwise accept the values proposed by the MS. Initiate data transfer from the MS. Do not acknowledge the first frame sent from the MS and verify that the MS complies with the values of T200 and N200 that were agreed upon.

Initiate inter-SGSN Routing Area Update from the MS, which will make the SS send an XID command with the Reset parameter. Send I+S frames from the MS, with the A bit set to 1. Do not acknowledge the first I+S frame. Verify that the MS sends the I+S frame N200 times, every T201 seconds. Verify that the values of N200 and T201 are the default values.

Initiate unacknowledged data transfer from the MS for the same SAPI and for the same TLLI used before sending Reset from the SS. Verify that the frames are numbered from 0 and not from N_{MS}. Verify that the frames can be decrypted using OC = 0.

Maximum duration of the test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS using PDP Context 9.
2	MS -> SS	UI frame	
3			Repeat step 2 until N_{MS} frames are sent.
4	SS -> MS	UI frame	
5			Repeat step 4 until N_{SS} frames are sent.
6		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS for PDP Context 11.
7	MS -> SS	SABM	If the MS negotiates N200 and T200, then accept the proposed values if N200 >= 4 and T200 >=10.
8	SS -> MS	UA	Send N200 = 4, T200 = 10 s in the UA response, if the MS does not negotiate N200 and T200, or if the values of N200 and T200 proposed by the MS are not accepted by the SS in step 7.
9			Initiate acknowledged mode data transfer of 1 octet from the MS.
10	MS -> SS	I + S	
11			Do not respond with an RR. Verify that the MS retransmits the I+S frame every T200 seconds N200 times.
12	MS -> SS	SABM	Verify that the MS sends a SABM to re-establish the link
13	SS -> MS	UA	Respond with a UA within T200 seconds.
14		{Inter-SGSN Routing Area Update}	Macro. Initiate Inter-SGSN Routing Area Update from the MS. (This procedure sends XID reset). The MS shall reselect the new cell and do a Routing Area Update with the new SGSN.
15	SS->MS	SABM	Send N200 and T200 with values higher than the ones negotiated in step 7 and 8.
16	MS-> SS	UA	
17	MS -> SS	I + S	Resume data transfer from the MS.
18			Do not respond with an RR from the SS. Check that the MS retransmits the frame after T201 seconds, N200 times. T201 and N200 shall be as per the values negotiated, if any, after link re-establishment and not as per the values of N200 and T200 negotiated before sending a Reset, in step 8.
19	MS -> SS	SABM	Verify that the MS sends a SABM to re-establish the link
20	SS -> MS	UA	Respond with a UA within T200 seconds.
21	MS -> SS	UI	Initiate unacknowledged data transfer from the MS and send 50 octets for the same SAPI and for the same TLLI used before sending Reset from the SS. Verify that these frames have been ciphered with OC = 0 and are numbered from 0 and not from N_{MS}.

46.1.2.7.7 XID command with unrecognised type field

46.1.2.7.7.1 Conformance requirement

If a SABM or XID command with an invalid XID information field is received, then the SABM or XID command, respectively, shall be ignored.

If a SABM or XID command with unrecognised type field is received, then this parameter shall be ignored.

Reference

3GPP TS 04.64, subclause 8.5.3.3.

46.1.2.7.7.2 Test purpose

To test the MS response to an XID command with an unrecognised type field.

46.1.2.7.7.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Send an XID frame from the SS with N201-U = 800 and another parameter with type = 15. Verify that the MS responds with an XID response. Verify that the MS sends UI frames with N201-U taking negotiated value.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate a PDP context from the MS using PDP Context 10.
2	SS -> MS	XID	Send an XID command with N201-U = 800 and an XID parameter with its type = 15, length =4 and value = 1500.
3	MS -> SS	XID	Verify the XID response received. If the MS has requested for a new XID value, verify that the new values are within range the sense of negotiation is correct The values received in the XID response shall be regarded as the final negotiated values.
4			Initiate unacknowledged mode data transfer of 2000 octets from the MS.
5	MS -> SS	UI frame	Verify that the frame length does not exceed the negotiated value for N201-U

46.1.2.7.8 XID Response with out of range values

46.1.2.7.8.1 Conformance requirement

If UA or XID response with an invalid XID information field is received, then the UA or XID response shall be ignored, the SABM or XID command shall be retransmitted, and the retransmission counter shall be incremented.

Reference

3GPP TS 04.64, subclause 8.5.3.3.

46.1.2.7.8.2 Test purpose

To test the MS response to an XID response with the N201-I value out of range.

46.1.2.7.8.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Send an XID frame within SABM , from the MS with layer3 parameters. Respond from the SS with an XID, with N201-I = 1600. Verify that the MS ignores this response and resends the SABM with the XID command. Now accept the XID values received at the SS. Send an I+S frame with length less than N201-I and the A bit set to 1 and verify that the MS responds with an RR. Send an I+S frame from the SS with its length larger than the maximum negotiated value of N201-I and verify that the MS sends an FRMR and re-establishes the link.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS, using PDP context 11.
2	MS -> SS	SABM[XID]	XID command with layer3 parameters, sent with SABM.
3	SS -> MS	UA[XID]	Send an XID response in UA, with N201-I = 1600
4	MS -> SS	SABM[XID]	Verify that the MS resends the SABM command.
5	SS -> MS	UA[XID]	Send UA accepting all the XID values.
6	SS -> MS	I+S	Send an I+S frame with the maximum negotiated value of N201-I, with the A bit set to 1.
A7 (optional step)	MS -> SS	RNR	If the MS sends an RNR, verify that the RNR acknowledges the frame sent in step 6. Do not transmit the next I+S frame to the SS until the MS sends an RR.
7	MS -> SS	RR	Verify that the MS responds with an RR
8	SS -> MS	I+S	Send an I+S frame with length = N201 – I + 1, with the A bit set to 1.
9	MS -> SS	FRMR	Verify that the MS responds with an FRMR
10	MS -> SS	SABM	Verify that the MS initiates link re-establishment
11	SS -> MS	UA	Respond with a UA.

46.2 SNDCP Tests

This clause contains the test case requirements for Subnetwork Dependent Convergence Protocol(SNDCP) procedures in the General Packet Radio Service (GPRS).

46.2.1 Default Conditions

- The MS default initial condition is that it is GPRS attached.
- Data and header compression are off.

The N-PDU size shall be more than the negotiated values of N201-U and N201-I so that segmentation at SNDCP is ensured. Unless stated otherwise, the default conditions shall apply.

If the MS sends an XID command with XID parameters any time before a data transfer, the SS shall send an XID response, accepting the values proposed by the MS.

Test cases identified in TS 51.010-2 as “EC-GSM –IoT compatible” should consider the default cells in the Initial Conditions to be EC-GSM- IoT Cells if the test has to be executed in “EC Mode”.Otherwise the cell should be considered as a basic GPRS cell.

46.2.2 Test cases

46.2.2.1 Data transfer

46.2.2.1.1 Mobile originated normal data transfer with LLC in acknowledged mode

46.2.2.1.1.1 Conformance requirement

The SNDCP entity shall initiate acknowledged data transmission only if the PDP context for the NSAPI identified in the SN-DATA.request has been activated and if acknowledged LLC operation has been established.

The N-PDU number in acknowledged mode is a number assigned to each N-PDU received by SNDCP through an SN-DATA.request. N-PDU numbers for different NSAPIs shall be assigned independently. The N-PDU number shall be included in the SNDCP header of the first segment of an N-PDU.

Upon reception of an SN-DATA.request, the SNDCP entity shall assign to the N-PDU received the current value of the Send N-PDU number as the N-PDU number, increment the Send N-PDU number by 1, perform the compression and segmentation functions, then forward the SN-PDU(s) in LL-DATA.request to the LLC layer. The N-PDU shall be stored into a buffer in the SNDCP entity. The buffered N-PDU shall be deleted when the SN-DATA PDU carrying the last segment of the N-PDU is confirmed by an LL-DATA.confirm primitive.

A (possibly compressed) N-PDU shall be segmented into one or more SN-PDUs. The length of each SN-PDU shall not be greater than N201-I (for acknowledged mode) or N201-U (for unacknowledged mode).

Reference

3GPP TS 04.65, subclauses 6.9.1 and 6.7.1.1.

46.2.2.1.1.2 Test purpose

To verify that:

- The MS sends the N-PDU number in the first segment of every N-PDU.
- The MS increments the N-PDU number properly.
- The size of a segment must not be greater than N201-I.

46.2.2.1.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Activation of PDP context 13 is initiated from MS.

Verify that the first segment of the first N-PDU received has N-PDU number 0. Acknowledge all the segments received from the MS. For the subsequent N-PDUs received, verify that the N-PDU number is incremented properly.

Repeat the test case for PDP contexts 11 and 12.

Maximum duration of the test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. The PDP context used here is PDP context 13.
2			Initiate data transfer of 5000 octets from the MS .
3	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0.
4			Verify that the last segment of every N-PDU received has M=0, T=0, and F=0. Note: Final SN-DATA-PDU could have M=0, T=0 and F=1, if the last N-PDU is too short to be segmented
5			Verify that for the subsequent N-PDUs, the N-PDU number is incremented properly
6			Repeat step 3 to 5 until data transfer is completed.
7			Repeat the test case for SAPIs 3 and 9.The PDP context used for SAPI 3 is PDP Context 11 and the one for SAPI 9 is PDP Context 12.

46.2.2.1.2 Mobile originated normal data transfer with LLC in unacknowledged mode

46.2.2.1.2.1 Conformance requirement

The SNDCP entity shall initiate unacknowledged data transmission only if the PDP context for the NSAPI identified in the SN-DATA.request has been activated. The SNDCP entity may initiate unacknowledged data transmission even if the acknowledged peer-to-peer operation is not established for that NSAPI. The N-PDU number in unacknowledged mode is a number assigned to each N-PDU received by SNDCP through an SN-UNITDATA.request. N-PDU numbers for different NSAPIs shall be assigned independently. The N-PDU number shall be included in the SNDCP header of every SN-UNITDATA PDU.

A variable, the Send N-PDU number (unacknowledged), shall be maintained for each NSAPI using unacknowledged peer-to-peer LLC operation. When an NSAPI using unacknowledged peer-to-peer LLC operation is activated, the Send N-PDU number (unacknowledged) shall be set to 0. The Send N-PDU number (unacknowledged) shall also be set as described in subclauses 5.1.2.1 and 5.1.2.22. Modulo 4096 operation shall be applied to the Send N-PDU number (unacknowledged).

Upon reception of an SN-UNITDATA request, the SNDCP entity shall assign the current value of the Send N-PDU number (unacknowledged) as the N-PDU number of the N-PDU received, increment Send N-PDU number (unacknowledged) by 1, compress and segment the information, then forward the SN-PDU(s) in LL-UNITDATA.request to the LLC layer. The N-PDU shall be deleted immediately after the data has been delivered to the LLC layer.

A (possibly compressed) N-PDU shall be segmented into one or more SN-PDUs. The length of each SN-PDU shall not be greater than N201-I (for acknowledged mode) or N201-U (for unacknowledged mode).

The segment number is a sequence number assigned to each SN-UNITDATA PDU. The sequence number shall set to 0 in the first SN-UNITDATA PDU of an N-PDU, and incremented by 1 for each subsequent SN-UNITDATA PDU. Modulo 16 operation is applied. N-PDU number is included in every SN-UNITDATA PDU.

The SNDCP entity shall perform the mapping function of SN_UNITDATA primitives onto LL_UNITDATA primitives

Reference

3GPP TS 04.65, subclauses 6.9.2, 6.7.1.1, 6.7.3 and 5.2.

46.2.2.1.2.2 Test purpose

To verify that:

- The MS sends the N-PDU number in every segment of every N-PDU.
- The MS increments the N-PDU number and segment number properly and modulo 16 operation is applied.
- The size of a segment shall not be greater than N201-U.
- The MS maps the SN_UNITDATA PDUs onto SAPIs allocated by Network.

46.2.2.1.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP context 10 is initiated from MS.

Initiate unacknowledged data transfer from MS.

Verify that the first segment of the first N-PDU received has N-PDU number 0. For the subsequent N-PDUs received, verify that the N-PDU number is incremented properly.

Verify that the SN-UNITDATA PDUs are numbered correctly.

Verify the SAPI number on which the data PDU is received.

Verify that Modulo 16 operation is applied.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. The PDP context used here is PDP context 10.
2	SS -> MS	XID	XID command with N201-U = 140.
3	MS -> SS	XID	XID response.
4			Initiate data transfer of 5000 octets (with each N-PDU being more than 140 octets) from the MS.
5	MS -> SS	SN-UNITDATA PDU	Verify that the number of octets in the SN-UNITDATA PDU does not exceed N201-U. Verify that the first SN-UNITDATA PDU received has M=1, T=1, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0, segment = 0.
6	SS		Verify that the segment number is incremented properly for every SN-PDU. Verify that the last segment of every N-PDU received has M=0, T=1, and F=0. The last N-PDU may not be segmented; the F bit shall not be checked.
7	SS		Verify that for the subsequent N-PDUs, the N-PDU number is incremented properly and N-PDU number is present in every SN-UNITDATA PDU
8	SS		Verify the SAPI number In the received LLC frame header
9			Repeat steps 5 to 8 until data transfer is completed. Verify modulo 16 operation is applied for the 17th segment of SN-UNITDATA PDU, Note: This check of ‘Modulo 16 operation’ is to be done only if; the NPDUs are having 17 or more segments.

46.2.2.1.3 Usage of acknowledged mode for data transmission before and after PDP Context modification, on different SAPIs

46.2.2.1.3.1 Conformance Requirement

Upon reception of the SNSM-MODIFY.indication from the SM sublayer:

- the SNDCP entity shall, if necessary, establish the acknowledged peer-to-peer LLC operation for the indicated SAPI (the establishment criteria and procedure are described in subclause 6.2.1);
- the SNDCP entity shall also, if necessary, release the acknowledged peer-to-peer LLC operation for the originally-assigned SAPI (the release criteria and procedure are described in subclause 6.2.2); In addition, if the newly-assigned SAPI is different from the original SAPI:
    - LL-DATA.indication, LL-DATA.confirm and LL-UNITDATA.indication received on the old SAPI shall be ignored;
    - LL-DATA.request and LL-UNITDATA.request shall be sent on the new SAPI; and
    - if acknowledged peer-to-peer LLC operation is used both before and after the receipt of the SNSM-MODIFY. indication, then all buffered N-PDUs (i.e., the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting from the oldest N-PDU.

Reference

3GPP TS 04.65, subclause 5.1.2.23.

46.2.2.1.3.2 Test purpose

To verify that after the PDP context modification:

- the MS resumes acknowledged data transfer correctly with the oldest N-PDU which is buffered after a PDP context modification.

46.2.2.1.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 11 is initiated from MS.

After the first N-PDU is correctly received in acknowledged mode, the last segment of the second N-PDU (N-PDU number=1) is not acked and a PDP context modification is initiated from SS to PDP context 12, i.e.: using SAPI 9 in acknowledged mode.

After the modification procedure is complete, the first SN-DATA PDU received shall have the N-PDU number 1. The N-PDU received shall be the same as the last one before the modification procedure was triggered.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 11.
2			Initiate acknowledged data transfer for 5000 octets, from the MS.
3	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0.
4			Verify that the last segment of the first N-PDU received has M=0, T=0, and F=0. The last segment of last N-PDU may be not segmented; the F bit shall not be checked.
5			Receive the next N-PDU, N-PDU = 1 by following steps 3 and 4. Do not acknowledge the last segment of the N-PDU.
6		{PDP Context Modification}	Macro. Initiate PDP context modification procedure from the SS. Use PDP context 12 (i.e.: using SAPI 9 in acknowledged mode)
7	SS->MS	DISC	Initiate the release of LLC link by sending DISC on SAPI 3 and receive UA or DM from MS.
8	MS->SS	UA or DM	
9	SS->MS	SABM	Initiate the establishment of LLC link by sending SABM on SAPI 9 and receive UA from MS.
10	MS->SS	UA	
11	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0. Verify that the N-PDU received has N-PDU number = 1.
12			Verify that the last segment of every N-PDU received has M=0, T=0, and F=0. The last segment of last N-PDU may be not segmented; the F bit shall not be checked.
13			Verify that for the subsequent N-PDUs, the N-PDU number is incremented properly
14			Repeat steps 11 to 13 until data transfer is completed.

46.2.2.1.4 Reset indication during unacknowledged mode

46.2.2.1.4.1 Conformance Requirement

Upon receipt of the LL-RESET.indication, the SNDCP layer shall:

- reset all SNDCP XID parameters to their default values;
- in the MS, for every NSAPI using unacknowledged peer-to-peer LLC operation, set the Send N-PDU number (unacknowledged) to 0.

Reference

3GPP TS 04.65, subclause 5.1.2.1.

46.2.2.1.4.2 Test purpose

To verify that the MS resets the Send N-PDU number to 0 on link reset during an unacknowledged mode data transfer.

46.2.2.1.4.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 8 is initiated from MS.

An XID command is sent with reset from SS during unacknowledged data transfer, after receiving N-PDU number 2 from MS. The next N-PDU number from MS shall be 0.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 8.
2			Initiate unacknowledged data transfer using sufficient amount of data (for example 150000 octets) to be sure that at step 8 the MS still has available N-PDUs for transmission subsequent to XID procedure at step 6 and step 7.
3	MS -> SS	SN-UNITDATA PDU	Verify that the number of octets in the SN-UNITDATA PDU does not exceed N201-U. Verify that the first SN-UNITDATA PDU received has M=1, T=1, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0, sequence number = 0.
4			Verify that the last segment of the first N-PDU received has M=0, T=1, and F=0.
5			Receive the N-PDUs from the MS until N-PDU number becomes 2
6	SS->MS	XID	Initiate the XID command from SS with reset
			Discard all UI frames received.
7	MS->SS	XID	XID response
8	MS -> SS	SN-UNITDATA PDU	Verify that the number of octets in the SN-UNITDATA PDU does not exceed N201-U. Verify that the first SN-UNITDATA PDU received after link reset has M=1, T=1, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0, segment number = 0.

46.2.2.1.5 Reset indication during acknowledged mode

46.2.2.1.5.1 Conformance Requirement

Upon receipt of the LL-RESET.indication, the SNDCP layer shall:

- reset all SNDCP XID parameters to their default values;
- for every NSAPI using acknowledged peer-to-peer LLC operation, enter the recovery state and suspend the transmission of SN-PDUs until an SNSM-SEQUENCE.indication primitive is received for the NSAPI.

Reference

3GPP TS 04.65, subclause 5.1.2.1.

46.2.2.1.5.2 Test purpose

To verify that the MS suspends the data transfer in acknowledged mode on link reset and resume when indicated by the SS.

46.2.2.1.5.3 Method of test

Initial conditions

Two cells , cell A and B need to be supported. B is in a routing area (in a new SGSN) and location area different from that of A. The power level of cell A shall be higher than that of cell B so that the MS selects cell A.

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 13 is initiated from MS.

Acknowledge the first 2 N-PDUs received from MS during the data transfer.

Initiate an inter SGSN Routing Area Update procedure from MS. An XID command is sent with reset from SS, after receiving N-PDU number N from MS. Specify the Receive N-PDU number to be 3 in the Routing Area Update Accept message. Verify that the data transfer is resumed and the MS sends the complete N-PDU with N-PDU number 3.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2			Initiate acknowledged data transfer for 7000 octets, from the MS.
3	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0.
4			Verify that the last segment of the first N-PDU received has M=0, T=0, and F=0.
5			Receive the N-PDUs from the MS until N-PDU number becomes 1 and acknowledge all the segments completely.
6			Receive the N-PDUs 2 and 3 from the MS and do not acknowledge the last SN-PDU of N-PDU 3..
7		{Inter-SGSN Routing Area Update}	Macro. Initiate a cell change requesting the MS to move to cell B. Initiate an inter SGSN Routing Area Update procedure from SS. Send the Receive N-PDU number as 3 in the Routing Area Update Accept message. Note: After changing the signal strength and before receiving the RAU REQUEST, MS may send some more SN-DATA PDUs. These PDUs are not acknowledged in cell A.
8	SS->MS	SABM	
9	MS->SS	UA	
10	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 3. Last N-PDU may be not segmented; in which case the M bit shall not be checked.
11			Repeat step 10 until data transfer is completed.

46.2.2.1.6 Inter SGSN (with NAS container / new Routing Area / SGSN indicated Reset) PS Handover / Synchronized cell case / successful

46.2.2.1.6.1 Conformance Requirement

If during PS handover the MS is requested to perform a Reset of LLC layer parameters and layer-3 parameters (see 3GPP TS 24.008 [8a]), the MS shall perform the actions described above and shall send the XID response on one of the active SAPIs once the PS handover procedure has been successfully completed.

If Reset of LLC layer parameters and layer-3 parameters without old XID indicator has been performed, following the sending of the XID response each active LLE in the MS shall:

- set timer T100; and
- not initiate any XID negotiation procedure while T100 is running.

3GPP TS 44.064, subclause 8.5.3.1.

46.2.2.1.6.2 Test purpose

To verify that the MS triggered by a Packet Switch Handover to move to a different SGSN will handle the different types of LLC reset contained in the NAS container.

46.2.2.1.6.3 Method of test

Initial conditions

Cells A and B need to be supported. Cell B is in a routing area (in a new SGSN) and location area different from that of Cell A. The power level of Cell A shall be higher than that of Cell B so that the MS selects Cell A.

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 13 is initiated from MS.

Acknowledge the first 2 N-PDUs received from MS during the data transfer.

Initiate an inter SGSN Routing Area Update procedure from MS triggered by a PSHO including the NAS container (same GEA used) after receiving N-PDU number N from MS. Specify the Receive N-PDU number to be 3 in the Routing Area Update Accept message. Verify that the data transfer is resumed and the MS sends the complete N-PDU with N-PDU number 3.

The procedure is run twice, the only difference being k, the old XID field in the {Inter-SGSN Routing Area Update – with PSHO} macro:

Sequence k=0, the MS shall perform a Reset of LLC and SNDCP without old XID indicator

Sequence k=1, the MS shall perform a Reset of LLC and SNDCP with old XID indicator

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2			Initiate acknowledged data transfer for 7000 octets, from the MS.
3	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0.
4			Verify that the last segment of the first N-PDU received has M=0, T=0, and F=0.
5			Receive the N-PDUs from the MS until N-PDU number becomes 1 and acknowledge all the segments completely.
6			Receive the N-PDUs 2 and 3 from the MS and do not acknowledge the last SN-PDU of N-PDU 3.
7		{Inter-SGSN Routing Area Update – with PSHO}	Macro parameter: **Old XID :** K parameter according to tested sequence. Send the Receive N-PDU number as 3 in the Routing Area Update Accept message.
8	SS->MS	SABM	
9	MS->SS	UA	
10	MS -> SS	SN-DATA PDU	Verify that the number of octets in the SN-DATA PDU does not exceed N201-I. Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 3. Last N-PDU may be not segmented; in which case the M bit shall not be checked.
11			Repeat step 10 until data transfer is completed.

46.2.2.2 Segmentation

46.2.2.2.1 LLC link re-establishment on reception of SN-DATA PDU with F=0 in ack mode in the Receive First Segment state

46.2.2.2.1.1 Conformance Requirement

Receive First Segment state:

- If an SN-DATA PDU is received with the F bit set to 0, the SN-DATA PDU shall be discarded, and the acknowledged LLC operation shall be re-established for the SAPI used.

Reference

3GPP TS 04.65, subclause 6.7.4.1.

46.2.2.2.1.2 Test purpose

To verify that the MS re-establishes the LLC SAPI on reception of an SN-DATA PDU with F=0 as the first segment in the acknowledged mode data transfer.

46.2.2.2.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 13 is initiated from MS.

An acknowledged mode data transfer is started from SS with the first SN_DATA PDU with F=0.

Verify that the MS shall re-establish the LLC SAPI 11.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2			Initiate acknowledged data transfer for 5000 octets, from the SS.
3	SS -> MS	SN-DATA PDU	Send the first SN-DATA PDU with M=1, T=0, F=0, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0 .
4	MS->SS	SABM	MS re-establishes the LLC SAPI 11
5	SS->MS	UA	
6	SS -> MS	SN-DATA PDU	Send the first SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0
7			Repeat step 6 until data transfer is completed. Verify that all SN-DATA PDUs are acknowledged.

46.2.2.2.2 LLC link re-establishment on receiving second segment with F=1 and with different PCOMP and DCOMP values in the acknowledged mode data transfer

46.2.2.2.2.1 Conformance Requirement

Receive Subsequent Segment state:

- If an SN-DATA PDU is received with the F bit set to 1, and if DCOMP, PCOMP or N-PDU number is different from those in the first segment, then the SN-DATA PDU and all previous segments belonging to the same N-PDU shall be discarded, and the acknowledged LLC operation shall be re-established for the SAPI used.

Reference

3GPP TS 04.65, subclause 6.7.4.2.

46.2.2.2.2.2 Test purpose

To verify that the MS re-establishes the LLC SAPI on reception of the second SN-DATA PDU with F=1 and with PCOMP and DCOMP values different from those of the previous segment, in the second segment in acknowledged mode data transfer.

46.2.2.2.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 13 is initiated from MS.

AN acknowledged mode data transfer is started from SS with the first SN_DATA PDU with F=1. Send the second SN-DATA PDU from SS with F=1 and with PCOMP and DCOMP values different from those in the first segment.

Verify that the MS shall re-establish the LLC SAPI 11.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2			Initiate acknowledged data transfer for 5000 octets, from the SS.
3	SS -> MS	SN-DATA PDU	Send the first SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0.
4	SS->MS	SN-DATA PDU	Send the second SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 1,N-PDU number = 0.
5	MS->SS	SABM	Re-establishment of LLC link on SAPI 11.
6	SS->MS	UA	
7	SS -> MS	SN-DATA PDU	Send the first SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0
8			Repeat step 7 until data transfer is completed. Verify that all SN-DATA PDUs are acknowledged.

46.2.2.2.3 Single segment N-PDU from MS

46.2.2.2.3.1 Conformance Requirement

- The F bit in the SNDCP header shall be set to 1 for the first segment, and 0 for all subsequent segments. For unacknowledged peer-to-peer LLC operation, DCOMP and PCOMP shall be included in the header when the F bit is set to 1, and shall not be included when the F bit is set to 0. For acknowledged peer-to-peer LLC operation, DCOMP, PCOMP and N-PDU number shall be included in the header when the F bit is set to 1, and shall not be included when the F bit is set to 0.
- The M bit in the SNDCP header shall be set to 0 for the last segment, and 1 for all previous segments. If only one SN-PDU is generated for an N-PDU, the F bit shall be set to 1 and the M bit set to 0.

Reference

3GPP TS 04.65, subclause 6.7.1.1.

46.2.2.2.3.2 Test purpose

To verify that for a single segment N-PDU, the MS shall send the SN_UNITDATA PDU with F=1 and M=0 during unacknowledged data transfer.

46.2.2.2.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 10 is initiated from MS.

An unacknowledged mode data transfer is started from MS for a data size less than N201-U. Verify that the MS sends the SN-UNITDATA PDU with M=0 and F=1.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 10.
2			Initiate unacknowledged data transfer for 1 LLC frame (<= N201-U octets), from the MS.
3	MS -> SS	SN-UNITDATA PDU	Verify that the single SN-UNITDATA PDU is received with M=0 and F=1.

46.2.2.3 Link Release

46.2.2.3.1 LLC link release on receiving DM from the SS during link establishment

46.2.2.3.1.1 Conformance Requirement

If the originator of the establishment procedure receives an LL-RELEASE.indication with Cause "DM received", it shall inform the SM sub-layer using the SNSM-STATUS.request primitive with Cause "DM received". SM shall then deactivate all PDP contexts for that SAPI requiring acknowledged peer-to-peer LLC operation.

Reference

3GPP TS 04.65, subclause 6.2.1.4.

46.2.2.3.1.2 Test purpose

To verify that in MS, the LLC SAPI is released and the PDP context is deactivated on reception of DM response from SS during link establishment.

46.2.2.3.1.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 13 is initiated from MS.

A DM response is sent from SS, after receiving a SABM from the MS for link establishment. The MS shall release the LLC SAPI 11 and the PDP context for the NSAPI shall be deactivated.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2	MS -> SS	SABM	SABM sent for link establishment during PDP context activation
3	SS->MS	DM	Initiate a DM response with F=1 from the SS.
4			Verify that the MS initiates PDP Context Deactivation.

46.2.2.4 XID negotiation

46.2.2.4.1 Response from MS on receiving XID request from the SS

46.2.2.4.1.1 Conformance Requirement

The XID negotiation is a one-step procedure; i.e., the initiating end proposes parameter values, and the responding end either accepts these or offers different values in their place according to the XID negotiation rules described in the present document; the rules limit the range of parameter values as well as the sense of negotiation. The initiating end accepts (or rejects) the values in the response; this concludes the negotiation.

A bit set to 0 means that the compression entity is not applicable to the corresponding NSAPI. A bit set to 1 means that the compression entity is applicable to the corresponding NSAPI.

Reference

3GPP TS 04.65, subclause 6.8.1.

46.2.2.4.1.2 Test purpose

To verify that:

- the MS which does not support compression, responds with applicable NSAPI field with 0 for an XID request from the SS with some compression entity;
- the MS which supports compression responds with the applicable NSAPI field set to 1 for an XID request from the SS with some compression entity.

46.2.2.4.1.3 Method of test

Initial conditions

-

Specific PICS statements:

- MS supporting compression has compression turned on (TSPC_AddInfo_GPRS_Data_Compr and/or TSPC_AddInfo_GPRS_Header_Compr).
- Support of GPRS header compression algorithm type RFC 1144 (TSPC_AddInfo_GPRS_Header_Compr_Type_RFC1144)
- Support of GPRS header compression algorithm type RFC 2507 (TSPC_AddInfo_GPRS_Header_Compr_Type_RFC2507)
- Support of ROHC algorithm type RFC 3241 (TSPC_AddInfo_ROHC_Type_RFC3241)
- Support of ROHC algorithm type RFC 3242 (TSPC_AddInfo_ROHC _Type_RFC3242)
- Support of ROHC algorithm type RFC 3408 (TSPC_AddInfo_ROHC _Type_RFC3408)
- Support of ROHC algorithm type RFC 3095 (TSPC_AddInfo_ROHC _Type_RFC3095)

PIXIT statements:

-

Test procedure

PDP Context 10 is initiated from MS. The MS supporting compression will also trigger an XID negotiation. Modify the PDP Context to PDP Context 9 from the SS.

After PDP context modification, trigger compression by sending an XID Request from SS including a L3-parameter with some compression entity for the NSAPI assigned for the PDP context.

The MS which does not support compression or has a lack of resources shall respond with XID response setting the applicable NSAPI field set to 0, indicating that compression is not supported/wanted.

The MS which support compression and has compression turned on shall respond with XID response setting the applicable NSAPI field set to 1, indicating that compression is supported. The MS may choose to not include an SNDCP XID parameter in its response (implicit response), which is equivalent to responding with the value proposed by the SS.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 10. The MS supporting compression will also trigger an XID negotiation.
2		{PDP Context Modification}	Macro. Initiate PDP Context Modification from the SS. The new context is PDP Context 9. If the MS supports compression, SS triggers an XID negotiation in order to remove the PDP Context from the Applicable NSAPIs of the compression entities negotiated in step 1.
3	SS -> MS	XID Request	In the layer3 XID parameters, send a PCOMP entity with parameter type = 2, entity number = 1 and algorithm type, which the MS supports or 0 if the MS does not have support of header compression, a DCOMP entity with parameter type = 1, entity number = 1 and algorithm type = 0. In the applicable NSAPI field, set the bit for the NSAPI assigned for the PDP context.
A4	MS -> SS	XID Response	Verify that the MS which does not support compression, has compression turned off or has a lack of resources responds with the assigned NSAPI field set to 0.
B4	MS -> SS	XID Response	Verify that the MS which supports compression and has compression turned on responds either with the assigned NSAPI field set to 1 or without including the relevant L3 XID parameter (implicit response).
5			Initiate unacknowledged data transfer for 5000 octets, from the MS.
6	MS -> SS	SN-UNITDATA PDU	Verify that the number of octets in the SN-UNITDATA PDUs does not exceed N201-U.
A7			For mobiles which do not support compression, verify that the first SN-UNITDATA PDU received has M=1, T=1, F=1, X = 0, DCOMP = PCOMP = 0,N-PDU number = 0.
B7			For mobiles which support compression such that the SN-UNITDATA-PDU needs to be segmented, verify that the first SN-UNITDATA PDU received has M=1, T=1, F=1, X = 0, DCOMP = the negotiated value (assuming that data is compressible), PCOMP = the negotiated value (assuming that data contains an valid TCP/IP header) or 0 (data did not contain a valid TCP/IP header), N-PDU number = 0.
C7			For mobiles which support compression such that the SN-UNITDATA-PDU does not need to be segmented, verify that the first SN-UNITDATA PDU received has M=0, T=1, F=1, X = 0, DCOMP = the negotiated value (assuming that data is compressible), PCOMP = the negotiated value (assuming that data contains an valid TCP/IP header)) or 0 (data did not contain a valid TCP/IP header), N-PDU number = 0. Go to step 9.
A8, B8			Verify that the last segment of the first N-PDU received has M=0, T=1, and F=0. The last segment of last N-PDU may be not segmented; the F bit shall not be checked.
9			Verify that for the subsequent N-PDUs, the N-PDU number is incremented properly
10			Repeat step 6 to 9 until data transfer is complete.

46.2.2.4.2 Response from MS on receiving an XID request from the SS with an unassigned entity number

46.2.2.4.2.1 Conformance Requirement

In the originating SNDCP XID block, if an unassigned entity number is included with the P bit set to 0, then the Applicable NSAPIs field in the response shall be set to 0.

Reference

3GPP TS 04.65, subclause 6.8.3.

46.2.2.4.2.2 Test purpose

To verify that in the originating SNDCP XID block, if an unassigned entity number is included with the P bit set to 0, the Applicable NSAPIs field in the response shall be set to 0.

46.2.2.4.2.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 10 is initiated from MS.

Send an XID command from the SS with P bit set to 0, with an unassigned entity number.

The MS shall respond with XID response setting the applicable NSAPI field set to 0, indicating that compression is not supported.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 10.
2	SS -> MS	XID	In the layer3 XID parameters, send a PCOMP entity with parameter type = 2. Set the P bit to 0 and the entity number to a number not assigned.
3	MS -> SS	XID	Verify that the MS responds with the assigned NSAPI field set to 0.

46.2.2.4.3 Response from MS on receiving an XID response from the SS with unrecognised type field

46.2.2.4.3.1 Conformance Requirement

If the responding SNDCP XID block includes a parameter with unrecognised Type field, unsupported length, an out-of-range value or a value violating the sense of negotiation, a parameter type 1 or 2 which violates the rules in subclause 6.8.1, a parameter with duplicated instances, contains prohibited changes (see subclauses 6.5.1.2 and 6.6.1.2) to the parameters of compression entities used with acknowledged peer-to-peer LLC operation when the SNDCP XID block is sent on LL-XID primitives, or a compression field with the P bit set to 1, then the originator shall ignore the block and reinitiate the negotiation.

Reference

3GPP TS 04.65, subclause 6.8.3.

46.2.2.4.3.2 Test purpose

To verify that in the XID response, if an unrecognised type field is specified, the originator shall ignore the block and reinitiate XID negotiation.

46.2.2.4.3.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

PDP Context 11 is initiated from MS.

In the response to SABM, in the UA, send SNDCP parameter type = 30.

The MS shall resend the SABM command or send an XID command.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 11.
2	MS -> SS	SABM	
3	SS -> MS	UA	Include an SNDCP XID parameter with parameter type = 30.
4	MS -> SS	XID Command Or SABM command	Verify that the MS sends an XID Command or resends the SABM command

46.2.2.5 LLC link release on receiving "Invalid XID response" from the network during link establishment procedure

46.2.2.5.1 Conformance Requirement

If the originator of the establishment procedure receives an LL-RELEASE.indication with Cause "Invalid XID response", it shall inform the SM sub-layer using the SNSM-STATUS.request primitive with Cause "Invalid XID response". SM shall then deactivate all PDP contexts for that SAPI.

Reference

3GPP TS 04.65, subclause 6.2.1.4.

3GPP TS 04.64, subclause 8.5.3.3.

46.2.2.5.2 Test purpose

To verify that in the MS, the PDP context is deactivated on reception of "Invalid XID response" from network during link establishment.

46.2.2.5.3 Method of test

Initial conditions

-

Specific PICS statements:

-

PIXIT statements:

-

Test procedure

Activation of PDP Context 13 is initiated from MS.

The MS sends a SABM from the MS for link establishment.

The SS responds to the SABM with a UA with Invalid XID information field.

The MS shall ignore this response and re-transmit the SABM N200 times.

The SS shall respond with the UA with Invalid XID information, N200 times.

Verify that the MS releases the LLC SAPI and the PDP context for the SAPI is deactivated.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1		{PDP Context Activation}	Macro. Initiate PDP context activation from the MS. Use PDP context 13.
2	MS -> SS	SABM	SABM sent for link establishment during PDP context activation
3	SS->MS	UA	In response to the SABM , SS sends UA with an Invalid XID information field. MS shall ignore this response and Re-transmit the SABM N200 times.
4			Repeat steps 2 and 3 N200 times. (Send UA with Invalid XID parameters in response to SABM received N200 times.)
5		{PDP Context De-Activation}	Verify that the MS initiates PDP Context Deactivation.

47 Dual Transfer Mode

The default cell configuration for section 47 for the system simulator is the “PBCCH not present” case unless stated explicitly in the test case initial conditions.

To bring the MS into active state U10, macro 40.4.3.22 shall be used.

47.1 Reallocation of CS resources

47.1.1 Reallocation of CS resources / Assignment Command

47.1.1.1 Conformance requirements

While in dual transfer mode an inter-frequency change of channel can be performed through the dedicated channel assignment procedure.

Upon receipt of the ASSIGNMENT COMMAND message, the MS shall abandon the packet resource immediately, enter dedicated mode and then initiate a local end release of link layer connections and disconnects the physical channels. The MS then commands the switching to the assigned channels and initiates the establishment of lower layer connections.

After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCH.

The sending of this message on the MS side and its receipt on the network side allow the resumption of the transmission of signalling layer messages other than those belonging to RR management which include the Packet Assignment signalling to re-establish DTM.

References

3GPP TS 04.18 / 44.018, sub-clause 3.4.3

47.1.1.2 Test purpose

To verify that the channel assignment procedure can completely modify the physical channel configuration of the MS within the current frequency band and that the MS can re-establish successfully the PS resources.

47.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Cell A, with both TCH of cell activated and DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call, on cell A, with a TMSI and P-TMSI allocated and the PDP context 2 activated but no allocated TBFs.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS. The MS is allocated a timeslot, in the same frequency band, on the current cell. The re-allocation of the MS resources is realised by the MS receiving an ASSIGNMENT COMMAND message from the SS. The ASSIGNMENT COMMAND message instructs the switching of the MS to the newly assigned channel and initiates the establishment of lower layer connections. The establishment of the lower layer connections includes the activation of the channels, the connection to the channels and the establishment of the main signalling link. Once the CS connection is established, the MS should return an ASSIGNMENT COMPLETE message on the new main signalling link. The SS then sends the PACKET ASSIGNMENT message to the MS over the main signalling link to establish the packet resources and the MS enters DTM.

MS supporting DTM shall complete test for k=1and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1, 2.

Step	Direction	Message	Comments
1	SS		MS in state U10, on Timeslot N (chosen arbitrarily), utilising default TCH of cell and either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
2	SS->MS	PACKET ASSIGNMENT	See specific message contents
3	SS<->MS	{ Acknowledged downlink data }	Macro – Transmitting 10,000 octets of Data
4	SS->MS	ASSIGNMENT COMMAND	This message to be sent before the termination of the macro. Allocating resources on Timeslot N' (chosen arbitrarily) utilising the first alternative TCH of Cell A and either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
5	MS->SS	ASSIGNMENT COMPLETE	Sent on the correct channel after establishment of the main signalling link.
6	SS->MS	PACKET ASSIGNMENT	See specific message contents
7	SS<->MS	{ Downlink Data Transfer }	Macro – Completion of the 10,000 octets of Data.

47.1.2 Reallocation of CS resources / Handover Command

47.1.2.1 Conformance requirements

While in dual transfer mode an intra-cell change of channel can be performed, when requested by the network, through the handover procedure.

Upon receipt of the HANDOVER COMMAND message, the MS shall immediately abandon the packet resources entering dedicated mode. Once the packet resources have been released the MS initiates the release of link layer connections and disconnects the physical channels. The MS then commands the switching to the assigned channels and initiates the establishment of lower layer connections.

After the main signalling link is successfully established, the MS returns a HANDOVER COMPLETE message to the network on the main DCCH, then the TBFs can be re-established using the Packet Assignment procedure.

References

3GPP TS 04.18/44.018, sub-clauses 3.4.4.1, 3.4.4.3 & 3.4.23

47.1.2.2 Test purpose

To verify that when the MS changes the CS resources to a different timeslot in the same frequency band using the Handover procedure, the MS successfully re-establishes the CS and PS resources.

47.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call, on cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

47.1.3 Intra frequency reallocation of CS resources / DTM Assignment Command

47.1.3.1 Conformance requirements

In dual transfer mode an intracell change of channel can be requested by upper layers for changing the channel type, or decided by the RR sublayer, e.g. for an internal handover or for the reallocation of all the resources of the mobile station. The purpose is to modify completely the physical channel configuration of the mobile station without frequency redefinition or change in synchronization while staying in the same cell.

Upon receipt of the DTM ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channel and initiates the establishment of lower layer connection (this includes the activation of the channel, their connection and the establishment of the main signalling link).

NOTE: This conformance requirement was taken from Rel-5 specifications, but it is also a requirement on R99 and Rel-4 MS.

References

3GPP TS 44.018, sub-clause 3.4.23.2

47.1.3.2 Test purpose

To verify that the MS can reallocate both the CS connection and PS resources to different timeslot(s) within the same frequency band, having received the DTM ASSIGNMENT COMMAND message.

47.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in GMM Ready state with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS. The SS allocates the MS a different timeslot configuration, in the same frequency band, on the current cell. The re-allocation of the MS resources is realised by the MS receiving a DTM ASSIGNMENT COMMAND from the SS. On receipt of the DTM ASSIGNMENT COMMAND message, the MS initiates a local end release of link layer connections, disconnects the physical channels. After the MS has switched to the assigned channel, the MS initiates the establishment of lower layer connection, the activation of the channel and the establishment of the main signalling link. The MS returns an ASSIGNMENT COMPLETE message on the new signalling link.

MS supporting DTM shall complete testing for k=1, and indicating support of single slot DTM shall complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in state U10, on Timeslot N (chosen arbitrarily), utilising a default TCH of cell and either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.

47.2.1.2 Test purpose

To verify that after the MS releases the CS connection, the PS resources are correctly re-established.

47.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.
The MS is GPRS attached with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

The MS is in dedicated mode when it is triggered to initiate uplink data transfer. The MS sends a DTM REQUEST message to the SS requesting uplink resources. The SS assigns the required resources and waits until approximately half the uplink data has been passed to the SS before triggering the MS to release the CS resources. The MS initiates the signalling required to release the channel by sending a DISCONNECT message. Once the resources have been cleared the MS requests the establishment of an uplink TBF and completes the data transmission.

MS supporting DTM shall complete testing for k=1and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

1	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.

47.3 Handover

47.3.1 Handover to same routeing area

47.3.1.1 Handover to same routeing area whilst in dedicated mode & MM Ready / Completed on the main DCCH

47.3.1.1.1 Conformance requirements

3GPP TS 04.18, sub-clause 3.4.26:

While in dedicated mode, upper layers in the mobile station or in the network may request the transport of GPRS information transparently over the radio interface. This procedure is only applicable when:

- the information from upper layers is signalling information; and

- the GTTP length of the message is below the maximum indicated by the network.

In any other case, the RR procedures related to packet resource establishment while in dedicated mode apply.

The information from upper layers shall be carried inside the GTTP Information message. The GTTP Information message contains:

- the TLLI of the MS; and
- the LLC PDU.

The GTTP messages are sent using "normal" priority at the data link layer.

3GPP TS 23.060, sub-clause 6.9.1.1

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routeing area update is executed instead of a cell update.

References

3GPP TS 04.18, sub-clause 3.4.26

3GPP TS 23.060, sub-clause 6.9.1.1

3GPP TS 04.64 / 44.064, sub-clause 6.4.1.7.

47.3.1.1.2 Test purpose

To verify that when the network completes the CS handover of the MS to a different cell, the MS sends a cell update on the main DCCH in the new cell.

47.3.1.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B both in the same Location Area and Routing Area. Both cells shall be activated. Cell A shall be the strongest.

Mobile Station:

The MS is in GMM Ready state with a P-TMSI allocated. The value of the Ready Timer is chosen such that the MS is in the Ready State when handed to the new cell.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

The MS is camped on cell A in packet idle mode

The MS is brought to dedicated mode. A HANDOVER COMMAND message instructs the switching of the MS to the newly assigned channel and the establishment of lower layer connections. Once the CS connection is established, the MS should return a HANDOVER COMPLETE message on the new main signalling link. The MS shall then send the GPRS INFORMATION message on the main DCCH including an empty LLC frame to indicate Cell Update.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS		MS in the active state (U10) of a call on Timeslot N. When: Channel Type=TCH/F;
3	SS->MS	HANDOVER COMMAND	Instructs the MS to do handover to Cell B
4	MS->SS	HANDOVER ACCESS	Repeated on every burst of the uplink main DCCH (and optionally on the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND.
5	SS-MS	PHYSICAL INFORMATION	
6	MS->SS	HANDOVER COMPLETE	
7 8	SS->MS MS->SS	DTM INFORMATION GPRS INFORMATION	 The MS sends an empty LLC frame to indicate Cell Update.

Specific Message Contents

HANDOVER COMMAND (Step 3):

Information Element	Value/remark
As default message contents, except:	
Channel Description	
- Timeslot Number	N (chosen arbitrarily)
- Channel Type	TCH/F
Cell Description	Default values from Cell B
Synchronization Indication	
- Report Observed Time Difference	Shall not be included.
- Synchronization Indication	"Non synchronized".
- Normal Cell Indication	Ignore out of range timing advance.

47.3.1.2 Handover to same routeing area whilst in DTM with downlink TBF Established

47.3.1.2.1 Conformance requirements

The handover procedure includes the:

- abortion of the downlink packet resources;
- disconnection and the deactivation of previously assigned channels and their release (layer 1);
- activation of the new channels, and their connection if applicable;
- triggering of the establishment of data link connection for SAPI = 0 on the new channels.

References

3GPP TS 04.18 / 44.018, sub-clause 3.4.4.

47.3.1.2.2 Test purpose

To verify that the downlink packet resources can be successfully aborted, then re-established in the new cell after the handover of CS resources.

47.3.1.2.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters and both support DTM.

Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A.

The MS is in GMM Ready state with a P-TMSI allocated and the PDP context 2 activated. The value of the Ready Timer is chosen such that the MS is in the Ready State when handed to the new cell.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

After the MS is in DTM with an active downlink TBF, the SS initiates the Handover procedure. Once the MS has successfully completed the handover procedure to the new cell, the SS sends the DTM INFORMATION message, informing the MS of new cell parameters. The MS performs the Cell Update procedure using an empty LLC PDU on the main DCCH. The MS shall then accept the establishment of a downlink TBF, initiated by the SS with a PACKET ASSIGNMENT message.

MS supporting DTM shall complete test for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in active state (U10) of a call and when: k=1, Channel Type = TCH/F; k=2, Channel Type = TCH/H.

47.3.1.3.2 Handover to same routeing area whilst in DTM with both DL & UL TBFs / Abnormal case / Handover Failure

47.3.1.3.2.1 Conformance requirements

If a lower layer failure happens on the new channel before the HANDOVER COMPLETE message has been sent, the MS deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a HANDOVER FAILURE message on the main signalling link and resumes normal operation as if no handover attempt had occurred.

References

3GPP TS 04.18/44.018, sub-clause 3.4.4.4

47.3.1.3.2.2 Test purpose

To verify that if an error occurs when attempting handover to a different cell, the MS shall abort all CS operations in the new cell and successfully attempt to re-establish CS and uplink PS resources in the old cell.

47.3.1.3.2.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, DTM supported, default parameters.

Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

The MS is in the active state (U10) of a call, on Timeslot N (chosen arbitrarily) of cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

A MS in dedicated mode with an active CS call is triggered to establish an uplink TBF. The MS sends a DTM REQUEST message appealing for uplink resources. Upon receiving the DTM request message the SS allocates uplink resources. Once the MS has entered DTM and has had at least ten RLC data blocks acknowledged, the SS sends a HANDOVER COMMAND message to the MS and completes the Handover procedure to a cell in the new RA. The Handover procedure is complete by the MS sending a HANDOVER COMPLETE message to the SS. Once the Handover procedure is complete the SS sends the MS a DTM INFORMATION message, providing the MS with the minimum information required to establish packet resources with the cell. The MS having received the DTM INFORMATION message indicating DTM support in the current cell, initiates the RA Update procedure. The RAU procedure is initiated by sending the ROUTING AREA UPDATE REQUEST message, encapsulated in GTTP, on the main DCCH. The SS completes the RA Update procedure by returning a ROUTING AREA UPDATE ACCEPT message on the main DCCH without re-allocating the P-TMSI. The MS can then again initiate the establishment of an uplink TBF.

MS supporting DTM shall complete test for k=1and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in active state (U10) of a call and when: k=1, Channel Type = TCH/F; k=2, Channel Type = TCH/H.

Test Procedure

A MS in dedicated mode with an active CS call is triggered to establish an uplink TBF. The MS sends a DTM REQUEST message appealing for uplink resources. Upon receiving the DTM request message the SS allocates uplink resources. Once the MS has entered DTM and has had at least ten RLC data blocks acknowledged, the SS sends a HANDOVER COMMAND message to the MS and completes the Handover procedure to a cell in a new RA. The Handover procedure is completed by the MS sending a HANDOVER COMPLETE message to the SS. Once the Handover procedure is complete the SS sends the MS a DTM INFORMATION message, providing the MS with the minimum information required to establish packet resources with the cell. The MS having received the DTM INFORMATION message indicating DTM support in the current cell, initiates the RA Update procedure. The RA Update procedure is initiated by the MS sending the ROUTING AREA UPDATE REQUEST message, encapsulated in GTTP, on the main DCCH. The SS then releases the CS connection to the MS and allocates downlink PS resources to the MS with an PACKET DOWNLINK ASSIGNMENT message. The SS then completes the RAU procedure by sending the RAU ACCEPT message to the MS, allowing the MS to request uplink PS resources.

MS supporting DTM shall complete test for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in active state (U10) of a call and when: k=1, Channel Type = TCH/F; k=2, Channel Type = TCH/H.
2	MS		Trigger the MS to initiate an uplink packet transfer containing 2kB of data.
3	MS->SS	DTM REQUEST	
4	SS->MS	PACKET ASSIGNMENT	See specific message contents.
5	SS<->MS	{ Uplink data transfer }	Macro – Transmitting 2kB of Data
6	SS->MS	HANDOVER COMMAND	This message to be sent before the termination of the macro. See specific message contents.
7	MS->SS	HANDOVER ACCESS	Repeated on every burst of the uplink main DCCH (and optionally on the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND.
8	SS->MS	PHYSICAL INFORMATION	Sent after reception of n HANDOVER ACCESS messages. See specific message contents.
9	MS->SS	HANDOVER COMPLETE	
10	SS->MS	DTM INFORMATION	
11	MS->SS	GPRS INFORMATION	It shall contain a ROUTING AREA UPDATE REQUEST message.
			All RAU REQUEST LAPDm frames shall be acknowledged by the SS.
12	SS->MS	CHANNEL RELEASE	The TCH is released.
13			The SS waits at least two SI13 repeat periods.
14			A downlink TBF is then established to allow the RAU ACCEPT message to be returned the MS.
15	SS->MS	ROUTING AREA UPDATE ACCEPT	Does not allocate MS a new P-TMSI.
16		{ Uplink dynamic allocation two phase access }	Macro
17	SS<->MS	{ Uplink data transfer }	Macro - Completion of the 2kB of Data.

Synchronisation Indication	
- Report Observed Time Difference	Shall not be included.
- Synchronization Indication	"Non synchronized".
- Normal Cell Indication	Ignore out of range timing advance.

47.3.4 Handover to UTRAN while in DTM

47.3.4.1 Handover to UTRAN while in DTM / Downlink TBF

47.3.4.1.1 Conformance requirements

Once the mobile station enters the dual transfer mode, the existent procedures apply (see 3GPP TS 44.060). Some exceptions to the existent procedures while in dedicated mode are:

- When the mobile station receives a HANDOVER COMMAND, HANDOVER TO UTRAN COMMAND, HANDOVER TO CDMA2000 COMMAND, HANDOVER TO IU MODE COMMAND or ASSIGNMENT COMMAND message, it shall abandon the packet resource immediately, enter dedicated mode and perform the handover or assignment procedure, respectively.

After the successful completion of the handover from an GSM cell to an UMTS cell, an MS which has performed the GPRS suspension procedure in Gb mode (see 3GPP TS 04.18) (i.e. an MS in MS operation mode B or an DTM MS in a GSM cell that does not support DTM) shall perform a normal RA update procedure in the UMTS cell in order to resume the GPRS services in the network, before sending any other signalling messages or user data.

Test Procedure

The SS starts the GSM cell and UTRAN cell and brings the MS into the call active state of Cell 1(CC state U10). The SS sends a PACKET ASSIGNMENT message to the MS on the main DCCH, instructing the MS to switch to the designated timeslot. The SS waits a specified time and then starts to transmit to the newly allocated resources. The SS configures the UTRAN dedicated channel corresponding to the default-configuration 3. After approximately 5k octets of data has been sent, the SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORT and then sends INTERSYSTEM TO UTRAN HANDOVER COMMAND message indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover has been performed, by verifying that the MS transmits the HANDOVER TO UTRAN COMPLETE message to the SS through DCCH of the UTRAN cell. The MS then performs the Routing Area Updating procedure, initiated with the transmission of a ROUTING AREA UPDATE REQUEST message. The SS completes the procedure by sending a ROUTING AREA UPDATE COMPLETE message to the MS. The SS establishes a radio bearer to the MS with the RADIO BEARER SETUP and RADIO BEARER SETUP COMPLETE messages. To check that PDP context is active, SS sends MODIFY PDP CONTEXT REQUEST in UMTS cell. The MS may or may not accept the QoS and replies to the SS accordingly.

Maximum Duration of Test

5 minutes

Expected Sequence

Note: Default message contents for UMTS signalling can be found in 3GPP TS 34.108 sub-clause 9.1.

Step	Direction	Message	Comments
1	SS		MS in state U10, utilising Timeslot N and TCH/F channel type for the CS connection on Cell 1 (Timeslot chosen arbitrarily)
2	SS->MS	PACKET ASSIGNMENT	Assigning downlink packet resources on Timeslot N+1 to the MS.
3	MS<->SS	{ Downlink data transfer }	Macro
4	SS		The SS configures the dedicated channel with the configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell.
5	SS		Waits until approximately 5k octets is sent to the MS
6	←	MEASUREMENT INFORMATION	
7	→	MEASUREMENT REPORT	Including Measurement Results on the UTRAN cell in Step 6. Received within 5 sec + 10% from Step 6.
8	SS->MS	INTER SYSTEM TO UTRAN HANDOVER COMMAND	See specific message contents.
9	MS		The MS accepts the handover command and configures its lower layers using the parameters contained in the INTERSYSTEM TO UTRAN HANDOVER COMMAND
10	SS		The SS waits for uplink physical channel in synchronisation
11	MS->SS	HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of Cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.
12	SS		The SS starts integrity protection for CS domain
13	SS->MS	UTRAN MOBILITY INFORMATION	The SS conveys CN system information for the PS domain to the UE in connected mode. See specific message contents.
14	MS->SS	UTRAN MOBILITY_INFORMATION CONFIRM	
15	MS->SS	ROUTING AREA UPDATE REQUEST	
16	SS->MS	AUTHENTICATION AND CIPHERING REQUEST	
17	MS->SS	AUTHENTICATION AND CIPHERING RESPONSE	
18	SS		The SS starts integrity protection for PS domain
19	SS->MS	ROUTING AREA UPDATE ACCEPT	
20	SS->MS	RADIO BEARER SETUP	PS RAB establishment
21	MS->SS	RADIO BEARER SETUP COMPLETE	
22			SS Releases the CS call.
23	SS->MS	MODIFY PDP CONTEXT REQUEST	SS requests the modification of a PDP context.
A24	MS->SS	MODIFY PDP CONTEXT ACCEPT	MS behaviour type A: Accept the PDP context modification
B24	MS->SS	DEACTIVATE PDP CONTEXT REQUEST	MS behaviour type B: Initiate the PDP context deactivation. Cause set to 'QoS not accepted'
B24a	SS->MS	DEACTIVATE PDP CONTEXT ACCEPT	MS behaviour type B: Accept the PDP context deactivation.
B24b	MS->SS	DETACH REQUEST	MS behaviour type B: A non-auto attach MS may (optionally) send a Detach Request. The SS shall wait up to 'T3390' seconds for the Detach Request.
B24c	SS->MS	DETACH ACCEPT	If the MS transmitted a Detach Request message in step B24b then the SS responds with a Detach Accept message.

Test Procedure

The SS starts the GSM cell and UTRAN and brings the MS into the call active state (CC state U10). The MS is then triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS sends a PACKET ASSIGNMENT message to the MS on the main DCCH, instructing the MS to switch to the designated timeslot. The SS waits a specified time and then starts to transmit to the newly allocated resources. The SS configures the UTRAN dedicated channel corresponding to the default-configuration 3. After approximately 5k octets of data has been sent, sent, the SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORT and then sends an INTERSYSTEM TO UTRAN HANDOVER COMMAND message, indicating the dedicated channel of the target cell to the MS, through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover has been performed, by verifying that the MS transmits a HANDOVER TO UTRAN COMPLETE message to the SS through the DCCH of the UTRAN cell. The MS then optionally attempt to resume the packet resources with the transmission of a SERVICE REQUEST message. The radio bearer is then established and the SS sends a SERVICE ACCEPT message to the MS instructing the MS to use the bearer for packet transmission. To check that PDP context is active, SS sends MODIFY PDP CONTEXT REQUEST in UMTS cell. The MS may or may not accept the QoS and replies to the SS accordingly.

Maximum Duration of Test

5 minutes

Expected Sequence

Note: Default message contents for UMTS signalling can be found in 3GPP TS 34.108 sub-clause 9.1.

Step	Direction	Message	Comments

Downlink counter synchronization info	Not Present

47.4 Session Management

47.4.1 PDP Context Activation / Performed on main DCCH and TBFs

47.4.1.1 Conformance requirements

MAX_LAPDm (3 bit field)
This field indicates the maximum number of LAPDm frames on which a layer 3 can be segmented into and be sent on the main DCCH. It is coded as described in the SI 6 Rest Octets IE.

The parameter N201 is the maximum number of octets which are partially or entirely available for the information field of a frame.

The maximum number of octets partially or entirely available for the information field (N201) is:

- for frames of format A and B:
  - for the SACCH: N201 = 18;
  - for the FACCH and SDCCH: N201 = 20.
- for frames of format Bbis:
  - for BCCH, AGCH, NCH and PCH: N201 = 23;
- for frames of format Bter:
  - for the SACCH: N201 = 21;
  - for the FACCH and SDCCH: N201 = 23;
- for frames of format B4:
  - for the SACCH: N201 = 19.

The network should not use the main DCCH to send messages that exceed the maximum length specified for the uplink. The mobile station, however, shall not reject messages that exceed the maximum length.

3GPP TS 03.55 sub-clause 4.1.1

47.4.1.2 Test purpose

To verify that:

a) the MS uses the main DCCH when the message size is less than the product of MAX_LAPDm and N201;

b) the MS uses an uplink TBFs when the message size is greater than the product of MAX_LAPDm and N201;

c) the MS does not discard a frame when the network uses the main DCCH when the MS is in DTM;

d) when the network exceeds the maximum LAPDm frame size in transmitting to the MS, the MS does not discard the message and continues to act upon the message.

47.4.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with same LAI but different RAI, both supporting DTM and with default parameters.

MAX_LAPDm = 000 (Allowing any PS message segmented in up to 5 LAPDm frames)

Network Mode of Operation II

Mobile Station:

The MS is in the active state (U10) of a call, on Timeslot N (chosen arbitrarily) of cell A, with a TMSI and P-TMSI allocated but no allocated TBFs or activated PDP context.

The MS is set to use the following as an APN:

APN Network Identifier = "THIS-APN-HAS-TO-BE-63-OCTETS-IN-LENGTH-AND-IS-ENCODED-IN-ASCII "

APN Operator Identifier = " mnc<MNC>.mcc<MCC>.gprs"

The <MNC> and <MCC> are derived from the IMSI.

Note: The APN has been chosen to ensure that the ACTIVATE PDP CONTEXT REQUEST message is over the threshold for main DCCH use, forcing the MS not to use the main DCCH for this signalling message.

Test Procedure

An MS in dedicated mode on cell A is ordered to complete the Handover procedure to cell B. Once the MS has successfully completed the handover procedure to the cell, the SS sends the DTM INFORMATION message, informing the MS of the cell parameters and then the MS completes the Routing Area Updating procedure on the main DCCH. The MS is then triggered to activate a PDP context. The MS has to establish an uplink TBF to be able to send the ACTIVATE PDP CONTEXT REQUEST because the message size is greater than is allowed on the main DCCH. The SS responds with the ACTIVATE PDP CONTEXT ACCEPT message on the main DCCH. After the MS has received the ACTIVATE PDP CONTEXT ACCEPT message optional can perform an XID negotiation procedure, the SS sends, on the main DCCH, a GMM INFORMATION message to the MS, with an incorrect message type included in the header. The MS responds to this unknown message type with a GMM STATUS message.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS		MS in state U10, on an arbitrarily chosen Timeslot N of cell A, k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
2	SS		SS waits 10 seconds, maintaining the CS call.
3	SS->MS	HANDOVER COMMAND	Instructs MS to Handover to Timeslot N of the cell B, utilising a TCH/F.
4	MS->SS	HANDOVER ACCESS	Repeated on every burst of the uplink main DCCH (and optionally on the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND.
5	SS->MS	PHYSICAL INFORMATION	
6	MS->SS	HANDOVER COMPLETE	
7	SS->MS	DTM INFORMATION	Contains the cell parameters
8	MS->SS	GPRS INFORMATION	Containing a ROUTING AREA UPDATE REQUEST message.
9	SS->MS	GPRS INFORMATION	Containing a ROUTING AREA UPDATE ACCEPT message. Does not allocate MS a new P-TMSI. Negotiated Ready timer value IE should not be included. Force to standby indicator set
10	SS		MS triggered to request PDP context activation.
11	MS->SS	DTM REQUEST	The MS requests the transition into DTM, to send the ACTIVATE PDP CONTEXT REQUEST message which requires more LAPDm frames then allowed for use of the main DCCH for PS signalling.
12	SS->MS	PACKET ASSIGNMENT	The SS allocates uplink resources to the MS, k=1:on Timeslot (N $\pm$ 1) MOD 8. k=2:on Timeslot N MOD 8.
13	MS->SS	ACTIVATE PDP CONTEXT REQUEST	Requests PDP context activation. This message is sent on the allocated uplink PDCH.
14	SS->MS	GPRS INFORMATION	Contains the ACTIVATE PDP CONTEXT ACCEPT message. Although the SS should establish a downlink TBF to send this message, as the MS is in DTM, the MS shall be able to receive this message on the main DCCH. Steps 15 to 19 are performed only if MS requests XID negotiation procedure after PDP context activation. SS waits 5 s for the request of the optional XID procedure. Steps 15 and 16 are only performed if MS is not in DTM mode any more. If the MS does not include any PDP address, dynamic PDP address shall be assigned by the SS. The MS with Rel-8 behaviour shall not include the PDP address and the PDP address allocation is dynamic.
15 (optional)	MS->SS	DTM REQUEST	The MS requests the transition into DTM, to send the XID REQUEST message
16 (optional)	SS->MS	PACKET ASSIGNMENT	The SS allocates uplink resources to the MS, k=1:on Timeslot (N $\pm$ 1) MOD 8. k=2:on Timeslot N MOD 8.
17 (optional)	MS->SS	XID REQUEST	
18 (optional)	SS->MS	PACKET ASSIGNMENT	The SS allocates downlink resources to the MS, k=1:on Timeslot (N +- 1) MOD 8. k=2:on Timeslot N MOD 8.
19 (optional)	SS->MS	XID RESPONSE	
20	SS->MS	GPRS INFORMATION	Wait 5 seconds before sending GPRS INFORMATION Contains the GMM INFORMATION message. This message is over the size that is allowed for transmission on the main DCCH, but it is a requirement that the MS shall be able to receive an ‘oversized’ message on the main DCCH.

21	MS->SS	GPRS INFORMATION	Contains the GMM STATUS message: Message cause #97 shall be returned by the MS to indicate the message received is of unknown message type.

48 to 49 Void

Void.

50 EGPRS Default Conditions, Message Contents and Macros

The following clause 50 details default conditions, messages and macros that shall be used for the EGPRS test cases. These conditions, messages and macros are derived from the "GPRS default conditions, message contents and macros" (see clause 40). In the following subclauses only those parameters are listed which deviate from the "GPRS default conditions, message contents and macros".

Where values have not been specified the equivalent overall GPRS default values (see subclause 40.1) should be used. If values need to be removed from the overall GPRS defaults then these should be specified as 'OMITTED'.

In case of ambiguity EGPRS settings take precedence over GPRS settings.

50.1 EGPRS Default Test Conditions

Since GPRS and EGPRS make use of the same channel combinations subclause 40.1 applies to both GPRS and EGPRS.

NOTE: 'One phase access' test cases may not be fully executed for MS requesting 'Two phases access'.

The resulting step "If the MS requests two phase access the Test Case is terminated" should be interpreted as "Test case is not applicable for the MS".

List of affected test cases (by this note):

51.2.3.1, 51.2.3.2, 51.2.3.3, 51.2.3.4, 51.2.3.5, 51.2.3.6, 51.2.3.7, 51.2.3.8, 51.2.3.9, 51.2.3.10, 51.2.3.11, 51.2.3.12, 51.2.3.13, 51.2.3.14, 51.2.3.15, 51.2.3.16, 51.2.3.17, 51.2.6.9, 52.8.1.6, 52.8.1.7, 52.8.1.8, 52.8.1.9, 52.8.1.10, 52.8.1.12, 52.10.2.

50.2 EGPRS Default Message Contents

50.2.1 EGPRS System Information Messages

The EGPRS system information messages for cell A, B, C, D, E, F are identical to the corresponding GPRS system information messages for cell A, B, C, D, E, F, except the settings in the system information messages as given in the tables below.

SYSTEM INFORMATION TYPE 13:

SI 13 Rest Octets: GPRS Cell Options IE: Extension Information - Extension length	 R99: 001000 Rel 4: 001010 Rel 6: 001110
- {0|1 <Extension Information>}	1 EGPRS supported by the cell.
- EGPRS_PACKET_CHANNEL_REQUEST	0 Use of EGPRS PACKET CHANNEL REQUEST_message for uplink TBF establishment.
- BEP_PERIOD	0110
- PFC_FEATURE_MODE	0 Packet Flow Context Procedures not supported
- DTM_SUPPORT	0 Cell does not support DTM procedures.
- BSS_PAGING_COORDINATION	0 Circuit-Switched paging coordination not supported in cell
For Rel 4 network simulation	
- CNN_ACTIVE	0 CNN is disabled in the cell
- NW_EXT_UTBF	0 Ext UL TBF not supported in the cell
For Rel 6 network simulation	
- MULTIPLE_TBF_CAPABILITY	0 Cell does not support multiple TBF procedures
- EXT_UTBF_NO_DATA	0 MS shall send a PACKET UPLINK DUMMY CONTROL BLOCK message when there is no other RLC/MAC block ready to send in an uplink radio block allocated by the network
- DTM_ENHANCEMENTS_CAPABILITY	0 Cell does not support enhanced DTM CS establishment and enhanced DTM CS release procedures
- { 0 | 1 }	0 -- MBMS procedures not supported by the cell
End Rel 6	
End Rel 4	

50.2.2 EGPRS Packet System Information messages

50.2.2.1 Cell A

The EGPRS packet system information messages for cell A, B, C, D, E, F are identical to the corresponding GPRS packet system information messages for cell A, B, C, D, E, F

50.2.3 EGPRS default contents of Layer 2 messages

The EGPRS default contents of Layer 2 messages are identical to the GPRS default contents of Layer 2 messages (see subclause 40.1.2.3) with the following exception in the tables given below. In these tables only those layer 2 messages are listed differing in specific EGPRS information elements (IE's) from the corresponding GPRS IE's.

NOTE: In this subclause all information element values are in binary. Numeric values written within quotes are in decimal.

50.2.4.3 PDCH ASSIGNMENT COMMAND message (downlink)

Information Element	Value/Remarks
Protocol Discriminator	RR Management
Skip indicator	0000
Message Type	00101010
Description of the Channel, after time	
- Channel Description	
- Channel Type and TDMA offset	TCH/F + ACCH's
- Timeslot Number	Slot 2[1]
- Training Sequence Code	Same as the BCC
- Hopping channel	Single RF channel
- ARFCN	Same as BCCH carrier
- RR Packet Downlink Assignment	
- LENGTH_IN_OCTETS	"400"
- MAC_MODE	00 (Dynamic allocation)
- RLC_MODE	1 (RLC unacknowledged mode)
- TIMESLOT_ALLOCATION	Slot 2
- Packet Timing Advance	
- { 0|1	1 (TIMING_ADVANCE_VALUE present)
-<TIMING_ADVANCE_VALUE> }	
- TIMING_ADVANCE_VALUE	"30" bit periods
- { 0|1 <TIMING_ADVANCE_INDEX> }	0 (TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER not present)
- { 0|1 <P0> }	0 (Downlink power control parameters not present)
- { 0|1 <Power Control Parameters> }	1 (Uplink Power Control Parameters present)
- ALPHA	"0.5"
- { 0|1 <GAMMA_TN0> }	0 (GAMMA_TN0 not present)
- { 0|1 <GAMMA_TN1> }	0 (GAMMA_TN1 not present)
- { 0|1 <GAMMA_TN2> }	1 (GAMMA_TN2 present)
- GAMMA_TN2	For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm For DCS 1800 and PCS 1900: +6 dBm
- { 0|1 <GAMMA_TN3> }	0 (GAMMA_TN3 not present)
- { 0|1 <GAMMA_TN4> }	0 (GAMMA_TN4 not present)
- { 0|1 <GAMMA_TN5> }	0 (GAMMA_TN5 not present)
- { 0|1 <GAMMA_TN6> }	0 (GAMMA_TN6 not present)
- { 0|1 <GAMMA_TN7> }	0 (GAMMA_TN7 not present)
- { 0|1 <DOWNLINK_TFI_ASSIGNMENT> }	1 (Assign downlink TFI)
- DOWNLINK_TFI_ASSIGNMENT	00011
- { 0|1 <MEASUREMENT_STARTING_TIME> }	0 (No measurement information)
Presence of following bit fields indicate EGPRS TBF mode	1 EGPRS TBF mode applied
- EGPRS Window Size	Dependant upon test case
- LINK_QUALITY_MEASUREMENT _MODE	00 MS reports neither BEP nor interferer meas.
- {0|1 Packet Extended Timing Advance}	0 Packet Extended TA for GSM 400 not present
- SPARE_BITS	Spare padding

50.2.4.4 DTM Assignment Command

For R99/Rel 4 network simulation: Optional extension information - {0|1 <Extension Information>} end R99	 1 Extension information present 1 EGPRS supported by the cell.

50.2.4.5 IMMEDIATE PACKET ASSIGNMENT messages

50.2.4.5.1 IMMEDIATE PACKET ASSIGNMENT message (IPA Downlink Assignment)

L2 pseudo length	This is the sum of the lengths of all the information elements present in the message except for the IPA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is xx.
Protocol Discriminator	RR Management.
Skip Indicator	0000
Message Type	01101001
Page Mode	
- Page Mode	Normal Paging.
Feature Indicator	
- PS-IR	0
- CS-IR	0
IPA rest octets	
- IPA Downlink Assignment	010 IPA Downlink Assignment present
-	1
- TLLI	(the value received from MS)
- TFI_ASSIGNMENT	Any value not used before
- GAMMA	For DCS 1800 and PCS 1900: +6 dBm For all other bands: +8 dBm
- TIMING_ADVANCE_VALUE	30 bit periods
-	1
- TLLI	(other value than received from MS)
- TFI_ASSIGNMENT	Any value not used before
- GAMMA	For DCS 1800 and PCS 1900: 0 dBm For all other bands: 0 dBm
- TIMING_ADVANCE_VALUE	10 bit periods
- No repeat for other device	0
- LINK_QUALITY_MEASUREMENT_MODE	0 (not present)
- RLC_MODE	RLC acknowledged mode
- TN	Dependant upon the test case (default = 4)
-	1
- Frequency Parameters	Dependant upon the test case (default: Serving cell, PDTCH as defined in section 40.1)
- spare padding	Spare Padding

50.2.4.5.2 IMMEDIATE PACKET ASSIGNMENT message (IPA Uplink Assignment):

L2 pseudo length	This is the sum of the lengths of all the information elements present in the message except for the IPA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is xx.
Protocol Discriminator	RR Management.
Skip Indicator	0000
Message Type	01101001
Page Mode	
- Page Mode	Normal Paging.
Feature Indicator	
- PS-IR	0
- CS-IR	0
IPA rest octets	
- IPA Uplink Assignment	100 IPA Uplink Assignment present
-	1
- Random Reference	11 bits of the EGPRS PACKET CHANNEL REQUEST from MS
- FN_OFFSET	offset to the FN of EGPRS PACKET CHANNEL REQUEST from MS
- GAMMA	For DCS 1800 and PCS 1900: +6 dBm For all other bands: +8 dBm
- TIMING_ADVANCE_VALUE	30 bit periods
- TFI_ASSIGNMENT	Any value not used before
- USF	Any value not used before
-EGPRS CHANNEL_CODING_COMMAND	Depending on test case (Default MCS_1)
-	1
- Random Reference	different to 11 bits of the EGPRS PACKET CHANNEL REQUEST from MS
- FN_OFFSET	different offset to the FN of EGPRS PACKET CHANNEL REQUEST from MS
- GAMMA	For DCS 1800 and PCS 1900: 0 dBm For all other bands: 0 dBm
- TIMING_ADVANCE_VALUE	10 bit periods
- TFI_ASSIGNMENT	Any value than above
- USF	Any value than above
- EGPRS CHANNEL_CODING_COMMAND	MCS_1
- Radio Access Capabilities Request	0
- No repeat for other device	0
- TN	Dependant upon the test case (default = 4)
-	1
- Frequency Parameters	Dependant upon the test case (default: Serving cell, PDTCH as defined in section 40.1)
- spare padding	Spare Padding

50.2.4.5.3 IMMEDIATE PACKET ASSIGNMENT message (IPA Single Block Uplink Assignment):

L2 pseudo length	This is the sum of the lengths of all the information elements present in the message except for the IPA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is xx.
Protocol Discriminator	RR Management.
Skip Indicator	0000

Page Mode	
- Page Mode	Normal Paging.
Feature Indicator	
- PS-IR	0
- CS-IR	0
IPA rest octets	
- IPA Uplink Assignment	001 IPA Single Block Uplink Assignment present
-	1
- Random Reference	11 bits of the EGPRS PACKET CHANNEL REQUEST from MS
- FN_OFFSET	offset to the FN of EGPRS PACKET CHANNEL REQUEST from MS
- GAMMA	For DCS 1800 and PCS 1900: +6 dBm For all other bands: +8 dBm
- TIMING_ADVANCE_VALUE	30 bit periods
- STARTING_TIME_OFFSET	offset to the start frame number of the assigned single uplink block
-	1
- Random Reference	different to 11 bits of the EGPRS PACKET CHANNEL REQUEST from MS
- FN_OFFSET	different offset to the FN of EGPRS PACKET CHANNEL REQUEST from MS
- GAMMA	For DCS 1800 and PCS 1900: 0 dBm For all other bands: 0 dBm
- TIMING_ADVANCE_VALUE	10 bit periods
- STARTING_TIME_OFFSET	different to offset to the start frame number of the assigned single uplink block assigned to MS
- No repeat for other device	0
- TN	Dependant upon the test case (default = 4)
-	1
- Frequency Parameters	Dependant upon the test case (default: Serving cell, PDTCH as defined in section 40.1)
- spare padding	Spare Padding

50.3 Default EGPRS Conditions, Message Contents and Macros for the Higher Layer Test Cases

Since the EGPRS higher layers (LLC, GPRS Mobility Management, Session Management and SNDCP) are identical with the GPRS higher layers the same test cases shall also apply to EGPRS.

50.4 EGPRS Macros

50.4.1 Overview

The following subclause presents macros for EGPRS test cases. Definition and syntax (see subclauses 40.4.1.1 and 40.4.1.2) of the macros for EGPRS test cases are identical to the definition and syntax of the macros of the GPRS test cases.

50.4.2 EGPRS Default Message Contents

The EGPRS default message contents of the macros for the EGPRS test cases are identical to the GPRS default message contents of the macros for the GPRS test cases (see subclause 40.4.2).

50.4.3 EGPRS Macro Message Sequences

The macros for EGPRS test cases are identical to the macros for the GPRS test cases (see subclause 40.4.) with the following exceptions in the tables given below. In these tables only those EGPRS macro sequences are listed differing from the corresponding GPRS macro sequences.

50.4.3.1 Acknowledged downlink data

Step	Direction	Message	Comments
	SS ↔ MS	{ Acknowledged downlink data }	Macro
1	SS → MS	{ Downlink data }	Macro
2	MS → SS	EGPRS PACKET DOWNLINK ACK/NACK	

50.4.3.2 Downlink data transfer

Step	Direction	Message	Comments
	SS ↔ MS	{ Downlink data transfer }	Macro
a. RLC unacknowledged mode			
1	SS → MS	{ Downlink data }	Macro
2	SS → MS	RLC DOWNLINK DATA	FBI bit set to '1' and valid RRBP field
3	MS → SS	PACKET CONTROL ACKNOWLEDGMENT	In the uplink block specified by the RRBP field
b. RLC acknowledged mode			
1	SS ↔ MS	{ Acknowledged downlink data }	Macro
2	SS ↔ MS	{ Acknowledged downlink data }	Macro
⋮	⋮	⋮	
N	SS ↔ MS	{ Acknowledged downlink data }	Macro. n ≥ 1
n+1	SS → MS	RLC DOWNLINK DATA	
n+2	SS → MS	RLC DOWNLINK DATA	
⋮	⋮	⋮	
M	SS → MS	RLC DOWNLINK DATA	m ≥ n+1. FBI bit set to '1' and valid RRBP field
m+1	MS → SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBP field. Final Ack Indicator bit set to '1'

50.4.3.3 Uplink data transfer

Step	Direction	Message	Comments
	MS ↔ SS	{ Uplink data transfer }	Macro (arguments: see note 4)
1	MS → SS	RLC UPLINK DATA	See notes 1 and 2
2a 2b	MS → SS SS → MS	RLC UPLINK DATA PACKET UPLINK ACK/NACK	 See note 3
3a 3b	MS → SS SS → MS	RLC UPLINK DATA PACKET UPLINK ACK/NACK	
⋮ N N+1 N+2	⋮ MS → SS SS → MS MS → SS	⋮ RLC UPLINK DATA PACKET UPLINK ACK/NACK PACKET CONTROL ACKNOWLEDGEMENT	 n ≥ 1. CV set to '0' Final Ack Indicator bit = '1' and valid RRBP field In the uplink block specified by the RRBP field

NOTE 1: SI bit set to '0' in all data blocks.

NOTE 2: The SS sends a PACKET UPLINK ACK/NACK message at least every k-1 RLC UPLINK DATA messages, being k the window size with a value according to the number of timeslots allocated in the direction (uplink or downlink) of the TBF operating in EGPRS TBF mode, see 3GPP TS 44.060.

NOTE 3: The field CV in the RLC UPLINK DATA messages verifies:

$$\text{Let integer } x = round\left(\frac{TBC - BSN' - 1}{NTS \times K}\right),$$

$$\text{then, } CV = \begin{cases} x, & if\ x \le BS\_CV\_MAX, \\ 15, & otherwise \end{cases}$$

where:
- TBC: total number of RLC data blocks that will be transmitted in the TBF;
- BSN': absolute block sequence number of the RLC data block, from 0 to (TBC - 1);
- NTS: number of timeslots assigned to the uplink TBF, with range 1 to 8;
- K = 2 when commanded MCS is MCS-7, MCS-8 or MCS-9 otherwise K=1.
- the function round() rounds upwards to the nearest integer;
- BS_CV_MAX is a parameter broadcast in the system information;
- the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.

NOTE 4: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds^{-1} or frames^{-1}) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.

NOTE 5: When an EGPRS RLC/MAC block for data transfer consists of two RLC data blocks, the CV of the RLC/MAC header refers to the second RLC data block.

50.4.3.4 Uplink dynamic allocation one phase access

Step	Direction	Message	Comments
		{Uplink dynamic allocation one phase access}	Macro parameters: **n**: the number of RLC data block to be transferred, **USF_GRANULARITY**: 1 or 4 blocks, **RLC_DATA_BLOCKS_GRANTED**: 9-261 (close-end), or absent (open-end) **EGPRS Channel Coding Command**: MCS-1, -2, -3, -4, -5, -6, -6, -7, -8, -9 or MCS-5-7, MCS-6-9 Resegment Bit: incremental redundancy on/off in uplink direction **Window Size**: according to number of allocated timeslots **TLLI_BLOCK_CHANNEL_CODING**: MCS-1 or as data block **REL_OR_ABS_FN**: absolute or relative frame number encoding for starting time **TBF_STARTING_TIME**
0	MS		Trigger the MS initiating uplink transfer **n** octets data according to the test PDP context activated
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST OR CHANNEL REQUEST	Received on RACH.
2	SS -> MS	IMMEDIATE ASSIGNMENT	uplink dynamic allocation, Sent on AGCH.
NOTE: After step 2, the MS is not yet in the packet transfer mode. The contention resolution must be completed.			

50.4.3.5 Uplink dynamic allocation one phase access with contention resolution

Step	Direction	Message	Comments
		{Uplink dynamic allocation one phase access with contention resolution}	Macro parameters: **n**: the number of RLC data block to be transferred, **USF_GRANULARITY**: 1 or 4 blocks, **RLC_DATA_BLOCKS_GRANTED**: 9-261 (close-end), or absent (open-end) **EGPRS Channel Coding Command:** MCS-1, -2, -3, -4, -5, -6, -6, -7, -8, -9 or MCS-5-7, MCS-6-9 **Resegment Bit:** incremental redundancy on/off in uplink direction **Window Size:** according to number of allocated timeslots **TLLI_BLOCK_CHANNEL_CODING**: MCS-1 or as data block **REL_OR_ABS_FN**: absolute or relative frame number encoding for starting time **TBF_STARTING_TIME**
0	MS		Trigger the MS initiating uplink transfer **n** octets data according to the test PDP context activated
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST OR CHANNEL REQUEST	Received on RACH.
2	SS -> MS	IMMEDIATE ASSIGNMENT	uplink dynamic allocation, Sent on AGCH.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment.
4A	MS -> SS	UPLINK RLC DATA BLOCK	For **USF_GRANULARITY** = 1, containing TLLI in the RLC/MAC header.
4B1	MS -> SS	UPLINK RLC DATA BLOCK	For **USF_GRANULARITY** = 4, containing TLLI in the RLC/MAC header.
4B2	MS -> SS	UPLINK RLC DATA BLOCK	For **USF_GRANULARITY** = 4, containing TLLI in the RLC/MAC header.
4B3	MS -> SS	UPLINK RLC DATA BLOCK	For **USF_GRANULARITY** = 4, containing TLLI in the RLC/MAC header.
4B4	MS -> SS	UPLINK RLC DATA BLOCK	For **USF_GRANULARITY** = 4, containing TLLI in the RLC/MAC header.
5	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, containing TLLI received at step 4.

50.4.3.6 Uplink dynamic allocation two phase access

Step	Direction	Message	Comments
		{Uplink dynamic allocation two phase access}	Macro parameters: **n**: the number of RLC data block to be transferred, **Multiblock Allocation Struct,** **USF_GRANULARITY**: 1 or 4 blocks, **RLC_DATA_BLOCKS_GRANTED**: 9-261 (close-end), or absent (open-end)**EGPRS Channel Coding Command:** MCS-1, -2, -3, -4, -5, -6, -6, -7, -8, -9 or MCS-5-7, MCS-6-9 **Resegment Bit:** incremental redundancy on/off in uplink direction **Window Size:** according to number of allocated timeslots **TLLI_BLOCK_CHANNEL_CODING**: MCS-1 or as data block, TBF_STARTING_TIME
0	MS		Trigger the MS initiating uplink transfer **n** octets data according to the test PDP context activated
1	MS -> SS	CHANNEL REQUEST Or EGPRS PACKET CHANNEL REQUEST	Received on RACH.
2	SS -> MS		
		IMMEDIATE ASSIGNMENT	Sent on AGCH, allocates two uplink blocks
3	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the first block assigned in step 2. EGPRS capability indicated in the MS Radio Access Capability IE. If the access type of the PACKET RESOURCE REQUEST specifies "Two Phase Access Req" check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used. In case of SMS over GPRS PEAK THROUGHPUT is not checked.
3a (conditional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 3) indicates 1, then step 3a is performed.
3b (optional)	MS -> SS	uplink control block (e.g. PACKET MEASUREMENT REPORT, PACKET UPLINK DUMMY CONTROL BLOCK)	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 3) indicates 0, then step 3b is optionally performed.
4	SS -> MS	PACKET UPLINK ASSIGNMENT	uplink dynamic allocation, no starting time (as default, otherwise use **TBF_STARTING_TIME**), Sent on PACCH of the same PDCH assigned in step 2.

50.4.3.7 Void

50.4.3.8 Void

50.4.3.9 Void

50.4.3.10 Downlink TBF establishment

Step	Direction	Message	Comments
		{Downlink TBF establishment}	Macro parameters: **RLC mode** **TBF_STARTING_TIME** **Window Size:** according to number of allocated timeslots
1	SS -> MS	PAGING REQUEST	1st Repeated Page info contains P-TMSI of the MS. Sent on PCH.
2	MS -> SS	EGPRS PACKET CHANNEL OR CHANNEL REQUEST	ACCESS TYPE = " Page Response ". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Random Reference = pertaining to the message received in step 2. Dynamic allocation, Sent on AGCH.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH containing USF assigned to the MS.
5	MS -> SS	UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3.
6	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block. Sent on uplink PACCH.
7	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Acknowledge the RLC control message. Received on uplink PACCH.
8	SS -> MS	IMMEDIATE ASSIGNMENT	Downlink Assignment, TLLI value as received. Sent on PCH. Three macro parameters as assigned in the test cases. EGPRS TBF mode indicated.

50.4.3.10A Uplink data

Step	Direction	Message	Comments
	MS ↔ SS	{ Uplink data }	Macro (arguments: see note 2)
1	MS → SS	RLC UPLINK DATA	SI bit set to '0'
2a	MS → SS	RLC UPLINK DATA	
⋮	⋮	⋮	See notes 1
2b	SS → MS	PACKET UPLINK ACK/NACK	
⋮	⋮	⋮	
N	MS → SS	RLC UPLINK DATA	till the required amount of blocks are received
N+1	SS → MS	PACKET UPLINK ACK/NACK	
NOTE 1: The SS sends a PACKET UPLINK ACK/NACK message at least every k-1 RLC UPLINK DATA messages, being k the window size with a value of 64 blocks. NOTE 2: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds^{-1} or frames^{-1}) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.			

50.4.3.11 GPRS Attach using EGPRS messages on CCCH

The following table describes a signalling sequence performing the GPRS attach procedure. Note that there are different possible sequences implementing the GPRS attach procedure.

The macros {Completion of GPRS attach} in the test cases refer to the table below starting at the step required for the particular sequence.

NOTE: EGPRS PACKET CHANNEL REQUEST shall be used in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used if support of EGPRS Packet Access enhancement is False for a R99 MS.

{GPRS attach procedure}

Step	Direction	Message	Comments
0			MS is triggered to initiate the GPRS attach procedure.
1	MS -> SS	CHANNEL REQUEST Or EGPRS PACKET CHANNEL REQUEST	Establishment Cause is 'One Phase', if it is CHANNEL REQUEST; Establishment Cause is 'signalling'; if it is EGPRS PACKET CHANNEL REQUEST.
2	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase access, dynamic allocation. Assigns GPRS TBF if CHANNEL REQUEST is received in step 1. Assigns EGPRS TBF if EGPRS PACKET CHANNEL REQUEST is received in step 1.
3	MS -> SS	(EGPRS) RLC data blocks	Transporting: **ATTACH REQUEST**
4	SS -> MS	PACKET UPLINK ACK/NACK	Indicating correct reception of uplink blocks, including RRBP field set.
5	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	Sent on PACCH
6	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF in EGPRS TBF Mode, sent 1 s. after step 5 on AGCH.
7	SS -> MS	EGPRS RLC data blocks	Transporting: **ATTACH ACCEPT**. Last block containing a valid RRBP field and FBI set.
8A	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Including Channel Request Description.
9A	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH.
10A	MS -> SS	EGPRS RLC data blocks	Transporting: **ATTACH COMPLETE**
11A	SS -> MS	PACKET UPLINK ACK/NACK	Including valid RRBP field
12A	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	
8B	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Not including Channel Request Description.
9B	MS->SS	CHANNEL REQUEST Or EGPRS PACKET CHANNEL REQUEST	Establishment Cause is 'One Phase', if it is CHANNEL REQUEST; Establishment Cause is 'signalling'; if it is EGPRS PACKET CHANNEL REQUEST.
10B	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase access, dynamic allocation. Assigns GPRS TBF if CHANNEL REQUEST is received in step 1. Assigns EGPRS TBF if EGPRS PACKET CHANNEL REQUEST is received in step 1.
11B	MS -> SS	(EGPRS) RLC data blocks	Transporting: **ATTACH COMPLETE**
12B	SS -> MS	PACKET UPLINK ACK/NACK	Indicating correct reception of uplink blocks, including RRBP field set.
13B	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	

50.4.3.12 Void

50.4.3.13 PDP Context Activation On CCCH

The following table describes a signalling sequence performing the PDP Context Activation.

The macros {Completion of PDP Context Activation} in the test cases refer to the table below starting at the step required for the particular sequence.

NOTE: EGPRS PACKET CHANNEL REQUEST shall be used in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used if support of EGPRS Packet Access enhancement is False for a R99 MS.

{PDP Context Activation procedure}

Step	Direction	Message	Comments
0			MS is triggered to initiate the PDP Context Activation procedure with specific Test PDP Context Number specified in test case.
1	MS -> SS	CHANNEL REQUEST Or EGPRS PACKET CHANNEL REQUEST	Establishment Cause is 'One Phase', if it is CHANNEL REQUEST; Establishment Cause is 'signalling'; if it is EGPRS PACKET CHANNEL REQUEST.
2	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase access, dynamic allocation; Assigns GPRS TBF if CHANNEL REQUEST is received in step 1. Assigns EGPRS TBF if EGPRS PACKET CHANNEL REQUEST is received in step 1.
3	MS -> SS	RLC data blocks	Transporting: **ACTIVATE PDP CONTEXT REQUEST**
4	SS -> MS	PACKET UPLINK ACK/NACK	Indicating correct reception of uplink blocks, including RRBP field set.
5	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	Sent on PACCH
6	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF in EGPRS Mode, sent 1 s. After step 5 on AGCH.
7	SS -> MS	EGPRS RLC data blocks	Transporting: **ACTIVATE PDP CONTEXT ACCEPT**. Last block containing a valid RRBP field and FBI set.
8A	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Not including Channel Request Description.
-			The following steps are required only if the Test PDP context is for LLC Acknowledge mode.
9A	MS->SS	EGPRS PACKET CHANNEL REQUEST	
10A	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF in EGPRS TBF Mode, one phase access, dynamic allocation.
11A	MS -> SS	RLC data blocks	Transporting: **SABM**
12A	SS -> MS	PACKET UPLINK ACK/NACK	Indicating correct reception of uplink blocks, including RRBP field set.
13A	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	
-			The following Path will be taken only if the Test PDP Context is for LLC Acknowledge mode.
8B	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Including Channel Request Description.
9B	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH.
10B	MS -> SS	RLC data blocks	Transporting: **SABM**
11B	SS -> MS	PACKET UPLINK ACK/NACK	Including valid RRBP field
12B	MS -> SS	PACKET CONTROL ACKNOWLEDGMENT	
13B		Void	
14	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF in EGPRS Mode, sent 1 s. After step 13 on AGCH.
15	SS -> MS	EGPRS RLC data blocks	Transporting: **UA**. Last block containing a valid RRBP field and FBI set.
16	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	

50.4.3.14 Void

50.4.3.15 PDP Context Activation, IPA capable MS

The procedure {PDP Context Activation procedure, IPA capable MS} is the same as procedure {PDP Context Activation procedure} in section 50.4.3.13 except:

- IPA support bit set to '1' in paging messages of MS paging-sub-channel during all steps
- In following steps Immediate Packet Assignment is sent by the SS:

2	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	For uplink TBF, one phase access, dynamic allocation; Assigns EGPRS TBF.

6	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	For downlink TBF in EGPRS Mode, sent 1 s. After step 5 on AGCH.

10A	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	For uplink TBF in EGPRS TBF Mode, one phase access, dynamic allocation.

14	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	For downlink TBF in EGPRS Mode, sent 1 s. After step 13 on AGCH.

50.5 Test PDP contexts

The PDP contexts used in the EGPRS dynamic allocation and EGPRS RLC test cases are identical to the PDP contexts used in the GPRS dynamic allocation and RLC test cases (see 40.5) with the following exception in the table given below.

Test PDP context30 is the default Test PDP context which is used in the test cases where no particular Test PDP contexts are specified. Compression is always turned off if nothing else is stated explicitly in the test case.

If the MS does not include any PDP address, dynamic PDP address shall be assigned by the SS. The MS with Rel-8 behaviour shall not include the PDP address and the PDP address allocation is dynamic always.

NOTE: In this subclause all information element values are in decimal.

Table 50.5: Test PDP contexts

	PDP Context30	PDP Context31
LLC SAPI	SAPI = 3	SAPI =9
Reliability Class	5 (RLC unacknowledged) (LLC unacknowledged)	3 (RLC acknowledged) (LLC unacknowledged)
Delay Class	4 (best effort)	4 (best effort)
Precedence Class	2 (normal)	2 (normal)
Peak Throughput Class	6 (32 000 octet/s)	7 (64 000 octet/s)
Mean Throughput Class	17 (20 000 000 octet/h)	17 (20 000 000 octet/h)
PDP Type	IP type	IP type
PDP Address	Static/Dynamic	Static/Dynamic
APN	Arbitrarily chosen	Arbitrarily chosen
Protocol Configuration Options	PPP options	PPP options
Radio Priority	1	1
Traffic Class	Background	Background
Delivery Order	'no'	'no'
Delivery of erroneous SDU	'yes'	'no'
Maximum SDU size	150	150
Maximum bit rate for uplink	256 kbps	512 kbps

51 EGPRS Paging, TBF establishment/release and DCCH related procedures

51.1 RR / Paging

The paging procedure is used by the network to cause the MS to establish either an RR connection for circuit switched services or a downlink TBF for EGPRS packet transfer. Normally the MS listens to its paging sub-channel when DRX is used, but this can be modified by the use of different page mode. The correct monitoring of its paging sub-channel on CCCH in different control channel configurations and correct implementation of the paging procedure in the MS are essential. They are the test objectives of this clause.

NOTE:

A R99 MS may optionally use either a Channel Request message or an EGPRS Packet Channel Request to answer to Packet Paging by the SS on CCCH.

In case the MS uses a Channel Request to respond to a Paging Request message on CCCH, the SS shall include GPRS specific message contents in the corresponding Immediate Assignment / Immediate Assignment Reject message.

In case the MS uses EGPRS Channel Request to respond to a Paging Request message on CCCH, the SS shall include EGPRS specific message contents in the corresponding Immediate Assignment / Immediate Assignment Reject message.

51.1.1 Void

51.1.2 Void

51.1.3 Void

51.1.4 Void

51.1.5 RR / Paging / on CCCH for EGPRS service

51.1.5.1 RR / Paging / on CCCH for EGPRS service / normal paging

51.1.5.1.1 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI successful

51.1.5.1.1.1 Conformance requirements

1. The network initiates the paging procedure by sending a paging request message on an appropriate paging sub-channel on CCCH. Paging initiation using a paging sub-channel on CCCH is used when sending paging information to a mobile station and PCCCH is not present in the cell.

2. The mobile station in packet idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging sub-channels on CCCH corresponding to the paging groups determined for it in packet idle mode.

3. A PAGING REQUEST message may include more than one mobile station identification.

4. In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall indicate the receipt of a paging request to the MM sub-layer.

   If the mobile station identified by its IMSI, it shall parse the message for a corresponding *Packet Page Indication* field:

   - if the *Packet Page Indication* field indicates a paging procedure for RR connection establishment, or the field is not present in the message, the mobile station shall initiate the immediate assignment procedure;

- if the *Packet Page Indication* field indicates a packet paging procedure, the mobile station shall indicate the receipt of a paging request to the MM sub-layer.

5. The mobile station initiates the packet access procedure by scheduling the sending of CHANNEL REQUEST messages on RACH.

3GPP TS 24.008, subclauses 3.3.2.1.1, 3.5.1.1, 3.5.1.2 and 3.5.2.1.

3GPP TS 05.02, subclause 6.5.6.

3GPP TS 04.18/44.018, subclause 3.5.2.1.2

51.1.5.1.1.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its CCCH group and PAGING group and that the MS responds correctly with CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST on RACH with cause value of 'packet access' upon receipt of a PAGING REQUEST TYPE 1 message for packet access with paging mode set to normal.

2. To verify that the MS is able to respond to PAGING REQUEST TYPE 1 for packet access when the MS is addressed with its P-TMSI, but another field of the paging message contains an IMSI different from that of the MS.

3. To verify that the MS is able to respond to PAGING REQUEST TYPE 2 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain a TMSI and an IMSI different from that of the MS.

4. To verify that the MS is able to respond to PAGING REQUEST TYPE 3 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain TMSIs different from that of the MS.

51.1.5.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLKS_RES = 2, BS_PA_MFRMS = 6, SPLIT_PG_CYCLE is supported on CCCH in the cell.

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated, SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)
- MS operation mode A (TSPC_operation_mode_A)
- MS operation mode B (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated three times. Each time the MS is paged for the packet paging procedure through a different paging request type message. After receiving a CHANNEL REQUEST with the establishment cause 'one phase access', or an EGPRS PACKET CHANNEL REQUEST with the establishment cause 'signalling' an open-end TBF is assigned. A

USF is assigned to the MS to enable it to transfer an uplink RLC data block. The received data block is acknowledged by the SS with , Final Ack Indicator = '1' , a valid RRBP. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.

Maximum Duration of Test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected Sequence

The test sequence is repeated for k = 1 … 3.

Step	Direction	Message	Comments
1A	SS -> MS	PAGING REQUEST TYPE 1	k=1 1st Mobile Identity contains P-TMSI of the MS, 2nd Mobile Identity not present. Sent on PCH.
1B	SS -> MS	PAGING REQUEST TYPE 2	k=2 1st Mobile Identity contains P-TMSI of the MS, the other two Mobile Identities not addressing the MS. Sent on PCH.
1C	SS -> MS	PAGING REQUEST TYPE 3	k=3 1st Mobile Identity contains P-TMSI of the MS, the remaining Mobile Identities not addressing the MS. Sent on PCH.
2	MS -> SS	CHANNEL REQUEST/ EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = "one phase access", received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Request Reference = pertaining to the message received in step 2. Uplink assignment, sent on AGCH.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH containing USF assigned to the MS.
5	MS -> SS	(EGPRS) UPLINK RLC DATA BLOCK (not L3 Message)	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 4.
6	SS -> MS	PACKET UPLINK ACK/NACK	acknowledge the received RLC data block, Final Ack Indicator = '1' , a valid RRBP. Sent on PACCH.
7	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	acknowledge the RLC control message. Received on PACCH.

51.1.5.1.2 RR / Paging / on CCCH for EGPRS service / normal paging with IMSI successful

51.1.5.1.2.1 Conformance requirements

1. If the MS was paged by the network with the IMSI (for EGPRS service), the MS shall delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored. The MS shall then perform a GPRS attach or combined GPRS attach procedure.

References

3GPP TS 24.008, subclause 4.7.9.1.2.

3GPP TS 04.18/44.018, subclause 3.5.2.1.2

51.1.5.1.2.2 Test purpose

To verify that the MS is able to respond to PAGING REQUEST TYPE 1 when the MS is addressed with its IMSI with *Packet Page Indication* set to packet paging procedure, and that the MS then performs a GPRS attach or combined GPRS attach procedure.

51.1.5.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLKS_RES = 2, BS_PA_MFRMS = 9.

Mobile Station:

The MS is in GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated, SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)
- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The MS is paged on PCH with IMSI for packet paging procedure. After receiving the CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST from the MS a TBF is assigned. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS verifies the completeness of ATTACH REQUEST and acknowledges the received RLC data blocks with a valid RRBP and Final Ack indicator = '1'.

Maximum Duration of Test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	PAGING REQUEST TYPE 1	1st Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH.
2	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = = "one phase packet access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase access.
4	MS -> SS	(EGPRS) UPLINK RLC DATA BLOCK (ATTACH REQUEST)	LLC PDU containing a TLLI and the first part of ATTACH REQUEST, the implicit paging response to step 1. Received on the uplink PDTCH assigned in step 3.
5	SS -> MS	PACKET UPLINK ACK/NACK	Contention resolution, acknowledge the received RLC data blocks, No USF assigned. Sent on PACCH.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	(EGPRS) UPLINK RLC DATA BLOCK	.Repeat step 6 & 7 until the CV = 0 to receive the complete ATTACH REQUEST message
8	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data blocks. Final Ack indicator = '1', containing valid RRBP, sent on PACCH
9	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Acknowledge the RLC control messages. Received on PACCH.

Information Element	value/ remark
RACH Control Parameters - Max Retrans	 Max 2 retransmission

51.1.5.1.3 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on CCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the both GSM EGPRS and circuit-switched services to other users of the mobile stations.

51.1.5.1.3.1 Conformance requirements

Paging initiation using the paging subchannel on CCCH is used when sending paging information to a mobile station in idle mode. It is also used when sending paging information to a mobile station in packet idle mode, if PCCCH is not present in the cell.

In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall proceed as specified in 3GPP TS 04.18, subclause 3.5.1.2.

References

3GPP TS 04.18/44.018, subclauses 3.3.2.1.1 and 3.5.1.1, 3.5.2.1.2.

51.1.5.1.3.2 Test purpose

To verify that the MS ignores a PAGING REQUEST TYPE 1, 2 messages where both P-TMSI and IMSI do not address the MS although the paging message is sent on the CCCH to which the CCCH_GROUP belongs.

51.1.5.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLKS_RES = 2, BS_PA_MFRMS = 7.

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)
- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated twice. Each time a different paging message not addressing the MS is sent on the PCH belonging to the MS. It is checked that the no access attempt is made by the MS for 5 s.

The MS is then paged for packet paging. The MS attempts a random access which is rejected.

Maximum Duration of Test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment in the following cases

a. If Release of EGPRS supported is Release 4 or above.
b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected Sequence

The test steps 1 - 2 is repeated for k = 1 .. 2

Step	Direction	Message	Comments
1A	SS -> MS	PAGING REQUEST TYPE 1	k=1, The two packet page indications are set to packet paging procedure. 1st Mobile Identity contains P-TMSI, 2nd Mobile Identity contains IMSI, both Identities do not address the MS. Sent on PCH belonging to the MS.
1B	SS -> MS	PAGING REQUEST TYPE 2	k=2, Packet page indication 3 is set to packet paging procedure. 1st Mobile Identity contains P-TMSI, 2nd Mobile Identity contains P-TMSI, 3rd Identity contains IMSI, all identities not addressing the MS. Sent on PCH belonging to the MS.
2	SS		Check that no CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST is sent from the MS for 5s.
3	SS -> MS	PAGING REQUEST TYPE 1	1st Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH belonging to the MS.
4	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause "one phase packet access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
5	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Random Reference = pertaining to the message received in step 4.

Specific Message Contents

PAGING REQUEST TYPE 1 message:

Information Element	value/ remark
Mobile Identity 1	
- odd/even indication	Even.
- Type of Identity	P-TMSI.
- Identity Digits	P-TMSI value not allocated to MS.
Mobile Identity 2	IMSI different from the value stored on the SIM.
P1 rest octets	
- Packet Page Indication 1	H, Packet Paging
- Packet Page Indication 2	H, Packet Paging

PAGING REQUEST TYPE 2 message:

Information Element	value/ remark
Mobile Identity 1	
- TMSI value	P-TMSI value not allocated to the MS.
P2 rest octets	LLLL
- Packet Page Indication 3	H, Packet Paging

51.1.5.2 RR / Paging / on CCCH for EGPRS service / extended paging

51.1.5.2.1 RR / Paging / on CCCH for EGPRS service / extended paging with P-TMSI successful

51.1.5.2.1.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

b) extended paging: the mobile station is required in addition to receive and analyse the next but one message on the PCH.

References

3GPP TS 04.18/44.018, subclauses 3.3.2.1.1, 3.5.2.1.2, 9.1.18, 9.1.19 and 9.1.20.

51.1.5.2.1.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 1 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 2 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 3 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
5. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT EXTENDED on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT REJECT on the paging sub-channel corresponding to the MS identity.

51.1.5.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, PCCCH absent, Max-Retrans = 2, CCCH_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS_AG_BLKS_RES = 3, BS_PA_MFRMS = 8.

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)
- MS operation mode A Yes/No (TSPC_operation_mode_A)

- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated 6 times. Each time a different downlink message is sent on PCH or AGCH for setting the page mode to extended paging. The MS is paged on the next but one page block for the packet paging procedure. The MS starts a random accesses which are rejected by the SS.

Maximum Duration of Test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected Sequence

The test sequence is repeated for k = 1 … 6

Step	Direction	Message	Comments
1A	SS -> MS	PAGING REQUEST TYPE 1	k=1, All mobile Identities do not address the MS. Page mode is set to "extended paging". Packet page indication indicates packet paging procedure. Sent on PCH.
1B	SS -> MS	PAGING REQUEST TYPE 2	k=2, All mobile Identities do not address the MS. Page mode is set to "extended paging". Packet page indication indicates packet paging procedure. Sent on PCH.
1C	SS -> MS	PAGING REQUEST TYPE 3	k=3, All mobile Identities do not address the MS. Page mode is set to "extended paging". Channel Needed IE's are coded with 00. Sent on PCH.
1D	SS -> MS	IMMEDIATE ASSIGNMENT	k=4, Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH).
1E	SS -> MS	IMMEDIATE ASSIGNMENT EXTENDED	Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH).
1F	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	k=6, Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH).
2	SS -> MS	PAGING REQUEST TYPE 1	1st Mobile Identity contains P-TMSI of the MS, 2nd Mobile Identity not present. Page mode is set to "normal paging". Packet page indication indicates packet paging procedure. Sent on the next but one subblock on the same CCCH as previous paging message.
3	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = "One phase access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
4	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause "One phase access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
5	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 4. Page mode is set to "normal paging". Sent on AGCH.

51.1.5.3 RR / Paging / on CCCH for EGPRS service / paging reorganisation

51.1.5.3.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

c) paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

References

3GPP TS 04.18/44.018, subclause 3.3.2.1.1, 3.5.2.1.2.

3GPP TS 04.60/44.060, subclause 7.1.2.1

51.1.5.3.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of reserved blocks, BS_AG_BLKS_RES, and the number of 51-multiframes between transmissions of paging messages for mobile stations of the same paging group BS_PA_MFRMS are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of basic physical channels for CCCH is changed.

51.1.5.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, PCCCH absent, Max-Retrans = 2, CCCH_CONF = 0 (1 basic physical channel used for CCCH with non-combined SDCCH), BS_AG_BLKS_RES = 3, BS_PA_MFRMS = 6. SPGC_CCCH_SUP = 0 (SPLIT_PG_CYCLE is not supported on CCCH in the cell).

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)
- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The page mode is set to paging reorganisation. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 1 which is sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. The MS starts the random access. The access attempt is rejected.

The SS changes the CCCH configuration with BS_AG_BLKS_RES=2 and BS_PA_MFRMS=5 and waits two SI13 repeat periods, and then sets the page mode to Normal Paging. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 2 sent on the new paging sub-channel. The MS starts the random access. The access attempt is rejected via IMMEDIATE ASSIGNMENT REJECT. PAGING REQUEST TYPE 1 with paging fill frame and page mode set to "paging reorganisation" is sent.

Two additional CCCHs are activated by the SS. The same test procedure as above is repeated.

Maximum Duration of Test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used to respond to Paging and Packet Paging Request for TBF Establishment in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used to respond to Paging Request for TBF Establishment if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT EXTENDED	Page mode set to "paging reorganisation"
2	SS -> MS	PAGING REQUEST TYPE 1	Sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. Page mode set to "normal paging", for packet paging procedure.
3	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = "one phase access", received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
4	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 3. Sent on AGCH.
5	SS	PAGING REQUEST TYPE 1	Sent on the MS's paging sub-channel. Paging fill frame and page mode set to "paging reorganisation". All L3 messages sent on any paging sub-channel are paging fill frame specify Paging Reorganisation.
6	SS		Set BS_AG_BLKS_RES=2 and BS_PA_MFRMS=5 in SI's. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the changes. SI_CHANGE_FIELD = 3.
7	SS		Wait two SI13 repeat periods. All L3 messages sent on any paging sub-channel are paging fill frame specify Normal Paging. Wait for the time required for BS_PA_MFRMS Multi-Frames.
8	SS -> MS	PAGING REQUEST TYPE 2	1st Mobile Identity contains P-TMSI of the MS. 2nd Mobile Identity contains P-TMSI, 3rd Identity contains IMSI, the last two identities not addressing the MS. Packet page indication indicates packet paging procedure. Page mode = "same as before", sent on the new PCH belonging to the MS.
9	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = "one phase access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
10	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 9.
11	SS	PAGING REQUEST TYPE 1	Sent on the MS's paging sub-channel. Paging fill frame and page mode set to "paging reorganisation". All L3 messages sent on any paging sub-channel are paging fill frame specify Paging Reorganisation.
12	SS		Reconfigure the SS channels so that additional two CCCH's are set on slot 2 and slot 4, Set CCCH_CONF = 4 in SI's. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the changes. SI_CHANGE_FIELD = 3.
13	SS		Wait two SI13 repeat periods. All L3 messages sent on any paging sub-channel are paging fill frame specify Normal Paging. Wait for the time required for BS_PA_MFRMS Multi-Frames.
14	SS -> MS	PAGING REQUEST TYPE 2	1st Mobile Identity contains P-TMSI of the MS. 2nd Mobile Identity contains P-TMSI, 3rd Identity contains IMSI, the last two identities not addressing the MS. Packet page indication indicates packet paging procedure. Page mode = "same as before", sent on the new PCH belonging to the MS.

15	MS -> SS	CHANNEL REQUEST/EGPRS PACKET CHANNEL REQUEST (see NOTE)	In case CHANNEL REQUEST is received Establishment Cause = "one phase access". Received on RACH. In case EGPRS PACKET CHANNEL REQUEST is received ACCESS TYPE = " Signalling ". Received on RACH.
16	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	Request Reference = pertaining to the message received in step 15. Sent on AGCH.

Specific Message Contents

None.

51.1.5.4 RR / Paging / on CCCH for EGPRS service / default message contents

Void

51.1.6 Void

51.2 RR procedures on CCCH related to temporary block flow establishment

This clause presents tests for "RR procedures on CCCH related to temporary block flow establishment" which are specified in 3GPP TS 04.18 subclause 3.5.

Default conditions

The SS default conditions simulate one cell with default settings as defined in the EGPRS general defaults section, except:

- SI 13 Rest Octets contains no PCCCH description (PCCCH is not supported by the network).

The MS default initial condition is GPRS/EGPRS attached. Unless otherwise stated, no PDP context is required.

Default message contents and signalling macros are also defined in the GPRS general defaults section, except for those messages and macros specified at the end of this clause.

51.2.1 Permission to access the network

51.2.1.1 Permission to access the network / priority classes

51.2.1.1.1 Conformance requirements

Access to the network is allowed:

- if packet access is allowed in the cell for the priority class associated with the packet transfer, as indicated by the PRIORITY_ACCESS_THR parameter broadcast in SI 13 message.

References

3GPP TS 04.18 subclause 3.5.2.1.1.

51.2.1.1.2 Test purpose

To verify that the MS accesses the network only if packet access is allowed in the cell for the priority class associated with the packet transfer.

51.2.1.1.3 Method of test

Initial conditions

System Simulator:

Network Mode of Operation is set to NMO II

Mobile Station:

For PRIORITY_ACCESS_THR >2 MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

For PRIORITY_ACCESS_THR <=2 MS is Idle Updated

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

For PRIORITY_ACCESS_THR >2 MS is triggered to transfer data. The SS verifies that the MS accesses the network as appropriate.

For PRIORITY_ACCESS_THR <=2 MS is triggered to perform an attach procedure. The SS verifies that the MS does not try to access the Network.

Specific test parameters:

- PRIORITY_ACCESS_THR is chosen from {0, 1, 2, 3, 4, 5, 6, 7}.
- priority level is chosen from { 1, 2, 3, 4 }

Expected sequence

For PRIORITY_ACCESS_THR >2

Step	Direction	Message	Comments
1 2	 SS		The MS is triggered to transfer data See verification

Verification:

The SS verifies for 10 s that MS access (or not) to the network according to the PRIORITY_ACCESS_THR values below.

0 1 1 packet access is allowed for priority level 1;
1 0 0 packet access is allowed for priority level 1 to 2;
1 0 1 packet access is allowed for priority level 1 to 3;
1 1 0 packet access is allowed for priority level 1 to 4;
1 1 1 spare, shall be interpreted as (packet access allowed).

For PRIORITY_ACCESS_THR <=2

Step	Direction	Message	Comments
1 2	 SS		The MS is triggered to do Attach procedure The SS verifies for 10 s that MS does not try to access to the network.

51.2.2 Initiation of the packet access procedure

51.2.2.1 Initiation of the packet access procedure / establishment causes

51.2.2.1.1 Conformance requirements

The CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages are sent on RACH and contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or single block packet access for a CHANNEL REQUEST (clause 9.1.8), or a request for one phase access or two phase access or short access or sending of signalling data for an EGPRS PACKET CHANNEL REQUEST (see 3GPP TS 04.60);

- a random reference which is drawn randomly from an uniform probability distribution for every new transmission.

References

3GPP TS 04.18/44.018 subclause 3.5.2.1.2.

Justification

51.2.2.1.2 Test purpose

To verify that the CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST message sent by the MS contains the correct establishment cause or Access Type when initiating a packet access procedure.

51.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

If the MS supports PDP context, the MS is triggered to initiate a PDP Context Activation procedure for RLC unacknowledged mode. The SS verifies that the MS attempts either a one phase packet access by sending a CHANNEL REQUEST or by sending an EGPRS PACKET CHANNEL REQUEST with Access Type 'signalling'.

The MS is triggered to transfer RLC data blocks. The SS verifies that the MS correctly sets the Access Type in the EGPRS PACKET CHANNEL REQUEST message.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		MS is triggered to initiate a PDP Context Activation 3.
2	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS verifies that Establishment Cause is 'one phase' if the MS has sent a CHANNEL REQUEST. SS verifies that Access Type is 'signalling' if the MS has sent an EGPRS PACKET CHANNEL REQUEST.
3	SS <->MS	{Completion of PDP Context Activation Procedure}	Macro completion from step 2.
4	MS		MS is triggered to transfer data.
5	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS verifies that Access Type is 'two phase access'.
6	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	

Specific Message Contents:

None.

51.2.2.2 Random references for two phase packet access

51.2.2.2.1 Conformance requirements

The CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages are sent on RACH and contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or single block packet access for a CHANNEL REQUEST (clause 9.1.8), or a request for one phase access or two phase access or short access or sending of signalling data for an EGPRS PACKET CHANNEL REQUEST (see 3GPP TS 04.60);
- a random reference which is drawn randomly from an uniform probability distribution for every new transmission.

References

3GPP TS 04.18/44.018 subclause 3.5.2.1.2.

51.2.2.2.2 Test purpose

To verify that the MS produces different Random References when accessing the network for two phase access.

51.2.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 4 retransmissions.

Mobile Station:

MS is GPRS attached, a PDP context in RLC unacknowledged mode has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data, it shall attempt a Two Phase packet access (3GPP TS 04.18 / 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 7) in its Random Reference.

Justification

The length of the Random Reference is 3 bits two phase packet access (3GPP TS 04.18 / table 9.9). This test verifies that the MS uses all values (0 ... 7) in its Random Reference.

The probability that in a sequence of N samples one of the possible value does not appear is 8*(7/8)**N for large N.

Note: The number of samples N has been computed such that the probability of refusing a correct MS is less than 0,02 %.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		MS is triggered to transfer data. (Two phase Packet Access)
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
3	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
4	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
5	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
6	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
7	SS		SS waits 5.5 seconds (Maximum value of T3146 is 5 seconds) Note: Test Case executes Step 8A or 8B depending on MS behaviour. If any EGPRS PACKET CHANNEL REQUEST received during the wait time, SS continue with Step 8A else SS continue with Step 8B
8A (Conditional)	MS -> SS	EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References and repeats the Steps 3 to 7.
8B (Conditional)	SS		Repeat Steps 1 to 7
-9	MS<->SS		Steps 1 to 8 are repeated until 80 EGPRS PACKET CHANNEL REQUEST messages have been received.
-10	SS		SS verifies that all Request Reference values (0 to 7) come out in the stored samples.

51.2.2.3 Random references for one phase packet access and for Access Type 'signalling'

51.2.2.3.1 Conformance requirements

The CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages are sent on RACH and contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or single block packet access for a CHANNEL REQUEST (clause 9.1.8), or a request for one phase access or two phase access or short access or sending of signalling data for an EGPRS PACKET CHANNEL REQUEST (see 3GPP TS 04.60);
- a random reference which is drawn randomly from an uniform probability distribution for every new transmission.

References

3GPP TS 04.18/44.018 subclause 3.5.2.1.2.

51.2.2.3.2 Test purpose

To verify that the MS produces different Random References when accessing the network for one phase access or with Access Type 'signalling'.

51.2.2.3.3 Method of test

Initial conditions

System Simulator: default settings except:

Parameter MAX_RETRANS is set to 4 retransmissions.

T3302 = 1 minute

Mobile Station:

Note: MS may be brought into the required condition by causing it to be triggered to perform GPRS attach and the SS responding with ATTACH REJECT in which T3302 is set to 1 minute and the cause set to "MSC temporarily not reachable". MS treats this as a temporary failure and enters the test sequence by restarting the attach procedure.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS shall attempt either a one phase packet access using Channel Request or Access Type signalling using Egprs Packet Channel Request. The SS does not answer to the access bursts but stores N (N=80 in case of Channel Request and N=380 in case of Egprs Packet Channel Request) Random References and verifies that the MS uses all possible values in its Random Reference.

Possible values in case of Channel Request are 0...3 and not using value '111' as a value of the 3 least significant bits for channel request octet (see 3GPP TS 04.18/Table 9.1.8.1)

Possible values in case of Egprs Packet Channel Request are 0...31 (see 3GPP TS 04.60 / 11.2.5a and 3GPP TS 04.18/Table 9.1.8.1).

Justification

In case of Channel Request:

Possible values for Random Reference for one phase packet access are 0 to 3 (value '111' is not allowed). This test verifies that the MS uses all values (0 ... 3) in its Random Reference.

In case of Egprs Packet Channel Request

Possible values for Random Reference for signalling are 0 to 31. This test verifies that the MS uses all values (0 ... 31) in its Random Reference.

Maximum duration of the test

45 minutes.

Expected sequence

Step	Direction	Message	Comments
			MS re-starts the Attach Procedure.
1	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
2	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
3	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
4	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
5	MS -> SS	CHANNEL REQUEST or: EGPRS PACKET CHANNEL REQUEST	SS stores the value of Request References
			Step 6 is optional and depends on the mobile implementation.
6		**{Location Update Procedure}**	Macro for Location Updating.
7	MS<->SS		Steps 1 to 6 are repeated N/5 times Note: N=80 in case Channel Request is used by MS N=380 in case Egprs Packet Channel Request is used by MS.
8	SS		In case of Channel Requests: SS verifies that all Random Reference values (Random Reference field is filled with "x") in the range 0 to 3 come out in the stored samples and that value '111' is not used as a value of the 3 least significant bits for channel request octet. In case of Egprs Packet Channel Requests: SS verifies that all Random Reference values in the range 0 to 31 come out in the stored samples.

The Channel Request message is coded as follows (reference 3GPP TS 04.08 / 3GPP TS 44.018 table 9.9):

011110xx One phase packet access with request for single timeslot uplink.

01111x0x transmission; one PDCH is needed.

01111xx0 [TBD]

51.2.2.4 Initiation of the packet access procedure / timer T3146

51.2.2.4.1 Conformance requirements

Having sent the maximum number of EGPRS PACKET CHANNEL REQUEST messages, the mobile station starts timer T3146. At expiry of timer T3146, the packet access procedure is aborted and a packet access failure is indicated to upper layers.

Reference

3GPP TS 04.18 subclause 3.5.2.1.2.

51.2.2.4.2 Test purpose

To verify that the MS waits T3146 seconds before aborting the packet access procedure.

51.2.2.4.3 Method of test

Initial conditions

System Simulator: Default settings except:

System Information parameter MAX_RETRANS is set to 2 retransmissions.

CCCH non-combined with SDCCH.

System Information parameter TX_INTEGER in RACH Control Parameters is set to 3.

Mobile Station:

MS is GPRS attached, PDP Context 31 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS waits until the MS sends all M+1 EGPRS PACKET CHANNEL REQUEST messages, and then sends an IMMEDIATE ASSIGNMENT before minimum value of T3146 seconds elapse. In this case the MS shall correctly send the LLC PDU on the assigned PDCH.

The MS is triggered again to initiate uplink data transfer, the SS waits until the MS sends all M+1 EGPRS PACKET CHANNEL REQUEST messages, where M is the parameter Max Retrans broadcast on BCCH. The SS waits until the maximum value of T3146 seconds elapse and sends an IMMEDIATE ASSIGNMENT which shall be ignored by the MS since the access procedure should be aborted.

Note:

Timer T3146 (3GPP TS 04.18 clause 11) depends on parameter TX_INTEGER broadcast on BCCH.

The minimum value of the timer is 2*S+TX_INTEGER slots, where S is given in 3GPP TS 04.08 / 3GPP TS 44.018, Table 3.1.

The maximum value of this timer is 5 seconds. (Subclause 11.1.1 in 04.08)

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	The MS is triggered to initiate uplink data transfer..
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
3	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
4	SS		SS waits T3146 - 0.1*T3146 (using minimum value of T3146, which is 2*S + TX_INTEGER slots)
5	SS -> MS	IMMEDIATE ASSIGNMENT	Multi block assignment using Multiblock Allocation Struct, allocates two uplink blocks to order the MS to follow the two-phase access procedure. Sent on AGCH.
6	MS -> SS	PACKET RESOURCE REQUEST	Received on the first block assigned in step 5.
6a (condi-tional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 6) indicates 1, then step 6a is performed.
6b (optiona l)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 6) indicates 0, then step 6b is optionally performed.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	Uplink dynamic allocation. Sent on PACCH.
8	SS <->MS	Completion of macro {Uplink data transfer }	SS allows MS to complete the uplink data transfer.
9	MS -> SS	EGPRS PACKET CHANNEL REQUEST	The MS is triggered a second time to initiate uplink data transfer.
10	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request
11	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request
12	SS		SS waits 5.5 seconds (Maximum value of T3146 is 5 seconds)
13	SS -> MS	IMMEDIATE ASSIGNMENT	Multi block assignment using Multiblock Allocation Struct, to order the MS to follow the two-phase access procedure. Sent on AGCH.
14	SS		MS shall ignore the message, SS verifies that MS does not send PACKET RESOURCE REQUEST. Note: Depending upon the MS implementation the upper layers may have reinitiated the access procedure during the wait time at step 12. So SS shall ignore any EGPRS PACKET CHANNEL REQUEST received.
15	MS		Switch Off

The complete test is repeated for:

- TX_INTEGER set to 20 (MS shall set timer T3146 to 1.1s); and for
- TX_INTEGER set to 32 (MS shall set timer T3146 to 2.1s).

51.2.2.5 Initiation of the packet access procedure / Request Reference

51.2.2.5.1 Conformance requirements

On receipt of an IMMEDIATE ASSIGNMENT message corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile stops sending EGPRS PACKET CHANNEL REQUEST messages and switches to the assigned PDCH.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.1.

51.2.2.5.2 Test purpose

1. To verify that the MS continues sending EGPRS PACKET CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT containing an incorrect Request Reference.

2. To verify that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages and switches to the assigned PDCH when receiving an IMMEDIATE ASSIGNMENT containing a Request Reference IE corresponding to one of its last 3 EGPRS PACKET CHANNEL REQUEST messages.

51.2.2.5.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 7 retransmissions.

Mobile Station:

MS is GPRS attached, PDP Context 31 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. After 3 EGPRS PACKET CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT including an incorrect Request Reference. The SS verifies that the MS continues sending EGPRS PACKET CHANNEL REQUEST messages.

After the 5th EGPRS PACKET CHANNEL REQUEST message the SS sends an IMMEDIATE ASSIGNMENT including a correct Request Reference. The SS verifies that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages, switches to the assigned PDCH and completes the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
0	MS		The MS is triggered to transfer 200 octets of data.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
3	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
4	SS -> MS	IMMEDIATE ASSIGNMENT	Multi block assignment using Multiblock Allocation Struct, to order the MS to follow the two-phase access procedure. Sent on AGCH and including a Request Reference different from those included in previous EGPRS PACKET CHANNEL REQUEST messages.
5	MS -> SS	EGPRS PACKET CHANNEL REQUEST	MS continues sending EGPRS PACKET CHANNEL REQUEST messages. One or Two Phase Access Request.
6	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request.
7	SS -> MS	IMMEDIATE ASSIGNMENT	Multi block assignment using Multiblock Allocation Struct, allocates two uplink blocks to order the MS to follow the two-phase access procedure. Sent on AGCH. With Request Reference corresponding to step 3. MS shall stop sending further access bursts.
8	MS -> SS	PACKET RESOURCE REQUEST	Received on the first block assigned in step 7.
8a (conditional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 8) indicates 1, then step 8a is performed.
8b (optional)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 8) indicates 0, then step 8b is optionally performed.
9	SS -> MS	PACKET UPLINK ASSIGNMENT	Uplink dynamic allocation. Sent on PACCH.
10	MS<->SS	Completion of macro {Uplink data transfer}	SS allows MS to complete the uplink data transfer.

Specific Message Contents:

None.

51.2.2.6 Two phase packet access / establishment cause

51.2.2.6.1 Conformance requirement

if the SI 13 indicates that the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST on RACH is not supported in the cell, the EGPRS mobile station shall use the 8 bit CHANNEL REQUEST message and shall initiate a two phase access request.

Reference

3GPP TS 04.18 3.5.2.1.3.4.

51.2.2.6.2 Test purpose

To verify that the mobile station sends CHANNEL REQUEST using two-phase packet access.

51.2.2.6.3 Method of test

Initial conditions

System Simulator: Default settings except:

- SI13 indicating that EGPRS_PACKET_CHANNEL_REQUEST is not supported in the cell

Mobile Station:

- MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate acknowledged uplink data transfer. The SS shall verify that CHANNEL REQUEST indicates two-phase access.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate the transfer of 200 user data octets.
2	MS -> SS	CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMMEDIATE ASSIGNMENT	Multi block allocation struct, allocating two uplink blocks. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on the first block assigned in step 3.
4a (condi-tional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 4) indicates 1, then step 4a is performed.
4b (option al)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 4) indicates 0, then step 4b is optionally performed.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Dynamic allocation struct MCS1. Sent on the PACCH of the assigned PDCH.
6		{Uplink data transfer, dynamic allocation}	Macro. Completion from step 4 in the TBF procedure.

Specific message contents

None.

51.2.2.7 Initiation of the packet access procedure by IPA capable MS / IMMEDIATE PACKET ASSIGNMENT message configured initially and later not configured on MS own Paging sub-channel

51.2.2.7.1 Conformance requirements

If the mobile station supports the IMMEDIATE PACKET ASSIGNMENT message, the mobile station shall monitor cell's capability for IMMEDIATE PACKET ASSIGNMENT message within paging messages received on its own paging sub-channel.

Purpose of the packet access procedure	EGPRS PACKET CHANNEL REQUEST supported in the cell	EGPRS PACKET CHANNEL REQUEST not supported in the cell
User data transfer - requested RLC mode = unacknowledged	EGPRS PACKET CHANNEL REQUEST with access type = 'Two Phase Access Request'	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
User data transfer - requested RLC mode = acknowledged	EGPRS PACKET CHANNEL REQUEST with access type = 'One Phase Access Request' or 'Two Phase Access Request'	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
User data transfer - requested RLC mode = acknowledged (Reduced Latency supported by MS)	EGPRS PACKET CHANNEL REQUEST with access type = 'One Phase Access Request by Reduced Latency MS' (NOTE 2)	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
User data transfer - requested RLC mode = acknowledged by an IPA capable mobile station	EGPRS PACKET CHANNEL REQUEST with access type = 'One Phase Access Request' or 'Two Phase Access Request by IPA capable MS' (NOTE 3)	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
Upper layer signalling transfer (e.g. page response, cell update, MM signalling, etc)	EGPRS PACKET CHANNEL REQUEST with access type = 'Signalling'	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
Upper layer signalling transfer for a mobile station configured for "*NAS signalling low priority*" (e.g. page response, cell update, MM signalling, etc)	EGPRS PACKET CHANNEL REQUEST with access type = 'Signalling' (NOTE 5) or 'Two Phase Access Request' (NOTE 6)	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
Upper layer signalling transfer (e.g. page response, cell update, MM signalling, etc) by an IPA capable mobile station	EGPRS PACKET CHANNEL REQUEST with access type = 'Signalling Request by IPA capable MS'(NOTE 4)	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
Sending of a measurement report or of a PACKET CELL CHANGE FAILURE	CHANNEL REQUEST with establishment cause = 'Single block packet access'	
Sending of a PACKET PAUSE message	CHANNEL REQUEST with establishment cause = 'Single block packet access' (NOTE 1)	
Sending of an MBMS Service Request message	CHANNEL REQUEST with establishment cause = 'Single block MBMS access'	

NOTE 1: Upon sending the first CHANNEL REQUEST message the mobile station shall start timer T3204. If timer T3204 expires before an IMMEDIATE ASSIGNMENT message granting a single block period on an assigned packet uplink resource is received, the packet access procedure is aborted. If the mobile station receives an IMMEDIATE ASSIGNMENT message during the packet access procedure indicating a packet downlink assignment procedure, the mobile station shall ignore the message.

NOTE 2: The One phase Access Request by Reduced Latency MS shall be used by the mobile station supporting reduced latency if Reduced Latency Access is supported by the network. The 'One Phase Access Request by Reduced Latency MS' or 'Two Phase Access Request by IPA capable MS' may be used instead if the mobile station is capable of both Reduced Latency and IMMEDIATE PACKET ASSIGNMENT and the network supports IMMEDIATE PACKET ASSIGNMENT message and Reduced Latency Access.

NOTE 3: (This note does not apply if Note 2 is applicable) The 'One Phase Access Request' with IPA capability signalled by the MultislotClass field in the EGPRS PACKET CHANNEL REQUEST message or 'Two Phase Access Request by IPA capable MS' shall be used by the mobile station supporting IMMEDIATE PACKET ASSIGNMENT message if support of the IMMEDIATE PACKET ASSIGNMENT message is signalled by the network.

NOTE 4: The 'Signalling Request by IPA capable MS' shall be used if both mobile station and network supports IMMEDIATE PACKET ASSIGNMENT.

NOTE 5: The access type 'Signalling' shall be used if a mobile station receives an indication from the upper layers to override *NAS signalling low priority*

NOTE 6: The access type 'Two Phase Access Request' shall be used if a mobile station does not receive an indication from the upper layers to override *NAS signalling low priority*

51.2.2.7.2 Test purpose

To verify that the IPA capable MS shall monitor cell's capability for IMMEDIATE PACKET ASSIGNMENT message within the paging messages received on its own paging sub-channel. If the capability for IMMEDIATE PACKET ASSIGNMENT message within the paging messages received on its own paging sub-channel is configured initially by the network, the IPA capable MS follows the packet access procedure defined for an IPA capable MS. Later, when the capability for IMMEDIATE PACKET ASSIGNMENT message is not configured on the IPA capable MS own paging sub-channel via the PAGING REQUEST TYPE 1 with the IPA Support bit set to '0', the MS follows the legacy packet access procedure.

51.2.2.7.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH. EGPRS supported. EGPRS PACKET CHANNEL REQUEST supported in GPRS cell options. IPA support bit set to '1' in paging messages of MS paging-sub-channel.

Mobile Station:

MS is GPRS attached.

Specific PICS Statements

\-

Test procedure

The MS is triggered to activate PDP context. MS sends EGPRS PACKET CHANNEL REQUEST with establishment cause "Signalling by IPA capable MS". SS sends IMMEDIATE ASSIGNMENT and PDP context activation procedure is completed. SS configures MS paging-sub-channel to indicate support for IPA message. SS waits until MS reads its paging-sub-channel. MS is triggered to initiate an uplink data transfer of RLC data blocks with acknowledged mode. MS sends EGPRS PACKET CHANNEL REQUEST with establishment cause "Two Phase Access Request". SS sends IMMEDIATE ASSIGNMENT and Uplink data transfer is completed.

Maximum duration of the test

3 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		Wait until MS is in DRX mode and reads its paging-sub-channel.
2	MS		MS is triggered to initiate the PDP Context Activation procedure with PDP Context 31
3	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Establishment cause = "Signalling by IPA capable MS" Received on RACH.
4	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	
5	MS -> SS	Completion of macro { PDP context activation, IPA capable MS }	SS allows MS to complete the PDP context activation procedure.
6	SS		MS paging-sub-channel is configured to indicate not support for IPA message (IPA support bit set to '0').
7	SS		SS waits until MS reads its paging-sub-channel.
8	MS		MS is triggered to transfer data
9	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Establishment cause = "Two Phase Access Request" Received on RACH.
10	SS -> MS	IMMEDIATE ASSIGNMENT	
11	MS -> SS	Completion of macro { Uplink data transfer }	SS allows MS to complete the uplink data transfer.

51.2.3 Packet immediate assignment / One phase packet access

51.2.3.1 Two-message assignment / Successful case

51.2.3.1.1 Conformance requirements

If the mobile station receives an IMMEDIATE ASSIGNMENT message and the Dedicated mode or TBF information element indicates that this is the first message in a two-message assignment, the mobile station shall continue to listen to the full CCCH. The network may send a second IMMEDIATE ASSIGNMENT message within two multiframe periods following the first IMMEDIATE ASSIGNMENT, specifying the packet channel description and, if required, a mobile allocation for the assignment.

On receipt of an IMMEDIATE ASSIGNMENT message or, in case of a two-message assignment, a matching pair of IMMEDIATE ASSIGNMENT messages corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile station stops T3146 (if running), stops sending EGPRS PACKET CHANNEL REQUEST messages, and switches to the assigned PDCH.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.1.

51.2.3.1.2 Test purpose

To verify that the MS correctly decodes a two-message assignment and switches to the assigned PDCH.

51.2.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP Context 31 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST the SS sends a two-message IMMEDIATE ASSIGNMENT which actually describes a default IMMEDIATE ASSIGNMENT message, except that it is split in two parts: basically, the first part contains the IA Rest Octets, and the second part the Packet Channel Description IE.

The SS verifies that the MS correctly switches to the assigned PDCH and completes the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 200 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	first message of two-message assignment
4	SS -> MS	IMMEDIATE ASSIGNMENT	second message (see specific message contents), sent within two multiframes after step 3.
5	MS<->SS	Completion of macro {Uplink data transfer}	SS allows MS to complete the uplink data transfer.

Specific message contents:

IMMEDIATE ASSIGNMENT (first message)

Information Element	Value
as default except:	
Dedicated mode or TBF:	
- TMA	1 (is first message of a two-message assignment)
- Downlink	0
- T/D	1 (assign a TBF)
Packet Channel Description:	all bits are set to '0'
Request Reference:	as default
Timing Advance:	as default
Starting Time:	not present
IA Rest Octets:	as default

IMMEDIATE ASSIGNMENT (second message)

Information Element	Value
as default except:	
Dedicated mode or TBF:	
- TMA	0
- Downlink	0
- T/D	1 (assign a TBF)
Packet Channel Description:	as default
Request Reference:	as default
Timing Advance:	as default
Starting Time:	not present
IA Rest Octets:	Second Part Assignment.

51.2.3.2 Two-message assignment / Failure cases

51.2.3.2.1 Conformance requirements

If the indirect encoding is used, the IMMEDIATE ASSIGNMENT message may contain a CHANGE_MARK_1 field. If that is present, the mobile station shall verify the validity of the SI13_CHANGE_MARK associated with the GPRS mobile allocation to which the message refers, see 3GPP TS 04.60. If the CHANGE_MARK_1 field and the SI13_CHANGE_MARK do not match, the message does not satisfactorily define a PDCH.

The two IMMEDIATE ASSIGNMENT messages in a two-message assignment shall have the same contents of the Request Reference information elements.

If the mobile station does not receive the second IMMEDIATE ASSIGNMENT messages in a two-message assignment within two multiframe periods following the first message, the mobile station shall discard the first IMMEDIATE ASSIGNMENT message received.

If the information available in the mobile station, after the reception of an IMMEDIATE ASSIGNMENT message or the second IMMEDIATE ASSIGNMENT message of a two-message assignment, does not satisfactorily define a PDCH, a TBF establishment failure has occurred.

Reference

3GPP TS 04.18 subclauses 3.5.2.1.3.1 and 3.5.2.1.5.

51.2.3.2.2 Test purpose

To verify that the MS does not respond to a two-message assignment if:

- CHANGE_MARK_1 does not match SI13 CHANGE_MARK.
- the second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first - message.
- Request References in both messages do not have same contents.

51.2.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, CHANGE_MARK in SI13 is set to 1, TX-INTEGER = 7.

MAX _RETRANS = 7.

Mobile Station:

MS is GPRS attached, PDP Context 31 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST the SS sends a two-message IMMEDIATE assignment:

- **first attempt:** CHANGE_MARK_1 does not match SI13 CHANGE_MARK, leading to TBF establishment failure. (see 3GPP TS 04.18 subclause 3.5.2.1.5).
- **second attempt:** the second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first message. The MS shall discard the assignment and continue with packet access.
- **third attempt:** Request References in both messages do not have same contents. MS shall re-initiate packet access.
- **fourth attempt:** the second IMMEDIATE ASSIGNMENT message is received in the last access grant block before the second multiframes after the first message. In this case the MS shall successfully switch to the assigned PDCH and complete the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate uplink data transfer.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	first message of two-message assignment with contents as specified below (see specific message contents).
4	SS -> MS	IMMEDIATE ASSIGNMENT	second message (see specific message contents) except: Packet Channel Description IE describes a hopping channel including CHANGE_MARK_1 different from SI13 CHANGE_MARK.
-			Step 4a is an optional test step and is depending on the MS implementation. If the SS doesn't receive EGPRS PACKET CHANNEL REQUEST message within 5 sec step 4a applies.
4a (optional test step)			The MS is triggered to initiate uplink data transfer.
5	MS -> SS	EGPRS PACKET CHANNEL REQUEST	MS shall initiate packet access
5A			If the MS requests two phase access the Test Case is terminated
6	SS -> MS	IMMEDIATE ASSIGNMENT	first message of two-message assignment (see specific message contents)
7	SS -> MS	IMMEDIATE ASSIGNMENT	second message (see specific message contents) sent after two multiframes after the first message.
8	MS -> SS	EGPRS PACKET CHANNEL REQUEST	The MS shall discard the assignment and continue with packet access.
8A			If the MS requests two phase access the Test Case is terminated
9	SS -> MS	IMMEDIATE ASSIGNMENT	first message of two-message assignment (see specific message contents) including a Request Reference corresponding to step 8.
10	SS -> MS	IMMEDIATE ASSIGNMENT	second message (see specific message contents) except: Request Reference is different from that in step 8.
11	MS -> SS	EGPRS PACKET CHANNEL REQUEST	MS shall re-initiate packet access
11A			If the MS requests two phase access the Test Case is terminated
12	SS -> MS	IMMEDIATE ASSIGNMENT	first message of two-message assignment (see specific message contents)
13	SS -> MS	IMMEDIATE ASSIGNMENT	second message (see specific message contents) sent in the last access grant block before the second multiframe after the first message elapses.
14	MS<->SS	Completion of macro { Uplink data transfer}	SS allows MS to complete the uplink data transfer.

Specific message contents:

IMMEDIATE ASSIGNMENT (first message)

Information Element	Value
as default except:	
Dedicated mode or TBF:	
- TMA	1 (is first message of a two-message assignment)
- Downlink	0
- T/D	1 (assign a TBF)
Packet Channel Description:	all bits are set to '0'
Request Reference:	as default
Timing Advance:	as default
Starting Time:	not present
IA Rest Octets:	as default

IMMEDIATE ASSIGNMENT (second message)

Information Element	Value
as default except:	
Dedicated mode or TBF:	
- TMA	0
- Downlink	0
- T/D	1 (assign a TBF)
Packet Channel Description:	as default
Request Reference:	as default (0111 1111)
Timing Advance:	as default
Starting Time:	not present
IA Rest Octets:	HH { 1 < Second Part Packet Assignment > }
< Second Part Packet Assignment > ::= { H { 1 Extended RA > }	 Last five bits of the EGPRS Packet Channel Request received.

51.2.3.3 Packet uplink assignment / Polling bit set

51.2.3.3.1 Conformance requirement

If the Polling bit is set to 1, MS shall send a PACKET CONTROL ACKNOWLEDGEMENT message (see 04.60) on the assigned PDCH, in the uplink block specified by the TBF Starting Time. In this case the TBF Starting Time is used both to indicate when the assigned PDCH becomes valid and to specify the uplink block.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

51.2.3.3.2 Test purpose

To verify that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the correct uplink block if the Polling bit is set in packet uplink assignment construction.

51.2.3.3.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP Context 31 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and with the Polling bit set. The MS shall send a PACKET CONTROL ACKNOWLEDGMENT on the assigned uplink block and then complete the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		MS is triggered to initiate uplink data transfer.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, one phase access and Polling bit set, and arbitrarily chosen TBF starting time in the future.
4	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	sent on the block indicated by TBF starting time in step 3.
5	SS<->MS	Completion of macro {Uplink data transfer}	SS allows MS to complete the uplink data transfer.

Specific Message Contents:

IMMEDIATE ASSIGNMENT, Step 3:

Information Element	value/ remark
EGPRS Window Size	192 Max Window size for 1 TS

51.2.3.4 One phase packet access / Contention resolution / Successful case

51.2.3.4.1 Conformance requirements

After receiving an IMMEDIATE ASSIGNMENT message in which one phase packet access for an uplink transfer is granted, the mobile station shall start timer T3164 and proceed with the contention resolution at one phase access defined in 3GPP TS 04.60.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

51.2.3.4.2 Test purpose

To verify that the MS includes the correct TLLI (Temporary Logical Link Identifier) in the first RLC data blocks until contention resolution is completed.

51.2.3.4.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the RLC data blocks which are sent preceding the reception of PACKET UPLINK ACK/NACK.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
0	MS		The MS is triggered to transfer 200 octets of data.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
1A			If the MS requests two phase access the Test Case is terminated
2	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase access
3	MS -> SS	3 RLC data blocks	SS verifies correct TLLI in RLC headers.
4	SS -> MS	PACKET UPLINK ACK/NACK	Including correct TLLI
5	MS<->SS	Completion of macro {Uplink data transfer}	SS allows MS to complete data transfer.

Specific Message Contents:

IMMEDIATE ASSIGNMENT, Step 2:

Information Element	value/ remark
EGPRS Window Size	192 Max Window size for 1 TS

51.2.3.5 One phase packet access / Contention resolution / TLLI mismatch

51.2.3.5.1 Conformance requirement

If the TLLI in the PACKET UPLINK ACK/NACK message differs from that sent by the MS in the RLC block headers, the MS shall immediately stop transmitting on this TBF and re-initiate the packet access procedure unless it has already been repeated 4 times.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

51.2.3.5.2 Test purpose

To verify that the MS immediately stops transmitting if it receives a PACKET UPLINK ACK/NACK with incorrect TLLI.

51.2.3.5.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including an incorrect TLLI. The SS shall verify that the MS 'immediately' stops transmitting (see note below) and retries packet access procedure.

NOTE: The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
0	MS		The MS is triggered to transfer 200 octets of data.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
1A			If the MS requests two phase access the Test Case is terminated
2	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase packet access granted, dynamic allocation.
3	MS -> SS	3 RLC data blocks	SS verifies correct TLLI in RLC headers.
4	SS -> MS	PACKET UPLINK ACK/NACK	Including incorrect TLLI
5	SS		The SS verifies that the MS transmits at most further n (=6) data blocks after step 4 (see Note) before re-initiating packet access.
6	MS -> SS	EGPRS PACKET CHANNEL REQUEST	MS re-initiates packet access procedure.
6A			If the MS requests two phase access the Test Case is terminated
7	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, one phase packet access granted, dynamic allocation.
8	MS<->SS	Completion of macro {Uplink data transfer}	SS allows MS to complete uplink data transfer.

51.2.3.6 One phase packet access / Contention resolution / Counter N3104

51.2.3.6.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

51.2.3.6.2 Test purpose

To verify that the MS correctly sets and considers counter N3104.

NOTE: Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is N3104_MAX = 3 * (BS_CV_MAX+3)* no-of-timeslots-assigned, where BS_CV_MAX is broadcast in SI 13 Rest Octets.

51.2.3.6.3 Method of test

Initial conditions

System Simulator: Default settings except:

1 cell, CCCH combined with SDCCH, BS_CV_MAX value in System Information Type 13 arbitrarily chosen in the range 3 to 10.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 1000 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. SS assigns radio resource to the MS. The MS shall start transferring RLC data blocks. The SS verifies that the MS sends N3104_MAX data blocks. The SS verifies that the MS stops transmitting after sending N3104_MAX radio blocks and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

Maximum duration of the test

5 minutes.

51.2.3.7 One phase packet access / Contention resolution / Timer T3166

51.2.3.7.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value, or on expiry of timer T3166.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

51.2.3.7.2 Test purpose

To verify that the MS correctly considers timer T3166.

51.2.3.7.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX value in System Information Type 13 is set to 15.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 1 000 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and dynamic allocation. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s.) to expire before counter N3104 reaches N3104_MAX (with value 45 blocks for current settings). The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 seconds. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	MS is triggered to transfer 1000 data octets.
1A			If the MS requests two phase access the Test Case is terminated
2	SS -> MS	IMMEDIATE ASSIGNMENT	Indicating one phase packet access granted, dynamic allocation. MCS1 shall be used.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF addressing the MS
4	MS -> SS	RLC data block	
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF not addressing the MS
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF not addressing the MS
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF not addressing the MS

51.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts

51.2.3.8.1 Conformance requirement

If contention resolution for packet access fails, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times.

Reference

3GPP TS 04.60/44.060 subclause 7.1.2.3.

51.2.3.8.2 Test purpose

To verify that the MS attempts the packet access initiation 4 or 5 times.

51.2.3.8.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 200 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and attempts packet access a total of four or five times.

Note:

The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 200 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	indicating one phase packet access granted, dynamic allocation.
4	MS -> SS	3 RLC data blocks	
5	SS -> MS	PACKET UPLINK ACK/NACK	including incorrect TLLI
6	MS -> SS		MS aborts packet access procedure, and is allowed to transmit at most n RLC data blocks (see Note above).
7	MS<->SS		repetition 1: MS shall reinitiate a packet access procedure, steps 2 to 6 are repeated.
8	MS<->SS		repetition 2: MS reinitiates a packet access procedure, steps 2 to 6 are repeated.
9	MS<->SS		repetition 3: MS reinitiates a packet access procedure, steps 2 to 6 are repeated.
10 (optional step)	MS<->SS		If PICS 'Release of EGPRS supported' for MS is Release 99 or 4, this step is optional. If PICS 'Release of EGPRS supported' for MS is Release 5 or later, this step is not allowed. repetition 4: MS reinitiates a packet access procedure, steps 2 to 6 are repeated.
NOTE: After step 10 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.

51.2.3.9 One phase packet access / TBF starting time

51.2.3.9.1 Conformance requirement

In case the packet uplink assignment construction contains a TBF starting time and the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time before accessing the channel. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the TBF starting time and may immediately access the channel.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 8.1.1.5.

51.2.3.9.2 Test purpose

To verify that the MS correctly considers the TBF Starting Time included in the IMMEDIATE ASSIGNMENT message.

51.2.3.9.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a TBF starting time. The MS may start transferring RLC data blocks at the exact frame specified by the TBF starting time.

The test is repeated with a TBF starting time in the past. In this case the MS shall 'immediately' (see note below) send RLC data blocks.

NOTE: The MS shall start transmitting RLC blocks within n blocks after the block containing the IMMEDIATE ASSIGNMENT message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11.

Maximum duration of the test

5 minutes.

Expected sequence

51.2.3.10 One phase packet access / Timing Advance Index present

51.2.3.10.1 Conformance requirement

If the timing advance index (TAI) is included in the packet uplink assignment construction, the mobile station shall use the continuous update timing advance mechanism, see 3GPP TS 05.10, using PTCCH in the same timeslot as the assigned PDCH.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 03.64 subclause 6.5.7.2.

51.2.3.10.2 Test purpose

To verify that the MS uses the continuous update timing advance mechanism and sends access bursts in the PTCCH slots as determined by the Timing Advance Index (TAI) sent in the IMMEDIATE ASSIGNMENT.

51.2.3.10.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered for uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a Timing Advance Index. During TBF transfer, the SS shall verify the access bursts sent by the MS in the PTCCH.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 440 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	For one phase packet access, dynamic allocation and including Timing Advance Index TAI=0.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigning the USF assigned in step 3. Sent on PDTCH, 3 block after the message sent in step 3
5	MS -> SS	RLC data block	
6	SS -> MS	PACKET UPLINK ACK/NACK	Including correct TLLI.
7			Wait for 3 blocks.
8	MS<->SS	Completion of macro {Uplink data transfer}	SS allows MS to complete data transfer. During the data transfer, USF is assigned to MS once in 250ms

Verification

During TBF transfer (steps 4 to 8) the SS monitors access bursts on PTCCH which are located on slots with numbers FN, such that (FN mod (8*52)) = 12 for TAI = 0 (3GPP TS 03.64/6.5.7.2 and 3GPP TS 05.02/Table 6). The access burst contents shall be '11111111111'.

The test is repeated once more with an arbitrarily chosen TAI in the range 1 to 15. SS shall verify that the access bursts are sent in the correct PTCCH slots as specified in 3GPP TS 05.02 table 6.

51.2.3.11 One phase packet access / Timing Advance Index not present

51.2.3.11.1 Conformance requirement

If a timing advance index (TAI) field is not included, the continuous update timing advance mechanism shall not be used.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

51.2.3.11.2 Test purpose

To verify that the MS does not send any access bursts on PTCCH (i.e. it does not use the continuous update timing advance mechanism) if TAI is not present in the IMMEDIATE ASSIGNMENT message.

51.2.3.11.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message not including a Timing Advance Index. During TBF transfer, the SS shall verify that the MS does not send any access bursts in idle frames.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 440 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE ASSIGNMENT	not including Timing Advance Index
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigning the USF assigned in step 3. Sent on PDTCH, 3 block after the message sent in step 3
5	MS -> SS	RLC data block	
6	SS -> MS	PACKET UPLINK ACK/NACK	Including correct TLLI.
7			Wait for 3 blocks.
8	SS<->MS	Completion of macro {Uplink data transfer}	SS allows MS to complete data transfer. During the data transfer, USF is assigned to MS once in 250ms

Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 4 to 8). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

None

51.2.3.16 Packet Immediate Assignment by IPA Capable MS / One phase packet access / IPA uplink assignment / Multiple MS devices / Radio_Access_Capability_bit set

51.2.3.16.1 Conformance requirement

In the case the one phase packet access is granted to MS supporting IMMEDIATE PACKET ASSIGNEMENT, the *IPA Uplink Assignment struct* may assign packet uplink resource for multiple mobile stations and contain following parameters specific to different mobile stations:

- the temporary flow identity;
- the USF value;
- the EGPRS channel coding command for RLC data block;
- the timing advance value;
- the Radio Access Capabilities Request bit.

In addition, the *IPA Uplink Assignment struct* contains the timeslot number which is common to all mobile stations addressed in this construction. Relevant default values shall be used for the RLC window size, Alpha, RESEGMENT and USF_GRANULARITY parameters as specified in subclause 10.5.2.78.

If the Radio Access Capability Request bit is set to 1, mobile stations addressed in the IPA Uplink Assignment struct in the IMMEDIATE PACKET ASSIGNMENT message shall send MS Radio Access Capability 2 IE in PACKET RESOURCE REQUEST message.

Reference

3GPP TS 44.018 subclause 3.5.2.1.3.1and 3.5.2.1.3.2

51.2.3.16.2 Test purpose

To verify that in the case of one phase packet access is granted to MS supporting IMMEDIATE PACKET ASSIGNMENT, the IPA Uplink Assignment struct correctly assigns the packet uplink resource for multiple MS devices and contain parameters relevant to the uplink assignment of packet resources specific to different MS devices. If the Radio_Access_Capability_bit is set to 1, the MS devices addressed in the IPA Uplink Assignment struct send the MS_Radio_Access_Capability_2_IE in the PACKET RESOURCE MESSAGE.

51.2.3.16.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH. EGPRS supported. EGPRS PACKET CHANNEL REQUEST supported in GPRS cell options. Paging messages configured to indicate support for IMMEDIATE PACKET ASSIGNMENT message (IPA support bit set to '1').

Mobile Station:

MS is GPRS attached, PDP Context 2 is activated and the MS is in packet idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST, the SS initially sends an IMMEDIATE PACKET ASSIGNMENT message, which includes a different request reference from the EGPRS PACKET CHANNEL REQUEST and contains the Radio Access Capability Request bit set to 1. The MS ignores this IMMEDIATE PACKET ASSIGNMENT message.

The SS sends another IMMEDIATE PACKET ASSIGNMENT message which includes the request reference from the EGPRS PACKET CHANNEL REQUEST sent by the MS and contains the Radio Access Capability Request bit set to 1.

MS shall send the PACKET RESOURCE REQUEST including MS Radio Access Capability 2 IE.

The SS verifies that the MS correctly switches to the assigned PDCH and completes the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	IMMEDIATE PACKET ASSIGNMENT contains Radio Access Capability Request bit set to 1. Ignored by MS. Request reference is different from EGPRS PACKET CHANNEL REQUEST in step 2
4	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	IMMEDIATE PACKET ASSIGNMENT contains Radio Access Capability Request bit set to 1.
5	MS <-> SS	PACKET RESOURCE REQUEST	MS sends MS Radio Access Capability 2 IE.
6	MS <-> SS	Completion of macro {Uplink data transfer}	SS allows MS to complete the uplink data transfer.

51.2.4 Packet immediate assignment / Multiblock packet access

51.2.4.1 Multiblock packet access / Packet Resource Request

51.2.4.1.1 Conformance requirement

The network shall use the TBF starting time to indicate the first frame number belonging to the multiblock period granted for packet access. If a multiple block packet access is granted, it forces the mobile station to perform a two phase packet access.

Reference

3GPP TS 04.18 subclauses 3.5.2.1.3.1 and 3.5.2.1.3.3a.

51.2.4.1.2 Test purpose

To verify that the MS sends PACKET RESOURCE REQUEST in the assigned block as indicated by the TBF starting time when it is triggered for uplink transfer.

51.2.4.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources for multiblock in an IMMEDIATE ASSIGNMENT message including a TBF starting time. The SS verifies that the MS sends a PACKET RESOURCE REQUEST at the first allowed block as indicated by the TBF starting frame.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
0	MS		The MS is triggered to transfer 200 octets of data.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2	SS -> MS	IMMEDIATE ASSIGNMENT	For uplink TBF, multiblock assignment for an arbitrarily chosen TBF Starting Time in the future.
3	MS -> SS	PACKET RESOURCE REQUEST	SS verifies that first block is on first allowed block starting at frame number given by TBF Starting Time.
4	SS -> MS	PACKET ACCESS REJECT	with default contents.

Specific Message Contents:

IMMEDIATE ASSIGNMENT, Step 2:

Information Element	value/ remark
Number of radio blocks allocated	00

51.2.4.2 Void

51.2.5 Packet immediate assignment / Packet access rejection

51.2.5.1 Packet access rejection / wait indication

51.2.5.1.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.4.

51.2.5.1.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages.

Further on, the SS verifies that the MS makes a new attempt for uplink transfer only after T3142 seconds ("wait indication" timer) after last IMMEDIATE ASSIGNMENT REJECT elapse.

51.2.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 7 retransmissions.

Mobile Station:

MS is switched off.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- Support of EGPRS Packet Access Enhancement (TSPC_EGPRS_ENHANC)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of 3 CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST or EGPRS PACKET CHANNEL REQUEST messages and does not attempt a new packet access until T3142 seconds elapse.

Maximum duration of the test

5 minutes.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used in the following cases

a. If Release of EGPRS supported is Release 4 or above.

b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used if support of EGPRS Packet Access enhancement is False for a R99 MS.

Expected sequence

Step	Direction	Message	Comments
0	MS		MS is triggered to initiate GPRS attach procedure.
1	MS -> SS	CHANNEL REQUEST or; EGPRS PACKET CHANNEL REQUEST	
2	MS -> SS	CHANNEL REQUEST or; EGPRS PACKET CHANNEL REQUEST	
3	MS -> SS	CHANNEL REQUEST or; EGPRS PACKET CHANNEL REQUEST	
4	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	including Request Reference corresponding to the (EGPRS PACKET) CHANNEL REQUEST in step 1, and waiting time indication with value T3142=50s.
5	SS		SS verifies that MS does not send any further access bursts (see note below).
6	MS -> SS	CHANNEL REQUEST or; EGPRS PACKET CHANNEL REQUEST	SS verifies that the access burst does not arrive before T3142 – 0.1 * T3142 (=45s) after last IMMEDIATE ASSIGNMENT REJECT message.
7	SS -> MS	IMMEDIATE ASSIGNMENT	for uplink TBF, one phase access
8	MS<->SS	Completion of macro {GPRS attach procedure}	SS allows MS to complete GPRS attach.

The test is repeated with an arbitrarily chosen value of T3142 in the range 2 to 60 s.

NOTE: The number of frames between successive access bursts considering the default Sys Info parameters used in the test is larger than 58 frames (see 3GPP TS 04.08 / 3GPP TS 44.018 table 3.1). This value is large enough to allow the MS to respond to the IMMEDIATE ASSIGNMENT REJECT message by stopping sending the next access bursts.

Specific Message Contents:

none

51.2.5.2 Packet access rejection / assignment before T3142 expires

51.2.5.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile station stops sending EGPRS PACKET CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last EGPRS PACKET CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

Reference

3GPP TS 04.18, subclause 3.5.2.1.3.4.

51.2.5.2.2 Test purpose

To verify that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT and, if an IMMEDIATE ASSIGNMENT containing a correct Request Reference arrives before T = min {T3142, T3146} seconds elapse, then the MS shall accept this assignment. (See below for a note on T3146).

51.2.5.2.3 Method of test

Initial conditions

System Simulator: Default settings except:

Parameter MAX_RETRANS is set to 7 retransmissions.

Parameter TX_INTEGER is set to 32.

CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. After reception of 3 EGPRS PACKET CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages.

Before T = min {T3142, T3146} seconds elapse, the SS sends an IMMEDIATE ASSIGNMENT with correct Request Reference. The MS shall switch to the assigned PDCH and transfer the data.

Note on T3146:

NOTE: T3146 is started when sending the last EGPRS PACKET CHANNEL REQUEST or when receiving the IMMEDIATE ASSIGNMENT REJECT. At its expiry, the packet access is aborted.

The value of T3146 is given by T+2*S (3GPP TS 04.08 / 3GPP TS 44.018, clause 11.1.1), where T is TX_INTEGER and S is given in 3GPP TS 04.08 / 3GPP TS 44.018, Table 3.1. The value of T3146 is 2.15 s. for the current settings.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
0	MS		MS is triggered to transfer 200 octets.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
3	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
4	SS -> MS	IMMEDIATE ASSIGNMENT REJECT	including Request Reference corresponding to the EGPRS PACKET CHANNEL REQUEST in step 2, and waiting time indication with value T3142 = 2 s.
5			The SS verifies that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages.
6	SS -> MS	IMMEDIATE ASSIGNMENT	sent after 1.5s. (of the last IMMEDIATE ASSIGNMENT REJECT) and including Request Reference corresponding to step 1.
7	SS<->MS	Completion of macro {Uplink data transfer }	SS allows MS to complete the uplink data transfer.

51.2.5.3 Packet access rejection / Interpretation of Extended RA i / Correct value of Extended RA i

51.2.5.3.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile station stops sending EGPRS PACKET CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last EGPRS PACKET CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

The IMMEDIATE ASSIGNMENT REJECT message is sent on the CCCH by the network to up to four mobile stations to indicate that no channel is available for assignment.

When set to the value '0111 1111', the RA information of the Request Reference i IE indicates that an Extended RA i field may be included in the IAR Rest Octets. The mobile station shall use the information in the Extended RA i field to identify the Immediate Assignment Reject message corresponding to an EGPRS Packet Channel Request message. If the Extended RA i field is not included, the mobile station shall assume that the Request Reference i IE does not correspond to the EGPRS Packet Channel Request message.

Reference

3GPP TS 04.18, subclause 3.5.2.1.3.4.,9.1.20

51.2.5.3.2 Test purpose

To verify that the MS correctly decode a Request Reference i IE when set to value 0111 1111 and decode the corresponding Extended RA i field in a IMMEDIATE ASSIGNMENT REJECT message.

51.2.5.3.3 Method of test

Initial conditions

System Simulator: Default settings except:

Parameter MAX_RETRANS is set to 7 retransmissions.

Parameter TX_INTEGER is set to 32.

CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. After reception of 3 EGPRS PACKET CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT message with Request Reference 3 having the value '0111 1111' and including a waiting indication (T3142). The correct Extended RA value is stored in Extended RA 3 field. The SS verifies that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages.

Before T = min {T3142, T3146} seconds elapse, the SS sends an IMMEDIATE ASSIGNMENT with another value of Extended RA. The SS verifies that the MS switch to the assigned PDCH and transfer the data.

Note on T3146:

NOTE: T3146 is started when sending the last EGPRS PACKET CHANNEL REQUEST or when receiving the IMMEDIATE ASSIGNMENT REJECT. At its expiry, the packet access is aborted.

The value of T3146 is given by T+2*S (3GPP TS 04.08 / 3GPP TS 44.018, clause 11.1.1), where T is TX_INTEGER and S is given in 3GPP TS 04.08 Table 3.1 / 3GPP TS 44.018, Table 3.3.1.1.2.1. The value of T3146 is 2.28 s for the current settings.

Maximum duration of the test

5 minutes.

Expected sequence

51.2.6 Packet downlink assignment procedure using CCCH

51.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block

51.2.6.1.1 Conformance requirement

The network initiates the packet downlink assignment procedure by sending an IMMEDIATE ASSIGNMENT message in unacknowledged mode on the CCCH timeslot corresponding to CCCH group the mobile station belongs to.

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it starts timer T3190.

Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

51.2.6.1.2 Test purpose

To verify that the MS responds to an IMMEDIATE ASSIGNMENT for downlink TBF sent on PCH blocks corresponding to the MS's paging group.

51.2.6.1.3 Method of test

Initial conditions

System Simulator:

EGPRS supported.

Default settings except:

Parameters CCCH_CONF, BS_AG_BLKS_RES, and BS_PA_MFRMS are arbitrarily chosen.

Mobile Station:

MS is GPRS attached, DRX have been negotiated, MS is in Ready state.

A PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS sends an IMMEDIATE ASSIGNMENT for downlink transfer on a PCH block corresponding to its paging group (see 3GPP TS 05.02 subclause 6.5.2) which depends on Sys Info parameters and the MS's IMSI. The MS shall switch to the assigned PDCH and exercise downlink transfer.

Maximum duration of the test

NA

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with correct TLLI.
2	MS<->SS	Completion of macro {Downlink data transfer}	SS completes downlink transfer of 200 octets of data.

51.2.6.2 Initiation of packet downlink assignment procedure / timer T3190

51.2.6.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it then starts timer T3190.

If the mobile station does not receive a RLC/MAC block on the assigned PDCHs before timer T3190 expires, then a TBF establishment failure has occurred.

Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

51.2.6.2.2 Test purpose

To verify that the MS returns to packet idle updated if RLC/MAC blocks are sent after T3190 seconds, and that the MS correctly receives RLC/MAC blocks if they are sent before T3190 seconds.

51.2.6.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

EGPRS Supported.

Mobile Station:

MS is GPRS attached, PDP context 31 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a PDCH for downlink transfer but does not send any RLC/MAC blocks until T3190 seconds have elapsed. The MS shall return to packed idle updated and ignore the RLC/MAC blocks.

To verify that the MS returned to packet idle updated, the SS again assigns a PDCH and sends RLC/MAC blocks before T3190 seconds elapse. The SS shall successfully transfer all RLC data blocks.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	for downlink TBF on a PCH block corresponding to the MS, including a packet downlink assignment.
2	SS		SS waits T3190 + 10% (=5.5s) after the last IMMEDIATE ASSIGNMENT.
3	SS -> MS	RLC data blocks	SS sends data
4	SS		SS verifies for 10s. that the MS does not respond.
5	SS -> MS	IMMEDIATE ASSIGNMENT	SS assigns again a PDCH.
6	SS		SS waits T3190 – 10% (=4.5s) after the last IMMEDIATE ASSIGNMENT
7	SS -> MS	RLC data blocks	SS starts sending 200 octets of data, including FB=0, RRPB valid value, ESPB set
8	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	indicating correct reception of data blocks.
9	MS<->SS	Completion of macro {Downlink data transfer}	SS completes downlink transfer.

NOTE: The requirements to uplink and downlink assignment reaction times are stated in 3GPP TS 05.10 subclause 6.11: An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block B((x+3) mod 12) where block B(x) is the last radio block containing the uplink assignment.

51.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI

51.2.6.4.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned Temporary Flow Identifier (TFI).

Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

51.2.6.4.2 Test purpose

To verify that the MS correctly considers the TFI in the RLC/MAC blocks.

51.2.6.4.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

EGPRS Supported.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a PDCH and starts transmitting RLC/MAC blocks with incorrect TFI. The MS shall ignore these RLC/MAC blocks and, after T3190 expires, return to packet idle mode.

To prove that the MS returns to idle mode, the SS assigns again a PDCH, and this time the SS sends RLC/MAC blocks with correct TFI. The MS shall successfully receive the data packets.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	for downlink TBF
2	SS -> MS	RLC data block	SS sends RLC blocks with incorrect TFI (i.e. not corresponding to the last IMMEDIATE ASSIGNMENT), including Polling bit set and valid RRBP field.
3	SS		SS verifies that the MS does not respond in the assigned block.
4	SS		SS waits value of T3190 + 10% (=5.5s).
5	SS -> MS	IMMEDIATE ASSIGNMENT	for downlink TBF
6	SS -> MS	RLC data block	with correct TFI, including Polling bit set and valid RRBP field.
7	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	indicating correct reception of RLC block.
8	MS<->SS	Completion of macro {Downlink data transfer}	SS completes downlink transfer.

51.2.6.5 Initiation of the packet downlink assignment procedure by IPA capable MS/IPA downlink assignment

51.2.6.5.1 Conformance requirement

At the establishment of a downlink temporary block flow for MS supporting IMMEDIATE PACKET ASSIGNMENT message, the IPA Downlink Assignment struct sent in IMMEDIATE PACKET ASSIGNMENT message may assign packet downlink resources for multiple mobile stations and contains the following parameters specific to different mobile stations:

- the TLLI;
- the temporary flow identity;
- the power control parameters;
- optionally, the timing advance value.

In addition, the IPA Downlink Assignment struct also contains the following parameters which are common to all mobile stations addressed in this structure:

- the timeslot number;
- optionally the link quality measurement mode;
- the RLC mode;
- the frequency parameters;

Reference

3GPP TS 44.018 subclause 3.5.2.1.3.1and 3.5.2.1.3.2

51.2.6.5.2 Test purpose

To verify that at the establishment of a downlink TBF for the MS supporting IMMEDIATE PACKET ASSIGNMENT, the IPA Downlink Assignment struct sent in the IMMEDIATE PACKET ASSIGNMENT correctly assigns the packet downlink resources for the MS and contains relevant parameters specific to the MS.

To verify that the MS reacts to the IMMEDIATE PACKET ASSIGNMENT message addressed to it and successfully receive the data packets on the assigned PDCH.

51.2.6.5.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH. EGPRS supported. EGPRS PACKET CHANNEL REQUEST supported in GPRS cell options. Paging messages configured to indicate support for IMMEDIATE PACKET ASSIGNMENT message (IPA support bit set to '1').

Mobile Station:

MS is GPRS attached, PDP Context 2 is activated and the MS is in packet idle mode.

Specific PICS Statements

-PIXIT Statements

-

Test procedure

The SS assigns a PDCH via an IMMEDIATE PACKET ASSIGNMENT including a TBF starting time. The SS starts transmitting RLC data blocks which shall be acknowledged by the MS. The MS shall successfully receive the data packets.

Maximum duration of the test

5 minutes.

51.2.6.7 to 51.2.6.8 FFS

51.2.6.9 Initiation of both the packet uplink and downlink assignment procedure by IPA capable MS/Simultaneous IPA uplink and downlink assignment

51.2.6.9.1 Conformance requirement

In the case the one phase packet access is granted to MS supporting IMMEDIATE PACKET ASSIGNEMENT, the *IPA Uplink Assignment struct* may assign packet uplink resource for multiple mobile stations and contain following parameters specific to different mobile stations:

- the temporary flow identity;
- the USF value;
- the EGPRS channel coding command for RLC data block;
- the timing advance value;
- the Radio Access Capabilities Request bit.

In addition, the *IPA Uplink Assignment struct* contains the timeslot number which is common to all mobile stations addressed in this construction. Relevant default values shall be used for the RLC window size, Alpha, RESEGMENT and USF_GRANULARITY parameters as specified in subclause 10.5.2.78.

At the establishment of a downlink temporary block flow for MS supporting IMMEDIATE PACKET ASSIGNMENT message, the IPA Downlink Assignment struct sent in IMMEDIATE PACKET ASSIGNMENT message may assign packet downlink resources for multiple mobile stations and contains the following parameters specific to different mobile stations:

- the TLLI;
- the temporary flow identity;
- the power control parameters;
- optionally, the timing advance value.

In addition, the IPA Downlink Assignment struct also contains the following parameters which are common to all mobile stations addressed in this structure:

- the timeslot number;
- optionally the link quality measurement mode;
- the RLC mode;
- the frequency parameters;

Reference

3GPP TS 44.018 subclause 3.5.2.1.3.1and 3.5.2.1.3.2

51.2.6.9.2 Test purpose

To verify that the simultaneous establishment of a downlink and uplink TBF for the MS supporting IMMEDIATE PACKET ASSIGNMENT, the IPA Downlink Assignment struct and the IPA Uplink Assignment struct sent in the IMMEDIATE PACKET ASSIGNMENT correctly assigns the packet downlink and uplink resources respectively for the MS and contains relevant parameters specific to the MS.

51.2.6.9.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH. EGPRS supported. EGPRS PACKET CHANNEL REQUEST supported in GPRS cell options. Paging messages configured to indicate support for IMMEDIATE PACKET ASSIGNMENT message (IPA support bit set to '1').

Mobile Station:

MS is GPRS attached, PDP Context 2 is activated and the MS is in packet idle mode.

Specific PICS Statements

-PIXIT Statements

-

Test procedure

The MS is triggered to initiate simultaneous uplink and downlink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST the SS sends an IMMEDIATE PACKET ASSIGNMENT message. The SS assigns a PDCH via an IMMEDIATE PACKET ASSIGNMENT including a TBF starting time.

The SS immediately sends RLC data blocks which shall be acknowledged by the MS. The SS also verifies that the MS correctly switches to the assigned PDCH and completes the uplink data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 200 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	
2A			If the MS requests two phase access the Test Case is terminated
3	SS -> MS	IMMEDIATE PACKET ASSIGNMENT	IMMEDIATE PACKET ASSIGNMENT message including a packet uplink & downlink assignment with a TBF Starting Time
4	SS -> MS	RLC data block	
5	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Indicating correct reception of RLC block.
6	MS -> SS	Completion of macro {Uplink data transfer}	SS allows MS to complete the uplink data transfer.

51.3 MAC/RLC Release

The maximum duration of each test is per default 5 minutes.

51.3.1 TBF Release / Uplink / Normal / MS initiated

51.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode

51.3.1.1.1 Conformance requirements

1. The MS initiates release of the uplink TBF by beginning the countdown process. When the MS has sent the RLC data block with CV = 0 and there are no elements in the V(B) array set to the value Nacked, it shall start timer T3182 and stop timer T3180, if running. The MS shall continue to send RLC data blocks on each assigned uplink data block, according to the algorithm defined in 3GPP TS 04.60, subclause 9.1.3.2.

2. Upon reception of a PACKET UPLINK ACK/NACK message the MS shall stop timer T3182.

3. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the MS shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

4. If the PACKET UPLINK ACK/NACK message requests retransmission of RLC data blocks, the MS shall if necessary wait for allocation of uplink resources and then retransmit the RLC data blocks requested, restarting timer T3180 after each block is transmitted . The MS shall then start timer T3182 and wait for a PACKET UPLINK ACK/NACK message as above.

5. Upon transition from the packet transfer mode to the packet idle mode, a MS shall enter the Transfer non-DRX mode period.

6. Upon a receipt of a commanding message or indication from the network requiring an action by the MS, if the reaction time for such action is not specified elsewhere, the MS shall begin to perform the required action no later than the next occurrence of block B((x+6) mod 12), where block B(x) is the radio block containing the commanding message or indication from the network.

References

3GPP TS 04.60, subclauses 9.3.2.3 and 5.5.1.5.

3GPP TS 05.10, subclause 6.11.4.

51.3.1.1.2 Test purpose

To verify that in RLC acknowledged mode:

1. the MS initiates release of an uplink TBF by beginning countdown process. After CV = 0 and no elements in the V(B) array set to the value "Nacked" the MS continues to send RLC data blocks on each assigned uplink data block in the way defined in 3GPP TS 04.60, subclause 9.1.3 and waits for PACKET UPLINK ACK/NACK.

2. the MS retransmits the requested RLC data blocks if the PACKET UPLINK ACK/NACK message requests to do so. The MS then waits for another PACKET UPLINK ACK/NACK message.

3. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK with the Final Ack Indicator bit set to '1'. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

51.3.1.1.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

cell, default setting, BS_CV_MAX = 10.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context2 activated.

Specific PICS Statements

- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test Procedure

The test has three parts.

1. The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode with USF_GRANULARITY = 1 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1. The SS assigns a downlink TBF, transfers a number of downlink data blocks and polls the MS. The MS responses the polling.

2. The MS is assigned a TBF of dynamic allocation in acknowledged mode with USF_GRANULARITY = 4 blocks. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1.

3. The MS is triggered to transfer user data. A TBF of dynamic allocation on two timeslots in acknowledged mode with USF_GRANULARITY = 4 block is assigned. The countdown values are checked during the RLC data transferring.

The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution} Or {Uplink dynamic allocation two phase access}	N = 440 octets, USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND: MCS-1, Resegment bit = 1, TLLI_BLOCK_CHANNEL_CODING: '0'B, MCS-1. RLC acknowledged mode (PDP context2), without starting time
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 until the countdown value CV=4.
5	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all received data blocks, USF assigned to the MS. PREEMPTIVE_TRANSMISSION_BIT=1
6	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that CV=3.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
8	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that CV=2.
8a			Repeat steps 7 and 8 two more times and check that first CV =1 block is received and then CV = 0 is received.
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
10	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the data block is a retransmission of the data block transmitted in step 6, CV=3.
11	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
12	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the data block is a retransmission of the data block transmitted in step 8.
12a			Repeat steps 11 and 12 two more times and check that first CV =1 block is retransmitted and then CV = 0 is retransmitted
12b	SS		SS waits BS_CV_MAX periods

Step	Direction	Message	Comments
13	SS -> MS	PACKET UPLINK ACK/NACK	Negatively acknowledge the data block transmitted with CV = 0. PREEMPTIVE_TRANSMISSION_BIT=1
13a			Wait for 5 radio block periods.
13b	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Containing USF assigned to MS.
A14 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may retransmit block with CV=3 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B14
B14 (optional step)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
14	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the data block is a retransmission of the data block transmitted with CV = 0.
15	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing a valid RRBP=26. Acknowledge the last two data blocks. PREEMPTIVE_TRANSMISSION_BIT=1
16	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the radio block specified by RRBP
17	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode.
18	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	10 downlink data blocks, the data block with FBI = '1' and a valid RRBP
19	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 18. Check that the Final Ack indicator = '1'.
20		{Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access}	N = 440 octets, USF_GRANULARITY = 4 blocks, EGPRS_CHANNEL_CODING_COMMAND: MCS-1, Resegment bit = 1, TLLI_BLOCK_CHANNEL_CODING: '0'B, MCS-1. RLC acknowledged mode (PDP context2), without starting time PREEMPTIVE_TRANSMISSION_BIT=1(Applicable only in case of one phase access with contention resolution)
21	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
22	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
23	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
24	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
25	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
25A (optional step)	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all received data blocks. PREEMPTIVE_TRANSMISSION_BIT=1. This step should be executed only if two phase access has been performed at step20.
26			Regard the steps 21 - 25 as a step block. Repeat the step block until the countdown value CV = 0 in one of data blocks received.
26a	SS		SS waits BS_CV_MAX periods after reception of Data block with CV=0
27	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all received data blocks except for the data blocks which have CV=2, CV=1, and CV=0. Set SSN value in Ack/Nack description equal to the BSN' of the received data block with CV = 1. PREEMPTIVE_TRANSMISSION_BIT=1
27a	SS		Wait for 5 block periods
27b	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
A28 (optional step)	MS -> SS	UPLINK RLC DATA BLOCK	MS may retransmit block with CV=15 if it has already been scheduled before the end of the reaction time.
28	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 2.

Step	Direction	Message	Comments
29	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 1.
30	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 0.
31A (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	If Optional Step A28 is received, then this step shall be bypassed. (USF Granularity=1 and 4 blocks already received) Check that the countdown value CV = 2.
31	SS		SS waits BS_CV_MAX periods.
32	SS -> MS	PACKET UPLINK ACK/NACK	Negatively acknowledge the data blocks of CV=2, and CV=0.Acknowledge the data block of CV=1. PREEMPTIVE_TRANSMISSION_BIT=1
32a	SS		Wait for 5 block periods
32b	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
33A (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Optional Step . The MS may transmit the Data block already in the transmit buffer with CV=1 if 31A was received or CV=2 if 31A was not received.
33	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 2.
34	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 0.
35	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the countdown value CV = 2.
36A (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	If Optional Step 33A is received, then this step shall be bypassed. (USF Granularity=1 and 4 blocks already received) Check that the countdown value CV = 0.
37	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing valid RRBP. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. PREEMPTIVE_TRANSMISSION_BIT=1
38	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.
39	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode.
40	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	10 downlink data blocks, the data block with FBI = '1' and a valid RRBP
41	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 40. Check that the Final Ack indicator = '1'.
			The following steps are not applicable to the MS in EGPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40.
42		{Uplink dynamic allocation two phase access}	N = 1000 octets, without starting time, USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end, EGPRS_CHANNEL_CODING_COMMAND: MCS-4, Resegment bit = 1, RLC acknowledged mode (PDP context2), Two slots, USF_0 on TN_0 and USF_1 on TN_1, are assigned.
43	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_0 on $PDTCH_0$ addressing the MS.
44	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 on $PDTCH_1$ addressing the MS, sent on the same TDMA frame as step 43.
45	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	Received on the assigned $PDTCH_0$ and $PDTCH_1$. Check that the coding as specified in EGPRS_CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI.
46	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	Received on the assigned $PDTCH_0$ and $PDTCH_1$.
47	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	Received on the assigned $PDTCH_0$ and $PDTCH_1$.
48	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	Received on the assigned $PDTCH_0$ and $PDTCH_1$.

Step	Direction	Message	Comments
49			Regard the steps 43 - 48 as a step block. Repeat the step block until the countdown value CV =0 in one of data blocks received. Check the CV decrement from BS_CV_MAX (10) to 0.
50	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing a valid RRBP. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. PREEMPTIVE_TRANSMISSION_BIT=1
51	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode

51.3.1.2.1 Conformance requirements

The MS initiates release of the uplink TBF by beginning the countdown process. It indicates the end of the TBF by setting the CV value to 0 and starts timer T3182.

Upon reception of a PACKET UPLINK ACK/NACK message the MS shall stop timer T3182. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the MS shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

If timer T3182 expires the MS shall release the TBF as if a PACKET UPLINK ACK/NACK message was received.

References

3GPP TS 04.60, subclause 9.3.3.3.

51.3.1.2.2 Test purpose

To verify that in RLC unacknowledged mode:

1. the MS initiates release of an uplink TBF by beginning the countdown process and indicates the end of the TBF by setting the CV value to 0.

2. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1' after CV=0. If there is no ongoing downlink TBF the MS enters packet idle mode.

3. the MS releases the TBF as if a PACKET UPLINK ACK/NACK message was received when timer T3182 expires.

51.3.1.2.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 12.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context3 activated.

Specific PICS Statements

- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test Procedure

The test procedure has three parts.

1. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1 and polls the MS. The MS sends PACKET CONTROL ACKNOWLEDGEMENT in response of polling. After 6 blocks the SS assigns a downlink TBF in unacknowledged mode, sends a number downlink data blocks and polls the MS with a valid RRBP. The MS responses the polling.

2. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. After CV = 0 the SS waits for 5.5s (T3182 expires). Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.

3. The MS is triggered to transfer data. A TBF of dynamic allocation on two timeslots in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF. The last block may be transmitted twice (once in each slot) or the MS may transmit a PACKET UPLINK DUMMY CONTROL message..

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets in RLC unacknowledged mode. (PDP context3) TLLI_BLOCK_CHANNEL_CODING = '0'B, MCS-1, EGPRS_CHANNEL_CODING_COMMAND = MCS-1, Resegment bit = 1.
2	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 until the countdown value CV=0.
5	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing a valid RRBP=13, no retransmission needed. PREEMPTIVE_TRANSMISSION_BIT=1
6	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.
7	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS
8	SS		Check that no data block is transmitted by the MS in the next radio blocks.
9	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode. Steps 10 – 12 verify whether the MS has entered idle mode.
10	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	
11			Repeat step 10 ten times. In the last data block set FBI = '1' with a valid RRBP.
12	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP in step 11.
13		{Uplink dynamic allocation two phase access}	n = 600 octets in RLC unacknowledged mode. (PDP context3) TLLI_BLOCK_CHANNEL_CODING = '1'B, MCS-1, EGPRS_CHANNEL_CODING_COMMAND = MCS-1, Resegment bit = 1.
14	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDCH.
16			Repeat step 14 and 15 until the countdown value CV=0.

Step	Direction	Message	Comments
16 a	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS to delay start of T3180 by 500ms (SS should ignore any received Rlc data block). This step is repeated until a PACKET UPLINK DUMMY CONTROL BLOCK is received from the MS, but not more than 4 times.
17	SS		Wait 5.5 seconds (starting after the last RLC data block) to allow T3182 expiring
18 19	SS->MS SS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS Check that no data block is transmitted by the MS.
			The following steps are not applicable to the MS in EGPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40.
20 21 22 23	SS -> MS SS->MS MS->SS SS	{Uplink dynamic allocation two phase access} PACKET DOWNLINK DUMMY CONTROL BLOCKS EGPRS UPLINK RLC DATA BLOCKS	n = 1200 octets in RLC unacknowledged mode. (PDP context3) Uplink dynamic allocation EGPRS_CHANNEL_CODING_COMMAND = MCS-4, Resegment bit = 1, Two timeslots are assigned Sent on PDTCH0 and PDTCH1 Received on the assigned $PDTCH_1$ and $PDTCH_0$. Repeat steps 21 and 22 Check the CV decrement from BS_CV_MAX (=12) to 0 in the received data blocks. Last block (CV=0) may be transmitted twice, once in $PDTCH_0$ and once in $PDTCH_1$ or the MS may transmit a PACKET UPLINK DUMMY CONTROL BLOCK after the last EGPRS RLC DATA BLOCK
23 a	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS to delay start of T3180 by 500ms (SS should ignore any received Rlc data block). This step is repeated until a PACKET UPLINK DUMMY CONTROL BLOCK is received from the MS, but not more than 4 times.
24 25 26	SS SS->MS SS	 PACKET DOWNLINK DUMMY CONTROL BLOCKS	Wait 5.5 seconds (starting after the last RLC data block) for T3182 expiry Sent on PDTCH0 and PDTCH1 Verify that no data block is transmitted by the MS

51.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown

51.3.1.3.1 Conformance requirements

If the MS receives a change in the EGPRS Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the MS shall act upon the new EGPRS Channel Coding Command. The MS shall then recalculate the CV values for any untransmitted RLC data blocks using the new RLC data block size.

References

3GPP TS 04.60, subclause 9.3.1.

51.3.1.3.2 Test purpose

It is verified that the MS acts upon the new EGPRS Channel Coding Command and recalculates the CV values for any untransmitted RLC data blocks using the new RLC data block size when the MS receives a change of EGPRS Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure.

51.3.1.3.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS is triggered to transfer data. A TBF of dynamic allocation with channel coding MCS-4 in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring.
2. Once CV=7 (BS_CV_MAX) the SS acknowledges the all received RLC data blocks and changes the channel coding to MCS-1. In the next received RLC data block CV=15. The countdown values are checked during the RLC data transferring.
3. When CV=7 is reached the SS acknowledges the all received RLC data blocks and changes the channel coding to MCS-2. The SS checks the next received RLC data block containing CV=5 or 4 or 3 as the case may be. The countdown values are checked during the RLC data transferring until CV=0. The SS acknowledges all received RLC data blocks with the Final Ack Indicator bit set to '1.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1800 octets, USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND = MCS-4, Resegment bit = 1. RLC unacknowledged mode (PDP context3), without starting time
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS-> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
4			Repeat step 2 and 3 until the countdown value CV=7 (BS_CV_MAX).
5	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all received data blocks, EGPRS_CHANNEL_CODING_COMMAND = MCS-1, Resegment bit = 1. PREEMPTIVE_TRANSMISSION_BIT=1 SS will then wait for 6 blocks with no USF
6	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
A6 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may transmit a previously queued RLC block with the old coding scheme MCS-4 and CV=6
B6 (optional step)	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS. This step is executed in case step A6 is executed
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the countdown value CV = 15.
8	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned in step 2, containing USF assigned to the MS. PREEMPTIVE_TRANSMISSION_BIT=1
9	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
10			Repeat step 8 and 9 until the countdown value CV=7 (BS_CV_MAX).
11	SS -> MS	PACKET UPLINK ACK/NACK	EGPRS_CHANNEL_CODING_COMMAND = MCS-2, Resegment bit = 1. PREEMPTIVE_TRANSMISSION_BIT=1 SS will then wait for 6 blocks with no USF
12	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
A12 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may transmit a previously queued RLC block with the old coding scheme MCS-1 and CV=6
B12 (optional step)	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS. This step is executed in case step A12 is executed
13	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check the countdown value CV. In case the MS has sent an EGPRS UPLINK RLC DATA BLOCK in step A12, CV = 3 or 4, otherwise CV = 4 or 5.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
16			Repeat step 14 and 15 until the countdown value CV=0.
17	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing valid RRBP, acknowledge the all received data blocks. PREEMPTIVE_TRANSMISSION_BIT=1
18	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.2 TBF Release / Uplink / Normal / Network initiated

51.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode

51.3.2.1.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" the mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.2.3.

References

3GPP TS 04.60, subclause 8.1.1.4.

51.3.2.1.2 Test purpose

To verify that when the MS, in an uplink TBF of the RLC acknowledged mode, receives a PACKET TBF RELEASE message with cause value "Normal release":

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink acknowledged mode release procedure.

51.3.2.1.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS is triggered to transfer 2000 octets user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access}	n = 2000 octets (Note: more than one LLC PDU is needed for the test.) USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND: MCS-1, TLLI_BLOCK_CHANNEL_CODING: '1'B, MCS-1. RLC acknowledged mode (PDP context2), without starting time
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 three times
5	SS -> MS	PACKET TBF RELEASE	Sent on the PACCH of the PDCH assigned, USF not assigned to the MS, Global TFI is same as the assigned one in step 1, Uplink_Release = yes, Cause value = "Normal release".
5a	SS		SS waits 3 blocks.
6	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS, on PACCH of the assigned PDCH in step 1. PREEMPTIVE_TRANSMISSION_BIT=1
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
8			Repeat step 6 and 7 until the countdown value CV=0 in step 7. Use of the Length indicator and E bit of the received data headers to determine that only the 1st LLC PDU is transmitted.
9	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing valid RRBP. Acknowledge all data blocks. PREEMPTIVE_TRANSMISSION_BIT=1
10	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.
11	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned in step 1, containing USF assigned to the MS. PREEMPTIVE_TRANSMISSION_BIT=1
12	SS		Check that no data block is transmitted by the MS in the next radio block to step 11.

51.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode

51.3.2.2.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" a mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.3.3.

References

3GPP TS 04.60, subclauses 8.1.1.4 and 9.3.3.3.

51.3.2.2.2 Test purpose

To verify that when the MS receives a PACKET TBF RELEASE message with cause value "Normal release" during an unacknowledged mode uplink TBF:

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink unacknowledged mode release procedure.

51.3.2.2.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

Test Procedure

1. The MS is triggered to transfer 2000 octets user data. A TBF of dynamic allocation in unacknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 2000 octets in RLC unacknowledged mode. (PDP context3) TLLI_BLOCK_CHANNEL_CODING = '0'B, MCS-1, EGPRS_CHANNEL_CODING_COMMAND = MCS-1.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF Assigned to MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 five times.
5	SS -> MS	PACKET TBF RELEASE	Sent on the PACCH of the PDCH assigned, USF not assigned to the MS, Global TFI is same as the assigned one in step 1, Uplink_Release = yes, Cause value = "Normal release".
5a	SS		SS waits 3 blocks.
6	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS, on PACCH of the assigned PDCH in step 1.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
8			Repeat steps 6 and 7 until the countdown value CV=0 in step 7. Use of the Length indicator and E bit of the received data headers to determine that only the 1st LLC PDU is transmitted.
9	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indicator = '1' containing valid RRBP, No retransmission needed. Sent on PACCH of the assigned PDCH. PREEMPTIVE_TRANSMISSION_BIT=1
10	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.3 TBF Release / Uplink / Network initiated / Abnormal release

51.3.3.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. If the cause value is "Abnormal release" the mobile station shall immediately stop transmitting and follow the abnormal release with random access procedure.

References

3GPP TS 04.60, subclause 8.1.1.4.

51.3.3.2 Test purpose

To verify that the MS immediately stops transmitting and follows the abnormal release with random access procedure when it receives a PACKET TBF RELEASE message on the PACCH with cause value "Abnormal release".

51.3.3.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 9.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Abnormal release. The MS reinitiates a random access for one or two phase access request.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access}	n = 1200 octets in RLC acknowledged mode. (PDP context2) TLLI_BLOCK_CHANNEL_CODING = '0'B, MCS-1, EGPRS CHANNEL_CODING_COMMAND = MCS-1.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF Assigned to MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
4			Repeat steps 2 and 3 five times.
5	SS -> MS	PACKET TBF RELEASE	Sent on the PACCH of the PDCH assigned, Global TFI is same as the assigned one in step 1, Uplink_Release = yes, Cause value = "Abnormal release".
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS, on PACCH of the assigned PDCH in step 1. Sent on the next block of that of message sent in step 5. This step is repeated for 5 times. Repetition should be on the consecutive blocks as that of the first.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS is allowed to send max. 5 blocks. Received on the assigned PDTCH. Check that the MS does not send more than five blocks.
8	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH.

51.3.4 TBF Release / Downlink / Normal / Network initiated

51.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode

51.3.4.1.1 Conformance requirements

If the mobile station receives an RLC data block with the FBI bit set the value '1' and with a valid RRBP field, the mobile station shall transmit a EGPRS PACKET DOWNLINK ACK/NACK message in the specified uplink block. The mobile station shall continue to monitor all assigned PDCHs.

Whenever the mobile station receives an RLC data block with a valid RRBP and the mobile station has received all RLC data blocks of the TBF, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', stop timer T3190 and start or restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the assignment. Otherwise, and if there is no ongoing uplink TBF, enter packet idle mode.

References

3GPP TS 04.60, subclause 9.3.2.5.

51.3.4.1.2 Test purpose

To verify that in a downlink TBF of acknowledged mode:

1. The MS sends EGPRS PACKET DOWNLINK ACK/NACK in the specified uplink block and continues monitoring all assigned PDCHs when it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) = '1'.

2. Whenever the MS receives an RLC data block with a valid RRBP and has received all RLC data blocks of the TBF, it sends EGPRS PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1'.

3. If the MS receives more than one RLC data block with the FBI set to '1', it accepts the data from only the first one of these blocks.

4. While timer T3192 is running, if the MS receives, after sending EGPRS PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.

5. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires if there is no ongoing uplink TBF.

51.3.4.1.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on its PCH. The SS transmits 10 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the highest BSN which is ten higher than the BSN of the last RLC data block. The SS sets FBI bit and polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks and request a retransmission for the missing 9 data blocks in SSN and RBB fields.

2. The SS sends another 5 RLC data blocks and polls the MS with a valid RRBP. The MS acknowledges the received data blocks and request the retransmission of the missing 4 RLC data blocks. The SS transmits the last 4 RLC data blocks and polls the MS with RRBP=N+26. While the MS waiting for transmission of the final Acknowledgement the SS transmits a RLC data block which sets FBI bit and has same BSN as in the first FBI set beforehand. The MS ignores the downlink data and acknowledges the entire TBF with FINAL_ACK_INDICATION set. The SS transmits another data block with FBI set and polls the MS. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set. The SS waits 3 s.

3. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on its PCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set.

4. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on downlink PDTCH assigned.
3			Repeat step 2 nine times, each time BSN is incremented by 1
4	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with valid RRBP, FBI bit is set. BSN is incremented by 10. The MS has missed 9 consecutive RLC data blocks. BSN of this data block = (BSN of the last data block in step 3 + 10) mod 2048
5	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 4. Check that the Final Ack indicator = '0' and the SSN and RBB values for the 9 missing data blocks .
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	BSN of the data block = (BSN of the last data block in step 3 + 1) mod 2048
7			Repeat step 6 three times, each time BSN is incremented by 1 on the basis of the last BSN in step 6
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	A valid RRBP, BSN is incremented by 1.
9	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 8. Check that the Final Ack indicator = '0' and SSN and RBB values for the 4 missing data blocks.
10	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	BSN is incremented by 1
11			Repeat step 10 twice
12	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	RRBP.= N+26, BSN is incremented by 1
13	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	FBI bit is set, BSN is same as in step 4, RRBP.= N+26, sent on next radio block from step 12.
14	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 12. Check that the Final Ack indicator = '1'.
15	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 13. Check that the Final Ack indicator = '1'.
16	SS		Wait for expiry of T3192
17	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	FBI bit is set, a valid RRBP. Sent on downlink PDTCH assigned in step 1.
18	SS		Check that the MS does not respond on RRBP in step 17, the MS is now in packet idle mode.
19	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode.
20	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	
21			Repeat step 20 ten times
22	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI = '1' and valid RRBP.
23	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 22. Check that the Final Ack indicator = '1'.
24	SS		Wait for 80% of expiry of T3192
25	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Downlink Assignment, acknowledged mode. A different slot assigned. Control Ack Bit = 1. Sent on PACCH.
26	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	
27			Repeat step 26 ten times
28	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI = '1' and valid RRBP.

29	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 28. Check that the Final Ack indicator = '1'.

Specific Message Contents

EGPRS PACKET DOWNLINK ACK/NACK message in step 15:

Information Element	value/ remark
Ack/Nack Description	
- FINAL_ACK_INDICATION	1 (final ack)
- STARTING_SEQUENCE_NUMBER	V(R)
- RECEIVED_BLOCK_BITMAP	Acknowledges all data blocks transmitted by the MS

PACKET DOWNLINK ASSIGNMET message in step 25:

Information Element	value/ remark
CONTROL_ACK	1
TIMESLOT_ALLOCATION	Single slot arbitrarily chosen but different from the value in step 19
{L|H<DOWNLINK_TFI_ASSIGNMENT>}	H (assign downlink TFI)
- DOWNLINK_TFI_ASSIGNMENT	Arbitrarily chosen but different from the value in step 19

51.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode

51.3.4.2.1 Conformance requirements

For each RLC data block with the FBI bit set to '1' and with a valid RRBP field, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message in the uplink block specified by the RRBP field. The mobile station shall continue to read the assigned downlink PDCHs until the block period pointed to by the RRBP. If the mobile station receives more than one RLC data block with the FBI bit set to '1' and with valid RRBP fields that point the same uplink block period, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message only once. The mobile station shall then stop timer T3190, start timer T3192 and continue to monitor all assigned downlink PDCHs. If the mobile station then receives a subsequent RLC data block with a valid RRBP and the FBI bit set to '1', the mobile station shall retransmit the PACKET CONTROL ACKNOWLEDGEMENT message and restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET CONTROL ACKNOWLEDGEMENT message, receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs.

References

3GPP TS 04.60, subclause 9.3.3.5.

51.3.4.2.2 Test purpose

To verify that in a downlink TBF of unacknowledged mode:

1. The MS transmits PACKET CONTROL ACKNOWLEDGEMENT in the uplink block specified by the RRBP field whenever it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) set to the value '1'.

2. After sending PACKET CONTROL ACKNOWLEDGEMENT the MS continues to monitor all assigned downlink PDCHs.

3. While timer T3192 is running, if the MS receives, after sending the PACKET CONTROL ACKNOWLEDGEMENT, a PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.

4. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires.

51.3.4.2.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS_CV_MAX = 15, T3192 = 1,5 s.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Test Procedure

1. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on its PCH. The SS transmits 11 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the BSN which is ten higher than the BSN of the last RLC data block. The SS polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks.

2. The SS sends another RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.

3. The SS resends the RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT. The SS waits 1.2s and resends the RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT. The SS waits till T3192 expires. . The SS resends the RLC data block with FBI set and a valid RRBP and checks that the MS does not transmit any data block on RRBP block.

4. The SS sends an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on the PCHof the MS. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS shall respond with PACKET CONTROL ACKNOWLEDGEMENT.

5. The SS sends PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS shall respond with PACKET CONTROL ACKNOWLEDGEMENT.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on downlink PDTCH assigned.
3			Repeat step 2 ten times, each time BSN is incremented by 1
4	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with valid RRBP, BSN is incremented by 10. The MS has missed 9 consecutive RLC data blocks. BSN of this data block = (BSN of the last data block in step 3 + 10) mod 2048
5	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 4. Check that the Final Ack indicator = '0'
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	A valid RRBP, BSN is incremented by 1, FBI bit is set.
7	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP in step 6.
8			Repeat step 6 and 7 once; keeping the BSN same
9	SS		Wait 1,2 seconds (T3192 not expired).
10	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI ='1' and valid RRBP, BSN is same as the BSN of the data block sent in step 6.
11	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP in step 10.
12	SS		Wait for expiry of T3192
13	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with the same BSN as in Step 6, with FBI = '1' and valid RRBP. Sent on downlink PDTCH assigned in step 1.
14	SS		Check that the MS does not transmit any Control block on the block identified by the RRBP .
15	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode.
16	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	
17			Repeat step 16 ten times
18	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI = '1' and valid RRBP.
19	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	
			Wait 1,2 seconds (T3192 not expired).
20	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Downlink Assignment, unacknowledged mode. A different timeslot assigned. Control Ack Bit = 1. Sent on PACCH.
21	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent 5 blocks from last block containing PACKET DOWNLINK ASSIGNMENT
22			Repeat step 21 ten times
23	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI = '1' and valid RRBP.
24	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP in step 23.

PACKET DOWNLINK ASSIGNMENT message in step 20:

Information Element	value/ remark
RLC_MODE	Unacknowledged mode
CONTROL_ACK	1
{L|H<DOWNLINK_TFI_ASSIGNMENT>}	H (assign downlink TFI)
- DOWNLINK_TFI_ASSIGNMENT	Arbitrarily chosen but different from the value in step 15
TIMESLOT_ALLOCATION	Single slot arbitrarily chosen but different from the values already assigned.

51.3.5 PDCH Release

51.3.5.1 Void

51.3.5.2 PDCH Release / With TIMESLOTS_AVAILABLE

51.3.5.2.1 Conformance requirements

When a mobile station receives a PACKET PDCH RELEASE message containing a TIMESLOTS_AVAILABLE field, it shall immediately stop transmitting and receiving on all assigned PDCHs, which are indicated as not present in the TIMESLOTS_AVAILABLE field, remove those PDCHs from its list of assigned PDCHs.

If all of the mobile station's assigned PDCHs are removed from its list of assigned PDCH, and, if an uplink TBF was in progress, the mobile station shall perform an abnormal release with random access. If no uplink TBF was in progress, the mobile station shall perform an abnormal release with return to CCCH or PCCCH.

References

3GPP TS 04.60, subclause 8.2.

51.3.5.2.2 Test purpose

To verify that when the MS receives a PACKET PDCH RELEASE message with a TIMESLOTS_AVAILABLE field indicating that one or more timeslots is no longer available for packet data service:

1. it immediately stops transmitting and receiving on all assigned PDCHs which are not presented in the TIMESLOTS_AVAILABLE field.
2. it performs an abnormal release with random access when all of the MS's assigned PDCHs are removed, and an uplink TBF was in progress.
3. it performs an abnormal release with return to CCCH when all of the MS's assigned PDCHs are removed, and no uplink TBF was in progress.

51.3.5.2.3 Method of test

Initial Conditions

System Simulator:

EGPRS supported.

Test Procedure

1. The MS is triggered to transfer user data. A TBF on one slot of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available. It is checked that the MS initiates a random access for one or two phase access request. A TBF is assigned to the MS to allow it to complete the uplink data transferring.
2. The MS is triggered to transfer user data. A TBF on two consecutive slots of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH

RELEASE with TIMESLOTS_AVAILABLE indicating that only a timeslot is available and the assigned downlink control timeslot is no more available. The MS uses the available timeslot to complete the uplink data transferring.

3. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on its PCH. A downlink TBF with a timeslot is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.

4. A downlink TBF with two timeslots is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating only a timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling and continues receiving the downlink data on the available timeslot. The SS sends another PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access}	n = 1000 octets in RLC acknowledged mode (Test PDP context2). EGPRS CHANNEL_CODING_COMMAND = MCS-4.
2	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	Received data block on the assigned PDTCH.
4	SS		Repeat steps 2 and 3 five times
5	SS -> MS	PACKET PDCH RELEASE	Sent on the PACCH of the PDCH assigned in step 1. With TIMESLOTS_AVAILABLE indicating no timeslot available, RRBP = N + 26.
6	SS		SS checks that no PACKET CONTROL ACKNOWLEDGEMENT is received.
7	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to MS
8	SS		Verify that no data block is received.
9	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH.
10	SS -> MS	IMMEDIATE ASSIGNMENT	Multiblock assignment allocating two uplink blocks, to order the MS making two phase access procedure. Sent on AGCH.
11	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the first block assigned in step 10.
11a (condi-tional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 11) indicates 1, then step 11a is performed.
11b (optional)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 11) indicates 0, then step 11b is optionally performed.
12	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation with one time slot, USF_GRANULARITY = single block, EGPRS CHANNEL_CODING_COMMAND = MCS-4, Sent on PACCH of the same PDCH assigned in step 10.
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned in step 12, containing USF assigned to the MS.
14	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
15		{Completion of uplink RLC data block transfer}	
			The MS of the EGPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40 skips the steps 16 to 38
16		{Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access}	n = 1100 octets in RLC acknowledged mode. (Test PDP context2), EGPRS CHANNEL_CODING_COMMAND = MCS-2 Two timeslots
17	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	USFs assigned to MS. Sent on $PDTCH_6$ and $PDTCH_7$.
18	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_6$ and $PDTCH_7$.
19			Repeat step 17 and 18 three times
20	SS -> MS	PACKET PDCH RELEASE	Sent on the PACCH of the $PDCH_6$ assigned in step 16. With TIMESLOTS_AVAILABLE indicating no timeslot available RRBP=N+26.
21	SS		SS checks that no PACKET CONTROL ACKNOWLEDGEMENT is received.
22	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	USFs assigned to MS. Sent on PDTCH6 and PDTCH7

Step	Direction	Message	Comments
23	SS		Verify that MS stop sending on both $PDTCH_6$ and $PDTCH_7$
24	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH.
25	SS -> MS	IMMEDIATE ASSIGNMENT	Multiblock assignment allocating two uplink blocks, to order the MS making two phase access procedure. Sent on AGCH.
26	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the first block assigned in step 25.
26a (conditional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 26) indicates 1, then step 26a is performed.
26b (optional)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 26) indicates 0, then step 26b is optionally performed.
27	SS -> MS	PACKET UPLINK ASSIGNMENT	Uplink dynamic allocation EGPRS CHANNEL_CODING_COMMAND = MCS-4 Two timeslots assigned
28	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	USFs assigned to MS. Sent on $PDTCH_0$ and $PDTCH_1$.
29	MS -> SS	EGPRS UPLINK RLC DATA BLOCKS	data blocks received on the assigned $PDTCH_1$ and $PDTCH_0$.
30	SS		Repeat steps 28 and 29 three times
31	SS -> MS	PACKET PDCH RELEASE	Sent on the PACCH of the $PDCH_1$ assigned in step 27. With TIMESLOTS_AVAILABLE indicating only the timeslot corresponding to $PDCH_0$ available.
32	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent after 6 radio blocks from step 31 on $PDCH_1$, USFs assigned to MS
33	SS		Verify that no data block was received
34	SS->MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on $PDCH_0$, USFs assigned to MS
35	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned $PDTCH_0$.
36			Repeat step 34 and 35 until the countdown value CV=0
37	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all data blocks received RLC data blocks . Sent on $PACCH_0$. PREEMPTIVE_TRANSMISSION_BIT=1
38	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on $PDCH_0$
39	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with one timeslot assigned, acknowledged mode.
40	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	A valid RRBP
41	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP in step 40.
42	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Repeat the step three times.
43	SS -> MS	PACKET PDCH RELEASE	Sent on the next radio block from step 42 with TIMESLOTS_AVAILABLE indicating no timeslot available.
44	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the next radio block from step 43 on PDTCH released, a valid RRBP = N + 21 or 22.
45	SS		Check that no EGPRS PACKET DOWNLINK ACK/NACK received on the block specified in step 44.
			The steps from 46 onwards are applicable to all EGPRS multislot classes except the EGPRS multislot class1.
46A	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on a PCH block corresponding to the MS's paging group with TBF Starting time.
46B	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Timeslot1 and Timeslot0 assigned, acknowledged mode. Sent on the PACCH assigned in stpe46A.
47	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Repeat the step five times. The RLC data blocks are received on $PDTCH_1$ and $PDTCH_0$. The last data block on $PDTCH_1$ containing a valid RRBP.

Step	Direction	Message	Comments
48	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the block specified by RRBP on $PDTCH_7$ Check whether all data blocks in step 47 are acknowledged.
49	SS -> MS	PACKET PDCH RELEASE	With TIMESLOTS_AVAILABLE indicating only $timeslot_0$ available. Sent on the PACCH of $PDCH_1$.
50	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Repeat the step five times. The RLC data blocks are received on $PDTCH_0$. The last data block on $PDTCH_0$ containing a valid RRBP.
51	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	On the block specified by RRBP on $PDTCH_0$. Check whether all data blocks sent in step 50 are acknowledged.
52	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with a valid RRBP = N + 26 on $PDTCH_7$.
53	SS		Check that no EGPRS PACKET DOWNLINK ACK/NACK received on the block specified.
54	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Repeat the step five times on $PDTCH_0$.
55	SS -> MS	PACKET PDCH RELEASE	With TIMESLOTS_AVAILABLE indicating no timeslot available sent on the next block from step 54.
56	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the next radio block of step 55 on $PDTCH_0$, a valid RRBP = N + 21 or 22.
57	SS		Check that no EGPRS PACKET DOWNLINK ACK/NACK is received on the block specified in step 56.

IMMEDIATE ASSIGNMENT, Steps 10 and 25:

Information Element	value/remark
Number of radio blocks allocated	01

51.3.6 TBF Release / Extended Uplink

51.3.6.1 TBF Release / Extended Uplink / Recalculation of CV before CV = 0

51.3.6.1.1 Conformance requirements

In an uplink TBF operating in extended uplink TBF mode, the CV shall indicate the current number of RLC data blocks that has not been transmitted in the uplink TBF. The mobile station shall update the TBC value and recalculate the CV for any untransmitted RLC data block in the following cases:

- The RLC entity of the mobile station receives new data from upper layers for transmission in the uplink TBF.

References

3GPP TS 44.060, subclause 9.3.1.3

51.3.6.1.2 Test purpose

To verify that MS recalculates the CV when a new PDU is received from upper layers before MS has sent an RLC data block with CV=0.

51.3.6.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF using dynamic allocation in acknowledged mode is assigned. The SS assigns an USF to MS until MS has sent CV = 14. Then MS is triggered to send more data. SS acknowledges all received data. A new USF is assigned to MS every 4th second. The CV is checked in the data block. If the CV becomes '0' before having been recalculated, the test has failed. Otherwise the uplink TBF is continued and completed.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 500 octets, USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND: MCS-2, RLC acknowledged mode (PDP context2)
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 until CV=14 (BS_CV_MAX).
5	MS		Trigger MS to send 400 octets of data.
6	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge all received data. USF assigned to the MS.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check CV
8	SS		Wait 4s
9			Repeat step 6 to 8 until CV (as received in step 7) > 14 (successful) or CV = 0 (failed)
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS

51.3.6.2 TBF Release / Extended Uplink / Recalculation of CV after CV = 0

51.3.6.2.1 Conformance requirements

[3GPP TS 44.060, 9.1.3.1]

In the extended uplink TBF mode, if V(S) = V(A) and there is no RLC data block with BSN = V(S) available, the mobile station shall stop sending RLC data blocks. The mobile station shall continue sending RLC data blocks when a RLC data block with BSN = V(S) is available.

[3GPP TS 44.060, 9.3.1.3]

In an uplink TBF operating in extended uplink TBF mode, the CV shall indicate the current number of RLC data blocks that has not been transmitted in the uplink TBF. The mobile station shall update the TBC value and recalculate the CV for any untransmitted RLC data block in the following cases:

- The RLC entity of the mobile station receives new data from upper layers for transmission in the uplink TBF.

[3GPP TS 44.060, 9.3.1b.2]

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

References

3GPP TS 44.060, subclause 9.1.3.1, 9.3.1.3, 9.3.1b.2

51.3.6.2.2 Test purpose

1 To verify that MS sends an RLC/MAC control block after fully acknowledgement of transmitted RLC data.

2 To verify that MS continues to send RLC data blocks on the current TBF when MS receives new data from upper layers when all RLC data have been fully acknowledged.

3 To verify that MS recalculates the CV when a new LLC PDU is received from upper layers after MS has sent a RLC data block with CV=0.

51.3.6.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 15

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. SS assigns an USF to MS until MS has sent CV = 0. SS acknowledges all received data with Final Ack Indicator bit set to '0'. SS continues to assigns USF to MS. MS shall send a PACKET UPLINK DUMMY CONTROL BLOCK every time. Then

MS is triggered to send more data. After one second a new USF is assigned to MS. MS shall send a data block with a recalculated CV. Then the uplink TBF is continued and completed.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 500 octets, USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND: MCS-2, RLC acknowledged mode (PDP context2)
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 until CV=0
5	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 0. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
A6 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may retransmit the block with BSN=0 once if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B6.
B6 (optional step)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	
8			Repeat step 6 and 7 five times.
9	MS		Trigger the MS to send 400 octets of data. SS should take care of allocating USF's to the MS in order to prevent the MS from releasing the TBF. If SS receives PACKET UPLINK DUMMY CONTROL BLOCKs, these shall be discarded. If SS receives an UPLINK RLC DATA BLOCK, then verify that the MS has recalculated the CV.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
11	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
12			Repeat step 10 and 11 until CV=0
13	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 1 containing valid RRBP. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
14	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

Test Procedure

The MS is triggered to transfer user data. A TBF using dynamic allocation in acknowledged mode is assigned. The SS assigns an USF to MS. SS receives data blocks till CV=0 and acknowledges all the blocks with an UPLINK ACK/NACK setting FAI=0. Then SS checks that if a USF is matched to the MS it sends a UPLINK DUMMY CONTROL BLOCK. SS sends a PACKET TIMESLOT RECONFIGURE, reassigning the timeslot given for Uplink and initiating a downlink TBF. SS checks that the MS is sending a UPLINK DUMMY CONTROL BLOCK on the new channels whenever the USF is matched. SS releases the downlink TBF. SS initiates a data transfer of 200 octets. SS checks that the MS is using the newly assigned channels for doing the data transfer. SS allows the MS to complete the data transfer and releases the TBF.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 500 octets, USF_GRANULARITY = 1 block, EGPRS_CHANNEL_CODING_COMMAND: MCS-2, RLC acknowledged mode (PDP context2)

51.3.6.6 Extended Uplink TBF / Cell Change while in Extended Uplink/ No Packet Neighbouring Cell Data

51.3.6.6.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210.If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

51.3.6.6.2 Test purpose

To verify that an MS which is in Extended Uplink TBF, NACC active, changes to the proposed cell while in extending (sending uplink dummy control blocks).

51.3.6.6.3 Method of test

Initial conditions

System Simulator:

2 cells, EGPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm, NW_EXT_UTBF = 1.

Cell A: RLA_C = -50 dBm, is active.

Cell B: RLA_C = -60 dBm, is active.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. When MS reaches CV=0,it starts sending PACKET UPLINK DUMMY CONTROL BLOCKS During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send PACKET UPLINK DUMMY CONTROL BLOCKS. While MS is sending PACKET ULINK DUMMY CONTROL BLOCKs, the SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. The MS request resources for an uplink in the new cell and complete the uplink transfer in the new cell.

Maximum duration of the test

51.3.6.7 Extended Uplink TBF / Cell Change failure while in Extended Uplink/ No Packet Neighbouring Cell Data

51.3.6.7.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210.If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

51.3.6.7.2 Test purpose

To verify that an MS, which is in Extended Uplink TBF, NACC active, shall revert to the previous TBF, if selected cell disappears from the coverage and MS should still stay in Extended Uplink TBF

51.3.6.7.3 Method of test

Initial conditions

System Simulator:

2 cells, EGPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm, NW_EXT_UTBF = 1.

Cell A: RLA_C = -50 dBm, is active.

Cell B: RLA_C = -60 dBm, is active.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established. Ready timer is deactivated.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. When MS reaches CV=0,it starts sending PACKET UPLINK DUMMY CONTROL BLOCKS During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send PACKET UPLINK DUMMY CONTROL BLOCKS. While MS is sending PACKET ULINK DUMMY CONTROL BLOCKs, the SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. MS tries to access Cell B. SS deactivates Cell B, The MS request resources for an uplink in the old cell.

Maximum duration of the test

51.3.6.8 Extended Uplink TBF / Cell Change while in Extended Uplink/ With Packet Neighbouring Cell Data

51.3.6.8.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210.If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

51.3.6.8.2 Test purpose

To verify that: MS takes into consideration the change of parameter NW_EXT_UTBF in SI13 (sent in PACKET NEIGHBOUR CELL DATA) and operate in Extended Uplink TBF in the new cell.

51.3.6.8.3 Method of test

Initial conditions

System Simulator:

2 cells, EGPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm,.

Cell A: RLA_C = -50 dBm, is active and NW_EXT_UTBF = 0.

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm, is active and NW_EXT_UTBF = 1.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. SS sends one or more PACKET NEIGHBOUR CELL DATA to the MS (with NW_EXT_UTBF in SI13 set to 1). The SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. The MS requests resources for an uplink and asks for SI2 and SI2bis messages by sending PACKET_SI_STATUS In the new cell the MS completes the uplink transfer while operating in extended uplink TBF.

Maximum duration of the test

-

Expected sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1200 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding EGPRS_CHANNEL_CODING_COMMAND: MCS-1 No starting time present.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
4			Repeat step 2 and 3 five times
5	SS		Lower signal strength of Cell A to –80 dBm.
6	SS -> MS	PACKET UPLINK ACK/NACK	USF assigned to the MS
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK Or PACKET CELL CHANGE NOTIFICATION	
8			Step 6 and 7 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 7, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 5.
9	SS -> MS	PACKET NEIGHBOUR CELL DATA	USF assigned to the MS
10	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
11			Step 9 and 10 are repeated until all instances of PACKET NEIGHBOUR CELL DATA are sent (SI13 with NW_EXT_UTBF = 1 and SI_STATUS_IND = 1).
12	SS -> MS	PACKET CELL CHANGE CONTINUE	
			The following messages are to be sent and received in Cell B.
13		{Uplink dynamic allocation two phase access}	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding EGPRS_CHANNEL_CODING_COMMAND: MCS-1 No starting time present.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS USF is assigned once in 52-multiframes.
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK or PACKET SI STATUS or PACKET RESOURCE REQUEST	
			Step 16 is performed only if a PACKET RESOURCE REQUEST is received in step 15.
16	SS -> MS	PACKET UPLINK ASSIGNMENT	Repeats the PDTCH assignment given in step 13.

17			Step 14 and 15 are repeated until a PACKET SI STATUS is received in step 15. The PACKET SI STATUS shall be sent within 10 sec of accessing the cell. Verify that the MS does not request SI that was sent in step 9. If the RLC DATA BLOCK with BSN = 0 received in Step 15 contains an empty LLC PDU as the first LLC PDU, Steps 14 and 15 are further repeated until a PACKET RESOURCE REQUEST is received in Step 15. NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment or Packet Timeslot Reconfigure as required), in order to ensure that the radio resources are used efficiently.
18		PACKET SERVING CELL DATA	SI2,SI4 and SI2bis messages are sent .
19		PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
20 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST	
21 (conditional step)	SS->MS	PACKET UPLINK ASSIGNMENT	Step 21 is performed only PRR is sent step 20. Repeats the PDTCH assignment from the PUA step 13
22			Repeat step 19 and 20 until CV=0
23	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 0. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS, Sent after 6 blocks of sending the message in step 23.
A24 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may retransmit the block with BSN=0 once if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B24.
B24 (optional step)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
25	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	
26			Repeat step 24 and 25 five times.
27	MS		Trigger the MS to send 500 octets of data. SS should take care of allocating USF's to the MS in order to prevent the MS from releasing the TBF
28	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
29	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	
30			Repeat step 28 and 29 until CV=0
31	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 1 containing valid RRBP. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
32	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.6.9 TBF Release / Extended Uplink / Change of RLC mode / Normal release

51.3.6.9.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in acknowledged mode.

If the TBF is operated in extended uplink TBF mode (see sub-clause 9.3.1b), the mobile station shall use the procedure in sub-clause 8.1.1.6 for changing RLC mode.

The mobile station shall send a PACKET RESOURCE REQUEST message on PACCH indicating the new RLC mode and start timer T3168.

If timer T3168 expires, the mobile station shall retransmit the PACKET RESOURCE REQUEST message and restart timer T3168.

On receipt of a PACKET RESOURCE REQUEST message, indicating a change of RLC mode, the network shall release the uplink TBF at a point determined by the network, using the procedure defined in sub-clause 9.5.

On receipt of PACKET UPLINK ACK/NACK with Final Ack Indicator set to '1' the mobile station shall stop timer T3168 and after sending the PACKET CONTROL ACK perform the change of RLC mode by establishing a new TBF.

References

3GPP TS 44.060, subclauses 8.1.1.6, 8.1.1.1.2 and 9.5.

51.3.6.9.1.2 Test purpose

To verify that during extended uplink TBF the MS re-establishes the TBF and changes the RLC mode.

51.3.6.9.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 1 and context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. SS assigns USFs allowing the MS to transmit data blocks. The MS is triggered to transfer 220 octets user data with a different RLC mode and higher radio priority.

The mobile station shall complete the transmission of the current LLC PDU. SS will verify the complete reception of the LLC PDU.

SS acknowledge the LLC PDU with a EGPRS Packet Uplink Ack/Nack with TBF Est field is set to '1' and Final Ack Indicator bit set to '1'. The mobile station shall use the same procedures as are used for TBF establishment using two phase starting from the point where the mobile station transmits the PACKET RESOURCE REQUEST message.

In case the MS ignores the TBF Est field in the EGPRS PACKET UPLINK ACK/NACK , the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message, release the TBF and shall establish a new TBF using two phase access.

SS assigns a PDCH to the MS. SS assigns USFs allowing the MS to transmit data blocks until the countdown value CV=0.

SS sends an EGPRS Packet Uplink Ack/Nack with TBF Est field set to '0' and Final Ack Indicator bit set to '1' and the MS is polled. The MS answers with a Packet Control Acknowledgement and the TBF is released.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, TLLI_BLOCK_CHANNEL_CODING: MCS-1, EGPRS_CHANNEL_CODING_COMMAND: MCS-1, RADIO_PRIORITY = 4
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by EGPRS_CHANNEL_CODING_COMMAND, the TFI, and BSN is correct.
4			Repeat step 2 and 3 three times.
5	MS		To trigger the MS to transfer 220 octets: in test PDP context1, unacknowledged RLC mode and Radio Priority = 1
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK Or	Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI, and BSN is correct. Send PACKET UPLINK ACK/NACK to acknowledge all received data blocks when CV=0 and PACKET RESOURCE REQUEST is not yet received. (Note: MS may retransmit the block with BSN=0 once if it has already been scheduled while PACKET UPLINK ACK/NACK is being processed and the new LLC PDU is not ready for the transmission)
		PACKET RESOURCE REQUEST Or	Received on PACCH of the assigned PDCH indicating the change of RLC mode. Check for radio priority level = 1 and RLC mode Unacknowledged RLC mode.
		PACKET UPLINK DUMMY CONTROL BLOCK	The MS is in extended TBF mode.
8			Repeat step 6 and 7 until CV = 0 and a PACKET RESOURCE REQUEST has been received
9	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned, acknowledging all blocks so far. FINAL_ACK_INDICATION = '1',TBF Est = 1. Valid RRBP.
10	SS		Verify that only one complete LLC PDU has been received.
11 (optional)	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH. If not received continue with step 14.
12 (conditional)	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH. Access Type: "Two Phase Access".
13 (conditional)	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on the AGCH
14	MS -> SS	PACKET RESOURCE REQUEST	Received on PACCH of the assigned PDCH. Check for radio priority level = 1 and RLC mode Unacknowledged RLC mode. Received on the block specified by the single block assignment of step 13 or by the RRBP of step 9.
15	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the assigned PDCH.
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of the assigned PDCH.

Step	Direction	Message	Comments
17	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the PDTCH assigned.
18			Repeat step 16 and 17 until countdown value CV=0.
19	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = '1', TBF Est = 0, a valid RRBP, acknowledge all received data, sent on PACCH.
20	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.6.10 TBF Release / Extended Uplink / Change of RLC mode / Abnormal release

51.3.6.10.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in acknowledged mode. immediately request a resource reallocation for uplink according to the new Radio Priority of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.

If the TBF is operated in extended uplink TBF mode (see sub-clause 9.3.1b), the mobile station shall use the procedure in sub-clause 8.1.1.6 for changing RLC mode.

Then the mobile station shall complete the transmission of the current LLC PDU. If the TBF is operated in extended uplink TBF mode, the mobile station shall release the uplink TBF and re-establish a new uplink TBF in order to change the RLC mode.

The mobile station shall send a PACKET RESOURCE REQUEST message on PACCH indicating the new RLC mode and start timer T3168.

If timer T3168 expires, the mobile station shall retransmit the PACKET RESOURCE REQUEST message and restart timer T3168.

If timer T3168 expires and the PACKET RESOURCE REQUEST message has already been transmitted four times, the mobile station shall perform an abnormal release with access retry (see sub-clause 8.7.2).

On receipt of a PACKET RESOURCE REQUEST message, indicating a change of RLC mode, the network shall release the uplink TBF at a point determined by the network, using the procedure defined in sub-clause 9.5.

On receipt of PACKET UPLINK ACK/NACK with Final Ack Indicator set to '1' the mobile station shall stop timer T3168 and after sending the PACKET CONTROL ACK perform the change of RLC mode by establishing a new TBF.

References

3GPP TS 44.060, subclauses 8.1.1.6, 8.1.1.1.2, and 9.5.

51.3.6.10.1.2 Test purpose

To verify that during extended uplink TBF the MS perform an abnormal release with access retry after timer T3168 expired and PACKET RESOURCE REQUEST message has been transmitted four times.

51.3.6.10.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 1 and context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. SS assigns USFs allowing the MS to transmit data blocks until the MS completes the countdown procedure. As soon as the MS is in extended UL TBF mode, the MS is triggered to transfer 220 octets user data with different RLC mode.

The mobile station shall immediately request a resource reallocation for uplink indicating the changed RLC mode applied to the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and start timer T3168.

SS keeps assigning USFs, the MS will send Packet Uplink Dummy Control Blocks till T3168 expire. The MS will send a PACKET RESOURCE REQUEST message again on the PACCH and restart timer T3168.

The SS keeps assigning USFs till the MS has transmitted the Packet Resource Request four times.

The MS shall perform an abnormal release with access retry.

The SS will assign new resources to the MS to complete the new TBF.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS	{Uplink dynamic allocation two phase access}	In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, TLLI_BLOCK_CHANNEL_CODING: MCS-1, EGPRS_CHANNEL_CODING_COMMAND: MCS-1, RADIO_PRIORITY = 4,
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding as specified by EGPRS_CHANNEL_CODING_COMMAND, the TFI is correct.
4			Repeat step 2 and 3 till CV = 0
5	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Sent on the PACCH of the PDCH assigned, the USF not assigned to the MS, acknowledging all blocks. FINAL_ACK_INDICATION = '0',TBF Est = 1
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS, sent after 6 blocks from step 5
A6 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may retransmit the block with BSN=0 once if it has already been scheduled while EGPRS PACKET UPLINK ACK/NACK is being processed. In this case go to step B6.
B6(optional step)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	MS is in extended UL TBF mode.
8	MS		To trigger the MS to transfer 220 octets: in test PDP context1, unacknowledged RLC mode and Radio Priority = 1
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
A10 (optional step)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	MS may transmit while processing the uplink data trigger PACKET UPLINK DUMMY CONTROL BLOCK. In this case repeat step 9 until a PACKET RESOURCE REQUEST is received.
10	MS -> SS	PACKET RESOURCE REQUEST	MS starts T3168. Received on the PACCH of the assigned PDCH, Indicating the change of RLC mode: Check that radio priority level = 1 and Unacknowledged RLC mode.
11	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	To prevent T3184 from expiring, sent on the PACCH of the PDCH assigned, the USF not assigned to the MS, acknowledging all Blocks. FINAL_ACK_INDICATION = '0', TBF Est = 0
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
13	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	MS is in extended UL TBF mode.
		Or	
		PACKET RESOURCE REQUEST	Received on the PACCH of the assigned PDCH, Indicating the change of RLC mode: Check that radio priority level = 1 and Unacknowledged RLC mode.
14			Repeat Step 12 and 13 until a PACKET RESOURCE REQUEST has been received. Check that the PACKET RESOURCE REQUEST is received within T3168 +/- 10% from the previous PACKET RESOURCE REQUEST.
15			Repeat Step 11 to Step 14 until the PACKET RESOURCE REQUEST has been received a total of 4 times. .

Step	Direction	Message	Comments
			MS shall perform an abnormal release with access retry
16	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH for TBF establishment for transferring of the LLC PDU in PDP context1.
17	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on the AGCH
18	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 17. Check that radio priority level = 1, peak throughput class = 5, unacknowledged RLC mode.
19	SS -> MS	PACKET UPLINK ASSIGNMENT	Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 19.
21	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the PDTCH assigned.
22			Repeat step 20 and 21 until countdown value CV=0.
23	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	FINAL_ACK_INDICATION = '1', a valid RRBP, acknowledge all received data, sent on PACCH.
24	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

51.3.7 Void

51.4 Void

51.5 EGPRS Dual transfer mode

To bring the MS into active state U10, macro 40.4.3.22 shall be used.

51.5.1 PS establishment whilst in dedicated mode

51.5.1.1 Uplink TBF establishment

51.5.1.1.1 Uplink TBF establishment with no reallocation of CS resources

51.5.1.1.1.1 Uplink TBF establishment with no reallocation of CS resources / Successful case / Uplink resources assigned

51.5.1.1.1.1.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

51.5.1.1.1.2 Uplink TBF establishment with no reallocation of CS resources / Successful case / Downlink resources assigned

51.5.1.1.1.2.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

If the received DTM ASSIGNMENT COMMAND or PACKET ASSIGNMENT message includes uplink packet resources, the mobile station shall proceed with the packet access. If the received message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the procedure specified in clause 3.4.22.3, and then attempt an establishment of uplink TBF, using the applicable procedure specified in 3GPP TS 04.60.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

If the received PACKET ASSIGNMENT message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the downlink TBF establishment, and then attempt an establishment of uplink TBF.

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources and assigns PS resources to the MS. The SS accomplishes the resource assignment by passing a DTM ASSIGNMENT COMMAND message to the MS. Once the MS has received the assignment message, it moves to the new allocation, reconnects the CS resources, passes the ASSIGNMENT COMPLETE message to the SS on the main DCCH and starts to send RLC DATA BLOCKS to the SS on the assigned TBF.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS supporting DTM/EGPRS shall complete testing for k=1 and MSs indicating support of single slot DTM/EGPRS shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

51.5.1.2 Downlink TBF establishment

51.5.1.2.1 Whilst in Ready State

51.5.1.2.1.1 Downlink TBF establishment in Ready State / Successful case

51.5.1.2.1.1.1 Conformance requirements

This procedure is only applicable to a mobile station in dedicated mode and with no TBF allocated. If the mobile station already has an ongoing TBF, the establishment of the downlink packet resource is performed on the PACCH; see 3GPP TS 04.60.

The establishment of a downlink packet resource is initiated by the RR entity on the network side using the packet downlink assignment procedure in dedicated mode. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007. The request from upper layers specifies a QoS profile, an *RLC mode*, *DRX parameters* and an *MS classmark* associated with the packet transfer.

The network initiates the packet downlink assignment procedure in dedicated mode by sending a DTM assignment message (i.e. DTM ASSIGNMENT COMMAND or a PACKET ASSIGNMENT) in acknowledged mode on the main DCCH.

The completion of the packet downlink assignment procedure while in dedicated mode depends on the actual assignment message used by the network:

- when the network sends a PACKET ASSIGNMENT message, the packet downlink assignment procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

51.5.2 Void

51.5.3 PS establishment whilst in dual transfer mode

51.5.3.1 Uplink TBF establishment with a downlink TBF established

51.5.3.1.1 Uplink TBF establishment with a downlink TBF established and no PS downlink reallocation

51.5.3.1.1.1 Conformance requirements

The mobile station may request establishment of one or more uplink TBFs when there are one or more ongoing downlink TBFs by including a Channel Request Description or the Extended Channel Request Description information element in the (EGPRS) PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer an upper layer PDU.

When multiple TBF procedures are not supported, the mobile station initiates the packet access procedure by sending the Channel Request Description information element in the (EGPRS) PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of an (Extended) Channel Request Description information element in the (EGPRS)PACKET DOWNLINK ACK/NACK message, the network may assign radio resources to the mobile station on one or more PDCHs by transmitting an uplink assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE message) on the PACCH, or may reject one or more of the requests by sending a PACKET ACCESS REJECT message on the PACCH. If the PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the UPLINK_TFI_ASSIGNMENT field.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs.

PIXIT Statements

-

Test Procedure

Whilst in an active call on timeslot N, the MS receives a PACKET ASSIGNMENT message on the main DCCH, instructing the MS to switch to a designated timeslot and receive data. The SS then starts to transmit to the newly allocated resources. Before the SS completes transmission of the 1000 octets of data, the MS is triggered to initiate an uplink packet transfer. The SS then sends another RLC Downlink Data block to the MS with the S/P bit set to 1. The MS responds by sending a EGPRS PACKET DOWNLINK ACK/NACK message to the SS including the Channel Request Description IE. The SS allocates uplink resources to the MS with the PACKET UPLINK ASSIGNMENT message. The test procedure is complete when the SS successfully verifies both uplink and downlink transmission are working in parallel.

MS supporting DTM/EGPRS shall complete testing for k=1 and MSs indicating support of single slot DTM/EGPRS shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

51.5.3.2 Downlink TBF establishment with a uplink established

51.5.3.2.1 Downlink TBF establishment with a uplink TBF established and no PS uplink reallocation

51.5.3.2.1.1 Conformance requirements

During uplink transfer, the network may initiate a downlink TBF by sending a PACKET DOWNLINK ASSIGNMENT message, or a PACKET TIMESLOT RECONFIGURE, to the mobile station on the PACCH. If a PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the DOWNLINK_TFI_ASSIGNMENT field. The multislot restrictions of the mobile station shall be observed.

References

3GPP TS 04.60/44.060 sub-clause 8.1.1.1.3

51.5.3.2.1.2 Test purpose

To verify that a downlink TBF can be established without reallocation of uplink PS resources, whilst maintaining DTM.

51.5.3.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.
The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer of 1000 octets of data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS an uplink TBF. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. Once the MS has sent correctly approximately 500 octets, the SS transmits a PACKET DOWNLINK ASSIGNMENT message allocating the MS downlink packet resources. The test procedure is complete when the SS successfully verifies both uplink and downlink transmission are working in parallel.

MS supporting DTM/EGPRS shall complete testing for k=1 and MSs indicating support of single slot DTM/EGPRS shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.
2	MS		Trigger the MS to initiate an uplink packet transfer containing 1000 octets.
3	MS->SS	DTM REQUEST	
4	SS->MS	PACKET ASSIGNMENT	Includes information on the Radio resources provided to the MS. See specific message contents.
5	MS<->SS	{ Uplink data }	Macro – Approximately 500 Octets
6	SS->MS	PACKET DOWNLINK ASSIGNMENT	When: k=1, Timeslot = (N ± 1) MOD 8; k=2, Timeslot =N.
7	SS		Verify both uplink and downlink data transmission is functioning correctly.

51.6 Dynamic ARFCN mapping tests

51.6.1 Void

52 EGPRS Test of Medium Access Control (MAC) protocol

52.1 Test of Medium Access Control (MAC) Procedures

Default conditions

The SS default conditions simulate one cell with default settings as defined in the EGPRS general default section.

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

The default message contents and signalling macro not specified in the end of this subclause shall be set as in "EGPRS default conditions" clause 50. Specific message contents for a test case is specified in each test case.

Conditions or message contents specified in a test case have the highest precedence. In addition, the default message contents described in the end of this subclause override those specified in "EGPRS default conditions".

In case the test case not expected "short access" as access type for Packet Channel Request the amount of RLC data specified in the comments in expected sequence is not necessary to be exactly the specified amount of data. It only has to be more than the limit for short access. If the test case need a specific amount of data this is specified in the test case.

52.1.1 Void

52.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168

52.1.2.1.9.2.1.1 Conformance requirements

The contention resolution has failed on the mobile station side when the mobile station does not receive a PACKET UPLINK ASSIGNMENT message with its TLLI before expiry of timer T3168. The mobile station shall then reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.3.3.

52.1.2.1.9.2.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure after a time equal to timer T3168 and the procedure shall be repeated 4 times.

52.1.2.1.9.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH, SI13 GPRS Cell Options, T3168 = 7.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message including Multi Block Allocation struct information to order the MS to send PACKET RESOURCE REQUEST message. The MS shall perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS wait for a time greater than timer T3168 so the MS shall reinitiate packet access procedure. This procedure shall be repeated 4 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	ACCESS_TYPE = "Two Phase Access Request". Received on the single block assigned in step 3.
5	SS		The SS waits T3168 expiry.
6			The SS verifies that the MS reinitiate packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of EGPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of EGPRS supported' is Release 5 or later.
NOTE: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

52.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI in Packet Resource Request message

52.1.2.1.9.2.2.1 Conformance requirements

The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested information do not fit in the PACKET RESOURCE REQUEST.

The mobile station shall include the TLLI in these two messages until contention resolution. After that, the mobile station may use the uplink TFI or the TLLI whenever these messages are repeated.

The network may request a retransmission of the PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES messages. A request for retransmission of one or both of these messages shall be indicated in the PACKET UPLINK ACK/NACK message. The mobile station has to indicate within the PACKET RESOURCE REQUEST if the message is a retransmitted one.

If the mobile station has been allocated two radio blocks and all the requested information fit in the PACKET RESOURCE REQUEST message, no ADDITIONAL MS RADIO ACCESS CAPABILITIES message shall be sent. Instead, some uplink control block (e.g. packet measurement report, packet uplink dummy control block) may be sent by the mobile station.

The network may indicate in the next PACKET UPLINK ASSIGNMENT message a request for retransmission of the ADDITIONAL MS RADIO ACCESS CAPABILITIES message.

Reference

3GPP TS 04.60 subclauses 7.1.2.2.1a and 7.1.3.2.

52.1.2.1.9.2.2.2 Test purpose

To verify that the MS includes TLLI in both PACKET RESOURCE REQUEST message, and ADDITIONAL MS RADIO ACCESS CAPABILITIES, if it is present.

To verify that the mobile responds correctly for a request for retransmission of one or both of these messages indicated in the PACKET UPLINK ASSIGNMENT message.

52.1.2.1.9.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request two phase access and requesting Radio Access Capabilities of frequency bands supported by the mobile. The MS shall then send PACKET RESOURCE REQUEST message and optionally an ADDITIONAL MS RADIO ACCESS CAPABILITIES message with Radio Access Capabilities included.

Note: The SS shall request only one band, either GSM 1800 or GSM 1900.

The SS responds with PACKET UPLINK ASSIGNMENT message, with a valid TLLI and requesting retransmission of ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if it was sent by the mobile.

The SS verifies that the mobile retransmit the ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if applicable, addressed by TFI or TLLI.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Requesting the mobile to send Radio Access Capability of all frequency bands.
4	MS -> SS	PACKET RESOURCE REQUEST	ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on one of the block assigned in step 3. See specific message contents.
4a	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message indicates 1, then received on the second block assigned in Step 3. If no ADD ADDITIONAL MS RADIO ACCESS CAPABILITIES message is there, the MS may send a control block in the block assigned. Verify TLLI is included.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Include the correct TLLI according to step 4. Sent on the PACCH of the assigned PDCH. Request retransmission of ADDITIONAL MS RADIO ACCESS CAPABILITIES if it was received in Step 4a.
6	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If applicable as per Step 4a and Step 6. Verify that the mobile is addressed by TFI or TLLI in the message.
7		{ Completion of uplink RLC data block transfer }	

Specific message contents

IMMEDIATE ASSIGNMENT message in Step 3.

BCCH band is GSM 1900:

{ 0 | 1 < Access Technologies Request}	1 (Present)
Access Technology Type	0000
Access Technology Type	0001
Access Technology Type	0010
Access Technology Type	0100
Access Technology Type	0101
Access Technology Type	0110
Access Technology Type	0111

All other BCCH bands:

{ 0 | 1 < Access Technologies Request}	1 (Present)
Access Technology Type	0000
Access Technology Type	0001
Access Technology Type	0010
Access Technology Type	0011
Access Technology Type	0101
Access Technology Type	0110
Access Technology Type	0111

PACKET UPLINK ASSIGNMENT message in Step 5.

ARAC RETRANSMISSION REQUEST	1 (If message was received in Step 4a) 0 (If message was not received on Step 4a)

52.1.2.1.9.2.3 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

52.1.2.1.9.2.3.1 Conformance requirements

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reaches its maximum value in the contention resolution procedure, and repetition as described in subclauses 7.1.2.3, 7.1.3.2.1 or 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued, unless the failure takes place during a RR-cell change order procedure, in which case the mobile behaviour shall be as described in the Abnormal cases of the RR-Network Commanded Cell Change Order Procedure in 3GPP TS 04.08.

Reference

3GPP TS 04.60 subclauses 7.1.4 and 7.1.3.3.

52.1.2.1.9.2.3.2 Test purpose

To verify that the MS reinitiates packet access procedure with failure due to a TLLI mismatch in the contention resolution procedure, unless it has already been repeated 4 times. In that case, TBF failure has occurred.

52.1.2.1.9.2.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request two phase access. The MS shall then send PACKET RESOURCE REQUEST message. The SS responds with PACKET UPLINK ASSIGNMENT message with a TLLI different to that the MS has sent in PACKET RESOURCE REQUEST message. The MS shall reinitiate the packet access procedure.

This procedure shall be repeated 4 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on the single block assigned in step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Include incorrect TLLI according to step 4. Sent on the PACCH of the assigned PDCH.
6			The SS verifies that the MS attempts packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of EGPRS supported' is Release 99 or 4. Four times if PICS 'Release of EGPRS supported' is Release 5 or later.
NOTE: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

52.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Radio Access Capabilities

52.1.2.1.9.3.1 Conformance requirements

When assigning an EGPRS TBF, the network may request information about radio access capabilities of the mobile station on one or several frequency bands within the PACKET UPLINK ASSIGNMENT message ; the list of frequency bands is ordered by the network starting with the most important and ending with the least important one . The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested information do not fit in the PACKET RESOURCE REQUEST. If the mobile station does not support any frequency band requested by the network, it shall report its radio access capabilities for the BCCH frequency band. The mobile station shall indicate in the PACKET RESOURCE REQUEST if it will send more information about its radio access capabilities in the ADDITIONAL MS RADIO ACCESS CAPABILITIES message. The PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES shall be sent within the one or two first radio blocks allocated for the mobile station on the assigned PDCH. For release 5 and earlier , If the alternative coding by using the Additional access technologies struct is chosen by the mobile station, the mobile station shall indicate its radio access capability for the serving BCCH frequency band in the first included Access capabilities struct.

When assigning an EGPRS TBF, the network may request information about radio access capabilities of the mobile station on one or several frequency bands within the IMMEDIATE ASSIGNMENT message ; the list of frequency bands is ordered by the network starting with the most important and ending with the least important one. The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested information do not fit in the PACKET RESOURCE REQUEST. If the mobile station does not support any frequency band requested by the network, it shall report its radio access capabilities for the BCCH frequency band. The mobile station shall indicate in the PACKET RESOURCE REQUEST if it will send more information about its radio access capabilities in the ADDITIONAL MS RADIO ACCESS CAPABILITIES message. The PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES shall be sent within the one or two first radio blocks allocated for the mobile station on the assigned PDCH.

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send IMMEDIATE ASSIGNMENT message with Access Technology request for all the bands. The MS shall respond back with a PACKET RESOURCE REQUEST and an ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if the information do not fit in the PACKET RESOURCE REQUEST message.

SS verifies that the Radio Access Capabilities of all the frequency bands supported are available, with respect to the band interworking PICS, and are in the same priority as requested by the SS (in case of Rel-5 and earlier and if the alternative coding by using the Additional access technologies struct is chosen, the MS may indicate its radio access capability for the serving BCCH frequency band in the first included Radio Access Capabilities struct.).

SS verifies that among GSM 900-P, GSM 900-E and GSM 900-R, only 1 is reported.

The SS shall request only one band, either GSM 1800 or GSM 1900. See Specific message contents.

Maximum duration of the test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate the transfer of 100 user data octets.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH. SS request Access Technologies Request from the mobile. See specific message contents.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on one of the blocks assigned in Step 3.
4a	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message indicates 1, then received on the second block assigned in Step 3. If no ADD ADDITIONAL MS RADIO ACCESS CAPABILITIES message is there, the MS may send a control block in the block assigned.
5	SS	Verification	With the message(s) received in 4/4a: SS verifies that the Radio Access Capabilities of the supported access technologies are in the same order of priority as requested. Note :In case of Rel-5 and earlier, the MS may indicate its radio access capability for the serving BCCH frequency band in the first included Radio Access Capabilities struct. SS verifies that among GSM 900-P, GSM 900-E and GSM 900-R, only 1 is reported. SS verifies that all supported access technologies that can fit into the message are reported, with respect to the band interworking PICS.
6	SS -> MS	PACKET UPLINK ASSIGNMENT	Dynamic allocation struct. Sent on the PACCH of the assigned PDCH.
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigning USF to the MS. Sent at least 3 block periods from the assignment in step 6.
8		{Uplink data transfer}	Macro. Completion of the TBF procedure.

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send IMMEDIATE ASSIGNMENT message with Access Technology request for the bands not supported by the MS. SS verifies that MS reports its radio access capability for the BCCH frequency band in the PACKET RESOURCE REQUEST message.

Maximum duration of the test

10 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate the transfer of 100 user data octets.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH. Allocates two uplink blocks. SS request Access Technologies Request from the mobile. See specific message contents.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on first block assigned in Step 3. SS verifies that the MS sends Radio Access Capabilities for the BCCH frequency band.
4a (conditional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 4) indicates 1, then step 4a is performed.
4b (optional)	MS -> SS	PACKET UPLINK DUMMY CONTROL BLOCK	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 4) indicates 0, then step 4b is optionally performed.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Dynamic allocation struct. Sent on the PACCH of the assigned PDCH.
6		{Uplink data transfer, dynamic allocation}	Macro. Completion from step 4 in the TBF procedure.

Specific message contents

IMMEDIATE ASSIGNMENT message

{ 0 | 1 < Access Technologies Request} Access Technology Type	1 (Present) Include some frequency bands that are not supported by the mobile

52.1.2.1.9.5 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment

52.1.2.1.9.5.1 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168. Further more, the mobile station shall not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running.

Reference

3GPP TS 04.60 subclause 7.1.3.1.

52.1.2.1.9.5.2 Test purpose

To verify that the mobile station does not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running after sending of the PACKET RESOURCE REQUEST message.

52.1.2.1.9.5.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS , CCCH combined with SDCCH.

T3168 indicates value 7 in GPRS Cell Options.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send IMMEDIATE ASSIGNMENT message including EGPRS Packet UL Assignment struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

While timer T3186 is running the SS send PACKET DOWNLINK ASSIGNMENT message and starts to send data on the allocated downlink before the timer expire. The MS shall not respond to the Downlink data transfer.

The SS should then send PACKET UPLINK ASSIGNMENT message before the timer T3168 expire and the MS should then begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU containing 400 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 3.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH.
6	SS -> MS	DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH with poll bit set to 1.
	SS		Verify no response from the MS.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	Dynamic allocation struct. Sent on the PACCH of the assigned PDCH 0,9* T3168.
8		{Uplink data transfer, dynamic allocation}	Macro. Completion from step 4 in the TBF procedure.

Specific message contents

None.

52.1.2.1.10 Packet Uplink Assignment / Abnormal cases

52.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment

52.1.2.1.10.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.4.

52.1.2.1.10.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure when the mobile station has been assigned more PDCHs than it supports and after 4 repetitions of the packet access procedure the mobile station shall initiate TBF failure.

52.1.2.1.10.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS , CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

- Release of EGPRS Supported (TSPC_MS_EGPRS_RELEASE)
- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test procedure

Convert the MS EGPRS Multislot Class to number of uplink timeslot supported.

The MS is triggered to send 200 octets of data. The SS sends PACKET UPLINK ASSIGNMENT message containing more assigned PDCHs than the MS supports according to its EGPRS multislot class. The MS shall reinitiate packet access procedure; this procedure shall be repeated 4 times.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to send 200 octets data
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on one of the blocks assigned in Step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign one more Tx than the MS supported, MCS1. Sent on PACCH.
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the third block from the message sent in step 5. Assigning USF to the MS.
7			The SS verifies that the MS does not send UPLINK RLC DATA BLOCKS and instead attempts packet access procedure (steps 2-6 are repeated) in total: Four or five times if PICS ‘Release of EGPRS supported’ is Release 99 or 4. Four times if PICS ‘Release of EGPRS supported’ is Release 5 or later
NOTE: After step 7 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

52.1.2.1.10.2 Packet Uplink Assignment / Abnormal cases / Expiry of timer T3164

52.1.2.1.10.2.1 Conformance requirements

On expiry of timer T3164, the mobile station shall reinitiate the packet access procedure unless it has already been reinitiated 3 times, in which case the mobile station shall return to packet idle mode and notify higher layers.

Reference

3GPP TS 04.60 subclause 7.1.4.

52.1.2.1.10.2.2 Test purpose

To verify that the mobile station reinitiate the packet access procedure when the network have sent a PACKET UPLINK ASSIGNMENT message but the MS has not sent the first block within the time equal to the timer T3164. This packet access procedure shall at most be reinitiated 3 times.

52.1.2.1.10.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH.

GPRS cell options, ACCESS_BURST_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message with a USF assigned to the MS. The SS shall send PACKET DOWNLINK DUMMY CONTROL BLOCK messages with USF not assigned to the MS. T3164 expires. The SS send a PACKET DOWNLINK DUMMY CONTROL BLOCK containing the assigned USF. The SS verifies that the MS does not send a RLC data block. The SS verifies that the MS reinitiate the packet access procedure within 5 seconds of T3164 expiry; this shall be repeated 3 times.

Maximum duration of the test

1 minute.

Expected sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting 200 octets of data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	One or Two Phase Access Request. Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	EGPRS Packet UL Assignment. Sent on AGCH.
4	MS -> SS	PACKET RESOURCE REQUEST	Received on one of the blocks assigned in Step 3.
5	SS -> MS	PACKET UPLINK ASSIGNMENT	Allocate a USF for the MS
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKs	Don't contain the assigned USF in step 5. Repeat step 6 for a maximum of 5.5 seconds (1.1*T3164). The MS may send an EGPRS PACKET CHANNEL REQUEST at any time after 0.9*T3164, in this case go to step 9 .
7	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKs	Containing the assigned USF in step 5.
8	SS		Verify the MS does not transmit an RLC data block
9	SS		The SS verifies that the packet access procedure (steps 2-6) is reinitiated three times. The EGPRS PACKET CHANNEL REQUEST for reinitiation (in step 2) shall be sent within 5 sec of T3164 expiry (to cater for T3168 - the maximum duration of a packet access procedure).
NOTE: After step 9 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure.			

Specific message contents

None.

52.1.2.2 Packet Downlink Assignment

52.1.2.2.1 Packet Downlink Assignment / Response to poll bit

52.1.2.2.1.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message;

- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

The mobile station shall always transmit the uplink radio block on the same timeslot as the block where the RRBP was received. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit.

Reference

3GPP TS 04.60 subclause 7.2.1.1 and 10.4.5.

52.1.2.2.1.2 Test purpose

To verify that the mobile station sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts if the network sets the poll bit in the PACKET DOWNLINK ASSIGNMENT message when CONTROL_ACK_TYPE is set to four access bursts.

52.1.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to indicate PACKET CONTROL ACKNOWLEGEMENT format as four access bursts and the ACCESS_BURST_TYPE indicates 11 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message. The poll bit in the MAC header of the PACKET DOWNLINK ASSIGNMENT message will be set to indicate RRBP field is valid. The MS may delay the establishment of the downlink channels in order to answer the poll request on the common control channel. The SS verifies that the MS sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts on the timeslot on which it received the polling command.

Maximum duration of the test

2 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The SS initiate a downlink transfer of 200 octets data.
2a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
2b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Poll bit in the MAC header is set to indicate a valid RRBP = 1. Sent on PACCH.
3	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	As four access bursts. Received on PACCH.
4	SS		The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT as four access bursts, one per TDMA frame of the uplink radio block and the RRBP = 1.

Specific message contents

None.

52.1.2.2.2 Void

52.1.2.2.3 Void

52.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling

52.1.2.2.4.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message;
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING REQUEST message shall be sent on PAGCH.

Reference

3GPP TS 04.60 subclauses 7.2.1.3 and 7.2.1.1.

52.1.2.2.4.2 Test purpose

To verify that on receipt of a PACKET POLLING REQUEST message, the mobile station responds with PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

52.1.2.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to not indicate acknowledgement as four access bursts and ACCESS_BURST_TYPE indicate 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. The SS sends PACKET PDCH RELEASE message to the MS. The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS without TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

Maximum duration of the test

5 minutes.

Expected sequence

Step	Direction	Message	Comments
1	SS		The SS initiate a downlink transfer of 200 octets data.
2a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
2b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	See specific message contents. Sent on PACCH.
3	SS -> MS	PACKET POLLING REQUEST	Sent on PACCH after TBF starting time in step 2 has elapsed. See specific message contents.
4	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH.
5	SS -> MS	PACKET PDCH RELEASE	Sent on PACCH.
6	SS		Wait 20 seconds.
7	SS		The SS initiate a downlink transfer of 200 octets data.
8a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH
8b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	See specific message contents. Sent on PACCH.
9	SS -> MS	PACKET POLLING REQUEST	Sent on PACCH. See specific message contents.
10	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH.

52.3 EGPRS Testcases for Dynamic Allocation in Packet Transfer Mode

52.3.1 Dynamic Allocation / Uplink Transfer

52.3.1.1 Dynamic Allocation / Uplink Transfer / Normal

52.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful

52.3.1.1.1.1 Conformance requirements

1. The mobile station shall set the TFI field of each uplink RLC data block to the TFI value assigned to the mobile station in the PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.

2. Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH in the next block period(s). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 05.02. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.

3. At two-phase access the mobile station does not include its TLLI in any RLC data block.

References

3GPP TS 04.60, subclauses 8.1.1, 8.1.1.1 and 7.1.3.3.

3GPP TS 05.02, subclause 6.3.2.2.1.

52.3.1.1.1.2 Test purposes

To verify that the MS:

1. depending on the parameter USF_GRANULARITY, transmits one or a sequence of four RLC/MAC data block(s) in the next block period(s) on the PDCH on which it has detected its corresponding assigned USF.

2. includes the assigned TFI in each uplink RLC data blocks.

3. does not include its TLLI in any RLC data block at two phase access.

52.3.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC unacknowledged mode. The SS orders the MS to have two-phase access, in PACKET UPLINK ASSIGNMENT message the USF_GRANURALITY is set to 4 blocks. The SS sends the assigned USF assigned to the MS and checks that a sequence of four RLC/MAC data blocks in the next radio block period is received, and that each data block contains the correct TFI, but without TLLI. The SS assigns the USF assigned to the MS again. The check is repeated. The procedure is going on until the MS completes the packet data transfer.

The above test procedure is repeated once for USF_GRANURALITY set to one block.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n =800 octets, without starting time, Message Escape bit = 1 (EGPRS) USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING = arbitrarily chosen between MCS 1 and MCS 4 EGPRS Channel coding command arbitrarily chosen between MCS 1 and MCS 4 EGPRS Window Size: 00000 (value 64)

52.3.1.1.2 Void

52.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding

52.3.1.1.3.1 Conformance requirements

1. In case of dynamic allocation, if no uplink TBF is in progress, the MS needs not monitor the USF field until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.

2. If an uplink TBF is already in progress, the MS shall continue to use the parameters of the existing TBF until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.

3. In case of single block allocation, the mobile station shall use the assigned timeslot during the RLC/MAC block whose first TDMA burst occurs in the indicated TDMA frame number.

4. If the mobile station is in packet transfer mode during the block immediately before the starting time and the lowest numbered PDCH assigned to the MS is different immediately before and after the starting time then the mobile station shall be ready to receive or transmit no later than one radio block from the starting time.

5 If the Starting FN (in absolute frame number encoding) is not aligned to the start of a block period and the mobile station is in packet transfer mode during the TDMA immediately before the Starting FN, then the mobile station shall align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

References

3GPP TS 04.60, subclauses 11.2.29, 12.21 and 12.21.1.

52.3.1.1.3.2 Test purposes

To verify that the MS, in transfer mode:

1. correctly uses the starting frame number description in PACKET UPLINK ASSIGNMENT, and in all subsequent RLC/MAC control messages which are sent on the uplink TBF;

2. is ready to receive or transmit no later than one radio block from the starting time;

3. is able to align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

52.3.1.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer 440 octets in the RLC unacknowledged mode. The IMMEDIATE ASSIGNMENT message contains a starting time for the single block allocation. It is checked that the MS uses the time slot at the assigned frame number. In the two-phase access a starting time is included in PACKET UPLINK ASSIGNMENT. The assigned USF is on a radio block before the starting time. The MS does not react upon that. The assigned USF is on one block after the starting time. The MS sends a RLC data block.

The test procedure is repeated once. The starting time is encoded in relative frame number format.

Maximum Duration of Test

5 minutes.

Expected Sequence

The expected sequence is repeated once. In the 2nd execution the starting frame numbers in the specific message contents are encoded in the relative format.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding EGPRS Channel coding command MCS-3 The IMMEDIATE ASSIGNMENT contains starting time current frame + 1001. It is checked that PACKET RESOURCE REQUEST in the macro is sent at the starting time. The PACKET UPLINK ASSIGNMENT contains starting time specified in absolute frame number encoding, current frame + 91, The timeslot TN_7 assigned.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS, Sent on one radio block before the starting time.
3	SS		Check that there is no RLC data block sent by the MS on the assigned PDTCH.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent on one block after the starting time.
5	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. Check that the coding is the scheme specified by EGPRS Channel coding command in step 1, and TFI is correct.
6		{Completion of uplink RLC data block transfer}	

52.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time

52.3.1.1.4.1 Conformance requirements

1 If a TBF starting time information element is present and no uplink TBF is in progress, but a downlink TBF is in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs.

2 If an uplink TBF is already in progress, the mobile station shall continue to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. At that time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters.

3 While waiting for the frame number indicated by the TBF starting time if the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

4 An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block B((x+3) mod 12) where block B(x) is the last radio block containing the assignment message. This applies also for the reception of the first USF for dynamic uplink assignment.

References

52.3.1.1.4.2 Test purposes

To verify that after the MS receives an uplink assignment with starting time:

1. if a downlink TBF is in progress and no uplink TBF is in progress it monitors the assigned PDCHs while waiting for the starting time. If another uplink assignment received while waiting, the mobile station acts upon that and ignores the previous uplink assignment.

2. if an uplink TBF is already in progress, it continues to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. While waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station acts upon that and ignores the previous uplink assignment. As soon as the starting time occurs the MS immediately begins to use the newly assigned uplink TBF parameters.

52.3.1.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

Test Procedure

A downlink TBF is established and in progress. An uplink TBF is established with a starting time which does not yet elapse. The SS sends two downlink data blocks before the starting time to the MS and signals the assigned TBF addressing the MS for uplink transfer. It is checked that no uplink RLC data blocks are sent by the MS. The SS sends PACKET TIMESLOT RECONFIGURE on three radio blocks before the starting time, assigning a new starting time. Two downlink data blocks are then sent to the MS before the new starting time occurs. Each data block contains one of the assigned USFs addressing the MS. It is checked that no uplink data blocks are sent from the MS. After the new starting time elapses the SS sends a downlink data block containing the USF assigned to the MS. The MS sends an uplink data block. The MS is brought to Idle mode.

An uplink TBF is established and in progress. The SS sends PACKET UPLINK ASSIGNMENT assigning a reconfigured PDCH with a starting time and a new USF associated. Before the starting time the SS signals the USF of the ongoing TBF addressing the MS. The SS receives an uplink data block from the MS. The SS sends UPLINK ASSIGNMENT on three radio blocks before the starting time, assigning a new reconfigured PDCH with a starting time and a different USF associated. The later assignment overwrites the earlier one. While waiting for the frame number of the newly assigned starting time the SS signals the USF of the previous assignment on both the ongoing PDCH and on the previous assigned PDCH. The MS ignores it. The SS signals the USF of the ongoing TBF addressing the MS. An uplink data block can be received. On one radio block before the starting time the SS signals the later assigned USF assigned to the MS on the later assigned PDCH. No uplink data block is received. On one radio block after the starting time the SS signals the just expired USF. No uplink data block is received. Then the SS signals the valid USF assigned to the MS. An uplink data block is received.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	RLC mode: acknowledged, without starting time
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	The data block contains FBI=0, ES/P field set to 01 and a valid RRBP, sent on the third block after the last radio block containing the downlink assignment.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
4	MS		The MS is triggered to send 440 octets of user data.
5	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	The data block contains FBI=0 and a valid RRBP.
6	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH. Contains Channel Request Description IE. Note : If the triggering of the uplink access involves a manual operation taking more than 5s to complete, steps 5 and 6 are repeated (until the MS does include the Channel Request Description IE) at least once every 5s in order to keep the downlink transfer active.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. TBF Starting Time : starting time$_1$, the current frame + 104 frames, encoded in absolute frame number. The uplink TBF is assigned on the same timeslot as the downlink TBF.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	FBI=0, the assigned USF$_1$ to the MS. Sent on downlink PDTCH, 12 data blocks (52 TDMA frames) before the starting time$_1$.
9	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	FBI=0, the assigned USF$_1$ to the MS. Sent on downlink PDTCH, 5 blocks before the starting time$_1$, a valid RRBP = N+13 and ES/P set to 01.
10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRBP on downlink PACCH.
11	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assigned USF$_1$ addressing the MS, sent on three blocks before the starting time$_1$. Assigned a new USF$_2$ on the same timeslot, with starting time$_2$, current frame + 104 frames in relative frame number encoding.
12	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On 4 blocks from the last radio block containing the uplink assignment in step 11, with FBI=0, the assigned previous USF$_1$ addressing the MS. Sent on downlink PDTCH.
13	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI=0, the assigned USF$_2$ addressing the MS. Sent on downlink PDTCH, one radio block before the starting time$_2$.
14	SS		Check that from the step 4 onwards till the starting time$_2$, there is no RLC data block sent by the MS on the assigned uplink PDTCH.
15	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI=0, a valid RRBP, ES/P set to 01, the assigned USF$_2$ addressing the MS. Sent on downlink PDTCH, on the frame number specified in the starting time$_2$.
16	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned uplink PDTCH.
17	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of downlink PACCH.
18	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	One data block with FBI=1, ES/P set to 01 and a valid RRBP. Sent on downlink PDTCH.
19	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRBP of the downlink PACCH.
20		{Completion of uplink RLC data block transfer}	
21		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen. EGPRS channel coding command: MCS 1 The timeslot TN$_3$ assigned

Step	Direction	Message	Comments
22	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF_1 addressing the MS, sent on 3 blocks from the last radio block containing the uplink assignment in step 21.
23	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the coding is MCS 1, the TFI is correct.
24	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Assigned USF_1 addressing the MS.
25	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH.
26	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign an uplink TBF on the timeslot TN_2, containing new TFI_2, USF_2, starting $time_3$, current frame + 117 in relative encoding. Sent on PACCH assigned.
27	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	USF_1 addressing the MS, sent on 5 radio blocks before the starting $time_3$, on PACCH assigned in step 21.
28	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the coding is MCS 1, the TFI is correct.
29	SS -> MS	PACKET UPLINK ASSIGNMENT	Assign a TBF on the timeslot TN_1, containing new TFI_3, USF_3, MCS 3 coding, starting $time_4$, current frame + 325 in relative encoding. Sent on three radio blocks before the starting $time_3$, on PACCH assigned in step 21.
30	SS -> MS	PACKET UPLINK ACK/NACK	USF_2 addressing the MS, sent one block after Starting $Time_3$ on the PACCH assigned in step 26.
31	SS		Check that no data block is sent from the MS on the assigned radio block on the PDTCH assigned in step 26.
32	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF_1 addressing the MS, sent on 5 radio blocks before the starting $time_4$, on PACCH assigned in step 21.
33	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Check that the coding is MCS1, the TFI is correct.
34	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF_3 addressing the MS, sent on one radio block before the starting $time_4$, on PACCH assigned in step 29.
35	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF_1 addressing the MS, sent on one radio block after the starting $time_4$, on PACCH assigned in step 21.
36	SS		Check that no data blocks are sent from the MS on the radio blocks assigned in steps 34 and 35, or any intermediate radio blocks, on any of the three PDTCHs assigned
37	SS -> MS	PACKET UPLINK ACK/NACK	Containing USF_3. Sent on PACCH of assigned in step 29.
38 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the PDTCH assigned in step 29. Use coding MCS 1. If step 38 is performed, then step 39 must be performed.
