Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing, and gpsAssDataMissing for sub-test cases 3, 4 and 10. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the second one. The MS shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST with same reference number and same extended reference IE as in step 13 (Option 1) or RRLP MEASURE POSITION REQUEST with same reference number and same extended reference IE as in step 14c (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE (ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10)
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

RRLP Measure Position Response (Step 16):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

FACILITY (Step 17):

Information element	Value/remark
Protocol Discriminator	Call Independent SS message (1011)
Transaction Identifier Message Type Facility	 FACILITY (0011 1010) Return Result = LCS-MOLR LCS-MOLRRes ->locationEstimate (Note)
Note: Any value for locationEstimate may be used. The SS shall not be required to calculate the value from the returned gps-MeasureInfo values.	

RELEASE COMPLETE (Step 18):

Information element	Value/remark
Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.10 MO-LR / Multiple RRLP Requests with Different Reference Number

70.14.10.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.10.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the first one. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.10.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE

POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing, and gpsAssDataMissing for sub-test cases 3, 4 and 10. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3, 4 and 10 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST with different reference number and same extended reference IE as in step 13 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with different reference number and same extended reference IE as in step 14c (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10 (Option 1 or 2a). Check reference number is 2 or locationError with gpsAssDataMissing (Sub-Tests 3, 4 and 10) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3, 4 and 10) and/or ganssAssistanceData (Option 2b) Check reference number is 2

16a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262143
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1 Sub-Test 9: bit 6 set to value 1 Sub Test 10: bits 0 and 6 set to value 1

RRLP Measure Position Response (Step 16 (Option 1 or 2a) or Step 16d (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response (Step 16 (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
locationError	SEQUENCE	
locErrorReason	ENUMERATED	Sub-Tests 1, 2 and 9: ganssAssDataMissing Sub-Tests 3, 4 and 10: ganssAssDataMissing or gpsAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing assistance data elements. This field shall only be present for Sub-Tests 3, 4 and 10.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 16a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	If the MS requested further assistance data in Step 16 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further assistance data in Step 16 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Assistance Data Ack (Step 16b):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceDataAck

RRLP Measure Position Request (Step 16c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msAssisted
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 16 (Option 2).
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262143
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1 Sub-Test 9: bit 6 set to value 1 Sub Test 10: bits 0 and 6 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 16.

FACILITY (Step 17):

Information element	Value/remark
Protocol Discriminator	Call Independent SS message (1011)
Transaction Identifier Message Type Facility	 FACILITY (0011 1010) Return Result = LCS-MOLR LCS-MOLRRes ->locationEstimate (Note)
Note: Any value for locationEstimate may be used. The SS shall not be required to calculate the value from the returned gps-MeasureInfo values.	

RELEASE COMPLETE (Step 18):

Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.11 MO-LR / Multiple RRLP Requests with Different Extended Reference Number

70.14.11.1 Conformance requirements

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Extended Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.11.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with the same REFERENCE NUMBER as the first one and a different EXTENDED REFERENCE IE. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.11.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE

COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one and a different EXTENDED REFERENCE IE (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3, 4 and 10). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one and a different EXTENDED REFERENCE IE. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3, 4 and 10 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement

15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST with same reference number as in Step 13 and different extended reference IE (Option 1) or RRLP MEASURE POSITION REQUEST 3 with same reference number as in Step 14c and different extended reference IE (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10 (Option 1 or 2a). Check extended reference IE is the equal to the one contained in the request of step 15 or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3, 4 and 10) and/or ganssAssistanceData (Option 2b) Check extended reference IE is the equal to the one contained in the request of step 15
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only: RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only: RRLP Assistance Data Ack. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only: RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and, the SS sends a RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3, 4 and 10 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR MANAGEMENT COMMAND	
16	MS -> SS	RR MANAGEMENT COMPLETE	MS terminates the measurement procedure and act on the RR management command

17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 (Option 1) or RRLP MEASURE POSITION REQUEST 3 (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10 (Option 1 or 2a). or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3, 4 and 10) and/or ganssAssistanceData (Option 2b)
18a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests3, 4 and 10).
19	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
20	MS -> SS	RELEASE COMPLETE	Terminates the session
21	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.15 Assisted GNSS Mobile Terminated Location Request (MT-LR)

70.15.1 MT-LR / Location Notification

70.15.1.1 Conformance requirements

1. The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the MS with notificationType set to notifyLocationAllowed. The MS notifies the MS user of the location request.

2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result.

3GPP TS 24.030 sub clause 4.1.1.

3GPP TS 24.080 sub clauses 2.4, 2.5, and 3.4.

70.15.1.2 Test Purpose

To verify that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to NotifyLocationAllowed, the MS notifies the MS user of the location request and sends a RELEASE COMPLETE message containing a LocationNotification return result.

70.15.1.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valued TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The MS notifies the MS user of the location request. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return result to terminate the dialogue.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	“mobile station classmark 2” includes settings for ES_IND. “mobile station classmark 3” includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support and Additional Positioning Capabilities
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	REGISTER	Call Independent SS containing Facility IE Location Notification Invoke message set to notifyLocationAllowed
12	MS		MS notifies the MS user of the location request
13	MS -> SS	RELEASE COMPLETE	
14	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

PAGING RESPONSE

Information element	Value/remark
Protocol Discriminator	RR management

70.15.2 MT-LR / Notification and Verification / Location Allowed If No Response

70.15.2.1 Conformance requirements

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS: a) notifies the user of the location request, b) indicates the default is location allowed if no response is received within a predetermined period, and c) provides the opportunity for the user to grant or withhold permission.

2. Option 1: The user accepts the location request. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

   Option 2: The user denies the location request.
   The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

   Option 3: The user takes no action and the verification process times-out. The SS shall terminate the dialogue.

References

3GPP TS 23.271 sub clause 9.1.2.

3GPP TS 24.030 sub clause 4.1.1.

3GPP TS 24.080 sub clauses 2.4, 2.5, and 3.4.

70.15.2.2 Test Purpose

To verify that the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent, gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

70.15.2.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

- MS LCS Notification timeout timer

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationAllowedIfNoResponse. The MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent and gives the user the option to accept or reject the request.

Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The SS responds with RELEASE COMPLETE.

Maximum duration of the test

5 minutes.

Expected Sequence

The test sequence is repeated for k = 1 … 3.

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support and Additional Positioning Capabilities.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	REGISTER	Call Independent SS containing Facility IE LCS Location Notification Invoke set to notifyAndVerify-LocationAllowedIfNoResponse
12	SS		SS starts timer T(LCSN) set to 90% of MS LCS Notification timeout timer
13A (k=1)	MS		The MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent and gives the user the option to accept or reject the request. The user accepts location request before timer T(LCSN) expires.
14A (k=1)	MS -> SS	RELEASE COMPLETE	Containing a LocationNotification return result with verificationResponse set to permissionGranted.
13B (k=2)	MS		The MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent and gives the user the option to accept or reject the request. The user rejects location request before timer T(LCSN) expires.
14B (k=2)	MS -> SS	RELEASE COMPLETE	Containing a LocationNotification return result with verificationResponse set to permissionDenied.
13C (k=3)	MS		The MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent and gives the user the option to accept or reject the request. The user does not reply and waits for T(LCSN) to expire.
14C (k=3)	SS->MS	RELEASE COMPLETE	SS terminates the dialogue after T(LCSN) expiry
15	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

3GPP TS 23.271 sub clause 9.1.2.

3GPP TS 24.030 sub clause 4.1.1.

3GPP TS 24.080 sub clauses 2.4, 2.5, and 3.4.

70.15.3.2 Test Purpose

To verify that if the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, then the MS notifies the MS user of the location request, indicates that the default response is location not allowed if no response is sent, gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

70.15.3.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

- MS LCS Notification timeout timer

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationNotAllowedIfNoResponse. The MS notifies the MS user of the location request, indicates that the default response is location not allowed if no response is sent and gives the user the option to accept or reject the request.

Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The SS responds with RELEASE COMPLETE.

Maximum duration of the test

5 minutes.

Expected Sequence

The test sequence is repeated for k = 1 … 3.

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	“mobile station classmark 2” includes settings for ES_IND. “mobile station classmark 3” includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support and Additional Positioning Capabilities.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	REGISTER	Call Independent SS containing Facility IE LCS Location Notification Invoke set to notifyAndVerify-LocationNotAllowedIfNoResponse
12	SS		SS starts timer T(LCSN) set to 90% of MS LCS Notification timeout timer
13A (k=1)	MS		The MS notifies the MS user of the location request, indicates that the default response is location not allowed if no response is sent and gives the user the option to accept or reject the request. The user accepts location request before timer T(LCSN) expires.
14A (k=1)	MS -> SS	RELEASE COMPLETE	Containing a LocationNotification return result with verificationResponse set to permissionGranted.
13B (k=2)	MS		The MS notifies the MS user of the location request, indicates that the default response is location not allowed if no response is sent and gives the user the option to accept or reject the request. The user rejects location request before timer T(LCSN) expires.
14B (k=2)	MS -> SS	RELEASE COMPLETE	Containing a LocationNotification return result with verificationResponse set to permissionDenied.
13C (k=3)	MS		The MS notifies the MS user of the location request, indicates that the default response is location not allowed if no response is sent and gives the user the option to accept or reject the request. The user does not reply and waits for T(LCSN) to expire.
14C (k=3)	SS->MS	RELEASE COMPLETE	SS terminates the dialogue after T(LCSN) expiry
15	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

70.15.4 Void

70.15.5 MT-LR / Location Error

70.15.5.1 MT-LR / Location Error / Requested Method not Supported

70.15.5.1.1 Conformance requirements

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS04.31 sub clause 2.2, A.3.2.6

70.15.5.1.2 Test Purpose

To verify that the MS sends the correct positioning capability via controled early classmark sending. The MS shall send a RRLP MEASURE POSITION RESPONSE message with Location Error component if the MS does not support the requested method. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.5.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

The SS sends an RRLP MEASURE POSITION REQUEST message with a method type not supported by the mobile (Type not supported to be GPS for sub-tests 1, 2 and 9, Galileo for sub-tests 3, 4 and 10).

The MS sends RRLP MEASURE POSITION RESPONSE to SS containing a Location Error component (Requested Method not Supported) as the requested method is not supported.

The MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by a new RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gnssAssDataMissing or gpsAssDataMissing (sub-tests 3, 4 and 10). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST (Request method not supported)
12	MS->SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE (location_error)
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
16	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
17	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
18	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: ganssMeasureInfo and gps-MeasureInfo, (Sub-Tests 3, 4 and 10) (Option 1) or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3, 4 and 10) and/or ganssAssistanceData (Option 2)
18a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data Ack. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10).
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2).

70.15.5.2 Location Error: GNSS Assistance Data Missing

70.15.5.2.1 Conformance requirement

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS 44.031

70.15.5.2.2 Test Purpose

To verify that the MS sends the correct positioning capability via controlled early classmark sending and that the MS sends a RRLP MEASURE POSITION RESPONSE message with Location Error component because the GNSS assistance data is missing. On receipt of second RRLP MEASURE POSITION REQUEST (with all necessary GNSS assistance data to obtain a location estimate included) from SS to start the measurement, the MS sends back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.5.2.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The A-GNSS assistance data stored in the MS is reset.

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS receives an RRLP MEASURE POSITION REQUEST message with Reference Time GPS assistance data.

The MS requests additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-test cases 3 and 4). The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
0	MS		Reset all stored A-GNSS assistance data
1	SS->MS	PAGING REQUEST TYPE I	
3	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
4	SS -> MS	IMMEDIATE ASSIGNMENT	
5	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
6	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.

locationError	SEQUENCE	Any error value is acceptable.
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

70.15.6 MT-LR / Multiple RRLP Requests with Same Reference Number and Extended Reference Number

70.15.6.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS ignores the latter component if the old and new RRLP Measure Position Request components have the same Reference Number.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS04.31 sub clause 2.5.5

3GPP TS04.31 sub clause 3.2

70.15.6.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall ignore the second RRLP MEASURE POSITION REQUEST if the second RRLP MEASURE POSITION REQUEST has the same REFERENCE NUMBER as in the previous one. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the current measurement.

70.15.6.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay to of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall ignore the second RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3, 4 and 10). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP

Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one. The MS shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data Ack. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST with same reference number and same extended reference IE as in step 15 (Option 1) or RRLP MEASURE POSITION REQUEST with same reference number and same extended reference IE as in step 16c (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE (ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10)
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

RRLP Measure Position Response (Step 18):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

70.15.7 MT-LR / Multiple RRLP Requests with Different Reference Number

70.15.7.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS aborts activity for the former component, and starts to act according to the latter component, if the old and new RRLP Measure Position Request components have different Reference Numbers.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS 04.31 sub clause 2.5.5

3GPP TS 04.31 sub clause 3.2

70.15.7.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.7.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3, 4 and 10). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	“mobile station classmark 2” includes settings for ES_IND. “mobile station classmark 3” includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support.

referenceNumber	Integer,0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	Enumerated	gps
measureResponseTime	Integer 0 to 7	5
accuracy	Integer (0-127)	127
useMultipleSets	Enumerated	oneSet
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262143
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1 Sub-Test 9: bit 6 set to value 1 Sub Test 10: bits 0 and 6 set to value 1

RRLP Measure Position Response (Step 18 (Option 1 or 2a) or Step 18d (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable except gpsAssDataMissing or ganssAssDataMissing
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response (Step 18 (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10); otherwise locationError will be returned)
locationError	SEQUENCE	
locErrorReason	ENUMERATED	Sub-Tests 1, 2 and 9: ganssAssDataMissing Sub-Tests 3, 4 and 10: gpsAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing assistance data elements. This field shall only be present for Sub-Tests 3, 4 and 10.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 18a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	If the MS requested further assistance data in Step 18 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further assistance data in Step 18 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Measure Position Request (Step 18c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2b).
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262143
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1 Sub-Test 9: bit 6 set to value 1 Sub Test 10: bits 0 and 6 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2b).

70.15.8 MT-LR / Multiple RRLP Requests with Different Extended Reference Number

70.15.8.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS aborts activity for the former component, and starts to act according to the latter component, if the old and new RRLP Measure Position Request components have different Extended Reference Numbers.

The SMLC may use the same Extended Reference Number or different Extended Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS04.31 sub clause 2.5.5

3GPP TS04.31 sub clause 3.2

70.15.8.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different EXTENDED REFERENCE NUMBER. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.8.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different EXTENDED REFERENCE IE and the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3, 4 and 10). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different EXTENDED REFERENCE IE and the same REFERENCE NUMBER as the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates “answer to paging”.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. “mobile station classmark 2” includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	“mobile station classmark 2” includes settings for ES_IND. “mobile station classmark 3” includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP Assistance Data Ack
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3, 4 and 10 within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST with same reference number and different extended reference IE as in step 15 (Option 1) or RRLP MEASURE POSITION REQUEST with same reference number and different extended reference IE as in step 16c (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3, 4 and 10 (Option 1 or 2a). Check extended reference IE is the equal to the one contained in the request of step 17 or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3, 4 and 10) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3, 4 and 10) and/or ganssAssistanceData (Option 2b) Check extended reference IE is the equal to the one contained in the request of step 17

18a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only: RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only: RRLP Assistance Data Ack. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only: RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only: RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3, 4 and 10).
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2b).

70.15.9 MT-LR / RR Management Commands

70.15.9.1 Conformance requirement

A target MS shall terminate any positioning procedure or the transfer of RRLP positioning assistance data without sending any response to the SMLC if any RR message is received from the BSC that starts some other RR management procedure, including a new positioning procedure. The new RR procedure shall then be executed by the MS.

Upon receiving the HO or other RR management command, the MS will stop the location procedure and start on handover or other RR management procedure, since this has higher priority than location. The MS will then send the HO complete or other RR management response message to BSC.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS 03.71 sub clause 7.11.5,

3GPP TS 03.71 sub clause 10.6

3GPP TS 04.31 sub clause 3.2

70.15.9.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if an RR MANAGEMENT command is received during the measurement procedure. The MS shall send an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST and send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.9.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST (possibly by requesting additional assistance data first).

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set ganssAssDataMissing or gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends a RR

MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 20a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	If the MS requested further assistance data in Step 20 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further assistance data in Step 20 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Measure Position Request (Step 20c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 20 (Option 2b).
extended-reference	SEQUENCE	
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1 Sub-Test 9: bit 6 set to value 1 Sub Test 10: bits 0 and 6 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 20 (Option 2b).

70.16 A-GNSS Minimum Performance tests

This sub clause specifies the measurement procedures for the conformance test of the minimum performance requirements for GSM user equipment (MS) that supports Assisted Global Navigation Satellite Systems (A-GNSS). It excludes performance requirements for MSs where the only A-GNSS supported is A-GPS L1C/A which are specified in sub clause 70.11

70.16.1 Abbreviations

A-GNSS	Assisted - Global Navigation Satellite Systems
A-GPS	Assisted - Global Positioning System
BDS	BeiDou Navigation Satellite System
C/A	Coarse/Acquisition
ECI	Earth-Centered-Inertial
ECEF	Earth Centred, Earth Fixed
EGNOS	European Geostationary Navigation Overlay Service
FEC	Forward Error Correction
GAGAN	GPS Aided Geo Augmented Navigation
GANSS	Galileo and Additional Navigation Satellite Systems
GLONASS	GLObal'naya NAvigatsionnaya Sputnikovaya Sistema (Engl.: Global Navigation Satellite System)
GNSS	Global Navigation Satellite System
GPS	Global Positioning System
GSS	GNSS System Simulator
HDOP	Horizontal Dilution Of Precision
ICD	Interface Control Document
LOS	Line Of Sight
MSAS	Multi-functional Satellite Augmentation System
QZSS	Quasi-Zenith Satellite System
SBAS	Space Based Augmentation System
SV	Space Vehicle
SV ID	Space Vehicle Identification
WAAS	Wide Area Augmentation System
WLS	Weighted Least Square
WGS-84	World Geodetic System 1984

70.16.2 GNSS test conditions

70.16.2.1 GNSS signals

The GNSS signal is defined at the A-GNSS antenna connector of the MS. For MS with integral antenna only, a reference antenna with a gain of 0 dBi is assumed.

70.16.2.2 GNSS frequency

The GNSS signals shall be transmitted with a frequency accuracy of $\pm$ 0.025 PPM.

70.16.2.3 GNSS static propagation conditions

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

70.16.2.4 GNSS multi-path conditions

Doppler frequency difference between direct and reflected signal paths is applied to the carrier and code frequencies. The Carrier and Code Doppler frequencies of LOS and multi-path for GNSS signals are defined in table 70.16.2.1.

Table 70.16.2.1: Multi-path Conditions for GNSS Signals

Initial relative Delay [GNSS chip]	Carrier Doppler frequency of tap [Hz]	Code Doppler frequency of tap [Hz]	Relative mean Power [dB]
0	Fd	Fd / N	0
X	Fd - 0.1	(Fd-0.1) /N	Y
NOTE: Discrete Doppler frequency is used for each tap.			

Where the X and Y depends on the GNSS signal type and is shown in Table 70.16.2.2, and N is the ratio between the transmitted carrier frequency of the signals and the transmitted chip rate as shown in Table 70.16.2.3 (where k in Table 70.16.2.3 is the GLONASS frequency channel number).

Table 70.16.2.2

System	Signals	X [m]	Y [dB]
Galileo	E1	125	-4.5
	E5a	15	-6
	E5b	15	-6
GPS/Modernized GPS	L1 C/A	150	-6
	L1C	125	-4.5
	L2C	150	-6
	L5	15	-6
GLONASS	G1	275	-12.5
	G2	275	-12.5
BDS	B1I	75	-4.5

Table 70.16.2.3

System	Signals	N
Galileo	E1	1540
	E5a	115
	E5b	118
GPS/Modernized GPS	L1 C/A	1540
	L1C	1540
	L2C	1200
	L5	115
GLONASS	G1	$3135.03 + k \cdot 1.10$
	G2	$2438.36 + k \cdot 0.86$
BDS	B1I	763

The initial carrier phase difference between taps shall be randomly selected between 0 and 2 π radians. The initial value shall have uniform random distribution.

70.16.2.5 Mobile stations supporting multiple GNSS signals

For mobile stations supporting multiple GNSS signals, different minimum performance requirements may be associated with different signals. The satellite simulator shall generate all signals supported by the MS. Signals not supported by the MS do not need to be simulated. The relative power levels of each signal type for each GNSS are defined in Table 70.16.2.4. The individual test scenarios define the reference signal power level for each satellite. The power level of each simulated satellite signal type shall be set to the reference signal power level defined in each test scenario plus the relative power level defined in Table 70.16.2.4.

Table 70.16.2.4: Relative signal power levels for each signal type for each GNSS

	Galileo		GPS/Modernized GPS		GLONASS		QZSS		SBAS		BDS		
Signal power levels relative to reference power levels	E1	0 dB	L1 C/A	0 dB	G1	0 dB	L1 C/A	0 dB	L1	0 dB	B1I	D1	0 dB
	E6	+2 dB	L1C	+1.5 dB	G2	-6 dB	L1C	+1.5 dB				D2	+5 dB
	E5	+2 dB	L2C	-1.5 dB			L2C	-1.5 dB					
			L5	+3.6 dB			L5	+3.6 dB					

NOTE 1: For test cases which involve “Modernized GPS”, the satellite simulator shall also generate the GPS L1 C/A signal if the MS supports “GPS” in addition to “Modernized GPS”.

NOTE 2: The signal power levels in the Test Parameter Tables represent the total signal power of the satellite per channel not e.g. pilot and data channels separately.

NOTE 3: For test cases which involve "BDS", D1 represents MEO/IGSO satellites B1I signal type and D2 represents GEO satellites B1I signal type.

70.16.2.6 GNSS multi System Time Offsets

If more than one GNSS is used in a test, the accuracy of the GNSS-GNSS Time Offsets used at the system simulator shall be better than 3 ns.

70.16.3 GSM and other test conditions

70.16.3.1 GSM frequency band and frequency range

The tests in this sub clause are performed on one of the mid range ARFCNs of the GSM operating frequency band of the MS. The ARFCNs to be used for mid range are defined in Table 3.3.

If the MS supports multiple frequency bands then the Sensitivity tests in clause 70.16.5 shall be repeated in each supported frequency band.

70.16.3.2 Sensors

The minimum performances shall be met without the use of any data coming from sensors that can aid the positioning. A dedicated test message 'RESET MS POSITIONING STORED INFORMATION' has been defined in TS 44.014 for the purpose of disabling any such sensors.

70.16.4 A-GNSS test conditions

70.16.4.1 General

This sub clause defines the minimum performance requirements for both MS based and MS assisted A-GNSS terminals. If a terminal supports both modes then it shall be tested in both modes.

70.16.4.2 Measurement parameters

70.16.4.2.1 MS based A-GNSS measurement parameters

In case of MS-based A-GNSS, the measurement parameters are contained in the RRLP GANSS LOCATION INFORMATION IE. The measurement parameter is the horizontal position estimate reported by the MS and expressed in latitude/longitude.

70.16.4.2.2 MS assisted A-GNSS measurement parameters

In case of MS-assisted A-GNSS, the measurement parameters are contained in the RRLP GANSS MEASUREMENT INFORMATION IE, and in the RRLP GPS MEASUREMENT INFORMATION IE if GPS L1C/A is supported. The measurement parameters are the MS GANSS Code Phase measurements and the MS GPS Code Phase measurements (if supported). The MS GANSS Code Phase measurements and MS GPS Code Phase measurements are converted into a horizontal position estimate using the procedure detailed in clause 70.16.4.3.

70.16.4.2.3 2D position error

The 2D position error is defined by the horizontal difference in meters between the ellipsoid point reported or calculated from the MS Measurement Report and the actual simulated position of the MS in the test case considered.

70.16.4.2.4 Response time

Max Response Time is defined as the time starting from the moment that the MS has received the final RRLP MEASURE POSITION REQUEST sent before the MS sends the MEASURE POSITION RESPONSE containing the Location Information or the GPS and GANSS Measurement Information, and ending when the MS starts sending the MEASURE POSITION RESPONSE containing the Location Information or the GPS and GANSS Measurement Information on the Air interface. The response times specified for all test cases are Time-to-First-Fix (TTFF), i.e. the MS shall not re-use any information on GNSS time, location or other aiding data that was previously acquired or calculated and stored internally in the MS. A dedicated test message 'RESET MS POSITIONING STORED INFORMATION' has been defined in TS 44.014 for the purpose of deleting this information.

70.16.4.3 Converting MS-assisted measurement reports into position estimates

To convert the MS measurement reports in case of MS-assisted mode of A-GNSS into position errors, a transformation between the "measurement domain" (code-phases, etc.) into the "state" domain (position estimate) is necessary. Such a transformation procedure is outlined in the following clauses. The details can be found in [ICD-GPS 200], [IS-GPS-705], [IS-GPS-800], [SBAS], [IS-QZSS], [GLONASS -ICD], [Galileo-ICD], [P. Axelrad, R.G. Brown], [S.K. Gupta] and [BDS-ICD].

70.16.4.3.1 MS measurement reports

In case of MS-assisted A-GANSS, the measurement parameters are contained in the RRLP GANSS MEASUREMENT INFORMATION ELEMENT (sub clause A.3.2.10 in 3GPP TS 44.031). In case the MS provides also measurements on the GPS L1 C/A signal, the measurement parameters are contained in the RRLP GPS MEASUREMENT INFORMATION ELEMENT (sub clause A.3.2.5 in 3GPP TS 44.031). The measurement parameters required for calculating the MS position are:

1) Reference Time: The MS has two choices for the Reference Time:

   a) "Reference Frame";

   b) "GANSS TOD" and/or "GPS TOW" if GPS L1 C/A signal measurements are also provided.

   NOTE: It is not expected that an MS will ever report both a GANSS TOD and a GPS TOW. However if two time stamps are provided and they derive from different user times, be aware that no compensation is made for this difference and this could affect the location accuracy.

2) Measurement Parameters for each GANSS and GANSS Signal: 1 to <maxSat>:

   a) "SV ID"; mapping according to Table A.10.14 in 3GPP TS 44.031;

   b) "Code Phase";

   c) "Integer Code Phase";

   d) "Code Phase RMS Error";

3) Additional Measurement Parameters in case of GPS L1 C/A signal measurements are also provided: 1 to <maxSat>:

   a) "Satellite ID (SV PRN)";

   b) "Whole GPS chips";

c) "Fractional GPS Chips";

d) "Pseudorange RMS Error".

Additional information required at the system simulator:

1) "Reference Location" (sub clause A.4.2.4 or A.4.2.6.1 in 3GPP TS 44.031):
Used for initial approximate receiver coordinates.

2) "GANSS Navigation Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031):
Contains the ephemeris and clock correction parameters as specified in the relevant ICD of each supported GANSS; used for calculating the satellite positions and clock corrections.

3) "GANSS Ionospheric Model" (sub clause A.4.2.6.1 in 3GPP TS 44.031):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [Galileo-ICD] for computation of the ionospheric delay.

4) "GANSS Additional Ionospheric Model" (sub clause A.4.2.6.1 in 3GPP TS 44.031):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [QZSS-ICD] and [BDS-ICD] for computation of the ionospheric delay.

5) "GANSS Time Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031):
Contains the GNSS-GNSS Time Offset for each supported GANSS. Note, that "GANSS Time Model" IE contains only the sub-ms part of the offset. Any potential integer seconds offset may be obtained from "UTC Model" (sub clause A.4.2.4 in 3GPP TS 44.031), "GANSS UTC Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031), or "GANSS Additional UTC Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031).

6) "Navigation Model" (sub clause A.4.2.4 in 3GPP TS 44.031):
Contains the GPS ephemeris and clock correction parameters as specified in [IS-GPS-200]; used for calculating the GPS satellite positions and clock corrections in case of GPS L1 C/A signal measurements are the only GPS measurements provided in addition to GANSS measurements.

7) "Ionospheric Model" (sub clause A.4.2.4 in 3GPP TS 44.031):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [IS-GPS 200] for computation of the ionospheric delay.

70.16.4.3.2 WLS position solution

The WLS position solution problem is concerned with the task of solving for four unknowns; x_u, y_u, z_u the receiver coordinates in a suitable frame of reference (usually ECEF) and b_u the receiver clock bias relative to the selected GNSS specific system time. It typically requires the following steps:

Step 1: Formation of pseudo-ranges

The observation of code phase reported by the MS for each satellite SV_i is related to the pseudo-range/c modulo the "GANSS Code Phase Ambiguity", or modulo 1 ms (the length of the C/A code period) in case of GPS L1 C/A signal measurements. For the formation of pseudo-ranges, the integer number of milliseconds to be added to each code-phase measurement has to be determined first. Since 1 ms corresponds to a travelled distance of 300 km, the number of integer ms can be found with the help of reference location and satellite ephemeris. The distance between the reference location and each satellite SV_i at the time of measurement is calculated, and the integer number of milliseconds to be added to the MS code phase measurements is obtained.

Step 2: Correction of pseudo-ranges for the GNSS-GNSS time offsets

In case the MS reports measurements for more than a single GNSS, the pseudo-ranges are corrected for the time offsets between the GNSSs relative to the selected reference time using the GNSS-GNSS time offsets available at the system simulator:

$$\rho_{GNSS_m,i} \equiv \rho_{GNSS_m,i} - c \cdot (t_{GNSS_k} - t_{GNSS_m}),$$

where $\rho_{GNSS_m,i}$ is the measured pseudo-range of satellite *i* of $GNSS_m$. The system time t_{GNSS_k} of $GNSS_k$ is the reference time frame, and $(t_{GNSS_k} - t_{GNSS_m})$ is the available GNSS-GNSS time offset, and *c* is the speed of light.

Step 3: Formation of weighting matrix

The MS reported "Code Phase RMS Error" and/or "Pseudorange RMS Error" values are used to calculate the weighting matrix for the WLS algorithm described in [P. Axelrad, R.G. Brown]. According to 3GPP TS 44.031, the encoding for these fields is a 6 bit value that consists of a 3 bit mantissa, X_i and a 3 bit exponent, Y_i for each SV_i of $GNSS_j$:

$$w_{GNSS_j,i} = RMSError = 0.5 \times \left(1 + \frac{X_i}{8}\right) \times 2^{Y_i}$$

The weighting Matrix **W** is defined as a diagonal matrix containing the estimated variances calculated from the "Code Phase RMS Error" and/or "Pseudorange RMS Error" values:

$$\mathbf{W} = \mathrm{diag}\left\{1/w^2_{GNSS_1,1}, 1/w^2_{GNSS_1,2}, \cdots, 1/w^2_{GNSS_1,n}, \cdots, 1/w^2_{GNSS_m,1}, 1/w^2_{GNSS_m,2}, \cdots, 1/w^2_{GNSS_m,l}\right\}$$

Step 4: WLS position solution

The WLS position solution is described in e.g., [P. Axelrad, R.G. Brown] and usually requires the following steps:

1) Computation of satellite locations at time of transmission using the ephemeris parameters and user algorithms defined in the relevant ICD of the particular GNSS. The satellite locations are transformed into WGS-84 reference frame, if needed.

2) Computation of clock correction parameters using the parameters and algorithms as defined in the relevant ICD of the particular GNSS.

3) Computation of atmospheric delay corrections using the parameters and algorithms defined in the relevant ICD of the particular GNSS for the ionospheric delay, and using the Gupta model defined in [S.K. Gupta] p. 121 equation (2) for the tropospheric delay. For GNSSs which do not natively provide ionospheric correction models (e.g., GLONASS), the ionospheric delay is determined using the available ionospheric model adapted to the particular GNSS frequency.

4) The WLS position solution starts with an initial estimate of the user state (position and clock offset). The Reference Location is used as initial position estimate. The following steps are required:

   a) Calculate geometric range (corrected for Earth rotation) between initial location estimate and each satellite included in the MS measurement report.

   b) Predict pseudo-ranges for each measurement including clock and atmospheric biases as calculated in 1) to 3) above and defined in the relevant ICD of the particular GNSS and [P. Axelrad, R.G. Brown].

   c) Calculate difference between predicted and measured pseudo-ranges $\Delta\boldsymbol{\rho}$.

   d) Calculate the "Geometry Matrix" **G** as defined in [P. Axelrad, R.G. Brown]:

$$\mathbf{G} \equiv \begin{bmatrix} -\hat{\mathbf{1}}^T_{GNSS_1,1} & 1 \\ -\hat{\mathbf{1}}^T_{GNSS_1,2} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_1,n} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_m,1} & 1 \\ -\hat{\mathbf{1}}^T_{GNSS_m,2} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_m,l} & 1 \end{bmatrix}$$ with $\hat{\mathbf{1}}_{GNSS_m,i} \equiv \dfrac{\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u}{\left|\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u\right|}$ where $\mathbf{r}_{s_{GNSSm,i}}$ is the satellite position vector for SV_i of $GNSS_m$ (calculated in 1) above), and $\hat{\mathbf{r}}_u$ is the estimate of the user location.

e) Calculate the WLS solution according to [P. Axelrad, R.G. Brown]:

$$\Delta\hat{\mathbf{x}} = \left(\mathbf{G}^T\mathbf{W}\mathbf{G}\right)^{-1}\mathbf{G}^T\mathbf{W}\Delta\boldsymbol{\rho}$$

f) Adding the $\Delta\hat{\mathbf{x}}$ to the initial state estimate gives an improved estimate of the state vector:

$$\hat{\mathbf{x}} \rightarrow \hat{\mathbf{x}} + \Delta\hat{\mathbf{x}}\,.$$

5) This new state vector $\hat{\mathbf{x}}$ can be used as new initial estimate and the procedure is repeated until the change in $\hat{\mathbf{x}}$ is sufficiently small.

Step 4: Transformation from Cartesian coordinate system to Geodetic coordinate system

The state vector $\hat{\mathbf{x}}$ calculated in Step 3 contains the MS position in ECEF Cartesian coordinates together with the MS receiver clock bias relative to the selected GNSS system time. Only the user position is of further interest. It is usually desirable to convert from ECEF coordinates x_u, y_u, z_u to geodetic latitude φ , longitude λ and altitude h on the WGS84 reference ellipsoid.

Step 5: Calculation of "2-D Position Errors"

The latitude φ / longitude λ obtained after Step 4 is used to calculate the 2-D position error.

70.16.5 Sensitivity

70.16.5.1 Sensitivity Coarse Time Assistance

70.16.5.1.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.5.1.1.

Table 70.16.5.1.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

70.16.5.1.1 Definition

Sensitivity with coarse time assistance is the minimum level of GNSS satellite signals required for the MS to make an A-GNSS position estimate to a specific accuracy and within a specific response time when the network only provides coarse time assistance.

70.16.5.1.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.5.1.4 for the parameters specified in table 70.16.5.1.2.

Table 70.16.5.1.2: Test parameters for Sensitivity Coarse Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.1.3
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
GPS(1)	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
GLONASS	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
BDS	Reference high signal power level	dBm	-136
	Reference low signal power level	dBm	-145
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.5.1.3: Power level and satellite allocation

		Satellite allocation for each constellation		
		GNSS-1(1)	GNSS-2	GNSS-3
Single constellation	High signal level	1	-	-
	Low signal level	5	-	-
Dual constellation	High signal level	1	-	-
	Low signal level	2	3	-
Triple constellation	High signal level	1	-	-
	Low signal level	1	2	2
Note 1: For GPS capable receivers, GNSS-1, i.e. the system having the satellite with high signal level, shall be GPS.				

Table 70.16.5.1.4: Conformance requirement for Sensitivity Coarse Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.1.1.

70.16.5.1.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent weak signal conditions and with only Coarse Time Assistance provided by the SS.

70.16.5.1.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.5.1.5 for GNSS scenario #1. For GNSS-1, select the first satellite SV ID defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the one satellite with the higher level.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.5.1.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.5.1.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.5.1.7 and record one Good Result or Bad Result as appropriate; or

   For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS, used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.5.1.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. For GNSS-1, select the first satellite SV ID defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the one satellite with the higher level. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.5.1.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, for GNSS-1 select the next satellite SV ID from the one used previously, defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the one satellite with the higher level.

7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.5.2 Sensitivity Fine Time Assistance

70.16.5.2.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.5.2.1.

Table 70.16.5.2.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

70.16.5.2.1 Definition

Sensitivity with fine time assistance is the minimum level of GNSS satellite signals required for the MS to make an A-GNSS position estimate to a specific accuracy and within a specific response time when the network provides fine time assistance in addition to coarse time assistance.

70.16.5.2.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.5.2.4 for the parameters specified in table 70.16.5.2.2.

Table 70.16.5.2.2: Test parameters for Sensitivity Fine Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.2.3
	Total number of generated satellites	-	6

Table 70.16.5.2.4: Conformance requirement for Sensitivity Fine Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.1.2.

70.16.5.2.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent weak signal conditions and with Fine Time Assistance provided by the SS.

70.16.5.2.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.5.2.5 for GNSS scenario #1.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7

2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the values of GNSS TOW and BN offset by random values as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.

3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.5.2.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.5.2.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.

4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.5.2.7 and record one Good Result or Bad Result as appropriate; or

   For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.5.2.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW and BN offsets in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.5.2.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.

7. Release the signalling connection.

Dual constellation	3	3	-
Triple constellation	2	2	2

Table 70.16.5.2.7: Test requirements for Sensitivity Fine Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.6 Nominal Accuracy

70.16.6.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.6.1.

Table 70.16.6.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

70.16.6.1 Definition

Nominal accuracy is the accuracy of the MS's A-GNSS position estimate under ideal GNSS signal conditions.

70.16.6.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.6.4 for the parameters specified in table 70.16.6.2.

Table 70.16.6.2: Test parameters for Nominal Accuracy

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.6.3
	Total number of generated satellites	-	6 or 7[(2)]
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
GPS[(1)]	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
QZSS	Reference signal power level for all satellites	dBm	-128.5
SBAS	Reference signal power level for all satellites	dBm	-131
BDS	Reference signal power level for all satellites	dBm	-133
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities. NOTE 2: 7 satellites apply only for SBAS case.			

If QZSS is supported, one of the GPS satellites will be replaced by a QZSS satellite with respective signal support.

If SBAS is supported, the SBAS satellite with the highest elevation will be added to the scenario.

Table 70.16.6.3: Satellite allocation

	Satellite allocation for each constellation			
	GNSS 1[(1)]	GNSS 2[(1)]	GNSS 3[(1)]	SBAS
Single constellation	6	--	--	1
Dual constellation	3	3	--	1
Triple constellation	2	2	2	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS and BDS.				

Table 70.16.6.4: Conformance requirement for Nominal Accuracy

System	Success rate	2-D position error	Max response time
All	95 %	15 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.2.

70.16.6.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent ideal conditions.

70.16.6.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.6.5 for GNSS scenario #3.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #3 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7

2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.

3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.6.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.6.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.

4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.6.7 and record one Good Result or Bad Result as appropriate; or

   For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.6.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #4 instead of #3 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.6.5 are met. Each time scenario #3 or #4 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.

7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

Specific Message Contents

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	7.7m
Required Response Time	20s

70.16.6.5 Test Requirements

For the parameters specified in table 70.16.6.5 the MS shall meet the requirements and the success rate specified in table 70.16.6.7 with a confidence level of 95% according to annex A7.2.

Table 70.16.6.5: Test parameters for Nominal Accuracy

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.6.3
	Total number of generated satellites	-	6 or 7[2]
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±1.8
GPS[1]	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
QZSS	Reference signal power level for all satellites	dBm	-128.5
SBAS	Reference signal power level for all satellites	dBm	-131
BDS	Reference signal power level for all satellites	dBm	-133
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities. NOTE 2: 7 satellites apply only for SBAS case.			

If QZSS is supported, one of the GPS satellites will be replaced by a QZSS satellite with respective signal support.

If SBAS is supported, the SBAS satellite with the highest elevation will be added to the scenario.

Table 70.16.6.6: Satellite allocation

	Satellite allocation for each constellation			
	GNSS 1[1]	GNSS 2[1]	GNSS 3[1]	SBAS
Single constellation	6	--	--	1
Dual constellation	3	3	--	1
Triple constellation	2	2	2	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS and BDS				

Table 70.16.6.7: Test requirements for Nominal Accuracy

System	Success rate	2-D position error	Max response time
All	95 %	16.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.7 Dynamic Range

70.16.7.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.7.1.

Table 70.16.7.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

70.16.7.1 Definition

Dynamic Range is the maximum difference in level of the GNSS signals from a number of satellites that allows the MS to make an A-GNSS position estimate with a specific accuracy and a specific response time.

70.16.7.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.7.4 for the parameters specified in table 70.16.7.2.

Table 70.16.7.2: Test parameters for Dynamic Range

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.7.3
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference high signal power level	dBm	-127,5
	Reference low signal power level	dBm	-147
GPS(1)	Reference high signal power level	dBm	-129
	Reference low signal power level	dBm	-147
GLONASS	Reference high signal power level	dBm	-131.5
	Reference low signal power level	dBm	-147
BDS	Reference high signal power level	dBm	-133.5
	Reference low signal power level	dBm	-145
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.7.3: Power level and satellite allocation

		Satellite allocation for each constellation		
		GNSS 1(1)	GNSS 2(1)	GNSS 3(1)
Single constellation	High signal level	2	--	--
	Low signal level	4	--	--
Dual constellation	High signal level	1	1	--
	Low signal level	2	2	--
Triple constellation	High signal level	1	1	1
	Low signal level	1	1	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS and BDS.				

Table 70.16.7.4: Conformance requirement for Dynamic Range

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.3.

70.16.7.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that have a wide dynamic range. Strong satellites are likely to degrade the acquisition of weaker satellites due to their cross-correlation products.

70.16.7.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.7.5 for GNSS scenario #1. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the higher levels.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.7.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.7.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.7.7 and record one Good Result or Bad Result as appropriate; or

   For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.7.7 and record one Good Result or Bad Result as appropriate.
5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the higher levels. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.7.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the satellites with the higher levels.

7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.8 Multi-Path scenario

70.16.8.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.8.1.

Table 70.16.8.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only
5	Reserved
6	Reserved
7	Reserved
8	Reserved
9	MS supporting A-BDS only
10	MS supporting A-GPS and A-BDS only

70.16.8.1 Definition

Multi-path performance measures the accuracy and response time of the MS's A-GNSS position estimate in a specific GNSS signal multi-path environment.

70.16.8.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.8.4 for the parameters specified in table 70.16.8.2.

Table 70.16.8.2: Test parameters for Multi-Path scenario

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.8.3
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference signal power level	dBm	-127
GPS(1)	Reference signal power level	dBm	-128.5
GLONASS	Reference signal power level	dBm	-131
BDS	Reference signal power level	dBm	-133
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.8.3: Channel model allocation

		Channel model allocation for each constellation		
		GNSS-1	GNSS-2	GNSS-3
Single constellation	One-tap channel (see note)	2	--	--
	Two-tap channel (see note)	4	--	--
Dual constellation	One-tap channel (see note)	1	1	--
	Two-tap channel (see note)	2	2	--
Triple constellation	One-tap channel (see note)	1	1	1
	Two-tap channel (see note)	1	1	1
NOTE: One-tap channel: no multi-path. Two-tap channel: multi-path defined in clause 70.16.2.4				

Table 70.16.8.4: Conformance requirement for Multi-Path scenario

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.4.

70.16.8.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent simple multi-path conditions.

70.16.8.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.8.5 for GNSS scenario #1. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with one-tap channels.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements:

-

PIXIT statements:

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7. The initial carrier phase difference between taps of the multi-path model shall be randomly selected between 0 and 2π radians by selecting the next random number from a standard uniform random number generator, in the range 0 to 2π, representing radians with a resolution of 0.1, representing 0.1 radians.
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.

3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.8.8 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.8.8 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.

4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.8.8 and record one Good Result or Bad Result as appropriate; or

   For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.2.3. Compare the 2D position error against the value in table 70.16.8.8 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the one-tap channels. Use new random values for the MS location and altitude, and the initial carrier phase difference between taps of the multi-path model in step 1 and for the GNSS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.8.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the satellites with the one-tap channels.

7. Release the signalling connection

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

80 Generic Access default conditions, message contents and macros

80.1 Default test conditions

The following default test conditions shall apply if not stated otherwise within an individual test description.

80.1.1 Unlicensed Radio Access

80.1.1.1 IEEE 802.11

First access point.

	Setting
Channel	7
SSID	GAN_1
SSID-Broadcast	On
Ciphering	Off
Mode	Infrastructure

Second access point.

	Setting
Channel	3
SSID	GAN_2
SSID-Broadcast	On
Ciphering	Off
Mode	Infrastructure

80.1.1.2 Bluetooth

	Setting
Profile	PAN

80.1.2 Protocol Settings

80.1.2.1 Dynamic Host Configuration Protocol - DHCP

	Setting
Server IP-Address	192.168.11.1
Port	67
Client (Transport) IP Range Pool	192.168.11.10 - 15
Address Mask	255.255.255.0
Default Gateway	192.168.11.1

80.1.2.2 Domain Name System – DNS

80.1.2.2.1 Public DNS Server

	Setting
Server IP-Address	192.168.11.16
Port	53

The following entries should be used:

	FQDN	IP
Provisioning SEGW	psgw.gan.mnc001.mcc001.3gppnetwork.org	192.168.11.32
Default SEGW	dsgw.default.gan	192.168.11.33
Serving SEGW	ssgw.serving.gan	192.168.11.34

80.1.2.2.2 DNS associated with GANC

	Setting
Server IP-Address	172.16.0.144
Port	53

The following entries should be used:

	FQDN	IP
Provisioning GANC	gan.mnc001.mcc001.3gppnetwork.org	172.16.0.192
Default GANC	gan.default.gan	172.16.0.193
Serving GANC	gan.serving.gan	172.16.0.194

80.1.2.3 Secure Gateway (SEGW)

	FQDN	IP
Provisioning SEGW	psgw.gan.mnc001.mcc001.3gppnetwork.org	192.168.11.32
Default SEGW	dsgw.default.gan	192.168.11.33
Serving SEGW	ssgw.serving.gan	192.168.11.34

80.1.2.4 Generic Access Network Controller (GANC)

	FQDN	IP
Provisioning GANC	gan.mnc001.mcc001.3gppnetwork.org	172.16.0.192
Default GANC	gan.default.gan	172.16.0.193
Serving GANC	gan.serving.gan	172.16.0.194

The TCP port used for Discovery and Registration is port number 14001 (see 44.318: 12.2.1)

80.1.2.5 Secure Internet Protocol - IPsec

All cryptographic suites must be supported on SS side.

The certificates specified in annex A9 shall be used for authentication of the SS by the MS.

	Setting
Client (Local) IP Range Pool	172.16.0.202 -217

80.2 Default message contents

80.3 Macros

80.3.1 Overview

The present document presents macros for Generic Access test cases. It is intended to be a working document forming part of the Generic Access Test Specifications.

80.3.1.1 Definition

A macro is a name or sentence, possibly followed by an argument list, that is equated to a text to which it is to be expanded, possibly with the substitution of actual arguments.

Macros may be used to simplify the writing and reading of the test cases or to avoid the repetition of common sentences, message contents or message sequences. The macros defined in this subclause can be used throughout the test cases.

The definition of the macros is done in alphabetical order.

80.3.1.2 Syntax

80.3.1.2.1 Message contents

Any macro referencing message contents shall use the following table:

Macro reference (arguments)		
(P)SI	**Information Element**	**Value/Remarks**

The table must contain:

Macro reference: word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some IE's.

(P)SI: the System Information and Packet System Information messages whose content is referenced. Several (P)SIs can be referenced in this column. The defined IE value(s) refers to the (P)SI(s) in the same row.

Information Element: IE which value is specified.

Value/Remarks: value and any other comment specific to the IE's. In particular, the mapping between an argument value and its coding shall be specified in this column (see note).

NOTE: If possible, only the meaning of the value will be shown and not the value itself; this avoids updating when the core specifications are modified.

80.3.1.2.2 Message sequence

Any macro referencing message contents shall use the following table:

Step	Direction	Message	Comments
		{ Macro reference }	Macro (arguments)

The table must contain:

Macro reference: word or sentence that assigns the name to the macro. It may include a list of arguments with actual values for some parameters used within the macro.

Step: Number of the message. Letters may be used for general values: the same rules as in 3GPP TS 11.10 apply.

Direction: it must be either:

- "MS → SS": for an uplink message or a macro containing only uplink message(s);
- "SS → MS": for a downlink message or a macro containing only downlink message(s);
- "SS ↔ MS": for a macro containing both uplink and downlink message(s);

- "MS": for an action performed on the mobile side; or
- "SS": for an action performed on the system simulator side.

Message: Message name or macro reference.

Comments: any other comment specific to the message. In particular, value of certain bits/fields of the corresponding message.

The symbol '⁝' can be used to indicate that the previous and following message or sequence of messages (both previous and following must appear) is repeated an unknown number of times, probably referenced with a letter on the 'step' column.

80.4 Test PDP contexts

PDP context 1: same as PDP context 1 in section 40.5.

81 GAN Discovery and Registration Procedures

81.1 Discovery Procedure

81.1.1 Discovery Procedure, Accepted

81.1.1.1 Discovery Procedure, MS holds the IP address of the provisioning SEGW and FQDN of provisioning GANC, provisioning GANC and default GANC belong to the same SEGW

81.1.1.1.1 Conformance requirement

The MS shall:

- If the MS holds an IP address of the Provisioning SEGW, the MS establishes the secure connection towards the Provisioning SEGW according to sub-clause 4.2
- Following successful establishment of secure connection to the Provisioning SEGW:

- If the MS holds a FQDN of the Provisioning GANC, the MS shall perform a DNS query "inside the secure connection" to retrieve the IP-address of the Provisioning GANC. The MS shall establish a TCP connection to the Provisioning GANC using this IP address and a TCP port defined for Discovery (see sub-clause 12.2.1). The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).

When the MS receives GA-RC DISCOVERY ACCEPT message, it shall:

- stop the timer TU3901.
- set the timer value for TU3903 to the default value,
- store the information about Default GANC in persistent storage:

- The Default GANC information consists of the Default GANC, SEGW associated with the Default GANC and optionally a TCP port to be used with that Default GANC. If a specific TCP Port is not received in the message, the defined port for Registration is used (see sub-clause 12.2.1)

- release the TCP connection towards the Provisioning GANC
- the secure connection to the Provisioning SEGW can be reused as follows;

- If the MS is provisioned with an IP address of the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW IP address IE, the MS shall reuse the existing secure connection.

- If the MS is provisioned with a FQDN of the Provisioning GANC-SEGW or derived a FQDN for the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW FQDN IE, the MS shall reuse the existing secure connection.

- otherwise the MS shall release the existing secure connection towards the SEGW of the Provisioning GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the Default GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 5.3 and 5.5.1

81.1.1.1.2 Test purpose

To verify that the MS is able to initiate the Discovery Procedure with an IP address to the SEGW associated with the provisioning GANC and the FQDN to the GANC.

To verify that the MS keeps the secure connection when registering to the default GANC if the provisioning GANC and default GANC have the same SEGW.

81.1.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Provisioning GANC and default GANC belonging to the same SEGW
- Public DNS without knowledge of SEGW FQDN associated with Provisioning GANC

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address for the SEGW associated with the provisioning GANC, but not the FQDN
- The MS has the FQDN for the provisioning GANC, but not the IP address
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTERED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with a valid FQDN or IP address of Default GANC and IP address of the SEGW associated with Default GANC matching the IP address of SEGW associated with Provisioning GANC before timer TU3901 expires.

The MS shall attempt to register towards the Default GANC reusing the same security connection used during Discovery procedure.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			Set up Ipsec tunnel to SEGW
3	→			DNS Standard Query for GANC to the DNS server associated with the GANC
4	←			Standard Query Response with IP address to GANC
5	MS			Establish TCP connection to provisioning GANC
6	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
7	←		GA-RC DISCOVERY ACCEPT	Default GANC and SEGW provided. Note: Default GANC belongs to the same SEGW as the Provisioning GANC The message is sent before expiry of TU3901.
8	MS			Establish TCP connection to default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.1.1.2 Discovery procedure, the MS holds the FQDN of the provisioning SEGW and IP address of the provisioning GANC, provisioning GANC and default GANC belong to different SEGWs

81.1.1.2.1 Conformance requirement

- If the MS holds a FQDN of the Provisioning SEGW, the MS performs a public DNS query to retrieve the IP-address of the Provisioning SEGW and establish the secure connection towards the Provisioning SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).

- Following successful establishment of secure connection to the Provisioning SEGW

- If the MS holds an IP address of the Provisioning GANC, the MS shall establish a TCP connection to the Provisioning GANC using the well-known TCP port for Discovery as defined in sub-clause 12.2.1

When the MS receives GA-RC DISCOVERY ACCEPT message, it shall:

- stop the timer TU3901.

- set the timer value for TU3903 to the default value,

- store the information about Default GANC in persistent storage:

- The Default GANC information consists of the Default GANC, SEGW associated with the Default GANC and optionally a TCP port to be used with that Default GANC. If a specific TCP Port is not received in the message, the defined port for Registration is used (see sub-clause 12.2.1)

- release the TCP connection towards the Provisioning GANC

- the secure connection to the Provisioning SEGW can be reused as follows;

- If the MS is provisioned with an IP address of the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW IP address IE, the MS shall reuse the existing secure connection.

- If the MS is provisioned with a FQDN of the Provisioning GANC-SEGW or derived a FQDN for the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW FQDN IE, the MS shall reuse the existing secure connection.

- otherwise the MS shall release the existing secure connection towards the SEGW of the Provisioning GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the Default GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 5.3 and 5.5.1

81.1.1.2.2 Test purpose

To verify that the MS can initiate the Discovery Procedure with the FQDN to the SEGW associated with the provisioning GANC and IP address to the GANC.

To verify that the MS releases the secure connection when registering to the default GANC if the provisioning GANC and default GANC don't have the same SEGW.

81.1.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS that holds the IP address to the SEGW associated with the provisioning GANC, but without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the FQDN for the SEGW associated with the provisioning GANC, but not the IP address
- The MS has the IP address to the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message before timer TU3901 expires.

The MS shall release the Security Association towards the SEGW associated with Provisioning GANC.

The MS shall establish a secure tunnel towards the SEGW provided in Discovery Accept messasge and establish TCP to the Default GANC.

The MS shall send Register Request message towards the Default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	→			DNS Standard Query for the SEGW to the public DNS server
3	←			Standard Query Response with IP address to the SEGW
4	MS			MS sets up a secure connection to the SEGW and establishes TCP connection to the provisioning GANC
5	MS			MS establish a TCP connection using the stored IP address
6	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
7	←		GA-RC DISCOVERY ACCEPT	Default GANC and SEGW provided. The message is sent before expiry of TU3901.
8				MS releases the secure connection to the SEGW
9				MS sets up a secure connection to the new SEGW using either IP address or FQDN
10				MS establish a TCP connection to the default GANC using either IP address or FQDN
11	→		GA-RC REGISTER REQUEST	To default GANC

81.1.1.3 Discovery procedure, the MS is not provisioned with information about the provisioning GANC or its SEGW

81.1.1.3.1 Conformance requirement

- In case the MS is not provisioned with information about the Provisioning SEGW, derive a FQDN of the Provisioning SEGW from the IMSI (as described in [3]);

  The MS performs a public DNS Query to retrieve the IP-address of the Provisioning SEGW and establish the secure connection towards the Provisioning SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching);

- Following successful establishment of secure connection to the Provisioning SEGW:

- In cases where the MS is not provisioned with information about the Provisioning GANC, the MS derives a FQDN of the Provisioning GANC from the IMSI (as described in [3]).

A DNS query is performed "inside the secure connection" to retrieve the IP-address of the Provisioning GANC. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).A TCP connection is then established inside the IPsec tunnel, to the Provisioning GANC using the TCP port defined for Discovery procedure (see sub-clause 12.2.1).

- In all cases the MS shall establish only a single TCP connection to the GANC over the IPsec tunnel.

Reference(s)

3GPP TS 44.318 sub-clause 5.3.

81.1.1.3.2 Test purpose

To verify that the MS can derive the FQDN from its IMSI and go to the correct DNS to ask for the IP address to the SEGW and provisioning GANC.

81.1.1.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS does not have any knowledge about the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The MS will derive SEGW associated with provisioning GANC and provisioning GANC from the IMSI.

The SS is supposed to answer the Discovery Request message before timer TU3901 expires.

Use a default GANC associated with the same SEGW as the provisioning GANC in order to simplify the test sequence.

The MS will attempt to register towards the default GANC reusing the same security association.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			Derive FQDN to SEGW from the IMSI
3	→			DNS Standard Query for the SEGW to the public DNS server
4	←			Standard Query Response with IP address to the SEGW
5	MS			MS sets up a secure connection to the SEGW
6	MS			Derive FQDN to GANC from the IMSI
7	→			DNS Standard Query for GANC to the DNS server associated with the GANC
8	←			Standard Query Response with address to GANC
9	MS			Establish TCP connection to provisioning GANC over the secure connection
10	→		GA-RC DISCOVERY REQUEST	To provisioning GANC

11	←	GA-RC DISCOVERY ACCEPT	Default GANC provided and SEGW matching the SEGW associated with provisioning GANC. The message is sent before expiry of TU3901.
12	MS		Establish TCP connection to default GANC using either IP address or FQDN
13	→	GA-RC REGISTER REQUEST	To default GANC

81.1.2 Discovery Procedure, Rejected

81.1.2.1 Discovery Procedure, Discovery Reject, Network Congestion

81.1.2.1.1 Conformance requirement

When the MS receives GA-RC DISCOVERY REJECT message it shall:

- stop the timer TU3901,
- set the timer value for TU3903 to the default value,
- If the value of the Reject Cause IE indicates 'Network Congestion' , the MS shall
- Maintain the secure connection to the GANC-SEGW and the TCP connection to the GANC
- Create a random value between zero and the received value in TU3902 Timer IE and
- Add this value to the received value in TU3902 Timer IE, this becomes the new value for TU3902
- Start timer TU3902 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 5.5.2

81.1.2.1.2 Test purpose

To verify that the MS wait the correct time after receiving Discovery Reject due to network congestion before it tries to go through the discovery procedure again.

81.1.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with Discovery rejected with cause ‘Network congestion’ before timer TU3901 expires. The TU3902 timer is set to 60 (1 minutes).

The MS will set TU3902 between 1 and 2 minutes and send a Discovery Request message towards the provisioning GANC after expiration of the timer.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
4	←		GA-RC DISCOVERY REJECTED	With cause set to Network congestion TU3902 Timer IEs set to 60
5	MS			Wait for 1 – 2 minutes . The MS sets TU3902 randomly between 60 and 120, i.e. 1 to 2 minutes.
6	→		GA-RC DISCOVERY REQUEST	New attempt on the same secure connection to the provisioning GANC

81.1.2.2 Discovery Procedure, Discovery Reject, IMSI not allowed

81.1.2.2.1 Conformance requirement

When the MS receives GA-RC DISCOVERY REJECT message it shall:

- If the value of the Reject Cause IE indicates 'IMSI not allowed' or "Unspecified", then the MS shall:

- Release the TCP connection established to the Provisioning GANC, if still established.

- Release the secure connection towards the SEGW associated with the Provisioning GANC as defined in sub-clause 4.5.

- Not initiate a new Discovery procedure until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 5.5.2.

81.1.2.2.2 Test purpose

To verify that the MS does not try to kick off the Discovery procedure again after receiving Discovery Reject due to IMSI not allowed.

81.1.2.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC’s FQDN

- DNS inside of the SEGW associated with the provisioning GANC with knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will start the discovery procedure and receive Discovery rejected with cause value 'IMSI not allowed'. The MS will not try to kick off the Discovery procedure until it is powered off and back on again. When the second attempt to register has started the signalling is interrupted and the MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with Discovery rejected with cause 'IMSI not allowed' before timer TU3901 expires. The TU3902 timer is set to 60 (1 minutes).

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
4	←		GA-RC DISCOVERY REJECTED	Cause: IMSI not allowed
5				MS releases the TCP connection and the secure connection
6	MS			Wait for 2 minutes. Make sure that the MS does not try to access the GAN network.
7	MS			Switch off the MS and then back on again.
8	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
9	→		GA-RC DISCOVERY REQUEST	New attempt

81.1.2.3 Void

81.1.3 Discovery Procedure, Abnormal Cases

81.1.3.1 Discovery Procedure, TU3901/TU3903 Expires

81.1.3.1.1 Conformance requirement

If timer TU3901 has expired in the MS, the MS shall:

- release the TCP connection towards the Provisioning GANC,
- release the secure connection towards SEGW of the Provisioning GANC as defined in sub-clause 4.5,
- double the current value for timer TU3903 but not exceeding the maximum value defined for this timer as defined in sub-clause 12.1.1 and
- start timer TU3903

Reference(s)

3GPP TS 44.318 sub-clause 5.6.1.

81.1.3.1.2 Test purpose

To verify that the MS attempts to kick off the Discovery procedure again after the correct time has elapsed when the TU3901/TU3903 timer expires.

81.1.3.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN
- DNS inside of the SEGW associated with the provisioning GANC with knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC
- Timer TU3901 set to the default value 30 seconds
- Timer TU3903 set to 1 minute

Foreseen final state of the MS

The MS will start the discovery procedure and when TU3901 expires it will set TU3903 to 2 minutes. When TU3903 expires it will kick off the Discovery procedure again. The same sequence is repeated and for each time TU3903 is doubled until it reaches its maximum value of 32 minutes.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is not supposed to answer the Discovery Request message at any occasion.

Specific Test Parameters

-

Maximum duration of test

100 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC, MS starts TU3901
4	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 2 min. when TU3901 expires.
5				MS releases the TCP connection and the secure connection
6	MS			Wait for 2 minutes so that TU3903 expires
7	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
8	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
9	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 4 min. when TU3901 expires the 2nd time.
10				MS releases the TCP connection and the secure connection
11	MS			Wait for 4 minutes so that TU3903 expires.
12	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
13	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
14	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 8 min. when TU3901 expires the 3rd time.
15				MS releases the TCP connection and the secure connection
16	MS			Wait for 8 minutes so that TU3903 expires.
17	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
18	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
19	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 16 min. when TU3901 expires the 4th time.
20				MS releases the TCP connection and the secure connection
21	MS			Wait for 16 minutes so that TU3903 expires.
22	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
23	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
24	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 32 min. when TU3901 expires the 5th time.
25				MS releases the TCP connection and the secure connection

26	MS		Wait for 32 minutes so that TU3903 expires.
27	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
28	→	GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
29	MS		Wait for 30 s so TU3901 expires. TU3903 is set to 32 min. again when TU3901 expires the 6th time.
30			MS releases the TCP connection and the secure connection
31	MS		Wait for 32 minutes so that TU3903 expires.
32	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
33	→	GA-RC DISCOVERY REQUEST	New attempt

81.1.3.2 Void

81.1.3.3 Void

81.1.3.4 Void

81.1.3.5 Void

81.1.3.6 Void

81.1.3.7 SEGW certificate checking, the MS holds the “invalid” FQDN of the provisioning SEGW

81.1.3.7.1 Conformance requirement

As the MS and GANC-SEGW use EAP-SIM or EAP-AKA for mutual authentication, IKEv2 mandates that this is used in conjunction with a public key signature based authentication of the GANC-SEGW to the MS.

The MS requirements for certificate authentication and handling are listed in 3GPP TS 33.234 [10].

In addition to the requirements listed in 3GPP TS 33.234 [10], the MS shall take the following actions for received GANC-SEGW certificates:

- match the SubjectAltName in the end entity certificate with the IDr payload, and with GANC-SEGW identity obtained from derivation of the Provisioning GANC-SEGW FQDN, provisioning, discovery or register redirect.
- If the MS was provisioned with an IP address of the GANC-SEGW, (or received it in the GA-RC DISCOVERY ACCEPT or GA-RC REGISTER REDIRECT message), then the certificate shall contain an IPaddress SubjectAltName that matches that address.
- If the MS was provisioned with an FQDN of the GANC-SEGW, or received it in the GA-RC DISCOVERY ACCEPT or GA-RC REGISTER REDIRECT message, then the certificate shall contain a DNSname SubjectAltName that matches that FQDN.
- If the MS derived the FQDN of the Provisioning GANC-SEGW, then the certificate shall contain a DNSname SubjectAltName that matches that FQDN.

If the MS and GANC-SEGW are not able to set up the SA for any other reason than EAP-SIM or EAP-AKA authentication failure, and the current GANC-SEGW is the SEGW associated to the Provisioning GANC, the MS shall act as if a "Lower layer failure in the MS" has occurred and act as defined in sub-clause 5.6.2.

Reference(s)

3GPP TS 44.318 sub-clauses 4.2.5 and 4.2.6

81.1.3.7.2 Test purpose

To verify that the MS does correct SEGW certificate checking during secure tunnel establishment.

81.1.3.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS that holds the IP address to the SEGW associated with the provisioning GANC, but that DNS entry is not in provisioning SEGW certificate.

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the "invalid" FQDN for the SEGW

The MS holds an "invalid" FQDN of the Provisioning SEGW. MS is made to perform a public DNS query to retrieve the IP-address of the Provisioning SEGW and to initialise establishment of the secure connection towards the Provisioning SEGW. Secure tunnel establishment will fail, because provisioning SEGW certificate does not contain DNS subjectAltName "invalid.provisioning.gan".The MS shall act as if "a Lower layer failure in the MS" has occurred and act as defined in sub-clause 5.6.2.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	→			DNS Standard Query for the SEGW to the public DNS server
3	←			Standard Query Response with IP address to the SEGW
4	→		IKE_SA_INIT	MS sends IKE_SA_INIT message to initialize secure connection setup to the SEGW
5	←		IKE_SA_INIT	SEGW replies with IKE_SA_INIT
6	→		IKE_AUTH	MS informs trusted CA certificates in CERT_REQ payload. Authentication phase is started
7	←		IKE_AUTH	SEGW replies with certificate that does not contain "invalid" FQDN in its SubjectAltName field
8 (optional)	→		IKE_AUTH	MS may optionally send one more IKE_AUTH message
9	MS			MS stops attempting to set up a security connection and starts TU3903
10	MS			Wait for 10 seconds
11	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC using either IP address or FQDN

81.2 Registration Procedure

81.2.1 Registration Procedure, Accepted

81.2.1.1 Registration Procedure, MS in GSM Coverage, Serving GANC for CGI Known

81.2.1.1.1 Conformance requirement

If the MS is in GERAN or UTRAN coverage, it shall check if it has stored Serving GANC information for the current GSM CGI in case of GERAN coverage, or UTRAN cell Identity, in case of UTRAN Coverage, or if the MS is not in GERAN/UTRAN coverage, it shall check if it has stored Serving GANC information for the current AP-ID

- if found, the MS shall initiate Registration procedure towards the stored Serving GANC

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.1.2 Test purpose

To verify that the MS can store the address to a serving GANC associated with a certain GSM cell and access that GANC at the Registration procedure.

81.2.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.
5	MS			Wait for 1 minutes so that TU3906 expires
A5 (Optional)			{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update while TU3906 is still running
6	→		GA-RC KEEP ALIVE	

81.2.1.2 Registration Procedure, MS in GSM Coverage, Serving GANC for CGI Not Known; MS not in GSM Coverage, Serving GANC for AP Known

81.2.1.2.1 Conformance requirement

If the MS is in GERAN or UTRAN coverage, it shall check if it has stored Serving GANC information for the current GSM CGI in case of GERAN coverage, or UTRAN cell Identity, in case of UTRAN Coverage, or if the MS is not in GERAN/UTRAN coverage, it shall check if it has stored Serving GANC information for the current AP-ID

- if found, the MS shall initiate the GAN Registration procedure towards the stored Serving GANC

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

The GANC may at any time initiate the deregistration of a MS by sending the GA-RC DEREGISTER message to the MS. When the GA-RC layer in the network has submitted the GA-RC DEREGISTER message to the TCP layer, it may initiate release of its half of the bidirectional TCP connection

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1, 6.2.3.1, and 6.4.3

81.2.1.2.2 Test purpose

To verify that the MS can register to the default GANC if it doesn't have any data stored about serving GANC in the current GSM cell.

To verify that the MS can store the address to a serving GANC associated with a certain AP and access that GANC at the Registration procedure.

81.2.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, default parameter

- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored a serving GANC associated with the AP-ID
- MS has not stored a serving GANC associated with the GSM cell (CGI)
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

The SS requests the MS to deregister. The GSM cell is then removed. The MS should now attempt to register using the stored AP-ID.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To default GANC, verify correct GSM CGI is used.
4	←		GA-RC REGISTER ACCEPT.	GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.
A4 (Optional)			{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update
5	←		GA-RC DEREGISTER	Reject Cause = Unspecified
6	SS			Remove GSM Coverage
7	MS			Remove the TCP connection and the secure connection to SEGW
8	MS			MS is joining the AP
9	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
10	→		GA-RC REGISTER REQUEST	To serving GANC, verify correct AP-ID is used.

11	←	GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds
12	MS		Wait for 1 minutes so that TU3906 expires
13	→	GA-RC KEEP ALIVE	

81.2.1.3 Void

81.2.1.4 Registration Procedure, MS Holds The IP Address to The serving SEGW And The FQDN to The Serving GANC

81.2.1.4.1 Conformance requirement

To initiate the registration procedure the MS shall:

- If the MS has stored an IP address of the GANC-SEGW, and the MS does not already have an established secure connection to this GANC-SEGW, the MS establishes a secure connection towards the GANC-SEGW according to sub-clause 4.2,

Following successful establishment of secure tunnel:

- If the MS holds a FQDN of the GANC, the MS performs a DNS query "inside the secure tunnel" to retrieve the IP-address of the GANC. The MS establishes a TCP connection to the GANC at the stored TCP port to be used for Registration with this GANC. If no TCP port has been stored for this GANC, the default TCP port (see sub-clause 12.2.1) shall be used. The MS shall not store the retrieved IP address for subsequent procedures (apart from DNS resolver caching);

- The MS shall only establish a single TCP connection to the GANC over the IPsec tunnel.

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.4.2 Test purpose

To verify that the MS can register to the GANC by using IP addresses to SEGW and GANC.

81.2.1.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored the IP address to the SEGW associated with the serving GANC associated with the AP-ID but not the FQDN

- MS has stored the FQDN to the serving GANC associated with the AP-ID but not the IP address

- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

	MS	SS		
1	MS			MS is joining the AP
2	MS			Set up Ipsec tunnel to serving SEGW
3	→			DNS Standard Query for GANC to the DNS server associated with the GANC
4	←			Standard Query Response with IP address to GANC
5	MS			Establish TCP connection to serving GANC
6	→		GA-RC REGISTER REQUEST	To serving GANC
7	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds. GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.
8	MS			Wait for 1 minutes so that TU3906 expires
A8 (Optional)			{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update while TU3906 is still running
9	→		GA-RC KEEP ALIVE	

81.2.1.5 Registration Procedure, MS Holds The FQDN to The serving SEGW And The IP Address to The Serving GANC

81.2.1.5.1 Conformance requirement

To initiate the GAN registration procedure the MS shall:

- If the MS has stored a FQDN of the GANC-SEGW, the MS performs a public DNS query to retrieve the IP-address of the GANC-SEGW, if the MS does not already have an established secure connection to this GANC-SEGW, the MS establishes the secure connection towards the GANC-SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).

Following successful establishment of secure tunnel:

- If the MS holds an IP address of the GANC, the MS establishes a TCP connection to the GANC at the stored TCP port to be used for Registration with this GANC. If no TCP port has been stored for this GANC, the default TCP port (see sub-clause 12.2.1) shall be used.

- The MS shall only establish a single TCP connection to the GANC over the IPsec tunnel.

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.5.2 Test purpose

To verify that the MS can register to the GANC by using FQDN to SEGW.

81.2.1.5.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN

Mobile Station:

- MS has stored the FQDN to the SEGW associated with the serving GANC associated with the AP-ID, but not the IP address
- MS has stored the IP address to the serving GANC associated with the AP-ID, but not the FQDN
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

	MS	SS		
1	MS			MS is joining the AP
2	→			DNS Standard Query for the SEGW to the public DNS server
3	←			Standard Query Response with IP address to the SEGW
4	MS			MS sets up a secure connection to the SEGW and establishes TCP connection to the serving GANC using the stored IP address
5	→		GA-RC REGISTER REQUEST	To serving GANC
6	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.

7	MS		Wait for 1 minutes so that TU3906 expires
A7 (Optional)		{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update while TU3906 is still running
8	→	GA-RC KEEP ALIVE	

81.2.1.6 Registration Procedure, MS is capable of GAN A/Gb mode and GAN Iu mode, directed to operate in GAN A/Gb mode

81.2.1.6.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:

- if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.

- if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1

81.2.1.6.2 Test purpose

To verify that the MS that is capable of both GAN A/Gb mode and GAN Iu mode operation can be directed to operate in GAN A/Gb mode as a result of the Registration procedure.

81.2.1.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

3	→	GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN A/Gb mode and GAN Iu mode
4	←	GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds No GAN Mode Indicator IE included
5		{GAN A/GB Mode Location Update Procedure}	

81.2.1.9 Registration Procedure, MS is capable of GAN Iu mode only, no GAN Mode Indicator IE in GA-RC REGISTER ACCEPT

81.2.1.9.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:

- if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.

- if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

If no GAN Mode Indicator IE is included in the GA-RC REGISTER ACCEPT message or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, but the MS does not support GAN A/Gb mode, then the MS shall immediately initiate GAN deregistration per sub-clause 6.4.1 and then proceed according to the registration reject procedures defined for the case of 'Invalid GANC' in sub-clause 6.2.3.3.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1 and 6.2.4.6

81.2.1.9.2 Test purpose

To verify that the MS that is capable of GAN Iu mode operation (only) initiates GAN deregistration if the GA-RC REGISTER ACCEPT message does not include the GAN Mode Indicator.

81.2.1.9.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

81.2.2 Registration Procedure, Redirected

81.2.2.1 Registration Procedure, Redirected, Not Possible to Reuse Secure Connection

81.2.2.1.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- otherwise release the secure connection towards SEGW of the previous GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.1.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration Redirect as a response on the Registration Request message.

81.2.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID

- The serving GANC does not belong to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, with associated default SEGW IP or FQDN
4	MS			Remove the TCP connection and the secure connection to SEGW
5	MS			MS sets up secure connection to the new SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.2.2 Registration Procedure, Redirected, Current And Received GANC Belongs to The Same SEGW, IP Address Matches

81.2.2.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- if the returned SEGW is the same as the one used for the connection towards the previous GANC,

- if the MS held a Serving GANC-SEGW IP address for the current Serving GANC (either in the Serving GANC store or received in a previous GA-RC REGISTER REDIRECT) and the received GA-RC REGISTER REDIRECT contains the Serving GANC-SEGW IP address IE, and these two IP addresses match, the MS shall reuse the secure connection, or

- initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.2.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration Redirect as a response on the Registration Request message.

To verify that the same Ipsec tunnel can be reused if the current GANC belongs to the same SEGW as the received GANC using FQDN as identifier.

81.2.2.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC and default GANC.

Mobile Station:

- MS has stored the IP address or FQDN to the serving GANC and its SEGW associated with the AP-ID
- The serving GANC belongs to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, IP address for the SEGW sent

4	MS		Remove the TCP connection
5	MS		Establish a TCP connection to the default GANC over the same secure connection
6	→	GA-RC REGISTER REQUEST	To default GANC

81.2.2.3 Registration Procedure, Redirected, Current And Received GANC Belongs to The Same SEGW, FQDN Matches

81.2.2.3.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- if the returned SEGW is the same as the one used for the connection towards the previous GANC,

- if the MS held a Serving GANC-SEGW FQDN identifier (either in the Serving GANC store or received in a previous GA-RC REGISTER REDIRECT) and the received GA-RC REGISTER REDIRECT contains the Serving GANC-SEGW FQDN IE, and these identifiers match, the MS shall reuse the secure connection

- initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2

.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.3.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration. Redirect as a response on the Registration Request message.

To verify that the same Ipsec tunnel can be reused if the current GANC belongs to the same SEGW as the received GANC using FQDN as identifier.

81.2.2.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC and default GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and the IP address or FQDN of its SEGW associated with the AP-ID
- The serving GANC belongs to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, FQDN for the SEGW sent
4	MS			Remove the TCP connection
5	MS			Establish a TCP connection to the default GANC over the same secure connection
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3 Registration Procedure, Rejected

81.2.3.1 Registration Procedure, Registration rejected, Network congestion

81.2.3.1.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Network Congestion'
- create a random value between zero and the received value in IE 'TU3907 Timer' and
- add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
- start timer TU3907 according to the new calculated value and wait for it to expire.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.1.2 Test purpose

To verify that the MS retries to register again after the correct time, according to the received timer TU3907, after receiving Register reject.

81.2.3.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN or IP address of the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to network congestion before timer TU3904 expires. TU3907 Timer IE is set to 60 (1 minutes).

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
5	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until the TU3907 expires
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.2.3.2 Registration Procedure, Registration rejected, AP not allowed

81.2.3.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'AP not allowed'

- release the TCP connection established to the GANC, if still established,
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- store the AP-ID in the AP Black List and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP Black List i.e. as a result of power-cycle.

The MS shall also:

  - Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':

- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.2.2 Test purpose

To verify that the MS does not try to register again, after receiving Register reject due to Location not allowed until the MS is joining another AP.

81.2.3.2.3 Method of test

Initial conditions

System Simulator:

- 2 GAN cells, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC and its SEGW associated with the AP-ID
- MS has stored the FQDN or IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to AP not allowed before timer TU3904 expires.

The MS are not allowed to try to register again from the same AP. Therefore wait for 2 minutes and let the MS join the second AP, where the mobile will try to register again.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: AP not allowed
5	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			MS is joining the second AP
8	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3.3 Registration Procedure, Registration rejected, Location not allowed

81.2.3.3.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Location not allowed'
- release the TCP connection established to the GANC, if still established,
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- update the Location Black List according to the received information elements Location Black List indicator and Location Area Identification (i.e. the same as that included in the GA-RC REGISTER REQUEST message) and not initiate a new Register Request from the locations indicated by the updated Location Black List, until they are removed from the Location Black List i.e. as a result of power-cycle.

The MS shall also:

  - Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':

- If the MS is in GERAN/UTRAN coverage it shall remove information related to the current GSM-CGI or UTRAN Cell Identity, if it exists in the table.
- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.3.2 Test purpose

To verify that the MS does not try to register again, after receiving Register reject due to Location not allowed until it is powercycled.

81.2.3.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, default parameters
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC and its SEGW associated with the GSM cell (CGI)
- MS has stored the FQDN or IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to Location not allowed before timer TU3904 expires.

The MS are not allowed to try to register again from the same Location Area. Therefore wait for 5 minutes and then powercycle the MS so that the LAI disappears from the Location black list and the MS can register again from that Location area.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP

2	MS		MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN

8	MS		MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→	GA-RC REGISTER REQUEST	Todefault GANC

81.2.3.4 Registration Procedure, Registration rejected, IMSI not allowed

81.2.3.4.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'IMSI not allowed'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- not initiate a new GAN Registration procedure until the next power-on.

The MS shall also:

  - Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':

- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.4.2 Test purpose

To verify that the MS does not try to register again after receiving Registration reject due to IMSI not allowed until the MS is power cycled.

81.2.3.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or the IP address to the serving GANC and its SEGW associated with the AP-ID
- MS has stored the FQDN or the IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to IMSI not allowed before timer TU3904 expires.

Wait for 2 minutes to confirm that the MS does not try to register again.

Switch off the MS and switch it back on again. The MS is supposed to try to register with the default GANC.

Specific Test Parameters

\-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: IMSI not allowed
5	MS			Release the TCP connection to the serving GANC and the secure connection to the serving SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			Power cycle the MS
8	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3.5 Void

81.2.3.6 Registration Procedure, Registration rejected, invalid GANC

81.2.3.6.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Invalid GANC' or 'Unspecified'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- act as defined in sub-clause 6.2.4.5

The MS shall also:

  - Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':

- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

The MS shall;

  - If the GANC selection is ongoing:

- act on upper layer indications as follows;
- If no more PLMNs/GANCs are available for GANC selection or the GANC selection is finished unsuccessfully;
- stop all ongoing registration procedures;
- release the TCP connection towards the current GANC, if established,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5
- initiate registration towards the Default GANC as defined in sub-clause 6.2.1;
- else if the GANC selection process indicates new PLMN/GANC selection:
- initiate registration procedure towards the GANC associated with the selected PLMN as defined in sub-clause 6.2.

  - else if the MS attempted the registration towards the Default GANC

- delete the stored information about the Default GANC,
- delete the contents of the stored Serving GANC table
- Increment Redirection Counter
- initiate Discovery Procedure as defined in sub-clause 5.3

  - else if the MS attempted the registration towards current GANC is a Serving GANC

- Update the stored Serving GANC table as defined in the end of sub-clause 6.2.3.3 (i.e. delete information about this Serving GANC in the table) and

- Increment Redirection Counter

- initiate Registration Procedure towards the Default GANC as defined in sub-clause 6.2.1

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3 and 6.2.4.5

81.2.3.6.2 Test purpose

To verify for serving and default GANC that the MS does not try to register again to the same GANC after receiving Registration reject due to invalid GANC.

81.2.3.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of any GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC
- DNS inside of the provisioning SEGW associated with the provisioning GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC associated with the AP-ID
- MS has stored the FQDN or IP address to the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due invalid GANC before timer TU3904 expires.

Check that the MS kicks off the Registration procedure towards the Default GANC. Check the Register Reject Cause IE and Redirection Counter IE in the Discovery Request message.

The SS is supposed to answer the Registration Request message with Registration Rejected due invalid GANC before timer TU3904 expires.

Check that the MS kicks off the Discovery procedure towards the Provisioning GANC. Check the Register Reject Cause IE and Redirection Counter IE in the Discovery Request message.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP

81.2.3.7 Registration Procedure, Registration rejected, Geo location not known

81.2.3.7.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.

- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Geo Location not known'
  - release the TCP connection established to the GANC, if still established.
  - release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
  - not retry registration from this AP until the location is provided or until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.7.2 Test purpose

To verify that the MS does not try to register again after receiving Registration Reject due to 'Geo location not known' until the MS is power cycled.

81.2.3.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN or the IP address to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to Geo location not known before timer TU3904 expires.

Wait for 2 minutes to confirm that the MS does not try to register again.

Switch off the MS and switch it back on again. The MS is supposed to try to register again.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: Geo location not known
5				Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			Power cycle the MS

8	MS		MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
9	→	GA-RC REGISTER REQUEST	To serving GANC

81.2.4 Registration Procedure, Abnormal Cases

81.2.4.1 Registration Procedure, TU3904/TU3905 expiry, Serving GANC

81.2.4.1.1 Conformance requirement

If timer TU3904 expires in the MS, the MS shall:

- release the TCP connection towards the GANC,
- release the secure connection towards SEGW of the GANC as defined in sub-clause 4.5,
- If GAN registration is unsuccessful after a number of attempts defined by the MS parameter "Up Register Max Retries" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.
- Otherwise, if GAN Registration can be re-attempted according to the MS parameter "Up Register Max Retries", start timer TU3905 and wait for it to expire.

If timer TU3905 has expired in the MS, the MS shall restart the Registration procedure as defined in sub-clause 6.2.1.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.4.1 and 6.2.4.3

81.2.4.1.2 Test purpose

To verify that the MS retries to register correct number of times before it tries to register at another GANC when it does not get any reply on the Registration Request message.

81.2.4.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC’s FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is not supposed to answer the Registration Request message at all.

The MS will wait for TU3904 and TU3905 to expire and retry to register again the number of times that is set in the MS parameter ‘Up Register Max Retries’. After that it will try to register at the default GANC

Specific Test Parameters

'Up Register Max Retries' (3 times)

Maximum duration of test

3 min.

Expected sequence

3	→		GA-RC REGISTER REQUEST	1st time to serving GANC, MS starts TU3904
4	MS			Wait for 30 seconds so that TU3904 expires. TU3905 is set
5	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 10 seconds so that TU3905 expires
7	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
8	→		GA-RC REGISTER REQUEST	2nd time to serving GANC, MS starts TU3904. 1st reattempt
9	MS			Wait for 30 seconds so that TU3904 expires. TU3905 is set
10	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
11	MS			Wait for 10 seconds so that TU3905 expires
12	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
13	→		GA-RC REGISTER REQUEST	3rd time to serving GANC, MS starts TU3904. 2nd reattempt
14	MS			Wait for 30 seconds so that TU3904 expires.
15	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
16	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
17	→		GA-RC REGISTER REQUEST	To default GANC

81.2.4.2 Registration Procedure, Registration Rejected, Network Congestion, Persistent Fault

81.2.4.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
    - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Network Congestion'

- create a random value between zero and the received value in IE 'TU3907 Timer' and
- add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
- start timer TU3907 according to the new calculated value and wait for it to expire.

If timer TU3907 expires in the MS, the MS shall:

- If GAN registration is unsuccessful after a number of attempts defined by the MS parameter "Up Register Max Retries" (defined in sub-clause 12.2.3), the MS shall act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2
- else, if the TCP connection to the GANC is still established,

- send a GA-RC REGISTER REQUEST that includes information elements as described in sub-clause 6.2.1 and
- start timer TU3904
    - else, restart the GAN Registration procedure towards the GANC as defined in sub-clause 6.2.1

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3 and 6.2.4.4

81.2.4.2.2 Test purpose

To verify that the MS retries to register to the same GANC the correct number of times when it gets rejected due to network congestion several times.

81.2.4.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC’s FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to network congestion before timer TU3904 expires. TU3907 Timer IE is set to 60 (1 minutes).

The MS will wait for TU3904 and TU3907 to expire and retry to register again the number of times that is set in the MS parameter ‘Up Register Max Retries’.

At the first reject the SS releases the TCP connection and the Ipsec tunnel, so that the MS has to establish the connection again. The rest of the rejects can keep the connection as that is the most likely scenario.

Specific Test Parameters

Up Register Max Retries' is set to 3 times

Maximum duration of test

7 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	1st time to serving GANC, MS starts TU3904
4	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
5	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
6	→		GA-RC REGISTER REQUEST	2nd time to serving GANC, MS starts TU3904. 1st reattempt
7	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
8	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
9	→		GA-RC REGISTER REQUEST	3rd time to serving GANC, MS starts TU3904. 2nd reattempt
10	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
11 (optional)	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
12	MS			Release the TCP connection to the GANC and the secure connection to the SEGW

81.2.4.3 Void

81.2.4.4 Void

81.2.4.5 Void

81.2.4.6 Void

81.2.4.7 Void

81.2.5 Registration Procedure, Register Update

81.2.5.1 Registration Procedure, Register Update, Rejected

81.2.5.1.1 Conformance requirement

If the network rejects the Registration Update, it shall send the GA-RC DEREGISTER message to the MS. This message shall contain the Register Reject Cause information element.

When the MS receives the GA-RC DEREGISTER message, it shall behave as defined in sub-clause 6.4.4 "Reception of GA-RC DEREGISTER by MS".

When the MS receives the GA-RC DEREGISTER message, it shall:

- 'AP not allowed'

- release the TCP connection established to the GANC, if still established,

- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,

- store the AP-ID in the AP Black List of and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP black list i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.3.2.2, 6.3.3.1 and 6.4.4

81.2.5.1.2 Test purpose

To verify that the MS acts according to the Register Update Reject Cause contained in the GA-RC DEREGISTER from the network.

81.2.5.1.3 Method of test

Initial conditions

System Simulator:

- 2 GAN cells, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED

Test procedure

Make the MS join a second AP so that the Registration Update procedure is kicked off.

The SS is supposed to reply with GA-RC DEREGISTER.

The MS will then check the Register Reject Cause IE contained in GA-RC DEREGISTER message and act as specified in GANC 44.318 section 6.4.4.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is changing APs
2	→		GA-RC REGISTER UPDATE UPLINK	To serving GANC

3	←	GA-RC DEREGISTER	To MS Cause: AP not allowed
4	MS		Release the TCP connection to the GANC and the secure connection to the SEGW
5	MS		Wait for 5 minutes. Make sure that the MS doesn't try to register again.

81.2.5.2 Registration Procedure, Register Update, Redirection

81.2.5.2.1 Conformance requirement

If the network decides to redirect the MS to another GANC, it shall send the GA-RC REGISTER REDIRECT message to the MS. This message shall contain valid information about another GANC, so that the MS is able to initiate the Registration procedure towards that GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.3.2.3

81.2.5.2.2 Test purpose

To verify that the MS can register to another GANC if it gets redirected as a result of the Registration Update procedure.

81.2.5.2.3 Method of test

Initial conditions

System Simulator:

- 1GAN cell, default parameter
- 1 GSM cell, initially switched off

Mobile Station:

- MS in state GA-RC REGISTERED under no GSM coverage

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED as the Registration procedure to the new GANC is interrupted.

Test procedure

GSM cell is activated, MS is changing location area by going into GSM coverage area and Registration Update procedure is kicked off.

The SS is supposed to reply with .GA-RC REGISTER REDIRECT

The MS will then send GA-RC REGISTER REQUEST to the suggested GANC.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	SS			The GSM cell is activated.

2	→	GA-RC REGISTER UPDATE UPLINK	To serving GANC
3	←	GA-RC REGISTER REDIRECT	Suggest a different GANC
4	→	GA-RC REGISTER REQUEST	To the suggested GANC.

81.2.6 Registration Procedure, Deregister

81.2.6.1 Registration Procedure, Deregister, Network Congestion, MS in State GA-CSR DEDICATED

81.2.6.1.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Network Congestion'

- release all local GAN resources (e.g. MS is in active call over GAN)

- release the TCP connection towards the current GANC and

- release the secure connection towards the GANC-SEGW, as defined in sub-clause 4.5

- create a random value between zero and the received value in IE 'TU3907 Timer' and

- add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907

- start timer TU3907 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.1.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and starts to try to register again after receiving GA-RC DEREGISTER with cause 'Network Congestion'.

81.2.6.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the serving GANC's FQDN

- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID

- MS in state GA-CSR DEDICATED with an active call

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause ‘Network Congestion’.

The MS is supposed to start the Registration procedure when TU3907 has expired.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: network congested. TU3907 is set to 10 sec.
2	MS			Release the active call
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
4	MS			The SS checks that the following step is initiated by the MS within min 10 and 20 sec
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.2.6.2 Registration Procedure, Deregister, AP Not Allowed, MS in State GA-RC REGISTERED

81.2.6.2.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'AP not allowed'

- release the TCP connection established to the GANC, if still established,

- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,

- store the AP-ID in the AP Black List of and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP black list i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.2.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'AP not allowed' until it is powercycled.

81.2.6.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'AP not allowed'.

The MS are not allowed to try to register again from the same AP. Therefore, wait for 5 minutes and then powercycle the MS so that the AP disappears from the AP black list and the MS can register again from that AP.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: AP not allowed.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5				MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.3 Registration Procedure, Deregister, Location Not Allowed, MS in State GA-CSR IDLE

81.2.6.3.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

  - if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Location not allowed'

- release the TCP connection established to the GANC, if still established,

- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,

- update the Location Black List according to the received information elements Location Black List indicator and Location Area Identification and not initiate a new Register Request from that Location, until the Location is removed from the Location Black List i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.3.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause ‘Location not allowed’ until it is powercycled.

81.2.6.3.3 Method of test

Initial conditions

System Simulator:

  - 1 GSM cell, default parameters

  - 1 GAN cell, default parameter

  - Public DNS without knowledge of the serving GANC’s FQDN

  - DNS inside of the SEGW associated with the serving GANC

Mobile Station:

  - MS has stored the FQDN to the serving GANC and its SEGW associated with the GSM cell (CGI)

  - MS in state GA-CSR IDLE

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause ‘Location not allowed’.

The MS are not allowed to try to register again from the same Location area. Therefore, wait for 5 minutes and then powercycle the MS so that the LAI disappears from the Location black list and the MS can register again from that Location area.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: Location not allowed.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.4 Registration Procedure, Deregister, IMSI Not Allowed

81.2.6.4.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.

- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'IMSI not allowed'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
- not initiate a new Registration procedure until the next power-on.

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'
- If the MS is not in GERAN/UTRAN coverage

- Remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.4.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'IMSI not allowed' until it is powercycled.

81.2.6.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the default GANC's FQDN
- DNS inside of the SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'IMSI not allowed'.

The MS are not allowed to try to register again. Therefore, wait for 5 minutes and then powercycle the MS so that the MS can register again.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: IMSI not allowed.
2				Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5				MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.5 Registration Procedure, Deregister, Unspecified

81.2.6.5.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Unspecified'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,

- act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'

- If the MS is not in GERAN/UTRAN coverage

- Remove information related to the AP-ID, if exists in the table.

Lower layer failure in the MS can be for example related to DNS, IPsec or TCP. If any lower layer failure happens in the MS, the MS shall:

- release the TCP connection towards the current GANC, if established,

- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5 and

-

-

If registration is still unsuccessful after a number of attempts defined by the MS parameter "Up Connect Attempt Count" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.

- Otherwise, start timer TU3905 and wait for it to expire.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4 and 6.2.4.2

81.2.6.5.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and act as if it has discovered a lower layer fault when it receives the GA-RC DEREGISTER message with message code ‘Unspecified’ and the number of failed attempts doesn’t exceed the Up Connection Attempt Count.

81.2.6.5.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the default GANC’s FQDN

- DNS inside of the SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW associated with the AP-ID

- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause ‘Unspecified’.

The MS will try to register again to the default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, with reject cause: Unspecified.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW and TU3905 is started
3	MS			TU3905 expires
4	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using FQDN
5	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.6 Registration Procedure, Deregister, Unspecified, Persistent Fault, Default GANC

81.2.6.6.1 Conformance requirement

3GPP TS 44.318, section 6.4.4:

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.

- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Unspecified'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
- act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'
- If the MS is not in GERAN/UTRAN coverage

- Remove information related to the AP-ID, if exists in the table.

3GPP TS 44.318, section 6.2.4.2:

Lower layer failure in the MS can be for example related to DNS, IPsec or TCP. If any lower layer failure happens in the MS, the MS shall:

- release the TCP connection towards the current GANC, if established,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5 and
- If registration is still unsuccessful after a number of attempts defined by the MS parameter "Up Connect Attempt Count" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.
- Otherwise, start timer TU3905 and wait for it to expire.

3GPP TS 44.318, section 6.2.4.5:

else if the MS attempted the registration towards the Default GANC

- delete the stored information about the Default GANC,
- delete the contents of the stored Serving GANC table
- Increment Redirection Counter
- initiate Discovery Procedure as defined in sub-clause 5.3

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4 and 6.2.4.2, 6.2.4.5

81.2.6.6.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and will act as after a Registration Failure when it receives the GA-RC DEREGISTER message with message code ‘Unspecified’ and the number of failed attempts exceeds the Up Connection Attempt Count..

81.2.6.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause ‘Unspecified’. The MS treat this as a lower layer fault and starts to try to set up the connection to the GANC again. The SS simulates a persistent lower layer fault and after three attempts the number of failed attempts has reached the ‘Up Connect Attempt Count’ parameter and the fault will be treated as a registration fault. The MS will perform a Discovery procedure towards the Provisioning GANC.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, with reject cause : Unspecified.
2	MS			Release the TCP connection to the serving GANC and the secure connection to the SEGW and TU3905 is started
3	MS			TU 3905 expires after 10 seconds
4	MS			MS tries to set up a secure connection to the default SEGW but fails. MS removes the secure connection. Number of Up Connect Attempts is increased to 1 and TU3905 is started
5	MS			TU 3905 expires after 10 seconds
6	MS			MS sets up a secure connection to the default SEGW and tries to set up a TCP connection to the default GANC but fails with the TCP connection. MS removes the TCP connection and the secure connection. Number of Up Connect Attempts is increased to 2 and TU3905 is started
7	MS			TU 3905 expires after 10 seconds
8	MS			MS sets up a secure connection to the default SEGW and tries to set up a TCP connection to the default GANC but fails with the TCP connection. MS removes the TCP connection and the secure connection. Number of Up Connect Attempts is increased to 3.
9	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
10	→		GA-RC DISCOVERY REQUEST	To provisioning GANC

81.2.6.7 Registration Procedure, Deregister, Invalid GANC, Serving GANC

81.2.6.7.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Invalid GANC'

- release the TCP connection established to the GANC, if still established.

- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,

- act as defined in sub-clause 6.2.4.5 "Registration Failure"

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.7.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again to the same GANC after receiving GA-RC DEREGISTER with cause 'Invalid GANC'.

81.2.6.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Invalid GANC'.

The MS will try to register to default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, invalid GANC.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
4	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.8 Registration Procedure, Deregister, Geo Location Not Known

81.2.6.8.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

  - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

  - 'Geo Location not known'

- release the TCP connection established to the GANC, if still established.

- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,

- not retry registration from this AP until the location is provided or until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.8.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'Geo location not known' until it is powercycled.

81.2.6.8.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Geo location not known'.

The MS are not allowed to try to register again. Therefore, wait for 5 minutes and then powercycle the MS so that the MS can register again.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		

1	←	GA-RC DEREGISTER	From serving GANC, cause: Geo location not known'.
2			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS		Wait for 5 minutes
4	MS		Powercycle the MS
5			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→	GA-RC REGISTER REQUEST	To serving GANC

81.2.6.9 Registration Procedure, Deregister, MS Initiated

81.2.6.9.1 Conformance requirement

When the MS is leaving or about to leave the GAN coverage and the MS has successfully registered with a GANC, it should:

- send the GA-RC DEREGISTER -message using the currently established TCP-connection,
- release the TCP connection towards the GANC,
- release the secure connection towards the SEGW, as defined in sub-clause 4.5 and
- release all resources related to GAN

Reference(s)

3GPP TS 44.318 sub-clause 6.4.1

81.2.6.9.2 Test purpose

To verify that the MS sends GA-RC DEREGISTER when it is about to leave the AP e.g. when it is powered off.

81.2.6.9.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will be switched off.

Test procedure

The MS sends the GA-RC DEREGISTER message as it is switched off.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			Switch off the MS
2	→		GA-RC DEREGISTER	To serving GANC
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW

81.2.6.10 Registration Procedure, Deregister, Network Congestion, MS in State GA-RRC CONNECTED

81.2.6.10.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;

- ignore the received Register Reject Cause Information Element, and

- proceed as defined in sub-clause 6.2.4.5.

- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:

- 'Network Congestion'

- release all local GAN resources (e.g. MS is in active call over GAN)

- release the TCP connection towards the current GANC and

- release the secure connection towards the GANC-SEGW, as defined in sub-clause 4.5

- create a random value between zero and the received value in IE 'TU3907 Timer' and

- add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907

- start timer TU3907 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.10.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and starts to try to register again after receiving GA-RC DEREGISTER with cause 'Network Congestion'.

81.2.6.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RRC CONNECTED (CS sublayer entity or CS sublayer entity or both CS and PS CS sublayer entities)

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Network Congestion'.

The MS is supposed to start the Registration procedure when TU3907 has expired.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: network congested. TU3907 is set to 10 sec.
2	MS			Release the active call
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
4	MS			The SS checks that the following step is initiated by the MS within min 10 and 20 sec
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3 Lower Layer Faults

81.3.1 TCP Reset

81.3.1.1 TCP Reset, Successful Re-establishment, MS in State GA-CSR DEDICATED

81.3.1.1.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-CSR or GA-PSR resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.1.2 Test purpose

To verify that the MS ca re-establish the TCP connection after receiving a TCP Reset.

81.3.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR DEDICATED
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will stay in GA-CSR DEDICATED.

Test procedure

The MS starts in GA-CSR DEDICATED.

The SS sends a TCP RST and the MS re-establish the TCP connection and send the GA-RC SYNCHRONISATION INFORMATION message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR DEDICATED
2	SS			The SS sends TCP RST
3	MS			The MS re-establish the TCP connection
4	→		GA-RC SYNCHRONIZATION INFORMATION	To serving GANC

81.3.1.2 TCP Reset, Unsuccessful Re-establishment, MS in State GA-CSR IDLE

81.3.1.2.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RC or GA-PSR resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.2.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR IDLE
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-CSR IDLE.

The SS sends a TCP RST and the MS tries to re-establish the TCP connection. When that fails it start timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR IDLE
2	SS			The SS sends TCP RST
3	MS			The MS tries to re-establish the TCP connection, the SS doesn’t reply. MS starts timer TU3905
4	MS			Wait for 10 seconds
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3.1.3 TCP Reset, Successful Re-establishment, MS in State GA-RRC-CONNECTED (CS domain)

81.3.1.3.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RRC resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.3.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-RRC-CONNECTED (CS domain)
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will stay in GA-RRC-CONNECTED (CS domain).

Test procedure

The MS starts in GA-RRC-CONNECTED (CS domain).

The SS sends a TCP RST and the MS re-establish the TCP connection and send the GA-RC SYNCHRONISATION INFORMATION message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-RRC-CONNECTED (CS domain)
2	SS			The SS sends TCP RST
3	MS			The MS re-establish the TCP connection
4	→		GA-RC SYNCHRONIZATION INFORMATION	To serving GANC

81.3.1.4 TCP Reset, Successful Re-establishment, MS in State GA-RRC-CONNECTED (PS domain)

81.3.1.4.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RRC resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.4.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-RRC-CONNECTED (PS domain)
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will stay in GA-RRC-CONNECTED (PS domain).

Test procedure

The MS starts in GA-RRC-CONNECTED (PS domain).

The SS sends a TCP RST and the MS re-establish the TCP connection and send the GA-RC SYNCHRONISATION INFORMATION message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-RRC-CONNECTED (PS domain)
2	SS			The SS sends TCP RST
3	MS			The MS re-establish the TCP connection
4	→		GA-RC SYNCHRONIZATION INFORMATION	To serving GANC

81.3.1.5 TCP Reset, Unsuccessful Re-establishment, MS in State GA-RRC-IDLE (CS and PS domains)

81.3.1.5.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RC or GA-RRC resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.5.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.5.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-RRC-IDLE (CS and PS domains)
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-RRC-IDLE (CS and PS domains).

The SS sends a TCP RST and the MS tries to re-establish the TCP connection. When that fails it start timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-RRC-IDLE (CS and PS domains)
2	SS			The SS sends TCP RST
3	MS			The MS tries to re-establish the TCP connection, the SS doesn't reply. MS starts timer TU3905
4	MS			Wait for 10 seconds
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3.2 Lower Layer Faults, MS is Registered

81.3.2.1 IPSec Tunnel Failure, MS in State GA-CSR IDLE

81.3.2.1.1 Conformance requirement

The handling of lower layer failures in the MS while in the GA-RC-DEREGISTERED state is described in sub-clauses 5.6.2 and 6.2.4.2.

The handling of lower layer failures in the MS while not in the GA-RC-DEREGISTERED state is described below:

For all lower layer failures in the MS (for example related to DNS, IPsec or TCP failures other than RST) except the TCP connection failure specified in section 6.6, the MS shall:

- release the TCP connection towards the current GANC, if established,
- stop timer TU3906,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5,
- start timer TU3905, and
- enter GA-RC-DEREGISTERED state.

Reference(s)

3GPP TS 44.318 sub-clause 9.5.

81.3.2.1.2 Test purpose

To verify that the MS tries to register again after a lower layer fault when in state GA-CSR IDLE.

81.3.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR IDLE
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-CSR IDLE.

The SS removes the Ipsec tunnel. When that happens the MS starts timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR IDLE
2	SS			The SS removes the Ipsec tunnel
3	MS			MS starts timer TU3905
4	MS			Wait for 10 seconds

5	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→	GA-RC REGISTER REQUEST	To serving GANC

81.3.2.2 TCP Failure, MS in State GA-CSR DEDICATED

81.3.2.2.1 Conformance requirement

The handling of lower layer failures in the MS while in the GA-RC-DEREGISTERED state is described in sub-clauses 5.6.2 and 6.2.4.2.

The handling of lower layer failures in the MS while not in the GA-RC-DEREGISTERED state is described below:

5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

82 GAN CS Domain Procedures

82.1 GA-CSR connection establishment

82.1.1 GA-CSR connection establishment / successful case

82.1.1.1 GA-CSR connection establishment, Upper Layer Message Transmission and GA-CRS connection release by GANC

82.1.1.1.1 Conformance requirement

The GA-CSR connection is a logical connection between the MS and the GANC. It is established when the upper layers in the MS request GA-CSR to enter dedicated mode. The MS initiates GA-CSR connection establishment by sending the GA-CSR REQUEST message to the network. When a successful response is received from the network, GA-CSR replies to the upper layer that it has entered dedicated mode. The upper layers have then the possibility to request transmission of messages to the network. These messages are sent to the network using GA-CSR UPLINK DIRECT TRANSFER messages as defined in sub-clause 7.2.1.

The GA-CSR UPLINK DIRECT TRANSFER message is used for the transfer of upper layer messages from the MS to the GANC while the GA-CSR DOWNLINK DIRECT TRANSFER message is used for the transfer of upper layer messages from the GANC to the MS. The first GA-CSR UPLINK DIRECT TRANSFER message received by the GANC triggers the establishment of the signalling connection to the CN for that MS.

The GANC initiates this procedure to command the MS to release the GA-CSR and any traffic channel resources and instruct the MS to leave GA-CSR-DEDICATED state.

The GA-CSR RELEASE message will include an RR cause indication as follows:

#0: normal release, e.g. at the end of a call.

- #1: unspecified abnormal release.
- #65: if e.g. a handover procedure is stopped because the call has been cleared.

When the MS receives the GA-CSR RELEASE message, it shall:

- transmit a GA-CSR RELEASE COMPLETE message to the GANC and release all GA-CSR and any traffic channel resources,
- Enter GA-CSR-IDLE state.

Reference(s)

3GPP TS 44.318 subclause 7.1 / 7.2 / 7.5.3 / 7.5.4

82.1.1.1.2 Test purpose

To verify that MS is able to initiate GA-CSR connection establishment between the MS and GANCand to verify that MS is able to communicate with the CN by encapsulating upper layer messages (CC/MM/SS/SMS messages) to GA-CSR UPLINK DIRECT TRANSFER container message and able to receive upper layer messages within GA-CSR DOWNLINK DIRECT TRANSFER container message.

To verify that MS is able to release the GA-CSR connection, able to move into GA-CSR-IDLE state and release all GA-CSR and any traffic channel resources, when the MS receives the GA-CSR RELEASE message from SS.

82.1.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR-IDLE state.

Test Procedure

The MS is made to initiate a GA-CSR connection establishment. The MS moves into GA-CSR-DEDICATED state when the MS receives the GA-CSR REQUEST ACCEPT message from the SS within timer TU3908 (5 sec.) from sending GA-CSR REQUEST message. SS verifies that MS sends GA-CSR UPLINK DIRECT TRANSFER message within 10s from GA-CSR REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-CSR DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-CSR RELEASE message. The MS enters GA-CSR-IDLE state and transmits a GA-CSR RELEASE COMPLETE to the SS and releases all GA-CSR and any traffic channel resources.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-CSR connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-CSR REQUEST	
4	←		GA-CSR REQUEST ACCEPT	
5	MS			MS in GA-CSR-DEDICATED state
6	→		GA-CSR UPLINK DIRECT TRANSFER	Within 10s from GA-CSR REQUEST ACCEPT message Containing (UL) CC/MM/SS/SMS message
7	←		GA-CSR DOWNLINK DIRECT TRANSFER	Containing (DL) CC/MM/SS/SMS message
8	←		GA-CSR RELEASE	IE ‘RR cause’ indicates #0
9	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.1.2 GA-CSR connection establishment / negative cases

82.1.2.1 GA-CSR REQUEST rejected

82.1.2.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.1.2.2:

If the GANC rejects the GA-CSR connection establishment request, it shall send the GA-CSR REQUEST REJECT message to the MS.

3GPP TS 44.318 subclause 7.1.3.2:

When the MS receives the GA-CSR REQUEST REJECT message, it shall:

- if timer TU3908 is active:

- stop timer TU3908,
- remain in GA-CSR-IDLE state and
- indicate to upper layers that GA-CSR was not able to enter dedicated state

3GPP TS 44.318 subclause 7.3.2:

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

- if timer TU3908 is not active and access to the network is allowed;

- send a GA-CSR PAGING RESPONSE message to the GANC and
- enter GA-CSR-DEDICATED state.

3GPP TS 44.318 subclauses 7.1.2.2 / 7.1.3.2 / 7.3.2

82.1.2.1.2 Test purpose

To verify that MS will remain in GA-CSR-IDLE state when MS receives the GA-CSR REQUEST REJECT message.

82.1.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR- IDLE state.

Test Procedure

The MS is made to initiate a GA-CSR connection establishment. SS sends the GA-CSR REQUEST REJECT message to the MS. MS is not able to enter GA-CSR-DEDICATED state. The SS sends GA-CSR PAGING REQUEST to verify that MS in GA-CSR-IDLE state. MS answers by sending GA-CSR PAGING RESPONSE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-CSR connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-CSR REQUEST	TU3908 is started
4	←		GA-CSR REQUEST REJECT	The SS sends GA-CSR REQUEST REJECT before the expiry of TU3908.

5	MS		MS in GA-CSR-IDLE state
6	←	GA-CSR PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI')
7	→	GA-CSR PAGING RESPONSE	MS enters GA-CSR-DEDICATED state
8	←	GA-CSR RELEASE	IE 'RR cause' indicates #0
9	→	GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.1.2.2 MS receives GA-CSR REQUEST ACCEPT message after TU3908 expiry

82.1.2.2.1 Conformance requirement

If the GANC accepts the GA-CSR connection establishment request, it shall send the GA-CSR REQUEST ACCEPT message to the MS.

When the MS receives the GA-CSR REQUEST ACCEPT message, it shall:

- if timer TU3908 is active:

- stop timer TU3908,
- move into GA-CSR-DEDICATED state,
- indicate to upper layers that GA-CSR has entered dedicated state and
- send the initial GA-CSR UPLINK DIRECT TRANSFER message to the network

  - if timer TU3908 is not active:

- ignore the GA-CSR REQUEST ACCEPT message and
- continue with any ongoing procedure as if the GA-CSR REQUEST ACCEPT message was not received

  - If timer TU3908 expires in the MS, the MS shall remain in GA-CSR-IDLE state and indicate to upper layers that GA-CSR was not able to enter dedicated state

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

  - if timer TU3908 is not active and access to the network is allowed;

- send a GA-CSR PAGING RESPONSE message to the GANC and
- enter GA-CSR-DEDICATED state.

  - if timer TU3908 is active;
  - discard the received GA-CSR PAGING REQUEST message.

82.2 Upper layer message transmission

82.2.1 Upper layer message transmission / successful cases

82.2.1.1 Void

82.2.2 Upper layer message transmission / negative cases

82.2.2.1 MS receives GA-CSR DOWNLINK DIRECT TRANSFER message when not in GA-CSR-DEDICATED state

82.2.2.1.1 Conformance requirement

If the MS receives a GA-CSR DOWNLINK DIRECT TRANSFER message and MS is not in GA-CSR-DEDICATED state, the MS shall:

- ignore the contents of the GA-CSR DOWNLINK DIRECT TRANSFER message;
- transmit a GA-CSR STATUS message as follows:

- set the IE "RR Cause" to " Message type not compatible with protocol state"
- include the received message contents in the IE "PDU in error"

- continue with any ongoing procedure and act as if the GA-CSR DOWNLINK DIRECT TRANSFER message was not received.

Reference(s)

3GPP TS 44.318 subclause 7.2.4.1

82.2.2.1.2 Test purpose

To verify that MS ignores the contents of the GA-CSR DOWNLINK DIRECT TRANSFER message if MS is not in GA-CSR-DEDICATED state and to be able to send GA-CSR STATUS message to the SS.

82.2.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR-IDLE state in service of GAN cell

Test Procedure

MS is in GA-CSR-IDLE state in service of GAN cell. SS sends GA-CSR DOWNLINK DIRECT TRANSFER message containing upper layer message. MS ignores the contents of the message and sends GA-CSR STATUS message to the SS with IE ‘RR Cause’: ‘Message type not compatible with protocol state’. MS includes the received message contents in the IE ‘PDU in error’.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-IDLE state
2	←		GA-CSR DOWNLINK DIRECT TRANSFER	Containing (DL) CC/MM/SS/SMS message
3	→		GA-CSR STATUS	RR Cause: 'Message type not compatible with protocol state' PDU in Error: '<received (DL) message>'

82.3 Paging for CS domain

82.3.1 Paging for CS domain / successful case

82.3.1.1 Paging for CS domain

82.3.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.3.1:

The GANC initiates this procedure when it receives a PAGING REQUEST message over the A-interface or a Paging CS over the Gb-interface. The MS to be paged is identified by the identity received in the request from the CN. If the request includes the TMSI then the GANC should include the TMSI as the mobile identity else it should include the IMSI received in the request.

3GPP TS 44.318 subclause 7.3.2:

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

- if timer TU3908 is not active and access to the network is allowed;

- send a GA-CSR PAGING RESPONSE to the GANC and

- enter GA-CSR-DEDICATED state.

3GPP TS 44.318 subclause 7.3.4:

If the MS receives a GA-CSR PAGING REQUEST and the mobile identity included in the message does not match any of the valid identities assigned to the MS, the MS shall:

- ignore the GA-CSR PAGING REQUEST message

- continue with any ongoing procedure as if the GA-CSR PAGING REQUEST message was not received.

Reference(s)

3GPP TS 44.318 subclauses 7.3.1 / 7.3.2 / 7.3.4

82.3.1.1.2 Test purpose

To verify that MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure, if received GA-CSR PAGING REQUEST doesn't contain valid identity.

To verify that MS is able send a GA-CSR PAGING RESPONSE to the SS and enter GA-CSR-DEDICATED state when MS receives GA-CSR PAGING REQUEST with valid identities of the MS.

82.3.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR-IDLE state in service of GAN cell Test Procedure

The SS initiates paging procedure by sending GA-CSR PAGING REQUEST message with not matching identity to the MS. MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received. After 10s the SS sends GA-CSR PAGING REQUEST to verify that MS in GA-CSR-IDLE state. MS answers by sending GA-CSR PAGING RESPONSE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-CSR PAGING REQUEST	With not matching identity
2	MS			MS ignores GA-CSR PAGING REQUEST message
3	SS			SS waits 10s for response
4	←		GA-CSR PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI')
5	→		GA-CSR PAGING RESPONSE	MS enters GA-CSR-DEDICATED state
6	←		GA-CSR RELEASE	IE 'RR cause' = #0
7	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.3.2 Paging for CS domain / negative cases

82.3.2.1 Void

82.3.2.2 MS receives GA-CSR PAGING REQUEST when TU3908 is active

82.3.2.2.1 Conformance requirement

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

- if timer TU3908 is not active and access to the network is allowed;

- send a GA-CSR PAGING RESPONSE message to the GANC and

- enter GA-CSR-DEDICATED state.

- if timer TU3908 is active;

- discard the received GA-CSR PAGING REQUEST message

Reference(s)

3GPP TS 44.318 subclause 7.3.2

82.3.2.2.2 Test purpose

To verify that MS discards the received GA-CSR PAGING REQUEST message if timer TU3908 is active.

82.3.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR- IDLE state.

Test Procedure

MS is made to initiate GA-CSR connection. MS sends GA-CSR REQUEST message and activates timer TU3908. The SS initiates paging procedure by sending GA-CSR PAGING REQUEST message to the MS when TU3908 is active in MS. MS discards the received GA-CSR PAGING REQUEST message. After TU3908 expiry the SS sends GA-CSR PAGING REQUEST to verify that MS in GA-CSR-IDLE state. MS may answer by sending GA-CSR PAGING RESPONSE or re-establish the GA-CSR connection by re-sending GA-CSR REQUEST message.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-CSR connection
2	→		GA-CSR REQUEST	MS activates TU3908
3	←		GA-CSR PAGING REQUEST	Valid identity of the MS (‘TMSI’/’IMSI’), sent before TU3908 expiry
4	MS			MS discards GA-CSR PAGING REQUEST message
5	SS			SS waits for TU3908 to expire. The MS may resend GA-CSR REQUEST after the expiry of TU3908. The following steps are executed only if no GA-CSR REQUEST is received from the MS.
6	←		GA-CSR PAGING REQUEST	Valid identity of the MS (‘TMSI’/’IMSI’)
7	→		GA-CSR PAGING RESPONSE	MS enters GA-CSR-DEDICATED state
8	←		GA-CSR RELEASE	IE ‘RR cause’ indicates #0
9	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.3.2.3 MS receives GA-CSR PAGING REQUEST when in GA-CSR DEDICATED state

82.3.2.3.1 Conformance requirement

If the MS receives a GA-CSR PAGING REQUEST message and MS is in GA-CSR-DEDICATED state or GA-RC-REGISTERED state, the MS shall:

- ignore the GA-CSR PAGING REQUEST message
- continue with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 7.3.4

82.3.2.3.2 Test purpose

To verify that MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received, if MS receives GA-CSR PAGING REQUEST when MS is in GA-CSR-DEDICATED state.

82.3.2.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell.

Foreseen Final State of the MS

MS in GA-CSR-IDLE state in service of GAN cell.

Test Procedure

The MS is in GA-CSR-DEDICATED state in service of GAN cell. The SS initiates paging procedure by sending GA-CSR PAGING REQUEST message to the MS. The MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received. After 10s the SS sends GA-CSR RELEASE to verify that MS in GA-CSR-DEDICATED state. MS answers by sending GA-CSR RELEASE COMPLETE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-DEDICATED state with ongoing procedure
2	←		GA-CSR PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI')
3	MS			MS ignores the GA-CSR PAGING REQUEST and continues with ongoing procedure
4	SS			SS waits 10s for response
5	←		GA-CSR RELEASE	IE 'RR cause'

82.4 Traffic Channel assignment

82.4.1 Traffic Channel assignment / successful cases

82.4.1.1 Traffic Channel assignment

82.4.1.1 Traffic Channel assignment and Release

82.4.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.4.2:

The MS shall act on the received GA-CSR ACTIVATE CHANNEL message when in GA-CSR-DEDICATED state as follows:

- Code and decode the CS payload samples according to the IE "Channel Mode";
- Use the value indicated by the IE "Sample Size" as the minimum sampling size for the coding and decoding of the CS payload samples, if the MS is not able to use the indicated value. If AMR is used with FEC by sending redundant frames, the sample size is defined as the size of the new speech sample in each RTP packet, not including any redundant speech sample.
- Configure the uplink CS payload stream to be transmitted to the UDP port identified by the IE "UDP Port";
- Configure the uplink CS payload stream to be transmitted to the IP address identified by the IE "IP address";
- If received, use the configuration included in the IE 'Multi-rate Configuration' for the CS payload stream;
- If received, use the configuration included in the IE "RTP Redundancy Configuration" for the CS payload stream. The redundancy policy is defined for each of the AMR modes to use. The level of redundancy can span from no redundancy to double redundancy. In the same active codec set, a lower codec mode shall not be associated with a lower redundancy level then a higher codec mode. For example, the highest mode in the set is used with no redundancy, the next lower with single redundancy and rest of the modes with double redundancy;
- If received, use the Payload Type included in the IE 'Payload Type' for the PT field in the RTP header for the CS downlink and uplink payload streams;
- On successful activation of the channel, the MS shall:

- Transmit a GA-CSR ACTIVATE CHANNEL ACK message and include the UDP port number in the IE 'UDP Port" for the downlink CS payload stream to be used by the GANC.

- Include the selected RTP sample size, to be used uplink and downlink, in the IE Sample Size.

- if the IE ‘RTCP UDP Port’ was received in the GA-CSR ACTIVATE CHANNEL message and the MS is capable of supporting RTCP, activate the uplink RTCP stream and include the IE ‘RTCP UDP Port’ for the downlink RTCP stream to be used by the GANC.

3GPP TS 44.318 subclause 7.4.4:

The RTP channel is available for use by upper layers. To enable uplink quality measurements in the GANC, the MS shall send at least one RTP frame each 480 ms. The AMR payload Table of Contents shall indicate NO_DATA if there is no speech or SID frames to send.

3GPP TS 44.318 subclause 7.5.1:

If the MS needs to release the GA-CSR connection and signalling connection to the core network, it shall send the GA-CSR CLEAR REQUEST message to the GANC. The MS shall include the ‘RR Cause’ IE.

Reference(s)

3GPP TS 44.318 subclauses 7.4.2 / 7.4.4/ 7.5.1

82.4.1.1.2 Test purpose

To verify that MS is able to establish a GAN traffic channel.

The MS initiates the release the GA-CSR connection by sending GA-CSR CLEAR REQUEST to the SS. The MS enters GA-CSR-IDLE state and releases all GA-CSR and any traffic channel resources.

82.4.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-CSR-IDLE state in service of GAN cell.

Test Procedure

A voice call is ongoing.The SS configures a traffic channel by transmitting GA-CSR ACTIVATE CHANNEL to the MS. MS responses by transmitting a GA-CSR ACTIVATE CHANNEL ACK with the IE ‘UDP Port’. Then the SS configures itself for transmission of RTP packets to the MS to the indicated UDP port and transmits a GA-CSR ACTIVATE CHANNEL COMPLETE message to the MS. MS and SS sends at least one RTP frame each 480 ms. The SS releases the call by sending GA-CSR DL DIRECT TRANSFER message (Release) and receiving GA-CSR UL DIRECT TRANSFER (Release Complete) message. Therefore, the MS will send GA-CSR CLEAR REQUEST to release CSR connection.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-DEDICATED state, voice call is ongoing.

2	←	GA-CSR ACTIVATE CHANNEL	IE ‘Channel Mode’, IE ‘Sample Size’, IE ‘UDP Port’, IE ‘IP address’, optional IE ‘Multi-rate Configuration’, optional IE ‘RTP Redundancy Configuration ‘, optional IE ‘Payload Type’.
3	→	GA-CSR ACTIVATE CHANNEL ACK	IE ‘UDP Port’, optional IE ‘RTCP UDP Port’
4	←	GA-CSR ACTIVATE CHANNEL COMPLETE	
5	→		Verify that the MS sends at least one RTP frame
6	←	GA-CSR DL DIRECT TRANSFER (Release)	
7	→	GA-CSR UL DIRECT TRANSFER (Release Complete)	Eventual CC L3 messages are ignored.
8	→	GA-CSR CLEAR REQUEST	

82.4.2 Traffic Channel assignment / negative cases

82.4.2.1 MS fails to establish the traffic channel

82.4.2.1.1 Conformance requirement

If the MS fails to establish the channel indicated in the GA-CSR ACTIVATE CHANNEL the MS shall:

- transmit a GA-CSR ACTIVATE CHANNEL FAILURE message
- act as if the GA-CSR ACTIVATE CHANNEL message was not received.

Reference(s)

3GPP TS 44.318 subclause 7.4.5

82.4.2.1.2 Test purpose

To verify that if MS fails to establish the traffic channel, it transmits a GA-CSR ACTIVATE CHANNEL FAILURE and act as if the GA-CSR ACTIVATE CHANNEL was not received.

82.4.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-CSR- IDLE state in service of GAN cell.

Test Procedure

A voice call is ongoing. The SS configures a traffic channel by transmitting corrupted GA-CSR ACTIVATE CHANNEL to the MS. In the corrupted GA-CSR ACTIVATE CHANNEL message “Sample Size” octet 3 is set to “1” (1ms), which is a undefined value.

MS fails to establish the traffic channel and transmits a GA-CSR ACTIVATE CHANNEL FAILURE and acts as if the GA-CSR ACTIVATE CHANNEL was not received.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-DEDICATED state, voice call is ongoing
2	←		GA-CSR ACTIVATE CHANNEL	This message has non-supportive configuration, with a “Sample Size” octet 3 set to “1”
3	MS			MS fails to establish the traffic channel
4	→		GA-CSR ACTIVATE CHANNEL FAILURE	IE ‘FAILURE message identity’
5	←		GA-CSR RELEASE	IE ‘RR cause’ indicates #0
6	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.5 Release of GA-CSR

82.5.1 Release of GA-CSR

82.5.1.1 Void

82.5.1.2 Void

82.6 Classmark Indication

82.6.1 Classmark Indication Procedure

82.6.1.1 Classmark Indication, Initiation of Classmark Interrogation by MS

82.6.1.1.1 Conformance requirement

On receipt of the GA-CSR CLASSMARK ENQUIRY message or in case of "early classmark sending" procedure based on the system information indication received in GA-RC REGISTER ACCEPT message, the mobile station sends a GA-CSR CLASSMARK CHANGE message to the GANC.

The MS shall include the IE "Mobile Classmark 2" in the GA-CSR CLASSMARK CHANGE. It may also contain a IE "Mobile Classmark 3" depending on the MS capabilities.

In addition a MS supporting UTRAN sends a GA-CSR UTRAN CLASSMARK CHANGE message.

The Classmark Enquiry Mask information element in the GA-CSR CLASSMARK ENQUIRY message indicates the type of request. If the Classmark Enquiry Mask information element is not included in the GA-CSR CLASSMARK ENQUIRY message, this indicates a request for GA-CSR CLASSMARK CHANGE message.

Reference(s)

3GPP TS 44.318 sub-clause 7.6.2

82.6.1.1.2 Test purpose

To verify that the MS replies the GA-CSR CLASSMARK ENQUIRY correctly.

82.6.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR-DEDICATED

Foreseen final state of the MS

MS in GA-CSR- IDLE state.

Test procedure

The SS sends the GA-CSR CLASSMARK ENQUIRY message. The MS replies with the GA-CSR CLASMARK CHANGE message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Reference(s)Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-CSR CLASSMARK ENQUIRY	The Classmark Enquiry Mask information element is not included
2	→		GA-CSR CLASSMARK CHANGE	
3	←		GA-CSR RELEASE	IE ‘RR cause’ indicates #0
4	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.7 Handover to GAN

82.7.1 Handover to GAN / successful cases

82.7.1.1 Handover from GERAN to GAN

82.7.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.7.1:

The procedure is initiated when the source radio access technology (e.g. GERAN) orders the MS to make handover to GAN.

The procedure is applicable in GA-RC REGISTERED state provided the conditions described in Annex C: "(Source-RAT) Measurement Report for Handover and Cell Change Order to GAN" are met.

The handover order in the source radio access technology mode is sent via the (RR) HANDOVER COMMAND message. If the ARFCN and BSIC parameters included in the Cell Description IE in the (RR) HANDOVER COMMAND message (specified in [12]) match those of the GAN cell, the MS shall:

- send a GA-CSR HANDOVER ACCESS message to the network including the complete (RR) HANDOVER COMMAND message in the Handover To GAN Command IE and enter GA-CSR-DEDICATED state;

NOTE: sending the complete (RR) HANDOVER COMMAND message in the Handover To GAN Command IE instead of the Handover Reference IE allows for more than 256 concurrent handover requests

- if non-signalling mode is indicated in Channel Mode IE, the MS shall:

- start timer TU3920;

3GPP TS 44.318 subclause 7.7.3:

- If the traffic channel assignment was successfully completed within timer TU3920, the MS shall:

- stop timer TU3920;
- send a GA-CSR HANDOVER COMPLETE message to the network;
- switch to GAN mode i.e. attach the GA-RR entity to the RR-SAP;

In addition the MS shall send upper layer messages for which LAPDm has not yet received acknowledgement from the network to the network using the GA-RR entity.

8	MS		MS terminates handover procedure and resumes connection on GERAN cell
9	→	HANDOVER FAILURE	Sent on GERAN cell

82.8 Handover from GAN

82.8.1 Handover from GAN / successful cases

82.8.1.1 Handover from GAN to GERAN

82.8.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.8.1:

The purpose of this procedure is to transfer, upon request from the MS (and under the control of the GAN), a connection between MS and GAN to another radio access technology (e.g. GERAN).

The procedure is applicable in GA-CSR-DEDICATED state.

The procedure may be initiated by the MS based on:

- local measurements of GAN coverage signal quality;
- reception of a GA-CSR UPLINK QUALITY INDICATION message indicating poor uplink quality in the *UL Quality Indication* IE; If the UL Quality Indication IE indicates "Network problem" a handover out to GERAN or UTRAN should be attempted. In case the UL Quality Indication information element shows "Radio problem" or "Undetermined problem" a search for a new access point should be done before the handover out is initiated;
- reception of RTCP packets indicating poor uplink quality;
- excessive loss or delay in the received RTP packets.

When the MS decides to trigger the handover from GAN, it shall:

- send a GA-CSR HANDOVER INFORMATION message to the network including a list of candidate/ target cell identifiers ranked in order of preference which is the most recent list available from the other radio access technology (e.g. GSM RR) and including the received signal strength for each identified GERAN or UTRAN cell. The MS may include GERAN cells, UTRAN cells or both.

3GPP TS 44.318 subclause 7.8.3:

The MS shall:

- suspend all NAS layer signalling transmissions;
- start the connection establishment to the target radio access technology (e.g. GERAN) by using the contents of the Handover From GAN Command IE. This message carries information about the candidate/ target cell identifier and radio parameters relevant for the target radio access technology;

A MS that is simultaneously operating in GPRS and CS modes over GAN shall follow the procedure as outlined in 3GPP TS 43.055 when it switches to target cell.

NOTE: The requirements concerning the establishment of the radio connection towards the target radio access technology (e.g. GERAN) and the signalling procedure are outside of the scope of this specification.

3GPP TS 44.318 subclause 7.8.4:

Upon successfully completing the handover, the GANC should:

- release all radio resources associated with the GAN connection.

Upon successfully completing the handover, the MS shall:

- switch to target radio access technology (e.g. GERAN) mode i.e. detach the GA-RR entity from the RR-SAP;
- enter GA- RC -REGISTERED state.

NOTE: The release of the GAN radio resources is initiated from the target RAT. The MS may deregister from the GANC (as defined in sub-clause 6.4) after successfully completing the handover. If the MS chooses to deregister from the GANC, it may do so either immediately after successfully completing the handover or after sending the GA-CSR RELEASE COMPLETE message to the GANC in response to the GA-CSR RELEASE message from the GANC.

MS in GA-CSR-IDLE state

Test Procedure

The MS is in GA-CSR-DEDICATED state in service of GAN cell, voice call activated. SS sends GA-CSR UPLINK QUALITY INDICATION to the MS indicating poor uplink quality. MS sends a GA-CSR HANDOVER INFORMATION with candidate lists. SS sends GA-CSR HANDOVER COMMAND message to the MS. MS starts the connection establishment to the GERAN cell. MS does not succeed in establishing a connection to the target GERAN cell. MS reverts back to the GAN configuration, sends a GA-CSR HANDOVER FAILURE message and resumes normal operation.

Specific test parameters

	MS	SS		
1				MS in GA-CSR-DEDICATED state in service of GAN cell, voice call activated
2	←		GA-CSR UPLINK QUALITY INDICATION	IE ‘UL Quality Indication’
3	→		GA-CSR HANDOVER INFORMATION	IE ‘Cell Identifier List’
4	←		GA-CSR HANDOVER COMMAND	IE ‘Handover From GAN Command’. Indicates non-synchronized handover.
5	→		HANDOVER ACCESS	Repeated until T3124 (TS 3GPP 44.018) expires.
6	→		GA-CSR HANDOVER FAILURE	IE ‘RR Cause’ as in test case 26.6.5.8.
7	←		GA-CSR RELEASE	IE 'RR cause' indicates #0
8	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.8.2.2 Handover command with non-supported configuration

82.8.2.2.1 Conformance requirement

If the GA-CSR HANDOVER COMMAND message instructs the MS:

- to perform a non-supported scenario, or
- to use a non-supported configuration,

the MS shall return a GA-CSR HANDOVER FAILURE message with cause as defined in 3GPP TS 44.018 and resume normal operation as if the GA-CSR HANDOVER COMMAND message has not been received.

Reference(s)

3GPP TS 44.318 subclause 7.8.7

82.8.2.2.2 Test purpose

To verify that if the GA-CSR HANDOVER COMMAND message instructs the MS to use a non-supported configuration, MS resumes normal operation as if the GA-CSR HANDOVER COMMAND message has not been received.

82.8.2.2.3 Method of test

Initial Conditions

System Simulator:

- 2 cells: GERAN cell & GAN cell
- 1 GERAN cell, default parameters
- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell, voice call activated

Foreseen Final State of the MS

MS in GA-CSR-IDLE state.

Test Procedure

The MS is in GA-CSR-DEDICATED state in service of GAN cell, voice call activated. SS sends GA-CSR UPLINK QUALITY INDICATION to the MS indicating poor uplink quality. MS sends a GA-CSR HANDOVER INFORMATION with candidate lists. SS sends GA-CSR HANDOVER COMMAND message to the MS. The GA-CSR HANDOVER COMMAND message instructs the MS to use a not supported frequency. MS sends a GA-CSR HANDOVER FAILURE message and resumes normal operation as if the GA-CSR HANDOVER COMMAND message has not been received.

Specific test parameters

82.9 Ciphering Configuration Procedure

82.9.1 Ciphering Configuration Procedure, Normal cases

82.9.1.1 Ciphering Configuration Procedure

82.9.1.1.1 Conformance requirement

The network initiates the ciphering mode setting procedure by sending a GA-CSR CIPHERING MODE COMMAND message to the mobile station, indicating whether ciphering shall be used or not, and if yes which algorithm to use.

Additionally, the network may, by the use of the cipher response information element, request the mobile station to include its IMEISV in the GA-CSR CIPHERING MODE COMPLETE message.

Whenever the mobile station receives a valid GA-CSR CIPHERING MODE COMMAND message, it shall, if a SIM is present and considered valid and the ciphering key sequence number stored on the SIM indicates that a ciphering key is available, save information about the ciphering key to use if the MS is later performing Handover from GAN. A valid GA-CSR CIPHERING MODE COMMAND message is defined to be one of the following:

- one that indicates "start ciphering" and is received by the mobile station in the "not ciphered" mode;
- one that indicates "no ciphering" and is received by the MS in the "not ciphered" mode; or
- one that indicates "no ciphering" and is received by the mobile station in the "ciphered" mode.

Other GA-CSR CIPHERING MODE COMMAND messages shall be regarded as erroneous, and a GA-CSR STATUS message with cause "Protocol error unspecified" shall be returned, and no further action taken.

The MS shall also calculate a MAC (Message Authentication Code). The MAC shall be calculated over the following data:

RAND | IMSI

using "HMAC-SHA1-96" algorithm, as specified in [24] with Kc as authentication key.

In the formulas above, the "|" character denotes concatenation. RAND is the 16-octet random number received from the GANC in the GA-CSR CIPHERING MODE COMMAND message. IMSI is the MS IMSI, in the same format as defined for the Mobile Identity IE as defined in [8 / 3GPP TS 44.318 v.6.0.0] i.e. as a variable-length sequence of digits in BCD format (e.g. the IMSI "123456789098765" is encoded as the following octets (in hexadecimal): "21 43 65 87 09 89 67 F5"). Network byte order is used.

The Kc key is the Kc that has been derived during the last authentication. The length of the MAC is 12 octets.

When the appropriate action on the GA-CSR CIPHERING MODE COMMAND message has been taken, the mobile station sends back a GA-CSR CIPHERING MODE COMPLETE message. If the "cipher response" field of the cipher response information element in the GA-CSR CIPHERING MODE COMMAND message specified "IMEISV must be included" the mobile station shall include its IMEISV in the GA-CSR CIPHERING MODE COMPLETE message.

Reference(s)

3GPP TS 44.318 sub-clause 7.9.1 and 7.9.2

82.9.1.1.2 Test purpose

To verify that the MS can reply a GA-CSR CIPHERING MODE COMMAND message and return the correct Message Authentication Code (MAC).

82.9.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR-DEDICATED
- MS in not ciphered mode

Foreseen final state of the MS

MS in GA-CSR IDLE state.Test procedure

The SS sends the GA-CSR CIPHERING MODE message. The Cipher Response IE should indicate that IMEISV should not be included. The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. SS checks that the IMEISV is not included and that the MAC is correct. The SS sends another GA-CSR CIPHERING MODE COMMAND message with SC in Cipher Mode Setting IE set to “No ciphering”. The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. The SS sends new GA-CSR CIPHERING MODE message. The Cipher Response IE should indicate that IMEISV should be included. The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. SS checks that the IMEISV is included and that the MAC is correct.

82.10 Channel mode modify procedure

82.10.1 Channel mode modify procedure / successful cases

82.10.1.1 Channel mode modify / successful case

82.10.1.1.1 Conformance requirement

In dedicated mode, the GANC can request a modification of the channel mode, multi-rate configuration, RTP redundancy configuration, sample size, GANC IP address, GANC RTP UDP port and GANC RTCP UDP port used for an active traffic channel.

The channel mode modify procedure allows the network to request the mobile station to modify configuration used for an active channel. The channel mode covers the coding, decoding and transcoding mode as well as the redundancy policy used on the active channel.

This procedure is always initiated by the network.

The network initiates the procedure by sending a GA-CSR CHANNEL MODE MODIFY message to the mobile station.

When the MS has received the GA-CSR CHANNEL MODE MODIFY message, the mobile station modifies the configuration, sets the mode and/or the RTP redundancy configuration for the active channel and then replies by a GA-CSR CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the ordered channel mode.

Reference(s)

3GPP TS 44.318 subclauses 7.10 / 7.10.1.1 / 7.10.1.2

82.10.1.1.2 Test purpose

To verify that MS is able to change active channel mode if requested when it is different from the one used by the

mobile station or whether it is already in use.

82.10.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell, voice call activated

Foreseen Final State of the MS

MS in GA-CSR-IDLE state

Test Procedure

The MS is in GA-CSR-DEDICATED state in service of GAN cell, voice call activated. SS sends GA-CSR CHANNEL MODE MODIFY message to change active channel mode. The mode is different from the one used by the mobile station.

MS sets the mode for the active channel and then replies by a GA-CSR CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the ordered channel mode.

83.1.2.2 GANC Rejects GA-PSR TC Activation

83.1.2.2.1 Conformance requirements

Upon receiving the uplink user data transfer request from the LLC for LLC SAPI 3, 5, 9 or 11 and while the MS GA-PSR is in the GA-PSR-STANDBY state, the MS shall,

- send a GA-PSR-ACTIVATE-UTC-REQ message,
- start timer TU4002,
- set the uplink packet sequence number to 0,
- set the expected downlink packet sequence number to 0 and

If the GANC decides to reject GA-PSR TC activation, it shall send a GA-PSR-ACTIVATE-UTC-ACK message to the MS with the failure cause code and shall not include GANC IP address and UDP port number. The following rejection cause values are supported:

- "No available resources" indicates that the GANC failed to allocate required resources.
- "GANC failure" indicates internal GANC failure
- "Not authorized for data service" indicates that the MS is not authorized to use data services via GAN

Upon receiving the GA-PSR-ACTIVATE-UTC-ACK message indicating failure, the MS shall declare the procedure as failed to the upper layers.

References

3GPP TS 44.318, subclauses 8.2.1; 8.2.4.1; 8.2.4.4

83.1.2.2.2 Test purpose

To verify that by receiving the GA-PSR-ACTIVATE-UTC-ACK message with the failure cause code, described below, the MS would declare the procedure as failed to the upper layers.

83.1.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The MS initiates the GA-PSR-ACTIVE state transmitting GA-PSR-ACTIVATE-UTC-REQ to the SS. The SS responds with GA-PSR-ACTIVATE-UTC-ACK with failure code "No available resources". The MS remains in the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the SS sends GA-PSR-ACTIVATE-UTC-REQ and waits for the GA-PSR-ACTIVATE-UTC-ACK from the MS. Upon receiving theGA-PSR-ACTIVATE-UTC-ACK, the SS concludes that the MS was in GA-PSR-STANDBY state in step 4.

Maximum Duration of Test

1 min.

83.1.3 Network Initiated GA-PSR Transport Channel Activation, Normal Case

83.1.3.1 Processing of the GA-PSR TC Activation Request by the MS

83.1.3.1.1 Conformance requirements

Upon receiving the downlink user data transfer request associated with LLC SAPI 3, 5, 9 or 11 and if there is no GA-PSR TC associated with the specific MS, the GANC allocates the IP address and the UDP port number to be used by the MS for GPRS user data transport and sends a GA-PSR-ACTIVATE-UTC-REQ message to the MS. The GANC also:

- sets downlink packet sequence number to 0 and
- sets the expected uplink packet sequence number to 0

Upon receiving the GA-PSR-ACTIVATE-UTC-REQ message from the GANC, the MS shall verify the following:

- the GA-PSR is in GA-PSR-STANDBY state
- the GA-PSR TC does not exist
- the GPRS service is not suspended

Assuming successful verification, the MS shall allocate UDP port number for the MS GPRS user data transport and store the associated information. In parallel, the MS GA-PSR shall transition to GA-PSR-ACTIVE state and start TU4001 timer. Subsequently, the MS shall send the GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the cause indicating successful activation. The message includes the MS UDP port to be used for the downlink GPRS user data transport.

After the MS has sent the GA-PSR-ACTIVATE-UTC-ACK message, it shall:

- set the uplink packet sequence number to 0 and
- set the expected downlink packet sequence number to 0

When the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR shall send the GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel. In parallel, the MS shall start TU4002 timer to wait for the confirmation.

83.1.4.2 MS Rejects GA-PSR TC Activation when the GPRS Service is suspended

83.1.4.2.1 Conformance requirements

If the MS determines that the GPRS service is suspended when the GA-PSR-ACTIVATE-UTC-REQ is received, it shall send a GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the failure cause code set to "GPRS Suspended".

Upon receiving the GA-PSR-ACTIVATE-UTC-ACK message indicating that the GPRS service is suspended, the GANC aborts the activation procedure.

References

3GPP TS 44.318, subclause 8.3.4.2

83.1.4.2.2 Test purpose

To verify that on receiving a GA-PSR-ACTIVATE-UTC-REQ by the MS when the GPRS service for the MS is suspended, the MS sends a GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the failure cause code set to "GPRS Suspended".

83.1.4.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates the GA-PSR-ACTIVE state transmitting GA-PSR-ACTIVATE-UTC-REQ to the MS. The SS responds with GA-PSR-ACTIVATE-UTC-ACK and MS enters the GA-PSR-ACTIVE state. The MS starts to transmit data using GA-PSR-UNITDATA. The MS is made to initiate a voice call, which will make MS initiate the GPRS suspend procedure. The SS intitiates the GA-PSR-ACTIVE procedure, sending the GA-PSR-ACTIVATE-UTC-REQ.

The MS responds with GA-PSR-ACTIVATE-UTC-ACK, with failure cause code set to "GPRS Suspended"

The SS checks that GA-PSR-ACTIVATE-UTC-ACK, contains failure cause code "GPRS Suspended"

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				Trigger MS to initiate data transfer
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state
3	←		GA-PSR-ACTIVATE-UTC-ACK	MS is waiting for this message
4	→		GA-PSR-UNITDATA	MS is transmitting the uplink user data packets
5				MS is made to initiate a voice call
6		→	GA-CSR GPRS SUSPENSION REQUEST Or GA-CSR REQUEST	Repeat step 6 until both messages GA-CSR GPRS SUSPENSION REQUEST and GA-CSR REQUEST are received
7		←	GA-CSR REQUEST ACCEPT	MS in GA-CSR-DEDICATED state
8		→	GA-CSR UPLINK DIRECT TRANSFER	
9	←		GA-PSR-ACTIVATE-UTC-REQ	
10	→		GA-PSR-ACTIVATE-UTC-ACK	Failure cause code set to "GPRS Suspended"
11		←	GA-CSR RELEASE	IE 'RR cause', including GPRS resumption indication as per standard GSM/GPRS to indicate that resume of GPRS service is not necessary.
12		→	GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state and GA-PSR-STANDBY

83.1.4.3 MS Receives GA-PSR TC Activation Request while GA-PSR TC active

83.1.4.3.1 Conformance requirements

If the MS receives a GA-PSR TC activation message from the GANC while the GA-PSR TC is active, it shall send the GA-PSR-ACTIVATE-UTC-ACK message to the GANC. The message shall include MS UDP port allocated to the existing GA-PSR TC. In parallel, if the GANC provided new IP Address and UDP port number, the MS shall update the GA-PSR TC attributes accordingly.

After sending the GA-PSR-ACTIVATE-UTC-ACK message, the MS shall:

- set uplink packet sequence number to 0 and
- set the expected downlink packet sequence number to 0

References

3GPP TS 44.318, subclauses 8.2.1; 8.2.3 & 8.3.4.3

83.1.4.3.2 Test purpose

To verify that if the MS receives a GA-PSR TC activation message from the GANC while the GA-PSR TC is active, the MS sends the GA-PSR-ACTIVATE-UTC-ACK message to the GANC.

83.1.4.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS enters the GA-PSR-ACTIVE state and sends GA-PSR-UNITDATA. While the MS is transmitting data the SS sends GA-PSR-ACTIVATE-UTC-REQ with a different IP address and port number.

The MS responds with GA-PSR-ACTIVATE-UTC-ACK, containing the MS UDP port allocated to the existing GA-PSR TC. MS is triggered to initiate another data transfer. The MS transmits GA-PSR-UNITDATA, using new IP address and port number.

SS checks that the MS transmits the GA-PSR-UNITDATA, using new IP address and port number, and that the MS sets uplink packet sequence number to 0.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				Trigger MS to initiate data transfer
2	→		GA-PSR-ACTIVATE-UTC-REQ	
3	←		GA-PSR-ACTIVATE-UTC-ACK	
4	→		GA-PSR-UNITDATA	MS is transmitting the uplink user data packets
5	←		GA-PSR-ACTIVATE-UTC-REQ	SS provides different IP address and port number
6	→		GA-PSR-ACTIVATE-UTC-ACK	Message includes the MS UDP port allocated to the existing GA-PSR TC
7				Trigger MS to initiate an other data transfer
8	→		GA-PSR-UNITDATA	MS using new IP address and port number, SS verifies that sequence number =0.
9	←		GA-PSR-DEACTIVATE-UTC-REQ

83.1.5 MS Initiated Deactivation of GA-PSR Transport Channel, Normal Case

83.1.5.1 GA-PSR TC Deactivation Initiation by the MS

83.1.5.1.1 Conformance requirements

When the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR shall send GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel. In parallel, the MS shall start TU4002 timer to wait for the confirmation.

Upon receipt of a GA-PSR-DEACTIVATE-UTC-REQ message from the MS, the GANC releases the GA-PSR TC and sends the GA-PSR-DEACTIVATE-UTC-ACK message to the MS indicating successful deactivation; i.e. the cause IE is set to "success".

Upon receipt of a GA-PSR-DEACTIVATE-UTC-ACK message from the GANC, the MS GA-PSR shall stop TU4002 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

Packets received out-of-sequence should be dropped.

References

3GPP TS 44.318, subclauses 8.4.1; 8.4.2; 8.4.3 and 8.7.5.3

83.1.5.1.2 Test purpose

To verify that, when the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR sends GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel and in parallel, the MS starts TU4002 timer to wait for the confirmation.

To verify that upon receiving a GA-PSR-DEACTIVATE-UTC-ACK message from the GANC, the MS GA-PSR stops TU4002 timer, and releases the GA-PSR TC and that the MS GA-PSR transitions to GA-PSR-STANDBY state.

83.1.5.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS enters the GA-PSR-ACTIVE state and sends GA-PSR-UNITDATA. Once all expected data has been transmitted and the sequential TU has expired, the MS sends GA-PSR-DEACTIVATE-UTC-REQ, and starts TU4002, requesting SS to deactivate GA-PSR state. In response, the SS sends GA-PSR-DEACTIVATE-UTC-ACK. Upon receiving the GA-PSR-DEACTIVATE-UTC-ACK the MS stops the TU4002 and enters the GA-PSR-STANDBY state.

To verify that the MS deactivated timer TU4002, SS sends a GA-PSR-ACTIVATE-UTC-REQ again. If the MS deactivated TU4002, the MS will respond with a GA-PSR-ACTIVATE-UTC-ACK.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				Trigger MS to initiate data transfer
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state

83.1.6 MS Initiated Deactivation of GA-PSR Transport Channel, Abnormal Cases

83.1.6.1 Uplink User Data Transfer is initiated while GA-PSR TC Deactivation is in Progress

83.1.6.1.1 Conformance requirements

If the MS LLC initiates the uplink user data transfer after the MS GA-PSR has sent the deactivation request to the GANC, the MS GA-PSR shall complete the deactivation procedure first and than initiate a new GA-PSR TC activation procedure to enable data transfer.

References

3GPP TS 44.318, subclause 8.4.4.3

83.1.6.1.2 Test purpose

To verify that if the MS LLC initiates the uplink user data transfer after the MS GA-PSR has sent the deactivation request to the GANC, the MS GA-PSR completes the deactivation procedure first and than initiate a new GA-PSR TC activation procedure to enable data transfer.

83.1.6.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment by triggering a user data transfer of 1 octet. The SS responds with GA-PSR-ACTIVATE-UTC-ACK. After the MS completes the user data transfer it initiates deactivation by sending the GA-PSR-DEACTIVATE-UTC-REQ. Then MS is triggered to initiate the uplink user data transfer. The MS shall not start data transmission but instead initiates second activation by sending GA-PSR-ACTIVATE-UTC-REQ after the deactivation procedure is completed. The SS responds with GA-PSR-ACTIVATE-UTC-ACK and MS begins to transmit the data, sending GA-PSR-UNITDATA.

Maximum Duration of Test

1 min.

83.1.6.2 Downlink User Data Transfer is received while the GA-PSR TC Deactivation is in Progress

83.1.6.2.1 Conformance requirements

If the MS receives any downlink user data packets while waiting for the GA-PSR-DEACTIVATE-UTC-ACK message response, it shall abort the deactivation procedure (i.e. stop timer TU4002) and restart TU4001 timer.

References

3GPP TS 44.318, subclause 8.4.4.4

83.1.6.2.2 Test purpose

To verify that if the MS receives any downlink user data packets while waiting for the GA-PSR-DEACTIVATE-UTC-ACK response, it aborts the deactivation procedure (i.e. stop timer TU4002) and restarts TU4001 timer.

83.1.6.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The MS is made to initiate GA-PSR-ACTIVE state establishment by triggering a user data transfer of 1 octet. The SS responds with GA-PSR-ACTIVATE-UTC-ACK. After the MS completes the user data transfer it initiates deactivation by sending GA-PSR-DEACTIVATE-UTC-REQ. The SS sends GA-PSR-UNITDATA, preventing deactivation of the GA-PSR TC by the MS. To check that the MS is in GA-PSR-ACTIVE state, a data transmission is triggered in the MS. SS initiates deactivation procedure and sends GA-PSR-DEACTIVATE-UTC-REQ. The MS responds with GA-PSR-DEACTIVATE-UTC-ACK.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state by triggering user data transfer of 1 octet.

83.1.6.3 Unexpected GA-PSR-DEACTIVATE-UTC-ACK response

83.1.6.3.1 Conformance requirements

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR shall stop TU4001 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-STANDBY state, the message is silently discarded.

References

3GPP TS 44.318, subclauses 8.4.4.5

83.1.6.3.2 Test purpose

To verify that if the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR stops TU4001 timer, releases the GA-PSR TC and, the MS GA-PSR transitions to GA-PSR-STANDBY state.

83.1.6.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. While the MS transmits data, the SS sends GA-PSR-DEACTIVATE-UTC-ACK. The MS enters the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the SS sends the GA-PSR-UNITDATA message and expects to receive the GA-PSR-ACTIVATE-UTC-REQ.

Check for 10 sec that MS does not send any more messages.

To verify that the MS is in GA-PSR-STANDBY state a new connection is initiated with GA-PSR-ACTIVATE-UTC-REQ. If the MS responses with GA-PSR-ACTIVATE-UTC-ACK, the MS was in GA-PSR-STANDBY state.

Maximum Duration of Test

1 min.

Expected Sequence

83.1.6.4 Unexpected GA-PSR-ACTIVATE-UTC-REQ

83.1.6.4.1 Conformance requirements

If the MS receives any downlink user data packets while waiting for the GA-PSR-DEACTIVATE-UTC-ACK message response, it shall abort the deactivation procedure (i.e. stop timer TU4002) and restart TU4001 timer.

If the MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ message while waiting for GA-PSR-DEACTIVATE-UTC-ACK message response, the MS ignores the request and continues waiting for deactivation response.

References

3GPP TS 44.318, subclauses 8.4.4.4 and 8.4.4.6

83.1.6.4.2 Test purpose

To verify that if the MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ while waiting for GA-PSR-DEACTIVATE-UTC-ACK response, the MS ignores the request and continues waiting for deactivation response.

83.1.6.4.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS transmits data and sequentially initiates the deactivation procedure sending GA-PSR-DEACTIVATE-UTC-REQ. The MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ while waiting for GA-PSR-DEACTIVATE-UTC-

ACK response. MS ignores this message and continues to wait for the GA-PSR-DEACTIVATE-UTC-ACK response. SS waits for one second to make sure MS receives GA-PSR-ACTIVATE-UTC-REQ before GA-PSR-UNIT-DATA. SS sends the GA-PSR-UNITDATA, and MS responds by aborting the deactivation procedure. To finish the test SS sends GA-PSR-DEACTIVATE-UTC-REQ and MS responds with GA-PSR-DEACTIVATE-UTC-ACK.

Maximum Duration of Test

1 min.

Expected Sequence

83.1.7 GANC Initiated Deactivation of GA-PSR Transport Channel, Normal Case

83.1.7.1 GA-PSR TC Deactivation Initiation by the GANC

83.1.5.7.1 Conformance requirements

When the GANC decides to deactivate GA-PSR TC channel, it shall send GA-PSR-DEACTIVATE-UTC-REQ message to the MS to request the deactivation.

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR shall stop TU4001 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

References

3GPP TS 44.318, subclauses 8.5.1 & 8.4.4.5

83.1.7.1.2 Test purpose

To verify that upon receiving a GA-PSR-DEACTIVATE-UTC-REQ message from the GANC, the MS releases the GA-PSR TC, sends the GA-PSR-DEACTIVATE-UTC-ACK message to the GANC indicating successful deactivation and MS GA-PSR enters the GA-PSR-STANDBY state.

83.1.7.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates active state. The MS responds with GA-PSR-ACTIVATE-UTC-ACK. The SS initiates deactivation of the TC and sends GA-PSR-DEACTIVATE-UTC-ACK. The MS responds with GA-PSR-DEACTIVATE-UTC-ACK and enters the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the MS is triggered to send user data. Therefore, GA-PSR-ACTIVATE-UTC-REQ is expected to be sent from the MS. The SS sends GA-PSR-ACTIVATE-UTC-ACK message and waits for GA-PSR-UNITDATA.

Maximum Duration of Test

1 min.

Expected Sequence

83.1.8 Void

83.2 GA-PSR GPRS User Data Transport

83.2.1 GA-PSR GPRS User Data Transport , Normal Cases

83.2.1.1 MS Initiates Uplink GPRS User Data Transfer

83.2.1.1.1 Conformance requirements

The GPRS user data packets are tunnelled using UDP transport as specified for GA-PSR Transport Channel. Each packet is assigned a sequence number in the range of 0 to 65535 sequentially. The sequence number is set to 0 after reaching the maximum – 65535.

Assuming that the GA-PSR TC has been already activated as specified in sub-clauses 8.2 or 8.3, the MS GA-PSR is able to immediately forward any uplink GPRS user data packets to the GANC. Upon the request from the LLC to transfer an uplink LLC PDU with GPRS user data identified with LLC SAPI 3, 5, 9 or 11, the MS GA-PSR shall restart TU4001 timer and encapsulate the complete LLC PDU within a GA-PSR UNITDATA message.

Subsequently, the MS shall send the GA-PSR UNITDATA message to the GANC using the existing GA-PSR TC; i.e. using the corresponding GANC IP address and UDP port number.

The MS shall increment the uplink packet sequence number for each GA-PSR-UNITDATA message sent to the GANC.

References

3GPP TS 44.318, subclauses 8.7 & 8.7.1.

83.2.1.1.2 Test purpose

To verify that MS:

1) Uses corresponding GANC IP address and UDP port number,

2) Transmits at least 65537 packets, and that each packet is assigned a sequence number in the range of 0 to 65535 sequentially.

3) Assigns sequence number to 0 after reaching the maximum – 65535

83.2.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

The MS activates the GA-PSR TC with the corresponding GANC IP address and UDP port number and immediately forwards uplink GPRS user data, which consist of 65537 of packets, being requested from the MS LLC, to the GANC. The MS tunnels the GPRS data packets using UDP transport, assigning number to the packets in range from 0 to 65535 sequentially. The MS increments the uplink packet sequence number for each GA-PSR-UNITDATA message, being sent to the GANC, and assigns the number 0 after reaching the 65535.

SS verifies that MS:

1) Uses corresponding GANC IP address and UDP port number,

2) Transmits at least 65537 packets, and that each packet is assigned a sequence number in the range of 0 to 65535 sequentially.

3) Assigns sequence number to 0 after reaching the maximum – 65535

Maximum Duration of Test

30 min.

Expected Sequence

83.2.2.3 MS Receives a Downlink Message to Initiate Uplink GPRS User Data Transfer while the GA-PSR TC activation Procedure is in progress

83.2.2.3.1 Conformance requirements

Upon receiving a downlink message while the GA-PSR TC activation procedure is in progress (TU4002 timer is still running), the MS GA-PSR shall process the request as if the transport channel was active. The MS shall not initiate uplink GPRS user data transfer until the GA-PSR TC activation procedure is successfully completed (as specified in the subclause 8.2). The MS shall use the IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message for sending uplink GPRS user data packets to the GANC on that transport channel.

References

3GPP TS 44.318, subclause 8.7.5.4

83.2.2.3.2 Test purpose

To verify that MS GA-PSR shall only use IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message to send uplink GPRS user data packets to the SS

83.2.2.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated

Foreseen Final State of the MS

MS in GA-PSR-ACTIVE state in service of GAN cell.

Test Procedure

The MS receives a downlink message GA-PSR UNITDATA while Transport Channel activation is in progress. The MS activates the GA-PSR TC with the GANC IP address and UDP port number given in the GA-PSR ACTIVATE UTC ACK message and sends uplink GPRS user data.

SS verifies that MS:

1) GA-PSR shall only use IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message to send uplink GPRS user data packets to the SS

Maximum Duration of Test

5 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			MS in GA-PSR-STANDBY state
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiates GA-PSR TC activation
3	←		GA-PSR-UNITDATA	SS initiates a GPRS user data transfer by sending GA_PSR UNIT DATA message with IP address and UDP port address
4	SS			Waiting for 2 sec to check MS does not send any data
5	←		GA-PSR-ACTIVATE-UTC-ACK	SS sends a different IP address and UDP port number than source IP address and UDP port number in step 3
6	MS			MS in GA-PSR-ACTIVE state
7	→		GA-PSR-UNITDATA	MS completes data transfer using new IP address and UDP port given in GA-PSR-ACTIVATE-UTC-ACK

83.3 Packet paging for packet service

83.3.1 PS Paging Request Processed by the MS, Normal Case

83.3.1.1 PS Paging Request Processed by the MS

83.3.1.1.1 Conformance requirements

Upon receiving a GA-PSR-PS-PAGE message from the GANC, the MS GA-PSR shall forward the indication to the GMM layer using the GMMRR SAP as per standard GPRS. Subsequently, the MS shall send an uplink LLC PDU as a page response per standard GPRS. The MS may either send GA-PSR-DATA or GA-PSR-UNITDATA message as described in sub-clauses 8.7 and 8.8.

References

3GPP TS 44.318, subclauses 8.9.2

83.3.1.1.2 Test purpose

To verify that the MS responds with GA-PSR-DATA message upon receiving a GA-PSR-PS-PAGE message from the GANC.

83.3.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in Idle state

Test Procedure

The SS sends the GA-PSR-PS-PAGE, paging the MS. The MS responds with GA-PSR-DATA. The SS checks the received data is the paging response.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction	Message	Comments
1	x		MS is in GA-PSR-STANDBY state
2	←	GA-PSR-PS-PAGE	MS is made to initiate GA-PSR TC
3	→	GA-PSR-DATA	SS verifies that the MS sends the GA-PSR-DATA Check that the received data is the paging reponse (Empty LLC PDU)

83.4 GPRS Suspend Procedure

83.4.1 GPRS Suspension Initiation by the MS, normal Case

83.4.1.1 GPRS Suspension Initiation by the MS

83.4.1.1.1 Conformance requirements

While transitioning to dedicated mode and if unable to support simultaneous CS and PS services, the MS shall request the suspension of the downlink GPRS data transfer by sending a GA-CSR GPRS SUSPENSION REQUEST message to the GANC

Upon receiving a GA-CSR GPRS SUSPENSION REQUEST message from the MS, the GANC completes the GPRS suspend procedure via the Gb interface as defined in [3GPP 48.018].

References

3GPP TS 44.318, subclauses 8.10.1 & 8.10.2

83.4.1.1.2 Test purpose

To verify that the MS requests the suspension of the downlink GPRS data transfer by sending a GA-CSR GPRS SUSPENSION REQUEST message to the GANC, while the MS is transitioning to dedicated mode and if the MS unable to support simultaneous CS and PS services.

83.4.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates GA-PSR TC, sending the GA-PSR-ACTIVATE-UTC-REQ. The MS responds with GA-PSR-ACTIVATE-UTC-ACK. The SS sends data, sending GA-PSR-UNITDATA. The SS sends GA-CSR PAGING REQUEST, requesting transitioning of the MS to dedicated mode. MS sends GA-CSR GPRS SUSPENSION REQUEST. The SS verifies that the MS requests GPRS suspension.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			MS is in GA-PSR-STANDBY state
2	←		GA-PSR-ACTIVATE-UTC-REQ	SS initiates GA-PSR TC
3	→		GA-PSR-ACTIVATE-UTC-ACK	
4	←		GA-PSR-UNITDATA	
5	←		GA-CSR PAGING REQUEST	
6	→		GA-CSR GPRS SUSPENSION REQUEST	SS verifies that the MS sends the GA-PSR-DATA message

83.5 Downlink Flow Control

83.5.1 Initiation of the Downlink Flow Control and Processing of the TU4003 Timer Expiry by the MS, Normal Case

83.5.1.1 Initiation of the Downlink Flow Control and Processing of the TU4003 Timer Expiry by the MS

83.5.1.1.1 Conformance requirements

Upon detecting the downlink flow control condition, the MS shall initiate a downlink flow control procedure by sending a GA-PSR-DFC-REQ message to the GANC via the existing GA-PSR TC. The message includes new estimated data rate that can be supported. At the same time the MS shall start timer TU4003 to continue monitoring the flow control condition. The timer TU4003 is specified in sub-clause 12.

When the TU4003 timer expires, the MS shall re-evaluate the flow control condition and perform the following based on the outcome of the evaluation:

- If the flow control condition still exists (e.g. downlink buffer utilization is still above the low watermark level), the MS shall calculate a new data rate that can be supported and forward the corresponding GA-PSR-DFC-REQ to the GANC via the existing GA-PSR TC. Simultaneously, the MS shall start timer TU4003 to continue monitoring the downlink data transfer.

- If the flow condition has been resolved (e.g. buffer utilization is below the low mark level), the MS shall not restart the TU4003 timer and shall stop sending flow control requests to the GANC.

References

3GPP TS 44.318, subclauses 8.11.1 & 8.11.3

83.5.1.1.2 Test purpose

To verify that:

1) If the flow control condition exists the MS calculates a new data rate that can be supported and forwards the corresponding GA-PSR-DFC-REQ to the GANC via the existing GA-PSR TC.

2) If the timer expires, the MS checks the downlink flow control condition, and if it continues to exist, the MS restarts the timer TU4003, and optionally sends another GA-PSR-DFC-REQ message to the GANC.

3) If the flow condition has been resolved (e.g. buffer utilization is below the low mark level), the MS not restarts the TU4003 timer and stops sending flow control requests to the GANC.

83.5.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

SS initiates the activation procedure and starts to transmit data. The MS detects flow control condition, sends the GA-PSR-DFC-REQ message and starts the TU4003 timer. SS reduces the data rate and continues to send the data. The SS verifies that the MS does not send GA-PSR-DFC-REQ message.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is in GA-PSR-STANDBY state
2	←		GA-PSR-ACTIVATE-UTC-REQ	SS initiates GA-PSR TC
3	→		GA-PSR-ACTIVATE-UTC-ACK	
4	←		GA-PSR-UNITDATA	SS sends data, with very high data rate to overflow the MS
5	→		GA-PSR-DFC-REQ	MS request DL Flow Control and starts TU4003
6	←		GA-PSR-UNITDATA	SS sends data, with normal data rate
7	SS			SS verifies that MS does not sends GA-PSR-DFC-REQ for the time exceeding TU4003
8	←		GA-PSR-DEACTIVATE-UTC-REQ	SS deactivates
9	→		GS-PSR DEACTIVATE-UTC-ACK

83.6 Uplink Flow Control

83.6.1 Processing of the Uplink Flow Control Request by the MS, Normal Case

83.6.1.1 Processing of the Uplink Flow Control Request by the MS

83.6.1.1.1 Conformance requirements

Upon detecting the uplink flow control condition, the GANC initiates an uplink flow control procedure by sending a GA-PSR-UFC-REQUEST message to the MS via the existing GA-PSR TC. The request is PFC based if the packet flow management procedures are supported.

Upon receiving the GA-PSR-UFC-REQUEST message from the GANC, the MS adjusts the uplink data rate accordingly.

References

3GPP TS 44.318, subclauses 8.12.1 & 8.12.2

83.6.1.1.2 Test purpose

To verify that the MS adjusts the uplink data rate accordingly with GA-PSR-UFC-REQUEST message received from the GANC.

83.6.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in Idle state

Test Procedure

The MS activates GA-PSR TC and starts to send lowest data rate to the SS. SS requests UL Flow Control sending the GA-PSR-UFC-REQ. The MS sends the data with rate adjusted according to GA-PSR-UFC-REQ.

The SS verifies whether the MS sends the data with adjusted data rate.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is in GA-PSR-STANDBY state
2	→		GA-PSR-ACTIVATE-UTC-REQ	SS is made to activate GA-PSR TC
3	←		GA-PSR-ACTIVATE-UTC-ACK	
4	→		GA-PSR-UNITDATA	MS sends data
5	←		GA-PSR-UFC-REQ	SS request UL Flow Control of 100 bits/s.
6	→		GA-PSR-UNITDATA	MS sends data with the adjusted data rate (100 bits/s), according with GA-PSR-UFC-REQ
7	SS			SS verifies whether the MS have adjusted data rate
8	←		GA-PSR-DEACTIVATE-UTC-REQ	SS initiates the deactivation

84 GAN Iu Mode Procedures

84.1 Macros for GAN Iu mode

84.2 GA-RRC connection establishment

84.2.1 GA-RRC connection establishment / successful case

84.2.1.1 GA-RRC connection establishment, Upper Layer Message Transmission and GA-RRC connection release by GANC (CS domain)

84.2.1.1.1 Conformance requirement

The GAN Iu mode GA-RRC CS and PS connections are logical connections between the MS and the GANC. As described in 3GPP TS 43.318, the GA-RRC sub-layer in the MS contains two entities, the CS domain GA-RRC sublayer entity and the PS domain GA-RRC sublayer entity. These entities operate independently and in parallel; e.g., two GA-RRC connections are established in the case of simultaneous CS and PS services, one GA-RRC connection for each domain. Each GA-RRC sub-layer entity in the MS can be in one of two states, GA-RRC-IDLE or GA-RRC-CONNECTED.

A GA-RRC connection is established when the upper layers in the MS request the establishment of a signalling connection for either CS or PS domain and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for that domain; i.e., no GA-RRC connection exists. When a successful response is received from the network, GA-RRC replies to the upper layer that the GA-RRC sub-layer entity in the MS has entered the RRC connected mode (i.e., the GA-RRC-CONNECTED state). The upper layers then have the possibility to request transmission of NAS messages to the network.

The GA-RRC INITIAL DIRECT TRANSFER message is used to transfer the "initial" upper layer message for the domain (i.e., the first NAS message after GA-RRC connection establishment for the domain) from the MS to the GANC. Receipt of the GA-RRC INITIAL DIRECT TRANSFER message by the GANC triggers the establishment of the signalling connection to the indicated CN domain for the MS. The GA-RRC UPLINK DIRECT TRANSFER message is used to transfer all subsequent upper layer messages for the signalling connection from the MS to the GANC.

The GA-RRC DOWNLINK DIRECT TRANSFER message is used to transfer upper layer messages from the GANC to the MS.

The GANC initiates the GA-RRC connection release procedure to command the MS to release the GA-RRC connection and any user plane resources for a particular domain and instruct the GA-RRC sub-layer entity of the MS to leave the GA-RRC-CONNECTED state and return to the GA-RRC-IDLE state for the domain. The GANC normally initiates this procedure when it receives the Iu Release Command from the CN; however, the GANC may also initiate this procedure under certain failure conditions.

The GA-RRC RELEASE message includes the IE "GA-RRC Cause". The GA-RRC Cause value should be one of the following:

#83: normal release; e.g., at the end of a call

#115: unspecified failure

Other values, if received, should be treated as "unspecified failure".

When the GA-RRC sublayer entity in the MS receives the GA-RRC RELEASE message, it shall:

- send a GA-RRC RELEASE COMPLETE message to the GANC,
- release the GA-RRC connection and any user plane resources for the indicated domain,
- stop timer TU5002 for the domain (if running),
- stop timer TU5909 for the domain (if running), and
- enter the GA-RRC-IDLE state for the domain.

Reference(s)

3GPP TS 44.318 subclause 8a.1 / 8a.2 / 8a.5.3 / 8a.5.4

84.2.1.1.2 Test purpose

To verify all of the following for the CS domain.

To verify that MS is able to initiate GA-RRC connection establishment between the MS and GANC and to verify that MS is able to communicate with the CN by encapsulating NAS messages in the GA-RRC INITIAL DIRECT TRANSFER message (first NAS message after GA-RRC connection establishment) and GA-RRC UPLINK DIRECT TRANSFER message and able to receive upper layer messages within GA-RRC DOWNLINK DIRECT TRANSFER message.

To verify that MS is able to release the GA-RRC connection, able to move into GA-RRC-IDLE state and release all GA-RRC and any traffic channel resources, when the MS receives the GA-RRC RELEASE message from SS.

84.2.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for CS domain.

Test Procedure

The MS is made to initiate a GA-RRC connection establishment for CS domain. The MS moves into GA-RRC-CONNECTED state when the MS receives the GA-RRC REQUEST ACCEPT message from the SS within timer TU5908 (5 sec.) from sending GA-RRC REQUEST message. SS verifies that MS sends GA-RRC INITIAL DIRECT TRANSFER message within 10s from GA-RRC REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-RRC DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-RRC RELEASE message. The MS enters GA-RRC-IDLE state and transmits a GA-RRC RELEASE COMPLETE to the SS and releases all GA-RRC and any traffic channel resources.

Specific test parameters

-

Maximum Duration of Test

1 min.

84.2.1.2 GA-RRC connection establishment, Upper Layer Message Transmission and GA-RRC connection release by GANC (PS domain)

84.2.1.2.1 Conformance requirement

The GAN Iu mode GA-RRC CS and PS connections are logical connections between the MS and the GANC. As described in 3GPP TS 43.318, the GA-RRC sub-layer in the MS contains two entities, the CS domain GA-RRC sublayer entity and the PS domain GA-RRC sublayer entity. These entities operate independently and in parallel; e.g., two GA-RRC connections are established in the case of simultaneous CS and PS services, one GA-RRC connection for each domain. Each GA-RRC sub-layer entity in the MS can be in one of two states, GA-RRC-IDLE or GA-RRC-CONNECTED.

A GA-RRC connection is established when the upper layers in the MS request the establishment of a signalling connection for either CS or PS domain and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for that domain; i.e., no GA-RRC connection exists. When a successful response is received from the network, GA-RRC replies to the upper layer that the GA-RRC sub-layer entity in the MS has entered the RRC connected mode (i.e., the GA-RRC-CONNECTED state). The upper layers then have the possibility to request transmission of NAS messages to the network.

The GA-RRC INITIAL DIRECT TRANSFER message is used to transfer the "initial" upper layer message for the domain (i.e., the first NAS message after GA-RRC connection establishment for the domain) from the MS to the GANC. Receipt of the GA-RRC INITIAL DIRECT TRANSFER message by the GANC triggers the establishment of the signalling connection to the indicated CN domain for the MS. The GA-RRC UPLINK DIRECT TRANSFER message is used to transfer all subsequent upper layer messages for the signalling connection from the MS to the GANC.

The GA-RRC DOWNLINK DIRECT TRANSFER message is used to transfer upper layer messages from the GANC to the MS.

The GANC initiates the GA-RRC connection release procedure to command the MS to release the GA-RRC connection and any user plane resources for a particular domain and instruct the GA-RRC sub-layer entity of the MS to leave the GA-RRC-CONNECTED state and return to the GA-RRC-IDLE state for the domain. The GANC normally initiates this procedure when it receives the Iu Release Command from the CN; however, the GANC may also initiate this procedure under certain failure conditions.

The GA-RRC RELEASE message includes the IE "GA-RRC Cause". The GA-RRC Cause value should be one of the following:

#83: normal release; e.g., at the end of a call

#115: unspecified failure

Other values, if received, should be treated as "unspecified failure".

When the GA-RRC sublayer entity in the MS receives the GA-RRC RELEASE message, it shall:

- send a GA-RRC RELEASE COMPLETE message to the GANC,
- release the GA-RRC connection and any user plane resources for the indicated domain,

- stop timer TU5002 for the domain (if running),
- stop timer TU5909 for the domain (if running), and
- enter the GA-RRC-IDLE state for the domain.

Reference(s)

3GPP TS 44.318 subclause 8a.1 / 8a.2 / 8a.5.3 / 8a.5.4

84.2.1.2.2 Test purpose

To verify all of the following for the PS domain.

To verify that MS is able to initiate GA-RRC connection establishment between the MS and GANC and to verify that MS is able to communicate with the CN by encapsulating NAS messages in the GA-RRC INITIAL DIRECT TRANSFER message (first NAS message after GA-RRC connection establishment) and GA-RRC UPLINK DIRECT TRANSFER message and able to receive upper layer messages within GA-RRC DOWNLINK DIRECT TRANSFER message.

To verify that MS is able to release the GA-RRC connection, able to move into GA-RRC-IDLE state and release all GA-RRC and any traffic channel resources, when the MS receives the GA-RRC RELEASE message from SS.

84.2.1.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for PS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for PS domain.

Test Procedure

The MS is made to initiate a GA-RRC connection establishment for PS domain. The MS moves into GA-RRC-CONNECTED state when the MS receives the GA-RRC REQUEST ACCEPT message from the SS within timer TU5908 (5 sec.) from sending GA-RRC REQUEST message. SS verifies that MS sends GA-RRC INITIAL DIRECT TRANSFER message within 10s from GA-RRC REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-RRC DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-RRC RELEASE message. The MS enters GA-RRC-IDLE state and transmits a GA-RRC RELEASE COMPLETE to the SS and releases all GA-RRC and any traffic channel resources.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-RRC connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-RRC REQUEST	IE 'CN Domain Identity' indicates PS domain

4	←	GA-RRC REQUEST ACCEPT	IE 'CN Domain Identity' indicates PS domain
5	MS		MS in GA-RRC-CONNECTED state for PS domain
6	→	GA-RRC INITIAL DIRECT TRANSFER	Within 10s from GA-RRC REQUEST ACCEPT message Containing NAS message IE 'CN Domain Identity' indicates PS domain
7	←	GA-RRC DOWNLINK DIRECT TRANSFER	Containing NAS message IE 'CN Domain Identity' indicates PS domain
8	←	GA-RRC RELEASE	IE 'GA-RRC Cause' indicates #83 IE 'CN Domain Identity' indicates PS domain
9	→	GA-RRC RELEASE COMPLETE	MS enters GA-RRC-IDLE state IE 'CN Domain Identity' indicates PS domain

84.2.2 GA-RRC connection establishment / negative cases

84.2.2.1 GA-RRC REQUEST rejected (CS domain)

84.2.2.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.1.2.2:

If the GANC rejects the GA-RRC connection establishment request, it shall send the GA-RRC REQUEST REJECT message to the MS including the IE "CN Domain Identity".

3GPP TS 44.318 subclause 8a.1.3.2:

When the MS receives the GA-RRC REQUEST REJECT message, it shall:

- if timer TU5908 is active for the domain indicated by the IE "CN Domain Identity":

- stop timer TU5908 for that domain,
- remain in the GA-RRC-IDLE state for that domain, and
- indicate to upper layers that GA-RRC was not able to enter the connected state for that domain;

- if timer TU5908 is not active for the domain indicated by the IE "CN Domain Identity":

- ignore the GA-RRC REQUEST REJECT message, and
- continue with the procedure as if the GA-RRC REQUEST REJECT message was not received.

3GPP TS 44.318 subclause 8a.3.2:

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and
- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;
- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

- if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

84.2.2.1.2 Test purpose

To verify that MS will remain in GA-RRC-IDLE state (CS domain) when MS receives the GA-RRC REQUEST REJECT message (CS domain).

84.2.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC- IDLE state for CS domain.

Test Procedure

The MS is made to initiate a GA-RRC connection establishment for CS domain. SS sends the GA-RRC REQUEST REJECT message to the MS. MS is not able to enter GA-RRC-CONNECTED state. The SS sends GA-RRC PAGING REQUEST to verify that MS in GA-RRC-IDLE state. MS answers by sending GA-RRC INITIAL DIRECT TRANSFER message containing paging response.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-RRC connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-RRC REQUEST	IE 'CN Domain Identity' indicates CS domain TU5908 is started
4	←		GA-RRC REQUEST REJECT	The SS sends GA-RRC REQUEST REJECT before the expiry of TU5908. IE 'CN Domain Identity' indicates CS domain
5	MS			MS in GA-RRC-IDLE state for CS domain
6	←		GA-RRC PAGING REQUEST	Valid identity of the MS (‘TMSI’/’IMSI’) IE 'CN Domain Identity' indicates CS domain

7	→	GA-RRC INITIAL DIRECT TRANSFER	IE 'L3 Message' contains Paging Response IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-CONNECTED state for CS domain
8	←	GA-RRC RELEASE	IE 'RR cause' indicates #83 IE 'CN Domain Identity' indicates CS domain
9	→	GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-IDLE state for CS domain

84.2.2.2 MS receives GA-RRC REQUEST ACCEPT message after TU5908 expiry (CS domain)

84.2.2.2.1 Conformance requirement

If the GANC accepts the GA-RRC connection establishment request, it shall send the GA-RRC REQUEST ACCEPT message to the MS including the IE "CN Domain Identity".

When the MS receives the GA-RRC REQUEST ACCEPT message, it shall:

- if timer TU5908 is active for the domain indicated by the IE "CN Domain Identity":

- stop timer TU5908 for that domain,

- move into the GA-RRC-CONNECTED state for that domain,

- indicate to upper layers that GA-RRC has entered the connected state for that domain, and

- send the GA-RRC INITIAL DIRECT TRANSFER message to the network;

- if timer TU5908 is not active for the domain indicated by the IE "CN Domain Identity":

- ignore the GA-RRC REQUEST ACCEPT message, and

- continue with the procedure as if the GA-RRC REQUEST ACCEPT message was not received.

If timer TU5908 expires in the MS, the GA-RRC sub-layer entity in the MS shall remain in the GA-RRC-IDLE state and indicate to upper layers that GA-RRC was not able to enter the connected state for the domain.

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and

- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

- if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and

- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

84.4 Paging

84.4.1 Paging for CS domain / successful cases

84.4.1.1 Paging for CS domain

84.4.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.3.1:

The GANC sends the GA-RRC PAGING REQUEST message to the MS when the GANC receives a PAGING message over the Iu interface from a CN domain. The IMSI of the MS to be paged is identified by the IE "Permanent NAS UE Identity" received in the request from the CN. If the request also includes the (P-)TMSI then the GANC shall include the (P-)TMSI in the IE "Mobile Identity"; else the GANC shall include the IMSI in the IE "Mobile Identity". The GANC also includes the IE "CN Domain Identity" and the IE "GA-RRC Paging Cause", if a cause is received from the CN.

3GPP TS 44.318 subclause 8a.3.2:

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and

- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

- if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and

- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

3GPP TS 44.318 subclause 8a.3.3:

If the MS receives a GA-RRC PAGING REQUEST and the mobile identity included in the message does not match any of the valid identities assigned to the MS, the MS shall:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with any ongoing procedure as if the GA-RRC PAGING REQUEST message was not received.

Reference(s)

3GPP TS 44.318 subclauses 8a.3.1 / 8a.3.2 / 8a.3.3

84.4.1.1.2 Test purpose

To verify all of the following for the CS domain.

To verify that MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure, if received GA-RRC PAGING REQUEST doesn’t contain valid identity.

To verify that MS is able send a GA-RRC INITIAL DIRECT TRANSFER containing a page response to the SS and enter GA-RRC-CONNECTED state when MS receives GA-RRC PAGING REQUEST with valid identities of the MS.

84.4.1.1.3 Method of test

84.4.2 Paging for CS domain / negative cases

84.4.2.1 Void

84.4.2.2 Paging for CS domain / negative cases / MS receives GA-RRC PAGING REQUEST when TU5908 is active

84.4.2.2.1 Conformance requirement

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and

- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

  - if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and

- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 8a.3.2

84.4.2.2.2 Test purpose

To verify that MS discards the received GA-RRC PAGING REQUEST message (indicating CS domain page) if timer TU5908 is active for the CS domain.

84.4.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

  - MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC- IDLE state for CS domain.

Test Procedure

MS is made to initiate GA-RRC connection for CS domain. MS sends GA-RRC REQUEST message and activates timer TU5908. The SS initiates paging procedure by sending GA-RRC PAGING REQUEST message to the MS when TU5908 is active in MS. MS discards the received GA-RRC PAGING REQUEST message. After TU5908 expiry the SS sends GA-RRC PAGING REQUEST to verify that MS in GA-RRC-IDLE state. MS may answer by sending GA-RRC INITIAL DIRECT TRANSFER or re-establish the GA-RRC connection by re-sending GA-RRC REQUEST message.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-RRC connection for CS domain
2	→		GA-RRC REQUEST	IE 'CN Domain Identity' indicates CS domain MS activates TU5908 for CS domain
3	←		GA-RRC PAGING REQUEST	Valid identity of the MS (‘TMSI’/’IMSI’), sent before TU5908 expiry IE 'CN Domain Identity' indicates CS domain
4	MS			MS discards GA-RRC PAGING REQUEST message

5	SS		SS waits for TU5908 to expire. The MS may resend GA-RRC REQUEST after the expiry of TU5908. The following steps are executed only if no GA-RRC REQUEST is received from the MS.
6	←	GA-RRC PAGING REQUEST	Valid identity of the MS (‘TMSI’/’IMSI’) IE 'CN Domain Identity' indicates CS domain
7	→	GA-RRC INITIAL DIRECT TRANSFER	IE 'L3 Message' contains Paging Response IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-CONNECTED state for CS domain
8	←	GA-RRC RELEASE	IE ‘GA-RRC Cause’ = #83 IE 'CN Domain Identity' indicates CS domain
9	→	GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-IDLE state for CS domain

84.4.2.3 Paging for CS domain / negative cases / MS receives GA-RRC PAGING REQUEST when in GA-RRC-CONNECTED state

84.4.2.3.1 Conformance requirement

If the MS receives a GA-RRC PAGING REQUEST message and the GA-RRC sublayer entity in the MS is in GA-RRC-CONNECTED state for the indicated domain or the MS is in the GA-RC-REGISTERED state but in GERAN/UTRAN mode, the MS shall:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

3GPP TS 44.318 subclause 8a.3.3

84.4.2.3.2 Test purpose

To verify that MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received, if MS receives GA-RRC PAGING REQUEST indicating CS domain when MS is in GA-RRC-CONNECTED state for the CS domain.

84.4.2.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state for CS domain in service of GAN cell.

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for CS domain in service of GAN cell.

Test Procedure

The MS is in GA-RRC-CONNECTED state for CS domain in service of GAN cell. The SS initiates paging procedure by sending GA-RRC PAGING REQUEST message to the MS. The MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received. After 10s the SS sends

GA-RRC RELEASE to verify that MS in GA-RRC-CONNECTED state. MS answers by sending GA-RRC RELEASE COMPLETE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-RRC-CONNECTED state for CS domain with ongoing procedure

3	MS			MS ignores the GA-RRC PAGING REQUEST and continues with ongoing procedure
4	SS			SS waits 10s for response
5	←		GA-RRC RELEASE	IE ‘GA-RRC Cause’ IE 'CN Domain Identity' indicates CS domain
6	→		GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-IDLE state for CS domain

84.4.2.4 Paging for CS domain / negative cases / MS receives GA-RRC PAGING REQUEST when in GA-RC REGISTERED state

84.4.2.4.1 Conformance requirement

If the MS receives a GA-RRC PAGING REQUEST message and the GA-RRC sublayer entity in the MS is in GA-RRC-CONNECTED state for the indicated domain or the MS is in the GA-RC-REGISTERED state but in GERAN/UTRAN mode, the MS shall:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 8a.3.3

84.4.2.4.2 Test purpose

To verify that MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received, if MS receives GA-RRC PAGING REQUEST when MS is in GA-RC-REGISTERED state but in GERAN/UTRAN mode.

84.4.2.4.3 Method of test

Initial Conditions

System Simulator:

- 2 cells: GERAN cell & GAN cell
- 1 GERAN cell, default parameters
- 1 GAN cell, default parameters

Mobile Station:

- MS in GERAN mode camped on a GERAN cell, voice call activated and in GA-RC-REGISTERED state

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for the CS domain.

Test Procedure

MS is camped on a GERAN cell, voice call activated and in GA-RC-REGISTERED state. The SS initiates CS domain paging procedure by sending GA-RRC PAGING REQUEST message to the MS. The MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received. After 10s, the voice call is deactivated to switch the serving RR entity to GA-RRC. The SS waits 30 seconds to ensure that the MS enters the GA-RRC-IDLE state (CS domain) and sends GA-RRC PAGING REQUEST (CS domain) to verify that MS in GA-RRC-IDLE state. MS answers by sending GA-RRC INITIAL DIRECT TRANSFER (CS domain) message containing the page response.

Specific test parameters

84.4.3 Paging for PS domain / successful cases

84.4.3.1 Paging for PS domain

84.4.3.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.3.1:

The GANC sends the GA-RRC PAGING REQUEST message to the MS when the GANC receives a PAGING message over the Iu interface from a CN domain. The IMSI of the MS to be paged is identified by the IE "Permanent NAS UE Identity" received in the request from the CN. If the request also includes the (P-)TMSI then the GANC shall include the (P-)TMSI in the IE "Mobile Identity"; else the GANC shall include the IMSI in the IE "Mobile Identity". The GANC also includes the IE "CN Domain Identity" and the IE "GA-RRC Paging Cause", if a cause is received from the CN.

3GPP TS 44.318 subclause 8a.3.2:

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and

- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

- if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and

- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

3GPP TS 44.318 subclause 8a.3.3:

If the MS receives a GA-RRC PAGING REQUEST and the mobile identity included in the message does not match any of the valid identities assigned to the MS, the MS shall:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with any ongoing procedure as if the GA-RRC PAGING REQUEST message was not received.

84.4.4 Paging for PS domain / negative cases

84.4.4.1 Void

84.4.4.2 Paging for PS domain / negative cases / MS receives GA-RRC PAGING REQUEST when TU5908 is active

84.4.4.2.1 Conformance requirement

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:

- indicate reception of paging to upper layers, and

- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

  - if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and

- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 8a.3.2

84.4.4.2.2 Test purpose

To verify that MS discards the received GA-RRC PAGING REQUEST message (indicating PS domain page) if timer TU5908 is active for the PS domain.

84.4.4.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

  - MS in GA-RRC-IDLE state for PS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC- IDLE state for PS domain.

Test Procedure

MS is made to initiate GA-RRC connection for PS domain. MS sends GA-RRC REQUEST message and activates timer TU5908. The SS initiates paging procedure by sending GA-RRC PAGING REQUEST message to the MS when TU5908 is active in MS. MS discards the received GA-RRC PAGING REQUEST message. After TU5908 expiry the SS sends GA-RRC PAGING REQUEST to verify that MS in GA-RRC-IDLE state. MS may answer by sending GA-RRC INITIAL DIRECT TRANSFER or re-establish the GA-RRC connection by re-sending GA-RRC REQUEST message.

84.5 Traffic Channel assignment

84.5.1 CS Traffic Channel assignment / successful cases

84.5.1.1 CS Traffic Channel assignment and Release

84.5.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.4.1.2:

The MS shall act on the received GA-RRC ACTIVATE CHANNEL message indicating the CS domain as follows:

- for each CTC specified in the IE "CTC Activation List":
    - store the RAB ID;
    - if the IE "RAB Configuration" indicates that the CTC is for AMR or AMR-WB speech, use the format specified in Annex A.1 and Annex D to code and decode the RTP packets;
    - if the IE "RAB Configuration" indicates that the CTC is for circuit switched data, use the format specified in Annex A.2 to code and decode the RTP packets;
    - use the value indicated by the IE "Sample Size" as the minimum sample size for the coding and decoding of the RTP packets, if the MS is not able to use the indicated value. If the circuit transport channel is for AMR or AMR-WB speech with RTP redundancy, the sample size is defined as the size of the new speech sample in each RTP packet, not including any redundant speech samples;
    - configure the uplink RTP packets to be transmitted to the UDP port and IP address identified by the IE "RTP UDP Port" and the IE "GANC IP address", respectively;
    - use the Payload Type included in the IE "Payload Type" for the PT field in the RTP header for the RTP packets;
    - if received, use the configuration included in the IE "Multi-rate Configuration 2" for the circuit transport channel that is for AMR or AMR-WB speech;
    - if received, use the configuration included in the IE "RTP Redundancy Configuration" for the circuit transport channel that is for AMR or AMR-WB speech. The redundancy policy is defined for each of the AMR modes specified in the IE "Multi-rate Configuration 2". The level of redundancy can span from no redundancy to double redundancy. In the same active codec set, a lower codec mode shall not be associated with a lower redundancy level then a higher codec mode. For example, the highest mode in the set is used with no redundancy, the next lower with single redundancy and rest of the modes with double redundancy.
    - if received, pass the contents of the NAS Synchronisation Indicator to upper layers.

On completing the above procedure, the MS shall:

- start timer TU5911 for the CS domain;
- transmit a GA-RRC ACTIVATE CHANNEL ACK message including the IE "CN Domain Identity" and the IE "CTC Activation Ack List". For each CTC specified in the IE "CTC Activation Ack List":
    - include the IE "RAB ID" for the CTC with the same value as received in the GA-RRC ACTIVATE CHANNEL message in the IE "RAB ID";
    - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
    - for each CTC that is successfully configured (i.e., GA-RRC Cause value is '0'):
        - include the allocated UDP port number in the IE "RTP UDP Port" for the downlink RTP packets to be sent from the GANC to the MS;
        - include the selected RTP sample size, to be used for uplink and downlink RTP packets, in the IE "Sample Size";
        - include the Payload Type in the IE "Payload Type";

- if the IE "RTCP UDP Port" was received in the GA-RRC ACTIVATE CHANNEL message and the MS is capable of supporting RTCP, activate the uplink RTCP stream and include the IE "RTCP UDP Port" for the downlink RTCP packets to be sent from the GANC to the MS.

3GPP TS 44.318 subclause 8a.4.1.4:

On reception of the GA-RRC ACTIVATE CHANNEL COMPLETE message indicating the CS domain, the MS shall stop timer TU5911 for the CS domain and consider the successfully activated CTC(s) to be available for use by upper layers. To enable uplink quality measurements in the GANC, the MS shall send at least one RTP frame each 480 ms for each active CTC. During periods of discontinuous transmission (DTX), each RTP frame transmitted by the MS shall bear a format in the AMR/AMR-WB payload Table of Contents that either (a) omits all NO_DATA indications and contains only the next AMR speech or SID frame that is available, or (b) includes a single NO_DATA frame should no AMR speech or SID frame become available for 480 ms. The RTP timestamp shall indicate the time of that speech or SID or NO_DATA frame. See Section A.1.2 of Annex A for examples.

3GPP TS 44.318 subclause 8a.5.1:

If the MS needs to release the GA-RRC connection and signalling connection to a particular CN domain, it shall send the GA-RRC RELEASE REQUEST message to the GANC and start timer TU5909 for the domain. The MS shall include the IE "CN Domain Identity" and the IE "GA-RRC Cause". The GA-RRC Cause value shall be one of the following:

#40: UE generated signalling connection release

#115: unspecified failure

Reference(s)

3GPP TS 44.318 subclauses 8a.4.1.2 / 8a.4.1.4/ 8a.5.1

84.5.1.1.2 Test purpose

To verify that MS is able to establish a CS domain traffic channel.

The MS initiates the release the GA-RRC connection (CS domain) by sending GA-RRC CLEAR REQUEST to the SS. The MS enters GA-RRC-IDLE state and releases all GA-RRC and any traffic channel resources (CS domain).

84.5.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (CS domain) in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (CS domain) in service of GAN cell.

Test Procedure

A voice call is ongoing. The SS configures a CS traffic channel by transmitting GA-RRC ACTIVATE CHANNEL (CS domain) to the MS. MS responses by transmitting a GA-RRC ACTIVATE CHANNEL ACK including the IE ‘UDP Port’. Then the SS configures itself for transmission of RTP packets to the MS to the indicated UDP port and transmits a GA-RRC ACTIVATE CHANNEL COMPLETE message to the MS. MS and SS sends at least one RTP frame each 480 ms. The SS releases the call by sending GA-RRC DL DIRECT TRANSFER message (Release) and receiving GA-RRC UL DIRECT TRANSFER (Release Complete) message. Therefore, the MS will send GA-RRC RELEASE REQUEST to release the CS domain connection.

Specific test parameters

  - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
  - for each CTC that is successfully configured (i.e., GA-RRC Cause value is '0'):
    - include the allocated UDP port number in the IE "RTP UDP Port" for the downlink RTP packets to be sent from the GANC to the MS;
    - include the selected RTP sample size, to be used for uplink and downlink RTP packets, in the IE "Sample Size";
    - include the Payload Type in the IE "Payload Type";
    - if the IE "RTCP UDP Port" was received in the GA-RRC ACTIVATE CHANNEL message and the MS is capable of supporting RTCP, activate the uplink RTCP stream and include the IE "RTCP UDP Port" for the downlink RTCP packets to be sent from the GANC to the MS.

Reference(s)

3GPP TS 44.318 subclauses 8a.4.1.2

84.5.2.1.2 Test purpose

To verify that if MS fails to establish the traffic channel, it transmits a GA-RRC ACTIVATE CHANNEL ACK message including the reason for the failure.

84.5.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (CS domain) in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (CS domain) in service of GAN cell.

Test Procedure

A CS domain voice call is ongoing. The SS configures a traffic channel by transmitting corrupted GA-RRC ACTIVATE CHANNEL to the MS. In the corrupted GA-RRC ACTIVATE CHANNEL message “Sample Size” octet 3 is set to “1” (1ms), which is an undefined value.

MS fails to establish the traffic channel and transmits a GA-RRC ACTIVATE CHANNEL ACK message including the reason for the failure.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-RRC-CONNECTED state (CS domain), voice call is ongoing
2	←		GA-RRC ACTIVATE CHANNEL	This message has non-supportive configuration, with a "Sample Size" octet 3 set to "1"
3	MS			MS fails to establish the traffic channel
4	→		GA-RRC ACTIVATE CHANNEL ACK	For the (single) CTC specified in the IE 'CTC Activation Ack List': IE 'RAB ID', IE 'GA-RRC Cause' indicates a value other than #0 (e.g., 'Invalid RAB Parameters Value' #19).
5	←		GA-RRC RELEASE	IE 'GA-RRC Cause' = #83 IE 'CN Domain Identity' indicates CS domain
6	→		GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-IDLE state for CS domain

84.5.3 PS Traffic Channel assignment / successful cases

84.5.3.1 PS Traffic Channel assignment and Release

84.5.3.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.4.2.2:

The MS shall act on the received GA-RRC ACTIVATE CHANNEL message indicating the PS domain as follows:

- for each PTC specified in the IE "PTC Activation List":
  - store the RAB ID;
  - allocate local PTC resources based on the values in the IE "RAB Configuration";
  - use the TEID value included in the IE "GANC TEID" for the TEID field in the GA-RRC PDU messages to be sent to the GANC;
  - use the TEID value included in the IE "MS TEID" to verify the TEID field in the GA-RRC PDU messages to be received from the GANC;
  - configure the uplink GA-RRC PDU messages to be transmitted to the UDP port and IP address identified by the IE "GANC UDP Port" and the IE "GANC IP address", respectively.

On completing the above procedure, the MS shall:

- start timer TU5911 for the PS domain;
- transmit a GA-RRC ACTIVATE CHANNEL ACK message including the IE "CN Domain Identity" and the IE "PTC Activation Ack List". For each PTC specified in the IE "PTC Activation Ack List":

- include the IE "RAB ID" for the PTC with the same value as received in the GA-RRC ACTIVATE CHANNEL message in the IE "RAB ID";
- include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
- for each PTC that is successfully configured (i.e., GA-RRC Cause value is '0'):
  - include the allocated UDP port number in the IE "MS UDP Port" for the downlink GA-RRC PDU messages to be sent from the GANC to the MS.

3GPP TS 44.318 subclause 8a.4.2.4:

On reception of the GA-RRC ACTIVATE CHANNEL COMPLETE message indicating the PS domain, the MS shall stop timer TU5911 for the PS domain, and start timer TU4001 for each of the successfully activated PTC(s) which are now available for use by upper layers.

3GPP TS 44.318 subclause 8a.5.1:

If the MS needs to release the GA-RRC connection and signalling connection to a particular CN domain, it shall send the GA-RRC RELEASE REQUEST message to the GANC and start timer TU5909 for the domain. The MS shall include the IE "CN Domain Identity" and the IE "GA-RRC Cause". The GA-RRC Cause value shall be one of the following:

#40: UE generated signalling connection release

#115: unspecified failure

Reference(s)

3GPP TS 44.318 subclauses 8a.4.2.2 / 8a.4.2.4/ 8a.5.1

84.5.3.1.2 Test purpose

To verify that MS is able to establish a PS domain traffic channel.

The MS initiates the release the GA-RRC connection (PS domain) by sending GA-RRC RELEASE REQUEST to the SS. The MS enters GA-RRC-IDLE state and releases all GA-RRC and any traffic channel resources (PS domain).

84.5.3.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (PS domain) in service of GAN cell.

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (PS domain) in service of GAN cell.

Test Procedure

A PS session is ongoing. The SS configures a PS traffic channel by transmitting GA-RRC ACTIVATE CHANNEL (PS domain) to the MS. MS responses by transmitting a GA-RRC ACTIVATE CHANNEL ACK and configures the uplink GA-RRC PDU messages to be transmitted to the UDP port and IP address identified by the IE "GANC UDP Port" and the IE "GANC IP address", respectively. Then the SS configures itself for transmission of downlink GA-RRC PDU messages to be transmitted to the UDP port identified by the IE "MS UDP Port" and the IE "GANC IP address", and transmits a GA-RRC ACTIVATE CHANNEL COMPLETE message to the MS. The SS releases the PS session by sending GA-RRC DL DIRECT TRANSFER message (Deactivate PDP Context Request) and receiving GA-RRC UL DIRECT TRANSFER (Deactivate PDP Context Accept) message. Therefore, the MS will send GA-RRC RELEASE REQUEST to release the PS domain connection.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-RRC-CONNECTED state (PS domain).
2	←		GA-RRC ACTIVATE CHANNEL	For the (single) PTC specified in the IE 'PTC Activation List': IE 'RAB ID', IE 'RAB Configuration', IE 'GANC TEID', IE 'MS TEID', IE 'GANC UDP Port', IE 'GANC IP address'.

84.6 Release of GA-RRC

FFS

84.7 Void

84.8 Void

84.9 Security Mode Control Procedure

84.9.1 Security Mode Control Procedure / successful cases

84.9.1.1 Security Mode Control Procedure (CS domain)

84.9.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.6.1:

The GANC initiates the security mode control procedure by sending a GA-RRC SECURITY MODE COMMAND message to the MS. This message includes the IE "Selected Integrity Protection Algorithm", the IE "Selected Encryption Algorithm" (optional), and the IE "Random Number". The GANC selects the algorithms based on the permitted algorithms received from the CN and the MS security capabilities indicated in the IE "3G Security Capability" received from the MS in the GA-RC REGISTER REQUEST message.

3GPP TS 44.318 subclause 8a.6.2:

Whenever the MS receives a valid GA-RRC SECURITY MODE COMMAND message, it shall, if a (U)SIM is present and considered valid and the key set identifier (KSI) stored on the (U)SIM indicates that an integrity key and cipher key are available for the domain indicated in the IE "CN Domain Identity", store the selected integrity protection algorithm and (if received) the selected encryption algorithm for possible future use after a handover from GAN Iu mode to UTRAN during the same upper layer transaction. If handover from GAN Iu mode to UTRAN occurs, encryption is enabled if the IE “Selected Encryption Algorithm” is present in the message and disabled otherwise.

The MS shall also calculate a MAC (Message Authentication Code). The MAC shall be calculated over the following data:

RAND | IMSI

using "HMAC-SHA1-96" algorithm, as specified in [24] with the integrity key (IK) for the domain indicated in the IE "CN Domain Identity" used as the authentication key.

In the formulas above, the "|" character denotes concatenation. RAND is the 16-octet random number received from the GANC in the GA-RRC SECURITY MODE COMMAND message. IMSI is the MS IMSI, in the same format as defined for the Mobile Identity IE as defined in [8]; i.e. as a variable-length sequence of digits in BCD format (e.g. the IMSI "123456789098765" is encoded as the following octets (in hexadecimal): "21 43 65 87 09 89 67 F5"). Network byte order is used.

The IK key is the IK that has been derived during the last authentication for the domain indicated in the IE "CN Domain Identity". The length of the MAC is 12 octets.

When the appropriate action on the GA-RRC SECURITY MODE COMMAND message has been taken, the MS sends a GA-RRC SECURITY MODE COMPLETE message to the GANC. The MS includes the calculated MAC value in the IE "Ciphering Command MAC".

Reference(s)

3GPP TS 44.318 sub-clause 8a.6.1 and 8a.6.2.

84.9.1.1.2 Test purpose

To verify that the MS can reply to a GA-RRC SECURITY MODE COMMAND message and return the correct Message Authentication Code (MAC).

84.9.1.1.3 Method of test

84.10 Channel modify procedure

84.10.1 CS channel modify procedure / successful cases

84.10.1.1 CS channel modify / successful case

84.10.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.1.1:

The GANC initiates the circuit transport channel (CTC) modification procedure when it determines that one or more active CTCs require modification; e.g., based on information received from the MSC in the RAB Assignment Request message or based on local GANC logic.

The following CTC parameters may be modified:

- RAB Configuration
- Sample Size
- GANC RTP UDP Port
- GANC IP Address
- Multi-rate Configuration 2
- RTP Redundancy Configuration
- GANC RTCP UDP Port

- NAS Synchronisation Indicator

The GANC only includes the IEs which specify modifications to the existing CTC parameters.

One or more CTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the CTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating CS domain) and IE "CTC Modification List" which includes the parameters necessary to describe the modifications to each circuit transport channel.

3GPP TS 44.318 subclause 8a.7.1.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the CS domain, the MS shall process the specified CTC modifications.

On completion of the modification of the CTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "CTC Modification Ack List". For each CTC specified in the IE "CTC Modification Ack List":
  - include the IE "RAB ID" for the CTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";
  - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
  - for each CTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
    - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting RTP packets based on the successful parameter modifications. The MS shall be able to receive RTP packets with the old parameters until the MS determines that the first RTP packet using the new parameters has been received.

Reference(s)

3GPP TS 44.318 subclauses 8a.7.1.1, 8a.7.1.2

84.10.1.1.2 Test purpose

To verify that MS is able to change active CTC parameters if requested.

84.10.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (CS domain) in service of GAN cell, voice call activated

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (CS domain)

Test Procedure

The MS is in GA-RRC-CONNECTED state (CS domain) in service of GAN cell, voice call activated. SS sends GA-RRC MODIFY CHANNEL message to change the active sample size for the CTC. The MS sets the sample size for the active CTC and then replies by a GA-RRC MODIFY CHANNEL ACK message indicating the modified parameter.

84.10.3 PS channel modify procedure / successful cases

84.10.3.1 PS channel modify / successful case

84.10.3.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.2.1:

The GANC initiates the packet transport channel (PTC) modification procedure when it determines that one or more active PTCs require modification; e.g., based on information received from the SGSN in the RAB Assignment Request message or based on local GANC logic.

The following PTC parameters may be modified:

- RAB Configuration
- GANC UDP Port
- GANC IP Address

The GANC only includes the IEs which specify modifications to the existing PTC parameters.

One or more PTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the PTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating PS domain) and IE "PTC Modification List" which includes the parameters necessary to describe the modifications to each packet transport channel.

3GPP TS 44.318 subclause 8a.7.2.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the PS domain, the MS shall process the specified PTC modifications.

On completion of the modification of the PTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "PTC Modification Ack List". For each PTC specified in the IE "PTC Modification Ack List":
  - include the IE "RAB ID" for the PTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";
  - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
  - for each PTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
    - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting GA-RRC PDU messages based on the successful parameter modifications. The MS shall be able to receive GA-RRC PDU messages with the old parameters until the MS determines that the first GA-RRC PDU message using the new parameters has been received.

Reference(s)

3GPP TS 44.318 subclauses 8a.7.2.1, 8a.7.2.2

84.10.3.1.2 Test purpose

To verify that MS is able to change active PTC parameters if requested.

84.10.3.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (PS domain) in service of GAN cell, with active PTC

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (PS domain)

Test Procedure

The MS is in GA-RRC-CONNECTED state (PS domain) in service of GAN cell, with an active PTC. SS sends GA-RRC MODIFY CHANNEL message to change the RAB Configuration. The MS modifies the RAB Configuration for the active PTC and then replies by a GA-RRC MODIFY CHANNEL ACK message indicating the modified parameter.

84.10.4 PS channel modify procedure / negative cases

84.10.4.1 PS channel modify requests illegal change to parameter

84.10.4.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.2.1:

The GANC initiates the packet transport channel (PTC) modification procedure when it determines that one or more active PTCs require modification; e.g., based on information received from the SGSN in the RAB Assignment Request message or based on local GANC logic.

The following PTC parameters may be modified:

- RAB Configuration
- GANC UDP Port
- GANC IP Address

The GANC only includes the IEs which specify modifications to the existing PTC parameters.

One or more PTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the PTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating PS domain) and IE "PTC Modification List" which includes the parameters necessary to describe the modifications to each packet transport channel.

3GPP TS 44.318 subclause 8a.7.2.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the PS domain, the MS shall process the specified PTC modifications.

On completion of the modification of the PTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "PTC Modification Ack List". For each PTC specified in the IE "PTC Modification Ack List":
    - include the IE "RAB ID" for the PTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";

- include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
- for each PTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
  - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting GA-RRC PDU messages based on the successful parameter modifications. The MS shall be able to receive GA-RRC PDU messages with the old parameters until the MS determines that the first GA-RRC PDU message using the new parameters has been received.

	MS	SS		
1	MS			MS in service with one PTC active on GAN cell
2	→		GA-RRC DEACTIVATE CHANNEL REQUEST	IE 'CN Domain Identity' indicates PS domain, IE ‘GA-RRC Cause’ = #0. For the (single) PTC specified in the IE 'RAB ID List': IE 'RAB ID'. MS starts TU5002 (PS domain)
3	SS			SS waits for period longer than TU5002

4	MS		TU5002 (PS domain) expires. MS releases the PTC resources
5	MS		MS with GA-RRC connection (PS domain) but no active PTC
6	←	GA-RRC RELEASE	IE 'GA-RRC Cause' = #83 IE 'CN Domain Identity' indicates PS domain
7	→	GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates PS domain MS enters GA-RRC-IDLE state for PS domain

90 Text Telephony (TTY) Services

This subclause contains test cases for Text Telephony (TTY) services.

90.1 Transmission of CTM Bearer Code

90.1.1 Mobile Originated TTY Call

90.1.1.1 Conformance requirement

1) When establishing a mobile originated call with TTY mode enabled in the MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '1'.

2) When establishing a mobile originated call with TTY mode disabled in the TTY-compatible MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '0'.

Reference(s):

For conformance requirement 1 and 2:

3GPP TS 04.08 / TS 24.008, subclause 10.5.4.5

90.1.1.2 Test purpose

1) To verify that a TTY compatible MS, with TTY mode enabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 1 when made to originate a call.

2) To verify that a TTY compatible MS, with TTY mode disabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 0 when made to originate a call.

90.1.1.3 Method of test

90.1.1.3.1 void

90.1.1.3.2 Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

90.1.1.3.3 Final foreseen state of the MS

U0, null.

90.1.1.3.4 Test Procedure

a) The MS is set to TTY mode using the normal MMI. A mobile originated call is established following the generic call set-up procedure for mobile originating speech calls.

b) After receipt of the SETUP message from the MS, the SS shall disconnect the call.

c) TTY mode is disabled in the MS using the normal MMI. A mobile originated call is established following the generic call set-up procedure for mobile originating speech calls.

d) After receipt of the SETUP message from the MS, the SS shall disconnect the call.

90.1.1.4 Test requirement

1) In step a), the MS shall send a SETUP message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 1.

2) In step c), the MS shall send a SETUP message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 0.

90.1.2 Mobile Terminated TTY Call

90.1.2.1 Conformance requirement

1) When establishing a mobile terminated call with TTY mode enabled in the MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '1'.

2) When establishing a mobile terminated call with TTY mode disabled in the TTY-compatible MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '0'.

Reference(s):

For conformance requirement 1 and 2:

3GPP TS 04.08 / TS 24.008, subclause 10.5.4.5

90.1.2.2 Test purpose

3) verify that a TTY compatible MS, with TTY mode enabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 1 when receiving a mobile terminated call.

4) To verify that a TTY compatible MS, with TTY mode disabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 0 when receiving a mobile terminated call.

90.1.2.3 Method of test

90.1.2.3.1 void

90.1.2.3.2 Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS is in MM-state “idle, updated” with valid TMSI and CKSN.

90.1.2.3.3 Final foreseen state of the MS

U0, null.

90.1.2.3.4 Test Procedure

a) The MS is set to TTY mode using the normal MMI. A mobile terminated call is established following the generic call set-up procedure for mobile terminating speech calls.

b) After receipt of the CALL CONFIRMED message from the MS, the SS shall disconnect the call.

c) TTY mode is disabled in the MS using the normal MMI. A mobile terminated call is established following the generic call set-up procedure for mobile terminating speech calls.

d) After receipt of the CALL CONFIRMED message from the MS, the SS shall disconnect the call.

90.1.2.4 Test requirement

1) In step a), the MS shall send a CALL CONFIRMED message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 1.

2) In step c), the MS shall send a CALL CONFIRMED message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 0.

Annex 1 (normative): Reference test methods

A1.1 General Conditions (GC)

A1.1.1 Outdoor test site and general arrangements for measurements involving the use of radiated fields (GC4)

The outdoor test site shall be on a reasonably level surface or ground. At one point on the site a ground plane of at least 5 m diameter shall be provided. In the middle of this ground plane a non-conducting support capable of rotation through 360 degrees in the horizontal plane shall be used to support the test sample at 1,5 m above the ground plane.

The test site shall be large enough to allow the erection of a measuring or transmitting antenna at a distance of half a wavelength or at least 3 m whichever is the greater. Sufficient precautions shall be taken to ensure that reflections from extraneous objects adjacent to the site and ground reflections do not degrade the measurement results.

The test antenna is used to detect the radiation from both the test sample and the substitution antenna, when the site is used for radiation measurements. Where necessary the substitution antenna is used as a transmitting antenna, when the site is used for the measurement of receiver characteristics. This antenna is mounted on a support such as to allow the antenna to be used in either the horizontal or vertical polarization and for the height of its centre above ground to be varied over the range 1 m to 4 m. Preferably test antennas with pronounced directivity should be used. The size of the test antenna along the measurement axis shall not exceed 20 % of the measuring distance.

For radiation measurements the test antenna is connected to a test receiver capable of being tuned to any frequency under investigation and of measuring accurately the relative levels of signals at its input. When necessary (for receiver measurements) the test receiver is replaced by a signal source.

The substitution antenna shall be a half wave dipole, resonant at the frequency under consideration, or a shortened dipole, or (in the range 1 GHz to 4 GHz) a horn radiator. Antennas other than a half wave dipole shall have been calibrated to the half wave dipole. The centre of this antenna shall coincide with the reference point of the test sample it has replaced. This reference point shall be the volume centre of the sample when its antenna is mounted inside the cabinet, or the point where an external antenna is connected to the cabinet. The distance between the lower extremity of the dipole and the ground shall be at least 30 cm.

The substitution antenna shall be connected to a calibrated signal generator when the site is used for radiation measurements and to a calibrated measuring receiver when the site is used for measurements of receiver characteristics. The signal generator and the receiver shall be operating at the frequencies under investigation and shall be connected to the antenna through suitable matching and balancing network.

A1.1.2 Anechoic shielded chamber (GC5)

As an alternative to the above mentioned outdoor test site an indoor test site, being a well shielded anechoic chamber simulating free space environment may be used. If such a chamber is used, this shall be recorded in the test report.

NOTE: The anechoic shielded chamber is the preferred test site for testing to the present document.

The measurement site may be an electrically shielded anechoic chamber being 10 m long, 5 m broad and 5 m high. Walls and ceiling should be coated with RF absorbers of 1 m height. The ground should be covered with absorbing material 1 m thick able to carry test equipment and operators. A measuring distance of 3 m to 5 m in the long middle axis of the chamber can be used for measurements up to at least 10 GHz.

The test antenna, test receiver, substitution antenna and calibrated signal generator are used in a way similar to that of the outdoor test site method with the exception that, because the floor absorbers reject floor reflections, the antenna height need not be changed and shall be at the same height as the test sample. In the range between 30 MHz and 100 MHz some additional calibration may be necessary.

A1.1.3 Temporary antenna connector (GC7)

If the MS to be tested does not normally have a permanent external 50 Ω connector then for test purposes only it may be modified to fit a temporary 50 Ω antenna connector.

The permanent integral antenna shall be used for measurement of:

- Transmitter effective radiated power (subclause 13.3).
- Radiated spurious emissions (clause 12).

For tests in the relevant MS Receive band:

- The temporary antenna coupling factor is determined using the procedure defined in annex 1, subclause 1.1.5. When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the receive band.

For tests in the relevant MS Transmit band:

- The temporary antenna coupling factor is determined using the procedure defined in subclause 13.3.4.2 When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the transmit band.

For frequencies outside the above mentioned relevant bands the temporary antenna coupling factor is assumed to be 0 dB.

NOTE 1: The uncertainty in the determined value of the temporary antenna coupling factor is directly related to the uncertainty of the field strength value measured in subclause 13.3.4.2 step n) and annex 1, subclause 1.1.5.2 (approximately ±[3 dB]). By mutual agreement, between the MS manufacturer and the testing authority, a value of 0 dB for the temporary antenna coupling factor could be used.

NOTE 2: The accommodation of the uncertainty in the temporary antenna coupling factor in the relevant MS receive band for the tests in clause 14 is for further study.

NOTE 3: The uncertainty in the temporary antenna coupling factor in the relevant MS transmit band can be accommodated with appropriate adjustment of the measured levels by the uncertainty.

Testing must be performed in the following order to ensure that all the free field measurements are performed before the MS is modified.

- Subclause 12.1.2.
- Annex 1, subclauses 1.1.5.1 and 1.1.5.2.
- Subclause 13.3.4.2 (during this step the MS is modified).
- Annex 1, subclause 1.1.5.3.
- All remaining tests of clauses 12, 13, 14, 15, 16, 17, 18, 19, 20, 21 and 22.

A1.1.4 Temporary antenna connector characteristics

The method of connection of the temporary connector shall allow secure and repeatable connections to be made to the device under test.

The antenna connector shall present a nominal 50 Ω impedance over the GSM receive and transmit frequency ranges. The maximum loss within the frequency range 100 kHz to 12,75 GHz shall be less than 1 dB.

The connection circuitry shall be maximally broadband and shall contain no non-linear or active devices.

The characteristics of the connector shall not be significantly affected by temperatures in the range -25° to +60° Celsius.

A1.1.5 Calibration of the temporary antenna connector

For equipments fitted with an integral antenna and not provided with a permanent means for connection to an external antenna a calibration procedure is required to allow subsequent measurements to be performed on the temporary antenna connector.

Once calibrated this temporary antenna connector enables all receiver test procedures to be identical for equipments with an integral antenna and for equipments with an antenna connector.

The calibration procedure shall be carried out at three frequencies, namely an ARFCN in the low mid and high ARFCN ranges. The procedure consists of three distinct stages as follows:

1) Establish the MS antenna radiation pattern for the three selected frequencies.

2) Calibrate the test range (or anechoic shielded chamber) for the conditions needed in 1).

3) Determine the temporary antenna connector coupling factor.

A1.1.5.1 Antenna radiation pattern

a) The MS shall be in the anechoic shielded chamber, or on an outdoor test site, on an isolated support in a vertical position at an orientation specified by the manufacturer. This position is the 0° position.

   A test antenna, connected to the SS shall be in the anechoic shielded chamber, or on the outdoor test site, at a distance of at least 3 m from the MS.

b) A call shall be originated by the SS to the MS on a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power.

c) The SS shall, using estimated parameters for the outdoor test site or anechoic shielded chamber, set its output level "E" [see figure A1-1 to give an MS receiver input level of approximately 32 dBμVemf. This corresponds to a field strength of 55,5 dBμV/m at the MS position. The signal shall be the Standard Test Signal C1.

NOTE 1: The absolute value of the received signal level is not critical. The value suggested however will ensure that the MS receiver is operating essentially error free, yet is low enough to avoid any non linear effects in the receiver.

d) The SS shall use the RXLEV message from the MS to determine a measure of the received field strength. The procedure detailed in the flow chart of figure A1-1 shall now be followed.

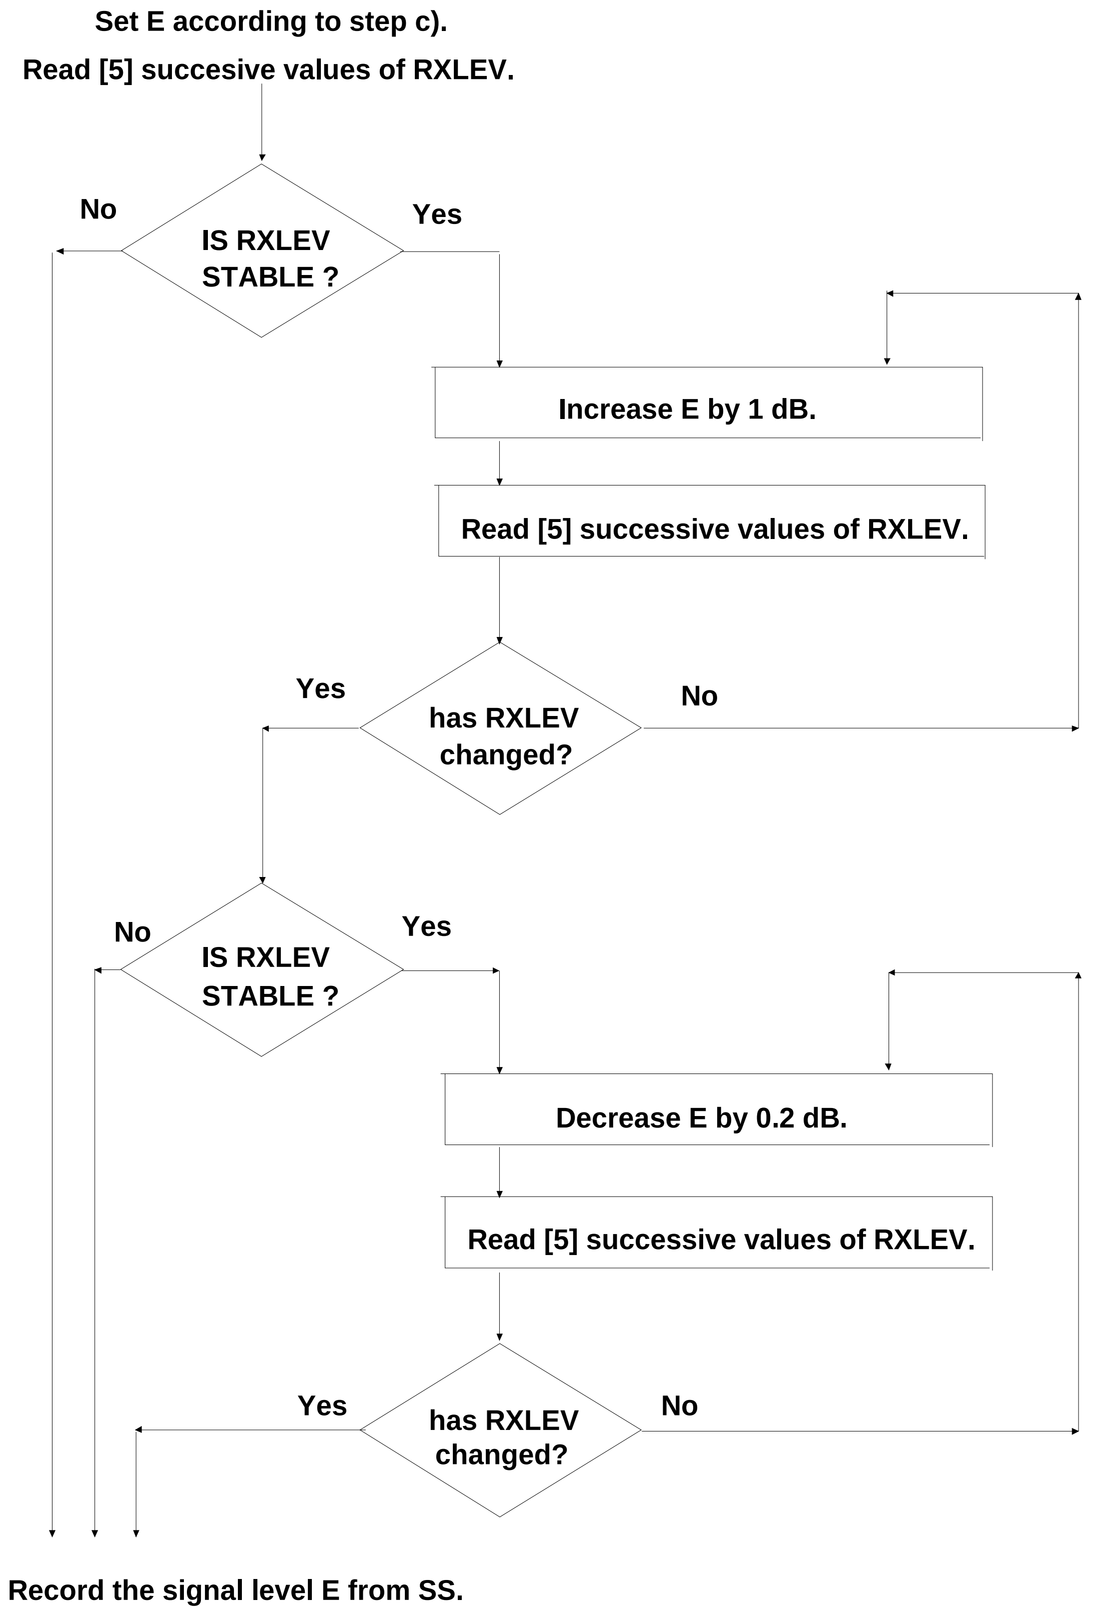

Figure A1-1

The signal level from the SS that just results in the transition from $RXLEV_a$ to $RXLEV_b$ shall be recorded as $E_{i.}$

NOTE 2: The actual values of $RXLEV_a$ and $RXLEV_b$ will need to be recorded, because this transition will be used as the reference point for all further stages of the calibration procedure.

e) Step d) shall be repeated after the MS has been rotated by n × 45° in the horizontal plane. Ensuring that the same RXLEV transition is used, the signal levels from the SS shall be recorded as E_{in}.

f) Calculate the effective mean signal level from the RMS value of the eight signal levels obtained in d) and e) above by using the following formula:

$$E_1 = \left[\frac{8}{\sum_{n=0}^{n=7} \frac{1}{E_{in}}} \right]^{\frac{1}{2}}$$

g) Repeat steps b) to f), except in step b) use an ARFCN in the mid ARFCN range to obtain a mean signal level E_2. Ensure the same RXLEV transition is used.

h) Repeat steps b) to f), except in step b) use an ARFCN in the high ARFCN range to obtain a mean signal level E_3.

Ensure the same RXLEV transition is used.

A1.1.5.2 Test range calibration

The objective of this step is to determine the actual field strength at the MS corresponding to the three signal levels E_1, E_2 and E_3 established in annex 1, subclause 1.1.5.1. The following procedure shall be used:

a) Replace the MS by a calibrated reception antenna connected to a measuring receiver.

b) For each frequency used in annex 1, subclause 1.1.5.1 measure the field strength E_{fr} corresponding to the respective signal levels E_r determined in steps f), g) and h) of annex 1, subclause 1.1.5.1 record these values as E_{f1}, E_{f2}, E_{f3}.

A1.1.5.3 Temporary antenna connector coupling factor

The coupling factor of the temporary antenna connector is the relationship expressed in dB, between the output signal of the SS and the effective receiver input signal for the MS.

The test sample MS is modified to fit a temporary antenna connector in accordance with annex 1, subclause 1.1.3. Or alternatively a second MS shall be provided, fitted with such a temporary antenna connector.

NOTE: If only one MS is supplied for testing, the tests of radiated spurious emissions (transmit and receive) and receiver sensitivity shall be performed before the MS is modified to accept a temporary antenna connector.

The calibration procedure shall be as follows:

a) The MS temporary connector is connected to the output of the SS.

b) A call shall be originated by the SS to the MS using a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power, non hopping encrypted mode.

c) The SS shall, using the procedures of annex 1, subclause 1.1.5.1, adjust its output signal level to determine the $RXLEV_a$ to $RXLEV_b$ transition. This signal level shall be recorded as E_{c1}.

d) Repeat steps b) and c) for frequencies in the mid ARFCN range and the high ARFCN range. Record the RXLEV transitions as E_{c2} and E_{c3} respectively.

e) The temporary antenna connector coupling factor F is then calculated from:

$$F_n = 20\log_{10}\left[\frac{E_{cn}}{E_{fn} * K_n}\right]$$

where K_n = conversion factor of an isotropic antenna expressed as $\underline{\mu V}$ at the frequency µV/m corresponding to the ARCFN used.

f) The mean antenna coupling factor F_m to be used for measurements requiring hopping shall be calculated from the RMS value of all parameters in e) as follows:

$$E_{cm} = \left[\frac{3}{1/E_{c1} + 1/E_{c2} + 1/E_{c3}} \right]^{1/2}$$

$$E_{fm} = \left[\frac{3}{1/E_{f1} + 1/E_{f2} + 1/E_{f3}} \right]^{1/2}$$

$$k_m = \left[\frac{k_1 + k_2 + k_3}{3} \right]^{1/2}$$

$$F_m = 20\log_{10} \left[\frac{E_{cm}}{E_{fm} + k_m} \right]$$

g) In all tests in which a MS with integral antenna is the unit under test, the signal level at the temporary antenna connector is determined from:

- E_{in} = E_{req} + F;

where:

- E_{in} = signal level at coupling device (dBµVemf);
- E_{req} = signal level required by the test (dBµVemf);
- F = coupling factor at the respective ARFCN (dB).

This is indicated in the test procedures as E_{req}, dBµVemf( ), where the empty parenthesis is to be read as E_{in}.

For frequencies not in the receive band or the transmit band, 0dBi antenna gain shall be assumed.]

A1.1.6 Connection of devices with multiple antennae

Devices with multiple antennae must be connected in well defined manner in order for test requirements to be considered valid. This applies equally to those tests which are specifically testing these requirements associated with a device with multiple antennae, as those which are not.

A1.1.6.1 DARP phase 2 MS

For those tests which are specifically designed for DARP phase 2 MS, the SS must present signals to, and connect to the MS in a manner specified in TS 45.005 Annex N.2. Additionally, the SS must be able to accommodate the MS transmission being on either one or both or these antennae, or indeed an alternative antenna.

A1.1.6.2 VAMOS III MS

For those tests which are specifically designed for VAMOS III MS, the SS must present signals to, and connect to the MS in a manner specified in TS 45.005 Annex Q.7. Additionally, the SS must be able to accommodate the MS transmission being on either one or both or these antennae, or indeed an alternative antenna.

A1.2 Normal and extreme Test Conditions (TC)

A1.2.1 Power sources and ambient temperatures (TC2)

During type approval tests the power source of the equipment shall be replaced by a test power source, capable of producing normal and extreme test voltages as specified in subclauses 1.2.2 and 1.2.3. The internal impedance of the test power source shall be low enough for its effect on the test results to be negligible. For the purpose of tests, the voltage of the power source shall be measured at the input terminals of the equipment. If the equipment is provided with a permanently connected power cable, the test voltage shall be that measured at the point of connection of the power cable to the equipment. In equipment with incorporated batteries the test power source shall be applied as close to the battery terminals as practicable.

During tests the power source voltages shall be maintained within a tolerance of ±3 % relative to the voltage at the beginning of each test.

A1.2.2 Normal test conditions (TC2.1)

The normal temperature and humidity conditions for tests shall be any convenient combination of temperature and humidity within the following ranges:

- Temperature: +15°C to +35°C (degrees Celsius).
- Relative humidity: up to 75 %.

NOTE: When it is impracticable to carry out the tests under the conditions stated above, the actual temperature and relative humidity during the tests shall be recorded in the test report.

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of these specifications, the nominal voltage shall be the declared voltage or any of the declared voltages for which the equipment was designed. The frequency of the test power source corresponding to the mains shall be within 1 Hz of the nominal mains frequency.

When the radio equipment is intended for operation from the usual types of regulated lead-acid battery power source of vehicles, the normal test voltage shall be 1,1 times the nominal voltage of the battery (6 volts, 12 volts etc.).

For operation from other power sources or types of battery (primary or secondary) the normal test voltage shall be that declared by the equipment manufacturer.

A1.2.3 Extreme test conditions (TC2.2)

For tests under extreme test conditions the 4 combinations of extreme voltages and extreme temperatures in table A1.1 shall be applied.

Table A1.1

	1	2	3	4
Temperature Voltage	High High	High Low	Low High	Low Low

For tests at extreme ambient temperatures measurements shall be made at the temperatures given in table A1.2 (see 3GPP TS 45.005, D.2.1 for further details), following the testing procedures given in IEC publications 68-2-1 and 68-2-2 for the low and high temperature tests.

For tests at the high temperature, after thermal balance has been achieved, the MS is switched on in the transmit condition (non DTX) for a period of one minute followed by 4 minutes in the idle mode (non DRX) after which the MS shall meet the specified requirements.

For tests at the low temperature, after thermal balance has been achieved, the MS is switched to the idle mode (non DRX) for a period of one minute after which the MS shall meet the specified requirements.

Table A1.2

	Temperature (degrees Celsius)	
	Low	High
For small MS units	-10	+55
For other units	-20	+55
Note 1: Mobile phones, Tabs, Data cards, Embedded modules etc. are considered belonging to the small MS category		

For tests at extreme voltages measurements shall be made at the lower and higher extreme voltages as declared by the MS manufacturer. For MS that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified in table A1.3.

Table A1.3

	Voltage (relative to nominal)		
	Lower extreme	Higher extreme	Normal cond.
Power source:			
AC mains	0,9	1,1	1,0
Regulated lead acid battery	0,9	1,3	1,1
Non regulated batteries:			
Leclanché	0,85	1,0	1,0
lithium	0,95	1,10	1,10
mercury/ nickel cadmium	0.9	1,0	1,0

A1.2.4 Vibration requirements (TC4)

When the MS is to be tested under vibration, then random vibration is used, where the acceleration spectral densities (ASD) and the frequency ranges of 3GPP TS 05.05 [subclause D.2.3] apply. These are given in table A1.4.

Table A1.4

frequency in Hz	ASD in m^2/s^3
5- 20	0,96
20 - 500	0,96 at 20 Hz, thereafter -3 dB / octave

The test shall be performed as described in IEC publication 68-2-36.

Annex 2:
Void

Annex 3: Protocol implementation information

General

The list of PICS and PIXIT gives all the information needed to perform the tests described in 3GPP TS 11.10.

A3.1 Protocol Implementation Conformance Statement (PICS)

For the points listed the manufacturer has the choice between different solutions in implementation. The manufacturer has to describe his choice if there is any consequence for the tests.

A3.1.1 LAPDm protocol (3GPP TS 04.05 and 04.06)

A3.1.1.1 Simplified protocol - 3GPP TS 04.06 clause 6

Statement about the choice made by the manufacturer.

A3.1.1.2 Management of SAPI = 3 - 3GPP TS 04.11 subclause 2.3

Statement about the handling of SAPI = 3 on the data link layer chosen by the manufacturer.

A3.1.2 Mobility management

A3.1.2.1 IMSI detach initiation by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.1

During a location updating, if an IMSI detach has to be performed (SIM or power off), the IMSI detach can be delayed until the location updating is finished, or can be omitted.

A3.1.2.2 IMSI detach completion by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.3

The MS should delay the local release of the channel to allow a normal release from the network after a detach by power off command, if possible.

If not possible the RR sub-layer on the MS side should be aborted without waiting for something from the network.

A3.1.2.3 MM specific procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4 and 4.5.1.1

During the lifetime of an MM specific procedure, if an MM connection establishment is required by a CM-entity, this request will either be rejected or delayed until the running MM specific procedure is terminated and, provided that the network has not sent a "follow-on proceed" indication, the RR connection is released.

If the LOCATION UPDATING REQUEST message has not been sent, the mobile station may include a "follow-on request" indicator in the message. The mobile station shall then delay the request until the MM specific procedure is completed, when it may be given the opportunity by the network to use the RR connection.

A3.1.2.4 Receiving an MM STATUS message - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.6

If the MM-entity of the Mobile Station receives a MM-STATUS message no state transition and no specific action shall be taken as seen from the radio interface, i.e. local actions are possible.

A3.1.3 Call control

A3.1.3.1 Status enquiry procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.1

The MS may send a STATUS ENQUIRY and take the appropriate actions based on the answer (STATUS) of the network.

A3.1.3.2 Receiving a STATUS message by a CC entity - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.2

The determination of which CC states are incompatible between the MS and the network is left as an implementation decision except in some particular cases.

A3.1.3.3 Called side compatibility checking - 3GPP TS 04.08 / 3GPP TS 24.008 clause B.3

Compatibility checking can be performed in various ways from the viewpoint of execution order and information to be checked, e.g. first DDI number, sub-address and then compatibility or vice versa.

A3.1.3.4 Disconnect on incoming call

The mobile equipment may or may not offer the possibility to disconnect an incoming call:

a) after having confirmed an incoming call, but before alerting;

b) after alerting, but before connecting.

3GPP TS 02.30 (subclause 5.2.3) allows the combination of SEND and END function in one key.

A3.1.4 Layer 1

A3.1.4.1 Optional storage of BCCH carrier information - 3GPP TS 05.08 subclause 6.3

The MS may include optional storage of BCCH carrier information. For instance, the MS may store the BCCH carriers in use by the PLMN accessed when it was last active in the GSM network, or it may store BCCH carriers for more than one PLMN.

A3.1.5 Autocalling - (ref.: 3GPP TS 02.07, annex 1)

Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

A3.1.6 Transient states

The following call control states may be transient in the mobile station:

State U6

State U6 may be transient if the mobile station is not configured to support explicit refusal of an incoming call by the (human or non-human) user (e.g. via a terminal interface) before call confirmation.

If U6 is transient, there is an internal transition:

```
               CALL CONFIRMED
U6  ------------------------------------------> U9
```

or an internal transition:

```
              RELEASE COMPLETE
U6  ------------------------------------------ > U0.
```

State U7:

State U7 is transient if the implementation allows for automatic connect after an implementation specific time T.

If U7 is transient, there is an internal transition:

```
              after T, CONNECT
U7  ------------------------------------------ > U8.
```

State U9:

State U9 is not transient if:

- the implementation does not support immediate connect;
- an appropriate TCH is not yet assigned;
- the signalling element has not been present in the SETUP.

If the implementation supports immediate connect, there is an internal transition:

```
              CONNECT
U9  ------------------------------------------ > U8.
```

If the appropriate TCH is available or the signalling element was present in SETUP, there is an internal transition:

```
              ALERTING
U9  ------------------------------------------ > U7.
```

State U12:

U12 is a stable state, if an appropriate speech traffic channel is connected and progress indicator #8 was present in the DISCONNECT message. Otherwise U12 is transient, and there is an internal transition:

A3.2 Protocol Implementation Extra Information for Testing (PIXIT)

A3.2.0 Introduction

Some of the features listed below are mandatory, others are not ; but in any case for each feature implemented the manufacturer must provide information to enable regulatory testing to be conducted.

A3.2.1 Basic characteristics

A3.2.1.1 Type of antenna

- Integrated without a connector.
- Position for normal use (if integrated without a connector).
- With a connector allowing the connection of an external antenna.
- If with a connector, declare in band impedance.

A3.2.1.2 Power supply

- Type of battery (if any).
- Type of power supply.
- Nominal voltage(s).
- End-point voltage(s) of battery(s) (if any).
- Details of MS shut-down voltage.

A3.2.1.3 Power class of the MS

- Different class declared.
- Class mark change: description of the means to change the RF power capabilities.

A3.2.1.4 Channel modes supported

- Speech full rate.
- Speech half rate.
- Data 14.5 kbit/s T/NT.
- Data 12 kbit/s full rate T/NT.
- Data 6 kbit/s full rate T/NT.
- Data 6 kbit/s half rate T/NT.
- Data 3,6 kbit/s full rate T.
- Data 3,6 kbit/s half rate T.

A3.2.1.5 Teleservices supported

11) Telephony.

12) Emergency calls.

21) Short message MT/PP.

22) Short message MO/PP.

23) Short message transmission cell broadcast.

61) Alternate speech and facsimile group 3 T/NT.

62) Automatic facsimile group 3 T/NT.

A3.2.1.6 Supplementary services supported

- Call forwarding.
- Call restriction.
- Handling of undefined GSM Supplementary Services.

A3.2.1.7 Bearer services supported

20) Asynchronous General Bearer Service see 3GPP TS 02.02 subclause 3.1

21) Data circuit Duplex asynchronous 300 bit/s T/NT
22) Data circuit Duplex asynchronous 1 200 bit/s T/NT

23)	Data circuit Duplex asynchronous	1 200/75 bit/s	T/NT
24)	Data circuit Duplex asynchronous	2 400 bit/s	T/NT
25)	Data circuit Duplex asynchronous	4 800 bit/s	T/NT
26)	Data circuit Duplex asynchronous	9 600 bit/s	T/NT
30)	Synchronous General Bearer Service	see 3GPP TS 02.02 subclause 3.1	
31)	Data circuit Duplex synchronous	1 200 bit/s	T
32)	Data circuit Duplex synchronous	2 400 bit/s	T/NT
33)	Data circuit Duplex synchronous	4 800 bit/s	T/NT
34)	Data circuit Duplex synchronous	9 600 bit/s	T/NT
40)	General PAD Access Bearer Service	see 3GPP TS 02.02 subclause 3.1	
41)	PAD Access circuit asynchronous	300 bit/s	T/NT
42)	PAD Access circuit asynchronous	1 200 bit/s	T/NT
43)	PAD Access circuit asynchronous	1 200/75 bit/s	T/NT
44)	PAD Access circuit asynchronous	2 400 bit/s	T/NT
45)	PAD Access circuit asynchronous	4 800 bit/s	T/NT
46)	PAD Access circuit asynchronous	9 600 bit/s	T/NT
50)	General Packet Access Bearer Service	see 3GPP TS 02.02 subclause 3.1	
51)	Data Packet Duplex synchronous	2 400 bit/s	NT
52)	Data Packet Duplex synchronous	4 800 bit/s	NT
53)	Data Packet Duplex synchronous	9 600 bit/s	NT
61)	Alternate Speech/Date (here Data offers the same service as bearer services 21-34 with "3,1kHz" information transfer capability)		
81)	Speech followed by Data (here Data offers the same service as bearer services 21-34 with "3,1kHz" information transfer capability).		

A3.2.1.8 SIM removal

- Removal of the SIM is possible without disconnection of the power supply (Y/N).

A3.2.1.9 Classmark

The coding of Mobile station classmark 1, 2, and 3 and the fact whether and under which conditions the classmark 3 information element is included in a CLASSMARK CHANGE message, has to be declared by the manufacturer. The declaration has to fulfil the following requirements:

- Mobile station classmark 1: Bits 4, 5 and 8 of the first (and only) octet of the value part of the information element shall be coded as "0". The "Revision level" and "RF power capability" field shall specify the value that is correct for the MS.

- Mobile station classmark 2: Bits 4, 5 and 8 of the first octet, bits 2, 3 and 8 of the second octet, bits 3 to 7 of the third octet of the value part of the information element shall be coded as "0". The "Revision level" field, "RF power capability" field, "PS capability" field, "SS Screening indicator" field, "SM capability" field, "Frequency capability" field, "Classmark 3" field, "A5/2 algorithm supported" field, and "A5/3 algorithm supported" field shall specify the value that is correct for the MS.

- Mobile station classmark 3: Bits 5 to 8 of the first octet of the value part of the information element shall be coded as "0". If the value part contains more octets, they shall be coded as "0000 0000". The "A5/4 algorithm supported" field, "A5/5 algorithm supported" field "A5/6 algorithm supported" field, and "A5/7 algorithm supported" field shall specify the value that is correct for the MS (that is, they shall be set to "0").

NOTE: The requirements to the classmark may be subject to changes. That is why test cases are expected to verify the manufacturer's declaration, whereas the correctness of the manufacturer's declaration is to be verified "off line".

A3.2.1.10 Type of SIM/ME interface (ref. 3GPP TS 11.11 and 3GPP TS 11.12)

- 5V SIM/ME interface (5V only ME).
- 3V SIM/ME interface (3V only ME).
- 5V/3V SIM/ME interface (3V technology ME).

A3.2.1.11 Multislot class

- Multislot class as defined in clause B.1 of 3GPP TS 05.02.

A3.2.2 Man machine interface

A3.2.2.1 Mobile station features

- Description of manual entry and display of a called number.
- Description of the basic way to send a call manually.
- Description of the basic way to take a call manually.
- Description of the basic way to end a call manually.
- Description of the basic way to send an emergency call manually.
- Description of the basic way to send DTMF manually.
- Description of the manual PLMN selector.
- Description of the automatic PLMN selector.
- Description of the indication of the country.
- Description of the indication of the available PLMN.
- Description of the indication of the automatic registration to a PLMN.
- Description of the service indicator.
- Description of the management of the SIM by the user:
    - keying PIN and changing PIN;
    - indication of acceptance or rejection of keyed PIN;
    - indication of blocked SIM;
    - indication of successful unblocking of the SIM;
    - storing an abbreviated number;
    - displaying an abbreviated number.
- Description of the selection of the hands free.
- Description of the volume control.
- Description of local barring of outgoing calls.
- Description of prevention of unauthorized calls.
- Description of the auto calling management:
    - selection of the auto calling;

    - indication that the call failed and a re-try is attempted;
    - indication that the call finally failed;
    - number of B-party numbers that can be stored in the list of blacklisted numbers.

- Description of the way in which the MS generates an MS originated NOTIFY, if possible. This feature may or may not be supported by the MS.
- Description of the way the MS indicates the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Description of the way the MS indicates the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

NOTE: All the above description could be extracted from the user's manual.

A3.2.2.2 Short message service

- Description of the basic procedures to send a mobile originated short message.
- Description of the basic procedures to display a mobile terminated short message.
- Description of the basic procedures to display a cell broadcasted short message.
- Whether SMS messages are stored in the SIM and/or the ME.
- Maximum length (characters) of a mobile originated short message.

A3.2.2.3 Supplementary services

A3.2.2.3.1 Call forwarding

- Description of the user's commands and of the display of the answers from the network for:
    - registration;
    - erasure;
    - activation;
    - deactivation;
    - interrogation;
    - specific data request.
- Description of the display of:
    - notification of an incoming call to the "served" mobile or the "forwarded to" mobile;
    - notification during out-going call;
    - information to the calling mobile.

A3.2.2.3.2 Call restriction

- Description of the user's commands and the display of the answers from the network for:
    - registration;
    - change of the password;
    - activation;
    - deactivation;

  - interrogation.

- Description of the display of the indication of call barring.

A3.2.2.3.3 Handling of (undefined) GSM supplementary services

- Description of the user's commands and the display of the answer from the network.
- Identification of the short strings defining MS manufacturer defined procedure in idle mode (1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND").

A3.2.3 Electrical Man Machine Interface (EMMI)

A3.2.3.1 Methods supported for activation/deactivation of EMMI

- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2.
- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2, except activation by inserting a test SIM (when the ME is already switched on).
- Activation/deactivation only via layer 3 messages on the radio interface according to 3GPP TS 11.10, subclause 36.2.2.

A3.2.3.2 Transmission rate supported by the ME on the EMMI

A3.2.3.3 Layer 3 messages supported on the EMMI

- Layer 3 messages as specified in 3GPP TS 11.10, subclause 36.3.5.3.2, except: (followed by the list of messages not supported).
- others than defined in 3GPP TS 11.10 subclause 36.3.5.3.1 table 9.

A3.2.3.4 Keystroke sequence messages

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, subclause 36.3.5.3.2):

- related to tests of the mobile station features (3GPP TS 11.10, clause 33);
- related to testing of the ME/SIM interface (3GPP TS 11.10, clause 27);
- related to tests of autocalling restrictions (3GPP TS 11.10, clause 28);
- related to tests of supplementary services (3GPP TS 11.10, clause 31);
- related to tests of data services (3GPP TS 11.10, clause 29);
- related to tests of short message service (3GPP TS 11.10, clause 34);
- related to other tests.

A3.2.3.5 Internal malfunction detected messages

List of the error indicators provided.

A3.2.4 Digital Audio Interface (DAI)

Description of the speech data routing:

- via the control lines; or
- via the test interface message.

A3.2.5 Characteristics related to bearer services or teleservices

A3.2.5.1 Access interface

Description of the access interface to connect the DTE (e.g. V series (V.24, V.28), X series, two wire analogue interface for use with fax group 3, I.420 (S-reference point).

In case of a proprietary interface to a DTE (non standard), description of this interface (hardware and software).

In case of a non standard connector provide a mechanical adapter.

A3.2.5.2 Configuration of the MT

Description of the configuration information to be selected in the MT to connect a terminal equipment to the mobile termination.

Description of the (different) configuration(s) of the MT for each bearer service and each teleservice supported, with the range or value for the parameters and the configuration procedure.

For the purpose of test of MOC, the manufacturer shall describe precisely how it is possible to put the MT in the different configurations to generate the capability information of the Mobile according to subclause 3.2.5.3, and described as supported by the MS.

For the purpose of test of MTC, the manufacturer shall describe how to verify the correct selection by the MT of the required function with regard to the capability information as described below, especially using the messages at the Um interface if there is no R or S interface available (case MTO). The description shall be made for every combination of the parameter value valid for the MT.

A3.2.5.3 Capability information

Description of the capability information, related to supported bearer services:

- bearer capabilities;
- higher layer capabilities;
- lower layer capabilities.

The manufacturer shall describe for every capability the associated terminal functions and their characteristics.

A3.2.5.4 Subaddress or DDI number

Subaddress or a DDI number of the MT.

Procedure to allocate or change DDI number or subaddress, if possible.

A3.2.5.5 User to user signalling

Description of the function and the user's access to it.

A3.2.5.6 Data call set-up and data call clearing

For each implemented transparent and non-transparent data service:

- Description of the data call establishment mechanism:
  - Terminal initiated (CT108) (if possible);
  - MT (MMI/EMMI) initiated;
  - Description of DCE provided information (MT to TE), if any;
  - Declaration of optimal function and procedure, services supported by the MT.
- Description of the data call clearing mechanism:

- Terminal initiated (CT109) (if possible);
- MT (MMI/EMMI) initiated;
- Description of DCE provided information (MT to TE) related to a mobile or network initiated call clearing, if any.

A3.2.5.7 Characteristics of non-transparent data services

Description of Radio Link Protocol (RLP) features supported.

Description of supported RLP parameters and how to modify these values (if possible):

`<iws>` IWF to MS window size

`<mws>` MS to IWF window size

`<T1>` acknowledgement timer T1

`<N2>` retransmission attempts N2

Ability to configure the MS to use non-default RLP parameters.

Description of flow control mechanism:

- INBAND (XON/XOFF);
- OUTBAND COPnoFICt (CT105 and CT106).

A3.2.5.8 Possible ways of setting-up a call from either an external interface or internally

Describe in detail all possible ways a call can be initiated from the MS or a connected terminal.

A3.2.5.9 Application layer causing automatic call termination

State whether the call termination facility can be disabled and if so, describe in detail how.

A3.2.5.10 Call re-establishment for MS not supporting speech

Applicability of call re-establishment.

A3.2.6 International mobile station equipment identity

IMEI of the MS.

A3.2.7 Receiver intermediate frequencies

F_{lo} - Local Oscillator frequency applied to first receiver mixer.

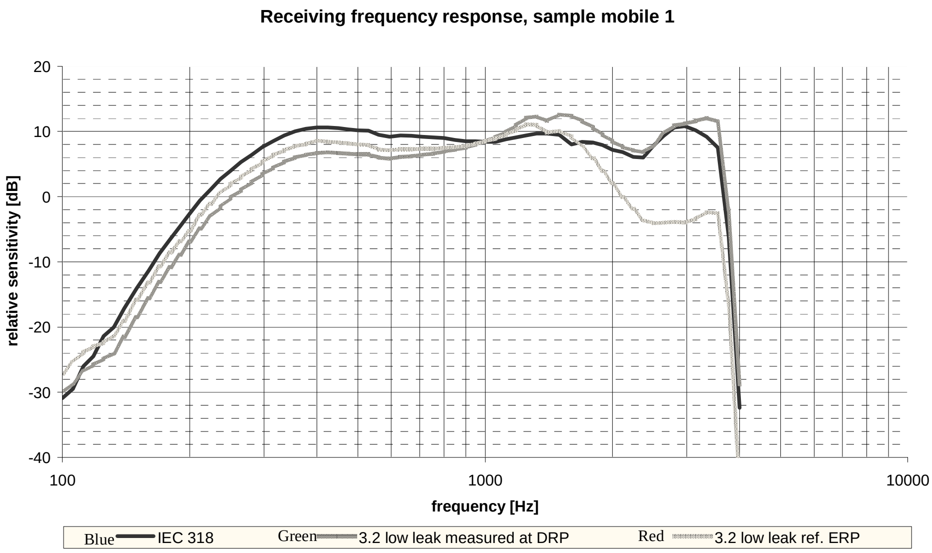
IF_1 ... IF_n - intermediate frequencies.

A3.2.8 Artificial ear

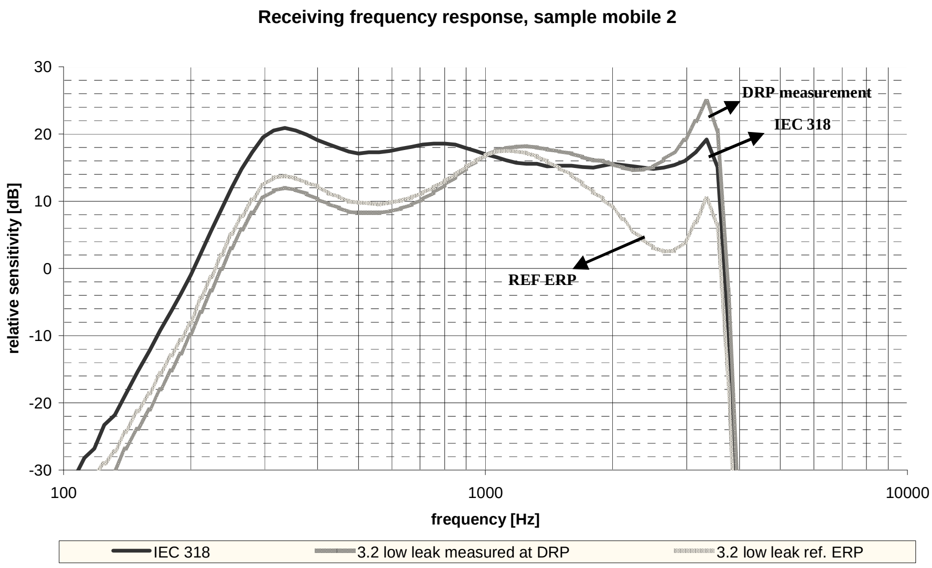
The manufacturer shall declare which type of artificial ear (type 1 or type 3.2 or type 3.4) is used for teleservices speech testing.

The following illustrate the results of both artificial ears when specified for acoustic receiving measurement.

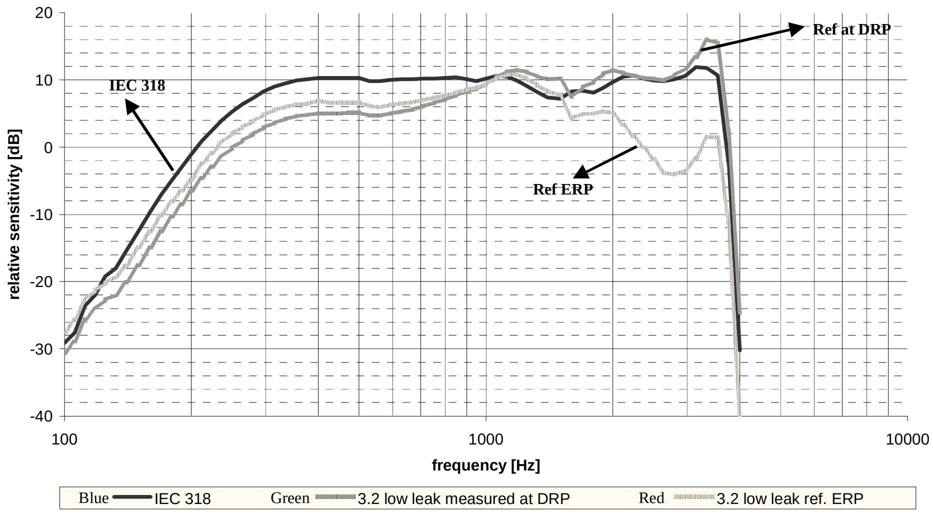
Type 3.2 results are currently referred to ERP (as specified), but measured at DRP. When introducing DRP to ERP correction, a special frequency response is used which is obtained with the artificial ear in a free sound field. The overall result actually differs substantially from the transfer function under the IEC 318 test conditions. Referring the results to DRP instead avoids misleading interpretations.



This slide as well as the following two shows results of three measurement and evaluation methods per each mobile sample. The blue curve is as measured sealed to IEC 318 closed coupler. The green curve is as measured with type 3.2 low leak coupler at DRP. The red curve shows the same measurement data corrected to ERP using the correction function provided by the manufacturer.

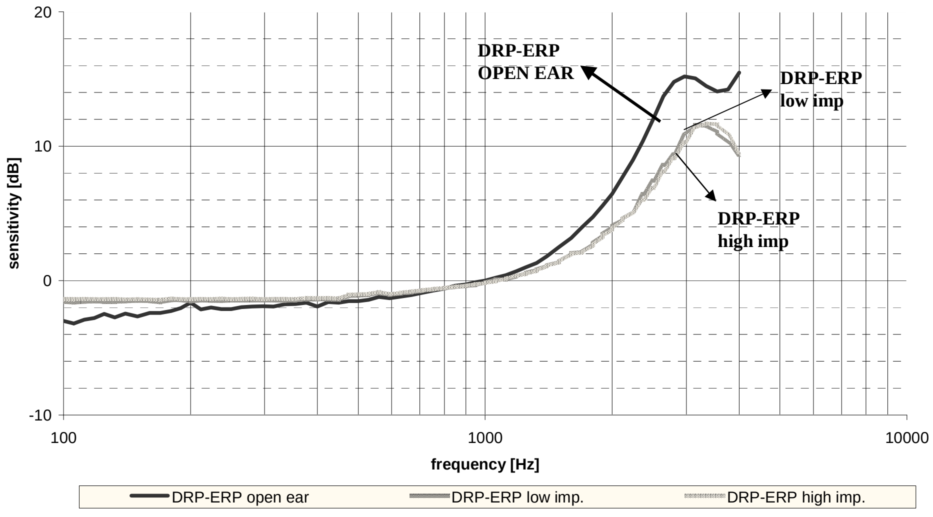


Receiving frequency response, sample mobile 3

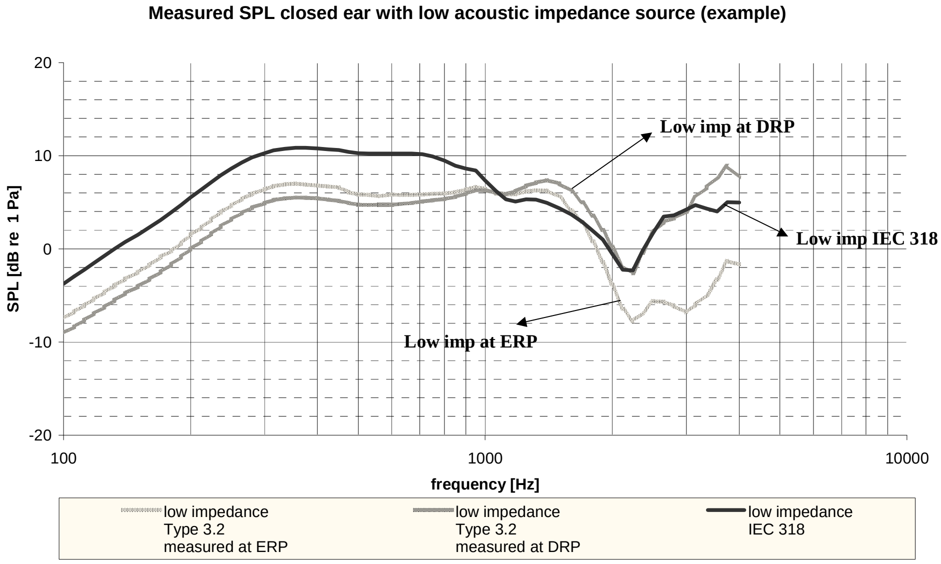


Below 1 KHz both type 3.2 curves are similar. The level decreases from IEC 318 to the type 3.2 results is due to the leak. At high frequencies the measured type 3.2 curve without DRP to ERP correction (green) clearly illustrates better compatibility towards IEC 318 results than the curve referred to ERP (red).

DRP to ERP transfer function of type 3.2 artificial ear



The three curves show the DRP to ERP transfer function for different source conditions. The blue line is obtained mounted in a baffle. The other two functions are measured with a probe microphone at ERP on two mobiles with different acoustic source impedance.



Contrary to the first three slides, the type 3.2 low leak response at ERP her is not calculated, but measured with a probe microphone. The relationship between the three curves is the same as in each of the first three slides.

The difference between the results of type 3.2 low leak artificial ear referred to DRP and ERP respectively is due to the acoustic input impedance of the artificial ear. The high acoustic impedance at DRP is transferred to a relatively low impedance at ERP for high frequencies according to the quarter wavelength distance between both points. This means that acoustic energy at ERP is more in terms of sound velocity, which is not measured with the used pressure microphone. The human ear is known to have its highest sensitivity around 5 KHz. Type 3.2 low leak measurement referred to ERP has particularly low sensitivity at this frequency. In order to account for compatibility between IEC 318 results and type 3.2 low leak results as well as for the sensitivity of the human ear, it is up to the choice of the terminal manufacturer, whether acoustic test results from the type 3.2 low leak artificial ear should be referred to ERP or to DRP.

Annex 4: Test SIM Parameters

A4.1 Introduction

This clause defines the GSM related default parameters for programming the elementary files of the test SIM or test USIM. The requirements of this annex do not apply to the SIM/ME tests of clause 27.

A4.1.1 Definitions

"Test SIM card":

A SIM card supporting the test algorithm for authentication, programmed with the parameters defined in this subclause. The electrical, mechanical and environmental requirements of the test SIM card are specified in 3GPP TS 11.11 / 3GPP TS 51.011.

"Test SIM":

Either a test SIM card or the SIM simulator programmed with the parameters defined in this subclause.

A4.1.2 Definition of the test algorithm for authentication

The following procedure employs bit wise modulo 2 addition ("XOR").

The following convention applies:

In all data transfer the most significant byte is the first byte to be sent; data is represented so that the left most bit is the most significant bit of the most significant byte.

Step 1:

XOR to the challenge RAND, a predefined number Ki, having the same bit length (128 bits) as RAND. The result RES1 of this is

RES1 = RAND XOR Ki

Step 2:

The most significant 32 bits of RES1 form SRES. The next 64 bits of RES1 form Kc. The remaining 32 bits are not used.

A4.2 Default Parameters for the test SIM

Ki:

The authentication key "Ki" will be chosen by the test house and will be non zero. The "Ki" value used by the SS will align with this value.

PIN Disabling

The PIN enabled / disabled flag will be set to "PIN Disabled". This ensures that when the Test SIM is inserted into a MS the user will not be prompted for PIN entry. This requires a specific card capability defined by the SIM service table (see subclause 2.9).

A4.3 Default settings for the Elementary Files (EFs)

The format and coding of elementary files of the SIM are defined in 3GPP TS 11.11 / 3GPP TS 51.011. The following subclauses define the default parameters to be programmed into each elementary file. Some files may be updated by the MS based on information received from the SS. These are identified in the following subclauses.

A4.3.1 EF_{ICCID} (ICC Identification)

The programming of this EF is a test house option.

A4.3.2 EF_{LP} (Language preference)

The programming of this EF is a test house option.

A4.3.3 EF_{IMSI} (IMSI)

The IMSI value will be chosen by the test house. The IMSI used by the SS will align this value.

File size:	9 bytes		
Default values:	Byte 1 (DEC):	8	
	Bytes 2-9 (DEC):	09 10 10 ** ** ** $\boxed{*}$* $\boxed{**}$	for GSM 400, GSM 900 and DCS 1 800
	Bytes 2-9 (DEC):	09 10 10 *1 ** ** $\boxed{*}$* $\boxed{**}$	for GSM 700, GSM 850 and GSM 1 900

"*" indicates any number between 0 and 9 subject to the restriction that IMSI mod 1000 (i.e. the three boxed "*" digits number 13, 15 and 16) lies in one of the following ranges:

- 063-125, 189-251, 315-377, 441-503, 567-629, 693-755, 819-881 or 945-999.

NOTE: This ensures that the MS can listen to the second CCCH when more than one basic physical channel is configured for the CCCH. This is necessary for the test of "paging re-organization".

A4.3.4 EF_{Kc} (Ciphering key Kc)

File size: 9 Bytes

Default values (HEX):	Bytes 1-8:	Align with Kc used by SS
	Byte 9:	07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

A4.3.5 $EF_{PLMNsel}$ (PLMN selector)

GSM 400, GSM 900 and DCS 1 800 begin

File size:	102 bytes		
Default values (HEX):	Bytes 1-3:	32 F4 10	(MCC, MNC) - Translates to 234, 01
	Bytes 4-6:	32 F4 20	(MCC, MNC)
	Bytes 7-9:	32 F4 30	(MCC, MNC)
	....		
	....		
	....		
	Bytes 94-96:	32 F4 23	(MCC, MNC)
	Bytes 97-99:	32 F4 33	(MCC, MNC)
	Bytes 100-102:	32 F4 43	(MCC, MNC)

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size:	102 bytes		
Default values (HEX):	Bytes 1-3:	32 24 10	(MCC, MNC) - Translates to 234, 012
	Bytes 4-6:	32 34 20	(MCC, MNC)
	Bytes 7-9:	32 44 30	(MCC, MNC)
	....		
	....		
	....		
	Bytes 94-96:	32 34 23	(MCC, MNC)

Bytes 97-99: 32 44 33 (MCC, MNC)
Bytes 100-102: 32 54 43 (MCC, MNC)

GSM 700, GSM 850 and PCS 1900 end

34 PLMNs are shown coded above since this is the largest number required for a test - see subclause 27.9.4.1. It is necessary to take this into account since the SIM cards must be dimensioned to cope with this number of records.

A4.3.6 EF_{HPLMN} (HPLMN search period)

File size: 1 byte

Default value (HEX): 00 (no HPLMN search attempts)

A4.3.7 EF_{ACMmax} (ACM maximum value)

File size: 3 bytes
Default: Byte 1: 00
Byte 2: 00
Byte 3: 00

The above translates to: "Not valid".

A4.3.8 EF_{SST} (SIM service table)

Services will be allocated and activated as follows:

Service	Allocated	Activated
No. 1: CHV1 disable function	Yes	Yes
No. 2: Abbreviated Dialling numbers (ADN)	Yes	Yes
No. 3: Fixed dialling numbers (FDN)	Yes	Optional
No. 4: Short Message Storage (SMS)	Yes	Yes
No. 5: Advice of Charge (AoC)	Yes	Yes
No. 6: Capability Configuration Parameters (CCP)	Yes	Yes
No. 7: PLMN Selector	Yes	Yes
No. 8: Reserved for future use	No	No
No. 9: MSISDN	Optional	Optional
No. 10: Extension 1	Yes	Optional
No. 11: Extension 2	Yes	Optional
No. 12: SMS Parameters	Yes	Yes
No. 13: Last Dialled Number (LND)	Yes	Yes
No. 14: Cell Broadcast Message Identifier	Yes	Yes
No. 15: Group identifier Level 1	Yes	Optional
No. 16: Group identifier Level 2	Yes	Optional
No. 17: Service Provider Name	Optional	Optional
No. 18: Service Dialling Numbers (SDN)	Optional	Optional
No. 19: Extension3	Optional	Optional
No. 20: RFU	Optional	Optional
No. 21: VGCS Group Identifier List (EF_{VGCS} , EF_{VGCSS})	Yes	Yes
No. 22: VBS Group Identifier List (EF_{VBS} , EF_{VBSS})	Yes	Yes
No. 23: eMLPP service	Yes	Yes
No. 24: Automatic answer for eMLPP	Yes	Yes
No. 25: Data download via SMS-CB	Optional	Optional
No. 26: Data download via SMS-PP	Optional	Optional
No. 27: Menu selection	Optional	Optional
No. 28: Call control	Optional	Optional
No. 29: Proactive SIM	Optional	Optional
No. 30: Cell Broadcast Message Identifier Ranges	Optional	Optional
No. 31: Barred Dialling Numbers (BDN)	Optional	Optional
No. 32: Extension4	Optional	Optional
No. 33: De-personalization Control Keys	Optional	Optional
No. 34: Co-operative Network List	Optional	Optional
No. 35: Short Message Status Reports	Optional	Optional
No. 36: Network's indication of alerting in the MS	Optional	Optional

Service	Allocated	Activated
No. 37: Mobile Originated Short Message control by SIM	Optional	Optional
No. 38: GPRS	Optional	NOTE 1
No. 39: Image (IMG)	Optional	Optional
No. 40: SoLSA (Support of Local Service Area)	Optional	Optional
No. 41: USSD string data object supported in Call Control	Optional	Optional
No. 42: RUN AT COMMAND command	Optional	Optional
No. 43: User controlled PLMN Selector with Access Technology	Optional	Optional
No. 44: Operator controlled PLMN Selector with Access Technology	Optional	NOTE 2
No. 45: HPLMN Selector with Access Technology	Optional	NOTE 2
No. 46: CPBCCH Information	Optional	Optional
No. 47: Investigation Scan	Optional	Optional
No. 48: Extended Capability Configuration Parameters	Optional	Optional
No. 49: MExE	Optional	Optional
No. 50: Reserved and shall be ignored	No	No
No. 51: PLMN Network Name	Optional	Optional
No. 52: Operator PLMN List	Optional	Optional
No. 53: Mailbox Dialling Numbers	Optional	Optional
No. 54: Message Waiting Indication Status	Optional	Optional
No. 55: Call Forwarding Indication Status	Optional	Optional
No. 56: Service Provider Display Information	Optional	Optional
No. 57: Multimedia Messaging Service (MMS)	Optional	Optional
No. 58: Extension 8	Optional	Optional
No. 59: MMS User Connectivity Parameters	Optional	Optional
NOTE 1: For GPRS tests the GPRS service shall be activated.		
NOTE 2: If allocated $EF_{PLMNwAcT}$, $EF_{OPLMNwAcT}$ are present on the SIM they shall have same settings as $EF_{PLMNsel}$.		

A4.3.9 EF_{ACM} (Accumulated call meter)

File size:		3 bytes
Default:	Byte 1:	00
	Byte 2:	00
	Byte 3:	00

The above translates to: "Not yet implemented".

A4.3.10 EF_{PUCT} (Price per unit and currency table)

File size:		5 bytes
Default:	Byte 1-3:	FF
	Byte 4-5:	00

A4.3.11 EF_{CBMI} (Cell broadcast Message Identifier Selection)

The programming of this EF is a test house option.

The file size is 2n bytes, where n is the number of Cell broadcast message identifier records - each record defining a type of Cell Broadcast message which may be accessed by the MS. Care should be taken when dimensioning the SIM to take into account the number of Cell Broadcast message identifier records required.

A4.3.12 EF_{BCCH} (Broadcast control channels)

File size:	16 Bytes	
Default values (BIN):	Bytes 1-2:	11111111 11111111
	Bytes 3-4:	11111111 11111111
	Bytes 5-6:	11111111 11111111
	Bytes 7-8:	11111111 11111111
	Bytes 9-10:	11111111 11111111
	Bytes 11-12:	11111111 11111111

Bytes 13-14:	11111111 11111111
Bytes 15-16:	11111111 11111111

This field may be updated dependent on the MS implementation.

A4.3.13 EF_{ACC} (Access control class)

File size:	2 Bytes	
Default values (BIN):	Byte 1:	00000000
	Byte 2:	********

The test house may set any single bit of byte 2 to "1". All remaining bits of byte 2 will be set to "0". This determines the access control class of the SIM.

A4.3.14 EF_{FPLMN} (Forbidden PLMNs)

Length:		12 Bytes
Format (HEX):	Bytes 1-3:	FF FF FF
	Bytes 4-6:	FF FF FF
	Bytes 7-9:	FF FF FF
	Bytes 10-12:	FF FF FF

This coding corresponds to an empty "forbidden PLMN list". The bytes within this file may be updated if a LOCATION UPDATE REJECT message is received by the MS with cause, "PLMN not allowed".

A4.3.15 EF_{LOCI} (Location information)

GSM 400, GSM 900 and DCS 1 800 begin

File size:	11 Bytes	
Default values:	Bytes 1-4 (HEX):	FF FF FF FF (TMSI)
	Bytes 5-9 (HEX):	42 F6 18 FF FE (LAI)
	Byte 10 (HEX):	FF (Periodic LU Time = "the timer is not running")
	Byte 11 (BIN):	00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 81 (byte 7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size:	11 Bytes	
Default values:	Bytes 1-4 (HEX):	FF FF FF FF (TMSI)
	Bytes 5-9 (HEX):	42 36 18 FF FE (LAI)
	Byte 10 (HEX):	FF (Periodic LU Time = "the timer is not running")
	Byte 11 (BIN):	00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 813 (bytes 6-7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 700, GSM 850 and PCS 1900 end

A4.3.16 EF_{AD} (Administrative data)

File size:	3 bytes	
Default values	Byte 1:	10000000 - (type approval operations)
	Byte 2:	11111111
	Byte 3:	11111111

A4.3.17 EF_{Phase} (Phase identification)

File size:	1 byte	
Default value (HEX):	02	Phase 2

A4.3.18 EF_{ADN} (Abbreviated dialling numbers)

The programming of this EF is a test house option. It should be noted that sufficient space should be provided on the SIM card for 101 records - see subclause 27.15.4.1.

A4.3.19 EF_{FDN} (Fixed dialling numbers)

Optional.

A4.3.20 EF_{SMS} (Short messages)

Default:	Records 1-5	Byte 1:	00
		Byte 2:	FF
		Bytes 3-14:	FF FF FF FF FF FF FF FF FF FF FF FF
		Bytes 15-26:	FF FF FF FF FF FF FF FF FF FF FF FF
		Byte 27:	FF
		Byte 28:	FF
		Bytes 29-35:	FF FF FF FF FF FF FF
		Byte 36:	FF
		Bytes 37-176:	All Bytes set to FF

A4.3.21 EF_{CCP} (Capability configuration parameters)

File size:	14 bytes	
Default values	Byte 1:	04
	Byte 2:	01
	Byte 3:	A0
	Bytes 4-14:	FF

The above translates to: "Full rate, GSM Standardized coding, circuit mode and speech".

A4.3.22 EF_{MSISDN} (MSISDN)

Optional.

A4.3.23 EF_{SMSP} (Short message service parameters)

The programming of this EF is a test house option.

Each record size is 28+Y bytes, where Y is the number of bytes in the Alpha Identifier. Care should be taken when dimensioning the SIM to take into account the number of Short message service parameter records required.

A4.3.24 EF_{SMSS} (SMS status)

File size:	2 bytes	
	Byte 1:	00
	Byte 2 (BIN):	11111111

The above translates to:

(a) Last Mobile Originated Short Message had a TP Message Reference parameter of "00".

(b) SMS Memory Capacity Exceeded, Notification Flag unset: memory capacity available.

A4.3.25 EF_{EXT1} (Extension 1)

Optional.

A4.3.26 EF_{EXT2} (Extension 2)

Optional.

A4.3.27 EF_{VGCS} (Voice Group Call Service)

This EF contains a list of the default VGCS group identifiers.

File size: Bytes 200

Default values:

Bytes	Group ID	Value	BCD encoding in the SIM card
1-4	1	12	21 FF FF FF
5-8	2	123	21 F3 FF FF
9-12	3	1234	21 43 FF FF
13-16	4	12348	21 43 F8 FF
17-20	5	123491	21 43 19 FF
21-24	6	1235029	21 53 20 F9
25-28	7	12351	21 53 F1 FF
29-32	8	12352	21 53 F2 FF

197-200	50	1111119	11 11 11 F9

A4.3.28 EF_{VGCSS} (Voice Group Call Service Status)

This EF contains the default activation of the VGCS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, and 50.

File size: Bytes 7
Default values (HEX): Bytes 1-7: '09 00 08 20 00 00 FE'

A4.3.29 EF_{VBS} (Voice Broadcast Service)

This EF contains a list of the default VBS group identifiers.

File size: Bytes 200

Default values:

Bytes	Group ID	Value	BCD encoding in the SIM card
1-4	1	12	21 FF FF FF
5-8	2	123	21 F3 FF FF
9-12	3	1234	21 43 FF FF
13-16	4	12348	21 43 F8 FF
17-20	5	123491	21 43 19 FF
21-24	6	1235029	21 53 20 F9
25-28	7	12351	21 53 F1 FF
29-32	8	12352	21 53 F2 FF
33-36	9	12353	21 53 F3 FF
37-40	10	12354	21 53 F4 FF
41-44	11	12355	21 53 F5 FF
45-48	12	12356	21 53 F6 FF
49-52	13	12357	21 53 F7 FF
53-56	14	12358	21 53 F8 FF
57-60	15	12359	21 53 F9 FF
61-64	16	20000	02 00 F0 FF
65-68	17	20001	02 00 F1 FF
69-72	18	20002	02 00 F2 FF
73-76	19	20003	02 00 F3 FF
77-80	20	20004	02 00 F4 FF
81-84	21	20005	02 00 F5 FF

181-184	46	80128	08 21 F8 FF
185-188	47	80129	08 21 F9 FF
189-192	48	80130	08 31 F0 FF
193-196	49	99999	99 99 F9 FF
197-200	50	1111119	11 11 11 F9

A4.3.30 EF_{VBSS} (Voice Broadcast Service Status)

This EF contains the default activation of the VBS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, and 50.

File size:	Bytes	7
Default values (HEX):	Bytes 1-7:	'09 00 08 20 00 00 FE'

A4.3.31 EF_{eMLPP} (enhanced Multi Level Pre-emption and Priority)

This EF contains default information about priority levels and fast call set-up conditions for the enhanced Multi Level Pre-emption and Priority service.

Length:	2 Bytes	
Format (HEX):	Byte 1 (Priority levels):	'74'
	Byte 2 (Fast call set-up conditions):	'04'

The coding corresponds to available priority levels 2, 3, 4 and 0. For fast call setup, the coding corresponds to available priority level 0.

A4.3.32 EF_{AAeM} (Automatic Answer for eMLPP Service)

This EF contains the default priority levels (of the Multi Level Pre-emption and Priority service) for which the mobile station shall answer automatically to incoming calls.

Length:	1 Byte	
Format (HEX):	Byte 1:	'0F'

The coding corresponds to the default capability of the MS to answer automatically to incoming calls that have a priority level higher than 2.

A4.3.33 EF_{KcGPRS} (GPRS Ciphering key KcGPRS)

Mandatory if GPRS shall be tested else optional.

File size:	9 bytes	
Default values (HEX):	Bytes 1-8:	Align with KcGPRS used by SS
	Byte 9:	07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test unless other conditions follow from the definition of the initial conditions of the mobile.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

A4.3.34 $EF_{LOCIGPRS}$ (GPRS location information)

Mandatory if GPRS shall be tested else optional.

File size:	14 bytes	
Default values:	Bytes 1-4 (HEX):	FF FF FF FF (P-TMSI)
	Bytes 5-7 (HEX):	FF FF FF (P-TMSI signature value)
	Bytes 8-13 (HEX):	FF FF FF FF FF FF (RAI)
	Byte 14 (BIN):	00000001 (Routing Area Update Status = "not updated")

Bytes in this file (e.g. P-TMSI in bytes 1-4) may be updated as a result of a routing area update attempt by the MS.

Annex 4A: Test USIM Parameters

Test USIM application is defined in 3GPP TS 34.108 clause 8 “Test USIM Parameters” and can be used instead of test SIM.

Test USIM (UICC hardware) shall allow MS to perform GSM test algorithm for authentication (GSM AKA) or UMTS Authentication Challenge (UMTS AKA) as defined in TS 33.102.

The SS shall support both algorithm and the algorithm applied is configured by pixit settings.

For UMTS Authentication Challenge (i.e. UMTS AKA using an USIM as defined in TS 33.102), the SS shall be able to handle vectors of AUTN, RAND, CK, IK, AUTS and XRES in the way as the MSC/BSS entities. The SS and Test USIM shall incorporate a test algorithm for generating RES and CK, IK from RAND, AUTN and IK which operates as described in TS 34.108 clause 8.1.2.

For test cases indicating Test USIM to be used test SIM can not be used.

Annex 5: Test equipment

A5.1 Introduction

A5.1.1 General

The test equipment is either an equipment or assembly of equipments which enables the tests described in the present document to be conducted.

This annex describes requirements for the test equipment which cannot be derived from and which are assumed in, the conformance test descriptions described in the present document.

Specifically stimulus setting and measurement uncertainties are defined.

A5.1.2 Test equipment terms

The term "System Simulator" (SS) is used to describe the complete suite of test equipment required to perform the tests in the present document when interacting with the following MS interfaces:

- Antenna (Connector or radiated);
- Acoustic;
- Data Port(s);
- Power supply;
- DAI.

NOTE: To perform a sub-set of tests, the SS may be simplified accordingly.

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see 3GPP TS 11.11) with specific parameters defined in annex 3.

A5.1.3 Confidence level

All uncertainty values stated in this annex are quoted for a Confidence Level of 95 %.

A5.2 Standard test signals

The Cx signals represent the wanted signals and the Ix signals represent the unwanted signals.

Signal C0 Unmodulated continuous carrier.

Signal C1 A standard signal with GMSK AQPSK, 8-PSK, 16-QAM or 32-QAM modulation as appropriate. The channel coder will depend on the test and the cipher mode shall be selectable by the test method. When using this signal in the non hopping mode, the unused seven time slots shall also contain dummy bursts, with power levels variable with respect to the used timeslot, see also DYNAMIC LEVEL SETTING in subclause A5.3.4.7.

Signal I0 Unmodulated continuous carrier.

Signal I1 A GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or pseudo random data stream.

Signal I2 A standard GMSK modulated signal with valid midamble, different from C1. The data bits (including bits 58 and 59) shall be derived from a random or pseudo random data stream.

Signal I3 An Additive White Gaussian Noise (AWGN) signal having a minimum bandwidth of 1,5 times the symbol rate i.e. minimum 402,6kHz for a GSM channel. The AWGN power shall be measured over a noise bandwidth of 270,833 kHz. In the complex baseband, the AWGN signals shall be independent in the real and in the imaginary part, zero-mean and with equal power.

Signal I4 A GMSK modulated signal with valid training sequence code (TSC) randomly selected on a burst-by-burst basis from {TSC1,…,TSC7}. The interferer shall be a single slot wide, and shall apply power ramping according to the requirements in 3GPP TS 45.005. The interferer shall be delayed with respect to the wanted signal by an integer number of symbols in the range –1 to +4. Unless specified in a given test case, The delay shall be randomly chosen and shall remain fixed for the duration of the test.

Signal I5 A GMSK modulated signal following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or pseudo random data stream. The interferer shall be a single slot wide, and shall apply power ramping according to the requirements in 3GPP TS 45.005. The interferer shall be delayed with respect to the wanted signal by 74 symbols.

NOTE: For multi-slot configuration the same number of active slots for test signal I4 and I5 shall be used.

A5.3 SS functional requirements

A5.3.1 Level setting range

It is assumed that the SS is capable of setting stimulus levels, at the MS interface, to those required in the test specification extended by the measurement uncertainty defined in this annex.

NOTE: This ensures that the SS is able adequately to stimulate the MS performance at and just beyond the limit requirement under all conditions.

A5.3.2 Level Measurement / operation range

It is assumed that the SS is capable of performing measurements, within the uncertainty defined in this annex, over a level range, at the MS interface, as required in the test specification extended by the SS measurement uncertainty defined in this annex and extended by a further 3dB on the MS conformity requirement.

NOTE: This ensures that the SS is able adequately to measure the MS performance at and just beyond the limit requirement under all conditions.

A5.3.3 MS power supply interface

Test DC power supply for MS:

Voltage setting uncertainty < 1 %.

Ripple < 10 mV RMS, 50 mV peak to peak.

Test AC power supply for MS:

Voltage setting uncertainty: < 1 %.

A5.3.4 MS antenna interface

The SS is assumed to offer a nominal 50 ohm impedance to the MS.

	GSM/DCS/PCS bands	< 4 GHz	< 10 GHz	< 12,75 GHz
VSWR	≤ 1,3	≤ 2,0	≤ 3,0	≤ 3,5

A5.3.4.1 Uplink receiver error

The SS receiver should be capable of performing the tests as specified in 3GPP TS 11.10 without the addition of bit errors in excess of 1 in 10E7 due to the receiver performance when operated with a MS which meets the transmitter requirements of 3GPP TS 05.05. This requirement shall apply for GMSK and 8PSK modulation.

NOTE: This requirement is based on a minimum BER measurement of 1 in 10E5.

A5.3.4.2 Power and Power versus time measurements

Measurement uncertainty of transmitter output power for GMSK and 8PSK signals: ±1 dB.

In the case of 8PSK, provision is made for power measurement by averaging over multiple bursts or by using an estimation method, see 3GPP TS 05.05, clause 4. The estimation method may be based on measurements of one or more bursts, or part of a burst.

If 8PSK power is measured by averaging over multiple bursts, allowance must be made for variations in burst power as a function of the data. This allowance must be included within the ±1 dB measurement limit. The allowance is related to the number of bursts taken in the average and shall be defined as follows:

Allowance for burst power variation = 2σ/SQRT(N)

Where: σ = the standard deviation of burst power variation for random data (0,2 dB).

(two standard deviations yield a 95 % confidence interval).

N = number of averages.

EXAMPLE: An average is calculated from 4 bursts. The allowance for burst power variation is 0,2 dB. The accuracy for the power meter should then be better than ±0,8 dB.

If 8PSK power is measured using an estimation method, it shall be demonstrated, using the method described below, that the accuracy of the estimation technique is also ±1 dB.

A test signal is established consisting of properly formatted bursts with midambles and random data in the payload. The long-term average power of this signal is determined by measuring the power over 200 bursts and taking the average (P_{avg}). The measurement uncertainty of the equipment used to determine the long-term average shall be noted (ΔP).

The same test signal is then measured using the estimation technique. The difference between the estimated value of long-term average power and the measured long-term average power is noted (P_{est}). The following inequality shall hold:

$$|\Delta P| + |(P_{avg} - P_{est})| \leq 1 \text{ dB}$$

For GMSK, measurement uncertainty of power level (relative to peak transmitter carrier power):

Power level	Measurement uncertainty
+6 dB to -7 dB	±0,25 dB
-7 dB to -20 dB	±1,0 dB
-20 dB to -32 dB	±2,0 dB
-32 dB to -45 dB	±5,0 dB
-45 dB to -71 dB	±1,0 dB
< -71 dB	±2,0 dB

For 8PSK, measurement uncertainty of power level (relative to output power):

Power level	Measurement uncertainty
+6 dB to -7 dB	±0,25 dB
-7 dB to -16 dB	±1,0 dB
-16 dB to -32 dB	±2,0 dB
-32 dB to -45 dB	±5,0 dB
-45 dB to -71 dB	±1,0 dB
< -71 dB	±2,0 dB

NOTE: Due to the method of measurement (downconversion to I/Q baseband / filtering / A/D conversion / postprocessing) several uncertainties occur. The sources are:

a) absolute level uncertainty;

b) filter ripple,
I/Q gain imbalance,
I/Q imperfect quadrature;

c) A/D conversion (resolution),
I/Q offset.

Items under b) and c) affect the individual samples and can be observed as a "ripple" in the horizontal part of the power time mask.

Items under b) are uncertainties which are proportional to the signal measured.

Items under c) are constant amounts of uncertainty, independent of the signal measured.

The item a) moves the entire power time template up or down.

The uncertainties b) and c) are added to the measured signal as an uncorrelated interferer.

The above mentioned absolute measurement uncertainty refers to a). The table covers uncertainties b) and c).

Uncertainty of time measurement

The relative timing uncertainty of the transition point:

- symbol 13 to 14 in the midamble (normal burst);

- end of the sync sequence (access burst);

is ±1/8 symbol.

Timing uncertainty of the measurement samples in the vertical part of the power time mask are displayed as marked fields in the figure A5.3-1.

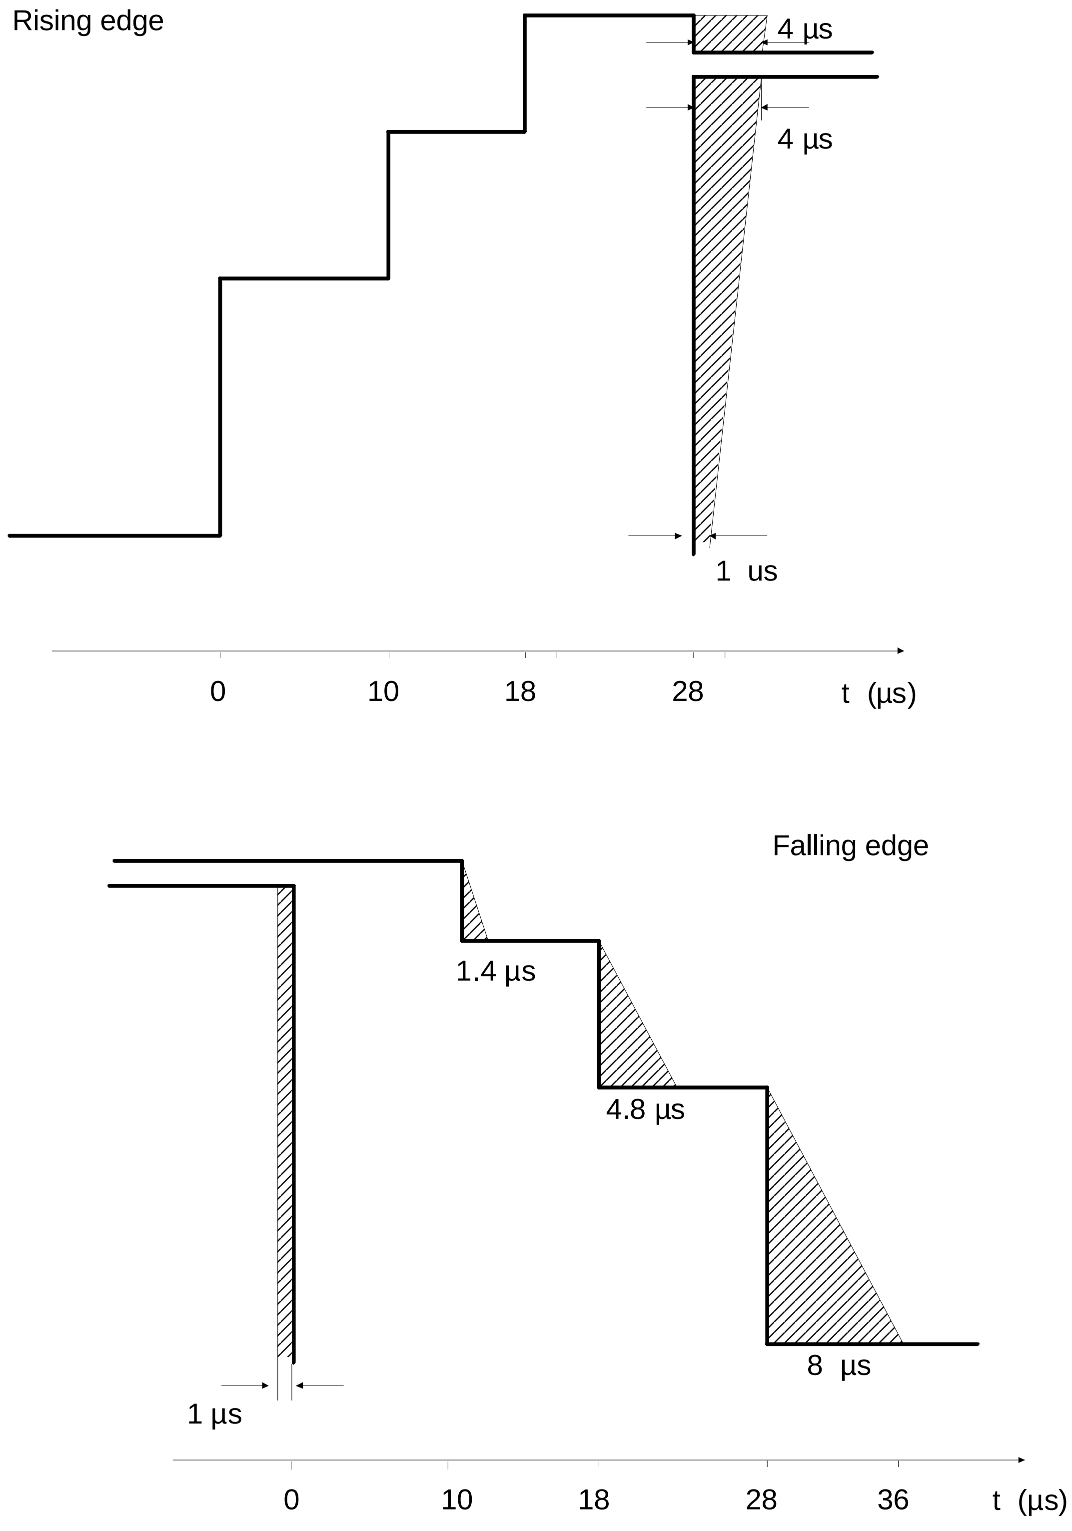

Figure A5.3-1: Time Measurement Uncertainty for the Power Time Mask

NOTE: With a real method of measurement one has to reckon on systematic measurement uncertainties in the vertical part of the power time template (figures 13-2 & 13-3). The reason for this is that the measurement is conducted through a filter which has to fulfil different requirements simultaneously, requirements in the frequency domain and in the time domain as well. The time behaviour of the filter causes the above mentioned measurement uncertainty. It occurs clearly when measuring the falling edge of the power burst. The measurement uncertainty, which in principle delays the actual performance, depends on the filter characteristics and on the signal shape. At favourable signal shapes the uncertainty is negligible, however, at unfavourable signal shapes it consumes the marked area in figure A5.3-1 (falling edge).

The underlying filter is:

- type inverse Chebycheff.
- passband ≤ ±200 kHz.
- stopband (40 dB stop att.) ≥ ±541,67 kHz.

To avoid aliasing with this filter the RF output spectrum must meet the requirements of subclause 13.4.

If the lowest limit line in the power time template is replaced by a -54 dBm line, measuring lower carrier powers, the area of measurement uncertainty is reduced equivalently.

The marked area in figure A5.3-1 describes the systematic measurement uncertainty of the test equipment and does not widen the design requirements.

Uncertainties associated with 13.3.5 requirement b) (power control levels, adjacent steps):

Repeatability	± 0,3 dB
Linearity	± 0,03 dB/dB
Combined uncertainty is:	± (0,3 + 0,03 dB/dB) dB

E.g. where the indicated value of the step size is 2,0 dB, the uncertainty is:

± (0,3 + 0,06) dB = ± 0,36 dB.

A5.3.4.3 Wideband selective power measurement

Power is to be measured selectively for spurious emissions without frequency hopping (ref.: clause 12).

Uncertainty conducted	100 kHz to 1GHz	±1,5 dB
	1 GHz to 12,75 GHz	±3,0 dB
Uncertainty radiated	30 MHz to 4 GHz	±6 dB

NOTE: The uncertainties include the effect of a worst case reflection from the MS of 0,7 for out of band signals.

It is acceptable to use a band stop filter in spurious emission measurements of the transceiver in order to fulfil the above requirements.

A5.3.4.4 Inband selective power measurements

Power is to be measured selectively for output RF spectrum.

The measurement is performed on a single frequency while the MS is frequency hopping (ref.: subclause 13.3).

Uncertainty < ±1,6 dB

NOTE: The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser.

A5.3.4.5 Modulation accuracy and frequency error measurements

GMSK modulation

Ref.: Subclauses 13.1 and 13.2 for definitions and methods of measurement.

Phase measurement uncertainty:

±1 degree RMS;

±4 degrees for individual phase measurement samples.

The phase measurement uncertainties above apply during the useful bits.

Frequency measurement uncertainty: ±5 Hz.

8PSK modulation

Ref.: Subclause 13.17.1 for definitions and methods of measurement.

EVM measurement uncertainty:

+(0,75 - 0,025RMS_EVM), -(0,75 + 0,025RMS_EVM) % RMS;

4% for individual EVM measurement samples.

NOTE 1: The value of the RMS EVM specification is a function of the value of RMS_EVM being measured. The asymmetric specification results from the RMS EVM minimisation method used for parameter estimation (see 3GPP TS 05.05, annex G). This method of measurement for RMS EVM always produces a result that is lower than the actual value of RMS EVM.

NOTE 2: The value for individual EVM samples assumes a Rayleigh distribution of measurement errors. It represents the maximum 95th percentile value test equipment should return when measuring a signal without error.

NOTE 3: If the test equipment demodulates the transmitted signal to derive the reference signal for the EVM measurement, the symbol error rate of the demodulation process must be less than 4.4×10E-4 for 95% confidence that no detection errors occur in a burst.

Origin Offset uncertainty (for a single burst) < ±1,5 dB for origin offset ≥ -35dBc.

Frequency measurement uncertainty < ±20 Hz.

A5.3.4.6 RF delay measurements relative to nominal times

Range -140 to +140 symbol periods.

Resolution 1/4 symbol period.

Uncertainty ±1/8 symbol period.

A5.3.4.7 The wanted signal or traffic channel of serving cell

The Wanted signal is used in most of the specified RF measurements. The traffic channel of the serving cell is used in most of the signalling tests.

FREQUENCY:

GMSK

Uncertainty: < ± 5*10E-9.

8PSK

Uncertainty: < ± 20*10E-9.

MODULATION (see 3GPP TS 05.04):

GMSK

Phase uncertainty: < ±1 degree RMS; and

< ±4 degrees peak(as defined in 3GPP TS 05.05).

8PSK

EVM uncertainty < 4 % RMS.

Origin offset suppression < -35 dBc.

LEVEL:

Uncertainty: < ±1 dB in subclause 13, 14 except;

< ±3 dB for test 14.2 radiated;

< ±1,2 dB for test 14.6;

< ±2,5 dB for all other tests.

Settling time: < 10 us.

DYNAMIC LEVEL SETTING:

The SS shall be able to switch from any power level to any other power level within the range of 30 dB on a timeslot per timeslot basis. This dynamic switching requirement only applicable for a single channel for a limited number of tests.

SPURIOUS:

in channel:

Covered by phase error.

out channel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;

< -110 dBc for > 300 kHz carrier offset;

< -121 dBc for > 1 500 kHz carrier offset.

Non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -68 dBc for > 1 500 kHz carrier offset.

FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

A5.3.4.8 The first interfering signal or traffic channel of the first adjacent cell

The First interfering signal is used in measurements of co-channel rejection, adjacent channel rejection and intermodulation rejection. The Traffic channel of the first adjacent cell is used in handover tests.

FREQUENCY:

Uncertainty:

< ±5*10E-9

PHASE:

Uncertainty:

< ±1 degree RMS; and

< ±4 degrees peak(as defined in 3GPP TS 05.05).

LEVEL:

Uncertainty:

< ±1 dB relative to the wanted signal for test 13.2 and 14.5;

< ±0,3 dB relative to the wanted signal for test 14.4, 14.10, 14.11, 14.12 and 14.16.4;

< ±1 dB for test 14.6;

< ±2,5 dB for all other tests.

MODULATION:

GMSK (as specified in 3GPP TS 05.04)

The total relative single sideband power (noise + harmonics) in the frequency range 1,5 MHz to 1,7 MHz offset from the nominal carrier frequency shall be less than -72 dBc.

SPURIOUS:

In channel:

Covered by phase error.

Out channel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100kHz carrier offset;

< -110 dBc for > 300kHz carrier offset;

< -127 dBc for > 1 500kHz carrier offset.

non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -68 dBc for > 1 500 kHz carrier offset.

FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

A5.3.4.9 The second interfering signal

The second interfering signal is used in the measurements of intermodulation rejection and blocking.

FREQUENCY:

Uncertainty:

< ±5*10E-9.

LEVEL:

Uncertainty:

< ±1 dB for test 14.6;

< ±1,5 dB relative to the wanted signal for all other tests.

MODULATION:

Unmodulated.

SPURIOUS:

In channel:

No requirements.

Out channel:

Noise Power, 1 Hz bandwidth:

< -135 dBc for > 500kHz carrier offset;

< -140 dBc for > 700kHz carrier offset;

< -150 dBc for > 1 500kHz carrier offset.

Non harmonics:

< -79 dBc for > 500 kHz carrier offset;

< -84 dBc for > 700 kHz carrier offset;

< -94 dBc for > 1 500 kHz carrier offset.

Harmonically related spurii:

< -40 dBc.

A5.3.4.10 BCCH carriers of serving and adjacent cells

The BCCH of the serving cell is used for synchronizing the MS and to send network information to the MS under test. The BCCH signals of the adjacent cells are used in the handover tests. The MS measures the RF-levels of the BCCHs of adjacent cells.

FREQUENCY:

Uncertainty:

< ±5*10E-9.

PHASE:

Uncertainty:

< ±1 degree RMS; and

< ±4 degrees peak(as defined in 3GPP TS 05.05).

LEVEL:

Uncertainty:

< 1 dB for test 13.2 and 20;

< 2,5 dB for all other tests;

< 0,6 dB relative to each other and to TCH for test 21 over the range 65 dBmicroVoltemf to 3 dBmicroVoltemf;

< 1,2 dB relative to each other and to TCH for test 26.3.

MODULATION:

GMSK (as specified in 3GPP TS 05.04).

SPURIOUS:

In channel:

Covered by phase error.

Out channel:

Noise Power, 1Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;

< -125 dBc for > 1 500 kHz carrier offset.

Non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -72 dBc for > 1 500 kHz carrier offset.

A5.3.4.11 The wide frequency range signal

The wide frequency range signal is used in the measurements of spurious response.

FREQUENCY

Uncertainty:

< ± 5*10E-9.

LEVEL

Uncertainty:

< ±1,5 dB relative to the wanted signal for test 14.7;

< ±1 dB error of substituted "wanted signal".

MODULATION:

Unmodulated.

SPURIOUS in the MS receiving range:

Non harmonics:

< -94 dBc.

Harmonically related spurii:

< -40 dBc.

Noise:

< -4 dBuVemf equivalent at the MS receiver input when measured in a 200 kHz bandwidth.

A5.3.4.12 The multipath fading function

The multipath fading function simulates the fading effects of a broadband radio channel in mobile radio communication.

The propagation conditions are specified in 3GPP TS 05.05, annex 3.

The multipath fading function shall be performed only within a 5 MHz bandwidth during one test case.

A5.3.5 MS audio interface and DAI

A5.3.5.1 General uncertainties

Unless otherwise specified, the following uncertainties apply to the audio interface:

Signal level measurement uncertainty: ± 0,2 dB;

Sound pressure measurement uncertainty: ± 0,6 dB;

Frequency Measurement uncertainty: ± 0,1 %.

Stimulus frequency setting uncertainty:

Frequency settings are taken from ISO 3, R10 series or R40 series or from table 2 of Rec. ITU-T Recommendation P.79. A departure from the nominal frequencies of ±5 % below 240 Hz and ±2 % at 240 Hz and above is accepted.

In the case of 4 kHz the departure is restricted to -2 %.

A5.3.5.2 Analogue single test tone

Total distortion:

< 0,5 %.

A5.3.5.3 Delay measurement between Um and DAI

The delay measurement between the Um interface of the MS and its DAI in both directions is described in subclause 32.5.

Uncertainty:

< ±0,1 ms.

A5.4 SIM simulator functional requirements

A5.4.1 General

The SIM simulator shall implement the functions of a SIM as described in 3GPP TS 02.17 and 3GPP TS 11.11.

The Test Algorithm for authentication incorporated in the SIM Simulator shall operate as described in annex 3.

A5.4.2 Contacts C1, C2, C6, C7

A5.4.2.1 Default measurement / setting uncertainties

Unless stated otherwise below, the following uncertainties apply:

Voltage measurement uncertainty: < ±50 mV;

Voltage setting uncertainty: < ±20 mV;

Time measurement uncertainty: < ±100 ns.

A5.4.2.2 Contact C1

Continuous Spikes:

Voltage measurement uncertainty:

< ± 100 mV.

Current Load Amplitude:

0 mA - 20 mA

Adjustable Step Size:

1 mA.

Uncertainty

< ±1 mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

< ±1 mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

< ±25 ns.

Rise and Fall Time:

≤ 50 ns.

Pause Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

< ±25 ns.

Random Spikes:

Voltage measurement uncertainty:

< ±100 mV.

Current Load Amplitude:

50 mA - 200 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

< ±1 mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

< ±0,1 mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

< ±25 ns.

Rise and Fall Time:

≤ 50 ns.

Pause Width:

0,1 ms - 500 ms, randomly varied.

Adjustable Step Size:

0,1 ms.

Uncertainty:

< ±0,1 ms.

A5.4.2.3 Contact C7

The Elementary Time Unit (etu) used in the subclauses below refer to the nominal bit duration on the I/O line, as defined in ISO 7816-3.

Rise & fall Time setting uncertainty: < ±100 ns.

Jitter measurement uncertainty: < ±5*10E-3 etu.

Jitter setting uncertainty: < ±5*10E-3 etu.

A5.4.3 Contact C3

Frequency measurement uncertainty: < ±0,5 %.

Voltage Measurement uncertainty: < ±50 mV.

Rise & fall time measurement uncertainty: < ±5 ns.

Duty cycle measurement uncertainty: < ±2,5 %.

A5.4.4 Definition of timing

It shall be possible to define all timings relative to the clock. The SIM simulator shall be able to calculate and to use the absolute values automatically, even if the ME changes the frequency during the communication.

A5.5 A-GPS and A-GNSS Minimum Performance Test System requirements

A5.5.1 Test System Uncertainty for A-GPS and A-GNSS Minimum Performance tests

The maximum acceptable uncertainty of the Test System is specified below for each test, where appropriate.

The Test System shall enable the stimulus signals in the test case to be adjusted to within the specified range, and the equipment under test to be measured with an uncertainty not exceeding the specified values. All ranges and uncertainties are absolute values, and are valid for a confidence level of 95 %, unless otherwise stated.

A confidence level of 95 % is the measurement uncertainty tolerance interval for a specific measurement that contains 95 % of the performance of a population of test equipment.

It should be noted that the uncertainties in this clause apply to the Test System operating into a nominal 50 ohm load and do not include system effects due to mismatch between the DUT and the Test System.

Table A5.5.1: Maximum Test System Uncertainty for A-GPS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error consists of ±0.05 m system uncertainty. The effect of position reporting resolution of approximately ±1.2 m (see note) is not included in the allowable test system uncertainty but is included in the Test Parameter Relaxations since this resolution limitation limits the reporting capability of the MS. . For simplicity the combined Test Parameter Relaxation is given as ±1.3 m
	Response time	± 300 ms	
70.11.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±200 ms	
	Fine Time Assistance	±1 us	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.6 Nominal Accuracy	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.7 Dynamic Range	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Relative GPS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.8 Multi-Path scenario	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Relative GPS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	

NOTE: For MS based mode the effect of position reporting resolution is given by:

$$\sqrt{\left(\frac{90\times 2\times \pi \times R}{2E23\times 360}\right)^2+\left(\frac{360\times 2\times \pi \times R\times \cos\phi}{2E24\times 360}\right)^2}$$

meters, where R is the radius of the earth and φ is the latitude of the location. For the two GPS scenarios defined in TS 51.010-7 subclause 5.2 this equates to approximately 2.32 m and 2.24 m. For simplicity this is given as ±1.2 m.

For MS assisted mode it is assumed that the output from the WLS position solution calculation in clause 70.11.4.3 is coded using the same position coding method as for MS based mode before being used to calculate position error. Therefore the effect of reporting resolution will be the same as for MS based mode.

Table A5.5.2: Maximum Test System Uncertainty for A-GNSS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
70.16.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error consists of ±0.05 m system uncertainty. The effect of position reporting resolution of approximately ±1.2 m (see note) is not included in the allowable test system uncertainty but is included in the Test Parameter Relaxations since this resolution limitation limits the reporting capability of the MS. For simplicity the combined Test Parameter Relaxation is given as ±1.3 m
	Response time	± 300 ms	
70.16.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±200 ms	
	Fine Time Assistance	±1 us	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.6 Nominal Accuracy	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.7 Dynamic Range	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.8 Multi-Path scenario	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	

NOTE: For MS based mode the effect of position reporting resolution is given by:

$\sqrt{\left(\frac{90\times 2\times \pi \times R}{2E23\times 360}\right)^2+\left(\frac{360\times 2\times \pi \times R\times \cos\phi}{2E24\times 360}\right)^2}$ meters, where R is the radius of the earth and φ is the latitude of the location. For the GNSS scenarios defined in TS 51.010-7 subclause 6.2 this equates to approximately [TBD] m. For simplicity this is given as ±1.2 m.

For MS assisted mode it is assumed that the output from the WLS position solution calculation in clause 70.16.4.3 is coded using the same position coding method as for MS based mode before being used to calculate position error. Therefore the effect of reporting resolution will be the same as for MS based mode.

A5.5.2 Test Parameter Relaxations (This clause is informative)

The Test Parameter Relaxations defined in this clause have been used to relax the Conformance requirement to derive the Test Requirements.

The Test Parameter Relaxations are derived from Test System uncertainties, regulatory requirements and criticality to system performance. As a result, the Test Parameter Relaxations may sometimes be set to zero.

The Test Parameter Relaxations should not be modified for any reason e.g. to take account of commonly known test system errors (such as mismatch, cable loss, etc.).

Table A5.5.2.1: Test Parameter Relaxations for A-GPS Minimum Performance tests

Clause	Test Parameter Relaxation	
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	200 ms
	Absolute GPS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.11.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	200 ms
	Fine Time Assistance	1 us
	Absolute GPS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.11.6 Nominal Accuracy	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Position error	1.3 m
	Response time	300 ms
70.11.7 Dynamic Range	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Relative GPS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms
70.11.8 Multi-Path scenario	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Relative GPS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms

Table A5.5.2.2: Test Parameter Relaxations for A-GNSS Minimum Performance tests

Clause	Test Parameter Relaxation	
70.16.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.16.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	200 ms
	Fine Time Assistance	1 us
	Absolute GNSS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.16.6 Nominal Accuracy	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Position error	1.3 m
	Response time	300 ms
70.16.7 Dynamic Range	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Relative GNSS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms
70.16.8 Multi-Path scenario	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Relative GNSS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms

A5.5.3 Interpretation of measurement results

The measurement results returned by the Test System are compared - without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in TR 102 273-1-2, clause 6.5.

The actual measurement uncertainty of the Test System for the measurement of each parameter shall be included in the test report.

The recorded value for the Test System uncertainty shall be, for each measurement, equal to or lower than the appropriate figure in clause A5.5.1.

If the Test System for a test is known to have a measurement uncertainty greater than that specified in clause A5.5.1, it is still permitted to use this apparatus provided that an adjustment is made value as follows:

Any additional uncertainty in the Test System over and above that specified in clause A5.5.1 shall be used to tighten the Test Requirement - making the test harder to pass. (This may require modification of stimulus signals). This procedure will ensure that a Test System not compliant with clause A5.5.1does not increase the chance of passing a device under test where that device would otherwise have failed the test if a Test System compliant with clause A5.5.1 had been used.

A5.5.4 Derivation of Test Requirements (This clause is informative)

The Test Requirements have been calculated by relaxing the Conformance requirement of the core specification using the Test Parameter Relaxations defined in clause A5.5.2. When the Test Parameter Relaxation is zero, the Test Requirement will be the same as the Conformance requirement. When the Test Parameter Relaxation is non-zero, the Test Requirements will differ from the Conformance requirement, and the formula used for this relaxation is given in table A5.5.4.1 and A5.5.4.2.

Table A5.5.4.1: Derivation of Test Requirements for A-GPS Minimum Performance tests

Test	Conformance requirement in 3GPP TS 45.005		Test Parameter Relaxation (TPR)	Test Requirement
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS signal level	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
70.11.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Fine Time Assistance	±10 us	1 us	UL-TPR, LL+TPR: ±9 us
	Absolute GPS signal level	-147 dBm	1 dB	Level + TPR: -146 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
70.11.6 Nominal Accuracy	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS signal level	-130 dBm	0 dB	Level + TPR: -130 dBm
	Position error	30 m	1.3 m	Error +TPR: 31.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
70.11.7 Dynamic Range	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS signal level	-129 to -147 dBm	1 dB	Level + TPR: each level +1 dBm
	Relative GPS signal level	18 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -128.2dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
70.11.8 Multi-Path scenario	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS signal level	-130 dBm	0 dB	Level + TPR: -130 dBm
	Relative GPS signal level	6 dB	0.2 dB	Level + TPR: lower level -0.2dB: -136.2 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s

Table A5.5.4.2: Derivation of Test Requirements for A-GNSS Minimum Performance tests

Test	Conformance requirement in 3GPP TS 45.005		Test Parameter Relaxation (TPR)	Test Requirement
70.16.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GNSS signal level (Galileo)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (GPS)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (GLONASS)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (BDS)	-136, -145 dBm	1 dB	Level + TPR: -135, -144 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s

Annex 6 (informative): E-OTD Accuracy Measurement Test Environment

A6.1 Recommended Timing Accuracy Test Environment (Unassisted)

3GPP TS 05.05, annex I calls for a best-case MS measurement observed timing difference (OTD) accuracy of 100 nanoseconds. This level of measurement accuracy implies that:

1. The time delay and phase shift of all components in the test environment must be taken into account.
2. The laboratory equipment utilized to measure the burst alignment of the two base station simulators must support a time resolution of at least 10 nanoseconds.
3. All base station simulators, active RF channel simulators, and time measurement equipment must be phase-locked to a common reference clock.
4. All base station simulators used for this test must be frame synchronized.

Figure A6-1 represents a recommended configuration for the unassisted measurement of E-OTD accuracy. If this test environment is utilized, the effects of differing cable lengths, channel simulator processing delays, etc., must be compensated for in order to establish the RTD between bursts from the base station simulators.

The "unassisted" test environment should require a relatively short time (< 3 000 s) for the test environment to obtain *N* measurements for the purpose of calculating the RMS_{90} timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The standard deviation of this distribution must be kept within a range that allows the test laboratory to confirm that this uncertainty component does not significantly affect the results of the OTD measurements made and reported by the MS. Test labs and base station simulator manufacturers are expected to quantify and document the test environment's RTD. Test labs and base station simulator manufacturers are also expected to have some means of verifying the standard deviation of the test environment's RTD (including phase jitter introduced by the RF channel simulators), declaring that this uncertainty will be negligible relative to the 100 nanosecond RMS_{90} best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

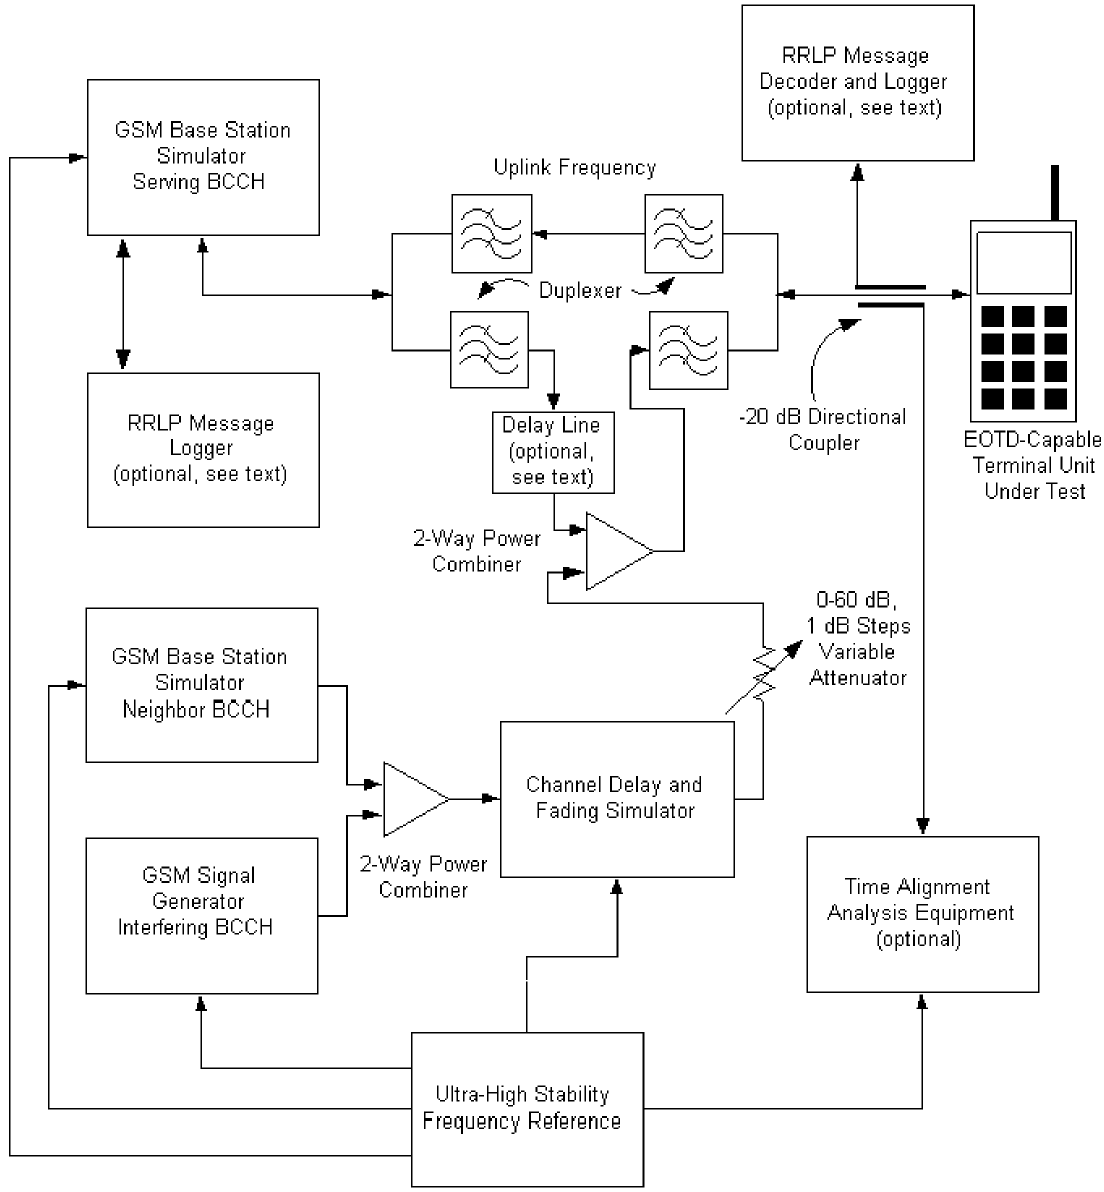

Figure A6-1: "Unassisted" E-OTD Test Environment

A6.2 Recommended Timing Accuracy Test Environment (Assisted)

In some laboratory environments, test equipment may not be available to measure and/or maintain the base station simulator burst time alignment to the accuracy required by the "unassisted" test environment described earlier. In such cases, a test configuration of the type shown in figure A6-2 may be employed for E-OTD performance validation. In this configuration, an LMU of known accuracy is used to measure the real timing difference (RTD) between the serving and neighbour base station simulators.

The "assisted" test environment should require a relatively short time (< 3 000 s) for the test environment to obtain *N* measurements for the purpose of calculating the RMS_{90} timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The timing offset or RTD between the two base station simulators is reported by the LMU. Even if an RTD measurement from the LMU is made in synchronism with an OTD measurement from the MS, some means of verification must be available to assure that the standard deviation of the RTD is kept within a range that allows the laboratory to confirm that this uncertainty does not significantly affect the results of the OTD reported by the MS. Test labs and LMU manufacturers are expected to have some means of verifying the standard deviation of the RTD reported for the test environment (including phase jitter introduced by the RF channel simulator), and declaring that this uncertainty component will be negligible relative to the 100 nanosecond RMS_{90} best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

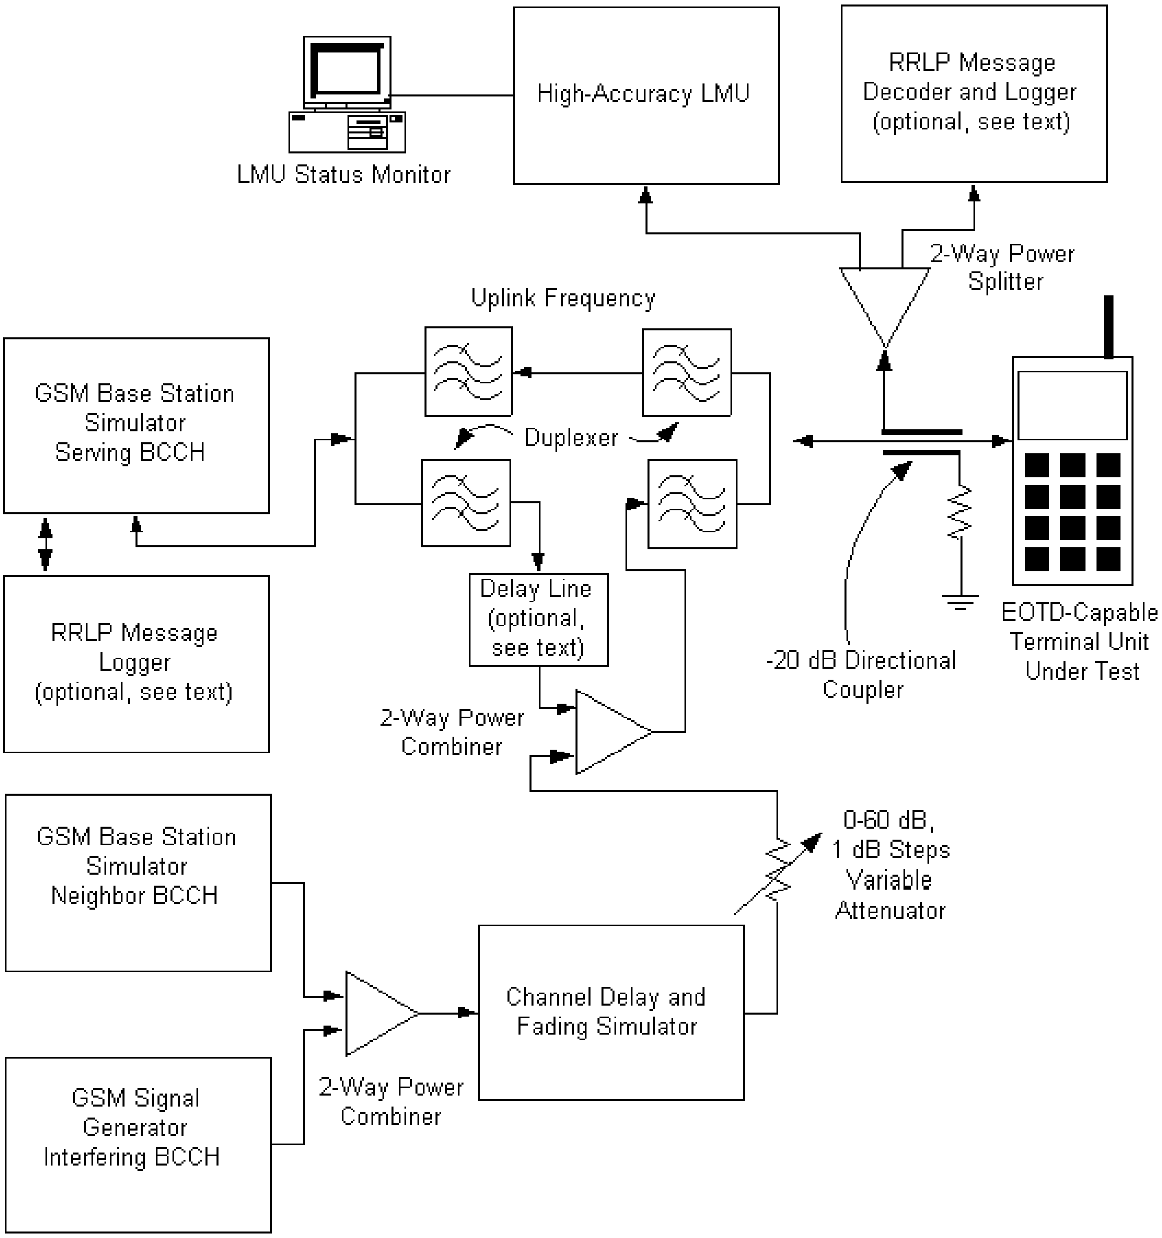

Figure A6-2: "Assisted" E-OTD Test Environment

Delay Line

Almost all active RF channel fading simulators introduce some intrinsic propagation delay, even when set to an RF channel delay of zero. In some cases, this delay may be to great to compensate for using a passive delay as shown in figure A6-1 and figure A6-2. In such cases, the intrinsic delay of the channel simulator shall be included in the calculation of RTD for the test environment. Any phase jitter contribution from the RF channel fading simulator must be taken into account when evaluating the standard deviation of the test environment's RTD.

Simulated Geometric Time Difference

Once the RTD of the test environment is known, any additional time delay added to the fading simulator RF path will simulate the effect of distance between the MS and its neighbour cell. 3GPP TS 05.05 (V8.7.1), Release 99, annex I does not specify a value for geometric time delay, in part because the MS could be equidistant from the three base stations required for E-OTD calculation in a real network. Also, in an actual network, the geometric delay an MS must contend with can vary from 0 µsec to over 50 µsec, however, the 3GPP TS 05.05, annex I specification is only concerned with measurement error. Consequently, the test procedures described in this subclause require that no additional time delay will be added to simulate a geometric time difference.

Neighbour Lists

The serving base station simulator must be configured to include the neighbour base station simulator in its BA list. During interference tests, the interfering signal generator shall not be included in the serving base station simulator's BA list.

Interfering BCCH Signal Generator

The interfering BCCH signal generator shall provide a continuous GMSK signal, modulated with a pseudo-random bit sequence. This signal generator shall not be frame-synchronized with the serving or neighbour base station simulators.

RRLP Measure Position Request

The RRLP Measure Position Request sent from the serving base station simulator shall include the field values listed in table A6-1.

Table A6-1: RRLP Measure Position Request Field Values, Positioning Instructions Data Element

Field Name	Value	Comments
Method Type	0	Value="MS assisted"
Positioning Methods	0	Value="E-OTD"
Response Time	1	Value=2 seconds
Accuracy	NA	This field is optional
Multiple Sets	0	Value=Multiple sets allowed
Environmental Characterisation	NA	This field is optional

The following Measure Position Request components will be used when relevant to the test:

- E-OTD Reference BTS of Assistance Data;
- E-OTD Measurement Assistance Data for System Information List Element;

These two assistance data elements are necessary in the Measure Position Request to facilitate the execution of certain physical-layer E-OTD tests. For example, 3GPP TS 05.05, Annex I requires that in some instances, an E-OTD capable MS must support a specified timing measurement accuracy when the neighbour BCCH is below the device's reference sensitivity. Without assistance data, it may be impossible to execute the necessary physical layer validation tests because the MS upper protocol layers would be incapable of decoding the BSIC of the neighbour BCCH.

MS Mode During Measurement

The MS under test shall make the requested measurements while in the dedicated mode on a TCH.

Automation of E-OTD Measurements

If at all possible, the laboratory environment used to verify E-OTD accuracy should be capable of supporting automated measurements. A minimum of 250 trials shall be utilized.

Terminal Unit RRLP Message Monitoring

The test lab shall have some means of logging the Measure Position Response message transmitted by the MS. This can be accomplished utilizing a suitable U_m interface analyzer monitoring the MS RRLP messages on the uplink, or through a base station simulator capable of reading and logging RRLP messaging. The device used to capture the received

RRLP messages should be capable of logging the MS observed time difference measurement to a flat ASCII file, with each of the reported OTD values in decimal.

E-OTD Measurement With 8PSK Modulated Bursts

3GPP TS 05.05 (V8.7.1) Release 99, annex I requires that an E-OTD-capable MS must support E-OTD measurements when the serving and the neighbour base stations are transmitting 8PSK modulated bursts. This test plan verifies that the timing error of an E-OTD-capable MS is maintained regardless of whether the serving and neighbour base station simulators are transmitting either GMSK or 8PSK in time slots 1 through 7.

Accuracy Calculation

In order to minimize the effects of "outlying" data points, the timing difference measurement accuracy of an E-OTD MS shall be calculated as an RMS value of 90% of the measurement trials with the least error. For example, if N=250 measurement trials, the trial error results x_1 through x_{250} shall be sorted in ascending order of error. A subset M that includes 90 % of the trials in set N (M=225 trials in this example) shall be established. In this example, the subset M will include the 225 trial results with the least error from set N. The RMS error is then calculated from the data points in subset M according to Equation A6-1 below:

(Equation A6-1) RMS$_{90}$ Calculation

$$\mathbf{Error_{RMS}} = \sqrt{\left(\left(\sum_{1}^{M} x^2\right) \div M\right)}$$

Annex 7 (informative): General rules for statistical testing

A7.1 Statistical testing of receiver performance

Testing the receiver performance can be done either in the classical way with a fixed minimum number of samples or using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with an error rate not on the limit.

Statistical testing of the receiver performance is based on the evaluation of error rates, such as bit error rates, block error rates or also the rate of missing bad frame indications.

A7.1.1 Basics

A7.1.1.1 Definition of (error) events

1) Bit Error Ratio (BER)

   The Bit Error Ratio is defined as the ratio of the bits wrongly received to all data bits sent.

2) Block Error Ratio (BLER)

   A Block Error Ratio is defined as the ratio of the number of erroneous blocks received to the total number of blocks sent. An erroneous block is defined as a Transport Block, the cyclic redundancy check (CRC) of which is wrong.

3) Rate of missing Bad Frame Indications (BFI)

   The rate of missing Bad Frame Indications is the ratio of frames not marked incorrect to all frames sent, although all frames sent are incorrectly. This mechanism is used to test Bad Frame Indication of the MS.

A7.1.1.2 Test Method

Each test is performed in the following manner:

a) Set up the required test conditions.

b) Continuously record the number of samples tested and the number of (error) events (bit error, block error or missing BFI).

c) While recording samples and errors continuously check, if it is about time to make a decision. The possible outcomes of a decision are: Early pass, early fail, continue with measuring the error rates, pass or fail.

A7.1.1.3 Test Criteria

The test shall fulfil the following requirements:

a) good pass fail decision with high confidence level

   1) to keep reasonably low the probability (risk) of passing a bad unit for each individual test;

   2) to have high probability of passing a good unit for each individual test;

b) good balance between test time and statistical significance

   3) to perform measurements with a high degree of statistical significance;

   4) to keep the test time as low as possible.

A7.1.1.4 Calculation assumptions

A7.1.1.4.1 Statistical independence

(a) It is assumed, that error events are rare (error rate close to zero) and independent statistical events.

The assumption of rare events is justified by the error rates that need to be met by the DUT. Statistical independence is given as data bits of completely transmitted bursts are evaluated without further memory of the receiver active. Samples and errors are summed up after every time slot interval. So the assumption of independent error events is justified.

(b) In error rate tests with fading there is the memory of the multipath fading channel which interferes the statistical independence. A minimum test time is introduced to average fluctuations of the multipath fading channel. So the assumption of independent error events is justified approximately.

A7.1.1.4.2 Applied formulas

The formulas, applied to describe the error rate test, are based on the following experiments:

(1) After having observed a certain number of (error) events (**ne**) the number of samples are counted to calculate the error rate. Provisions are made such that the complementary experiment is valid as well:

(2) After a certain number of samples (**ns**) the number of errors, occurred, are counted to calculate the error rate.

Experiment (1) stipulates to use the following Chi Square Distribution with degree of freedom **ne**:

$$2 \times X^2 (2 \times \nu, 2 \times \mathbf{ne})$$

Where X^2 is the Chi-square distribution.

Experiment (2) stipulates to use the Poisson Distribution:

$$P_\nu (\mathbf{ne})$$

Where P_ν(**ne**) is the Poisson distribution for **ne** with mean ν.

with ν as the mean of the distribution.

To determine the early stop conditions, the following inverse cumulative operation is applied:

$\frac{1}{2} C^{-1}(D, 2 \times \mathbf{ne})$. This is applicable for experiment (1) and (2).

D Wrong decision risk per test step.

NOTE: Where C^{-1} is the inverse cumulative distribution function for the X^2 distribution (the D-quantile function)
Other inverse cumulative operations are available, however only this is suited for experiment (1) and (2).

A7.1.2 Definition of good pass fail decision

A correct pass/fail decision requires the knowledge of the exact (true) error ratio of the DUT. However the true error ratio of the DUT is generally unknown. Measuring the true error ratio of the DUT requires to evaluate an infinite number of samples, which of course is not possible. This means that any error rate measurement within limited time is affected by an uncertainty, leading to two kinds of wrong decisions possible. If the measured error rate is higher than the true error rate a good DUT could possibly be failed and vice versa if the measured error rate is lower a bad DUT could possibly be passed.

Error rate tests within limited time hence require the acceptance of a wrong decision risk. The measure of a good pass fail decision is given by the probability (risk) F of the wrong decision at the end of the test. The probability of a correct decision is 1-F.

Wrong decision risk F for one single error ratio test:

The probability (risk) to fail a good DUT shall be F_{fail} according to the following definition: A DUT is failed, accepting a probability F_{fail} that the DUT is still better than the test requirement

The probability (risk) to pass a bad DUT shall be F_{pass} according to the following definition: A DUT is passed, accepting a probability F_{pass} that the DUT is still worse than M times the specified error ratio. (M>1 is the bad DUT factor).

The wrong decision risk F explained above applies to one single error ratio test. In most test cases where only one or few error ratio tests are done the wrong decision risk acceptable for an erroneous pass is identical to the acceptable risk for an erroneous fail:

$$F_{pass} = F_{fail} = F \qquad \text{and e.g.} \qquad F = 0.2\%$$

If a test is repeated under different conditions for several times, the total wrong decision risk for the DUT increases. The increasing risk for a bad fail decision is not acceptable for test cases that are composed of many single error rate tests like e.g. the blocking test, which implies approximately 3000 error rate tests (depends on design of MS). A DUT on the limit will fail approximately 6 to 7 times due to statistical reasons (wrong decision probability at the end of the test F = 0.2%). 30 fails (6 in inband range and 24 outside) are allowed in the blocking test but these fails are reserved for spurious responses. This problem shall be solved by the following rules:

- All passes (based on $F_{pass} = 0.2\%$) are accepted, including the wrong decisions due to statistical reasons.
- An early fail limit based on $F_{fail} = 0.02\%$ instead of 0.2% is established, that ensures that wrong decisions due to statistical reasons are reduced to less than one.

These asymmetric test conditions ensure that a DUT on the test limit consumes hardly more test time for a blocking test than in the symmetric case and on the other hand discriminates sufficiently between statistical fails and spurious response cases.

Wrong decision probability D per test step:

As one single error ratio test is composed of several test steps the wrong decision probability per test step needs to be sufficiently small to keep the wrong decision risk F (the wrong decision risk at the end of the test) within the requirements. The wrong decision probability D per test step is a numerically evaluated fraction of F. Considerations regarding symmetry between probability of wrong pass and wrong fail decision are identical to those given for F.

For most test cases where only one or few error rate tests are done the wrong decision probability D per test step for a pass decision is identical to the wrong decision probability for a fail decision.

$$D_{pass} = D_{fail} = D \qquad \text{and e.g.} \qquad D = 0.0085\%$$

For test cases where $F_{pass} \neq F_{fail}$ (e.g. blocking) this applies also to D: $D_{pass} \neq D_{fail}$.

A7.1.3 Implementation

A7.1.3.1 Proceeding

a) Set up the required test conditions.

b) Continuously record the number of samples tested and the number of (error) events (bit error, block error or missing BFI). Calculate the preliminary error rates ber_0 and ber_1 from the number of samples and the number of (error) events. Regarding ber_0 and ber_1 refer to "A7.1.3.1 Limit lines".

c) Continuously check while recording samples and errors, if it is about time to make a decision. The possible outcomes of a decision are: Early pass, early fail, continue with measuring the error rates, pass or fail.

- 1st decision after minimum test time due to fading (refer to Table A7.1.4.2 : Minimum test time due to fading) has elapsed. In case the test runs without fading conditions this time is zero and in case this time exceeds the target test time (refer to A7.1.3.1 Limit lines), the test is already finished requiring a pass/fail decision .
- 2nd and possibly further (early) decisions after a certain cyclic interval or the occurrence of the next error event. As long as no early decision can be made the test is continued.
- If the target test time has elapsed the test is definitively finished and a pass/fail decision can be made. In case the minimum test time due to fading exceeds the target test time this point is reached already in the 1st step.

A7.1.3.2 Limit lines

Early decisions require that the actual error rate is checked both against a limit line for early pass and a limit line for early fail.

<u>Limit line for early pass decision (for **ne** ≥1):</u>

The condition for an early pass decision is: $ber_1 < berlimbad_{pass}$

$$\mathrm{berlimbad}_{\mathrm{pass}}(D_{\mathrm{pass}}, \mathbf{ne}) = \frac{2 \times \mathbf{ne} \times M}{C^{-1}(1 - D_{\mathrm{pass}}, 2 \times \mathbf{ne})}$$

ber_1 is the normalised bit error rate with counting errors started from one which means that an artificial error is introduced at the beginning to avoid that the early pass condition is met when the test starts. After the first real error event has occurred the artificial error has to be removed to calculate the error rate correctly.

<u>Limit line for early fail decision (for **ne**≥ 7):</u>

The condition for an early fail decision is: $ber_0 > berlim_{fail}$

$$\mathrm{berlim}_{\mathrm{fail}}(D_{\mathrm{fail}}, \mathbf{ne}) = \frac{2 \times \mathbf{ne}}{C^{-1}(D_{\mathrm{fail}}, 2 \times \mathbf{ne})}$$

ber_0 is the normalised bit error rate with counting errors started from zero, meaning that no artificial erroneous sample is introduced at the beginning of the test..

Due to the nature of the test, namely discrete error events, the early fail condition shall not be valid, when fractional errors <1 are used to calculate the early fail limit: Any early fail decision is postponed until number of errors **ne** ≥7. In the blocking test any early fail decision is postponed until number of errors **ne** ≥ 8.

Parameters for limit lines:

1.	D		wrong decision probability per test step.
2.	M	= 1.5	bad DUT factor
3.	**ne**		number of (error) events. This parameter is the x-ordinate in figure A7.1.3.1 Limit lines.
4.	ns		number of samples. This parameter is not needed for limit lines, but enumerated here because it is aligned to ne closely. The bit error rate is calculated from ne and ns.
	Parameters D and M define the limit lines for early pass and early fail. With the two curves known the intersection point of the two limit lines can be calculated. The x-ordinate of this intersection point is the target number of errors (TNE) and y-ordinate is the (normalised) test limit (TL). This intersection point is reached when the target test time has elapsed. In this case a decision against the test limit (column "derived test limit") can be made.		
5.	TL	= 1.234	For tests with F = 0.2 the parameters given above lead to this (normalised) test limit. The BER limit given in the core specs (column "Orig. BER requirement" in the tables defining the test limits) is multiplied with the test limit factor TL to gain the limit for the pass/fail decision (column "derived test limit").
	TL	= 1.251	Normalized test limit for tests with F = 0.02 (e.g. blocking test).
6.	TNE		The parameters given above lead to a target number of errors. For tests with F = 0.2 the target number of errors is 345. For tests with F = 0.02 (e.g. blocking test) the target number of errors results in 403.

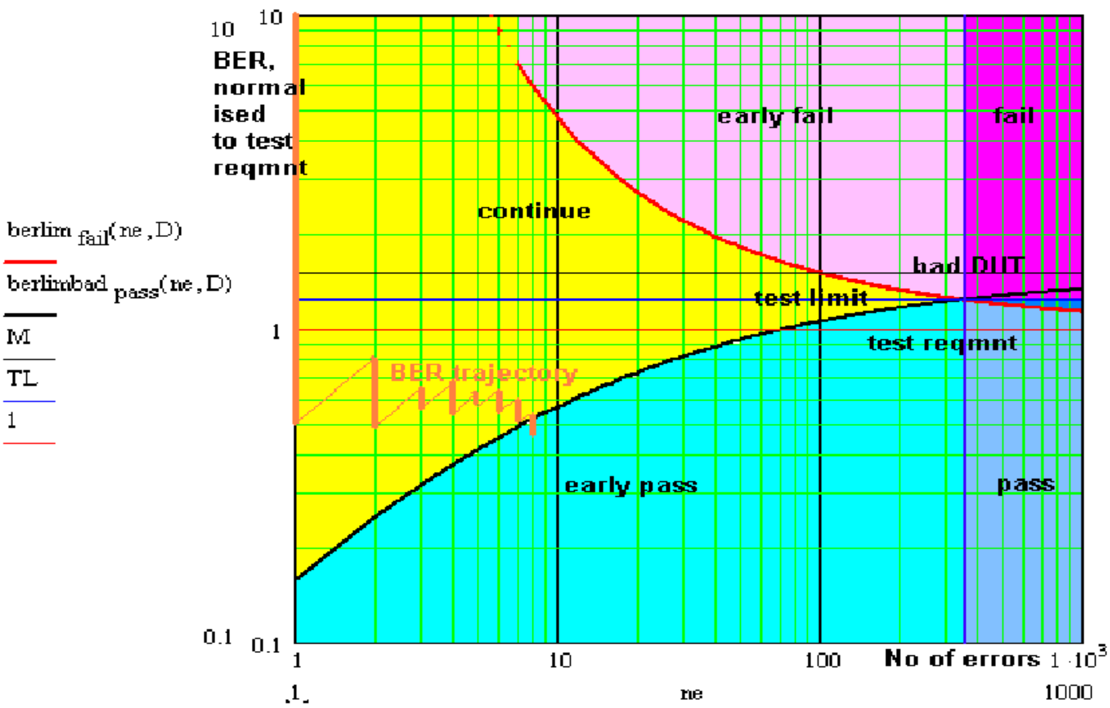

Figure A7.1.3.1 Limit lines

A typical error rate test, calculated form the number of samples and errors using experimental method (1) or (2) (see A7.1.1.4 Calculation assumptions) runs along the yellow trajectory. With an errorless sample the trajectory goes down vertically. With an erroneous sample it jumps up right. Making a pass/fail decision means to check if the error rate

("BER trajectory") intersects the limit lines for early pass or early fail. The term 'test limit' used in the figure above denotes the term 'derived test limit' used in this document.

A7.1.4 Good balance between test time and statistical significance

Three independent test parameters are introduced into the test and shown in Table A7.1.4.1. These are the obvious basis of test time and statistical significance. From the first two of them four dependent test parameters are derived. The third independent test parameter is justified separately.

Table A7.1.4.1 Independent and dependent test parameters

Independent test parameters			Dependent test parameters		
Test Parameter	**Value**	**Reference**	**Test parameter**	**Value**	**Reference**
Bad DUT factor M	1.5	Section A7.1.3.1	Early pass/fail condition	Curves	Section A7.1.3.1 Figure A7.1.3.1
Final probability of wrong pass/fail decision F	0.2% 0.02% for blocking	Section A7.1.2	Target number of error events	345 403 for blocking	Section A7.1.3.1
			Probability of wrong pass/fail decision per test step D	0.0085% 0.0008% for blocking	Section A7.1.2
			Test limit factor TL	1.234 1.251 for blocking	Section A7.1.3.1
Minimum test time		Table A7.1.4.2			

The minimum test time is derived from the following justification:

1) For no propagation conditions and static propagation condition

   No early fail calculated from fractional number of errors <1

2) For multipath fading condition

   No stop of the test until 990 wavelengths are crossed for fading profiles greater than 5km/h, and 250 wavelengths are crossed for fading profiles less than or equal to 5km/h. The minimum test time due to multipath fading conditions depends on the frequency of the DL signal, the vehicle speed and the data rate (full rate or half rate). Refer to table A7.1.6.2 : Minimum test time due to fading

Table A7.1.4.2: Minimum test time due to fading

Frequency	0,4	0,7	0,85	0,9	1,8	1,9	GHz

A7.1.5 Minimum and maximum expected duration of tests

Since there are a number of dependant and independent factors which determine the expected duration of a test using these statistical methods, it is recommended that in individual test cases an expected minimum and an expected maximum duration of test is specified for each configuration (e.g. times may significantly change for differing bands). Where the expected minimum and maximum duration are constrained by the same factor, and are thus the same, for clarity both values should be stated.

Where minimum and/or maximum test durations are specified, they should only be used a in an informative manner (e.g. by a test case implementer to determine whether a given implementation is correct). These specified durations should not be used as a failure determination unless this is explicitly stated in an individual clause.

A7.2 Statistical testing of 2 D position error and TTFF for A-GPS and A-GNSS Minimum Performance test cases

A7.2.1 Test Method

Each test is performed in the following manner:

a) Setup the required test conditions.

b) Measure the 2D position and Time to First Fix repeated times. Start each repetition after having applied the message 'RESET MS POSITIONING STORED INFORMATION'. This ensures that each result is independent from the previous one. The results, measured, are simplified to:

good result, if the 2D position and TTFF are ≤ limit.

bad result, if the 2D position or TTFF or both are > limit

c) Record the number of results (ns) and the number of bad results (ne)

d) Stop the test at a pass or an fail event.

e) Once the test is stopped, decide according to the pass fail decision rules (A7.2.4.2)

A7.2.2 Error Ratio (ER)

The Error Ratio (ER) is defined as the ratio of bad results (ne) to all results (ns).
(1-ER is the success ratio)

A7.2.3 Test Design

A statistical test is characterised by:

Test-time, Selectivity and Confidence level

A7.2.3.1 Confidence level

The outcome of a statistical test is a decision. This decision may be correct or in-correct. The Confidence Level CL describes the probability that the decision is a correct one. The complement is the wrong decision probability (risk) D = 1-CL

A7.2.3.2 Introduction: Supplier Risk versus Customer Risk

There are two targets of decision:

a) A measurement on the pass-limit shows, that the DUT has the specified quality or is better with probability CL (CL e.g.95%) This shall lead to a "pass decision"

The pass-limit is on the good side of the specified DUT-quality. A more stringent CL (CL e.g.99%) shifts the pass-limit further into the good direction. Given that the quality of the DUTs is distributed, a greater CL passes less and better DUTs.

A measurement on the bad side of the pass-limit is simply "not pass" (undecided)

aa) Complementary:

A measurement on the fail-limit shows, that the DUT is worse than the specified quality with probability CL.

The fail-limit is on the bad side of the specified DUT-quality. A more stringent CL shifts the fail-limit further into the bad direction. Given that the quality of the DUTs is distributed, a greater CL fails less and worse DUTs.

A measurement on the good side of the fail-limit is simply "not fail".

b) A DUT, known to have the specified quality, shall be measured and decided pass with probability CL. This leads to the pass limit.

For CL e.g. 95%, the pass limit is on the bad side of the specified DUT-quality. CL e.g.99% shifts the pass-limit further into the bad direction. Given that the DUT-quality is distributed, a greater CL passes more and worse DUTs.

bb) A DUT, known to be an ($\varepsilon \rightarrow 0$) beyond the specified quality, shall be measured and decided fail with probability CL.

For CL e.g.95%, the fail limit is on the good side of the specified DUT-quality.

NOTE: the different sense for CL in (a), (aa) versus (b), (bb).

NOTE: for constant CL in all 4 bullets (a) is equivalent to (bb) and (aa) is equivalent to (b).

A7.2.3.3 Supplier Risk versus Customer Risk

The table below summarizes the different targets of decision.

Table A7.2.3.3 Equivalent statements

	Equivalent statements, using different cause-to-effect-directions, and assuming CL = constant >0.5	
cause-to-effect-directions	Known measurement result → estimation of the DUT's quality	Known DUT's quality → estimation of the measurement's outcome
Supplier Risk	**A measurement on the pass-limit shows, that the DUT has the specified quality or is better (a)**	A DUT, known to have an (ε→0) beyond the specified DUT-quality, shall be measured and decided fail (bb)
Customer Risk	A measurement on the fail-limit shall shows, that the DUT is worse than the specified quality (aa)	**A DUT, known to have the specified quality, shall be measured and decided pass (b)**

NOTE: The bold text shows the obvious interpretation of Supplier Risk and Customer Risk. The same statements can be based on other DUT-quality-definitions.

A7.2.3.4 Introduction: Standard test versus early decision concept

In standard statistical tests, a certain number of results (ns) is predefined in advance of the test. After ns results the number of bad results (ne) is counted and the error ratio (ER) is calculated as ne/ns.

Applying statistical theory, a decision limit can be designed, against which the calculated ER is compared to derive the decision. Such a limit is one decision point and is characterised by:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a fixed predefined parameter)
- ne: the number of bad results (the limit based on just ns)

In the formula for the limit, D and ns are parameters and ne is the variable. In the standard test ns and D are constant. The property of such a test is: It discriminate between two states only, depending on the test design:

- pass (with CL) / undecided (undecided in the sense: finally undecided)
- fail (with CL) / undecided (undecided in the sense: finally undecided)
- pass(with CL) / fail (with CL) (however against two limits).

In contrast to the standard statistical tests, the early decision concept predefines a set of (ne,ns) co-ordinates, representing the limit-curve for decision. After each result a preliminary ER is calculated and compared against the limit-curve. After each result one may make the decision or not (undecided for later decision) The parameters and variables in the limit-curve for the early decision concept have a similar but not equal meaning:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a variable parameter)
- ne: the number of bad results (the limit. It varies together with ns)

To avoid a “final undecided” in the standard test, a second limit must be introduced and the single decision co-ordinate (ne,ns) needs a high ne, leading to a fixed (high) test time. In the early decision concept, having the same selectivity and the same confidence level an “undecided” does not need to be avoided, as it can be decided later. A perfect DUT will hit the decision coordinate (ne,ns) with ne=0. This test time is short.

A7.2.3.5 Standard test versus early decision concept

For Supplier Risk:
The wrong decision probability D in the standard test is the probability, to decide a DUT in-correctly in the single decision point. In the early decision concept there is a probability of in-correct decisions d at each point of the limit-curve. The sum of all those wrong decision probabilities accumulate to D. Hence d<D

For Customer Risk:
The correct decision probability CL in the standard test is the probability, to decide a DUT correctly in the single decision point. In the early decision concept there is a probability of correct decisions cl at each point of the limit-curve. The sum of all those correct decision probabilities accumulate to CL. Hence cl<CL or d>D

A7.2.3.6 Selectivity

There is no statistical test which can discriminate between a limit-DUT-quality and a DUT-quality which is an ($\varepsilon \rightarrow 0$) apart from the limit in finite time and confidence level CL>1/2. Either the test discriminates against one limit with the results pass (with CL)/undecided or fail (with CL)/undecided, or the test ends in a result pass (with CL)/fail (with CL) but this requires a second limit.

For CL>0.5, a (measurement-result = specified-DUT-quality), generates undecided in test “supplier risk against pass limit” (a in clause A7.2.3.2) and also in the equivalent test against the fail limit (aa in clause A7.2.3.2)

For CL>0.5, a DUT, known to be on the limit, will be decided pass for the test “customer risk against pass limit” (b in clause A7.2.3.2) and also in the equivalent test against fail limit (bb in clause A7.2.3.2).

This overlap or undecided area is not a fault or a contradiction, however it can be avoided by introducing a Bad or a Good DUT quality according to:

- Bad DUT quality: specified DUT-quality * M (M>1)
- Good DUT quality: specified DUT-quality * m (m<1)

Using e.g M>1 and CL=95% the test for different DUT qualities yield different pass probabilities:

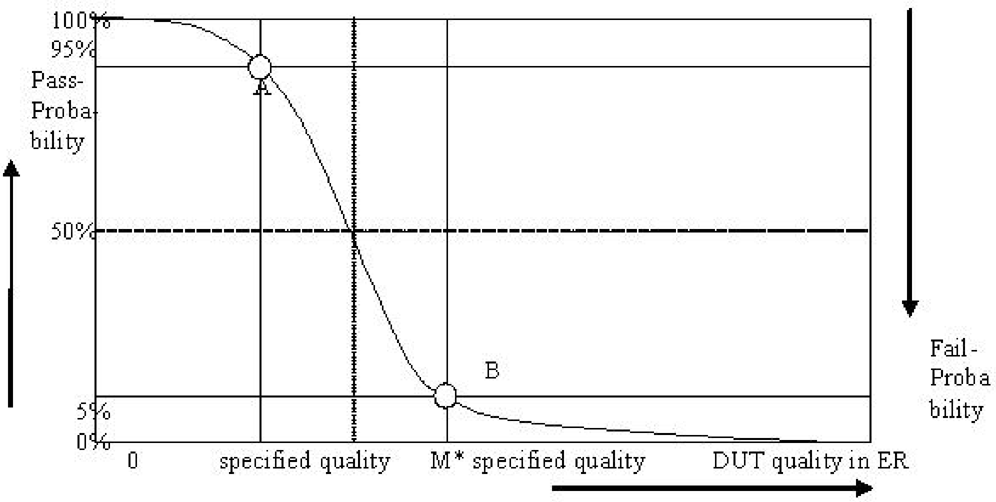

Figure A7.2.3.6: Pass probability versus DUT quality

A7.2.3.7 Design of the test

The test is defined according to the following design principles:

1. The early decision concept is applied.
2. A second limit is introduced: Bad DUT factor M>1
3. To decide the test pass:

    Supplier risk is applied based on the Bad DUT quality

    To decide the test fail

    Cusomer Risk is applied based on the specified DUT quality

The test is defined using the following parameters:

1. Specified DUT quality: ER = 0.05
2. Bad DUT quality: M=1.5 (selectivity)
3. Confidence level CL = 95% (for specified DUT and Bad DUT-quality)

This has the following consequences:

a) A measurement on the fail limit is connected with 2 equivalent statements:

A measurement on the fail-limit shows, that the DUT is worse than the specified DUT-quality	A DUT, known to have the specified quality, shall be measured and decided pass

A measurement on the pass limit is connected with the complementary statements:

A measurement on the pass limit shows, that the DUT is better than the Bad DUT-quality.	A DUT, known to have the Bad DUT quality, shall be measured and decided fail

The left column is used to decide the measurement.

The right column is used to verify the design of the test by simulation.

The simulation is based on the two fulcrums A and B only in Figure A7.2.3.6. There is freedom to shape the remainder of the function.

b) Test time

    1. The minimum and maximum test time is fixed.
    2. The average test time is a function of the DUT's quality.
    3. The individual test time is not predictable (except ideal DUT).

c) The number of decision co-ordinates (ne,ns) in the early decision concept is responsible for the selectivity of the test and the maximum test time. Having fixed the number of decision co-ordinates there is still freedom to select the individual decision co-ordinates in many combinations, all leading to the same confidence level.

A7.2.4 Pass fail decision

A7.2.4.1 Numerical definition of the pass fail limits

The third column is the number of results for the fail limit (ns_f)

A7.2.4.2 Pass fail decision rules

Having observed 0 bad results, pass the test at ≥77 results, otherwise continue

Having observed 1 bad result, pass the test at ≥106 results, otherwise continue

Having observed 2 bad results, pass the test at ≥131 results, otherwise continue

etc. until

Having observed 6 bad results, pass the test at ≥218 results, fail the test at ≤ 42 results, otherwise continue

Having observed 7 bad results, pass the test at ≥238 results, fail the test at ≤ 52 results, otherwise continue

etc. until

Having observed 168 bad results, pass the test at ≥2751 results, fail the test at ≤2747 results, otherwise continue

Having observed 169 bad results, pass the test at ≥2765 results, otherwise fail

NOTE: an ideal DUT passes after 77 results. The maximum test time is 2765 results.

A7.2.4.3 Background information to the pass fail limits

There is freedom to design the decision co-ordinates (ne,ns).

The binomial distribution and its inverse is used to design the pass and fail limits. Note that this method is not unique and that other methods exist.

$$\mathrm{fail}(ne, d_f) := \frac{ne}{(ne + \mathrm{qnbinom}(d_f, ne, ER))}$$

$$\mathrm{pass}(ne, cl_p, M) := \frac{ne}{(ne + \mathrm{qnbinom}(cl_p, ne, ER \cdot M))}$$

Where

fail(..) is the error ratio for the fail limit

pass(..) is the error ratio for the pass limit

ER is the specified error ratio 0.05

ne is the number of bad results. This is the variable in both equations

M is the Bad DUT factor M=1.5

d_f is the wrong decision probability of a single (ne,ns) co-ordinate for the fail limit.
It is found by simulation to be $d_f = 0.004$

cl_p is the confidence level of a single (ne,ns) co-ordinate for the pass limit.
It is found by simulation to be $cl_p = 0.9975$

qnbinom(..): The inverse cumulative function of the negative binomial distribution

The simulation works as follows:

A large population of limit DUTs with true ER = 0.05 is decided against the pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population passes and D (5%) of the population fails.

A population of Bad DUTs with true ER = M*0.05 is decided against the same pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population fails and D (5%) of the population passes.

This procedure and the relationship to the measurement is justified in clause A7.2.3.7. The number of DUTs decrease during the simulation, as the decided DUTs leave the population. That number decreases with an approximately exponential characteristics. After 169 bad results all DUTs of the population are decided.

NOTE: The exponential decrease of the population is an optimal design goal for the decision co-ordinates (ne,ns), which can be achieved with other formulas or methods as well.

Annex 8: Void

Annex 9 (normative): GAN certificate

A9.1 Files relating to GAN certificate for testing

All files associated with the certificates to be used for authentication in IPSec are contained in archive GAN_certificate_V1.zip.

Files to be used both by MS and SS are contained in this archive.

The archive file set consists of the following:

-	Ca.key	
-	Ca.crt	
-	Segw.key	
-	Segw.csr	
-	Segw.crt	
-	_Command.txt	The commands performed to generate the above files
-	_Openssl.txt	Input file containing information required to generate above certificates (renamed from openssl.cnf)
-	_Exectution.txt	Activity log generated whilst above files are generated (also contains details of information prompted for during command execution)

A9.1.1 Overview and usage of certificate files

In a regular network (non-test) environment, a public certification authority (CA) would be used to generate a SEGW certificate (ca.crt) using the CA’s private key and the network operator's information. For testing we are using our own test CA and have made available the test CA self-signed root certificate (self signing ca.crt).

Of the above files, the MS will need to store the test CA root certificate (ca.crt).

The SS will use the private key (segw.key) and certificate (segw.crt) for mutual authentication relating to the provisioning SEGW.

The SS vendor will use the test CA private key (ca.key) and test CA root certificate (ca.crt) to generate further certificates relating to the default and serving SEGWs.

A9.1.2 Privacy of private keys and usage of certificate

Since the private key relating to the root certificate is published here, there is no privacy, and thus no relationship of trust associated with this root certificate (ca.crt). It is of the utmost importance that the MS will only utilise this certificate for test purposes. For further details refer to TS 44.014.

Annex 10 (informative): Repeated SACCH Layer 1 Test Method:

A10.1 Details on Repeated SACCH Testing

Table A10.1.1 shows the PCL values exchanged in the L1 headers between a MS and SS during a typical session with zero block errors on time slot 0. On the DL the SS updates the commanded PCL every second SACCH interval as each SACCH block is repeated. The SS must complete the following actions during the period between the last burst of the UL SACCH and the first burst of the DL SACCH (26 frames):

- Decode the reported PCL in the UL SACCH L1 header.
- Determine the new PCL based on the reported PCL in the UL L1 header and the PCL commanded in the previous SACCH interval on the DL. The procedure used is specified in section 14.2.26 or 14.4.32.
- Format the data for the first burst in the DL SACCH L1 header.

Using the information in Table A10.1.1 as an example, the SS must complete the above steps between the end of FN 42106 and the start of FN 42132. The "Next Commanded PCL by SS" to use in FN 42132 is determined according to table 14.2.26-1 or 14.4.32-1, referring to the following parameters:

- The "Last Commanded PCL" is that used in the DL SACCH block that started at FN 42028,
- The "Corresponding Reported MS PCL" is that reported for the UL SACCH block that started at FN 42028.

The entries in table 14.2.26-1 or 14.4.32-1 are derived such that the "Next commanded PCL by SS" is chosen so that it is not equal to either the "Last commanded PCL by SS" or the "Corresponding Reported MS PCL". This ensures that the SS can detect all block error events. Only three PCL values are needed to ensure that all block error events are captured. The choice of PCL values 7, 8 and 9 are specified to ensure that all PCL values are within 2 steps of each other. This is to avoid rate limiting between changes in PCL values [see TS 45.008 subclause 4.7.1]. Note that PCL values 7, 8,and 9 were chosen to ensure all MSs, even those that do not support PCL values of 0, would work with these test cases.

Table A10.1.2 illustrates the specific case where an error only occurs in the first SACCH block of a repeated SACCH interval. Although this affects the SACCH block sequence that the SS receives from the MS, it does not alter its decisions as no block error occurs. In the case where only the second SACCH block of a repeated SACCH interval is in error, this is not detectable by the SS, however this is not a block error condition as the first SACCH block of the repeated SACCH interval was received without error.

Table A10.1.3 illustrates the specific case where an error occurs in the both the first and second SACCH blocks of a repeated SACCH interval. In this event, the SS detects the block error and the PCL sequence used by the SS is altered from the normal case in response to the sequence received from the MS.

Table A10.1.4 illustrates the specific case where multiple (in this case 4) sequential errors occur. In this event the SS detects two block errors and the PCL sequence used by the SS is altered from the normal case in response to the sequence received from the MS.

Annex B (informative): Change history

TSG #	TSG Doc	CR	Rev	Subject/Comment	Cat	Old	New	WG Doc	Work item
08/2000				Conversion to 3GPP layout and number		11.10-1 v 9.0.1	51.010-1 v 4.0.1		
G-02	GP-000489	001		Applicability of 2 new GPRS tests 20.22.8 and 20.22.9	F	4.0.1	4.1.0	G4-000003	GPRS
G-02	GP-000491	002		PIXIT information for SoLSA	B	4.0.1	4.1.0	G4-000021	SoLSA
G-02	GP-000492	003		Test case 31.3.1.4 – Additions to test procedure	F	4.0.1	4.1.0	G4-000039	TEI
G-02	GP-000492	004		Test case 31.3.1.5 – Additions to test procedure.	F	4.0.1	4.1.0	G4-000040	TEI
G-02	GP-000492	005		TC 31.4.3.1.2 - Alignment of Expected Sequence with the Test Procedure description	F	4.0.1	4.1.0	G4-000050	TEI
G-02	GP-000492	006		TC 31.4.3.5 –Corrections of the Method of test according to the core specification GSM 04.84	F	4.0.1	4.1.0	G4-000051	TEI
G-02	GP-000490	007		Introduction of PCS 1900 into section 23	B	4.0.1	4.1.0	G4-000053	PCS1900
G-02	GP-000490	008		Introduction of PCS 1900 into section 26.3	B	4.0.1	4.1.0	G4-000054	PCS1900
G-02	GP-000490	009		Introduction of PCS 1900 into section 26.5	B	4.0.1	4.1.0	G4-000055	PCS1900
G-02	GP-000490	010		Introduction of PCS 1900 into section 26.6	B	4.0.1	4.1.0	G4-000056	PCS1900
G-02	GP-000490	011		Introduction of PCS 1900 into section 26.7	B	4.0.1	4.1.0	G4-000057	PCS1900
G-02	GP-000490	012		Introduction of PCS 1900 into section 26.8	B	4.0.1	4.1.0	G4-000058	PCS1900
G-02	GP-000490	013		Introduction of PCS 1900 into section 30	B	4.0.1	4.1.0	G4-000059	PCS1900
G-02	GP-000490	014		Introduction of PCS 1900 into section 34	B	4.0.1	4.1.0	G4-000060	PCS1900
G-02	GP-000492	015		Correction for testcase 31.4.3.1.1	D	4.0.1	4.1.0	G4-000070	TEI
G-02	GP-000492	016		Correction for testcase 31.4.3.1.2	D	4.0.1	4.1.0	G4-000071	TEI
G-02	GP-000492	017		Correction for testcase 31.4.3.1.3	D	4.0.1	4.1.0	G4-000072	TEI
G-02	GP-000492	018		Correction for testcase 31.4.3.2	D	4.0.1	4.1.0	G4-000073	TEI
G-02	GP-000488	019		Addition of EDGE test cases to the applicability table	B	4.0.1	4.1.0	G4-000099	EDGE
G-02	GP-000488	020		Introduction of 8PSK test equipment measurement uncertainties in Annex 5	B	4.0.1	4.1.0	G4-000100	EDGE
G-02	GP-000488	021		COMPACT Signal Strength test case	B	4.0.1	4.1.0	G4-000103	EDGE
G-02	GP-000488	022		COMPACT Cell Selection and Re-selection	B	4.0.1	4.1.0	G4-000104	EDGE
G-02	GP-000488	023		EDGE Timing advance and absolute delay	B	4.0.1	4.1.0	G4-000105	EDGE
G-02	GP-000492	024		Clause 31.4. Problem with test for call state U0	F	4.0.1	4.1.0	G4-000108	TEI
G-02	GP-000492	025		Test case 31.4.3.1.3 – Incorrect name for timer T in Test Purpose statement	F	4.0.1	4.1.0	G4-000109	TEI
G-02	GP-000487	026		Correction to the numbering of sections and procedures of AMR tests in section 26.16	D	4.0.1	4.1.0	G4-000111	AMR
G-02	GP-000490	027		Inclusion of PCS1900 in clauses 12, 13 and 14	B	4.0.1	4.1.0	G4-000116	PCS1900
G-02	GP-000492	028		Clause 31.4.2.1.2.1. Correction to MPTY Auxiliary states.	F	4.0.1	4.1.0	G4-000119	TEI
G-02	GP-000492	029		Alignment of the AoC test case with the specification	F	4.0.1	4.1.0	G4-000120	TEI
G-02	GP-000492	030		26.10.2.1: mismatching value and use of the Extension Indication about the BCCH channel list, and inconsistencies in the measurement report list of ARFCNs	F	4.0.1	4.1.0	G4-000121	TEI
G-02	GP-000490	031		Introduction of PCS 1900 into section 40	B	4.0.1	4.1.0	G4-000122	PCS1900
G-02	GP-000490	032		Introduction of PCS 1900 into sections 1 to 10	B	4.0.1	4.1.0	G4-000123	PCS1900
G-02	GP-000490	033		Introduction of PCS 1900 into section 41	B	4.0.1	4.1.0	G4-000124	PCS1900
G-02	GP-000490	034		Introduction of PCS 1900 into section 42	B	4.0.1	4.1.0	G4-000125	PCS1900
G-02	GP-000491	035		Introduction of new cell selection and reselection test cases for SoLSA	B	4.0.1	4.1.0	G4-000126	SoLSA
G-02	GP-000491	036		Replacement of current chapter 26.15	B	4.0.1	4.1.0	G4-000127	SoLSA
G-02	GP-000491	037		Addition of SoLSA test cases to the applicability table	B	4.0.1	4.1.0	G4-000128	SoLSA
G-02	GP-000489	038		Clarification of GPRS Receive Initial Conditions	F	4.0.1	4.1.0	G4-000129	GPRS
G-02	GP-000489	039		Clarification of GPRS Transmitter Initial Conditions	F	4.0.1	4.1.0	G4-000130	GPRS
G-02	GP-000489	040		Clarification of GPRS Timing advance and absolute delay Conditions	F	4.0.1	4.1.0	G4-000131	GPRS
G-02	GP-000492	041		Correction for testcase 31.4.3.4	F	4.0.1	4.1.0	G4-000134	TEI
G-02	GP-000492	042		Correction for testcase 31.4.3.5	F	4.0.1	4.1.0	G4-000135	TEI
G-02	GP-000489	043		Medium Access Control (MAC) Medium Access Control (MAC) Procedures on PCCCH in idle mode	F	4.0.1	4.1.0	G4-000144	GPRS
G-02	GP-000489	044		Dynamic Allocation in Packet Transfer Mode	F	4.0.1	4.1.0	G4-000145	GPRS

TSG #	TSG Doc	CR	Rev	Subject/Comment	Cat	Old	New	WG Doc	Work item
G-02	GP-000489	045		TC's section 41 – Channel combination v) instead of iv) and vii)	D	4.0.1	4.1.0	G4-000146	GPRS
G-02	GP-000489	046		The ARFCN list encoding for DCS in 42.1.2.2.3 cannot use Bit Map 0 format.	F	4.0.1	4.1.0	G4-000147	GPRS
G-02	GP-000489	047		Incorrect References in Specific Message Contents of 41.1.3	F	4.0.1	4.1.0	G4-000148	GPRS
G-02	GP-000489	048		Misalignment between the "Test Procedure" and "Expected Sequence" of test case 42.3.1.1.7.	F	4.0.1	4.1.0	G4-000149	GPRS
G-02	GP-000489	049		Test case 42.3.1.1.4 - inconsistencies between "Test Procedure" and "Expected Sequence" along with chronologically errors in "Expected Sequence"	F	4.0.1	4.1.0	G4-000150	GPRS
G-02	GP-000489	050		GPRS Paging tests on CCCH for GPRS service	F	4.0.1	4.1.0	G4-000151	GPRS
G-02	GP-000489	051		TC 41.2.2.4 – Correction of Expected sequence numbering	F	4.0.1	4.1.0	G4-000152	GPRS
G-02	GP-000489	052		TC 41.2.3.1 – Correction of Specific message contents	F	4.0.1	4.1.0	G4-000153	GPRS

				operation in downlink					
GP-25	GP-051299	2937	-	New TC 42.9.2.1.5: Extended Dynamic Allocation / Uplink Transfer / Normal / Polling for PDAN	B	6.2.1	6.3.0	GP-051299	GPRS
GP-25	GP-051300	2938	-	New TC 52.9.2.1.4: Extended Dynamic Allocation / Uplink Transfer / Normal / PACCH operation in downlink	B	6.2.1	6.3.0	GP-051300	EGPRS
GP-25	GP-051301	2939	-	New TC 52.9.2.1.5: Extended Dynamic Allocation / Uplink Transfer / Normal / Polling for EPDAN	B	6.2.1	6.3.0	GP-051301	EGPRS
GP-25	GP-051303	2940	-	44.2.2.2.6 - Setting Force to Standby in Routing Area Accept	F	6.2.1	6.3.0	GP-051303	TEI-6
GP-25	GP-051311	2942	-	51010-1: Changes in the specific message content of 42.4.2.3.4.	F	6.2.1	6.3.0	GP-051311	GPRS
GP-25	GP-051312	2943	-	51010-1: Changes in the READY-TIMER used in the testcase 42.4.2.3.5.	F	6.2.1	6.3.0	GP-051312	GPRS
GP-25	GP-051313	2944	-	51010-1: Changes in the applicability of the combined attach testcases in section 44.2.1.2.	F	6.2.1	6.3.0	GP-051313	GPRS
GP-25	GP-051314	2945	-	51010-1: Changes in the testcase 44.2.10.	F	6.2.1	6.3.0	GP-051314	GPRS
GP-25	GP-051315	2946	-	51010-1: Changes in the applicability of the combined routing area update testcases in section 44.2.3.2.	F	6.2.1	6.3.0	GP-051315	GPRS
GP-25	GP-051316	2947	-	51010-1: Changes in the testcase 44.2.8.1.2 and 44.2.8.1.3	F	6.2.1	6.3.0	GP-051316	GPRS
GP-25	GP-051317	2948	-	51010-1: Changes in the testcase 46.1.2.2.2.3.	F	6.2.1	6.3.0	GP-051317	GPRS
GP-25	GP-051318	2949	-	51010-1: Changes in the testcase 46.2.2.1.2.	F	6.2.1	6.3.0	GP-051318	GPRS
GP-25	GP-051637	2950	1	51010-1: Changes in the testcase 46.2.2.1.5.	F	6.2.1	6.3.0	GP-051637	GPRS
GP-25	GP-051322	2951	-	42.4.8.4.5 - Clarifications in initial conditions	F	6.2.1	6.3.0	GP-051322	GPRS
GP-25	GP-051323	2952	-	26.7.4.5.4.x - HPLMN Search Timer handling	F	6.2.1	6.3.0	GP-051323	TEI
GP-25	GP-051331	2953	-	14.18.8.1 DARP EGPRS tests - Synchronous single co-channel interferer (DTS-1)	B	6.2.1	6.3.0	GP-051331	DARP
GP-25	GP-051332	2954	-	14.18.8.2 DARP EGPRS tests - Synchronous multiple interferers (DTS-2 / DTS-3)	B	6.2.1	6.3.0	GP-051332	DARP
GP-25	GP-051333	2955	-	14.2.1 Reference sensitivity - Procedure correction	F	6.2.1	6.3.0	GP-051333	TEI
GP-25	GP-051334	2956	-	14.16.2 Co-channel rejection Corrections and addition of DARP applicability	B	6.2.1	6.3.0	GP-051334	DARP
GP-25	GP-051335	2957	-	14.18.2 Co-channel rejection. Addition of DARP applicability	B	6.2.1	6.3.0	GP-051335	DARP
GP-25	GP-051663	2958	1	14.16.4.2 Editorial correction	F	6.2.1	6.3.0	GP-051663	
GP-25	GP-051664	2959	1	14.16.4.1 Correction of procedure steps	F	6.2.1	6.3.0	GP-051664	
GP-25	GP-051339	2960	-	51010-1: GPRS Uplink Power Control - Independence of TS Power Control	F	6.2.1	6.3.0	GP-051339	TEI-6
GP-25	GP-051340	2961	-	New Test Cases for 51.010-1 Clause 82: GAN CS Domain Procedures	B	6.2.1	6.3.0	GP-051340	GA
GP-25	GP-051352	2962	-	51010-1: Changes in the applicability of the some of the detach testcase in section 44.2.2.	F	6.2.1	6.3.0	GP-051352	GPRS
GP-25	GP-051353	2963	-	CR 51.010-1 section 42.4.2.1.3 - Conformance Requirement updated and Two Phase Access Procedure added	F	6.2.1	6.3.0	GP-051353	GPRS
GP-25	GP-051354	2964	-	CR 51.010-1 Section 42.4.2.1.4 Update of Conformance Requirement	F	6.2.1	6.3.0	GP-051354	GPRS
GP-25	GP-051366	2965	-	70.8.4.1 - Correction of RRLP Protocol Error Cause	F	6.2.1	6.3.0	GP-051366	TEI
GP-25	GP-051639	2966	-	Section 52.1.2.2.5.1 - Packet Downlink Assignment / Abnormal cases / Incorrect PDCH assignment	F	6.2.1	6.3.0	GP-051639	-
GP-25	GP-051369	2967	-	New Test Case for MS-Based A-GPS: RRLP Protocol Error	F	6.2.1	6.3.0	GP-051369	TEI
GP-25	GP-051370	2968	-	New Test Case for MS-Based A-GPS: RRLP Location Error - Requested Method Not Supported	F	6.2.1	6.3.0	GP-051370	TEI
GP-25	GP-051371	2969	-	New Test Case for MS-Based A-GPS: RRLP Location Error - GPS Assistance Data Missing	F	6.2.1	6.3.0	GP-051371	TEI
GP-25	GP-051373	2970	-	CR 51.010-1 Section 40.2.4.28 - DTM Assignment Command - Message Type corrected	F	6.2.1	6.3.0	GP-051373	GPRS
GP-25	GP-051374	2971	-	CR 51.010-1 Section 40.2.4.33 - Handover Command - ATC corrected	F	6.2.1	6.3.0	GP-051374	GPRS
GP-25	GP-051626	2972	1	CR 51.010-1 Section 40.4.3.21 Uplink data - new macro added	F	6.2.1	6.3.0	GP-051626	GPRS
GP-25	GP-051662	2973	2	CR 51.010-1 Section 42.3.1.1.9 - Dynamic Allocation / Uplink Transfer / Normal / Frequency	F	6.2.1	6.3.0	GP-051662	GPRS

GP-34	GP-070930	3847	3	41.5.5.2 New Enhanced DTM Test Case: Reallocation of PS Resources for Uplink and Downlink TBFs	F	7.5.0	7.6.0	GP-070930	TEI6
GP-34	GP-070647	3848	-	82.8.2 Test cases not compliant to latest core spec	F	7.5.0	7.6.0	GP-070647	TEI
GP-34	GP-070648	3849	-	41.3.x - Consideration of high multislot classes supporting one Tx timeslot only	F	7.5.0	7.6.0	GP-070648	TEI
GP-34	GP-070649	3850	-	51.3.x - Consideration of high multislot classes supporting one Tx timeslot only	F	7.5.0	7.6.0	GP-070649	TEI
GP-34	GP-070650	3851	-	42.9.2.1.4 – Correction of test step 25	F	7.5.0	7.6.0	GP-070650	TEI
GP-34	GP-070651	3852	-	44.2.11.3.2 Correction of initial conditions	F	7.5.0	7.6.0	GP-070651	TEI
GP-34	GP-070874	3853	1	26.19.9.11 In case of Full Rate Speech Version 5, step 27 to 29 are skipped	F	7.5.0	7.6.0	GP-070874	TEI
GP-34	GP-070653	3854	-	26.19.3a – In case of Full Rate Speech Version 5, the testcase can not be run with M=4	F	7.5.0	7.6.0	GP-070653	TEI
GP-34	GP-070875	3855	1	81.2.3.4 Register to default GANC after reject	F	7.5.0	7.6.0	GP-070875	TEI6
GP-34	GP-071020	3856	2	81.2.4.1 Attempt counting incorrect	F	7.5.0	7.6.0	GP-071020	TEI6
GP-34	GP-070877	3857	1	81.2.5.2 Redirecting to a different GANC as used before	D	7.5.0	7.6.0	GP-070877	TEI6
GP-34	GP-070878	3858	1	82.4.2.1 Initial Condition is not reflecting first step of the expecting sequence	F	7.5.0	7.6.0	GP-070878	TEI6
GP-34	GP-070879	3859	1	83.1.x GAN PS Domain Procedures: Initial trigger for data transfer	F	7.5.0	7.6.0	GP-070879	TEI6
GP-34	GP-070695	3861	-	81.1.3.3, 81.1.3.2 and 81.2.4.5 to be removed	F	7.5.0	7.6.0	GP-070695	TEI
GP-34	GP-070889	3866	1	TC 42.4.8.4.2 – changes in step 16.	F	7.5.0	7.6.0	GP-070889	TEI
GP-34	GP-070762	3868	-	Error correction to test case 70.9.4.3: Some GPS Assistance Data need to be sent	F	7.5.0	7.6.0	GP-070762	GAGR
GP-34	GP-070771	3871	-	32.12 Clarification of Test Requirements with respect to channel configuration	F	7.5.0	7.6.0	GP-070771	TEI
GP-34	GP-070772	3872	-	20. - Mobiles supporting Stored List Cell Selection may prevent the Test Purpose being met for Cell Selection tests.	F	7.5.0	7.6.0	GP-070772	TEI
GP-34	GP-070773	3873	-	47.3.1.3 Misalignment of k parameter	F	7.5.0	7.6.0	GP-070773	TEI
GP-34	GP-070922	3874	1	Chapter 13 test cases, vibration testing made conditional based on a PICS/PIXIT declaration	F	7.5.0	7.6.0	GP-070922	TEI
GP-34	GP-070896	3877	1	Annex A1.1 Connection of devices with multiple antennae	F	7.5.0	7.6.0	GP-070896	MSRD2-MSconf
GP-34	GP-070871	3879	-	26.7.x PICS/PIXIT cleanup	F	7.5.0	7.6.0	GP-070871	TEI
GP-34	GP-070905	3880	2	47.4.1 Ready Timer Handling	F	7.5.0	7.6.0	GP-070905	TEI6
GP-34	GP-070910	3881	-	Update of GPRS NITZ tests	F	7.5.0	7.6.0	GP-070910	TEI
GP-34	GP-070911	3882	-	Update of GSM NITZ test	F	7.5.0	7.6.0	GP-070911	TEI
GP-34	GP-071015	3883	-	TC 20.22.30.1 and 20.22.30.2 – changes in the note given in test requirements.	F	7.5.0	7.6.0	GP-071015	TEI
GP-34	GP-071016	3884	-	26.6.23.3 Addition of New Uplink Repeated SACCH Testcase with SAPI 3	B	7.5.0	7.6.0	GP-071016	TEI6
GP-34	GP-071017	3885	-	26.6.23.1 Addition of New Downlink Repeated SACCH Testcase	B	7.5.0	7.6.0	GP-071017	TEI6
GP-34	GP-071018	3886	-	26.6.23.2 Addition of a New Uplink Repeated SACCH Testcase	B	7.5.0	7.6.0	GP-071018	TEI6
GP-34	GP-071056	3869	1	Correction to extreme condition voltages for Lithium batteries in table A1.3	F	7.5.0	7.6.0	GP-071056	TEI
GP-35	GP-071422	3869	2	Correction to extreme condition voltages for Lithium batteries in table A1.3	F	7.6.0	7.7.0	GP-071422	TEI
GP-35	GP-071110	3887	-	14.16.4.2 Editorial correction of DTS-2 test procedure	F	7.6.0	7.7.0	GP-071110	TEI
GP-35	GP-071412	3888	1	New Test Case:14.16.5.1 Synchronous single co-channel interferer (DTS-1)	F	7.6.0	7.7.0	GP-071412	TEI
GP-35	GP-071112	3889	-	New Test Case14.16.5.2 Multiple interferers (DTS-2 / DTS-5)	F	7.6.0	7.7.0	GP-071112	TEI
GP-35	GP-071413	3890	1	New Test Case:14.18.9.1 Synchronous single co-channel interferer (DTS-1)	F	7.6.0	7.7.0	GP-071413	TEI
GP-35	GP-071383	3891	1	New Test Case: 14.18.9.2 Synchronous single co-channel interferer (DTS-1b)	F	7.6.0	7.7.0	GP-071383	TEI
GP-35	GP-071115	3892	-	New Test Case: 14.18.9.3 Multiple interferers (DTS-2 / DTS-5)	F	7.6.0	7.7.0	GP-071115	TEI
GP-35	GP-071117	3893	-	26.9. Removal of reference to speech codecs other than version 1	F	7.6.0	7.7.0	GP-071117	TEI
GP-35	GP-071118	3894	-	26.12.2.1 – Mandatory Channel Mode IE missing in Handover Command messages	F	7.6.0	7.7.0	GP-071118	TEI
GP-35	GP-071119	3895	-	26.19.5 – Support for transmission of ACCESS BURSTs on SACCH added and frequency lists tabulated.	F	7.6.0	7.7.0	GP-071119	TEI
GP-35	GP-071120	3896	-	31.1.5.1.2 Correction of expected sequence	F	7.6.0	7.7.0	GP-071120	TEI

TSG #	TSG Doc	CR	Rev	Subject/Comment	Cat	Old	New	WG Doc	Work item
GP-35	GP-071121	3897	-	42.1.1.4.3 Removal of incorrect brackets	F	7.6.0	7.7.0	GP-071121	TEI
GP-35	GP-071122	3898	-	Section 26.8 PICS/PIXIT Clean Up	F	7.6.0	7.7.0	GP-071122	TEI
GP-35	GP-071123	3899	-	Section 26.13 PICS/PIXIT Clean Up	F	7.6.0	7.7.0	GP-071123	TEI
GP-35	GP-071128	3900	-	14.10.x : missing PIXIT for normalisation factors	F	7.6.0	7.7.0	GP-071128	GAMRWB
GP-35	GP-071129	3901	-	70.8.x: Addition of the Error Cause "incorrectData" as a valid Error Cause	F	7.6.0	7.7.0	GP-071129	GAGR
GP-35	GP-071424	3902	1	70.x: inconsistent execution	F	7.6.0	7.7.0	GP-071424	GAGR
GP-35	GP-071131	3903	-	70.9.4.3: Addition of "gpsLocCalAssDataMissing" as a valid "LocErrorReason"	F	7.6.0	7.7.0	GP-071131	GAGR
GP-35	GP-071133	3905	-	83.x: PDP Context Activation moved to initial conditions	F	7.6.0	7.7.0	GP-071133	GAAI-CT
GP-35	GP-071384	3906	1	Darp Ph II, new test for Reference Sensitivity	B	7.6.0	7.7.0	GP-071384	MSRD2-MSconf
GP-35	GP-071139	3908	-	20.22.13: Bad selection criteria parameter calculation	F	7.6.0	7.7.0	GP-071139	TEI
GP-35	GP-071417	3909	1	26.6.3.9: Update of measurement information	F	7.6.0	7.7.0	GP-071417	TEI
GP-35	GP-071141	3910	-	44.2.3.3.1, removal of useless PICS	F	7.6.0	7.7.0	GP-071141	TEI
GP-35	GP-071407	3911	1	Annexes A4.3.3/4: Correction of EF(IMSI) and EF(KC)	F	7.6.0	7.7.0	GP-071407	TEI
GP-35	GP-071391	3912	-	81.1.3.7 Knowledge of Serving GANC	F	7.6.0	7.7.0	GP-071391	GAAI-CT
GP-35	GP-071392	3913	-	81.2.3.2 Connection to Default GANC	F	7.6.0	7.7.0	GP-071392	GAAI-CT
GP-35	GP-071404	3914	1	Section 80 & 81 - New Macro for Location Update Procedure	F	7.6.0	7.7.0	GP-071404	TEI6
GP-35	GP-071405	3915	1	81.2.6.4 and 81.2.6.5 – Correction to Expected Sequence	F	7.6.0	7.7.0	GP-071405	TEI6
GP-35	GP-071406	3916	1	81.2.6.6 Clarification of expected sequence	F	7.6.0	7.7.0	GP-071406	TEI6
GP-35	GP-071408	3917	1	Corrections to GAN test case 81.2.4.1	F	7.6.0	7.7.0	GP-071408	TEI
GP-35	GP-071409	3918	1	Corrections to GAN test case 81.2.4.2	F	7.6.0	7.7.0	GP-071409	TEI
GP-35	GP-071154	3919	-	Pointer version of 51.010-1 Rel-6 to Rel-7	F	6.6.0	7.7.0	GP-071154	TEI6
GP-35	GP-071156	3921	-	81.2.3.3: alignment with 81.2.6.3	F	7.6.0	7.7.0	GP-071156	GAAI-CT
GP-35	GP-071158	3923	-	53.1.1.11- Handling of Buffered Packet Uplink Dummy Control Block at step 11.	F	7.6.0	7.7.0	GP-071158	TEI
GP-35	GP-071159	3924	-	29.3.2.6.9 : Redundant step removed	F	7.6.0	7.7.0	GP-071159	TEI
GP-35	GP-071162	3927	-	13.4.2 – add 710, add 810	F	7.6.0	7.7.0	GP-071162	TGSM810-MStest
GP-35	GP-071163	3928	-	14.2.x – add 710, add 810	F	7.6.0	7.7.0	GP-071163	TGSM810-MStest
GP-35	GP-071164	3929	-	21.1 – add 710, add 810	F	7.6.0	7.7.0	GP-071164	TGSM810-MStest
GP-35	GP-071165	3930	-	26.12.5 – add 710, add 810	F	7.6.0	7.7.0	GP-071165	TGSM810-MStest
GP-35	GP-071166	3931	-	26.16.6 to 26.17.6– add 710, add 810	F	7.6.0	7.7.0	GP-071166	TGSM810-MStest
GP-35	GP-071167	3932	-	31.12.1 – add 710, add 810	F	7.6.0	7.7.0	GP-071167	TGSM810-MStest
GP-35	GP-071168	3933	-	34.1 and 34.3 – add 710, add 810	F	7.6.0	7.7.0	GP-071168	TGSM810-MStest
GP-35	GP-071387	3934	1	41.3.6.5 – add 710, add 810	F	7.6.0	7.7.0	GP-071387	TGSM810-MStest
GP-35	GP-071388	3935	1	42.1.2.1.14 to 42.1.2.1.18 – add 710, add 810	F	7.6.0	7.7.0	GP-071388	TGSM810-MStest
GP-35	GP-071389	3936	1	51.3.6.4 and 51.3.6.5 – add 710, add 810	F	7.6.0	7.7.0	GP-071389	TGSM810-MStest
GP-35	GP-071390	3937	1	52.3.2.1.1, 52.3.2.1.2 and 52.3.4 – add 710, add 810	F	7.6.0	7.7.0	GP-071390	TGSM810-MStest
GP-35	GP-071174	3938	-	Clarification of test procedure in 14.2.26 and 14.4.32	F	7.6.0	7.7.0	GP-071174	TEI6
GP-35	GP-071175	3939	-	Informative annex for Repeated SACCH layer 1 test method	F	7.6.0	7.7.0	GP-071175	TEI6
GP-35	GP-071385	3940	1	New Tests Cases: DARP Phase II Speech bearer tests DTS-1, DTS-2 and DTS-5	B	7.6.0	7.7.0	GP-071385	MSRD2-MSconf
GP-35	GP-071178	3941	-	26.8.1.3.5.3 - Change State U10 to U8	F	7.6.0	7.7.0	GP-071178	TEI
GP-35	GP-071179	3942	-	14.4.31 Correction of table references	F	7.6.0	7.7.0	GP-071179	TEI
GP-35	GP-071180	3943	-	14.2.25 Correction on setting the reference performance level	F	7.6.0	7.7.0	GP-071180	TEI
GP-35	GP-071181	3944	-	14.2.26 Correction on setting the reference performance level	F	7.6.0	7.7.0	GP-071181	TEI
GP-35	GP-071182	3945	-	14.2.24 Removal of extreme test conditions	F	7.6.0	7.7.0	GP-071182	TEI
GP-35	GP-071185	3947	-	52.1.1.6.3 Removal of incorrect brackets	F	7.6.0	7.7.0	GP-071185	TEI
GP-35	GP-071395	3949	1	82.7.1.3 Measurement reporting procedure added	F	7.6.0	7.7.0	GP-071395	TEI6
