Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the [ETSI IPR online database](#).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™**, **LTE™** and **5G™** logo are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found at [3GPP to ETSI numbering cross-referencing](#).

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

This specification has been prepared by the 3GPP Task Force, and gives a detailed specification of the 3GPP integrity algorithm GIA4.

This document is the first of three, which between them form the entire specification of the 3GPP Integrity Algorithm GIA4:

- **3GPP TS 55.241: "Specification of the GIA4 encryption algorithms for GPRS; GIA4 specification".**
- 3GPP TS 55.242: "Specification of the GIA4 encryption algorithms for GPRS; Implementers' test data".
- 3GPP TS 55.243: "Specification of the GIA4 encryption algorithms for GPRS; Design conformance test data".

1 Scope

The present document defines the technical details of the 3GPP integrity algorithm GIA4.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

[1] 3GPP TR 21.905: "Vocabulary for 3GPP Specifications".

[2] 3GPP TS 35.202: "3G Security; Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 2: KASUMI Specification".

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].

(none)

3.2 Symbols

For the purposes of the present document, the following symbols apply:

=	The assignment operator.
$\oplus$	The bitwise exclusive-OR operation.
	The concatenation of the two operands.
$\text{KASUMI}[x]_k$	The output of the KASUMI algorithm [2] applied to input value x using the key k .
$X[i]$	The i^{th} bit of the variable X . ($X = X[0] X[1] X[2] \dots$).
Y_i	The i^{th} block of the variable Y . ($Y = Y_0 Y_1 Y_2 \dots$).

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in 3GPP TR 21.905 [1].

CBC-MAC MAC	Cipher Block Chaining Message Authentication Code Message Authentication Code
----------------	--

4 Introductory information

4.1 Introduction

The integrity algorithm GIA4 computes a 32-bit MAC (Message Authentication Code) of a given input message using integrity key KI128. The approach adopted uses KASUMI [2] in a form of CBC-MAC mode.

4.2 Notation

4.2.1 Radix

The prefix "0x" indicates hexadecimal numbers.

4.2.2 Conventions

The assignment operator "=", as used in several programming languages.

$$\langle \text{variable} \rangle = \langle \text{expression} \rangle$$

means that $\langle \text{variable} \rangle$ assumes the value that $\langle \text{expression} \rangle$ had before the assignment took place. For instance,

$$x = x + y + 3$$

means

(new value of x) becomes (old value of x) + (old value of y) + 3.

4.2.3 Bit/byte ordering

All data variables in this specification are presented with the most significant bit (or byte) on the left hand side and the least significant bit (or byte) on the right hand side. Where a variable is broken down into a number of sub-strings, the left most (most significant) sub-string is numbered 0, the next most significant is numbered 1 and so on through to the least significant.

For example an n -bit MESSAGE is subdivided into 64-bit substrings $MB_0, MB_1 \dots MB_i$ so if the message is:

0x0123456789ABCDEFFEDCBA987654321086545381AB594FC28786404C50A37...

then:

$MB_0 = 0x0123456789ABCDEF$
 $MB_1 = 0xFEDCBA9876543210$
 $MB_2 = 0x86545381AB594FC2$
 $MB_3 = 0x8786404C50A37\dots$

In binary this would be:

```
00000001001000110100010101100111100010011010101111001101111011111111110...
```

with

```
MB0 = 0000000100100011010001010110011110001001101010111100110111101111
MB1 = 1111111011011100101110101001100001110110010101000011001000010000
MB2 = 1000011001010100010100111000000110101011010110010100111111000010
MB3 = 1000011110000110010000000100110001010000101000110111...
```

4.3 List of variables

A, B	are 64-bit registers that are used within the function to hold intermediate values.
BLOCKS	an integer variable indicating the number of successive applications of KASUMI that need to be performed.
CONSTANT-F	a 32-bit parameter which is constant for any given FRAMETYPE input.
DIRECTION	a 1-bit input indicating the direction of transmission (uplink or downlink).
FRAMETYPE	an 8-bit input to the function indicating the type of frame to be protected.
INPUT-I	a 32-bit time variant input to the function.
KI128	the 128-bit integrity key.
KM	a 128-bit constant that is used to modify a key.
M	an input to the function which specifies the number of octets of message to be MAC'd (1-65536).
MAC	the 32-bit message authentication code (MAC) produced by the function.
MESSAGE	the input octet stream of length M octets that is to be processed by the function.
PS	is the input padded string processed by the function.

5 Integrity algorithm GIA4

5.1 Introduction

The integrity algorithm GIA4 computes a Message Authentication Code (MAC) on an input message under an integrity key IK128. The input message may be between 1 and 65536 octets long.

For ease of implementation the algorithm is based on the same block cipher (KASUMI) as is used by the confidentiality algorithm GEA4.

5.2 Inputs and outputs

The inputs to the algorithm are given in table 5.2.1, the output in table 5.2.2:

Table 5.2.1: GIA4 inputs

Parameter	Size (bits)	Comment
INPUT-I	32	Frame dependent input INPUT-I[0]...INPUT-I[31]
M		The length of MESSAGE in octets (1-65536)
MESSAGE	8M	Input octet stream MESSAGE{0}...MESSAGE{M-1}
DIRECTION	1	Direction of transmission DIRECTION[0]
FRAMETYPE	8	Input value signifying the type of frame to be protected
KI128	128	Integrity key KI128[0]...KI128[127]

Table 5.2.2: GIA4 output

Parameter	Size (bits)	Comment
MAC	32	Message authentication code MAC[0]...MAC[31]
